A3297 *Acer saccharum - Tilia americana* Limestone Woodland Alliance

Alliance Summary Description: This alliance is composed of mostly rich, mesic deciduous woodlands of limestone pavement or colluvial slopes. *Acer saccharum* is the most constant species, but a variety of deciduous trees may also be present, including *Tilia americana* and *Quercus rubra*. Conifers, such as *Tsuga canadensis, Thuja occidentalis*, and *Abies balsamea*, are also present in some stands. The canopy is variable, ranging from open to closed (40-80% cover). The ground layer may contain a range of mesic herbaceous and shrub indicators.

[CEGL005058] *Acer saccharum - Tilia americana - Fraxinus americana / Ostrya virginiana / Geranium robertianum* Woodland

Translated Name: **Sugar Maple - American Basswood - White Ash / Hophornbeam / Robert's Geranium Talus Woodland**

Common Name: **Rich Northern Hardwood Talus Woodland**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hardwood Forest (G743)
Alliance	*Acer saccharum - Tilia americana* Limestone Woodland Alliance (A3297)

Element Concept

Global Summary: These open, circumneutral woodlands range from the Great Lakes to the Northern Appalachians and Lower New England regions. They typically occur on talus and colluvial slopes where soils are derived from circumneutral to calcareous bedrock, and often extend upslope onto ridges and low summits. The elevation range is from about 150 to 610 m (500-2000 feet) with most occurrences below 365 m (1200 feet), and southerly exposure is common. Soils are thin, patchy and dry. The hardwood canopy is very patchy, with open talus interspersed with wooded areas. Even the wooded areas generally have an open canopy, and canopy closure overall is usually less than 50%, often with stunted trees. Shrubs and herbs are scattered where soil is available; vines are unusually well-represented. Herb cover may be locally extensive on stabilized areas. The bryoid layer is very minor and varies from patches of lichens on the open talus to sparse mosses in wooded areas. The ground cover is boulder talus and deciduous litter. Canopy dominants are typically *Acer saccharum* and *Quercus rubra*, with the characteristic but usually subordinate species *Ostrya virginiana, Fraxinus americana*, and *Tilia americana*. Where shrubs are even present, they are scattered and clumped and include *Cornus rugosa, Acer pensylvanicum, Acer spicatum, Rubus odoratus, Corylus cornuta, Viburnum acerifolium, Staphylea trifolia*, and *Ribes* spp. Vines are locally abundant on talus. Rich-site herbs indicative of these talus slopes include *Asplenium platyneuron, Polystichum braunii, Aralia racemosa, Saxifraga virginiensis, Geranium robertianum, Arabis drummondii, Asarum canadense, Carex rosea, Carex sprengelii, Carex platyphylla*, and *Piptatherum racemosum (= Oryzopsis racemosa)*. This association is distinguished from other deciduous talus and low summit woodlands by the presence of enriched-site species such as *Tilia americana* and *Juglans cinerea* in the canopy, and the characteristic rich-site herb species listed above. However, sites do occur that are intermediate between this type and the more acidic oak-birch talus woodlands, *Betula alleghaniensis - Quercus rubra / Polypodium virginianum* Woodland (CEGL006584) and *Quercus rubra - Betula lenta / Polypodium virginianum* Woodland (CEGL006585).

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This enriched, dry-mesic to mesic woodland occurs on talus and ranges from New Brunswick and Vermont south to Connecticut at elevations ranging from 150 to 610 m (500-2,000 feet). Sites are somewhat steep east- and southwest-facing talus slopes, both lower slope and summit. Soils are moderately well-drained silt loam and well-drained loam. The unvegetated surface is a variable mixture of leaf litter, exposed bedrock, large rocks, and downed wood. Evidence of disturbance includes past logging, fallen trees and a minor presence of exotic plants.

Global Environment: Stands occur on talus and colluvial slopes where soils are derived from circumneutral to calcareous bedrock, and often extend upslope onto ridges and low summits. The elevation range is from about 150 to 610 m (500-2000 feet) with most occurrences below 370 m (1200 feet), and southerly exposure is common. Soils are thin, patchy, and dry.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This northern, enriched, dry-mesic forest/woodland is dominated by *Acer saccharum* and *Fraxinus americana* with *Ostrya virginiana* in the subcanopy, and species of non-enriched bedrock such as *Acer pensylvanicum* and *Acer spicatum*. The shrub and herb layers include circumneutral-calcareous indicators such as *Sambucus racemosa, Impatiens pallida, Caulophyllum thalictroides, Geranium robertianum, Arabis drummondii, Asarum canadense*, or the sedges *Carex rosea, Carex sprengelii*, or *Carex platyphylla*. In addition, this community supports VT state-imperiled *Poa saltuensis*.

Global Vegetation: The hardwood canopy is very patchy, with open talus interspersed with wooded areas. Even the wooded areas generally have an open canopy, and canopy closure overall is usually less than 50%. Shrubs and herbs are scattered where soil is available; vines are unusually well represented. Herb cover may be locally extensive on stabilized areas. The bryoid layer is very minor, and varies from patches of lichens on the open talus to sparse mosses in wooded areas. The ground cover is boulder talus and deciduous litter. Canopy dominants are typically *Acer saccharum* and *Quercus rubra*, with the characteristic but usually subordinate species *Ostrya virginiana, Fraxinus americana*, and *Tilia americana*. Other canopy associates include *Acer rubrum, Betula lenta, Betula papyrifera, Betula alleghaniensis, Juglans cinerea*, and *Ulmus rubra*. Where shrubs are even present, they are scattered and clumped and include *Cornus rugosa, Acer pensylvanicum, Acer spicatum, Rubus odoratus, Corylus cornuta, Viburnum acerifolium, Staphylea trifolia*, and *Ribes* spp. Vines are locally abundant on talus and include *Parthenocissus quinquefolia, Parthenocissus vitacea, Toxicodendron radicans, Clematis virginiana, Clematis occidentalis, Adlumia fungosa, Celastrus scandens*, and *Polygonum cilinode*. Rich-site herbs indicative of these talus slopes include *Asplenium platyneuron, Polystichum braunii, Aralia racemosa, Saxifraga virginiensis, Geranium robertianum, Arabis drummondii, Asarum canadense, Carex rosea, Carex sprengelii, Carex platyphylla*, and *Piptatherum racemosum (= Oryzopsis racemosa)*. Also present, and less restricted to circumneutral conditions, are *Cystopteris bulbifera, Carex pensylvanica, Carex communis, Deschampsia flexuosa, Schizachne purpurascens, Hepatica nobilis var. obtusa (= Hepatica americana), Dryopteris marginalis, Polypodium virginianum*, and *Athyrium filix-femina*.

A3241 *Quercus rubra - Acer saccharum* Forest Alliance

Alliance Summary Description: This alliance is regarded as the "red oak" version of northern hardwood forests and woodlands. Canopy composition is a variable mixture of hardwood species. *Quercus rubra* (usually at least 30% of the canopy) is considered the diagnostic species. The most common codominant species include *Acer saccharum, Acer rubrum, Betula alleghaniensis*, and *Fagus grandifolia*. Other minor canopy species may include *Betula papyrifera, Betula populifolia, Populus grandidentata*, and *Prunus pensylvanica*. Conifers, if present, generally make up less than 20% of the canopy cover and may include *Pinus strobus* or *Tsuga canadensis*. A subcanopy composed of *Acer pensylvanicum* and *Acer spicatum* may be present. Typical shrubs include *Acer pensylvanicum, Amelanchier* spp., *Corylus cornuta, Hamamelis virginiana, Lindera benzoin*, and *Viburnum acerifolium*. The herb layer may be quite diverse depending on site characteristics. Species may include *Actaea pachypoda, Actaea rubra, Arabis* spp., *Arisaema triphyllum, Carex blanda, Carex laxiflora, Carex pedunculata, Carex platyphylla, Festuca subverticillata, Hepatica nobilis var. obtusa (= Hepatica americana), Packera obovata (= Senecio obovatus), Phegopteris hexagonoptera (= Thelypteris hexagonoptera), Polygonatum pubescens, Thalictrum dioicum, Thalictrum thalictroides (= Anemonella thalictroides), Viola rotundifolia*, and *Viola sororia*. This alliance is found in the north-central and northeastern United States and southern Canada. These forests typically occur on deep, moist to well-drained loams and silt loams on north and east midslopes to mesic ridgetops and coves, but stands may also occur on talus slopes or dry-mesic fine sandy loams and loamy sands.

Group	Laurentian-Acadian Hardwood Forest (G743)
Alliance	*Quercus rubra - Acer saccharum* Forest Alliance (A3241)

Element Concept

Global Summary: This acidic, large-boulder talus slope woodland occurs in the northern Appalachian Mountains, and northern New England north into eastern Canada. The substrate is large boulders, with vascular plants confined to coarse-textured soils in crevices. Sites are at low to mid elevations, from near sea level to about 520 m (1700 feet). Soils are thin, patchy, and nutrient-poor. The hardwood canopy is very patchy, with open talus interspersed with wooded areas. Canopy closure overall is usually less than 50%. Shrubs are patchy and may form thickets in openings. The herb layer is sparse overall, although dense patches may occur where some soil is available; bryophytes are likewise sparse. The ground cover is exposed talus, moss-covered boulders, and deciduous litter. The tree canopy is dominated by a variable mixture of oak and birch species, including *Quercus rubra* and *Betula alleghaniensis*. In the northern portion of this community's range, *Quercus rubra* may drop out entirely, with *Betula* spp. and *Acer* spp. dominant. Other canopy associates include *Acer saccharum, Betula papyrifera, Betula populifolia, Fagus grandifolia, Acer rubrum, Prunus pensylvanica, Populus grandidentata, Tsuga canadensis*, and *Pinus strobus*. At the northern end of the range, *Betula x caerulea* and *Betula papyrifera* are also associated. The understory is composed of scattered and clumped tall shrubs and small trees, including *Acer spicatum, Acer pensylvanicum, Rubus* spp., *Viburnum acerifolium*, and *Ribes* spp. Ericaceous shrubs are not generally prevalent, but when present may include *Vaccinium angustifolium, Gaylussacia baccata*, or *Kalmia angustifolia*. Vines are particularly characteristic, and include *Parthenocissus quinquefolia, Parthenocissus vitacea, Toxicodendron radicans, Toxicodendron rydbergii, Celastrus scandens*, and *Polygonum cilinode*. Scattered ferns and herbs are *Dryopteris marginalis, Polypodium virginianum, Pteridium aquilinum, Maianthemum racemosum, Eurybia macrophylla (= Aster macrophyllus), Deschampsia flexuosa, Carex pensylvanica, Carex lucorum, Corydalis sempervirens, Solidago bicolor, Solidago caesia*, and *Aralia nudicaulis*. Bryophytes include *Polytrichum commune, Leucobryum glaucum, Umbilicaria* spp., and *Cladina* spp. This association is characterized by the patchy deciduous canopy, with *Betula* spp. common and *Ostrya virginiana* sparse or absent, and by the lack of rich-site indicator herbs.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon woodland association is only known from one location in New Hampshire at 590 m (1,935 feet) in elevation on a steep, exposed southwest-facing talus slope.
Global Environment: This acidic, large-boulder talus slope woodland occurs in the northern Appalachian Mountains and northern New England, north to eastern Canada. The substrate is large boulders, with vascular plants confined to coarse-textured soils in crevices. Sites are at low to mid elevations, from near sea level to about 520 m (0-1700 feet). Soils are thin, patchy, and nutrient-poor.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association has an open canopy of *Betula alleghaniensis* and/or *Betula papyrifera* with *Picea rubens* and *Acer rubrum* at low cover. *Acer spicatum, Acer pensylvanicum, Rubus* spp., *Viburnum acerifolium*, and *Ribes* spp. also common. Vines are characteristic, including *Parthenocissus quinquefolia, Parthenocissus vitacea, Toxicodendron radicans*, and others *Dryopteris marginalis, Dryopteris campyloptera, Polypodium virginianum*, and *Maianthemum canadense* are common herbs; enriched-site herbs are absent. Oak may drop out entirely in the northern portion of range.
Global Vegetation: The hardwood canopy is very patchy, with open talus interspersed with wooded areas. Canopy closure overall is usually less than 50%. Shrubs are patchy and may form thickets in openings. The herb layer is sparse overall, although dense patches may occur where some soil is available; bryophytes are likewise sparse. The ground cover is exposed talus, moss-covered boulders, and deciduous litter. The tree canopy is dominated by a variable mixture of oak and birch species, including *Quercus rubra* and *Betula alleghaniensis*. In the northern portion of this community's range, *Quercus rubra* may drop out entirely, with *Betula* spp. and *Acer* spp. dominant. CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: This is the northernmost occurrence of this association in the Northern Appalachian project area and is out of range of *Quercus rubra*.
Global Classification Comments: Intermediates between this type and the circumneutral/calcareous talus woodland (CEGL005058) do occur. See also a similar type, *Quercus rubra - Betula lenta / Polypodium virginianum* Woodland (CEGL006585), which was split from this type because it contains a greater mix of central hardwood oak and hardwood species, e.g., as shown by the distinction between the two Vermont talus types, the Transition Hardwood Talus Woodland and the Northern Hardwoods Talus Woodland (Sorenson and Thompson 2000).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only known from Moose Mountain in New Hampshire.
Global Range: This woodland occurs in the northern Appalachian Mountains, northern New England and eastern maritime Canada and possibly Quebec.

Group	Laurentian-Acadian Hardwood Forest (G743)
Alliance	*Quercus rubra - Acer saccharum* Forest Alliance (A3241)

ELEMENT CONCEPT

Global Summary: These mesic forests of oak and northern hardwoods, sometimes mixed with hemlock or pine, are distributed across the cooler parts of the glaciated northeastern United States and adjacent maritime Canada. They occur on slightly acidic, well-drained loamy and often rocky soils of intermediate fertility, most often positioned on midslopes and coves. Soil depth is often shallow, but some stands occur on deep tills. Most are at low to mid elevations, usually under 520 m (1700 feet).The deciduous-to-mixed canopy is mostly closed, and the lower layers are variable in extent. Tall shrubs are well-represented, although scattered, with occasional denser patches. Herbs are sparse and bryoids are nearly absent. Ericads and other dwarf-shrubs are also nearly absent, a characteristic that distinguishes this association from most other red oak forests in the Northeast. Canopy composition is a variable mixture of *Quercus rubra* (usually at least 30% of the canopy), *Fagus grandifolia, Acer saccharum, Acer rubrum*, and in some stands *Pinus strobus* or *Tsuga canadensis*. Conifers generally make up less than 20% of the canopy cover, and even in mixed stands the cover of deciduous trees exceeds that of conifers. Minor canopy associates include *Fraxinus americana, Tilia americana, Betula lenta, Juglans cinerea*, and *Ulmus americana*. *Acer pensylvanicum* is common as a small tree; *Corylus cornuta, Viburnum acerifolium*, and *Hamamelis virginiana* are typical shrubs. Typical species in the herb layer include *Gaultheria procumbens, Maianthemum canadense, Aralia nudicaulis, Trientalis borealis, Uvularia sessilifolia, Medeola virginiana, Brachyelytrum erectum, Dryopteris intermedia, Polystichum acrostichoides, Dennstaedtia punctilobula, Pteridium aquilinum*, and *Thelypteris noveboracensis*. On more nutrient-rich soils, the herb layer may contain *Solidago caesia, Caulophyllum thalictroides, Dryopteris marginalis*, and *Eurybia divaricata (= Aster divaricatus)*. This association is distinguished from northern hardwood forests by its greater amount of oak, from other oak forests by its greater prominence of northern hardwoods and lack of dwarf-shrub ericads, and from hemlock-hardwoods by the relatively low importance of hemlock.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association is only known from two locations in the Northern Appalachian project area from 320 to 360 m (1,050-1,180 feet) in elevation on moderate to steep low to mid slopes on southeast and northwest aspects. Soils are dry to mesic sandy loams with abundant litter and duff.

Global Environment: These mesic forests of oak, beech, and maple are distributed across the cooler parts of the glaciated northeastern United States. They occur on slightly acidic, well-drained loamy and often rocky soils of intermediate fertility, most often positioned on mid-slopes and coves. Soil depth is often shallow, but some occur on deep tills. Most are at low to mid elevations, usually under 520 m (1700 feet).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed deciduous canopies dominated by a variable mixture of *Quercus rubra* and *Acer saccharum* in association with *Acer rubrum, Betula alleghaniensis, Betula papyrifera*, and *Ostrya virginiana* occurring at lower cover. Shrub cover is low and variable. Species may include *Acer pensylvanicum, Cornus alternifolia, Corylus cornuta*, and *Viburnum acerifolium*. The herbaceous layer is depauperate with low cover. Species may include *Arisaema triphyllum, Athyrium filix-femina, Dennstaedtia punctilobula, Dryopteris intermedia*, and *Polystichum acrostichoides*.

Global Vegetation: The deciduous-to-mixed canopy is mostly closed, and the lower layers are variable in extent. Tall shrubs are well represented, although scattered, with occasional denser patches. Herbs are sparse, and bryoids are nearly absent. Ericads and other dwarf-shrubs are also nearly absent, a characteristic that distinguishes this association from most other red oak forests in the Northeast. Canopy composition is a variable mixture of *Quercus rubra* (usually at least 30% of the canopy), *Fagus grandifolia, Acer saccharum, Acer rubrum*, and, in some stands, *Pinus strobus* or *Tsuga canadensis*. In mixed stands, the cover of deciduous trees exceeds that of conifers. Minor canopy associates include *Fraxinus americana, Tilia americana, Betula lenta, Juglans cinerea*, and *Ulmus americana*. *Acer pensylvanicum* is common as a small tree; *Corylus cornuta, Viburnum acerifolium*, and *Hamamelis virginiana* are typical shrubs. Typical species in the herb layer include *Gaultheria procumbens, Maianthemum canadense, Aralia nudicaulis, Trientalis borealis, Uvularia sessilifolia, Medeola virginiana, Brachyelytrum erectum, Dryopteris intermedia, Polystichum acrostichoides, Dennstaedtia punctilobula, Pteridium aquilinum*, and *Thelypteris noveboracensis*. On more nutrient-rich soils, the herb layer may contain *Solidago caesia, Caulophyllum thalictroides*, and *Eurybia divaricata (= Aster divaricatus)*.

G741. LAURENTIAN-ACADIAN HEMLOCK - WHITE PINE - HARDWOOD FOREST

Group Summary Description: This cool, moist to dry-mesic forest type ranges from the northeastern United States and maritime Canada west to the Great Lakes and central Wisconsin. Canopy dominants include *Pinus strobus, Thuja occidentalis*, and *Tsuga canadensis* (at least 25% cover), with or without hardwoods, including *Acer saccharum, Fagus grandifolia, Betula alleghaniensis*, and *Quercus rubra* in varying percentages. *Acer rubrum* is also quite common; *Betula lenta* may be common at the southern periphery of this group's range. *Picea rubens* and *Abies balsamea* are <25%. *Quercus velutina* and *Quercus alba* are largely absent from this group, particularly in the northeast, being more representative of groups in the Central Interior-Appalachian division to the south. This is a widespread, matrix forest type for the more temperate portions of this division. Gap replacement and infrequent fire are the major natural regeneration modes. These mesic forests usually occur on low-nutrient soils at low elevations, mostly less than 610 m (2000 feet).

A3251 *Pinus strobus - Tsuga canadensis* Forest Alliance

Alliance Summary Description: These northern coniferous forests occur in southeastern and south-central Canada south to Wisconsin and east to northern New Jersey. These mesic northern coniferous forests are characterized by abundant *Pinus strobus* and *Tsuga canadensis*. Other conifers such as *Picea rubens* or *Abies balsamea* occur at the northern edge of the range of this group; hardwoods such as *Acer saccharum, Betula alleghaniensis, Betula lenta* and *Betula papyrifera* are frequent canopy associates, but are never codominant. Common shrubs include *Acer spicatum, Acer pensylvanicum, Hamamelis virginiana, Viburnum nudum var. cassinoides*, and *Vaccinium myrtilloides*. Herbaceous species are generally few and characterized by northern or cool climates and may include *Clintonia borealis, Cornus canadensis, Eurybia macrophylla, Maianthemum canadense, Oclemena acuminata*, and *Trientalis borealis*.. The bryophyte layer is often well-developed and characterized by *Dicranum* spp. and *Leucobryum glaucum*. The environmental setting is generally dry to slightly mesic, usually acidic and nutrient-poor sites.

[CEGL006324] *Pinus strobus - Tsuga canadensis - Picea rubens* Forest

Translated Name: **Eastern White Pine - Eastern Hemlock - Red Spruce Forest**
Common Name: **White Pine - Hemlock - Red Spruce Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hemlock - White Pine - Hardwood Forest (G741)
Alliance	*Pinus strobus - Tsuga canadensis* Forest Alliance (A3251)

ELEMENT CONCEPT

Global Summary: This dry-mesic pine - hemlock forest occurs on lower-elevation slopes and flats in northern New England. The typical setting is sheltered slopes with sandy or stony, acidic, moderately well-drained soils overlying bedrock, talus, or till. The closed coniferous canopy admits little light, and lower layers are patchy and sparse. Dense needle accumulation and dry conditions appear to further limit the growth of herbs and bryoids. The canopy is composed of substantial *Pinus strobus*, with variable components of *Picea rubens* and *Tsuga canadensis*. Near the coast, *Thuja occidentalis* may be a canopy component. *Picea rubens* is characteristic, although it may not be abundant, and its presence indicates a cool climatic regime. Occasionally *Abies balsamea* will be present in the canopy or subcanopy. Minor deciduous associates may include *Quercus rubra, Acer rubrum, Betula alleghaniensis, Betula papyrifera*, or *Betula populifolia*. In the shrub layer, characteristic species include *Gaylussacia baccata, Kalmia angustifolia, Viburnum nudum var. cassinoides (= Viburnum cassinoides), Vaccinium angustifolium, Vaccinium myrtilloides*, or, less commonly, *Comptonia peregrina, Diervilla lonicera, Nemopanthus mucronatus*, or *Rubus hispidus*. Characteristic herb species include *Pteridium aquilinum, Polypodium virginianum, Aralia nudicaulis, Maianthemum canadense, Gaultheria procumbens, Oclemena acuminata (= Aster acuminatus), Eurybia macrophylla (= Aster macrophyllus), Cornus canadensis, Trientalis borealis*, and *Clintonia borealis*. The bryophyte layer often includes *Dicranum undulatum* and *Leucobryum glaucum*, and may include species of *Cladina*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This dry-mesic pine - hemlock - spruce forest occurs on lower-elevation slopes and flats from Massachusetts to Maine on sheltered slopes with sandy or stony, acidic, moderately well-drained soils.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is known from low elevations locally in the Northern Appalachian project area at elevations ranging from 350 to 650 m (1,150-2,130 feet). Positions include ravines and low to high slopes on all aspects. Soils are loams and sandy loams.
Global Environment: This dry-mesic pine - hemlock forest occurs on lower-elevation slopes and flats in northern New England. The typical setting is sheltered slopes with sandy or stony, acidic, moderately well-drained soils overlying bedrock, talus, or till.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This forest is codominated by *Tsuga canadensis* and *Pinus strobus*. *Picea rubens* and northern hardwoods are typical in the understory.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy evergreen forests dominated by variable mixtures of *Pinus strobus, Picea rubens*, and *Tsuga canadensis*, any of which can be dominant, codominant or a canopy associate. Other species that may occur at low cover include *Abies balsamea, Acer rubrum, Acer saccharum, Betula alleghaniensis, Fagus grandifolia*, and *Thuja occidentalis*. These heavily shaded forests typically have understories with low cover and diversity. Shrub species that may occur at low cover include *Lonicera canadensis, Taxus canadensis, Vaccinium angustifolium*, and *Viburnum lantanoides*. Herbaceous species are variable and occur at very low cover as well. Species include *Aralia nudicaulis, Chimaphila umbellata, Clintonia borealis, Coptis trifolia, Cornus canadensis, Dryopteris intermedia*, and *Medeola virginiana*.
Global Vegetation: The closed coniferous canopy admits little light, and lower layers are patchy and sparse. Dense needle accumulation and dry conditions appear to further limit the growth of herbs and bryoids. The canopy is composed of substantial *Pinus strobus*, with variable components of *Picea rubens* and *Tsuga canadensis*. Near the coast, *Thuja occidentalis* may be a canopy component. *Picea rubens* is characteristic, although it may not be abundant, and its presence indicates a cool climatic regime. Occasionally *Abies balsamea* will be present in the canopy or subcanopy. Minor deciduous associates may include *Quercus rubra, Acer rubrum, Betula alleghaniensis, Betula papyrifera*, or *Betula populifolia*. In the shrub layer, characteristic species include *Gaylussacia baccata, Kalmia angustifolia, Viburnum nudum var. cassinoides (= Viburnum cassinoides), Vaccinium angustifolium, Vaccinium myrtilloides*, or, less commonly, *Comptonia peregrina, Diervilla lonicera, Nemopanthus mucronatus*, or *Rubus hispidus*. Characteristic herb species include *Pteridium aquilinum, Polypodium virginianum, Aralia nudicaulis, Maianthemum canadense, Gaultheria procumbens, Oclemena acuminata (= Aster acuminatus), Eurybia macrophylla (= Aster macrophyllus), Cornus canadensis, Trientalis borealis*, and *Clintonia borealis*. The bryophyte layer often includes *Dicranum undulatum* and *Leucobryum glaucum*, and may include species of *Cladina*.

A4072 *Tsuga canadensis - Betula alleghaniensis - Acer saccharum* Forest Alliance

Alliance Summary Description: Forests in this alliance are late-successional upland forests dominated by coniferous and deciduous trees. *Tsuga canadensis* and some combination of *Acer saccharum, Betula alleghaniensis, Fagus grandifolia, Picea rubens*, and *Thuja occidentalis* (in the Midwest) are typically the dominant trees. Associated trees include *Acer rubrum, Betula lenta* (in the eastern portion of this alliance's range), *Betula papyrifera, Pinus strobus*, and *Prunus serotina var. serotina*. *Picea rubens* can be found in northern New England. The shade from the canopy and dense saplings and seedlings inhibit the growth of many other species. These stands often have depauperate ground layer strata. Where the shade is not as complete, shrubs such as *Corylus cornuta, Diervilla lonicera, Hamamelis virginiana, Sambucus racemosa var. racemosa (= Sambucus pubens)*, and *Viburnum lantanoides (= Viburnum alnifolium)* are common. The herbaceous layer consists of species such as *Anemone quinquefolia, Cornus canadensis, Dryopteris carthusiana, Maianthemum canadense, Medeola virginiana, Mitchella repens, Oxalis montana, Trientalis borealis, Trillium grandiflorum*, and *Viola* spp. This alliance is known from the Laurentian-Acadian region ranging from New Brunswick and Nova Scotia to Ontario and possibly Quebec, south to New England and northern Pennsylvania, and west to Wisconsin. Stands of this alliance tend to be on dry-mesic to mesic loam and sand soils. The soil is typically acidic with parent material of glacial till in the north. Stands can be on flat to moderately steep slopes of any aspect.

[CEGL005005] *Acer saccharum - Pinus strobus / Acer pensylvanicum* Forest

Translated Name: **Sugar Maple - Eastern White Pine / Striped Maple Forest**
Common Name: **Northern Hardwood - White Pine Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hemlock - White Pine - Hardwood Forest (G741)
Alliance	*Tsuga canadensis - Betula alleghaniensis - Acer saccharum* Forest Alliance (A4072)

Element Concept

Global Summary: This dry white pine - northern hardwood forest occurs widely throughout the upper midwestern and northeastern United States and eastern Canada. The typical environmental setting is well-drained, acidic, sandy or gravelly soil over glacial till, in general a less mesic setting than northern hardwoods lacking white pine. Stands are characterized by a closed canopy, sometimes with supercanopy pine, patchy (but overall fairly sparse) shrubs, and relatively sparse herb and bryoid strata. Canopy dominants are the northern hardwood species *Acer saccharum, Betula alleghaniensis*, and in the Northeast *Fagus grandifolia*, with *Pinus strobus*, the pine often occurring as a supercanopy. Minor canopy associates may include *Tsuga canadensis* and *Quercus rubra*. In the Northeast at the northern edge of the range, *Abies balsamea, Picea rubens* and *Thuja occidentalis* may also occur sparingly. The subcanopy is dominated by *Acer pensylvanicum*. The herbaceous layer is characterized by *Trientalis borealis, Maianthemum canadense, Pteridium aquilinum, Oryzopsis asperifolia*, intermixed with the dwarf-shrubs *Gaultheria procumbens, Vaccinium angustifolium* and *Gaylussacia baccata*. Bryophytes include *Polytrichum commune, Pleurozium schreberi, Bazzania trilobata*, or *Hypnum imponens*. Distribution in Michigan needs further checking.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: Local data were not collected for this community.
Global Environment: In the Northern Appalachian region, stands occur on sandy-gravelly soils, eskers in the Adirondacks, and also in a narrow band along lakeshores (Northern Appalachian Ecoregional Planning Team pers. comm. 1998).

