1 Data Reported

a) Analyses of Stream Samples (quarterly sample sites, weekly/episode sample sites, special project sites, if any, and synoptic survey sites, if any)
   Time period: 1 January 2005 through 31 December 2006
b) Daily Stream Discharge
   Time period: 1 January 2005 through 31 December 2006

2 Summary Description of Sampling Program

The reported data are for stream samples collected from forested mountain watersheds in Shenandoah National Park and western Virginia. The reported data include chemical analysis of water samples collected quarterly, weekly, and more-frequently during storm flows, and volatile residue analyses of water samples collected quarterly in Shenandoah National Park.

During this period samples were collected at 85 headwater stream sites in 23 western Virginia counties. Most of the streams drain National Forest, National Park or other public land. Quarterly samples were collected during the last seven days of January, April, July, and October. Weekly stream samples were collected at six sites in Shenandoah National Park. Continuous discharge measurements were collected at five sites in Shenandoah National Park. Flow-actuated episodic high-flow event samples were obtained at three sites in Shenandoah National Park.

A listing of all sites is provided in ***Appendix 1 – Collection sites***.

3 Data Collection and Analysis

Staff from the Department of Environmental Sciences at UVA (UVA), the Shenandoah National Park (SHEN), the USDA Forest Service (USDA), the Virginia Department of Game and Inland Fisheries (VDGIF), and volunteers from Trout Unlimited (TU) collected the samples at established sites.

Samples were collected in 500 mL low-density and 250 mL high-density polyethylene (Nalgene) bottles that were pre-washed with laboratory-grade detergent and hydrochloric acid and rinsed with de-ionized water. Prior to sample collection each bottle was rinsed three times with the sampled streamwater. Upon collection the samples were placed in insulated containers with refrigerant for delivery to the project laboratory at the Department of Environmental Sciences at the University of Virginia. Upon receipt at the laboratory, the samples minus an aliquot poured off for DOC and aluminum analysis (stream samples only) were preserved by addition of chloroform (0.5mL/500mL) and stored at ambient laboratory temperature (about 23 deg. C). DOC/aluminum aliquots were preserved by refrigeration. Analyses included major acid-base constituents and DOC. Samples from all projects were analyzed concurrently. Methods of analysis are summarized in ***Appendix 2 – Analytical Procedures Detailed, Sorted by ID***. All analyses were performed at the Department of Environmental Sciences, University of Virginia.

The North Fork of Dry Run, Paine Run, Piney River, Staunton River, and White Oak Run watersheds in Shenandoah National Park were gauged using standard methods of the U.S. Geological Survey (Rantz et al., 1982). Periods of missing gage data have been estimated using linear regression on discharge at other gauged sites within Shenandoah National Park.

4 Data Quality Assurance

Quality assurance of analysis of stream-water samples was obtained by charge ratio analysis, use of minimum detection and lower quantification limits, precision analysis, trip blank analysis, and analysis of reference samples. This section describes the results of these analyses and lists the minimum detection limits and lower quantification limits used during the period.

During this reporting period some improvement in charge ratio performance was observed due to implementation of new analytical methods, although implementation of all new methods occurred too late in the period to provide conclusive results. Detection limits compared favorably with objectives and improved after the implementation of the new analytical methods. Precision analysis based on analysis of field replicates was observed to be in-control except for nitrate. Trip blank analysis indicated a lack of contamination but did indicate a low level bias in the new analytical methods.

4.1 Charge ratio analysis

Charge ratio for the samples is defined as the sum of anions divided by the sum of base cations. The sum of anions (SAA) is calculated as

$SAA = [SO_4^{2-}] + [CL^-] + [NO_3^-] + [ANC]$

The sum of base cations (SBC) is calculated as

$SBC = [Ca^{2+}] + [Mg^{2+}] + [Na^+] + [K^+] + [NH_4^+]$

or as

$SBC = [Ca^{2+}] + [Mg^{2+}] + [Na^+] + [K^+]$

for cases where NH4 was not measured. Over the life of this project several different instruments and methods have been used to measure anions, cations, and ANC, and so analysis of charge ratio statistics requires a division of the data into groups corresponding to the different methods used. The methods used during this reporting period are listed in Table 1.

To calculate SAA and SBC when one or more of the characteristics had a censored value, we substituted either one half of the MDL or one half of the sum of the MDL plus LQL, depending on whether the value determined was below the MDL or below the LQL, respectively.

