Fishes of the Tennessee Portion of the Natchez Trace Parkway

Chris J. Paxton, David A. Etnier, J. T. Baxter, Jr., and Michael H. Doosey

Department of Ecology and Evolutionary Biology
University of Tennessee
Knoxville, Tennessee 37996-1610

1 March 2000

Introduction

The Natchez Trace Parkway has its northern origin in Davidson County, Tennessee, 24.9 air km southwest of the center of Nashville, at Tennessee Highway 100. It continues in a southwesterly direction, leaving Tennessee in Wayne County. The entire Tennessee portion of the Parkway is in the Western Highland Rim physiographic province except for a small portion of the Nashville Basin physiographic province near where the Parkway crosses Duck River. From its northern origin southwest to Duck River Ridge, the Parkway is drained by Leipers Fork, tributary to West Fork Harpeth River system, Cumberland River drainage. This is the only portion of the Cumberland River drainage transgressed by the Parkway. This portion of the upper Harpeth River system has received less attention from ichthyologists than it perhaps deserves, and we anticipate that several additional species would be added with additional work in the area.

After crossing Duck River Ridge, the Parkway enters the Duck River system of the Tennessee River drainage. The remainder of the Williamson County portion of the Parkway is located approximately on the divide between Lick Creek to the west and Leipers Creek to the east, both northern tributaries to Duck River.

The Parkway continues its southwesterly orientation through the northwest corner of Maury County. Leipers Creek, tributary to Duck River, continues to drain the eastern slope of the Parkway, and the western slope is drained by additional Duck River tributaries, Lick Creek to the north and Leatherwood Creek farther south. Just prior to exiting Maury County to Hickman County, the Parkway is bordered by tributaries to a small Duck River tributary, Fattybread Branch.

Upon entering Maury County, the Parkway crosses a small portion of the Nashville Basin physiographic province and Duck River. The crossing of Duck River is on the border between Hickman and Maury counties, just downstream of the mouth of Fattybread Branch and just south of Tennessee Highway 50. This portion of Duck River has not been heavily collected, and additional species not on this list surely occur there. The Parkway continues to follow the valley of the Duck River on its western side in Hickman County, and then rises out of the Nashville Basin to continue on the Western Highland Rim, where it crosses tributaries that drain west into Duck River via Blue Buck Creek and Ugly Creek, both tributaries to the northward flowing Big Swan Creek.

The Parkway then enters northeastern Lewis County, where it continues to cross Duck River tributaries that enter the Duck River via Catheys Creek and upper Big Swan Creek. Near Meriwether Lewis National Monument the Parkway crosses a low divide that separates the Duck River system from its major tributary, the Buffalo River. Within the Buffalo River system the Parkway is crossed, from north to south, by upper Buffalo River, Chief Creek, and Little Buffalo River and their smaller tributaries.

The Parkway then crosses the northwest corner of Lawrence County, where it continues to cross tributaries to Buffalo River (Brush Creek to the west, upper reaches of Little Buffalo River to the east). The Parkway then enters northeastern Wayne County, where it continues in the Buffalo River system via tributaries to upper Fortyeight Creek. Continuing to the southwest in Wayne County, the Parkway crosses another low divide that separates the Buffalo River system from the south-flowing Shoal Creek system, a

direct tributary to the Tennessee River. Within the Shoal Creek system, it crosses tributaries to Factory Creek, and then farther southwest, tributaries to Big Butler Creek. The Parkway exits Tennessee in southcentral Wayne County, where its most southerly 27 km are drained by the Cypress Creek system, an additional direct tributary to the Tennessee River that enters the Tennessee River to the west of the Shoal Creek system.

Methods

Fish species occurring on this list have been collected within streams crossing the Natchez Trace Parkway, or in portions of those streams crossing or originating within the Parkway within 10 km on either side of the Parkway.

The data base from which this information was abstracted consists of (1) the University of Tennessee Research Collection of Fishes, with over 300,000 catalogued specimens representing approximately 25,000 lots (bottles of specimens), with over half of the lots from Tennessee; (2) miscellaneous records of fishes from Tennessee housed at other institutions (including all or nearly all Tennessee records at the University of Michigan Museum of Zoology, the Illinois Natural History Survey, Southern Illinois University at Carbondale, and Cornell University); (3) unpublished and uncatalogued records of fishes collected in Tennessee by the University of Tennessee, the Tennessee Valley Authority, and the Tennessee Wildlife Resources Agency; and (4) published records of fishes from Tennessee that have appeared in various journal articles and other publications. The data base is exactly the same as the one used for distributional records for the recently published Fishes of Tennessee (Etnier and Starnes, 1993), with a few records included that are subsequent to publication of that book.

We searched the dot distribution maps in *The Fishes of Tennessee* to generate a preliminary list of fish species occurring or probably occurring within the Natchez Trace Parkway corridor in Tennessee. For the following 13 species, the distribution maps suggested that a record was available from within the Parkway corridor, but the exact record responsible for the dot on the map could not be located or could not be placed with certainty within the corridor. These species may occur within the corridor based on those maps, but in most cases we suspect that their placement on the initial list reflects the relatively large size on the dots on the distribution maps rather than actual presence in the corridor. The species are *Dorosoma cepedianum*, gizzard shad; *Cyprinella whipplei*, steelcolor shiner; *Cyprinus carpio*, common carp; *Notemigonus crysoleucas*, golden shiner; *Notropis* sp., sawfin shiner; *Pimephales vigilax*, bullhead minnow; *Ameiurus melas*, black bullhead; *Ictalurus punctatus*, channel catfish; *Pylodictis olivaris*, flathead catfish; *Esox americanus*, grass pickerel; *Fundulus notatus*, blackstripe topminnow; *Micropterus punctulatus*, spotted bass; and *Aplodinotus grunniens*, freshwater drum.