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Local data were not collected for this community.
Global Vegetation: Stands are dominated primarily by *Acer saccharum* with a *Pinus strobus* supercanopy (pine may be less than 25%). There may be some *Tsuga canadensis*. Other northern hardwood tree species may also be present. The understory may contain *Oryzopsis asperifolia* and *Pteridium aquilinum* in addition to standard northern hardwood understory.

MOST ABUNDANT SPECIES

Global

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Pinus strobus*
Tree canopy	Broad-leaved deciduous tree	*Acer saccharum*
Tree subcanopy	Broad-leaved deciduous tree	*Acer pensylvanicum*
Herb (field)	Graminoid	*Oryzopsis asperifolia*

Global: *Acer pensylvanicum*, *Acer saccharum*, *Pinus strobus*

OTHER NOTEWORTHY SPECIES

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: GNR (3-Oct-1996).

RELATED CONCEPTS

Global Similar Types:
- *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006631)
- *Acer saccharum - Betula alleghaniensis - Tilia americana* Forest (CEGL002457)
- *Acer saccharum - Fagus grandifolia - Betula* spp. / *Maianthemum canadense* Forest (CEGL005004)
- *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632)
- *Quercus rubra - Acer saccharum - Fagus grandifolia / Viburnum acerifolium* Forest (CEGL006633)
- *Quercus rubra - Acer saccharum / Viburnum acerifolium - Lindera benzoin* Forest (CEGL006635)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Observed during mapping reconnaissance in MA and VT but no plot or observation point data collected.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type is difficult to sort out, and stands with only a scattered supercanopy of *Pinus strobus* (less than 25% cover) are floristically very similar to northern hardwoods types [see *Acer saccharum - Betula alleghaniensis - Tilia americana* Forest (CEGL002457), *Acer saccharum - Fagus grandifolia - Betula* spp. / *Maianthemum canadense* Forest (CEGL005004), *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632), and *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006631)]. Further review of this issue is needed. Note that the Ontario type to which this type is crosswalked is a mixed evergreen-deciduous type, with white pine between 25 and 50% canopy cover. The importance of white pine in this association is considered to indicate relatively dry, nutrient-poor site conditions and includes mature stands in natural condition. White pine can also be a successional component of forests that regenerated after clearing, which complicates interpretation. However, this association theoretically comprises stands where white pine is "natural" and not present as a result of land-use history.

[CEGL006129] *Tsuga canadensis - (Betula alleghaniensis) - Picea rubens / Cornus canadensis* Forest

Translated Name: **Eastern Hemlock - (Yellow Birch) - Red Spruce / Bunchberry Dogwood Forest**
Common Name: **Hemlock - Spruce - Hardwood Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hemlock - White Pine - Hardwood Forest (G741)
Alliance	*Tsuga canadensis - Betula alleghaniensis - Acer saccharum* Forest Alliance (A4072)

ELEMENT CONCEPT

Global Summary: This mesic coniferous to mixed hemlock forest of northern and central New England and New York occurs on somewhat sheltered slopes at moderate elevations (30-610 m [100-2000 feet]). Hillslopes, stream valleys, ravines, and river or kame terraces are typical settings. The soils are mesic, well-drained sands or loams, often derived from till, acidic and typically shallow (<50 cm to obstruction). Canopy cover is typically dense, resulting in low light levels near the forest floor and correspondingly sparse lower layers. The canopy is dominated by *Tsuga canadensis*, and may be either almost entirely coniferous or a mixture of conifers and deciduous trees. Northern hardwoods are characteristic associates, including *Betula alleghaniensis, Betula papyrifera, Fagus grandifolia*, and *Acer saccharum*. *Picea rubens* is a common conifer associate, and may approach codominance with hemlock at some sites. Scattered subcanopy and shrub layers may feature *Acer pensylvanicum* and *Viburnum lantanoides (= Viburnum alnifolium)*. Herb richness and cover are very low; typical species include *Aralia nudicaulis, Cornus canadensis, Dryopteris intermedia, Gaultheria procumbens, Maianthemum canadense, Medeola virginiana, Mitchella repens, Thelypteris noveboracensis*, and *Trientalis borealis*. In northern settings (e.g., where red spruce is common), the herb layer may contain more boreal species such as *Dryopteris campyloptera, Huperzia lucidula, Oxalis montana*, and *Trillium undulatum*. This association differs from other upland hemlock forest associations in the presence of red spruce and/or yellow birch and the more generally boreal species affinities, lacking plants such as *Kalmia latifolia, Rhododendron maximum, Betula lenta*, and *Quercus* spp.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hemlock - hardwood forest is known from northern and central New England and New York. It occurs globally on sheltered slopes at moderate elevations of 30-610 m (100-2,000 feet). Sites include a somewhat steep ravine with well-drained sandy loam soil and a moderate lower slope with moderately well-drained silt loam soil. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large rocks, and downed wood. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is known only from the southernmost and northernmost sections of the Northern Appalachian project area. It occurs at elevations ranging from 200 to 500 m (655-1,640 feet) on gentle to steep ravines, sheltered low and mid slopes. Soils are dry to mesic loam, silt loam and sandy loam often with abundant litter and duff.

Global Environment: This mesic coniferous to mixed hemlock forest of northern and central New England and New York occurs on somewhat sheltered slopes at moderate elevations (30-610 m [100-2000 feet]). Hillslopes, stream valleys, ravines, and river or kame terraces are typical settings. The soils are mesic, well-drained sands or loams, often derived from till, acidic and typically shallow (<50 cm to obstruction).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy and subcanopy are dominated by *Tsuga canadensis* with *Picea rubens* present (0.1-45% cover); additional tree species may include *Acer rubrum, Acer saccharum*, and *Betula alleghaniensis*. Shrubs include *Fagus grandifolia* and *Viburnum lantanoides*. The herb layer may contain more boreal species such as *Dryopteris campyloptera, Huperzia lucidula, Oxalis montana*, and *Trillium undulatum*. Common herbs in the sampled plots include *Aralia nudicaulis, Dryopteris intermedia*, and *Oxalis montana*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This mixed evergreen-deciduous forest is characterized by canopy cover of variable mixtures of *Tsuga canadensis, Picea rubens*, and *Betula alleghaniensis* with all three species typically present in stands. Other canopy associates may include *Acer rubrum, Betula papyrifera*, and *Pinus strobus*. The shrub layer is primarily dominated by saplings of canopy species, often with *Acer pensylvanicum*. Herbaceous cover tends to be relatively low, the most abundant species being *Aralia nudicaulis* and *Dryopteris intermedia*. Other herbaceous associates may include *Clintonia borealis, Coptis trifolia, Cornus canadensis, Maianthemum canadense, Medeola virginiana, Oclemena acuminata, Oxalis montana, Trientalis borealis*, and *Trillium undulatum*.

Global Vegetation: Canopy cover is typically dense, resulting in low light levels near the forest floor and correspondingly sparse lower layers. The canopy is dominated by *Tsuga canadensis*, and may be either almost entirely coniferous or a mixture of conifers and deciduous trees. Northern hardwoods are characteristic associates, including *Betula alleghaniensis, Betula papyrifera, Fagus grandifolia*, and *Acer saccharum*. *Picea rubens* is a common conifer associate, and may approach codominance with hemlock at some sites. Scattered subcanopy and shrub layers may feature *Acer pensylvanicum* and *Viburnum lantanoides (= Viburnum alnifolium)*. Herb richness and cover are very low; typical species include *Aralia nudicaulis, Cornus canadensis, Dryopteris intermedia, Gaultheria procumbens, Maianthemum canadense, Medeola virginiana, Mitchella repens, Thelypteris noveboracensis*, and *Trientalis borealis*. In northern settings (e.g., where red spruce is common), the herb layer may contain more boreal species such as *Dryopteris campyloptera, Huperzia lucidula, Oxalis montana*, and *Trillium undulatum*.

[CEGL006638] *Tsuga canadensis - Betula alleghaniensis - Acer saccharum / Dryopteris intermedia* Forest

Translated Name: **Eastern Hemlock - Yellow Birch - Sugar Maple / Intermediate Woodfern Forest**
Common Name: **Hemlock - Northern Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hemlock - White Pine - Hardwood Forest (G741)
Alliance	*Tsuga canadensis - Betula alleghaniensis - Acer saccharum* Forest Alliance (A4072)

Element Concept

Global Summary: This association comprises hemlock - northern hardwood forests of the northeastern United States and adjacent maritime Canada. This forest is associated with cool, dry-mesic to mesic sites and acidic soils, often on rocky, north-facing slopes. Soils can have a thick, poorly decomposed duff layer over sandy loams. *Tsuga canadensis* is characteristic and usually dominant in the coniferous to mixed canopy. While hemlock generally forms at least 50% of the canopy, in some cases it may be as low as 25% relative dominance. Hardwood codominants include *Betula alleghaniensis* or *Acer saccharum*, with *Fagus grandifolia* common but not usually abundant in all but the very southern portion of the range of this type. *Betula lenta* may replace *Betula alleghaniensis* in some areas. *Ostrya virginiana* may be present as a small tree. *Quercus* spp. and *Pinus strobus* tend to be absent or, if present, only occur with low abundance. The shrub layer may be dense to fairly open and often includes *Viburnum acerifolium* and *Acer pensylvanicum* in addition to *Tsuga canadensis* regeneration. Herbs may be sparse, particularly in dense shade, but include *Dryopteris intermedia, Medeola virginiana, Oxalis montana, Mitchella repens, Maianthemum canadense, Uvularia sessilifolia, Polystichum acrostichoides, Trientalis borealis, Huperzia lucidula (= Lycopodium lucidulum), Oclemena acuminata (= Aster acuminatus), Dennstaedtia punctilobula*, and *Thelypteris noveboracensis*. Nonvascular plants may be well-developed, often characterized by the liverwort *Bazzania trilobata*. Diagnostic characteristics of this forest are the dominance of *Tsuga canadensis*, presence of *Betula alleghaniensis* and *Acer saccharum*, and a lack of abundant *Quercus* spp., *Pinus strobus*, other conifers, or *Betula lenta*.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association is known from only one location in New Hampshire at 542 m (1,778 feet) in elevation on a somewhat steep mesic midslope on an eastern aspect. The soil is sandy loam.
Global Environment: This forest is associated with cool, dry-mesic to mesic sites and acidic soils, often on rocky, north-facing slopes. Soils can have a thick, poorly decomposed duff layer over sandy loams.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only occurrence of this association has a mixed evergreen-deciduous canopy dominated by *Tsuga canadensis* with about 50% of the canopy cover composed of *Betula alleghaniensis* with lesser amounts of *Picea rubens* and *Fagus grandifolia*. The tall-shrub layer is dominated by *Acer pensylvanicum*. The primary herbaceous species is the fern *Dryopteris intermedia*.
Global Vegetation: *Tsuga canadensis* is dominant and forms at least 50% of the canopy. *Betula alleghaniensis* can be codominant, with *Fagus grandifolia* and *Acer saccharum* common. The shrub layer may be dense to fairly open and often includes *Viburnum acerifolium* and *Acer pensylvanicum* in addition to *Tsuga canadensis* regeneration. Herbs may be sparse, particularly in dense shade, but often include *Dryopteris intermedia, Medeola virginiana, Oxalis montana, Mitchella repens, Maianthemum canadense, Trientalis borealis, Huperzia lucidula (= Lycopodium lucidulum)*, and *Thelypteris noveboracensis*. Nonvascular plants may be well-developed, often characterized by the liverwort *Bazzania trilobata*. Diagnostic characteristics of this forest are the presence of *Betula alleghaniensis* and *Acer saccharum* and a lack of abundant *Quercus* spp., *Pinus strobus*, or *Betula lenta*.

OTHER NOTEWORTHY SPECIES

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (3-Dec-2014). This association has a very large geographic distribution and occurs in large patches in the northern part of its range.

RELATED CONCEPTS

Global Similar Types:
- *Betula alleghaniensis - (Tsuga canadensis) / Rhododendron maximum / (Leucothoe fontanesiana)* Forest (CEGL007861)
- *Tsuga canadensis - (Betula alleghaniensis) - Picea rubens / Cornus canadensis* Forest (CEGL006129)
- *Tsuga canadensis - (Betula alleghaniensis, Quercus rubra) / Ilex montana / Rhododendron catawbiense* Forest (CEGL008513)
- *Tsuga canadensis - Acer saccharum - Fagus grandifolia / Dryopteris intermedia* Forest (CEGL006639)
- *Tsuga canadensis - Fagus grandifolia - Acer saccharum / (Hamamelis virginiana, Kalmia latifolia)* Forest (CEGL005043)
- *Tsuga canadensis - Fagus grandifolia - Quercus (prinus, alba)* Forest (CEGL006474)
- *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest (CEGL006088)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Global Classification Comments: This type was formerly included in CEGL006109, which was split into CEGL006638 and CEGL006639. It was separated from *Tsuga canadensis - Acer saccharum - Fagus grandifolia / Dryopteris intermedia* Forest (CEGL006639) to better recognize its Northern Appalachian - Acadian region characteristics, including much stronger dominance by *Betula alleghaniensis*. However, it may overlap strongly with *Tsuga canadensis - (Betula alleghaniensis) - Picea rubens / Cornus canadensis* Forest (CEGL006129). See also another conifer-dominated association in this region, *Pinus strobus - Tsuga canadensis - Picea rubens* Forest (CEGL006324). Stands of this vegetation type could become threatened by adelgid-caused tree mortality should the adelgid continue to spread northward.

G744. NORTHERN APPALACHIAN-ACADIAN RED SPRUCE - FIR - HARDWOOD FOREST

Group Summary Description: The vegetation comprises spruce-fir-hardwood forests and woodlands of northeastern North America within the range of *Picea rubens*, from the Acadian forests of southeastern Canada across northern New England and the Adirondacks and adjacent areas of New York and western Pennsylvania. Sites of this group occur in cool, mostly mesic settings on various glaciated landforms. Substrate geology also varies, although soils are generally acidic. They form the forest matrix in the coolest parts of this region, and they occur from sea level to treeline (below about 1370 m [4500 feet]). *Picea rubens* is generally present and often dominant. Following heavy disturbance from fire or timber harvesting, the canopy may be dominated by *Abies balsamea, Betula papyrifera*, or *Populus* spp. Typical canopy associates include *Betula alleghaniensis, Betula papyrifera, Thuja occidentalis*, and *Acer rubrum*. On less exposed sites in the southern part of this group's range, *Tsuga canadensis* may be an important canopy associate. Characteristic shrubs include *Vaccinium angustifolium* and/or *Vaccinium myrtilloides, Viburnum lantanoides*, and *Viburnum nudum var. cassinoides*. Characteristic herbs include *Clintonia borealis, Cornus canadensis, Mitchella repens, Oxalis montana, Trientalis borealis*, and *Trillium undulatum*. Ferns include *Dryopteris campyloptera, Dryopteris carthusiana*, and *Dryopteris intermedia*, among others. The bryophyte layer is generally very well-developed, characterized by *Bazzania trilobata, Pleurozium schreberi, Dicranum* spp., and many others. Moist sites may support *Sphagnum* spp. Mosses and liverworts grow densely on fallen logs, tree trunks, and the forest floor, giving these forests a distinctive carpeted appearance.

A0150 *Picea rubens - Abies balsamea* Forest Alliance

Alliance Summary Description: This alliance contains red spruce - balsam fir and mixed spruce - northern hardwood forest associations of southeastern Canada ranging to northern New England and New York. The canopy may be dominated by *Picea rubens, Abies balsamea*, or codominated by both species, with or without northern hardwood species such as *Betula alleghaniensis*. Typical canopy associates include *Betula alleghaniensis* and *Betula papyrifera*, with an understory of *Sorbus americana, Acer spicatum*, and *Acer pensylvanicum*. Occasional associates include a diversity of northern hardwoods, such as *Acer rubrum, Acer saccharum, Fagus grandifolia*, and *Tsuga canadensis*. Common herbs of this alliance include *Clintonia borealis, Coptis trifolia, Cornus canadensis, Huperzia lucidula (= Lycopodium lucidulum), Maianthemum canadense, Oclemena acuminata (= Aster acuminatus), Oxalis montana*, and *Trientalis borealis*. The bryophyte layer is generally very well-developed, characterized by *Bazzania trilobata, Brotherella recurvans, Pleurozium schreberi*, and many others. Stands occur primarily on acidic till derived from granites or from sandstone, at elevations from near sea level up to 1370 m (0-4500 feet). Though typically on mesic site, some site are relatively moist ("spruce flats").

[CEGL006112] *Abies balsamea - (Betula papyrifera var. cordifolia)* Forest

Translated Name: **Balsam Fir - (Mountain Paper Birch) Forest**
Common Name: **Montane Balsam Fir - Birch Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest (G744)
Alliance	*Picea rubens - Abies balsamea* Forest Alliance (A0150)

ELEMENT CONCEPT

Global Summary: These subalpine forests occur near treeline on mountains of the northeastern United States and adjacent Canada. They are found on upper mountain slopes and ridgetops (above 915 m [3000 feet]) where they are associated with high winds, cold temperatures and shallow, acidic soils with a strong organic component. They are usually coniferous, but in some cases *Betula papyrifera var. cordifolia* may be a long-term replacement after disturbance. Canopy coverage is usually 70-85%. The shrub layer is sparse where the canopy is closed, but disturbance-created patches that are frequent within this forest may have dense shrub cover. Dwarf-shrubs and herbs are sparse; the coverage of bryoids is variable. In the canopy, *Abies balsamea* is often dominant and may form pure stands; *Betula papyrifera var. cordifolia* and *Picea rubens* are common associates, usually of minor importance except for post-disturbance patches that may be strongly birch-dominated. Typically forms large patches between 1070 and 1370 m (3500-4500 feet), but may be almost matrix. The shrub layer is predominantly *Abies* seedlings with occasional *Sorbus americana, Alnus viridis, Viburnum nudum var. cassinoides*, and *Ledum groenlandicum*. Characteristic herbs include *Dryopteris campyloptera, Oxalis montana (= Oxalis acetosella), Maianthemum canadense, Clintonia borealis, Cornus canadensis, Coptis trifolia (= Coptis groenlandica), Solidago macrophylla*, and the clubmoss *Lycopodium annotinum*. Bryophytes include *Dicranum scoparium, Dicranum fuscescens, Polytrichum ohioense, Plagiothecium laetum, Bazzania trilobata*, and *Pleurozium schreberi*. These forests generally occur above montane spruce-fir forests and spruce-hardwood forests, and approach a matrix forest above 1220 m (4000 feet). Fir waves are a physiognomically unusual expression of this community.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This subalpine balsam fir forest occurs near treeline on upper mountain slopes and ridgetops above 914 m (3,000 feet). It is peripheral in Lower New England project area and common in Northern Appalachian project area. Sites are moderate north- and southwest-facing slopes with moderately well- to well-drained silt loam and sandy loam soil. The unvegetated surface consists of leaf litter, with small amounts of exposed bedrock, downed wood and/or bare soil. Evidence of disturbance includes windthrow.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is scattered throughout the Northern Appalachian project area at elevations ranging from 300 to 1200 m (985-3,940 feet). Positions include low to high slopes, summits and ridges on all aspects. Slopes range from gentle to steep. Soils are variable and range from dry to mesic sandy loams or loams often with abundant organic material. Unvegetated surfaces are typically high in litter and duff, although some sites have abundant exposed large rocks.

Global Environment: These subalpine forests occur near treeline on mountains of the northeastern United States and adjacent Canada. They are found on upper mountain slopes and ridgetops (above 915 m [3000 feet] elevation) where they are associated with high winds, cold temperatures and shallow, acidic soils with a strong organic component.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This subalpine forest is dominated by *Abies balsamea*. *Picea rubens* may be present but at less than 20% cover. The shrub layer is predominantly *Abies balsamea* seedlings with occasional *Sorbus americana*. Characteristic herbs include *Clintonia borealis, Dryopteris campyloptera, Huperzia lucidula, Oclemena acuminata*, and *Oxalis montana*. In addition, this community supports MA state-imperiled *Solidago macrophylla*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by open to closed evergreen or mixed evergreen-deciduous canopies ranging from 40-90% total cover. *Abies balsamea* is the always present and is the sole dominant or may be codominated by *Betula papyrifera var. cordifolia*. *Picea rubens* is frequently present at low cover. Few other canopy associates are consistently present, but may include *Acer rubrum, Acer saccharum*, and *Betula alleghaniensis*. A dense subcanopy may be present and composed of the mentioned canopy species. Other subcanopy dominants include *Acer pensylvanicum, Sorbus americana*, and *Sorbus decora*. The shrub layer is inconsistent and typically dominated by saplings of canopy species and may be extremely dense. No actual shrub species have high cover or consistency. The herbaceous layer ranges from open to dense. The most consistent dominant species include *Clintonia borealis, Dryopteris campyloptera, Huperzia lucidula*, and *Oxalis montana*. Other herbaceous associates include *Aralia nudicaulis, Coptis trifolia, Cornus canadensis, Dryopteris intermedia, Maianthemum canadense, Monotropa uniflora, Oclemena acuminata, Solidago macrophylla*, and *Trientalis borealis*.

Global Vegetation: They are usually coniferous, but in some cases *Betula papyrifera var. cordifolia* may be a long-term replacement after disturbance. Canopy coverage is usually 70-85%. The shrub layer is sparse where the canopy is closed, but disturbance-created patches that are frequent within this forest may have dense shrub cover. Dwarf-

shrubs and herbs are sparse; the coverage of bryoids is variable. In the canopy, *Abies balsamea* is often dominant and may form pure stands; *Betula papyrifera var. cordifolia* and *Picea rubens* are common associates, usually of minor importance except for post-disturbance patches that may be strongly birch-dominated. Typically forms large patches between 1070 and 1370 m (3500-4500 feet), but may be almost matrix. The shrub layer is predominantly *Abies* seedlings with occasional *Sorbus americana, Alnus viridis, Viburnum nudum var. cassinoides*, and *Ledum groenlandicum*. Characteristic herbs include *Dryopteris campyloptera, Oxalis montana (= Oxalis acetosella), Maianthemum canadense, Clintonia borealis, Cornus canadensis, Coptis trifolia (= Coptis groenlandica), Solidago macrophylla*, and the clubmoss *Lycopodium annotinum*. Bryophytes include *Dicranum scoparium, Dicranum fuscescens, Polytrichum ohioense, Plagiothecium laetum, Bazzania trilobata*, and *Pleurozium schreberi*. These forests generally occur above montane spruce-fir forests and spruce-hardwood forests, and approach a matrix forest above 1220 m (4000 feet). Fir waves are a physiognomically unusual expression of this community.

Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: (Summarized from Fitzgerald 1989): Frequent wind-induced disturbance tends to favor growth of balsam fir over red spruce when the two occur together (McIntosh and Hurley 1964, Sprugel 1976). Seedlings of both species can live suppressed for many years, but balsam fir has a competitive advantage due

to its more highly developed root system (Fowells 1965). This results in an increase of balsam fir at the expense of red spruce.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Greylock Summit Natural Heritage Site in Massachusetts and in Vermont (including the Coolidge Range).
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from Mount Moosilauke, Franconia Notch, Wildcat Ridge and Old Jackson Road in New Hampshire and Crocker Mountain, Little Bigelow, White Cap Mountains, Black Brook Notch, Baldpate Mountain, Grafton West, Surplus Pond, Saddleback North and Baxter State Park in Maine.
Global Range: These subalpine forests occur near treeline on mountains of the northeastern United States and adjacent Canada.
Nations: CA, US
States/Provinces: MA, ME:S3, NB, NH:S3S4, NY:S2, QC?, VT
TNC Ecoregions: 63:C

[CEGL006267] *Betula alleghaniensis - Picea rubens / Dryopteris campyloptera* Forest

Translated Name: **Yellow Birch - Red Spruce / Mountain Woodfern Forest**
Common Name: **Transitional Northern Hardwood - Red Spruce Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest (G744)
Alliance	*Picea rubens - Abies balsamea* Forest Alliance (A0150)

ELEMENT CONCEPT

Global Summary: This transitional hardwood - spruce forest occurs in montane regions of northern New England, the Northern Appalachians, and in adjacent Canada. This forest is most extensive at middle elevations, between 305 and 760 m (1000-2500 feet), occurring on slopes with rocky, nutrient-poor, and often shallow till soils that are well-drained to excessively well-drained. This association forms a relatively broad transitional zone between northern hardwood forests and montane spruce-fir forests. The canopy varies from nearly closed to partly open. Shrubs, herbs, and tree regeneration forms a dense cover in gaps; under closed canopies, understory layers can be sparse. The dominant trees are *Picea rubens* and a variable mixture of the northern hardwoods *Acer saccharum, Betula alleghaniensis*, and *Fagus grandifolia*. Other canopy associates include *Acer rubrum, Abies balsamea, Thuja occidentalis*, and *Betula papyrifera*. *Abies balsamea* may be the major conifer, in either the canopy or subcanopy, in stands that have been selectively logged. Shrub and herbaceous layers contain species common to both northern hardwood and spruce-fir forests. Characteristic shrubs include *Sorbus americana, Sorbus decora, Acer pensylvanicum, Acer spicatum*, and *Viburnum lantanoides (= Viburnum alnifolium)*. Characteristic herbs include *Dryopteris intermedia, Dryopteris campyloptera, Clintonia borealis, Oxalis montana, Linnaea borealis, Maianthemum canadense, Streptopus lanceolatus var. roseus (= Streptopus roseus)*, and *Aralia nudicaulis*. The bryophyte layer is of variable cover and may include *Bazzania trilobata, Dicranum scoparium, Hypnum imponens, Hylocomium splendens, Leucobryum glaucum*, and *Polytrichum commune*. On the ground, this community can grade into both northern hardwood forest and spruce-fir forest types; this type is distinguished by the codominance of conifers and hardwoods.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mixed deciduous - spruce forest is most extensive at middle elevations. Elevations at sampled sites range from 460-929 m (1,509-3,047 feet) on rocky slopes. Sites are variable, ranging from flat to somewhat steep mid and lower slopes. Soils are mesic poorly drained muck to well-drained sandy loam, silt loam and loam. The unvegetated surface consists almost exclusively of leaf litter, with very small amounts of exposed bedrock, large rocks, and downed wood. Evidence of disturbance includes possible past logging and wind damage.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association occurs at elevations ranging from 300 to 730 m (985-2,395 feet) on moderate to steep low to high slopes typically with cooler north, northwest, east and northeast aspects. Soils range from dry to mesic sand, sandy loams and clay loams. Unvegetated surfaces are most prominently litter and duff.

Global Environment: This transitional hardwood - spruce forest occurs in montane regions of northern New England, the northern Appalachian Mountains, and in adjacent Canada. This forest is most extensive at middle elevations, between 305 and 760 m (1000-2500 feet), occurring on slopes with rocky, nutrient-poor, and often shallow till soils that are well-drained to excessively well-drained. This association forms a relatively broad transitional zone between northern hardwood forests and montane spruce-fir forests.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These mixed deciduous northern hardwood - spruce forests are dominated by *Picea rubens* and, in logged stands, *Abies balsamea* comprises at least 25-50% total cover. Deciduous northern hardwood species, including *Betula alleghaniensis* and *Acer rubrum*, are abundant (>50% cover) along with occasional *Acer saccharum* and *Fagus grandifolia* in the canopy and subcanopy. *Picea rubens* is also common in the understory. Tall shrubs include *Acer pensylvanicum, Viburnum lantanoides*, and *Acer spicatum*. Herbs include *Clintonia borealis, Dennstaedtia punctilobula, Coptis trifolia, Oxalis montana, Oclemena acuminata, Maianthemum canadense*, and *Dryopteris intermedia*. This community lacks *Betula papyrifera var. cordifolia*, and *Sorbus americana* is sparse to absent.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy mixed deciduous-evergreen forests where *Betula alleghaniensis* and *Picea rubens* are codominant or present. Other canopy associates present at low cover may include *Acer rubrum, Acer spicatum, Abies balsamea, Fagus grandifolia, Acer saccharum*, and *Betula papyrifera*. The most frequent dominant shrub is *Viburnum lantanoides*. Other shrub species have low constancy among sites and may include *Chamaedaphne calyculata, Empetrum nigrum, Kalmia angustifolia*, and *Ledum groenlandicum*. The herbaceous layer is dense and most commonly dominated by the ferns *Dryopteris campyloptera, Dryopteris intermedia*, and *Dennstaedtia punctilobula*. Other herbaceous associates include *Aralia nudicaulis, Carex intumescens, Clintonia borealis, Coptis trifolia, Maianthemum canadense, Oclemena acuminata, Oxalis montana, Streptopus lanceolatus*, and *Trientalis borealis*. Nonvascular moss and lichen species may have as much as 60% cover.