Table 1: Methods used to calculate charge ratio

Charge ratio variable name	Description
IONRATIO_2PT_IC1_AA_AUTO	sum of anions by IC1 and manual 2-point titration / sum of cations by AA, collected by automated sampler
IONRATIO_2PT_IC1_AA_GRAB	sum of anions by IC1 and manual 2-point titration / sum of cations by AA, collected by hand
IONRATIO_2PT_IC2_AUTO	sum of anions by IC2 and manual 2-point titration / sum of cations by IC2, collected by automated sampler
IONRATIO_2PT_IC2_GRAB	sum of anions by IC2 and manual 2-point titration / sum of cations by IC2, collected by hand
IONRATIO_MET_IC2_AUTO	sum of anions by IC2 and titration by Metrohm auto-titrator/ sum of cations by IC2, collected by automated sampler
IONRATIO_MET_IC2_AUTO	sum of anions by IC2 and titration by Metrohm auto-titrator/ sum of cations by IC2, collected by hand

The capability of a process to fall within specified limits is often quantified using the C_p or C_{pk}, also known as process capability ratios. The formulas for C_p and C_{pk} are:

$$C_p = \frac{USL - LSL}{6\sigma}$$

$$C_{pk} = \min\left(\frac{USL - \mu}{3\sigma}, \frac{\mu - LSL}{3\sigma}\right)$$

where *USL* and *LSL* are the upper specification limit and lower specification limit, respectively. When a process is “on target”, or no target is known, the C_p is appropriate. When the target is known or the process is off-target, the C_{pk} provides a better metric of the process’s ability to remain within specification limits. For an off-target process, the C_p provides a metric of the process’s ability to operate within limits corresponding to the on-target process. Generally, a C_p or C_{pk} in excess of 1.3 is desired, in excess of 1.0 is acceptable (Montgomery, 1997). Values less than 1.0 indicate a need for process improvement.

Lower and upper specification limits for charge ratio have been given in the literature (Newell and Hjort, 1991) as 0.85 and 1.15 for the Maine Region and 0.80 and 1.10 for the Catskills Region, respectively. We report statistics based on the Catskills Region

limits because they more-closely approximate the range we observe in our samples. We report both the C_p and the C_{pk} because of the uncertainty in what the target value should be. Confidence intervals for the C_p and the C_{pk} can be large for small sample size. Figures 1-3 graphically illustrate the frequency with which charge ratio fell within the target specification limits of 0.95±0.15 for the various measurement methods, and give a confidence interval for the C_p and the C_{pk}.

Two samples were rejected because their charge ratio was more then 5 standard deviations away from the mean calculated for their characteristic group. These are listed in Table 2. One sample that was more than 5 standard deviations from the group mean was not rejected because it was not unusual for that site.

Table 2: Charge ratio outliers

ORG ID	Station ID	Start Date	Start Time	REP NUM	LocCharNameCode	ratio	SAA	SBC	Total ions
SHEN	PAIN	07/08/2005	2:00	0	IONRATIO_2PT_IC1_AA_AUTO	1.61	226.20	140.62	366.83
SHEN	PINE	04/17/2006	16:00	0	IONRATIO_2PT_IC2_AUTO	0.57	333.52	580.73	914.26

Figure 1 shows charge ratio distributions for 512 samples (32% of the total) where charge ratio was determined using 2-point manual titration of ANC, atomic absorption analysis of cations, and ion chromatography analysis of anions. The means for both collection types of samples are considerably below the target value. Both C_p and C_{pk} are below the minimum acceptable value of 1.00, although it falls within the confidence intervals for C_p.

