

Wolf Trap National Park for the Performing Arts

The National Capital Region Network Inventory & Monitoring (NCRN I&M) program monitors forest breeding birds in Wolf Trap National Park for the Performing Arts at 1 point (see map below). **Right:** Yearly abundance estimates (2007-2011) for two of the most abundant species in the NCRN that occur in Wolf Trap National Park for the Performing Arts, and 3 species of conservation concern detected within Wolf Trap National Park for the Performing Arts. Highest and lowest mean values are labeled and vertical lines indicate standard errors. Of the regionally abundant species, the Eastern Tufted Titmouse was detected in very high abundance in 2007, yet has decreased considerably, while Northern Cardinal abundance has remained stable. The 3 species of conservation concern detected within the park all had stable abundances. **Left:** Average Bird Community Index scores for Wolf Trap National Park for the Performing Arts (2007-2011).