Global Vegetation: The canopy varies from nearly closed to partly open. Shrubs, herbs, and tree regeneration forms a dense cover in gaps; under closed canopies, understory layers can be sparse. The dominant trees are *Picea rubens* and a variable mixture of the northern hardwoods *Acer saccharum, Betula alleghaniensis*, and *Fagus grandifolia*. Other canopy associates include *Acer rubrum, Abies balsamea, Thuja occidentalis*, and *Betula papyrifera*. *Abies balsamea* may be the major conifer, in either the canopy or subcanopy, in stands that have been selectively logged. Shrub and herbaceous layers contain species common to both northern hardwood and spruce-fir forests. Characteristic shrubs include *Sorbus americana, Sorbus decora, Acer pensylvanicum, Acer spicatum*, and *Viburnum lantanoides (= Viburnum alnifolium)*. Characteristic herbs include *Dryopteris intermedia, Dryopteris campyloptera, Clintonia borealis, Oxalis montana, Linnaea borealis, Maianthemum canadense, Streptopus lanceolatus var. roseus (= Streptopus roseus)*, and *Aralia nudicaulis*. The bryophyte layer is of variable cover and may include *Bazzania trilobata, Dicranum scoparium, Hypnum imponens, Hylocomium splendens, Leucobryum glaucum*, and *Polytrichum commune*.
Global Dynamics: This association forms a relatively broad transitional zone between northern hardwood forests and montane spruce-fir forests.

[CEGL006273] *Picea rubens - Abies balsamea - Betula papyrifera* Forest

Translated Name: **Red Spruce - Balsam Fir - Paper Birch Forest**
Common Name: **Low-Elevation Spruce - Fir Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest (G744)
Alliance	*Picea rubens - Abies balsamea* Forest Alliance (A0150)

Element Concept

Global Summary: These red spruce - balsam fir forests are widespread on lower-elevation slopes across boreal regions of the northeastern United States and adjacent Canada. They occur in cool and generally moist upland settings, on well-drained tills, and occasionally on kame deposits or eskers. Some areas of poorly drained soils may be present. Most are at elevations of 245-610 m (800-2000 feet). Cold-air drainage allows them to occur in lowlands elevationally below northern hardwood forests. These low-diversity forests have a closed canopy and very sparse shrub and herbaceous layers, except in gaps where regeneration can be dense. The canopy is dominated by *Picea rubens*, with a minor to moderate amount of *Abies balsamea*. Associate canopy species may include *Picea glauca, Picea mariana, Betula alleghaniensis (= Betula lutea), Betula papyrifera*, and minor amounts of *Acer rubrum, Populus tremuloides*, or *Larix laricina*. *Tsuga canadensis* and *Pinus strobus* may be present, but are rarely abundant. The shrub layer is patchy and typically includes *Acer pensylvanicum* and *Viburnum lantanoides (= Viburnum alnifolium)*. Occasional shrubs include *Viburnum nudum var. cassinoides, Nemopanthus mucronatus*, and *Sorbus americana* or *Sorbus decora*. The herb layer includes *Oxalis montana (= Oxalis acetosella), Cornus canadensis, Gaultheria hispidula, Clintonia borealis, Huperzia lucidula (= Lycopodium lucidulum), Aralia nudicaulis, Tiarella cordifolia*, and *Trillium erectum*. The bryoid layer varies from sparse to locally well-developed, and is typified by *Dicranum* spp. and *Bazzania trilobata*. Feathermosses, including *Hylocomium splendens, Pleurozium schreberi, Ptilium crista-castrensis*, and *Thuidium delicatulum*, are often present but less abundant than in other spruce-fir forest types. The influence of local cold-air drainage creates a micro-climate that favors this coniferous forest at elevations below the norm for montane spruce-fir. Certain high-elevation species such as *Dryopteris campyloptera* and *Sorbus decora* are less abundant here while other lower-elevation species such as *Aralia nudicaulis, Tiarella cordifolia*, and *Trillium erectum* may be more abundant. This association is distinguished from other spruce-fir forest types by the combination of upland soils, low- to mid-elevation setting, absence or low importance of black spruce, and not maritime-influenced.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This spruce-fir forest is widespread on lower-elevation slopes between 244 and 687 m (800-2,254 feet) elevation. It occurs across boreal regions of the northeastern United States and adjacent Canada. Sites range from moderate to steep slopes and ridges with mesic rapidly to well-drained sandy loam or loam soil. The unvegetated surface consists of leaf litter, with very small amounts of large rocks and downed wood. Evidence of disturbance includes past logging.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association occurs throughout the Northern Appalachian project area at elevations ranging from 200 to 750 m (655-2,460 feet) in elevation on low level areas, low to high slopes, ridges and summits on all aspects. Soils are dry to mesic sandy loams often with high organic content.
Global Environment: These red spruce - balsam fir forests are widespread on lower-elevation slopes across boreal regions of the northeastern United States and adjacent Canada. They occur in upland settings, on well-drained tills, and occasionally on kame deposits or eskers. Some areas of poorly drained soils may be present. Most are at elevations of 245-610 m (800-2000 feet). Cold-air drainage allows them to occur in lowlands elevationally below northern hardwood forests; they may be adjacent to wetlands of various types.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is dominated by *Picea rubens* with variable amounts of *Abies balsamea* and *Betula papyrifera*. *Acer rubrum* and *Betula alleghaniensis* are common subcanopy trees. *Acer pensylvanicum* is common in the shrub layer. Low-elevation

species such as *Aralia nudicaulis, Tiarella cordifolia*, and *Trillium erectum* are abundant. Common herbs in the sampled plots include *Clintonia borealis, Dryopteris intermedia, Trientalis borealis*, and *Trillium undulatum*. High-elevation species such as *Dryopteris campyloptera* and *Sorbus americana* are sparse to absent.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by variably closed-canopy forests dominated by *Picea rubens* and *Abies balsamea*. *Betula papyrifera* is typically present or codominant. Few other canopy associates are present, although *Acer pensylvanicum* may be prominent in the understory on some sites. Understories are low in diversity and are dominated by saplings of canopy species. No shrub species are consistent across sites to consider as typical to the association. Herbaceous cover is sparse to open. No species have high consistency, but may include *Aralia nudicaulis, Coptis trifolia, Cornus canadensis, Dryopteris intermedia, Gaultheria hispidula, Gaultheria procumbens, Maianthemum canadense, Trientalis borealis*, and *Trillium undulatum*. Nonvascular cover of mosses and lichens is often high in excess of 80%.

Global Vegetation: These low-diversity forests have a closed canopy and very sparse shrub and herbaceous layers, except in gaps where regeneration can be dense. The canopy is dominated by *Picea rubens*, with a minor to moderate amount of *Abies balsamea*. Associate canopy species may include *Picea glauca, Picea mariana, Betula alleghaniensis (= Betula lutea), Betula papyrifera*, and minor amounts of *Acer rubrum, Populus tremuloides*, or *Larix laricina*. *Tsuga canadensis* and *Pinus strobus* may be present, but are rarely abundant. The shrub layer is patchy and typically includes *Acer pensylvanicum* and *Viburnum lantanoides (= Viburnum alnifolium)*. Occasional shrubs include *Viburnum nudum var. cassinoides, Nemopanthus mucronatus*, and *Sorbus americana*. The herb layer includes *Oxalis montana (= Oxalis acetosella), Cornus canadensis, Gaultheria hispidula, Clintonia borealis, Huperzia lucidula (= Lycopodium lucidulum), Aralia nudicaulis, Tiarella cordifolia*, and *Trillium erectum*. The bryoid layer varies from sparse to locally well-developed, and is typified by *Dicranum* spp. and *Bazzania trilobata*. Feathermosses, including *Hylocomium splendens, Pleurozium schreberi, Ptilium crista-castrensis*, and *Thuidium delicatulum*, are often present but less abundant than in other spruce-fir forest types. The influence of local cold-air drainage and moist soils creates a micro-climate that favors this coniferous forest at elevations below the norm for montane spruce-fir. Certain high-elevation species such as *Dryopteris campyloptera* and *Sorbus decora* are less abundant here while other lower-elevation species such as *Aralia nudicaulis, Tiarella cordifolia*, and *Trillium erectum* may be more abundant.

Global Dynamics: The influence of local cold-air drainage creates a micro-climate that favors this coniferous forest at elevations below the norm for montane spruce-fir. CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: *Abies balsamea* is absent from this community in the Chateauguay - Notown region of Vermont. Northern Hardwood Forest (CEGL006252) often occurs downslope of this community in Vermont. At the Bridgewater Heights site in Vermont, there is an extraordinary soil profile with very deep OA (50-60 cm) and E horizons. *Betula papyrifera* is dying out of the canopy at this site. At the October Mountain site in Massachusetts, there is abundant *Kalmia latifolia*.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: These forests are often some of the most productive spruce forests, producing trees of extraordinary size; almost all have been logged.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at October Mountain State Forest in Massachusetts and in Vermont at Bear Mountain, Bridgewater Heights, Harmon Hill and Stratton.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is found throughout the Northern Appalachian project area. Known locations include Kinsman Notch and Franconia Notch in New Hampshire and Big Boardman Mountain, Grafton East, Andover East, Saddleback South, Nahmakanta Lake and Baxter State Park in Maine.
Global Range: These red spruce - balsam fir forests are widespread on lower-elevation slopes across boreal regions of the northeastern United States and adjacent Canada.

[CEGL006505] *Picea rubens - Abies balsamea - Betula* spp. - *Acer rubrum* Forest

Translated Name: **Red Spruce - Balsam Fir - Birch species - Red Maple Forest**
Common Name: **Successional Mixed Spruce - Fir - Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest (G744)
Alliance	*Picea rubens - Abies balsamea* Forest Alliance (A0150)

Element Concept

Global Summary: This association is a mixed forest of northern New England and New York in which the typical spruce and fir are mixed with earlier successional species. This forest occurs at various landscape positions and aspects but in general is more common on gentle to moderate slopes and low flats. Soils are loamy to sandy till and, in general, are deeper than those of pure spruce-fir forests. The canopy is more-or-less closed, and the cover of the lower layers is variable, but rarely extensive. The boreal conifers *Picea rubens* and/or *Abies balsamea* form a mixed canopy with *Acer rubrum* and other trees such as *Populus tremuloides, Populus grandidentata, Betula papyrifera, Thuja occidentalis*, or *Pinus strobus*. Less common associates include *Quercus rubra, Acer saccharum, Betula alleghaniensis, Picea glauca*, or *Prunus serotina*. The subcanopy and shrub layers are composed of *Picea rubens, Abies balsamea*, and *Acer pensylvanicum*. Dwarf-shrubs are usually absent or sparse; *Vaccinium angustifolium* or *Vaccinium myrtilloides* are typical species. The herbaceous layer is dominated by tree seedlings with herbs including *Pteridium aquilinum, Trientalis borealis, Cornus canadensis*, and *Maianthemum canadense*. In wetter spots, *Osmunda cinnamomea* and *Symplocarpus foetidus* (the latter usually only at near-coastal sites) may also be present. The bryophyte layer includes *Bazzania trilobata, Dicranum polysetum, Leucobryum glaucum, Hypnum imponens, Pleurozium schreberi*, and *Sphagnum girgensohnii*. This association has a mixed canopy, in contrast to the ecologically similar *Picea rubens - Abies balsamea - Betula papyrifera* Forest (CEGL006273). It can have relatively deeper soils than *Betula alleghaniensis - Picea rubens / Dryopteris campyloptera* Forest (CEGL006267), and usually lacks any appreciable amount of yellow birch.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This successional mixed spruce-fir-hardwoods forest is found in northern New England and New York. The elevation of sampled sites ranges from 601-798 m (1,972-2,618 feet). Sites range from gentle to steep slopes and summits with mostly western aspects. Soils are mesic, moderately well- to well-drained loam and sandy loam. The unvegetated surface consists of leaf litter, with some downed wood and occasional exposed bedrock. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This widespread successional forest is found throughout the Northern Appalachian project area at lower elevations ranging from 300 to 750 m (985-2,460 feet) on flat to moderately steep low to high slopes on all aspects. Soils are mesic sandy loam, silt loam and loams and have well-developed organic layers.
Global Environment: This association is a mixed forest of northern New England and New York in which the typical spruce and fir are mixed with earlier successional species. This forest occurs at various landscape positions and aspects but in general is more common on gentle to moderate slopes and low flats. Soils are loamy to sandy till and, in general, are deeper than those of pure spruce-fir forests.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is made up of *Picea rubens* and/or *Abies balsamea* (>50% total cover) and early-successional trees including *Acer rubrum, Populus tremuloides, Populus grandidentata*, and *Betula papyrifera*, or, less commonly, *Betula populifolia* or *Betula papyrifera var. cordifolia*. *Acer pensylvanicum* is a characteristic shrub. Common herbs include *Uvularia sessilifolia, Maianthemum canadense*, and *Trientalis borealis*. *Dryopteris intermedia* is a common fern.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This highly variable successional forest is characterized by canopies dominated by combinations of *Picea rubens, Abies balsamea, Acer rubrum, Betula alleghaniensis*, and *Betula papyrifera*. *Acer saccharum, Fagus grandifolia, Fraxinus americana, Pinus strobus*, and *Tsuga canadensis* often occur at low cover. It includes young stands dominated by softwoods. The shrub layer mainly consists of sapling of species from the canopy and may be very dense on some sites. Shrub species are inconsistent and occur at low cover, although *Viburnum lantanoides* may dominate some sites. Herbaceous species are inconsistent as well, although some species are locally dominant, including *Aralia nudicaulis, Carex gynandra, Clintonia borealis, Coptis trifolia, Cornus canadensis, Dennstaedtia punctilobula, Dryopteris campyloptera, Dryopteris intermedia, Huperzia lucidula, Maianthemum canadense, Oxalis montana, Pteridium aquilinum, Thelypteris noveboracensis*, and *Uvularia sessilifolia*.
Global Vegetation: The canopy is more-or-less closed, and the cover of the lower layers is variable, but rarely extensive. The boreal conifers *Picea rubens* and/or *Abies balsamea* form a mixed canopy with *Acer rubrum* and other trees such as *Populus tremuloides, Populus grandidentata, Betula papyrifera, Thuja occidentalis*, or *Pinus strobus*. Less common associates include *Quercus rubra, Acer saccharum, Betula alleghaniensis, Picea glauca*, or *Prunus serotina*. The subcanopy and shrub layers are composed of *Picea rubens, Abies balsamea*, and *Acer pensylvanicum*. Dwarf-shrubs are usually absent or sparse; *Vaccinium angustifolium* or *Vaccinium myrtilloides* are typical species. The herbaceous layer is dominated by tree seedlings with herbs including *Pteridium aquilinum, Trientalis borealis, Cornus canadensis*, and *Maianthemum canadense*. In wetter spots, *Osmunda cinnamomea* and *Symplocarpus foetidus* (the latter usually only at near-coastal sites) may also be present. The bryophyte layer includes *Bazzania trilobata, Dicranum polysetum, Leucobryum glaucum, Hypnum imponens, Pleurozium schreberi*, and *Sphagnum girgensohnii*.

- *Picea rubens - Abies balsamea / Sorbus americana* Forest (CEGL006128)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community is most common in the Northern Appalachian project area, but extends south into the Lower New England project area in Massachusetts and Vermont. The community must have a spruce-fir component in the tree layer. It most often occurs in close proximity to Transitional Northern Hardwood - Red Spruce Forest (CEGL006267).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: This community is similar to Transitional Northern Hardwood - Red Spruce Forest (CEGL006267), but includes early-successional species including *Acer rubrum, Populus tremuloides, Populus grandidentata*, and *Betula papyrifera* and usually lacks any appreciable amount of *Betula alleghaniensis* and *Fagus grandifolia*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: In northern Maine it's not uncommon to find clearcuts that regenerate to straight spruce-fir. Sometimes this softwood dominance is 'enhanced' by herbicides, but it's often natural. Clearcuts regenerating to straight softwoods tend to occur at either end of the elevation spectrum - at high elevations >610 m (2000 feet), and in low, poorly drained flats. During this project we broadened this type (CEGL006505) to include young stands dominated by softwoods. The UMESC mapping team observed many examples of this community with >75% red spruce; stumps and all.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Other Comments: None.
Global Classification Comments: The global description is based on data from Acadia National Park. Rangewide information is needed, as this type is suspected to be more common than current state and subsection lists indicate.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Vermont in the vicinity of Quimby Mountain, Stratton Pond and Shrewsbury.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is found throughout the Northern Appalachian project area with known locations from south of Lambert Ridge, east of Quintown, northwest of Mount Cube, east of Wachipauka Pond, Franconia Notch and Mount Hayes in New Hampshire, and East Flagstaff Lake, Black Brook Notch, Grafton West, Andover West, Saddleback South Jones Pond, Joe's Hole, Church Pond and Baxter State Park in Maine.
Global Range: This association is found in northern New England and New York and adjacent Canada.

[CEGL006128] *Picea rubens - Abies balsamea / Sorbus americana* Forest

Translated Name: **Red Spruce - Balsam Fir / American Mountain-ash Forest**
Common Name: **Montane Spruce - Fir Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest (G744)
Alliance	*Picea rubens - Abies balsamea* Forest Alliance (A0150)

ELEMENT CONCEPT

Global Summary: These are red spruce - balsam fir forests in moist upland environments of the northern Appalachian Mountains, northern Maine, and adjacent Canada, forming the matrix forest of elevations between 670 and 1070 m (2200-3500 feet), patchy at lower and higher elevations. They occur on well-drained, strongly podzolized, nutrient-poor, usually shallow soils in areas where high-elevation clouds and fog or other microsite conditions provide a continuously moist environment. Through much of its range in the Northeast, this forest is strictly montane; however, north of the 45th parallel it occurs in cool lower-elevation settings as well. It occurs on gentle to steep slopes, north-, east- or west-facing. These forests have mostly closed canopies, but gaps from windthrow are common and are rapidly colonized by regenerating tree species. The shrub and herb layers are variable in cover, generally sparse under closed canopies and better developed in gaps. The bryoid layer is well-developed: one of the characteristic features of these forests is the lush carpet of mosses and liverworts. The moderate to low light levels, persistent snowpack and high moisture availability create favorable conditions for mosses and ferns. The canopy is dominated by *Picea rubens* and *Abies balsamea* with associates including *Betula papyrifera var. cordifolia, Betula alleghaniensis*, and *Picea mariana*. Scattered shrubs include *Sorbus americana, Sorbus decora, Amelanchier bartramiana, Nemopanthus mucronatus*, and *Vaccinium myrtilloides*. Particularly characteristic herbs are boreal/montane species such as *Oxalis montana (= Oxalis acetosella), Clintonia borealis, Linnaea borealis, Coptis trifolia (= Coptis groenlandica), Huperzia lucidula, Dryopteris campyloptera*, and *Gaultheria hispidula*. More widespread associated herbs include *Trientalis borealis, Maianthemum canadense, Cornus canadensis*, and the ferns *Dryopteris intermedia* and *Phegopteris connectilis (= Thelypteris phegopteris)*. Bryophytes include *Pleurozium schreberi, Hylocomium splendens, Bazzania trilobata, Dicranum scoparium, Hypnum curvifolium*, and *Ptilium crista-castrensis*. These spruce-fir forests are distinguished from similar types by their montane or higher-latitude upland setting, prevalence of both red spruce and balsam fir in the canopy, and boreal herbs scattered in the lush bryoid layer.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This spruce-fir forest is widespread on lower-elevation slopes between 244 and 687 m (800-2,254 feet). It occurs across boreal regions of the northeastern United States and adjacent Canada. Sampled sites include a moderate northwest-facing shoulder summit with mesic moderately well-drained sandy loam soil and a gentle north-facing slope with somewhat poorly drained silt loam soil. The unvegetated surface consists of leaf litter, with small amounts of large rocks and downed wood. Evidence of disturbance includes wind damage and past logging. At the latter site, the canopy has been blown apart, in part due to windthrow, and there has been spruce decline due to acid precipitation.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is found throughout the Northern Appalachian project area from mid to high elevations ranging from 300 to 950 m (985-3,115 feet) on gentle to steep low to high slopes, ridges and summits, on primarily cooler north, northwest, northeast and east aspects and occasionally south and southeast aspects. Soils are dry to mesic with variable textures often with a high organic content. Unvegetated surfaces are primarily litter and duff.
Global Environment: These are red spruce - balsam fir forests in moist upland environments of the northern Appalachian Mountains, northern Maine, and adjacent Canada, forming the matrix forest of elevations between 670 and 1070 m (2200-3500 feet), patchy at lower and higher elevations. They occur on well-drained, strongly podzolized, nutrient-poor, usually shallow soils in areas where high-elevation clouds and fog or other microsite conditions provide a continuously moist environment. Through much of its range in the Northeast, this forest is strictly montane; however, north of the 45th parallel it occurs in cool lower-elevation settings as well. It occurs on gentle to steep slopes, north-, east- or west-facing.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is dominated by *Picea rubens* and *Abies balsamea*. High-elevation species such as *Dryopteris campyloptera* and *Sorbus americana* are less abundant here, while other lower-elevation species such as *Aralia nudicaulis, Tiarella cordifolia*, and *Trillium erectum* may be more abundant. *Viburnum lantanoides* is the dominant shrub. Herbs include *Clintonia borealis, Dryopteris campyloptera, Dryopteris intermedia, Huperzia lucidula, Maianthemum canadense*, and *Oxalis montana*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy evergreen forests dominated by variable mixtures of *Picea rubens* and *Abies balsamea* with *Acer pensylvanicum, Acer spicatum*, and *Sorbus americana* often forming an open to dense subcanopy. *Betula papyrifera var. cordifolia* and *Betula alleghaniensis* are common canopy associates occurring at lower cover. The shrub layer has low diversity and is typically composed of saplings of species from the canopy, although *Viburnum lantanoides* may dominate some sites. The herb layer is patchy and typical species include *Clintonia borealis, Cornus canadensis, Dryopteris campyloptera, Dryopteris intermedia, Maianthemum canadense, Oxalis montana*, and *Trientalis borealis*. Nonvascular moss and lichen species are often a prominent feature of the ground layer and may be in excess of 70% cover.
Global Vegetation: These forests have mostly closed canopies, but gaps from windthrow are common and are rapidly colonized by regenerating tree species. The shrub and herb layers are variable in cover, generally sparse under closed canopies and better developed in gaps. The bryoid layer is well-developed: one of the characteristic features of these forests is the lush carpet of mosses and liverworts. The moderate to low light levels, persistent snowpack and high moisture availability create favorable conditions for mosses and ferns. The canopy is dominated by *Picea rubens* and *Abies balsamea* with associates including *Betula papyrifera var. cordifolia, Betula alleghaniensis*, and *Picea mariana*. Scattered shrubs include *Sorbus americana, Sorbus decora, Amelanchier bartramiana, Nemopanthus mucronatus*, and *Vaccinium myrtilloides*. Particularly characteristic herbs are boreal/montane species such as *Oxalis montana (= Oxalis acetosella), Clintonia borealis, Linnaea borealis, Coptis trifolia (= Coptis groenlandica), Huperzia lucidula, Dryopteris campyloptera*, and *Gaultheria hispidula*. More widespread associated herbs include *Trientalis borealis, Maianthemum canadense, Cornus canadensis*, and the ferns *Dryopteris intermedia* and *Phegopteris connectilis (= Thelypteris phegopteris)*. Bryophytes include *Pleurozium schreberi, Hylocomium splendens, Bazzania trilobata, Dicranum scoparium, Hypnum curvifolium*, and *Ptilium crista-castrensis*.
Global Dynamics: High winds and associated windthrow are probably the dominant disturbance factors. Over time this creates old-growth stands with mixed age classes and abundant decaying woody material. Associated tree species are generally short-lived, disturbance-adapted species which colonize light gaps created by windthrow, extensive blowdowns, or (in some cases) old logging roads.

[CEGL006250] *Picea rubens / Ribes glandulosum* Woodland

Translated Name: **Red Spruce / Skunk Currant Woodland**
Common Name: **Red Spruce Talus Slope Woodland**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest (G744)
Alliance	*Picea rubens - Abies balsamea* Forest Alliance (A0150)

ELEMENT CONCEPT

Global Summary: This association is a red spruce woodland of acidic talus slopes in the Northern Appalachians. The community occurs generally within the spruce-fir forest zone at moderate to high elevations inland, and may occur near sea level along the coast. The substrate varies, even within a site, from cobble to large boulder-sized

talus. There is variable soil development depending on the periodicity and intensity of rockslides, but generally soils are thin and extremely patchy. The tree distribution is likewise patchy: in some areas there may be a partial to almost closed canopy; at most sites these areas are interspersed with patches of nearly open talus. Shrub and herb vegetation is very scattered and sparse. The bryoid layer ranges from sparse to well-developed; bryophytes are mostly desiccation-tolerant species, and crustose lichens may be extensive. The canopy is dominated by *Picea rubens*, in association with *Abies balsamea, Betula papyrifera var. papyrifera, Betula papyrifera var. cordifolia*, and *Betula alleghaniensis*. The tall-shrub cover is composed of *Acer spicatum, Acer pensylvanicum, Sorbus americana*, and *Sorbus decora*. *Ribes glandulosum* is a typical and diagnostic smaller shrub. Low heaths include *Kalmia angustifolia, Vaccinium angustifolium, Vaccinium myrtilloides*, and occasionally *Gaylussacia baccata*. The herbaceous layer is made up of vines and forbs confined to crevices and may include *Parthenocissus quinquefolia, Dryopteris marginalis, Polypodium appalachianum, Polygonum cilinode, Solidago simplex var. randii, Deschampsia flexuosa*, and, occasionally *Juncus trifidus*. The bryoid is made up of *Umbilicaria* spp., *Cladina* spp., *Grimmia* spp., *Ptilidium ciliare, Dicranum polysetum*, and other *Dicranum* spp. Ground cover is talus with variable litter accumulation. This association is differentiated from most other red spruce woodlands (e.g., *Picea rubens / Vaccinium angustifolium / Sibbaldiopsis tridentata* Woodland (CEGL006053)) in its occurrence on talus on steep slopes, and in general has a lower cover of heath shrubs. At some sites, near the base of the talus slope it may grade into *Picea mariana / Ledum groenlandicum - Empetrum nigrum / Cladina* spp. Dwarf-shrubland (CEGL006268); that cold-air talus community has a much more extensive dwarf-shrub layer dominated by *Ledum groenlandicum*.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon woodland association is known from elevations ranging from 650 to 900 m (2,130-2,950 feet) on steep to very steep exposed boulder and talus slopes on western and southern aspects. Soils may be purely organic or sandy loam.
Global Environment: This association is a red spruce woodland of acidic talus slopes in the northern Appalachians. The community occurs generally within the spruce-fir forest zone at moderate to high elevations inland, and may occur near sea level along the coast. The substrate varies, even within a site, from cobble to large boulder-sized talus. There is variable soil development depending on the periodicity and intensity of rockslides, but generally soils are thin and extremely patchy.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association may be forest or woodland in structure and is known from two sites in the Northern Appalachian project area, one of which is dominated *Picea rubens* in the canopy with lesser amounts of *Acer pensylvanicum, Betula alleghaniensis*, and *Abies balsamea*. The understory is entirely herbaceous with patchy cover. Species include *Dryopteris intermedia, Maianthemum canadense, Phegopteris connectilis*, and *Polygonum virginianum*. The other site is dominated by *Betula papyrifera var. cordifolia* with only trace amounts of understory species, including *Juncus trifidus, Rhododendron canadense, Solidago simplex ssp. randii, Spiraea alba var. latifolia*, and *Vaccinium myrtilloides*. Vegetation may be sparse in areas with massive talus blocks.
Global Vegetation: In some areas there may be a partial to almost closed canopy; at most sites these areas are interspersed with patches of nearly open talus. Shrub and herb vegetation is very scattered and sparse. The bryoid layer ranges from sparse to well-developed; bryophytes are mostly desiccation-tolerant species, and crustose lichens may be extensive. The canopy is dominated by *Picea rubens*, in association with *Abies balsamea, Betula papyrifera var. papyrifera, Betula papyrifera var. cordifolia*, and *Betula alleghaniensis*. The tall-shrub cover is composed of *Acer spicatum, Acer pensylvanicum, Sorbus americana*, and *Sorbus decora*. *Ribes glandulosum* is a typical and diagnostic smaller shrub. Low heaths include *Kalmia angustifolia, Vaccinium angustifolium, Vaccinium myrtilloides*, and occasionally *Gaylussacia baccata*. The herbaceous layer is made up of vines and forbs confined to crevices and may include *Parthenocissus quinquefolia, Dryopteris marginalis, Polypodium appalachianum, Polygonum cilinode, Solidago simplex var. randii, Deschampsia flexuosa*, and, occasionally *Juncus trifidus*. The bryoid is made up of *Umbilicaria* spp., *Cladina* spp., *Grimmia* spp., *Ptilidium ciliare, Dicranum polysetum*, and other *Dicranum* spp. Ground cover is talus with variable litter accumulation.