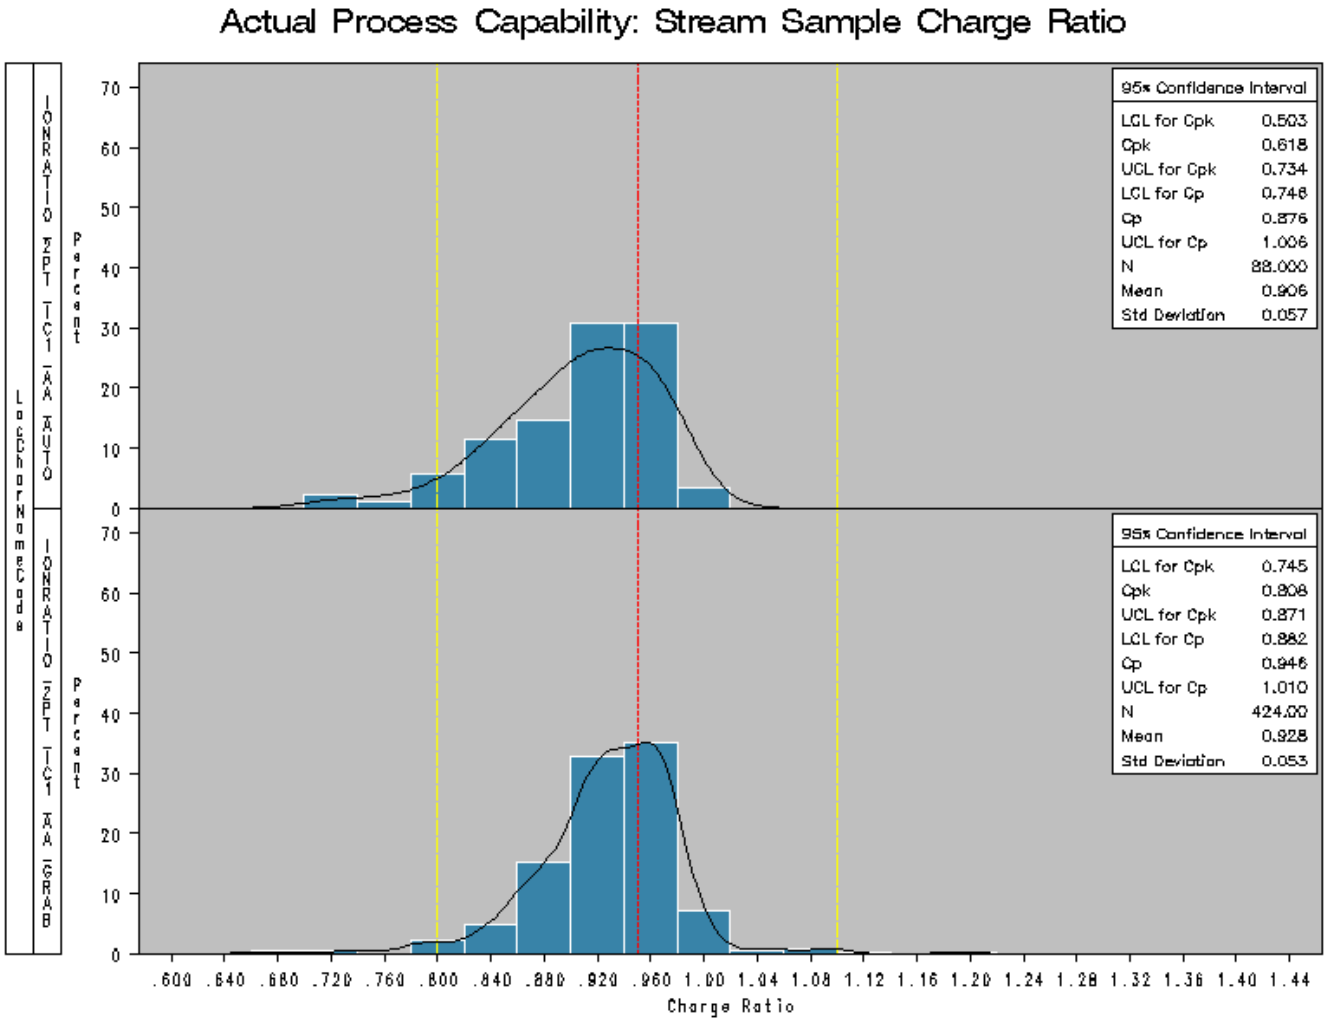

Figure 1: Distributions of charge balance ratio where charge concentrations were determined using 2-point manual titration for ANC, atomic absorption analysis for cations, and ion chromatography for anions. Upper plot: samples collected by auto-sampler. Lower plot: grab samples.

Figure 2 shows the distributions of charge ratio for 915 samples (57% of the total) analyzed using 2-point manual titration of ANC and using ion chromatography analysis for all ions. Again the means of these results are considerably below the target value. Both C_p and C_{pk} are below the minimum acceptable value of 1.00, although it falls within the confidence intervals for C_p for the automatically-collected samples. During October of 2006 all samples collected were analyzed for ANC using both the 2-point manual titration method and the auto-titrator. This resulted in two values for SAA and two values for charge ratio for each sample. Those results therefore appear both in Figure 2 and Figure 3, respectively.

