1:30 pm

Went to the Amaco sight again today, for more soil & water samples. The water continues to flow from the pipe, refilling the pit. As it flows into the pit, the water of course becomes polluted from the soil that was left after they pumped the water.

The water is flowing at the rate of 40 ounces a minute or almost 19 gallons an hour.

Soil samples were taken and sent to Gulf Coast Testing for hydro carbon refraction and oil & grease testing. Water samples were taken directly from the pipe flow and were sent in for Oil & Grease & trace element testing.

This water has a salinity of only ~~2.23~~ 2 or 3 ppm.