A3314 *Picea rubens / Vaccinium angustifolium* Northern Rocky Woodland Alliance

Alliance Summary Description: These are evergreen woodlands dominated by *Picea rubens* that occur in the Northern Appalachian and Acadian regions of the northeastern U.S. and Atlantic Canada on acidic bedrock or talus at high elevations. *Picea mariana* may occasionally be the dominant instead of *Picea rubens*. In the northern part of the range, associated canopy trees include *Abies balsamea, Betula papyrifera var. papyrifera*, and *Betula papyrifera var. cordifolia*. Shrubs include *Acer spicatum, Gaylussacia baccata, Ribes glandulosum, Sorbus americana, Vaccinium angustifolium*, and *Vaccinium myrtilloides*; typical herbs are *Clintonia borealis, Juncus trifidus, Piptatherum pungens (= Oryzopsis pungens), Sibbaldiopsis tridentata*, and *Solidago simplex var. randii*. These woodlands are often stunted and grade into montane shrublands. Stands occur either on steep, seepy boulderfields, on ridges and steep slopes with northeast to southwest exposures, above 1370 m (4500 feet) elevation, or at lower elevations on cold, clayey or rocky soils. Soils are shallow, often only a thin layer of duff overlying bedrock.

[CEGL006053] *Picea rubens / Vaccinium angustifolium / Sibbaldiopsis tridentata* Woodland

Translated Name: **Red Spruce / Lowbush Blueberry / Shrubby Fivefingers Woodland**
Common Name: **Northern Appalachian Red Spruce Rocky Ridge**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest (G744)
Alliance	*Picea rubens / Vaccinium angustifolium* Northern Rocky Woodland Alliance (A3314)

Element Concept

Global Summary: This red spruce woodland of the Northern Appalachians occurs primarily on acidic bedrock outcrops or summits. Soil development is restricted to crevices or sheltered areas interspersed with significant amounts of exposed bedrock. What soils are present are shallow, well-drained to excessively drained, acidic, coarse sands. Elevations of known examples range from near sea level at the coast to 305-760 m (1000-2500 feet) inland. The canopy is patchy and open, with areas of moderate canopy cover interspersed with areas of sparse vegetation and much open rock. Taken over a large area, woodland structure (25-60% canopy cover) is evident. Tall shrubs and herb are sparse. The dwarf-shrub layer is of variable cover, and may be locally extensive, as may bryoids. Canopy trees are primarily *Picea rubens* and *Abies balsamea*, with *Pinus strobus* occasionally codominant. Associated tree species include *Betula papyrifera var. papyrifera, Betula papyrifera var. cordifolia, Pinus rigida, Thuja occidentalis*, and *Picea mariana*. Typical tall shrubs are *Sorbus americana, Sorbus decora, Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Photinia melanocarpa (= Aronia melanocarpa)*, or *Amelanchier* spp. *Morella pensylvanica (= Myrica pensylvanica)* and *Picea glauca* may be present in this community near the seacoast. The low heath layer is made up of *Vaccinium angustifolium, Vaccinium myrtilloides, Gaylussacia baccata*, and *Kalmia angustifolia*. Forbs and graminoids include *Deschampsia flexuosa, Danthonia spicata, Piptatherum pungens (= Oryzopsis pungens), Sibbaldiopsis tridentata, Solidago simplex var. randii*, and *Maianthemum canadense*. Bryoids include *Cladina* spp., *Pleurozium schreberi, Dicranum polysetum, Polytrichum juniperinum, Polytrichum piliferum*, and *Polytrichum commune*. Ground cover is sparse needle litter and exposed bedrock. This association occurs on bedrock ridges and outcrops, compared to the floristically similar *Picea rubens / Ribes glandulosum* Woodland (CEGL006250), which occurs on talus.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This woodland association is known from 305 to 880 m (1,000-2,887 feet) in elevation on moderate to very steep exposed bedrock outcrops and summits on south, southeast and west aspects. Substrates are very dry to mesic. Soils are poorly developed and may be entirely organic or sandy loam.
Global Environment: This red spruce woodland of the Northern Appalachians occurs primarily on acidic bedrock outcrops or summits. Soil development is restricted to crevices or sheltered areas interspersed with significant amounts of exposed bedrock. What soils are present are shallow, well-drained to excessively drained, acidic, coarse sands. Elevations of known examples range from near sea level at the coast to 305-760 m (1000-2500 feet) inland.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by woodlands with canopies dominated by *Picea rubens* often in association with lesser amounts of *Abies balsamea*, both species regenerating vigorously in the understory, often with *Betula papyrifera var. cordifolia, Acer rubrum*, and *Tsuga canadensis*. Shrub and herbaceous species are patchy. Shrub cover ranges from sparse to open and may include *Kalmia angustifolia, Nemopanthus mucronatus, Vaccinium angustifolium*, and *Vaccinium myrtilloides*. Herbaceous cover is sparse with no species exhibiting substantial cover or consistency. Nonvascular cover of moss and lichen species may be in excess of 70%.

Global Vegetation: The canopy is patchy and open, with areas of moderate canopy cover interspersed with areas of sparse vegetation and much open rock. Taken over a large area, woodland structure (25-60% canopy cover) is evident. Tall shrubs and herb are sparse. The dwarf-shrub layer is of variable cover, and may be locally extensive, as may bryoids. Canopy trees are primarily *Picea rubens* and *Abies balsamea*, with *Pinus strobus* occasionally codominant. Associated tree species include *Betula papyrifera var. papyrifera, Betula papyrifera var. cordifolia, Pinus rigida, Thuja occidentalis*, and *Picea mariana*. Typical tall shrubs are *Sorbus americana, Sorbus decora, Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Photinia melanocarpa (= Aronia melanocarpa)*, or *Amelanchier* spp. *Morella pensylvanica (= Myrica pensylvanica)* and *Picea glauca* may be present in this community near the seacoast. The low heath layer is made up of *Vaccinium angustifolium, Vaccinium myrtilloides, Gaylussacia baccata*, and *Kalmia angustifolia*. Forbs and graminoids include *Deschampsia flexuosa, Danthonia spicata, Piptatherum pungens (= Oryzopsis pungens), Sibbaldiopsis tridentata, Solidago simplex var. randii*, and *Maianthemum canadense*. Bryoids include *Cladina* spp., *Pleurozium schreberi, Dicranum polysetum, Polytrichum juniperinum, Polytrichum piliferum*, and *Polytrichum commune*. Ground cover is sparse needle litter and exposed bedrock.

M159. Laurentian-Acadian Pine - Hardwood Forest & Woodland

G025. LAURENTIAN-ACADIAN PINE - OAK FOREST & WOODLAND

Group Summary Description: These dry-mesic to xeric pine forests are found across the northern Great Lakes and east to northern New England and Quebec. Typical occurrences are on coarse glacial deposits of sandy or loamy soils. Fire is an important natural disturbance. Stands are characterized by a pine overstory forming a patchy or continuous canopy, and a variable understory. A combination of *Pinus strobus, Pinus banksiana* (mostly in the Great Lakes region), and *Pinus resinosa* typically are the diagnostic overstory species. Hardwoods such as *Acer rubrum, Betula papyrifera, Populus grandidentata, Populus tremuloides, Quercus ellipsoidalis* (in the Great Lakes region), and *Quercus rubra* sometimes form a subcanopy; or *Quercus rubra* in particular may occasionally be an important canopy associate. The understory ranges from moderately herb- and shrub-rich to extremely poor. In the tall-shrub layer, the important species are *Amelanchier* spp. and *Corylus cornuta*. In the low-shrub layer, *Vaccinium angustifolium, Vaccinium myrtilloides, Diervilla lonicera, Gaultheria procumbens*, and *Linnaea borealis* are locally important. The herbaceous layer is variable, sometimes poorly developed and with more prominent cover of feathermosses and lichens, in other cases with an open herb layer, including *Aralia nudicaulis, Clintonia borealis, Cornus canadensis, Eurybia macrophylla, Maianthemum canadense, Pteridium aquilinum, Oryzopsis asperifolia, Streptopus lanceolatus (= Streptopus roseus)*, and *Trientalis borealis*.

A3238 *Pinus banksiana - Pinus resinosa - Quercus ellipsoidalis* Forest & Woodland Alliance

Alliance Summary Description: This alliance, found in New England and the Great Lakes region in the United States, as well as eastern temperate Canada, contains rocky or sandy pine barrens and woodlands on dry or shallow soils over bedrock or sandy outwash plains. It is typified by forests and woodlands dominated by *Pinus banksiana, Pinus resinosa*, and/or *Quercus ellipsoidalis*. Understory composition varies from heath-dominated to a mixture of graminoids, open rocky areas with lichens, and scrub oak. Stands are often fire-maintained.

[CEGL006041] *Pinus banksiana / Kalmia angustifolia - Vaccinium* spp. Woodland

Translated Name: **Jack Pine / Sheep Laurel - Blueberry species Woodland**
Common Name: **Jack Pine Heath Barrens**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Pine - Hardwood Forest & Woodland (M159)
Group	Laurentian-Acadian Pine - Oak Forest & Woodland (G025)
Alliance	*Pinus banksiana - Pinus resinosa - Quercus ellipsoidalis* Forest & Woodland Alliance (A3238)

Element Concept

Global Summary: The jack pine woodland of northern New England and the Canadian maritime provinces occurs sporadically on dry rocky summits, ridges, outcrops and lakeshores. Soil development is typically restricted to crevices or sheltered patches among the predominant exposed bedrock. Where they occur, soils are shallow, well-drained to excessively drained, dry, acidic, coarse sands. Elevations of known examples range from near sea level to 1220 m (4000 feet). The dominant vegetation features are the patchy and open canopy and the extensive dwarf-shrub layer. Tall shrubs and herbs are sparse. The bryoid layer often features large areas of reindeer lichens and drought-tolerant mosses. The ground cover is sparse needle litter and exposed bedrock. In the canopy, which ranges from 25-60% cover, *Pinus banksiana* is dominant. Less abundant conifers may include *Picea rubens, Picea mariana* (at coastal sites), *Pinus strobus*, or *Abies balsamea*. *Betula papyrifera var. papyrifera* and *Betula papyrifera var. cordifolia* may be present, but the deciduous canopy component is minor. Tall shrubs include *Sorbus americana, Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Photinia melanocarpa (= Aronia melanocarpa)*, or *Amelanchier* spp. The low heath layer is composed of *Vaccinium angustifolium, Vaccinium myrtilloides, Gaylussacia baccata, Kalmia angustifolia*, and, near the coast, *Empetrum nigrum* and *Vaccinium vitis-idaea*. Forbs and graminoids include *Deschampsia flexuosa, Danthonia spicata, Sibbaldiopsis tridentata, Cornus canadensis, Trientalis borealis, Solidago simplex var. randii*, and *Maianthemum canadense*. The bryophyte layer is dominated by lichens such as *Cladina stellaris (= Cladonia alpestris), Cladina rangiferina (= Cladonia rangiferina), Rhizocarpon geographicum*, and *Umbilicaria* spp. Mosses include *Pleurozium schreberi, Polytrichum juniperinum*, and *Polytrichum piliferum*. This association is distinguished from more boreal jack pine woodlands (*Pinus banksiana - (Picea mariana, Pinus strobus) / Vaccinium* spp. Rocky Woodland (CEGL002483)) by the lack or low importance of *Picea mariana* (in this type, only rarely present in extreme coastal occurrences), from midwestern jack pine pavement barrens (*Pinus banksiana / Photinia melanocarpa / Xanthoparmelia* spp. Woodland (CEGL005045)) by its occurrence on igneous bedrock, and from midwestern jack pine-oak woodlands (*Pinus banksiana - (Pinus resinosa) - Quercus ellipsoidalis / Carex pensylvanica* Forest (CEGL002478)) by its bedrock, rather than sand plain, substrate. Its distinction from the Great Lakes *Pinus banksiana / Cladina* spp. Rock Outcrop Vegetation (CEGL002491) is based primarily on geography.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This Jack pine community occurs at mid to high elevation of 550 to 1,190 m (1,800-3,900 feet) on mountain ridges.
Global Environment: The jack pine woodland of northern New England and the Canadian maritime provinces occurs sporadically on dry rocky summits, ridges, outcrops and lakeshores. Soil development is typically restricted to crevices or sheltered patches among the predominant exposed bedrock. Where they occur, soils are shallow, well-drained to excessively drained, dry, acidic, coarse sands. Elevations of known examples range from near sea level to 4000 feet.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: *Pinus banksiana* is dominant.
Global Vegetation: The dominant vegetation features are the patchy and open canopy and the extensive dwarf-shrub layer. Tall shrubs and herbs are sparse. The bryoid layer often features large areas of reindeer lichens and drought-tolerant mosses. The ground cover is sparse needle litter and exposed bedrock. In the canopy, which ranges from 25-60% cover, *Pinus banksiana* is dominant. Less abundant conifers may include *Picea rubens, Picea mariana* (at coastal sites), *Pinus strobus*, or *Abies balsamea*. *Betula papyrifera var. papyrifera* and *Betula papyrifera var. cordifolia* may be present, but the deciduous canopy component is minor. Tall shrubs include *Sorbus americana, Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Photinia melanocarpa (= Aronia melanocarpa)*, or *Amelanchier* spp. The low heath layer is composed of *Vaccinium angustifolium, Vaccinium myrtilloides, Gaylussacia baccata, Kalmia angustifolia*, and, near the coast, *Empetrum nigrum* and *Vaccinium vitis-idaea*. Forbs and graminoids include *Deschampsia flexuosa, Danthonia spicata, Sibbaldiopsis tridentata, Cornus canadensis, Trientalis borealis, Solidago simplex var. randii*, and *Maianthemum canadense*. The bryophyte layer is dominated by lichens such as *Cladina stellaris (= Cladonia alpestris), Cladina rangiferina (= Cladonia rangiferina), Rhizocarpon geographicum*, and *Umbilicaria* spp. Mosses include *Pleurozium schreberi, Polytrichum juniperinum*, and *Polytrichum piliferum*.

A4127 *Pinus strobus - Pinus resinosa - Quercus rubra* Forest & Woodland Alliance

Alliance Summary Description: This alliance contains pine-dominated and mixed pine-oak forests and woodlands found in the upper Midwest and New England of the United States, and in eastern temperate Canada. Most examples are dominated by *Pinus strobus* or *Pinus resinosa*. Hardwood species such as *Quercus alba, Quercus rubra*, or *Populus tremuloides* are common associates and may be locally dominant in some areas. The shrub and understory layers vary from sparse to moderately dense. Some typical shrubs include *Acer spicatum, Cornus* spp., *Corylus cornuta, Kalmia latifolia*, and *Vaccinium* spp. Common herbaceous species include *Aralia nudicaulis, Eurybia macrophylla (= Aster macrophyllus), Gaultheria procumbens*, and *Maianthemum canadense*. Stands typically occur on mostly mesic and dry-mesic sites within glaciated landscapes. Soils are typically acidic and range from shallow to moderately deep. Fire and logging can heavily impact examples of this alliance.

[CEGL006253] *Pinus strobus - Pinus resinosa / Cornus canadensis* Forest

Translated Name: **Eastern White Pine - Red Pine / Bunchberry Dogwood Forest**
Common Name: **White Pine - Red Pine Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Pine - Hardwood Forest & Woodland (M159)
Group	Laurentian-Acadian Pine - Oak Forest & Woodland (G025)
Alliance	*Pinus strobus - Pinus resinosa - Quercus rubra* Forest & Woodland Alliance (A4127)

Element Concept

Global Summary: This dry pine forest is scattered across northern New England, New York, and adjacent Canada on very well-drained, coarse-textured, acidic soils. Substrates include sand and gravel deposits on flats, such as outwash sands, delta sands, eskers, kames, kame terraces, and dry lake sands. They also occur on upper hillslopes and low ridges, with shallow-to-bedrock soils. The canopy closure is usually 70-90%; shrubs are sparse, and the herb and bryoid layers are patchy, with overall cover generally well under 20% and often virtually absent. Needle accumulation and dry conditions are factors in the limited understory growth. The canopy is dominated by *Pinus strobus* and *Pinus resinosa*, with scattered minor associates including *Quercus rubra, Betula alleghaniensis, Abies balsamea, Picea rubens, Thuja occidentalis* (near the coast), and *Acer rubrum*. Shrubs include *Kalmia angustifolia, Viburnum nudum var. cassinoides (= Viburnum cassinoides), Vaccinium angustifolium, Vaccinium myrtilloides, Gaylussacia baccata, Amelanchier canadensis*, and *Acer pensylvanicum*. Characteristic herbs include *Pteridium aquilinum, Oryzopsis asperifolia, Mitchella repens, Maianthemum canadense, Gaultheria procumbens, Cornus canadensis, Trientalis borealis*, and *Clintonia borealis*. Where mosses occur, typical species include *Dicranum polysetum, Dicranum undulatum, Polytrichum juniperinum, Pleurozium schreberi*, and *Brachythecium* spp. This community probably requires periodic fires for maintenance.

M016. Southern & South-Central Oak - Pine Forest & Woodland

G601. CHINQUAPIN OAK - SHUMARD OAK - BLUE ASH ALKALINE FOREST & WOODLAND

Group Summary Description: This group encompasses relatively dry calcareous forests and woodlands of temperate eastern North America, especially the unglaciated forest region of the south-central United States, in which various combinations of *Fraxinus quadrangulata, Juniperus virginiana, Quercus muehlenbergii*, and/or *Quercus shumardii* are characteristic. Examples can occur on a variety of topographic and landscape positions, including ridgetops and upper and midslopes, or rarely on the Atlantic Coastal Plain where erosion has exposed Tertiary-aged shell deposits or limesands. Droughts, fires, soil depth, and/or topographic position can determine the relative mixture of deciduous hardwood versus evergreen trees. In the Southern Ridge and Valley region, the Central Basin of Tennessee, the escarpment of the Cumberland Plateau and other related areas, these forests may cover large areas; elsewhere, they occur as relatively small inclusions within a forest matrix of other oak and pine species.

A3274 *Fraxinus americana - Carya glabra - Juniperus virginiana* Piedmont-Appalachian Woodland Alliance

Alliance Summary Description: This alliance encompasses a variety of woodlands found in the upper Piedmont of Georgia, North Carolina, and Virginia, as well as in the adjacent Southern Blue Ridge that have *Carya glabra, Fraxinus americana*, and/or *Quercus* species (e.g., *Quercus alba, Quercus stellata*) as typical canopy dominants, although *Juniperus virginiana* may have significant coverage in some associations. Other minor canopy species vary with geography, but may include *Carya ovata, Carya pallida, Pinus virginiana, Quercus rubra var. rubra*, and *Ulmus alata*. Subcanopy and shrub species are variable among associations, but can include *Amelanchier sanguinea, Ceanothus americanus, Celtis tenuifolia, Cercis canadensis, Chionanthus virginicus, Crataegus* sp., *Hypericum prolificum, Juniperus virginiana var. virginiana, Lonicera flava, Ostrya virginiana, Philadelphus hirsutus, Physocarpus opulifolius, Ptelea trifoliata, Rhus aromatica var. aromatica, Rhus typhina, Rosa carolina, Spiraea betulifolia var. corymbosa, Symphoricarpos orbiculatus, Toxicodendron radicans, Vaccinium arboreum, Vaccinium*

pallidum, Vaccinium stamineum, Viburnum rafinesquianum (= var. rafinesquianum), and *Viburnum rufidulum*. Herbaceous species also vary among associations. Examples are often a physiognomic complex of woodland, grassland, and rock outcrops, often associated with granitic domes or rocky summits. Soils are circumneutral and derived from such base-rich rocks as greenstone, plagioclase-rich granite, hornblende gneiss, amphibole gneiss, limestones, or calcareous shales. Some associations have a nearly closed or locally closed canopy, and could in some cases as readily be considered forests, while others have an edaphically-maintained woodland physiognomy. Canopy closure is probably also dependent on natural disturbances (fire, ice and wind storms) as well as management and edaphic factors.

[CEGL003752] *Carya (glabra, alba) - Fraxinus americana - (Juniperus virginiana var. virginiana)* Woodland

Translated Name: **(Pignut Hickory, Mockernut Hickory) - White Ash - (Eastern Red-cedar) Woodland**
Common Name: **Montane Basic Hardwood - Red-cedar Woodland**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Southern & South-Central Oak - Pine Forest & Woodland (M016)
Group	Chinquapin Oak - Shumard Oak - Blue Ash Alkaline Forest & Woodland (G601)
Alliance	*Fraxinus americana - Carya glabra - Juniperus virginiana* Piedmont-Appalachian Woodland Alliance (A3274)

Element Concept

Global Summary: These montane woodlands of the Southern Blue Ridge are currently known from the lower mountains of North Carolina and Georgia, at 750-1150 m (2500-3800 feet) elevation, on sites with biotite gneiss geology with veins of base-rich hornblende gneiss. They have open and stunted canopies (3-8 m tall), with or without gnarly *Juniperus virginiana var. virginiana* and various deciduous species, typically *Carya glabra, Fraxinus americana, Quercus prinus, Ostrya virginiana*, and *Chionanthus virginicus*. Occasionally, *Pinus virginiana* may be a component of the canopy mix. Occurrences are often physiognomic complexes of woodland, grassland, and rock outcropping, and are often associated with southern or eastern exposures on granitic domes or rocky summits. Some occurrences lack *Juniperus virginiana* but retain the same suite of species that are indicative of high base status rock. Shrubs are scattered or locally abundant and may include *Ptelea trifoliata, Physocarpus opulifolius, Hypericum prolificum, Vaccinium stamineum, Vaccinium pallidum, Lonicera flava, Amelanchier sanguinea*, and *Rosa carolina*. A dense, grassy herb layer can occur beneath the canopy or in open areas, interspersed with bare rock. Typical dominants include *Carex pensylvanica, Dichanthelium scoparium, Danthonia compressa, Danthonia sericea, Andropogon gyrans, Andropogon ternarius, Andropogon gerardii, Sorghastrum nutans, Schizachyrium scoparium var. scoparium, Aristida purpurascens*, and *Melica mutica*. Other herbaceous species can include *Dodecatheon meadia, Solidago nemoralis, Pycnanthemum curvipes, Pycnanthemum montanum, Hypericum punctatum, Hypericum gentianoides, Desmodium rotundifolium, Antennaria virginica, Piptochaetium avenaceum, Packera millefolia (= Senecio millefolium), Helianthus microcephalus, Claytonia virginica, Coreopsis major*, and *Coreopsis pubescens*. The steepest areas may have patches of *Sedum glaucophyllum, Houstonia longifolia*, and *Saxifraga michauxii*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This middle- to lower-elevation hickory woodland generally occurs below 1,220 m (4,000 feet) elevation (but rarely up to 1,340 m [4,400 feet]). It is associated with mafic biotite gneiss geology with veins of base-rich hornblende gneiss. Sites are steep upper slopes and ridgetops (including bedrock outcrops) with southern and eastern aspects. Soils are dry to xeric well-drained sandy loam. The unvegetated surface is a mix of leaf litter, downed wood, exposed bedrock, large and small rocks, and bare soil in various amounts. Evidence of disturbance includes possible landslide, pine bark beetle damage, and wind/ice damage due to exposed position.
Global Environment: Occurrences are often physiognomic complexes of woodland, grassland, and rock outcropping, and are often associated with southern or eastern exposures on granitic domes or rocky summits. These woodlands are currently known from the lower mountains of North Carolina and Georgia at 750-1150 m (2500-3800 feet) elevation, on sites with biotite gneiss geology with veins of base-rich hornblende gneiss.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is composed of scattered *Carya glabra, Fraxinus americana, Quercus prinus, Ostrya virginiana*, and *Chionanthus virginicus*. *Juniperus virginiana* is frequent but not always present. Shrubs are scattered and may include *Ptelea trifoliata, Physocarpus opulifolius, Hypericum prolificum, Vaccinium corymbosum, Vaccinium stamineum, Vaccinium pallidum, Lonicera flava, Amelanchier sanguinea, Rosa carolina*, and *Toxicodendron radicans*. Graminoids dominate the herb layer which may be sparse or fairly abundant and include *Andropogon gerardii, Danthonia compressa, Deschampsia flexuosa, Dichanthelium acuminatum*, and *Schizachyrium scoparium*. This community also supports GA-state critically imperiled *Oxalis montana* and regional endemic *Croton elliottii*.
Global Vegetation: The open and stunted (3-5 m) canopy of stands is dominated by gnarly *Juniperus virginiana var. virginiana* or by various deciduous species, typically *Carya glabra, Fraxinus americana, Quercus prinus, Ostrya virginiana*, and *Chionanthus virginicus*. Occasionally, *Pinus virginiana* may be a component of the canopy mix. Shrubs are scattered or locally abundant and may include *Ptelea trifoliata, Physocarpus opulifolius, Hypericum prolificum, Vaccinium stamineum, Vaccinium pallidum, Lonicera flava, Amelanchier sanguinea*, and *Rosa carolina*. A dense, grassy herb layer can occur beneath the canopy or in open areas, interspersed with bare rock. Typical dominants include *Carex pensylvanica, Dichanthelium scoparium, Danthonia compressa, Danthonia sericea, Andropogon gyrans, Andropogon ternarius, Andropogon gerardii, Sorghastrum nutans, Schizachyrium scoparium var. scoparium, Aristida purpurascens*, and *Melica mutica*. Other herbaceous species include *Allium cernuum, Dodecatheon meadia, Solidago nemoralis, Solidago sphacelata, Pycnanthemum montanum, Pycnanthemum curvipes, Hypericum punctatum, Hypericum gentianoides, Desmodium rotundifolium, Antennaria virginica, Piptochaetium avenaceum, Packera millefolia (= Senecio millefolium), Helianthus microcephalus, Claytonia virginica, Coreopsis major*, and *Coreopsis pubescens*. The steepest areas may have patches of *Sedum glaucophyllum, Houstonia longifolia*, and *Saxifraga michauxii*.

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (14-Dec-1998). This community is limited to regionally uncommon and small exposures of moderately nutrient-rich rock in the Southern Blue Ridge, and is thought to be inherently rare because of its unusual geology and topographic position. Total acreage of this community may be less than 1000 acres. Threats are few, although logging in adjacent areas can cause unnatural disturbance, along with alteration of light and seepage flow.

RELATED CONCEPTS

Global Similar Types:

- *Fraxinus americana - Carya glabra / Muhlenbergia sobolifera - Helianthus divaricatus - Solidago ulmifolia* Woodland (CEGL003683)
- *Fraxinus americana - Carya glabra / Symphoricarpos orbiculatus - Rhus aromatica / Piptochaetium avenaceum* Woodland (CEGL003684) a related Piedmont type.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Soil chemistry data are not available but composition suggests a somewhat basic substrate. Tom Govus suspects the substrate is hornblende gneiss (Fleming and Patterson 2009a).
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: *Pinus virginiana* is common in one of the plots. This is possibly a variant of Montane Basic Hardwood - Red-cedar Woodland (CEGL003752) with *Pinus virginiana*, which sometimes occurs on Virginia mafic outcrops with the more characteristic *Carya, Fraxinus*, and *Juniperus* (Fleming and Patterson 2009a).
Global Classification Comments: Some sites grade into forests dominated by *Quercus prinus*. In an 1134-plot regional analysis for the Southern Appalachian portion of the Appalachian Trail, only three Georgia plots were classified as this type (Fleming and Patterson 2009a).

G165. PIEDMONT-CENTRAL ATLANTIC COASTAL PLAIN OAK FOREST

Group Summary Description: Vegetation of this group encompasses both the prevailing upland oak and oak-hickory forests of the southern Piedmont, as well as the more open vegetation of more limited areas in the Piedmont where a particularly dense clay hardpan has developed over a range of typically mafic rocks, sometimes with interspersed areas of prairie- or glade-like herbaceous vegetation. In addition, it encompasses related oak-dominated forests of somewhat fire-sheltered dry to dry-mesic sites in the adjacent Mid-Atlantic and South Atlantic coastal plains from southeastern Virginia to Georgia. In general, high-quality and historic examples are typically dominated by combinations of upland *Quercus* spp., sometimes with *Pinus* spp. as a significant component, especially in the southern portions of the region. These forests occur in a variety of habitats and, under natural conditions, were the matrix vegetation type covering most of the landscape. Much of this group is currently composed of successional forests that have arisen after repeated cutting, clearing, and cultivation of original oak-hickory forests. Stands of these forests are dominated by combinations of upland *Quercus* spp., particularly *Quercus alba, Quercus coccinea, Quercus falcata, Quercus rubra, Quercus stellata*, and *Quercus velutina*, along with *Carya alba, Carya glabra*, and other *Carya* spp. Other common tree species include *Acer rubrum, Liquidambar styraciflua, Liriodendron tulipifera, Pinus echinata, Pinus taeda*, and *Pinus virginiana*.