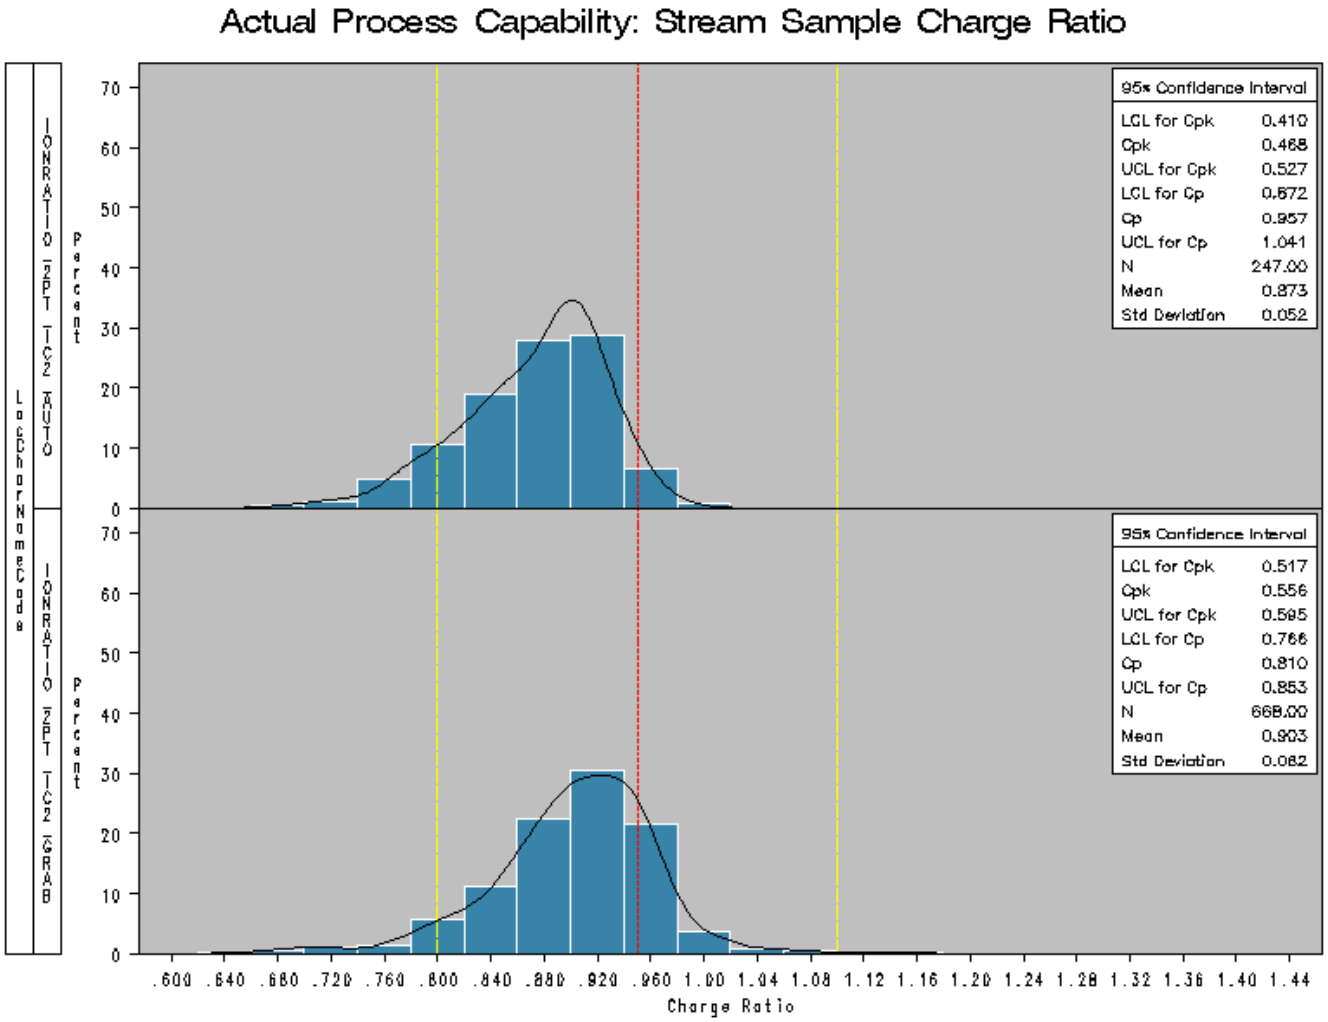

Figure 2: Distributions of charge balance ratio where charge concentrations were determined using 2-point manual titration for ANC, and ion chromatography for cations (including ammonium) and anions. Upper plot: samples collected by auto-sampler. Lower plot: grab samples.

Figure 3 shows the distributions of charge ratio for 185 samples (11% of the total) analyzed using auto-titration of ANC and using ion chromatography for all ions. In this case the means of these results bracket the target value. Both the C_p and the C_{pk} are above the minimum desirable value of 1.3 for the automatically-collected samples, although neither is above the acceptable value of 1.00 for the grab samples. The grab sample set includes two samples which appear as outliers in the figure, but were not outlying enough to meet the 5 standard deviation criteria for rejection. These two samples may be having an inordinate effect on the C_p and the C_{pk}, as otherwise the distribution appears to be equivalent to that for the automatically-collected set. This sample set is also rather small (N=60) compared to the others. It was expected that the

implementation of the auto-titrator and the new IC would improve charge ratio results, however, results from this implementation are mixed so far.

