

Antietam National Battlefield

The National Capital Region Network Inventory & Monitoring (NCRN I&M) program monitors forest breeding birds in Antietam National Battlefield at 6 points (see map below). **Right:** Yearly abundance estimates (2007-2011) for four of the most abundant species in the NCRN that occur in Antietam National Battlefield, and 9 species of conservation concern detected within Antietam National Battlefield. Highest and lowest mean values are labeled and vertical lines indicate standard errors. Of the regionally abundant species, Northern Cardinals have decreased, and Red-eyed Vireos have increased in abundance. Many of the species of conservation concern have large variances. However, Yellow-billed Cuckoos, Eastern Wood-Pewees, and Baltimore Orioles were relatively abundant, and Acadian Flycatchers have decreased within the park. **Left:** Average Bird Community Index scores for Antietam National Battlefield (2007-2011).