A3293 *Quercus rubra - Quercus alba - Carya* spp. Piedmont Forest Alliance

Alliance Summary Description: These are dry-mesic to mesic upland oak forests dominated by *Quercus alba* and/or *Quercus rubra*, with or without *Carya* species, found in the southern Piedmont, the lower elevations of the Appalachian Mountains, the adjacent Ridge and Valley, and peripherally in the adjacent Upper East Gulf Coastal Plain of the southeastern United States. *Quercus alba* usually dominates, either alone or in combination with *Quercus falcata* (especially on drier sites), *Quercus rubra* (especially on moister sites), and sometimes *Quercus velutina*. *Carya* species (particularly *Carya alba, Carya glabra*, or *Carya ovata*) are typically common either in the canopy or subcanopy. Other associated species include *Acer leucoderme, Acer rubrum, Calycanthus floridus, Cornus florida, Fraxinus americana, Kalmia latifolia, Nyssa sylvatica, Ostrya virginiana, Oxydendrum arboreum, Pyrularia pubera*, and others. Stands are found on gentle to moderately steep slopes on uplands and on steep valley sides. The soils are moderately deep to deep and vary from silts to clays and loams. The parent material ranges from glaciated till to limestone, shale, sandstone and other bedrock types.

[CEGL007230] *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest

Translated Name: **White Oak - (Northern Red Oak, Chestnut Oak) / Flame Azalea - (Bear Huckleberry) Forest**

Common Name: **Appalachian Montane Oak - Hickory Forest (Typic Acidic Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Southern & South-Central Oak - Pine Forest & Woodland (M016)
Group	Piedmont-Central Atlantic Coastal Plain Oak Forest (G165)
Alliance	*Quercus rubra - Quercus alba - Carya* spp. Piedmont Forest Alliance (A3293)

ELEMENT CONCEPT

Global Summary: These forests occur in a wide elevational range, from 610 to 1372 m (2000-4500 feet), in the Southern Blue Ridge, Blue Ridge/Piedmont transition, and the higher ridges of the Cumberland Mountains and Ridge and Valley in southwestern Virginia. The type occurs generally on deep soils of broad ridgetops, exposed upper slopes and saddles, occurring less frequently on protected lower slopes, bottoms and coves. Stands of this deciduous forest association are dominated or codominated by *Quercus alba*, occurring with other *Quercus* species (*Quercus rubra, Quercus prinus, Quercus coccinea*). Associated species are characteristically montane and typical of acidic forests. This association lacks indicators of circumneutral soils and also lacks low-elevation dry-site species such as *Pinus echinata, Quercus falcata, Quercus stellata*, and *Quercus marilandica*. Species other than oaks that can be important in the canopy include *Carya alba, Carya glabra, Carya ovalis, Liriodendron tulipifera, Acer rubrum*, and *Magnolia fraseri*. Common species in the subcanopy/sapling strata include *Cornus florida, Acer rubrum, Carya* spp., *Liriodendron tulipifera, Magnolia fraseri, Nyssa sylvatica, Oxydendrum arboreum, Pinus strobus*, and *Halesia tetraptera*. Shrub cover is sparse to very dense and is often dominated by deciduous heaths. *Kalmia latifolia* and *Gaylussacia ursina* are usually present, but other shrub species can include *Euonymus*

americanus, Rhododendron calendulaceum, Vaccinium stamineum, Vaccinium pallidum, Viburnum acerifolium, Calycanthus floridus, Pyrularia pubera, Ilex montana, Halesia tetraptera, and *Hamamelis virginiana*. In the northern portion of the range of this association (northwestern North Carolina and southwestern Virginia), *Gaylussacia ursina* is frequently absent from the shrub layer. *Smilax glauca* and *Vitis rotundifolia* are common vines. The herbaceous stratum is sparse to moderate in coverage, but often rich in species, approaching the diversity but not the coverage of rich cove forests. Associated herbaceous species vary with elevation and soil moisture. Often there is a dominant fern stratum, with *Thelypteris noveboracensis* and *Polystichum acrostichoides* most typically dominant.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This montane acidic oak-hickory forest of the Southern Appalachians generally occurs on deep soils of broad ridgetops, exposed upper slopes and saddles, occurring less frequently on protected sites. Elevation averages 972 m (3,189 feet) in southwestern Virginia (south of the New River) and into the Southern Appalachians. It was sampled at two locations in this portion of the park. Sites are moderate to somewhat steep, lower to upper slopes and ridges with mostly southern aspects. Soils are dry-mesic well-drained loam and clay loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional large/small rocks. Evidence of disturbance includes past logging.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This oak-hickory forest is usually found at 610 to 1,370 m (2,000-4,500 feet) elevation, but can be found down to about 305 m (1,000 feet) in Georgia. It occurs on convex, warm-aspect, upper slopes and crests. Soils are generally dry-mesic, moderately well- to well-drained very acidic loam, sandy loam and clay loam. The unvegetated surface is dominated by leaf litter with some downed wood and rocks. Evidence of disturbance includes possible past logging and the presence of exotic plant species.
Global Environment: These forests occur in a wide elevational range, from 610 to 1370 m (2000-4500 feet), in the Southern Blue Ridge, the Blue Ridge/Piedmont transition, and the higher ridges of the Cumberland Mountains and Ridge and Valley in southwestern Virginia. The type occurs generally on deep soils of broad ridgetops, exposed upper slopes and saddles, occurring less frequent on protected sites, typically lower slopes, bottoms and coves. Twenty-four plots classified as this type in the Appalachian Trail project have a mean elevation of 1095 m (3592 feet) and occur mostly on convex, southwest-facing upper slopes and crests. Soil samples collected from these plots have a mean pH of 4.4, along with low calcium, magnesium, and total base saturation, and high iron and aluminum.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus alba* often dominates the canopy with some combination of *Quercus prinus, Quercus velutina, Acer rubrum, Carya alba, Carya glabra, Carya ovalis*, and *Oxydendrum arboreum*. *Castanea dentata, Amelanchier arborea, Vaccinium pallidum*, and *Vaccinium stamineum* are usually present in the shrub layer. There is often a diverse herb layer that may include *Desmodium nudiflorum, Prenanthes altissima, Polygonatum biflorum, Potentilla canadensis, Uvularia perfoliata, Uvularia puberula*, and *Zizia trifoliata*.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: Stands have a mixed canopy, including *Quercus alba* (but often abundant), *Quercus rubra, Quercus prinus*, and *Quercus velutina*. Subcanopy trees include *Acer rubrum, Betula lenta, Sassafras albidum*, and *Oxydendrum arboreum*. Common shrubs include *Castanea dentata, Gaylussacia baccata, Ilex montana, Kalmia latifolia, Rhododendron calendulaceum, Vaccinium pallidum, Vaccinium corymbosum*, and *Vaccinium stamineum*. Herbs may be sparse to quite dense and dominated by acidic herbs and ferns. *Carex pensylvanica, Desmodium nudiflorum, Dioscorea quaternata, Galium latifolium, Goodyera pubescens, Medeola virginiana, Solidago arguta var. caroliniana, Solidago curtisii (= Solidago caesia var. curtisii), Uvularia puberula*, and *Viola hastata* are common. This community also supports GA-state imperiled *Prunus pensylvanica* and NC-state imperiled *Crataegus schuettei* and *Stenanthium gramineum var. micranthum*.
Global Vegetation: The canopies of stands of this association are dominated or codominated by *Quercus alba*, occurring with other *Quercus* species (*Quercus rubra, Quercus prinus, Quercus coccinea*). Species other than oaks that can be important in the canopy include *Carya alba, Carya glabra, Carya ovalis, Liriodendron tulipifera, Acer rubrum*, and *Magnolia fraseri*. Stands lack indicators of circumneutral soils and also lack low-elevation dry-site species such as *Pinus echinata, Quercus falcata, Quercus stellata*, and *Quercus marilandica*. Common species in the subcanopy/sapling strata include *Cornus florida, Acer rubrum, Carya* spp., *Liriodendron tulipifera, Magnolia fraseri, Nyssa sylvatica, Oxydendrum arboreum, Pinus strobus*, and *Halesia tetraptera*. Shrub cover is sparse to very dense, and is often dominated by deciduous heaths, including *Kalmia latifolia* and *Gaylussacia ursina*. Other shrub species can include *Euonymus americanus, Rhododendron calendulaceum, Vaccinium stamineum, Vaccinium*

pallidum, Viburnum acerifolium, Calycanthus floridus, Pyrularia pubera, Ilex montana, Halesia tetraptera, and *Hamamelis virginiana*. *Smilax glauca* and *Vitis rotundifolia* are common vines. The herbaceous stratum is sparse to moderate in coverage, but often rich in species, approaching that of rich cove forests (but with a different composition). Associated herbaceous species vary with elevation and soil moisture. Some of the more constant species include *Parthenocissus quinquefolia, Dioscorea quaternata, Dichanthelium* spp., *Carex pensylvanica, Chimaphila maculata, Desmodium nudiflorum, Goodyera pubescens, Maianthemum racemosum ssp. racemosum*, and *Trillium catesbaei*. Other species include *Dichanthelium laxiflorum, Oclemena acuminata (= Aster acuminatus), Eurybia divaricata (= Aster divaricatus), Galax urceolata, Galium latifolium, Lysimachia quadrifolia, Mitchella repens, Viola hastata, Uvularia puberula, Polygonatum biflorum, Solidago curtisii, Convallaria majuscula*, and *Melanthium parviflorum*. Often there is a dominant fern stratum, with *Thelypteris noveboracensis* and *Polystichum acrostichoides* most typically dominant. Other ferns include *Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula*, and *Dryopteris intermedia*.

Global Dynamics: Like many contemporary eastern oak forests, stands of this type in Virginia typically exhibit poor oak recruitment and an understory of *Acer rubrum* and other shade-tolerant mesophytic trees. This condition is generally considered symptomatic of long-term fire exclusion.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Castanea dentata* (G4, TN state-imperiled), *Crataegus schuettei* (G5?, NC state-imperiled), *Prunus pensylvanica* (G5, GA state-imperiled), *Stenanthium gramineum* var. *micranthum* (G4G5TNR, NC state-imperiled); **Invasive/Exotic Plants**: *Anthoxanthum odoratum* (invasive/exotic), *Berberis thunbergii* (High/Medium, invasive/exotic), *Elaeagnus umbellata* (High), *Ligustrum sinense* (High/Medium, invasive/exotic), *Lonicera japonica* (High/Medium, invasive/exotic), *Lonicera morrowii* (High/Medium, invasive/exotic), *Myosotis stricta* (invasive/exotic), *Rosa multiflora* (Medium/Low, invasive/exotic), *Rubus phoenicolasius* (Medium, invasive/exotic), *Stellaria graminea* (invasive/exotic), *Stellaria media* (Low, invasive/exotic), *Trifolium campestre* (invasive/exotic), *Trifolium repens* (Medium/Low, invasive/exotic), *Viburnum plicatum* (invasive/exotic), *Vicia sativa* ssp. *nigra* (invasive/exotic)
Global: Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Canoparmelia amabilis* (G1), *Carex lucorum* var. *austrolucorum* (G5T3T4), *Carex manhartii* (G3G4), *Penstemon smallii* (G3), *Robinia hispida* var. *kelseyi* (G4T1), *Sisyrinchium dichotomum* (G2), *Trillium rugelii* (G3), *Vaccinium hirsutum* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (22-Feb-2010). This is a broad-concept type, and while it may be subdivided in the future if analysis warrants this, it is widely distributed over the Southern Blue Ridge, the Blue Ridge/Piedmont transition, and the higher ridges of the Cumberland Mountains and Ridge and Valley in southwest Virginia, over a broad elevational range. It may form large patches at some sites. It is apparently secure, although fire suppression and insect pathogens represent ongoing stand-altering disturbances. It is not threatened or particularly vulnerable. Mature, high-quality stands are uncommon due to extensive past logging and more recent biotic disturbances.

RELATED CONCEPTS

Global Similar Types:
- *Acer rubrum var. rubrum - Betula lenta - Magnolia fraseri / (Rhododendron maximum, Kalmia latifolia)* Ruderal Forest (CEGL008558)
- *Quercus alba / Kalmia latifolia* Forest (CEGL007295)
- *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest (CEGL007267) is drier and less diverse, and occurs at somewhat lower elevations.
- *Quercus prinus - Quercus rubra / Vaccinium pallidum - (Rhododendron periclymenoides)* Forest (CEGL008523) is a dry, Central Appalachian mixed oak forest; usually lacks significant *Quercus alba*.
- *Quercus rubra - Acer rubrum / Pyrularia pubera / Thelypteris noveboracensis* Forest (CEGL006192)
- *Quercus rubra - Quercus prinus - Magnolia (acuminata, fraseri) / Acer pensylvanicum* Forest (CEGL004817)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This is a strongly Southern Appalachian community, common in southwestern Virginia, and only documented north to Bland and Pulaski counties, Virginia (i.e., strictly south of the New River). Stands are possible in Giles and Craig counties, but the community does not occur anywhere on the Northern Blue Ridge north of Roanoke.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: In comparison to Central Appalachian Montane Oak - Hickory Forest (Acidic Type) (CEGL008516), this association (CEGL007230) is a much more acidic and less floristically diverse oak-hickory forest.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Mixed oak forest with substantial *Quercus alba* component, moderately low to high richness of shrubs and herbs. Soils are extremely acidic with low Ca, Mg and high Fe and Al. Plots in this analysis are strongly associated with convex, warm-aspect, upper slopes and crests.
Global Classification Comments: This association is meant to cover the typical acidic, oak-hickory forests of the Southern Blue Ridge Mountains. It has a broad concept, and there is potential for subdividing this type by moisture, elevation, or undergrowth. It can be distinguished from *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest (CEGL007267) by higher species diversity and the presence of a substantial amount of *Quercus alba*. Twenty-four plots from Georgia, North Carolina, Tennessee, and southwestern Virginia were classified as this association in the Appalachian Trail vegetation mapping project (Fleming and Patterson 2009a). In 12 plots from this dataset, species richness ranges from 29 to 115 species per hectare, and averages 59 species per 1000-m2 plot.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This forest of the Southern Appalachians ranges from south of the New River in Virginia to Georgia. It was sampled in Smyth and Bland counties in Virginia, west of Dickeys Gap.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is scattered along and near the AT from Bland County, Virginia, south to Georgia. It was sampled in Georgia, including Springer Mountain and Tray Mountain; in North Carolina at Green Knob South (Great Smoky Mountains National Park) and Runaway Knob (Nantahala National Forest); in Tennessee, including north of Ekaneetlee Gap; and in Virginia at Bobby's Ridge, Feathercamp Ridge, French Broad River, Oteen, and Straight Mountain.
Global Range: This community is found in the Southern Blue Ridge, the Blue Ridge/Piedmont transition, and Central Appalachians of the eastern United States.
Nations: US
States/Provinces: GA, NC, SC, TN, VA:S3
TNC Ecoregions: 50:C, 51:C, 52:P, 59:C

Alliance	*Quercus rubra - Quercus alba - Carya* spp. Piedmont Forest Alliance (A3293)

ELEMENT CONCEPT

Global Summary: This is a dry-mesic to mesic, low-montane oak-hickory forest of the Ridge and Valley, Cumberland Mountains, and adjacent Southern Blue Ridge. It has moderately high species diversity, with a variable mixed overstory of *Quercus rubra, Quercus alba, Carya ovalis, Carya ovata, Carya alba, Liriodendron tulipifera* and, less frequently, *Carya cordiformis, Magnolia acuminata, Quercus velutina*, and *Quercus prinus*. The most characteristic subcanopy species are *Acer rubrum, Acer saccharum, Fraxinus americana, Sassafras albidum, Nyssa sylvatica, Oxydendrum arboreum, Ulmus rubra, Cornus florida*, and *Ostrya virginiana*. Shrubs of various heights are commonly present; these may include *Frangula caroliniana, Corylus cornuta, Corylus americana, Vaccinium stamineum, Cercis canadensis, Asimina triloba, Morus rubra*, and *Lindera benzoin*. The herb layer is often diverse; the most constant patch-dominants include *Polystichum acrostichoides, Desmodium nudiflorum, Amphicarpaea bracteata, Dichanthelium boscii, Actaea racemosa*, and *Ageratina altissima var. altissima*. Some other herbs include *Podophyllum peltatum, Maianthemum racemosum ssp. racemosum, Desmodium pauciflorum, Desmodium glutinosum, Galium circaezans, Uvularia perfoliata, Dioscorea quaternata, Arisaema triphyllum, Conopholis americana, Geranium maculatum, Solidago curtisii, Scutellaria elliptica, Brachyelytrum erectum, Eupatorium purpureum var. purpureum, Collinsonia canadensis*, and *Polymnia canadensis*. Many other mesophytic and dry-mesophytic herbs occur at low cover. The canopy is generally closed (>75% cover).

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This low-elevation oak-hickory forest is found below 700 m (2,297 feet) elevation and is more characteristic of the Ridge and Valley. Sites are steep to somewhat steep slopes with variable aspects and deep, well-drained clay loam and loam soils that are moderately calcareous. The unvegetated surface is dominated by leaf litter with occasional rocks and downed wood. Evidence of disturbance includes trails and wind/ice damage.

Global Environment: Most examples occur between 460 and 850 m (1500-2800 feet) (mean = 615 m [2018 feet]), with a few sites as low as 260 m (850 feet). It occupies a variety of sites, slope positions and aspects, most commonly northwestern to eastern. Most, if not all, sample sites for this type are underlain by sedimentary and metasedimentary rocks, including shale, metashale, siltstone, calcareous sandstone, and interbedded limestone and sandstone. Soil samples collected from plots have moderately high mean high calcium and magnesium, and manganese content.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by *Quercus alba, Carya ovata*, and *Carya alba*. *Quercus rubra* may be a dominant component of the canopy as well. Other species that may be present in the canopy are *Acer saccharum, Liriodendron tulipifera, Quercus velutina, Carya glabra, Fraxinus americana, Fagus grandifolia, Prunus serotina, Ulmus rubra*, and *Juglans nigra*. Shrubs are sparse but may include *Amelanchier arborea, Cercis canadensis, Cornus florida, Hamamelis virginiana, Rubus allegheniensis*, and *Viburnum acerifolium*. The herb layer can also be sparse or quite dense; common species include *Amphicarpaea bracteata, Desmodium nudiflorum, Dichanthelium boscii, Galium circaezans, Galium triflorum*, and *Polystichum acrostichoides*. *Parthenocissus quinquefolia* and *Smilax rotundifolia* are common vines.

Global Vegetation: This is a dry-mesic to mesic, low-montane oak-hickory forest with moderately high species diversity. It has a variable mixed overstory of *Quercus rubra, Quercus alba, Carya ovalis, Carya ovata, Carya alba, Liriodendron tulipifera* and, less frequently, *Carya cordiformis, Magnolia acuminata, Quercus velutina*, and *Quercus prinus*. Some stands may also include *Fagus grandifolia, Fraxinus americana, Pinus virginiana, Aesculus flava, Nyssa sylvatica, Quercus falcata, Quercus muehlenbergii, Tilia americana var. heterophylla, Pinus echinata, Pinus strobus, Prunus serotina, Quercus coccinea, Ulmus alata, Juglans nigra, Tsuga canadensis*, and *Ulmus rubra*. The canopy is generally closed (>75% cover). The most characteristic subcanopy species are *Acer rubrum, Acer saccharum, Fraxinus americana, Sassafras albidum, Nyssa sylvatica, Oxydendrum arboreum, Ulmus rubra, Cornus florida*, and *Ostrya virginiana*, with *Liquidambar styraciflua, Ulmus alata*, and *Prunus serotina* present in some stands. *Acer saccharum* and/or *Acer rubrum* typically strongly dominate the subcanopy. In the Tellico Pilot Project, *Acer saccharum* had a relative frequency value of >90% and an average canopy cover dominance of >25%. It is speculated that this high dominance is due to the mesic site conditions and lack of fire. Scrambling and low-

climbing vines of *Toxicodendron radicans* and *Smilax rotundifolia* are frequent. Shrubs of various heights are commonly present; these may include *Frangula caroliniana, Corylus cornuta, Corylus americana, Vaccinium stamineum, Cercis canadensis, Asimina triloba, Morus rubra*, and *Lindera benzoin*. The shrub and herbaceous layers tend to have a percent cover of >25%. The herb layer is often diverse; the most constant patch-dominants include *Polystichum acrostichoides, Desmodium nudiflorum, Amphicarpaea bracteata, Dichanthelium boscii, Actaea racemosa*, and *Ageratina altissima var. altissima*. Other herbs that can be important in some stands include *Podophyllum peltatum, Maianthemum racemosum ssp. racemosum, Desmodium pauciflorum, Desmodium glutinosum, Galium circaezans, Uvularia perfoliata, Dioscorea quaternata, Arisaema triphyllum, Conopholis americana, Geranium maculatum, Solidago curtisii, Scutellaria elliptica, Brachyelytrum erectum, Eupatorium purpureum var. purpureum, Collinsonia canadensis*, and *Polymnia canadensis*.

A stand on the western edge of the Blue Ridge (Cherokee National Forest, Tennessee, M221Dd418, Dry Branch #1) contains *Quercus alba, Carya ovata, Fraxinus americana, Quercus rubra, Aesculus flava, Juniperus virginiana var. virginiana, Juglans nigra*, and *Quercus stellata* in the canopy; *Ostrya virginiana, Cercis canadensis, Ulmus rubra, Fraxinus americana, Ulmus alata, Quercus prinus*, and *Juniperus virginiana var. virginiana* in the subcanopy; *Frangula caroliniana* as a tall shrub; *Symphoricarpos orbiculatus* and *Vaccinium stamineum* in the low-shrub stratum; *Parthenocissus quinquefolia* as a woody vine; and *Bromus pubescens, Elymus hystrix, Carex* sp., *Carex pensylvanica, Sedum ternatum, Asplenium platyneuron, Hybanthus concolor, Carex communis, Dichanthelium boscii (= Panicum boscii), Asplenium resiliens, Symphyotrichum undulatum (= Aster undulatus), Dioscorea quaternata, Solidago caesia, Galium circaezans, Antennaria plantaginifolia, Pellaea atropurpurea, Verbesina occidentalis, Scutellaria elliptica, Arabis* sp., *Agrimonia* sp., *Geum* sp., *Eurybia divaricata (= Aster divaricatus), Conyza canadensis, Hepatica nobilis var. obtusa, Maianthemum racemosum, Monarda fistulosa, Sanicula canadensis, Solidago erecta (= Solidago speciosa var. erecta), Viola x palmata*, and *Thalictrum* sp. as herbs.

Global Dynamics: Disturbances from fires and mudslides were observed in many of the Tellico Pilot Project sites of this type. Mesic site conditions can limit fire disturbance. Without disturbance this community may develop into an *Acer saccharum* or *Acer rubrum* forest type, as the subcanopy is strongly dominated by one or both of those species.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area)

Tree canopy	Broad-leaved deciduous tree	*Carya alba*, *Carya ovata*, *Quercus alba*
Herb (field)	Liana	*Parthenocissus quinquefolia*

Global

Stratum	Lifeform	Species
Tree (canopy & subcanopy)	Broad-leaved deciduous tree	*Carya alba*, *Carya ovata*
Tree canopy	Broad-leaved deciduous tree	*Carya glabra*, *Liriodendron tulipifera*, *Quercus alba*
Tree subcanopy	Broad-leaved deciduous tree	*Acer saccharum*, *Fraxinus americana*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Carya alba*, *Carya glabra*, *Carya ovata*, *Liriodendron tulipifera*, *Parthenocissus quinquefolia*, *Polystichum acrostichoides*, *Quercus alba*
Global: *Acer saccharum*, *Carya ovalis*, *Fagus grandifolia*, *Polystichum acrostichoides*, *Quercus alba*, *Quercus rubra*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Castanea dentata* (G4, TN state-imperiled), *Trillium luteum* (G4, TN state-imperiled)
Global: Vulnerable Plants: *Scutellaria pseudoserrata* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (14-Jan-2000). This is not an inherently rare forest type. It is presumed to be relatively common throughout its known range. It is at least a moderately widespread type, although its full range is not known. It occurs on a variety of aspects and elevations, and it is not restricted to any highly specific geologic substrates. It is poorly documented through EOs, and not much data are available on the specific condition of examples of this type. Some stands have been impacted by removal of more valuable timber species and loss of

herbaceous species diversity from the disturbance effects of logging. In all probability, most examples which are not on public land have been repeatedly logged and their composition altered thereby. Remaining unprotected examples are threatened by timber removal, conversion to other managed forest types, and/or development into residential or commercial real estate. The Grank was formerly G3G5. Changing this to G4 helps to clarify its status.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharum - Quercus muehlenbergii / Cercis canadensis* Forest (CEGL006017) is a drier association found to the North and East.
- *Quercus alba - Quercus prinus - Carya glabra / Cornus florida / Vaccinium pallidum* Forest (CEGL008515) is a drier, more acidic oak-hickory forest of the Central Appalachian / Ridge and Valley region.
- *Quercus alba - Quercus rubra - Carya alba / Cornus florida* Acidic Forest (CEGL002067)
- *Quercus alba - Quercus rubra - Carya ovata / Cercis canadensis - Juniperus virginiana var. virginiana* Forest (CEGL007240) is a related drier forest association.
- *Quercus alba - Quercus rubra - Carya ovata* Glaciated Forest (CEGL002068) is an equivalent of glaciated landscapes of the Midwest.
- *Quercus alba - Quercus rubra - Quercus prinus / Collinsonia canadensis - Podophyllum peltatum* Forest (CEGL007692) is a more montane oak-hickory forest of the Southern Blue Ridge; occurs at higher elevations and has a pronounced component of mesophytic montane species absent from CEGL007233.
- *Quercus alba - Quercus velutina - Carya (ovata, alba) - Pinus* sp. Forest (CEGL007231)
- *Quercus prinus - Quercus rubra - Carya* spp. *- Fraxinus americana / Solidago sphacelata* Forest (CEGL008549)
- *Quercus rubra - Acer saccharum - Liriodendron tulipifera* Forest (CEGL006125) has a more northeasterly distribution.
- *Quercus rubra - Acer saccharum / Ostrya virginiana / Cardamine concatenata* Forest (CEGL008517) is a very similar forest that has a more northern distribution; could be considered the Central Appalachian analogue of CEGL007233.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Plots in this group are distributed at low elevations of the Southern Blue Ridge and in the Ridge and Valley and Cumberland Mountains. The samples represent a fairly species-rich oak-hickory forest that occurs from about 250 to 850 m (850-2,800 feet) elevation. Soil chemistry data indicate that substrates are moderately calcareous. Habitats appear to be dry-mesic to almost mesic, and many low-elevation plants are frequent or common in this group.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: This is the matrix forest over large areas of Cumberland Gap NHP. At the time that vegetation mapping project was done, those plots were assigned to Appalachian Montane Oak - Hickory Forest (Rich Type) (CEGL007692), but this analysis does not support that assignment.
Global Classification Comments: This is primarily a type of the Ridge and Valley and Cumberlands (Alabama to southwestern Virginia), but it also occurs on metasedimentary substrates at low elevations on the western flank of the Blue Ridge, in northern Georgia, Tennessee, and extreme western North Carolina (Hot Springs Window). There is at least one occurrence in the upper Piedmont of Georgia. Occurrences in Kentucky and West Virginia are likely. The range of this association (CEGL007233) barely overlaps that of *Quercus alba - Quercus rubra - Quercus prinus / Collinsonia canadensis - Podophyllum peltatum* Forest (CEGL007692), and where it does, it is separated from the latter by elevation and soils (G. Fleming pers. comm. 2009, Fleming and Patterson 2009a).

This association was originally described from the Tellico Pilot Project (Ridge and Valley of Tennessee, northeastern Monroe County; 26 stands sampled) as the *Quercus alba - Carya ovata - Carya alba* Forest, where it was recorded from slopes with northwestern, northern and eastern aspects at elevations from 250 to 300 m (820-1000 feet). The high dominance of *Acer saccharum* in the subcanopy of some stands is thought to be due to the mesic site conditions combined with lack of fire. Twenty-five plots from a wider geographic range were classified as this association in the Appalachian Trail classification project (Fleming and Patterson 2009a). More information is needed on the variability of this community across its range. Described from the Ridge and Valley of Tennessee, the concept is generally applied to forests in the southern Cumberlands and adjacent Southern Blue Ridge.