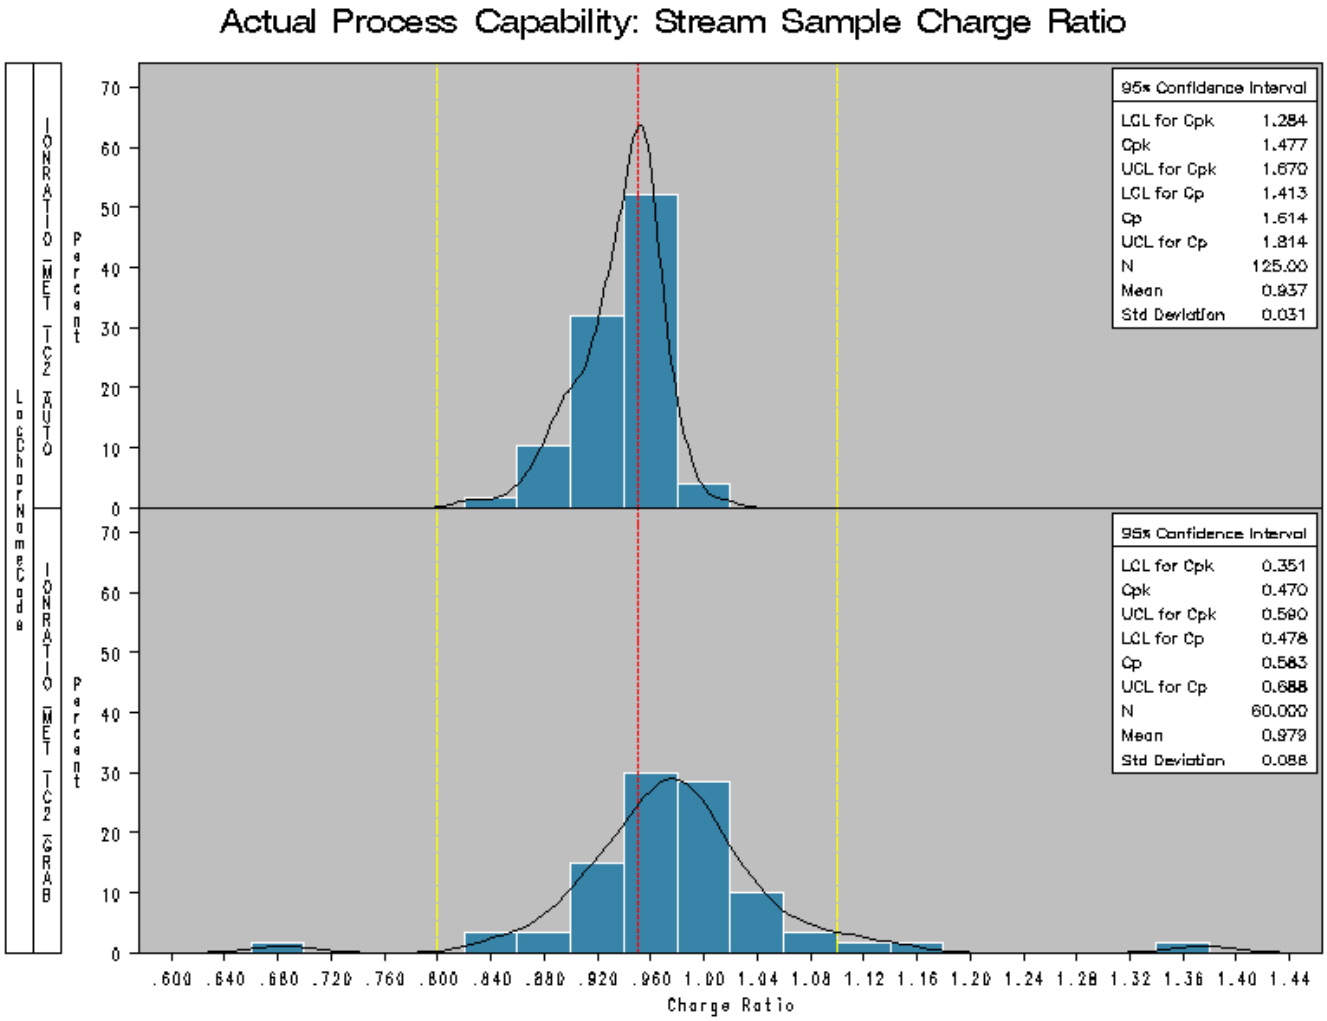

Figure 3: Distributions of charge balance ratio where charge concentrations were determined using auto-titration for ANC, and ion chromatography for cations (including ammonium) and anions. Upper plot: samples collected by auto-sampler. Lower plot: grab samples.

4.2 Minimum detection and lower quantification limits

In ***Appendix 3 – MDLs and LQLs used*** we report the minimum detection limits (MDLs) and lower quantification limits (LQLs) actually used during the 2005-2006 reporting period. MDLs and LQLs were calculated using historical analysis of de-

ionized water and/or 1% solution prepared samples. The MDL is a function of the standard deviation of the *n* analyzed samples, the number of samples, and the t-distribution, as follows: *MDL = s*t,* where *s* is the sample standard deviation and *t* is the 99th quantile from a t-distribution with *n-1* degrees of freedom. The LQL is defined as 3.18 times the MDL.

Table 3 summarizes detection limits determined for both the old and new methods used by UVA during the reporting period, and compares them with detection limit objectives suggested in Newell and Hjort (1991). All detection limits for the new methods meet those objectives. Detection limits for calcium and sulfate did not meet the objectives for the old method, but were only marginally above. The detection limit for silica is also marginally above the objective. Most field results for those three characteristics are well above the lower quantification limit, however, so this failure does not appear to be of consequence.

Table 3: Detection limit summary

Analyte	Objective (from Table 4)	Old method	New method
Chloride	1.0	0.569	0.076
Nitrate	0.5	0.201	0.081
Sulfate	1.0	**1.021**	0.310
Calcium	1.0	**1.269**	0.468
Magnesium	1.0	0.578	0.218
Sodium	1.0	0.710	0.029
Potassium	1.0	0.249	0.029
Aluminum	10.0	1.524	No method change
Ammonium	1.0	0.420	0.013
Silica	0.84	**1.051**	No method change

4.3 Precision analysis

Precision was verified by collecting replicate samples during each of the quarterly sampling windows at five locations each quarter. These locations are rotated randomly so that all seasons are sampled at each site over time. During the period 2005-2006 37 replicate samples were analyzed. The detailed results are given in ***Appendix 4 – Precision Analysis – All***. We use specification limits given in the last column of Table 4, adapted from Newell and Hjort (1991), to assess performance.

