

Arkansas Post N MEM Deer Monitoring

White-tailed deer were monitored between 2005 and 2016 on Arkansas Post National Memorial, Arkansas using methods developed by the Heartland Inventory and Monitoring Network. See: <http://science.nature.nps.gov/im/units/htln/deer.cfm>. An index of deer density was used to identify annual changes in the deer population within the survey area of the park. The annual indexes of deer density values demonstrate an up-and-down oscillation pattern since the start of surveys in 2005. The 2016 deer density in the survey area was 50% below the 12-year average.