This is an unglaciated equivalent of a Midwestern element of glaciated landscapes, *Quercus alba - Quercus rubra - Carya ovata* Glaciated Forest (CEGL002068) of Indiana, Illinois, and Missouri north to Ontario. A related drier forest association is *Quercus alba - Quercus rubra - Carya ovata / Cercis canadensis - Juniperus virginiana*

var. virginiana Forest (CEGL007240). It may also be similar to some limestone forests in Virginia's Ridge and Valley (*Acer saccharum var. saccharum - Quercus rubra - Carya [glabra, ovata] / Ageratina altissima* Forest (Fleming 1999)) (G. Fleming pers. comm.). In addition, the association has been identified in the far western edge of the Great Smoky Mountains National Park at a southerly aspect at about 570 m (1870 feet) in elevation.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community occurs in several spots along low-elevation stretches of the trail; widely distributed. It was sampled at Nolichucky River in Pisgah National Forest and elsewhere in Tennessee.
Global Range: This is primarily a type of the Ridge and Valley and Cumberlands from Alabama to southwestern Virginia, but it also occurs at low elevations on the western flank of the Blue Ridge, in northern Georgia, Tennessee, and extreme western North Carolina (Hot Springs Window). There is at least one occurrence in the upper Piedmont of Georgia. Occurrences in Kentucky and West Virginia are likely.

Macrogroup	Southern & South-Central Oak - Pine Forest & Woodland (M016)
Group	Piedmont-Central Atlantic Coastal Plain Oak Forest (G165)
Alliance	*Quercus rubra - Quercus alba - Carya* spp. Piedmont Forest Alliance (A3293)

ELEMENT CONCEPT

Global Summary: This association includes forests dominated by *Quercus alba, Quercus velutina, Quercus rubra*, or *Carya glabra, Carya alba*, or *Carya ovalis*, occurring over circumneutral soils in the Southern Blue Ridge and adjacent inner Piedmont. These forests can occur across a broad elevation range (530-1375 m [1750-4500 feet]) in exposed topographic settings (upper slopes), as well as on more protected sites (edges of coves). Presumed upper Piedmont examples may be at lower elevations (e.g., below 305 m [1000 feet]). Other species that can be important in the canopy include *Quercus coccinea, Quercus prinus*, and occasionally *Liriodendron tulipifera* where large gaps in the canopy have allowed for its generation On some sites, species more typical of "cove forests," such as *Fraxinus americana* or *Magnolia acuminata*, may form a very minor component. *Oxydendrum arboreum* and *Cornus florida* are common in the subcanopy. Heath species (*Rhododendron maximum* or *Kalmia latifolia*) are absent or very minor in the shrub stratum. On very high-base status soils, *Philadelphus hirsutus* or *Lindera benzoin* may be in the shrub

stratum. The herbaceous stratum can be quite diverse and is characterized by mesic herbs and species associated with circumneutral soils, such as *Podophyllum peltatum, Arisaema triphyllum, Amphicarpaea bracteata, Adiantum pedatum, Collinsonia canadensis, Asplenium platyneuron, Brachyelytrum erectum, Actaea racemosa (= Cimicifuga racemosa), Caulophyllum thalictroides, Sanguinaria canadensis, Tradescantia subaspera, Euphorbia purpurea, Phegopteris hexagonoptera, Polystichum acrostichoides, Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula*, and *Dryopteris intermedia*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This mid- to high-elevation rich oak-hickory forest is found on deep, basic soils from about 610 to 1,370 m (2,000-4,500 feet). Sites range from gentle to steep, mid and upper slopes and ridgetops with variable aspects. Soils are dry-mesic to mesic, moderately well- to well-drained loam. The unvegetated surface is dominated by leaf litter with occasional rocks and downed wood. Evidence of disturbance includes past logging, trails, wind/ice damage, and the presence of a few exotic plant species.

Global Environment: This association includes forests codominated by *Quercus alba*, occurring over nutrient-rich soils in the Southern Blue Ridge and adjacent Piedmont. These forests can occur across a broad elevational range, from 610 to 1372 m (2000-4500 feet), and can occur in exposed topographic settings (upper slopes and broad ridgetops), as well as on more protected sites (edges of coves). Presumed upper Piedmont examples may be at lower elevations (e.g., below 305 m [1000 feet]). Soils collected from plots of this association are strongly acidic with high organic matter content, but have higher magnesium and calcium levels than most other Southern Appalachian soils (Fleming and Patterson 2009a).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by *Quercus alba* (25-75%), often mixed with other *Quercus* spp., including *Quercus velutina, Quercus prinus*, and/or *Quercus rubra*, with *Carya glabra, Carya alba*, and/or *Carya ovalis, Liriodendron tulipifera*, and lacking abundant *Fraxinus americana*. Shrub layers are relatively sparse but may include *Rubus allegheniensis, Ilex montana*, and *Toxicodendron radicans*. The well-developed, diverse herbaceous layer includes species such as *Ageratina altissima, Amphicarpaea bracteata, Arisaema triphyllum, Actaea racemosa (= Cimicifuga racemosa), Collinsonia canadensis, Dennstaedtia punctilobula, Eupatorium purpureum, Laportea canadensis, Podophyllum peltatum, Solidago curtisii (= Solidago caesia var. curtisii), Thelypteris noveboracensis*, and *Viola sororia*. This community also supports TN-state critically imperiled *Melanthium virginicum* and GA-state imperiled *Stachys latidens* and *Triosteum aurantiacum*.

Global Vegetation: This association includes forests dominated by *Quercus alba*. Other species that can be important in the canopy include *Quercus rubra, Quercus coccinea, Quercus prinus, Quercus velutina, Carya glabra*, and *Carya alba*. On some sites, species more typical of "cove forests," such as *Fraxinus americana* or *Magnolia acuminata*, may form a very minor component. *Oxydendrum arboreum* and *Cornus florida* are common in the subcanopy. Heath species (*Rhododendron maximum* or *Kalmia latifolia*) are absent or very minor in the shrub stratum. On very high-base status soils, *Philadelphus hirsutus* or *Lindera benzoin* may be in the shrub stratum. Other woody species may include *Cercis canadensis, Viburnum acerifolium*, and *Ulmus alata*. The herbaceous stratum can be quite diverse and is characterized by mesic herbs and species associated with circumneutral soils, such as *Podophyllum peltatum, Arisaema triphyllum, Amphicarpaea bracteata, Adiantum pedatum, Collinsonia canadensis, Asplenium platyneuron, Actaea racemosa (= Cimicifuga racemosa), Caulophyllum thalictroides, Sanguinaria canadensis, Tradescantia subaspera, Euphorbia purpurea, Phegopteris hexagonoptera, Polystichum acrostichoides, Athyrium filix-femina ssp. asplenioides, Brachyelytrum erectum, Dennstaedtia punctilobula*, and *Dryopteris intermedia*. A stand included here from Chilhowee Mountain in the Cherokee National Forest also includes *Ageratina altissima var. altissima, Arabis canadensis, Aristolochia serpentaria, Asplenium platyneuron, Desmodium nudiflorum, Hepatica nobilis var. obtusa, Monarda fistulosa, Sanicula canadensis, Scutellaria elliptica, Silene stellata, Smallanthus uvedalius, Solidago curtisii (= Solidago lancifolia), Solidago simplex var. spathulata (= Solidago spathulata), Spigelia marilandica, Tradescantia subaspera*, and *Uvularia perfoliata*.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (17-May-2002). This montane oak-hickory forest is naturally limited to richer sites in the Southern Blue Ridge mountains and adjacent inner Piedmont. Later successional, unaltered occurrences are rare. Some stands have been impacted by removal of more valuable timber species (e.g., *Quercus alba*, other *Quercus* species) and the loss of herbaceous species diversity from the disturbance effects of logging.

RELATED CONCEPTS

Global Similar Types:

- *Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava - Acer saccharum / (Magnolia tripetala)* Forest (CEGL005222) is a mixed mesophytic forest of rich coves and lower slopes; lacks a significant oak component.
- *Quercus alba - Quercus rubra - Carya ovalis / Acer saccharum / Polystichum acrostichoides* Forest (CEGL007233) occurs at lower elevations, primarily in the Cumberlands and Southern Ridge and Valley; contains numerous low-elevation species absent from CEGL007692.
- *Quercus rubra - Acer rubrum / Pyrularia pubera / Thelypteris noveboracensis* Forest (CEGL006192) is a more acidic, montane oak forest.
- *Quercus rubra - Carya ovata - Fraxinus americana / Actaea racemosa - Hydrophyllum virginianum* Forest (CEGL008518) is similar but more northern in distribution; could be considered the Central Appalachian analogue of CEGL007692.
- *Quercus rubra - Tilia americana var. heterophylla - (Halesia tetraptera var. monticola) / Collinsonia canadensis - Prosartes lanuginosa* Forest (CEGL007878) is strongly dominated by *Quercus rubra* and is typically associated with middle-slope sites with high surficial rock cover.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Southern Appalachian montane oak-hickory forests that have a lush cover of mesophytic forbs. This association intergrades with higher-elevation oak forests.
Global Classification Comments: This association was originally defined based on occurrence information in the North Carolina Blue Ridge. More information is needed to better describe and define this association and its geographic distribution. Additional data on apparent occurrences have been collected in the Chattahoochee and

Cherokee national forests. In a regional analysis for the Appalachian Trail project and a follow-up comparative analysis with *Quercus rubra - Tilia americana var. heterophylla - Halesia tetraptera var. monticola / Collinsonia canadensis - Tradescantia subaspera* Forest (CEGL007878), 31 plots from Georgia, North Carolina, and Tennessee were classified as this type (Fleming and Patterson 2009a). The most constant and abundant species in these plots are *Quercus alba, Quercus rubra, Carya glabra, Liriodendron tulipifera, Acer rubrum, Fraxinus americana, Betula lenta, Magnolia acuminata, Castanea dentata, Cornus florida, Toxicodendron radicans, Smilax rotundifolia, Collinsonia canadensis, Actaea racemosa, Amphicarpaea bracteata, Maianthemum racemosum ssp. racemosum, Solidago curtisii, Polystichum acrostichoides, Eurybia divaricata*, and *Desmodium nudiflorum*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is found south of the Roanoke River in the Southern Appalachians. It was sampled on Chattahoochee National Forest and elsewhere in Georgia, North Carolina and Tennessee.
Global Range: This community occurs in the Southern Blue Ridge and adjacent inner Piedmont of the Carolinas, Georgia, and Tennessee in the eastern United States.

[CEGL006192] *Quercus rubra - Acer rubrum / Pyrularia pubera / Thelypteris noveboracensis* Forest

Translated Name: **Northern Red Oak - Red Maple / Buffalo-nut / New York Fern Forest**
Common Name: **Appalachian Montane Oak - Hickory Forest (Red Oak Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Southern & South-Central Oak - Pine Forest & Woodland (M016)
Group	Piedmont-Central Atlantic Coastal Plain Oak Forest (G165)
Alliance	*Quercus rubra* - *Quercus alba* - *Carya* spp. Piedmont Forest Alliance (A3293)

ELEMENT CONCEPT

Global Summary: This association includes *Quercus rubra* forests at intermediate elevations (mostly below 1067 m [3500 feet], ranging from 610-1220 m [2000-4000 feet]) occurring in the Southern Blue Ridge Escarpment, the Smoky Mountains and the Southern Blue Ridge. It may possibly range into adjacent areas of the Cumberland Plateau. These forests occur on mostly northern to eastern and southeastern, mid to upper, moderately steep slopes of intermediate exposure over acidic soils. The canopy is dominated by *Quercus rubra*, often with other oaks and

Acer rubrum and/or *Liriodendron tulipifera* codominating. Other minor canopy species may include *Betula lenta, Carya alba, Carya glabra, Halesia tetraptera, Quercus alba, Quercus prinus*, and *Magnolia fraseri*. In some examples, hickories are sparse or absent. The subcanopy and sapling strata include the canopy species, as well as *Halesia tetraptera, Betula lenta, Tsuga canadensis, Cornus florida, Acer pensylvanicum*, and *Oxydendrum arboreum*. The shrub stratum is typically sparse but may have local dominance by *Gaylussacia ursina* or *Rhododendron maximum*. Herbaceous cover is sparse to moderate but can be species-rich. Ferns can be locally dominant, typically *Thelypteris noveboracensis* and *Athyrium filix-femina ssp. asplenioides*. This forest is distinguished from High Elevation Red Oak forests[see associations in *Quercus rubra - Quercus alba* Montane Forest Alliance (A3116)] by lack of species such as *Betula alleghaniensis, Ilex montana, Vaccinium simulatum*, and by lacking abundant *Hamamelis virginiana*, as well as its occurrence at generally lower elevations. It is also characterized by having a more mixed oak composition (versus nearly monospecific *Quercus rubra*). In the Southern Blue Ridge Escarpment region, these montane oak-hickory forests seem to occupy environments intermediate between more-protected forests dominated by *Quercus alba* and drier more-exposed *Quercus prinus* forests.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This oak-hickory forest is found below 1,220 m (4,000 feet) elevation on somewhat steep mid to upper slopes with any aspect. Soils are mesic, well-drained loam, silt loam and sandy loam. The unvegetated surface is dominated by leaf litter with some downed wood. No evidence of disturbance was reported.

Global Environment: This association includes *Quercus rubra* forests at intermediate elevations (mostly below 1065 m [3500 feet], ranging from 610-1220 m [2000-4000 feet]) in the Southern Blue Ridge Escarpment to the Cumberlands and Southern Ridge and Valley (455-1005 m [1500-3300 feet]), the Smoky Mountains and the Southern Blue Ridge, and may possibly range into adjacent areas of the Cumberland Plateau. These forests occur on mostly northern to eastern and southeastern, mid to upper, moderately steep slopes of intermediate exposure over acidic soils. In the Southern Blue Ridge Escarpment region, these montane oak - hickory forests seem to occupy environments intermediate between more protected forests dominated by *Quercus alba* and drier, more exposed *Quercus prinus* forests.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by *Quercus rubra* and may include *Acer rubrum, Carya ovalis, Carya ovata, Liriodendron tulipifera, Quercus alba*, and *Quercus prinus*. Shrubs are sparse by may include *Magnolia acuminata, Pyrularia pubera*, and *Gaylussacia ursina*. The sparse to moderate herb layer is often dominated by ferns, including *Dennstaedtia punctilobula, Polystichum acrostichoides*, and *Thelypteris noveboracensis*. This community also supports NC-state imperiled *Eupatorium steelei* and TN-state imperiled *Brachyelytrum septentrionale*.

Global Vegetation: The canopy is dominated by *Quercus rubra*, often with other oaks and *Acer rubrum* and/or *Liriodendron tulipifera* codominating. Other minor canopy species may include *Betula lenta, Carya alba, Carya glabra, Halesia tetraptera, Quercus prinus*, and *Magnolia fraseri*. In some examples, hickories are sparse or absent. The subcanopy and sapling strata include the canopy species, as well as *Halesia tetraptera, Quercus alba, Betula lenta, Tsuga canadensis, Cornus florida, Acer pensylvanicum*, and *Oxydendrum arboreum*. The shrub stratum is typically sparse but may have local dominance by *Gaylussacia ursina* or *Rhododendron maximum*. Other typical species in the shrub stratum include *Castanea dentata, Calycanthus floridus, Pyrularia pubera, Rhododendron calendulaceum, Vaccinium corymbosum*, and *Viburnum acerifolium*. In the northernmost range of this association (northwestern North Carolina), *Calycanthus floridus* and *Gaylussacia ursina* are usually absent from the shrub layer. Herbaceous cover is sparse to moderate but can be species rich. Ferns can be locally dominant, typically *Thelypteris noveboracensis* and *Athyrium filix-femina ssp. asplenioides*. Other typical species include *Eurybia divaricata (= Aster divaricatus), Carex* spp. (e.g., *Carex aestivalis, Carex debilis, Carex digitalis, Carex laxiflora var. laxiflora, Carex pensylvanica), Chimaphila maculata (= var. maculata), Desmodium nudiflorum, Dioscorea quaternata, Eupatorium purpureum, Galium latifolium, Galax urceolata, Goodyera pubescens, Houstonia purpurea var. purpurea, Lysimachia quadrifolia, Maianthemum racemosum ssp. racemosum, Medeola virginiana, Polygonatum biflorum, Polystichum acrostichoides, Solidago curtisii (= Solidago caesia var. curtisii)*, and *Uvularia puberula*. Common vines are *Smilax rotundifolia, Smilax glauca*, and *Vitis aestivalis*.

Global: *Calycanthus floridus*, *Pyrularia pubera*, *Quercus rubra*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Brachyelytrum aristosum* (G5, TN state-imperiled), *Castanea dentata* (G4, TN state-imperiled), *Eupatorium steelei* (G4, NC state-imperiled)
Global: Vulnerable Plants: *Tsuga caroliniana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (3-Jan-2000). This community is uncommon but secure within its range. It is often overlooked in surveys or not recognized as distinct, thus it is much more common than the number of documented occurrences suggests. Resolution of taxonomic issues that distinguish this community from similar associations may lead to a range extension.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest (CEGL007230) contains more than 50% *Quercus alba* in the canopy.
- *Quercus alba - Quercus rubra - Quercus prinus / Collinsonia canadensis - Podophyllum peltatum* Forest (CEGL007692) is usually dominated by *Quercus rubra, Quercus alba, Quercus velutina*, and/or *Carya* spp. but is generally not very high in fern cover and generally more diverse than CEGL006192.
- *Quercus rubra - Quercus prinus - Magnolia (acuminata, fraseri) / Acer pensylvanicum* Forest (CEGL004817) occurs in the northern part of the Southern Appalachians and is a mixed red oak - chestnut oak forest; is otherwise similar to CEGL006192 and could be considered a northern analogue of it.
- *Quercus rubra / (Vaccinium simulatum, Rhododendron calendulaceum) / (Dennstaedtia punctilobula, Thelypteris noveboracensis)* Forest (CEGL007300) is a high-elevation forest.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This community is much less species-rich than Appalachian Montane Oak - Hickory Forest (Rich Type) (CEGL007692). This group represents more-or-less mesic *Quercus rubra*-dominated forests occurring at elevations lower than high-elevation red oak types, from about 600 to 1,200 m (2,100-4,000 feet). It appears to be confined to the southern part of the Southern Appalachians, where high rainfall and microclimatic conditions may favor the dispersal of *Quercus rubra* forests to lower elevations than further north. This type is absent from southwestern Virginia, where similar red oak - chestnut oak vegetation occupies a comparable environmental niche.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: The NVC global description attributes this association to a large geographic area and says it is often overlooked and much more common than documented occurrences suggest. The association seems uncommon along and near the AT.
Global Classification Comments: This association was originally defined from the Chattooga Basin Project (S. Simon pers. comm.) and later refined with information from the Great Smoky Mountains. Global name and concept may need revision as more information becomes available. This association may be a subset of the more broadly defined *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest (CEGL007230) but is distinguished by the dominance of *Quercus rubra*, its generally protected topographic setting, and may represent areas formerly dominated by *Quercus rubra* and *Castanea dentata*.

In a Southern Appalachian regional analysis (1134 plots) for the Appalachian Trail project, only nine North Carolina and Tennessee plots were classified as this type (Fleming and Patterson 2009a). This analysis confirms that this type does not reach Virginia, and suggests that its range is concentrated in the higher, more southern part of the Southern Appalachians (Great Smoky Mountains and Nantahala Mountains), where high rainfall and microclimatic conditions may favor the dispersal of *Quercus rubra* forests to lower elevations than further north. The most constant and abundant species in these plots are *Quercus rubra, Acer rubrum, Dioscorea quaternata, Thelypteris noveboracensis, Carya glabra, Acer pensylvanicum, Oxydendrum arboreum, Smilax rotundifolia, Gaylussacia ursina, Halesia tetraptera var. monticola, Rhododendron calendulaceum*, and *Castanea dentata*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled in the Great Smoky Mountains and Nantahala Mountains; it appears to be rather rare in the AT corridor.
Global Range: This association is found in the Southern Blue Ridge Escarpment and Cumberlands/Southern Ridge and Valley, the Smoky Mountains and the Southern Blue Ridge, and may possibly range into adjacent areas of the Cumberland Plateau.

G012. SHORTLEAF PINE - OAK FOREST & WOODLAND

Group Summary Description: This group encompasses forests and woodlands of the interior plateaus, Appalachians, Piedmont, Ozark-Ouachita, and upper coastal plain regions (north of the primary range of *Pinus palustris* in the coastal plains) in which *Pinus echinata* is the canopy dominant (or at least an important component). Examples can occur on a variety of topographic and landscape positions, including ridgetops, upper and midslopes, as well as lower elevations (generally below 700 m [2300 feet]) in the Southern Appalachians such as mountain valleys, as well as on rolling uplands in the Upper East Gulf Coastal Plain. Examples occur on a variety of acidic soils or bedrock types. Stands may be codominated by *Quercus* spp., *Carya* spp., and other hardwoods, with the varying proportion of pine versus hardwood depending on management (both commercial forestry and ecological management), particularly time since fire. Although examples of this group occur throughout this broad area, there is considerable local variation in their extent in the landscape and in their structure and composition. In more open

stands (such as ones in naturally drier regions or ones which have experienced more recent/frequent fire), the understory is characterized by *Andropogon gerardii, Schizachyrium scoparium*, and other prairie graminoid elements. In the lower elevations of the Southern Appalachians, and under current conditions, stands are dominated by *Pinus echinata* or *Pinus virginiana*. *Pinus rigida* may sometimes be present. Stands found outside of the coastal plains in which *Pinus palustris* is a component are also included here. Hardwoods are sometimes abundant, especially dry-site oaks such as *Quercus falcata, Quercus prinus, Quercus stellata*, and *Quercus coccinea*, but also *Carya glabra* and other hickories. The shrub layer may be well-developed, with *Vaccinium pallidum, Gaylussacia baccata*, or other acid-tolerant species being most characteristic. Herbs are usually sparse but may include *Pityopsis graminifolia* and *Tephrosia virginiana*. There is some regional variation in composition across the range of this group, with examples in the Ozark-Ouachita area and the upper coastal plain lacking *Pinus rigida, Pinus virginiana*, and *Quercus prinus*. In the upper coastal plains, where fire is more frequent, stands of vegetation affiliated with this group may develop a relatively pure and open canopy of *Pinus echinata* with scattered overstory trees and an herbaceous-dominated understory, but such examples are rare on the modern landscape unless maintained by ecological management. More typical are examples in which *Quercus* spp., *Carya* spp., *Liquidambar styraciflua, Liriodendron tulipifera, Acer* spp., and *Nyssa sylvatica* have become prominent in the midstory and overstory and in which herbaceous patches are rare.

A3269 *Pinus echinata - Pinus pungens - Quercus prinus* Appalachian Woodland Alliance

Alliance Summary Description: This Appalachian shortleaf pine - oak forest alliance is found in the Southern Blue Ridge and adjacent regions, including the Piedmont, Ridge and Valley, Central Appalachians and the Interior Low Plateau from Alabama and Georgia north and east to Kentucky, Virginia, the Carolinas, and possibly West Virginia. Stands of this alliance are typically dominated by *Pinus echinata* with dry-site oaks and other hardwoods. The typical oaks include *Quercus coccinea, Quercus prinus, Quercus stellata*, and/or *Quercus velutina*. Some stands may contain *Quercus falcata*. Other hardwoods may include *Acer rubrum, Carya glabra, Carya pallida, Cornus florida, Ilex opaca var. opaca, Nyssa sylvatica*, and/or *Oxydendrum arboreum*. The shrub layer is typically dominated by *Vaccinium pallidum*. Other shrubs include *Castanea pumila, Gaylussacia baccata, Gaylussacia ursina, Kalmia latifolia, Rhododendron calendulaceum, Rhododendron minus, Vaccinium arboreum*, and *Vaccinium stamineum*. The most frequent native grasses are *Danthonia spicata, Piptochaetium avenaceum*, and *Schizachyrium scoparium*. Typical forbs include *Antennaria plantaginifolia, Coreopsis major, Helianthus microcephalus, Pityopsis graminifolia var. latifolia, Symphyotrichum concolor*, and *Symphyotrichum patens*. These forests typically occur on exposed, rocky ridges and upper, convex slopes, as well as more protected sites. Species composition varies with bedrock geology, aspect, and degree of exposure.

[CEGL008500] *Pinus virginiana - (Pinus rigida, Pinus pungens) / Schizachyrium scoparium* Forest

Translated Name: **Virginia Pine - (Pitch Pine, Table Mountain Pine) / Little Bluestem Forest**
Common Name: **Appalachian Low-Elevation Mixed Pine / Little Bluestem Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Southern & South-Central Oak - Pine Forest & Woodland (M016)
Group	Shortleaf Pine - Oak Forest & Woodland (G012)
Alliance	*Pinus echinata - Pinus pungens - Quercus prinus* Appalachian Woodland Alliance (A3269)

Element Concept

Global Summary: This community includes primarily *Pinus virginiana*-dominated vegetation of low-elevation ridges and steep slopes, occurring in the transition zone between the Southern Blue Ridge and Piedmont / Cumberlands and Southern Ridge and Valley, from eastern Tennessee, western North Carolina, western South Carolina and northern Georgia. It occurs on thin soils over a variety of rocky substrates, including quartzite, sandstone, phyllite, and others. The canopy varies from open to closed and may be solely dominated by *Pinus virginiana* or in some cases *Pinus rigida*, or an admixture of other species, including *Pinus pungens, Pinus echinata, Pinus rigida, Quercus coccinea, Quercus prinus*, and *Quercus velutina*. An open midstory of often stunted hardwoods, including *Quercus marilandica, Quercus falcata, Oxydendrum arboreum*, and *Acer rubrum*, may also be present. The open shrub layer typically includes *Vaccinium pallidum* and may include other members of the

Ericaceae, including *Vaccinium arboreum, Vaccinium stamineum, Gaylussacia dumosa, Kalmia latifolia, Vaccinium hirsutum, Gaultheria procumbens*, and *Epigaea repens*. The structure of the herbaceous layer is variable, but may provide up to 75% cover. It is dominated by *Schizachyrium scoparium*. Other characteristic herbaceous components include *Clitoria mariana, Coreopsis major, Dichanthelium commutatum, Eurybia surculosa, Sericocarpus asteroides, Sericocarpus linifolius, Silphium compositum, Solidago odora, Solidago speciosa, Sorghastrum nutans*, and *Tephrosia virginiana*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This rare, dry, acidic mixed pine-oak woodland was sampled at four locations in the park and is found below 610 m (2,000 feet) elevation. Sites range from somewhat steep to very steep slopes and rock outcrops with mostly southern aspects. Soils are shallow, very dry, well-drained sandy loam occurring on various acidic sedimentary rocks (but not shale). The unvegetated surface consists of large and small rocks, exposed bedrock and usually has a dense needle litter layer along with downed wood and bare soil. No evidence of disturbance was reported. These exposed sites are subject to wind and ice damage.

Global Environment: Stands of this forest occur on low-elevation ridges, steep slopes, and other exposed sites along the transition between the Southern Blue Ridge and Piedmont / Cumberlands and Southern Ridge and Valley, from eastern Tennessee, western North Carolina, western South Carolina and northern Georgia. They are found on thin soils over a variety of rocky substrates including quartzite, sandstone, phyllite, and others.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy and subcanopy are primarily dominated by *Pinus virginiana* but may be made up of a mix of various pines and oaks, including *Pinus rigida, Pinus pungens, Pinus echinata, Pinus strobus, Quercus coccinea, Quercus falcata, Quercus prinus*, and/or *Quercus rubra*. The shrub layers are dominated by *Kalmia latifolia, Vaccinium pallidum*, and *Vaccinium stamineum*. Dry woodland herbs include species such as *Schizachyrium scoparium, Solidago odora, Tephrosia virginiana, Chimaphila maculata, Coreopsis major, Galax urceolata, Gaultheria procumbens, Hieracium venosum, Houstonia longifolia*, and *Pityopsis graminifolia var. latifolia*.

Global Vegetation: The canopy varies from open to closed and may be solely dominated by *Pinus virginiana* or *Pinus rigida* or an admixture of other species, including *Pinus pungens, Pinus echinata, Pinus rigida, Quercus coccinea, Quercus prinus*, and *Quercus velutina*. An open midstory of often stunted hardwoods, including *Quercus marilandica, Quercus falcata, Oxydendrum arboreum*, and *Acer rubrum*, may also be present. The open shrub layer typically includes *Vaccinium pallidum* and may include other members of the Ericaceae, such as *Vaccinium arboreum, Vaccinium stamineum, Gaylussacia dumosa, Kalmia latifolia, Vaccinium hirsutum, Gaultheria procumbens*, and *Epigaea repens*. The structure of the herbaceous layer is variable but may provide up to 75% cover. It is dominated by *Schizachyrium scoparium*. Other characteristic herbaceous components include *Clitoria mariana, Coreopsis major, Dichanthelium commutatum, Eurybia surculosa, Sericocarpus asteroides, Sericocarpus linifolius, Silphium compositum, Solidago odora, Solidago speciosa, Sorghastrum nutans*, and *Tephrosia virginiana*.