Table 4: Quality Assurance Objectives: Analytical Detection Limits, Precision, and Accuracy Objectives

Variable	Reporting Units	Detection Limit	Concentration Range	Precision[1] and Accuracy[2] Objectives	$x\sqrt{2}$ for duplicate differences and RPD
pH, field, closed system or equilibrated	pH units	na	≤ 5.75 > 5.75	±0.075 ±0.15	±0.106 ±0.21
ANC	µeq/L	na	≤ 100 > 100	±5 ±5%	±7 ±7%
Conductivity	µS/cm	na	≤ 50 > 50	±1.0 ±2%	±1.4 ±3%
Color	PCU	na	≤ 50 > 50	±5 ±10%	±7 ±14%
Cl^-	µeq/L	1.0	≤ 20 > 20	±1.0 ±5%	±1.4 ±7%
NO_3^-	µeq/L	0.5	≤ 10 > 10	±0.5 ±5%	±0.7 ±7%
SO_4^{2-}	µeq/L	1.0	≤ 20 > 20	±1.0 ±5%	±1.4 ±7%
Ca, Mg, Na, K	µeq/L	1.0	≤ 20 > 20	±1.0 ±5%	±1.4 ±7%
Al, total dissolved, and total and organic monomeric	µg/L	10	≤ 100 > 100	±10 ±10%	±14 ±14%
DOC and DIC	mg/L	0.1	≤ 1 > 1	±0.1 ±10%	±0.14 ±14%
NH_4	µeq/L	1.0	≤ 20 > 20	±1.0 ±5%	±1.4 ±7%
SiO_2	mg/L	0.05 (0.84 µM/L)	≤ 1 (17 µM/L) > 1 (17 µM/L)	±0.05 (0.84 µM/L) ±5%	±0.07 (1.17 µM/L) ±7%

[1] The precision objectives are based on the standard deviation of repeated measurements at lower concentrations, and as percent relative standard deviation at higher concentrations. If the difference between duplicates or the relative percent difference (RPD) is used to estimate precision, modify the above objectives so that they are also based on the difference and RPD. The objectives are modified by multiplying by $\sqrt{2}$.

[2] Accuracy is estimated as the difference between measured and target values of samples of known concentration at lower concentrations, and as percent difference at higher concentrations.

Table 5 gives precision results for all characteristics and for those characteristics where results fell outside of the specification limits given in Table 4. Under the null hypothesis that even when in a process is in control, a small percentage of results will fall outside of the specification limits, we calculate the probability of getting *k* or more defects. If this probability is significant, say 0.05 or greater, then the number of defects seen does not suggest the null hypothesis should be rejected. We assume results are independent and use a common individual probability of 0.003 (3 out of a thousand) that an individual result could be outside of the specification limits even when the process is in control.

Table 5: Precision results summary

Characteristic	Defects (k)	total	Percent defective	Probability of k or more outside of specification limits given acceptable individual probability of 0.003
ANC	1	42	2.38%	0.1186
calcium	0	37	0.00%	0.1052
chloride	0	37	0.00%	0.1052
conductivity	0	37	0.00%	0.1052
potassium	0	37	0.00%	0.1052
magnesium	0	37	0.00%	0.1052
sodium	0	37	0.00%	0.1052
ammonium	0	1	0.00%	**0.0030**
nitrate	5	8	62.50%	**0.0000**
pH	1	42	2.38%	0.1186
silica	0	37	0.00%	0.1052
sulfate	1	37	2.70%	0.1052
Monomeric aluminum, organic fraction	0	1	0.00%	**0.0030**
Total monomeric aluminum	0	9	0.00%	**0.0267**
ALL	8	399	2.01%	**0.0000**
ALL minus nitrate	3	391	0.77%	0.1144

Table 5 indicates that excluding nitrate, precision of analyses performed in the UVA lab during the period was in-control (p=0.1144). It should be pointed out that the low total number of analyses for nitrate resulted from the fact that most of the results were below the MDL or LQL, rendering them unsuitable for precision analyses. Several other characteristics, while having a significant probability of being out-of-control, had no defective results but had an insufficient total number of analyses to establish statistically that they were in control. In the case of ammonium, this is because most results were censored. In the case of aluminum, not many samples were actually analyzed.

4.4 Trip blank analysis

Trip blanks are sample bottles filled with de-ionized water that are carried to sample site locations, returned, and analyzed to test for system-wide contamination. One trip blank is analyzed during each quarterly sampling window. During 2005-2006 8 trip blanks were analyzed. The detailed results of trip blank analysis are given in ***Appendix 5 - Trip Blank Summary Statistics - Period of Record***.

Except for ANC, pH, and conductivity, trip blank results should be less than the MDL. Results above the MDL indicate contamination or some bias in the measurement process, although that bias may only be applicable at low levels.

