

OBSERVATION

May, 1987

Pine Leaf Adelgid (on white pine.)

Infestations of the adult form of adelgids were seen on needles of white pine. Infestations were severe on some trees, non-existent on others. Some needles were completely covered with winged adults, all facing toward the base of the needle and they remained on the needle, even when insects died. What looks like eggs were observed near or on the abdomen of adults.

Identified with Martineau, R. 1984. Insects Harmful to Forest Trees. pg. 57