Global Dynamics: The open canopy and diverse understory of this community can be the result of management, edaphic factors, or natural disturbances. While *Pinus virginiana* is a fire-intolerant species, many species found in examples of this community are fire-adapted or thrive in open, sunny habitats.

MOST ABUNDANT SPECIES

Herb (field)	Graminoid	*Schizachyrium scoparium*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Coreopsis major*, *Kalmia latifolia*, *Pinus virginiana*, *Vaccinium pallidum*, *Vaccinium stamineum*

Global:

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Euphorbia purpurea* (G3, Southern Blue Ridge endemic), *Selaginella tortipila* (G3, Southern Appalachian endemic), *Vaccinium hirsutum* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (3-Sep-2002). This xeric evergreen forest community is restricted to ridges, xeric slopes, and other sites with favorable conditions for pines. It will be maintained on sites where these local soil conditions, topographic extremes, or occasional fire function to retard hardwood invasion. Infestations of southern pine beetle (*Dendroctonus frontalis*) can cause mortality of canopy trees. The grass-dominated herbaceous layer may deteriorate without fire.

RELATED CONCEPTS

Global Similar Types:

- *Pinus virginiana - Pinus (rigida, echinata) - (Quercus prinus) / Vaccinium pallidum* Forest (CEGL007119)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: *Pinus virginiana* is a very fire-intolerant tree that would quickly be replaced by *Pinus rigida* and other fire-tolerant species under a regime of frequent fire.
Global Classification Comments: This community is described from the Chattahoochee and Cherokee national forests and along the Nantahala Gorge in Swain County, North Carolina. It is differentiated from the similar *Pinus virginiana - Pinus (rigida, echinata) - (Quercus prinus) / Vaccinium pallidum* Forest (CEGL007119) by the more open canopy and understory and the dense, grass-dominated herbaceous layer. In the Appalachian Trail project (Fleming and Patterson 2009a), these two associations emerged as distinct in ordination and cluster analysis. In the most typical examples of this association (e.g., CHER.17, CHAT.76, and 020-05-0362), over 50% of the total species composition is herbaceous plants.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled in Nantahala National Forest (Nantahala Gorge) and Pisgah National Forest (Lovers Leap), North Carolina. Examples are scattered in the southern part of the Southern Appalachians.
Global Range: This community occurs primarily in the transition zone between the Southern Blue Ridge and Piedmont / Cumberlands and Southern Ridge and Valley, from eastern Tennessee, western North Carolina, western South Carolina and northern Georgia.

Macrogroup	Southern & South-Central Oak - Pine Forest & Woodland (M016)
Group	Shortleaf Pine - Oak Forest & Woodland (G012)
Alliance	*Pinus echinata - Pinus pungens - Quercus prinus* Appalachian Woodland Alliance (A3269)

Element Concept

Global Summary: This community includes *Pinus virginiana*-dominated forests of low-elevation ridges and steep upper slopes, occurring primarily in the Appalachian provinces of the eastern United States, from southwestern Virginia, south and west to northern Georgia and northern Alabama. This community occurs on narrow ridges, steep slopes, and other topographic positions with high solar exposure, over shallow, infertile soils. This mainly evergreen forest is often of low stature, with a somewhat open to closed canopy, sparse to very dense shrub cover dominated by ericaceous species, and a sparse herb stratum. *Pinus virginiana* is the canopy dominant throughout the range of the type. In some parts of the range, other *Pinus* species may be significant canopy associates, as well as dry-site *Quercus* species (e.g., *Quercus prinus, Quercus coccinea*). Deciduous species may form a subcanopy or sapling stratum, particularly in areas where fire has been excluded. Common shrub dominants include *Vaccinium pallidum, Vaccinium stamineum, Gaylussacia baccata*, and *Kalmia latifolia*. Herbs vary with geography but are typical of infertile, xeric habitats. Some typical herbs in this forest are *Baptisia tinctoria, Chimaphila maculata, Dichanthelium commutatum, Epigaea repens, Euphorbia corollata, Galax urceolata, Gaultheria procumbens, Hypoxis hirsuta, Iris verna, Pityopsis graminifolia var. latifolia, Pteridium aquilinum var. latiusculum*, and *Schizachyrium scoparium*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This low-elevation mixed pitch pine - Virginia pine / blueberry forest occurs on narrow ridges and knobs, steep upper slopes, bluff and clifftops below 850 m (2,800 feet) elevation. It is found on less disturbed soils and with historic disturbance by fire or logging without plowing. It was sampled on a steep southwest-facing upper slope. The soil is a dry, well-drained sandy loam. The unvegetated surface is dominated by leaf litter with some exposed bedrock, large and small rocks, downed wood and bare soil. No evidence of disturbance was reported.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This dry, later-successional pine forest (disturbed more than 25 years ago) is typically found on various acidic sedimentary rocks, in edaphically stressful habitats below 610 m (2,000 feet) elevation. One site was sampled in the Southern Blue Ridge project area in North Carolina on a gentle south-facing midslope with dry, well-drained sandy loam soil. The unvegetated surface contains needle leaf litter with small amounts of exposed bedrock, large/small rocks and bare soil.

Global Environment: Stands of this forest occur on narrow ridges and knobs, steep upper slopes, bluff and cliff tops, and other exposed sites throughout the range of the type. The community is found primarily on south-, southeast- or southwest-facing aspects on excessively drained, shallow soils. In the Blue Ridge Escarpment region, the western margin of the Blue Ridge, and west into the Ridge and Valley and Cumberland Mountains, this xeric forest occurs on convex slopes and ridges below 850 m (2800 feet) elevation, over soils classed as Inceptisols, typically Lithic Dystrochrepts originating from sandstone, shale and other noncalcareous parent material. Occurrences in rugged parts of the western Piedmont are also likely. Its environmental situation in the western Alleghenies is not known. In the Interior Low Plateau of Kentucky, Tennessee, and Indiana, this association occurs in edaphically extreme situations, including bluff tops and narrow ridges in thin soils weathered from relatively acidic caprocks with southern and western aspects, as well as other similar slopes, over cherty limestone, siltstones, sandstones, and shales. In particular, in the Knobstone Escarpment Subsection (a few Indiana counties just north of Louisville, Kentucky), it occurs in gladelike situations on steep slopes with thin soils. Along the edges of cliff tops, there is usually a narrow zone of exposed bedrock pavement and patches of very shallow soil, but soils become progressively deeper back from the cliff edge. At least in West Virginia, portions of the stands along the cliff edge are likely to be edaphic climax communities, but farther back from the edge, they are likely to be successional following fire.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by *Pinus virginiana, Pinus rigida*, and/or *Pinus echinata* typically with *Quercus prinus*. *Acer rubrum, Nyssa sylvatica*, and *Sassafras albidum* occur in the subcanopy. *Vaccinium pallidum, Kalmia latifolia*, and *Gaylussacia baccata* dominate the low-shrub layer. Herbaceous cover is very sparse.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This dry pine forest is dominated primarily by *Pinus virginiana* with admixtures of *Pinus echinata* and/or *Pinus rigida*. Additional tree species may include *Quercus prinus, Acer rubrum, Nyssa sylvatica, Quercus alba*, and *Quercus velutina*. Ericaceous shrubs dominate, primarily *Vaccinium pallidum*, but can also include *Gaylussacia baccata, Gaylussacia ursina*, and *Kalmia latifolia*. There is very little herbaceous cover.

Global Vegetation: This community is a needle-leaved evergreen forest with a usually somewhat open (occasionally closed) canopy. The canopy is typically short (<20 m) with tree height and canopy cover decreasing with increasing severity of the microsite. A deciduous subcanopy may be present. The shrub layers can be sparse but are more often dense to very dense and are composed of tall and short shrubs, predominantly ericaceous species. Herb cover is sparse, and leaf litter often dominates the ground layer. *Pinus virginiana* is the canopy dominant throughout the range of the type. In the Southern Appalachians and Southern Ridge and Valley it may occur with mixes of *Pinus rigida, Pinus echinata*, or *Pinus strobus*. Within its range, *Pinus pungens* may be present as a very minor component. Regeneration of *Pinus virginiana* is concentrated along cliff edges and tends to drop off inward from the edge. Small stems of *Quercus prinus, Quercus coccinea, Acer rubrum, Nyssa sylvatica*, and *Oxydendrum arboreum* are common in the subcanopy and sapling strata and may occur in the canopy as well. In the Southern Blue Ridge/Piedmont and Southern Blue Ridge/Ridge and Valley transition regions, *Quercus marilandica, Quercus falcata*, and *Quercus stellata* can be deciduous components. Common shrub dominants include *Vaccinium pallidum, Vaccinium stamineum, Gaylussacia baccata*, and *Kalmia latifolia*. Other typical shrubs can include *Gaylussacia ursina, Kalmia latifolia, Sassafras albidum*, and *Vaccinium hirsutum* (southwestern North Carolina and southeastern Tennessee only). *Smilax glauca* and *Smilax rotundifolia* can be common vines. In the sparse herb layer, characteristic species from the Southern Blue Ridge and Southern Ridge and Valley include *Baptisia tinctoria, Chimaphila maculata, Dichanthelium commutatum, Danthonia spicata, Epigaea repens, Euphorbia corollata, Galax urceolata, Gaultheria procumbens, Hypoxis hirsuta, Iris verna, Pityopsis graminifolia var. latifolia, Pteridium aquilinum var. latiusculum*, and *Schizachyrium scoparium*. Typical herbs from examples in the western portion of the range (Interior Low Plateau) include *Antennaria plantaginifolia, Antennaria solitaria, Carex albicans var. albicans (= Carex artitecta), Danthonia spicata, Dichanthelium dichotomum, Lespedeza violacea (= Lespedeza intermedia), Hieracium gronovii, Hieracium venosum, Krigia biflora, Solidago erecta*, and *Tephrosia virginiana* (M. Homoya pers. comm. 1999). In some of these examples *Opuntia humifusa, Calamagrostis porteri ssp. insperata*, and *Solidago squarrosa* may occur locally. Nonvascular plants have not been documented rangewide; West Virginia examples have identified lichen species including *Cladonia caroliniana, Cladonia squamosa, Cladina rangiferina (= Cladonia rangiferina), Cladonia pyxidata, Umbilicaria mammulata, Lasallia papulosa, Lasallia pensylvanica, Xanthoparmelia plittii, Xanthoparmelia conspersa*, and *Flavoparmelia caperata*, and moss species including *Leucobryum glaucum, Leucobryum albidum, Polytrichum juniperinum, Dicranum scoparium, Dicranum spurium, Dicranum condensatum, Hypnum imponens*, and *Thuidium delicatulum*. In Indiana's Knobstone Escarpment, this community provides habitat for that state's only endemic vascular plant, *Penstemon deamii*.

Global Dynamics: This xeric, evergreen forest community will be maintained on sites where local soil conditions and topographic extremes function to retard hardwood invasion. Although *Pinus virginiana* can become established by seed following fire, the trees are thin-barked and are easily killed by fire. Repeated burning is likely to select for *Pinus rigida* at the expense of *Pinus virginiana*. Infestations of southern pine beetle (*Dendroctonus frontalis*) can cause mortality of canopy trees. Examples affected by southern pine beetle in the Great Smoky Mountains can have up to 80-90% standing dead pine. This forest is also susceptible to damage by fire and has been found to be particularly sensitive to ozone, which causes foliar damage of *Pinus virginiana* (Burns and Honkala 1990a).

This community may occur as early- to late-successional stands. On sites where local soil conditions or topographic extremes retard succession and maintain pine dominance indefinitely, this community is considered a topo-edaphic climax. Other occurrences may be successional to forests with mixed deciduous-evergreen canopies dominated by mixtures of *Pinus (pungens, rigida, virginiana, echinata)* and *Quercus (coccinea, prinus)* species.

Throughout most of its range, this community occurs as linear features along ridgetops and may be adjacent to or grade into xeric forests dominated by *Quercus coccinea* or *Quercus prinus* or more mesic forests dominated by *Quercus alba, Quercus rubra, Quercus velutina, Carya glabra*, and *Carya alba*. In the Interior Low Plateau, individual stands can be small in size, occurring in a matrix of *Quercus prinus* or *Quercus prinus - Quercus alba*

forest (e.g., *Quercus prinus / Smilax* spp. Forest (CEGL005022) or *Quercus prinus - Quercus (alba, coccinea) / Viburnum acerifolium - (Kalmia latifolia)* Forest (CEGL005023)), but in more edaphically extreme circumstances.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (20-May-2011). This xeric evergreen forest community will be maintained on sites where local soil conditions, topographic extremes, or occasional fire function to retard hardwood invasion. Although not rare (more than 300 occurrences rangewide are estimated), this vegetation is threatened by infestations of southern pine beetle (*Dendroctonus frontalis*) that can cause mortality of canopy trees. Examples affected by southern pine beetle in the Great Smoky Mountains can have up to 80-90% standing dead pine. Infestations are wide-ranging and include most of the range of this association, and with fire suppression, killed stands convert to different vegetation over time. This vegetation is also threatened by climate change because higher temperatures exacerbate southern pine beetle infestations.

RELATED CONCEPTS

Global Similar Types:

- *Pinus (pungens, rigida) - Quercus prinus / (Quercus ilicifolia) / Gaylussacia baccata* Woodland (CEGL004996)
- *Pinus echinata - Quercus prinus - Quercus (coccinea, velutina)* Forest (CEGL004761)
- *Pinus echinata* Ruderal Forest (CEGL006327)

- *Pinus virginiana - (Pinus rigida) - Nyssa sylvatica / Xanthorhiza simplicissima / Euphorbia corollata* Forest (CEGL006624)
- *Pinus virginiana - (Pinus rigida, Pinus pungens) / Schizachyrium scoparium* Forest (CEGL008500) has a more open structure with relatively well-developed herbaceous stratum, often graminoid-dominated.
- *Pinus virginiana - Quercus falcata - Carya pallida* Forest (CEGL006354)
- *Pinus virginiana / Quercus marilandica* Serpentine Ruderal Forest (CEGL006266)
- *Pinus virginiana* Ruderal Forest (CEGL002591) is distinguished from this community by differences in land-use history; CEGL002591 exists in flat to moderately sloping land that was heavily plowed in the recent past (10-60 years), whereas this community is generally a product of less disturbed soils and more historic disturbance by fire or logging without plowing.
- *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271)
- *Quercus prinus - Quercus (alba, coccinea) / Viburnum acerifolium - (Kalmia latifolia)* Forest (CEGL005023)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: See Global Comments.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This dry pine forest has a closed canopy with a more diverse structure and species composition than other pine communities.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: *Pinus virginiana* is a very fire-intolerant tree that would quickly be replaced by *Pinus rigida* and other fire-tolerant species under a regime of frequent fire.
Global Classification Comments: In Indiana examples, the substrate is primarily a matrix of acidic siltstone, shale, and sandstone. Rarely are cliffs formed; instead the setting is mostly very steep slopes with high hills and deep ravines. This association also includes vegetation from the transition between the Cumberland Plateau / Southern Ridge and Valley and the Upper East Gulf Coastal Plain in Alabama. Though located in the Coastal Plain, these occurrences are physiographically and floristically similar to this montane association. Related vegetation in Virginia has been treated as several associations within the Central Appalachian Shale Barren and Mountain / Piedmont Acidic Woodlands ecological groups (Fleming and Patterson 2011a).

Early-successional vegetation associated with old fields, old pastures, clearcuts, and burned or eroded areas and dominated by *Pinus virginiana* is classified as *Pinus virginiana* Ruderal Forest (CEGL002591). Appalachian xeric oak forests with similar floristics, but with a mainly deciduous canopy, are classed in *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271). Appalachian shale forests and woodlands with *Pinus virginiana* occur on steep, shaley slopes and have stunted canopies and sparse herb and shrub strata, characterized by species adapted to shaley substrates. These shale communities are classed in *Pinus virginiana - Quercus prinus* Acidic Shale Woodland Alliance (A3312). In 13 plots from the Southern Blue Ridge, species with ≥54% constancy and at least 10% mean cover are *Pinus virginiana, Vaccinium pallidum, Quercus prinus, Oxydendrum arboreum, Acer rubrum, Quercus coccinea, Nyssa sylvatica, Pinus rigida, Gaylussacia baccata*, and *Gaylussacia ursina*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from southwestern Virginia, south and west through the Ridge and Valley, Blue Ridge, and Cumberland Plateau to northern Georgia and Alabama. It was sampled in the Frogtown area of Clarke County, Virginia.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Xeric pine forest ranging throughout the Southern Appalachians and parts of the Central Appalachians, Interior Low Plateau, and Piedmont. This community was sampled at Tyre Knob in Nantahala National Forest, North Carolina.
Global Range: This community occurs primarily in the Appalachian region of the United States, ranging from southwestern Virginia, south and west through the Ridge and Valley, Blue Ridge, and Cumberland Plateau to northern Georgia and Alabama, extending westward to scattered areas in the Interior Low Plateau and eastward into the upper Piedmont. It is recorded from the states of Georgia, North Carolina, South Carolina, Tennessee, Kentucky, Pennsylvania, Indiana, Ohio, Maryland, and West Virginia.

G159. SOUTH-CENTRAL INTERIOR OAK FOREST & WOODLAND

Group Summary Description: This group represents the dry-mesic hardwood forests that cover much of the landscape in a band of unglaciated terrain, between about 34°N latitude and 38°N latitude, extending west of the Appalachians, including the unglaciated part of the Interior Low Plateau, the Upper East Gulf Coastal Plain and Crowley's Ridge, and extending into the Ozarks and Ouachitas of Arkansas, Missouri and Oklahoma. A number of different *Quercus* species (including *Quercus alba, Quercus rubra, Quercus falcata, Quercus velutina* or *Quercus stellata, Quercus marilandica*, and *Quercus coccinea*) may dominate stands of this group, with *Carya* species also prominent, including *Carya alba, Carya glabra, Carya ovata, Carya pallida*, and others. East of the Mississippi River, in some drier examples on more acidic substrates, *Quercus prinus* is typical, reflecting relations with similar Appalachian forest groups further to the east. *Quercus alba* may also be present but not necessarily dominant, but will typically exhibit dominance in the submesic to dry-mesic examples, possibly with *Quercus falcata* and/or *Quercus velutina*. In addition, *Quercus coccinea, Quercus marilandica*, and/or *Quercus stellata* will also share dominance or be prominent in many of the drier examples. *Quercus muehlenbergii, Quercus pagoda*, and/or *Quercus shumardii* may appear in examples with high base status. Under current conditions, the understories are typically shrub- and small tree-dominated, with the typical species varying with aspect, soil, and moisture relations. More open canopies and grass-dominated understories may have been more prevalent prior to the mid-twentieth century, when open grazing and surface fires were more common. In the Interior Low Plateaus, the range of this group is generally consistent with the "Western Mesophytic" Forest region of Braun (1950), Keever (1971), and Greller (1988). Examples are typically found along ridgetops and slopes of various aspects. The floristic expression of different associations included in this group varies considerably with aspect and soil type. The associations range

along a moisture gradient from submesic to dry. The submesic to dry-mesic expressions tend to be found on mid slopes with northerly to easterly aspects, and the dry expressions on southerly to westerly aspects and on narrow ridges. Parent material can range from calcareous to acidic with very shallow, well- to excessively well-drained soils in the dry expressions and moderately well-drained soils in the submesic to dry-mesic ones. The canopy closure of this group ranges from closed to somewhat open in the dry examples. On Crowley's Ridge, the vegetation is very distinctive from that of the adjacent alluvial plain, and the sites occur on distinct slopes that rise above the alluvial plain surface. Occurrences of this group generally comprise dry-mesic forests that occupy west-facing slopes and narrow, "finger" ridgetops in a highly dissected landscape. Historically, these examples may have been more open under conditions of more frequent fire. In the Ozarks and Ouachitas, soils are typically moderately to well-drained and more fertile than those associated with oak woodlands. Wind, drought, lightning, and occasional fires can influence vegetation of this group.

A3289 *Quercus prinus - Quercus falcata* Forest Alliance

Alliance Summary Description: These are dry-mesic to mesic forests dominated or codominated by *Quercus prinus* with other *Quercus* species, found in a broad band from the Chesapeake Bay region, through the southern Piedmont of the Carolinas and Georgia, the Cumberlands/Ridge and Valley of Tennessee, Kentucky, and Alabama, and the Interior Low Plateau of Illinois, Indiana, and Ohio, marginally ranging into the adjacent Gulf Coastal Plain. *Quercus prinus* is typically the leading dominant in these forests, but other common canopy species can include *Acer rubrum, Carya alba, Carya glabra, Carya ovalis, Carya ovata, Carya pallida, Fagus grandifolia, Liriodendron tulipifera, Nyssa sylvatica, Pinus strobus, Quercus alba, Quercus coccinea, Quercus falcata, Quercus rubra*, and *Quercus velutina*. The subcanopy often contains *Cornus florida* and *Oxydendrum arboreum*. The ground flora varies depending on available light, moisture and soil nutrients but can be quite diverse, especially in associations with sparse shrub cover. In the Cumberland Plateau and other areas, forests in this alliance have replaced forests once dominated by *Castanea dentata* and often have chestnut sprouts in the understory. This represents the southern portion of the range of *Quercus prinus* exclusive of the Southern Blue Ridge region. Stands found within that region are only known from lower elevations (760-1035 m [2500-3400 feet]), on moderately sheltered low ridges and slopes, flats and valleys. Stands of this alliance are generally known from upper slopes, draws and gorge slopes in the Cumberland Plateau, and from upper to middle, dry-mesic slopes in the Piedmont. Some associations at least apparently occur on mafic or circumneutral substrates.

[CEGL007720] *Quercus prinus - Juniperus virginiana - (Pinus virginiana) / Philadelphus hirsutus - Celtis occidentalis* Woodland

Translated Name: **Chestnut Oak - Eastern Red-cedar - (Virginia Pine) / Streambank Mock Orange - Common Hackberry**
Woodland
Common Name: **Blue Ridge Calcareous Shale Slope Woodland**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Southern & South-Central Oak - Pine Forest & Woodland (M016)
Group	South-Central Interior Oak Forest & Woodland (G159)
Alliance	*Quercus prinus - Quercus falcata* Forest Alliance (A3289)

ELEMENT CONCEPT

Global Summary: These mixed or deciduous, edaphically-maintained woodlands are known from the Southern Blue Ridge of North Carolina, Tennessee, and Virginia, possibly ranging into the adjacent Ridge and Valley and Cumberland Mountains. They occur as small-patch openings on steep slopes, below 915 m (3000 feet) elevation, over outcrops of moderately calcareous shales, siltstones and sandstones. Habitats are extremely steep and rocky, with some parts mantled by thin soil over bedrock, and other parts covered by loose gravel-sized shale fragments. Trees are sparse and stunted, generally 2-10 m tall. Primary species include *Quercus prinus, Juniperus virginiana var. virginiana, Pinus virginiana*, and *Acer rubrum*. Some stands have *Carya glabra, Carya ovata, Carya carolinae-septentrionalis, Fraxinus americana, Quercus rubra, Ulmus alata*, and *Acer saccharum* as important canopy associates. Shrubs include *Philadelphus hirsutus, Ostrya virginiana, Cercis canadensis var. canadensis, Celtis occidentalis, Celtis tenuifolia, Acer leucoderme, Cornus florida, Staphylea trifolia, Chionanthus virginicus, Ulmus rubra, Ptelea trifoliata, Symphoricarpos orbiculatus*, and *Rhus copallinum var. latifolia*. *Toxicodendron radicans*

ssp. radicans and *Parthenocissus quinquefolia* are common scrambling vines. Herbs include *Sedum ternatum, Solidago* spp., *Danthonia sericea, Danthonia spicata, Andropogon virginicus, Carex pensylvanica, Paronychia argyrocoma, Selaginella rupestris, Houstonia longifolia (= var. compacta), Amsonia tabernaemontana, Dichanthelium boscii, Muhlenbergia tenuifolia, Packera obovata (= Senecio obovatus), Asclepias quadrifolia, Erigeron pulchellus, Polygala paucifolia, Arabis laevigata, Campanula divaricata*, and *Aristolochia serpentaria*. Some openings are very grassy and include species such as *Sorghastrum nutans, Andropogon gerardii, Muhlenbergia capillaris, Panicum* sp., *Coreopsis major, Baptisia tinctoria, Lechea racemulosa, Liatris* sp., and *Penstemon* sp. Additional herbs from stands assigned here from the Ocoee River Gorge (Tennessee) include *Chasmanthium latifolium, Solidago sphacelata, Carex purpurifera*, and *Symphyotrichum oblongifolium (= Aster oblongifolius)* (these dominant to frequent), as well as *Asplenium platyneuron, Carex laxiflora, Carex pensylvanica, Cheilanthes lanosa, Dichanthelium* sp., *Euphorbia corollata, Geum* sp., *Heuchera* sp., *Oxalis grandis, Rudbeckia triloba, Sedum nevii, Senna marilandica, Tradescantia* sp., *Verbesina occidentalis*, and *Verbesina virginica*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This small-patch, rocky chestnut oak woodland generally occurs on calcareous shale at middle to lower elevations below 1,220 m (4,000 feet) (but rarely up to 1,340 m [4,400 feet]). The sampled site is a somewhat steep, north-facing upper slope with well-drained soil. The unvegetated surface is dominated by leaf litter with large rocks. Evidence of disturbance includes wind/ice damage from its exposed position.

Global Environment: This community is associated with steep slopes of the Southern Blue Ridge, below 915 m (3000 feet) elevation, over outcrops of moderately calcareous shales, siltstones and sandstones. Habitats are extremely steep and rocky, with some parts mantled by thin soil over bedrock, and other parts covered by loose gravel-sized shale fragments. Known stands are located on slopes fronting rivers and large streams, where downcutting over geological time has resulted in continual mass-wasting of the relatively soft shales. Quantitative soil chemistry data are not available, but the presence of some obligate nutrient-demanding species (e.g., *Philadelphus hirsutus, Acer leucoderme, Packera obovata, Solidago sphacelata*) and a conspicuous absence of ericaceous shrubs at every site is indicative of at least moderately calcareous soils. At the Virginia site, on a steep, southwest-facing sideslope along Whitetop Laurel Creek, calciphilic species tend to be concentrated on the lower, more erosive soils of the occurrence, and less common on more stable, upper slopes where bases have probably been leached. Bedrock is mapped as the Unicoi Formation, which here consists of conglomeratic sandstone and phyllite, with minor interbedded basalt. Numerous shaley-appearing outcrops and loose boulders cover about 50% of the slope where this community occurs. About 30% of the remaining surface substrate consists of exposed, dark-colored, clay-loam mineral soil with substantial coverage by mosses and lichens.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This is a deciduous or mostly deciduous small-patch, rocky woodland that occurs on calcareous shale, and is typically dominated by *Quercus prinus, Juniperus virginiana var. virginiana, Pinus virginiana*, and *Acer rubrum*. Some stands have *Carya glabra, Carya ovata, Carya carolinae-septentrionalis*, and *Fraxinus americana*. Typical shrubs include *Philadelphus hirsutus* and *Ostrya virginiana*. Other shrubs and small trees may include *Acer leucoderme, Cornus florida, Celtis tenuifolia, Staphylea trifolia, Cercis canadensis, Chionanthus virginicus, Ulmus rubra, Ptelea trifoliata*, and *Symphoricarpos orbiculatus*.

Global Vegetation: Trees are sparse and stunted, generally 2-10 m tall. Primary species include *Quercus prinus, Juniperus virginiana var. virginiana, Pinus virginiana*, and *Acer rubrum*. Some stands have *Carya glabra, Carya ovata, Carya carolinae-septentrionalis, Fraxinus americana, Quercus rubra, Ulmus alata*, and *Acer saccharum* as important canopy associates. Shrubs include *Philadelphus hirsutus, Ostrya virginiana, Cercis canadensis var. canadensis, Celtis occidentalis, Celtis tenuifolia, Acer leucoderme, Cornus florida, Staphylea trifolia, Chionanthus virginicus, Ulmus rubra, Ptelea trifoliata, Symphoricarpos orbiculatus*, and *Rhus copallinum var. latifolia*. *Toxicodendron radicans ssp. radicans* and *Parthenocissus quinquefolia* are common. Herbs include *Sedum ternatum, Solidago* spp., *Danthonia sericea, Danthonia spicata, Andropogon virginicus, Carex pensylvanica, Paronychia argyrocoma, Selaginella rupestris, Houstonia longifolia (= var. compacta), Amsonia tabernaemontana, Dichanthelium boscii, Muhlenbergia tenuifolia, Packera obovata (= Senecio obovatus), Asclepias quadrifolia, Erigeron pulchellus, Polygala paucifolia, Arabis laevigata, Campanula divaricata*, and *Aristolochia serpentaria*. Some openings are very grassy, and include species such as *Sorghastrum nutans, Andropogon gerardii, Muhlenbergia capillaris, Panicum* sp., *Coreopsis major, Baptisia tinctoria, Lechea racemulosa, Liatris* sp., and *Penstemon* sp. Additional herbs from stands assigned here from the Ocoee River Gorge (Tennessee) include *Chasmanthium latifolium, Solidago sphacelata, Carex purpurifera*, and *Symphyotrichum oblongifolium (= Aster*

oblongifolius) (these dominant to frequent), as well as *Asplenium platyneuron, Carex laxiflora, Carex pensylvanica, Cheilanthes lanosa, Dichanthelium* sp., *Euphorbia corollata, Geum* sp., *Heuchera* sp., *Oxalis grandis, Rudbeckia triloba, Sedum nevii, Senna marilandica, Tradescantia* sp., *Verbesina occidentalis*, and *Verbesina virginica*.