Table 6: Trip blank analysis summary

Variable	Count	Censored	< MDL	< LQL	≥ LQL	# of defects (k)	% defective	Probability K≥k under H_0
All except pH, ANC, conductivity	80	56	48	8	24	32	40.00%	0.0000
By AA	12	12	12	0	0	0	0.00%	0.0354
By IC1	9	9	9	0	0	0	0.00%	0.0267
By IC2	40	16	11	5	24	29	72.50%	0.0000
By TC	19	19	16	3	0	3	15.79%	0.0000

Table 6 indicates that the old measurement methods for cations and anions (AA and IC1) had zero instances of results above MDL, although insufficient analyses to establish statistically that the process was contamination-free. The new method (IC2) had a substantial number of results above MDL. We conclude that all of the trip blanks were contamination-free, but that the new methodology has a low-level bias. The method of analysis of silica and aluminum by Technicon (TC) did not change during the period; we conclude that the statistically high number of defects in the trip blanks for these characteristics is due to low-level bias.

4.5 Reference samples

Reference samples were analyzed during all analysis sessions for pH, alkalinity, conductivity, cations, anions, aluminum, DOC, ammonium, and silica. During this period the instrumentation used in UVA lab analyses was replaced, so analysis results for reference samples are summarized in ***Appendix 6 - old Lab QC results*** and in ***Appendix 7 - new Lab QC results***.

4.6 Inter-laboratory Quality Assurance:

The project laboratory at the Department of Environmental Sciences at the University of Virginia participates in inter-laboratory quality assurance (QA) studies administered by Environment Canada's National Water Research Institute (NWRI). Environmental programs in both the United States and Canada participate in these studies which are designed for laboratories analyzing acid rain and surface waters. The purpose of these QA studies is to provide a useful means of quantifying laboratory performance and data quality. The QA report for each study includes an assessment of any systematic bias and indicates any results flagged as a result of poor precision. A bias of greater than 5% is considered excessive by NWRI for most parameters in the studies. A result is flagged if its value is beyond that of the median (target) plus or minus the acceptable difference. The acceptable difference is calculated by NWRI using the following formula:

(Target - LLBAE) x CEI + BAE, where

LLBAE = Lower Limit for use of Basic Acceptable Error
CEI = Concentration Error Increment
BAE = Basic Acceptable Error
(The values for these terms are determined by NWRI.)

Each study consists of ten samples, which are analyzed by the project laboratory by the same means as the project samples and usually included in analysis sessions along with project samples. The analysis results are then reported to the NWRI. We report results for the studies in which the project laboratory has participated to date in Table 7.

Table 7: Project Laboratory Results for NWRI Inter-laboratory Quality Assurance Studies

Study Date	pH - manual	pH- titrator	specific conductance	Alkalinity – manual (2-point)	Alkalinity – titrator (11 point)	chloride	nitrate	sulfate	ammonia	reactive silica	sodium	potassium	calcium	magnesium	Dissolved organic carbon
10-MAY-94	A	N	A	N	N	A	A	A	A	A	A	A	A	A	N
15-JAN-95	A	N	1	A	N	2	A	A	A	3	A	A	A	4	N

01-DEC-07	N	A	15	N	A	A	A	A	A	A	A	A	A	A	A

Notes:

A) Acceptable

N) No results

1) Although no results are flagged, ranking indicates a slight bias low.
2) Although no results are flagged, ranking indicates a slight bias low. After these results were submitted, the ion chromatography column used for chloride analyses was replaced.
3) Acceptable, except for high on one out of ten samples.
4) Although no results are flagged, ranking indicates a slight bias high.
5) Flagged very high on one out of ten samples. This was due to a calculation error made after analysis.
6) Two out of 10 samples flagged: one extremely low, one low.
7) Two out of 10 samples flagged: both very low.
8) Flagged extremely low on one sample out of 10.
9) Three out of 10 samples flagged: one extremely low, one very low, and one low.

10) Satisfactory, except for low on one out of 10 samples.

11) Flagged extremely high on one sample out of 10.

12) Four out of 10 samples flagged low. Ranking indicates a low bias: -4.64%, blank – 0.3536.

13) Two out of 10 samples flagged: one very low, one low.

14) Ranking indicates a high bias: 8.50%, blank: -0.4069.

15) Ranking indicates a low bias: -9.10%, blank: 0.3390. Four out of 10 samples flagged as low: three action flags and one warning flag.

5 Data Files and Appendices

Analysis results are provided on CD in Excel format. Sample data and discharge, along with data definitions, are provided in spreadsheets

1) Export_Results.xls
2) flow.xls

Printouts of chemical analysis results are provided in ***Appendix 8 - Results Detailed***

Appendices appear in related files. Adobe Acrobat Reader or equivalent software is required to read them.

NPSTORET Analytical Procedures

Shenandoah National Park *Sorted by ID*

ID: ALUMINUM_TCON **Name:** Colorimetric procedure for aluminum using the Technicon Autoanalyzer II
Org/Nat: ORG **Specific Equipment:**
Description: Colorimetric detection with open-system samples by pyrocatechol violet technique. Fractionation with ion-exchange resin.
Source: Shenandoah National Park
Citation:
Characteristics: Aluminum, Organic + Inorganic Monomeric (reactive aluminum): T_AL_TC_AutoStream
Aluminum, Organic + Inorganic Monomeric (reactive aluminum): T_AL_TC_Grab
Aluminum, Organic Monomeric (reactive aluminum): O_AL_TC_AutoStream
Aluminum, Organic Monomeric (reactive aluminum): O_AL_TC_Grab

---

ID: AMMONIUM_TCON **Name:** Colorimetric procedure for ammonium using the Technicon Autoanalyzer II
Org/Nat: ORG **Specific Equipment:**
Description: Colorimetric detection by Indophenol blue technique.
Source: Shenandoah National Park
Citation:
Characteristics: Nitrogen, ammonium (NH4) as NH4: NH4_Chang_LH
Nitrogen, ammonium (NH4) as NH4: NH4_TC_AutoStream
Nitrogen, ammonium (NH4) as NH4: NH4_TC_AutoPpt

Nitrogen, ammonium (NH4) as NH4: NH4_TC_Wet

ID: ANC_2PT_MANUAL **Name:** 2-point manual titration with pH meter and electrode
Org/Nat: ORG **Specific Equipment:** pH meter
Description: Two-point Gran titration with 100 ml sample volumes and 0.005 N HCl titrant. Titration endpoints were approx. 4.5 and 4.2. Within-aliquot stability (<= 0.01 units/min.) was obtained for endpoint determinations.
Source: Shenandoah National Park
Citation:
Characteristics: Acid Neutralizing Capacity (ANC): ANC_Manual_Grab
Acid Neutralizing Capacity (ANC): ANC_Manual_AutoStream

ID: ANC_PH_AUTOTITR **Name:** ANC and pH with the Metrohm 809 titration system
Org/Nat: ORG **Specific Equipment:** Titration Apparatus
Description: pH measurement and ANC (Acid neutralizing capacity) Gran titration using Metrohm 809 titration system
Source: Shenandoah National Park
Citation:
Characteristics: Acid Neutralizing Capacity (ANC): ANC_Metrohm_Grab
Acid Neutralizing Capacity (ANC): ANC_Metrohm_AutoStream
pH: pH_Metrohm_Grab
pH: pH_Metrohm_AutoStream

ID: ANIONS_IC **Name:** Ion chromotography with the Dionex Model 14 IC for SO4, Cl, NO3
Org/Nat: ORG **Specific Equipment:** Ion Chromatograph
Description: Dionex Model 14 Ion Chromatograph; HPIC AS14 Separator Column; HPIC AG14 Guard Column; AMMS Anion

Micro-Membrane Suppressor. Simultaneous determination by ion chromatography. Injection volume: 200 µl. Eluent: 1.5 mL 4.8 mM Na2CO3/0.6mM NaHCO3/minute. Regenerant: 3-4 ml 0.035 N H2SO4/minute.

ID: CHLORIDE_TCON **Name:** Colorimetric procedure for chloride using the Technicon Autoanalyzer II
Org/Nat: ORG **Specific Equipment:** Colorimeter
Description:
Source: Shenandoah National Park
Citation: The composition of precipitation in remote areas of the world
Characteristics: Chloride: Cl_TC_Grab

ID: COND_VWR_MANUAL **Name:** Conductivity procedure using a VWR-brand NIST traceable digital conductivity meter w/ ATC
Org/Nat: ORG **Specific Equipment:** Conductivity Meter
Description: VWR-brand (manufactured by Control Company) NIST Traceable digital conductivity meter with automatic temperature compensation to 25 degrees C. Digital meter and conductivity probe.
Readings obtained at ambient lab temperature (about 23 deg. C).
Source: Shenandoah National Park
Citation:
Characteristics: Specific conductance: Cond_VWR_Manual_AutoStream

Appendix 6: Summary of Reference Sample Analyses for Sample Period: January 2005 through December 2006

Concentrations in µeq/L (alkalinity and ions), µmol/L (SiO_2), µS/cm (conductivity), µg/L (T_AL=total monomeric aluminum, O_AL=organic monomeric aluminum), and mg/L (DOC).

Chloroform (1 mL/L) added to bulk streamwater samples (other than aluminum aliquots).

Natural audit samples provided by Environmental Assessment Department, Lockheed Engineering and Sciences. Listed target values are based on data collected from multiple laboratories. Samples are maintained at approximately 4 °C. Chloroform (1 mL/L) added (other than aluminum aliquots).

Synthetic audit samples purchased from High Purity Standards, Charleston, South Carolina. Listed target values are provided by High Purity Standards. Samples are maintained at approximately 4°C. Chloroform (1 mL/L) added (other than aluminum aliquots).

CRM – Certified Reference Materials purchased from Environment Canada National Water Research Institute. Target values for these samples are derived from several performance evaluation studies in which multiple laboratories participated. Samples are maintained at approximately 4°C. Chloroform (1 mL/L) added (other than aluminum aliquots).