Stands included here from shale slopes above the French Broad River (Cherokee National Forest, Tennessee) are open stands on "sub-calcareous" shales. The vegetation has an open canopy of *Quercus prinus* with scattered examples of other woody plants. Other trees include *Ostrya virginiana, Ulmus alata, Quercus rubra, Carya pallida*, and *Pinus virginiana*. These are primarily deciduous stands, but with some pine. The stand in Virginia is a deciduous, apparently edaphically-maintained woodland dominated by stunted (6-10 m tall) *Quercus prinus* and *Carya glabra*, with less common associates of *Fraxinus americana, Carya ovata, Quercus rubra*, and *Acer saccharum*. Shrub cover varies from moderately to very dense and is dominated by patchy thickets of *Philadelphus hirsutus*. Associated small trees and shrubs include *Ostrya virginiana* and *Amelanchier arborea*. The herb layer is sparse on the steeper, more erosive slopes, becoming denser and more grass-dominated on the stabilized upper slope.

Global Dynamics: This community appears to be edaphically-maintained, but may also be maintained by periodic fires. The exotic grass *Microstegium vimineum* can be invasive in stands of this association.

Tall shrub/sapling	Broad-leaved deciduous shrub	*Philadelphus hirsutus*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Carya glabra*, *Fraxinus americana*, *Ostrya virginiana*, *Philadelphus hirsutus*, *Quercus prinus*

Global: *Acer rubrum*, *Celtis occidentalis*, *Juniperus virginiana*, *Philadelphus hirsutus*, *Pinus virginiana*, *Quercus prinus*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Pycnanthemum curvipes* (G3), *Sedum nevii* (G3), *Thaspium pinnatifidum* (G2G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (24-Feb-2010). This Southern Blue Ridge shale woodland community is limited in occurrence to steep river-fronting slopes with moderately calcareous, exposed and eroding shale. This community appears to be edaphically-maintained, but may also be maintained by periodic fires. Fewer than 10 occurrences totaling less than 1000 acres are known. Threats are few, although logging in adjacent areas can cause unnatural disturbance or downslope erosion, along with alteration of light levels.

RELATED CONCEPTS

Global Similar Types:

- *Pinus virginiana / Vaccinium pallidum / Schizachyrium scoparium - Carex pensylvanica* Woodland (CEGL003624)
- *Quercus prinus - Pinus virginiana - (Pinus pungens) / Schizachyrium scoparium - Dichanthelium depauperatum* Woodland (CEGL008540)

CLASSIFICATION

Status: Standard

Classification Confidence: 3 - Weak

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This community was sampled once in APPA in Virginia on the slopes of Whitetop Laurel Creek.

Global Classification Comments: In a regional analysis for the Southern Appalachian portion of the Appalachian Trail (Fleming and Patterson 2009a), a small group of three plots was determined to be conceptually and floristically

consistent with this association. All three plots were formerly assigned to the all-deciduous type (former *Carya glabra - Fraxinus americana - Quercus prinus / Ostrya virginiana / Philadelphus hirsutus* Woodland (CEGL004995)), and a decision was made to merge that type into this one.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled in Virginia on the slopes of Whitetop Laurel Creek.
Global Range: This shale woodland is limited to the Southern Blue Ridge of North Carolina, Tennessee, and Virginia. Known stands are from the Hot Springs Window in North Carolina, the French Broad River and Ocoee River Gorge in Tennessee, and along Whitetop Laurel Creek near Damascus, Virginia.

1.B.3. Temperate Flooded & Swamp Forest

1.B.3.Na. Eastern North American-Great Plains Flooded & Swamp Forest

M029. Central Hardwood Floodplain Forest

G652. Silver Maple - Green Ash - Sycamore Floodplain Forest

Group Summary Description: This group includes floodplain forests in the central and eastern United States and into southern Ontario, Canada. Stands are dominated by broad-leaved deciduous trees with a closed to moderately open canopy. Typical dominants include a combination of *Acer rubrum, Acer saccharinum, Acer saccharum, Fraxinus pennsylvanica, Platanus occidentalis, Populus deltoides*, and *Quercus macrocarpa*. This group occurs on sloping ridges, terraces, natural levees, or higher elevations that border rivers or streams. Examples occur on well-drained to poorly drained alluvial soils ranging from sands to clay. Sites are infrequently to frequently flooded.

A3710 *Acer saccharinum - Populus deltoides* Floodplain Forest Alliance

Alliance Summary Description: This alliance contains floodplain forests of major rivers in the central midwestern United States and in southern Ontario and southern Quebec, Canada, where *Acer saccharinum* and *Populus deltoides* are generally dominant. Other tree associates include *Celtis occidentalis, Ulmus americana, Acer negundo, Fraxinus pennsylvanica, Ulmus rubra, Betula nigra*, and *Salix nigra*. Stands occur on well-drained, sandy soils, on infrequently flooded bottomlands, on levees, and on deep silts on stabilized sites along larger rivers and lake margins.

[CEGL006147] *Acer saccharinum - (Populus deltoides) / Matteuccia struthiopteris - Laportea canadensis* Floodplain Forest

Translated Name: **Silver Maple - (Eastern Cottonwood) / Ostrich Fern - Canadian Woodnettle Floodplain Forest**
Common Name: **Silver Maple Floodplain Levee Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Green Ash - Sycamore Floodplain Forest (G652)
Alliance	*Acer saccharinum - Populus deltoides* Floodplain Forest Alliance (A3710)

Element Concept

Global Summary: These are silver maple floodplain forests along major rivers in the temperate northeastern United States. They occur on the deep, alluvial, silty to somewhat coarse soils of point bars, levees, and adjacent terraces of medium to large, high-energy and moderate-gradient rivers with heavy erosion and sedimentation, and are subjected to spring flooding. The more-or-less closed canopy is high and arching, and the dominant below-canopy feature is the lush and extensive herb layer, with ferns especially prominent. Shrubs are scattered and the overall shrub cover is low. Bryoids are very minor. The canopy is strongly dominated by *Acer saccharinum*. Other trees may be locally common, or scattered, including *Populus deltoides, Quercus rubra, Acer negundo, Ulmus rubra, Juglans nigra, Fraxinus americana*, and *Fraxinus pennsylvanica*. *Populus deltoides* tends to be characteristic of the siltier soils and levees within these forests. Typical shrubs include *Lindera benzoin, Cornus amomum, Sambucus canadensis*, and potentially invasive non-native *Lonicera* spp., *Rosa multiflora*, or *Ligustrum vulgare*. Vines such as *Vitis riparia* are common at some sites. The dominant herbs are *Matteuccia struthiopteris* and *Laportea canadensis*. Associated herbs include *Elymus riparius, Elymus virginicus, Amphicarpaea bracteata, Ageratina altissima (= Eupatorium rugosum), Arisaema triphyllum, Circaea lutetiana, Thalictrum pubescens, Onoclea sensibilis*, and *Polygonum virginianum (= Tovara virginiana)*. Particularly in the southern portions of this type's range, non-native herbs such as *Alliaria petiolata, Allium vineale, Ranunculus ficaria*, and *Microstegium vimineum* may essentially replace the native herbs. This association is distinguished from the related *Acer saccharinum / Onoclea sensibilis - Boehmeria cylindrica* Floodplain Forest (CEGL006176) by its greater abundance of *Matteuccia struthiopteris* relative to

Onoclea sensibilis and its better-drained soils. Flood duration is usually shorter in the ostrich fern type. It is distinguished from floodplain forests to the south by the absence (or only very rare presence) of *Platanus occidentalis* and *Celtis occidentalis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This silver maple floodplain forest occurs on the deep, alluvial, silty to somewhat coarse soils of point bars, levees, and adjacent terraces of medium to large, high-energy and moderate-gradient rivers. It was sampled at two locations in the Central Appalachian project area. The sites are seasonally flooded bottomlands with moderately well-drained silty clay and sandy loam soil. Evidence of disturbance includes possible past clearing, road and railroad development, and the presence of exotic plant species.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: This silver maple floodplain forest is generally associated with coarser soils and a relatively shorter flood duration. It ranges from New England south to Pennsylvania and Maryland.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These silver maple floodplain forests are found along major rivers in the temperate northeastern United States. They occur on the deep, alluvial, silty to somewhat coarse soils of point bars, levees, and adjacent terraces of medium to large, high-energy and moderate-gradient rivers with heavy erosion and sedimentation, and are subjected to spring flooding.
Global Environment: These are silver maple floodplain forests along major rivers in the temperate northeastern United States. They occur on the deep, alluvial, silty to somewhat coarse soils of point bars, levees, and adjacent terraces of medium to large, high-energy and moderate-gradient rivers with heavy erosion and sedimentation, and are subjected to spring flooding.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by high and arching *Acer saccharinum* with or without *Populus deltoides*. *Acer negundo, Ulmus rubra*, and *Fraxinus pennsylvanica* may be common in the canopy and subcanopy. The shrub layer is sparse but *Lindera benzoin* is often present. *Toxicodendron radicans* is a dominant vine. The lush herb layer includes *Boehmeria cylindrica, Impatiens* spp., *Laportea canadensis, Matteuccia struthiopteris*, and *Leersia oryzoides* along with invasive exotics such as *Alliaria petiolata, Lysimachia nummularia*, and *Microstegium vimineum*.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This floodplain forest is dominated by *Acer saccharinum* in the canopy with *Matteuccia struthiopteris* or *Laportea canadensis* prominent in the understory.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The more-or-less closed canopy is high and arching, and the dominant below-canopy feature is the lush and extensive herb layer, with ferns especially prominent. Shrubs are scattered and the overall shrub cover is low. Bryoids are very minor. The canopy is strongly dominated by *Acer saccharinum*. Other trees may be locally common, or scattered, including *Populus deltoides, Quercus rubra, Acer negundo, Ulmus rubra, Juglans nigra, Fraxinus americana*, and *Fraxinus pennsylvanica*. *Populus deltoides* tends to be characteristic of the siltier soils and levees within these forests. Typical shrubs include *Lindera benzoin, Cornus amomum, Sambucus canadensis*, and potentially invasive non-native *Lonicera* spp., *Rosa multiflora*, or *Ligustrum vulgare*. Vines such as *Vitis riparia* are common at some sites. The dominant herbs are *Matteuccia struthiopteris* and *Laportea canadensis*. Associated herbs include *Elymus riparius, Elymus virginicus, Amphicarpaea bracteata, Ageratina altissima (= Eupatorium rugosum), Arisaema triphyllum, Circaea lutetiana, Thalictrum pubescens, Onoclea sensibilis*, and *Polygonum virginianum (= Tovara virginiana)*. Particularly in the southern portions of this type's range, non-native herbs such as *Alliaria petiolata, Allium vineale, Ranunculus ficaria*, and *Microstegium vimineum* may essentially replace the native herbs.
Global Vegetation: The more-or-less closed canopy is high and arching, and the dominant below-canopy feature is the lush and extensive herb layer, with ferns especially prominent. [CEGL002586] *Acer saccharinum - Fraxinus pennsylvanica - Ulmus americana* Floodplain Forest

Translated Name: **Silver Maple - Green Ash - American Elm Floodplain Forest**
Common Name: **Midwestern Silver Maple - Elm Floodplain Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Green Ash - Sycamore Floodplain Forest (G652)
Alliance	*Acer saccharinum - Populus deltoides* Floodplain Forest Alliance (A3710)

Element Concept

Global Summary: This silver maple - green ash - elm - cottonwood forest is found throughout the midwestern United States and parts of the eastern United States. Stands occur on medium to large, regularly flooded floodplains. The canopy cover is more-or-less closed and dominated by *Acer saccharinum, Fraxinus pennsylvanica, Ulmus americana*, and *Populus deltoides*. Associated species may include *Ulmus rubra, Acer negundo, Salix nigra, Celtis occidentalis*, and *Carya cordiformis*. More southward, *Platanus occidentalis* and *Betula nigra* may occur. The shrub and sapling layer is often open (<25% cover). Species that may be present include *Sambucus canadensis, Rubus occidentalis*, or *Lindera benzoin*. Woody and herbaceous vines can be prominent, including among the woody vines *Parthenocissus quinquefolia, Toxicodendron radicans*, and *Vitis riparia*. Herbaceous vine species include *Apios americana, Amphicarpaea bracteata*, and *Echinocystis lobata*. Herbaceous grasses, forbs, and ferns dominate the ground layer, including *Symphyotrichum lateriflorum (= Aster lateriflorus), Boehmeria cylindrica, Erythronium americanum, Solidago gigantea, Cinna arundinacea, Leersia virginica, Elymus virginicus, Impatiens pallida, Laportea canadensis, Matteuccia struthiopteris, Onoclea sensibilis, Pilea pumila, Urtica dioica*, and others. A variety of exotics may be present, including *Lysimachia* spp., *Microstegium vimineum, Polygonum cuspidatum, Rosa multiflora*, and *Lonicera japonica*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: Silver maple forest restricted to Delaware Water Gap National Recreation Area in the Lower New England project area.
Global Environment: This community occurs on terraces of medium to larger rivers. Soils may be well-drained and sandy, more loamy on infrequently flooded bottomlands and levees, or deep silts on stabilized sites of terraces along larger rivers. It appears to be favored by deposition of deep sandy sediments by low-energy floodwaters. The community may form small linear patches among other floodplain associations or be locally extensive. The structure and composition of the type is influenced by the flooding regime. Floods leave river-deposited debris on the forest floor, ice scars on trees, and abandoned channels that retain water at or above the level of the main river channel.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Acer negundo* may be a canopy associate but not dominant; *Platanus occidentalis* and *Betula nigra* codominant in canopy; additional canopy associates include *Ulmus americana, Ulmus rubra, Salix nigra, Celtis occidentalis, Carya cordiformis, Juglans nigra, Fraxinus pennsylvanica*, and occasionally *Halesia tetraptera*. The shrub and sapling layer is often open (<25% cover). Woody and herbaceous vines can be prominent. Grasses, forbs, and ferns dominate the ground layer.
Global Vegetation: The canopy cover is more-or-less closed and dominated by *Acer saccharinum, Fraxinus pennsylvanica, Ulmus americana*, and *Populus deltoides*. Associated species may include *Ulmus rubra, Acer negundo, Salix nigra, Celtis occidentalis*, and *Carya cordiformis*. More southward, *Platanus occidentalis* and *Betula nigra* may occur. The shrub and sapling layer is often open (<25% cover). Species that may be present include *Sambucus canadensis, Rubus occidentalis*, or *Lindera benzoin*. Woody and herbaceous vines can be prominent,

including among the woody vines *Parthenocissus quinquefolia, Toxicodendron radicans*, and *Vitis riparia*. Herbaceous vine species include *Apios americana, Amphicarpaea bracteata*, and *Echinocystis lobata*. Grasses, forbs, and ferns dominate the ground layer, including various combinations of *Symphyotrichum lateriflorum (= Aster lateriflorus), Boehmeria cylindrica, Chasmanthium latifolium, Cryptotaenia canadensis, Erythronium americanum, Solidago gigantea, Cinna arundinacea, Leersia virginica, Elymus virginicus, Helianthus* sp., *Impatiens capensis, Impatiens pallida, Laportea canadensis, Matteuccia struthiopteris, Menispermum canadense, Onoclea sensibilis, Pilea pumila, Polygonum virginianum, Rudbeckia laciniata, Verbesina alternifolia, Urtica dioica*, and others. A variety of exotics may be present, including *Lysimachia* spp., *Microstegium vimineum, Glechoma hederacea, Polygonum cuspidatum, Rosa multiflora*, and *Lonicera japonica*. Anderson (1996) notes that *Celtis occidentalis, Gleditsia triacanthos*, and *Aesculus glabra* may be more common along the calcareous streams of western Ohio.

Global Dynamics: The structure and composition of the type are influenced by the flooding regime, which is typically an annual flooding of relatively brief duration (several weeks), but may be absent in dry years or extensive during flash-flood years. Floods leave river-deposited debris on the forest floor, ice scars on trees, and abandoned channels that retain water at or above the level of the main river channel. Anderson (1996) describes the successional characteristics of many of the tree species in this type.

MOST ABUNDANT SPECIES

- *Quercus macrocarpa - Quercus bicolor - Carya laciniosa / Leersia* spp. - *Cinna* spp. Floodplain Forest (CEGL002098)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community was mapped during the Delaware Water Gap National Recreation Area project. It was not observed within the APPA corridor in the project area; however, it is included in the classification to be comprehensive should the association be identified in the APPA corridor during accuracy assessment.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type (CEGL002586) includes stands where *Acer saccharinum* represents the majority of trees (>50% cover or basal area?). This type is most clearly expressed on medium to larger rivers, but occurs on higher flooded terraces. Compare with *Populus deltoides - Salix nigra - Acer saccharinum* Floodplain Forest (CEGL002018) (which also occurs on medium to large rivers but on more recently scoured sand bars and the inner most active part of the floodplain) and *Fraxinus pennsylvanica - Celtis occidentalis - Tilia americana - (Quercus macrocarpa)* Floodplain Forest (CEGL002081) (which occurs on the terraces of small to large river terraces). To some degree this type is more northern, separable from the more southern type *Acer saccharinum - Celtis laevigata - Carya illinoinensis* Floodplain Forest (CEGL002431), but this distinction is not yet well resolved. In the southern parts of its range, this type may overlap with *Platanus occidentalis - Acer saccharinum - Juglans nigra - Ulmus rubra* Floodplain Forest (CEGL007334), but that type is generally a higher terrace, small stream type. Compare this type with SAF cover type 62 (Eyre 1980). In Minnesota stands with less than either 50% cottonwood or silver maple and not in northwestern Minnesota tend to occur here (i.e., a mixed floodplain forest), as do silver maple stands with a supercanopy of cottonwoods. In southwestern Minnesota, stands with swamp white oak belong with *Quercus macrocarpa - Quercus bicolor - Carya laciniosa / Leersia* spp. - *Cinna* spp. Floodplain Forest (CEGL002098). *Fraxinus pennsylvanica* is a typical codominant in this type. In Wisconsin, this type may better be named *Acer saccharinum - Fraxinus pennsylvanica - Betula nigra* Forest (E. Epstein pers. comm. 1999).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community occurs in Delaware Water Gap National Recreation Area.
Global Range: This association is found throughout the midwestern United States and in the mid-Atlantic region of the eastern United States, ranging from Delaware, New Jersey, and Pennsylvania west to Minnesota, and south to Arkansas.
Nations: CA, US
States/Provinces: AR, DE, IA:SU, IL, IN, KY, MI, MN, MO, NJ, NY, OH, ON, PA, QC?, TN, WI:S3, WV:S3S4
TNC Ecoregions: 35:C, 36:C, 37:C, 38:C, 40:?, 42:C, 43:P, 44:C, 45:C, 46:C, 47:C, 48:C, 49:C, 50:C, 60:C, 61:C, 62:C

[CEGL006629] *Salix nigra - (Populus deltoides)* Floodplain Forest

Translated Name: **Black Willow - (Eastern Cottonwood) Floodplain Forest**
Common Name: **Eastern Black Willow Floodplain Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Green Ash - Sycamore Floodplain Forest (G652)
Alliance	*Acer saccharinum - Populus deltoides* Floodplain Forest Alliance (A3710)

ELEMENT CONCEPT

Global Summary: Stands occur on the banks of small to large low-gradient rivers where they are a component of point bar succession. The vegetation is a closed-canopy forest dominated by *Salix nigra*. Associates include *Platanus occidentalis* and *Populus deltoides*. Surface water is present for brief periods during the growing season, but the water table usually lies well below soil surface.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: No data available.
Global Environment: Stands occur on the banks of small to large low-gradient rivers where they are a component of point bar succession.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The floodplain forest vegetation is a closed-canopy forest dominated by *Salix nigra*. *Populus deltoides* is a primary canopy associate.
Global Vegetation: The vegetation is a closed-canopy floodplain forest dominated by *Salix nigra*. *Populus deltoides* is a primary canopy associate.

G673. SILVER MAPLE - SUGARBERRY - SWEETGUM FLOODPLAIN FOREST

Group Summary Description: Stands of these floodplain forests are dominated by some combination of *Acer saccharinum, Betula nigra, Celtis laevigata, Fraxinus pennsylvanica, Liquidambar styraciflua, Liriodendron tulipifera, Platanus occidentalis*, and *Ulmus americana*. Other species that may be present include *Acer negundo*. This complex and widespread group is found in a broad band in the northeastern and middle parts of the eastern United States from southern New England and the Ontario lakeplains of New York south and west through the Interior Low Plateau of Ohio, Indiana, Illinois and Kentucky to the Ozarks of Arkansas and Missouri.

A3697 *Acer saccharinum - Acer negundo* Appalachian-Piedmont Floodplain Forest Alliance

Alliance Summary Description: This alliance contains floodplain forests where *Acer saccharinum* is prevalent. Other tree associates include *Acer negundo, Betula nigra, Fraxinus pennsylvanica, Platanus occidentalis, Populus deltoides, Quercus palustris, Salix nigra, Ulmus americana*, and *Ulmus rubra*. Common shrub species include *Alnus serrulata, Asimina triloba, Cephalanthus occidentalis, Ilex decidua*, and *Lindera benzoin*. Characteristic herbs include *Boehmeria cylindrica, Impatiens capensis, Laportea canadensis, Leersia lenticularis, Matteuccia struthiopteris, Onoclea sensibilis, Pilea pumila*, and others. This alliance occurs along major rivers in the Piedmont, Central Appalachians, and Chesapeake Bay regions from Maryland and Virginia north to Pennsylvania and New Jersey.

[CEGL006217] *Acer saccharinum - Acer negundo / Ageratina altissima - Laportea canadensis - (Elymus virginicus)* Floodplain Forest

Translated Name: **Silver Maple - Box-elder / White Snakeroot - Canadian Woodnettle - (Virginia Wildrye) Floodplain Forest**

Common Name: **Piedmont-Central Appalachian Silver Maple Floodplain Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Sugarberry - Sweetgum Floodplain Forest (G673)
Alliance	*Acer saccharinum - Acer negundo* Appalachian-Piedmont Floodplain Forest Alliance (A3697)

Element Concept

Global Summary: This is a forested community of large river floodplains in the Mid-Atlantic states of Maryland, Virginia, West Virginia, and Pennsylvania. These forests occupy banks and first bottoms of major rivers with nutrient-rich silt loams, sand loams, and sands that are temporarily inundated, annually or less often, in major flood events. Canopies are closed and dominated by *Acer saccharinum*, with *Acer negundo* dominating a subcanopy layer. Other minor overstory and understory associates include *Populus deltoides, Celtis occidentalis, Fraxinus pennsylvanica, Ulmus americana*, and *Juglans nigra*. The shrub layer ranges from sparse to dense but is usually dominated by *Lindera benzoin*. Characteristic species of the herb layer are *Ageratina altissima, Laportea canadensis, Impatiens pallida, Viola sororia, Leersia virginica, Verbesina alternifolia, Urtica dioica ssp. dioica, Elymus virginicus, Elymus riparius, Geum canadense, Pilea pumila, Rudbeckia laciniata*, and *Cryptotaenia canadensis*. Vines of *Toxicodendron radicans* and *Parthenocissus quinquefolia* are common. Early-successional stands are usually strongly dominated by even-aged *Acer saccharinum*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This silver maple forest is restricted to large river floodplains, where it occurs on first bottoms and banks immediately adjacent to the river. It was sampled at two locations in the Central Appalachian project area. One site is a seasonally flooded alluvial terrace with well-drained sand soil. The unvegetated surface is dominated by exposed sand with some leaf litter and downed wood. Evidence of disturbance includes the presence of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This silver maple forest is restricted to large river floodplains, where it occurs on first bottoms and banks immediately adjacent to the river. Its range overlaps between the Central Appalachian project area and Lower New England project area from Maryland north to Massachusetts. Sites are seasonally or temporarily flooded alluvial terraces and floodplains. Soils are somewhat to very poorly drained clay, loam and sand. The unvegetated surface consists of leaf litter, with lesser amounts of downed wood, large rocks, and/or bare soil. Evidence of disturbance includes alterations to hydrology, period flooding, erosion, grazing/browsing, and the presence of exotic plants.

Global Environment: This community is restricted to large river floodplains, where it occurs on first bottoms and banks immediately adjacent to the river. Sites are usually well-drained to moderately well-drained. Soils are nutrient-rich with textures ranging from silt loams to sandy loams and occasionally sands. Habitats are temporarily inundated, annually or less often, in major flood events. In the Potomac Gorge, the average flood-return interval was from about 0.5 to 2.5 years (Lea 2000).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by *Acer saccharinum*, occasionally with *Platanus occidentalis* codominating. *Acer negundo* dominates the subcanopy layer. Other minor overstory and understory associates include *Populus deltoides, Celtis occidentalis, Fraxinus pennsylvanica, Ulmus americana*, and *Juglans nigra*. *Lindera benzoin* is dominant in the shrub layer. Characteristic species of the herb layer are *Ageratina altissima, Laportea canadensis, Impatiens pallida, Viola sororia, Leersia virginica, Verbesina alternifolia*, and others. Exotic species, particularly *Microstegium vimineum*, can be a problem in these naturally-disturbed sites.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These early-successional stands are usually strongly dominated by even-aged *Acer saccharinum*. *Acer negundo* is codominant in the subcanopy and/or canopy. *Lindera benzoin* is the dominant short shrub. Characteristic and/or abundant species of the herb layer are *Boehmeria cylindrica, Laportea canadensis, Impatiens pallida, Leersia virginica, Onoclea sensibilis, Elymus virginicus*, and the invasive exotic Microstegium vimineum. In addition, this community supports NY state-critically imperiled *Carex bullata*.

Global Vegetation: This community is a closed forest typically dominated by *Acer saccharinum*, with *Acer negundo* dominating a subcanopy layer. Along the Potomac, particularly on sandier sites, *Platanus occidentalis* may codominate the canopy layer. Minor overstory and understory associates include *Populus deltoides, Celtis occidentalis, Fraxinus pennsylvanica, Ulmus americana*, and *Juglans nigra*. At topographically lower sites, the shrub layer is often sparse; on higher surfaces, it may be moderately dense, with *Lindera benzoin* usually the dominant species. Characteristic species of the herb layer are *Ageratina altissima, Laportea canadensis, Impatiens pallida, Viola sororia, Leersia virginica, Verbesina alternifolia, Urtica dioica ssp. dioica, Elymus virginicus, Elymus riparius, Geum canadense, Pilea pumila, Rudbeckia laciniata*, and *Cryptotaenia canadensis*. Vines of *Toxicodendron radicans* and *Parthenocissus quinquefolia* are common. Invasive introduced species such as *Alliaria petiolata, Stellaria media, Microstegium vimineum, Glechoma hederacea, Urtica dioica ssp. dioica*, and *Humulus japonicus* are often rampant in this vegetation type. Early-successional stands are assigned to the same type and are usually strongly dominated by even-aged *Acer saccharinum*.

Global Dynamics: Early-successional stands are usually strongly dominated by even-aged *Acer saccharinum*.

- *Platanus occidentalis - Fraxinus pennsylvanica - Acer negundo / Sanicula odorata - Elymus virginicus* Floodplain Forest (CEGL006475)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type was defined through analysis of 41 plot samples from Virginia and Maryland and through consultation with ecologists from those states and West Virginia. It has also been confirmed for Pennsylvania by ecologists in that state. Data analysis supports the decision to split this unit from the more broadly defined USNVC unit *Acer saccharinum - Fraxinus pennsylvanica - Ulmus americana* Floodplain Forest (CEGL002586).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is found on floodplains of major Mid-Atlantic rivers in New Jersey, Maryland, West Virginia, Virginia and Pennsylvania. It was sampled in Maryland near the C&O Canal along the Potomac River and in Monroe County, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Housatonic River Floodplain Natural Heritage Site in Massachusetts, at Pochuck Creek in New Jersey, and at Wallkill River in New York.
Global Range: This community occurs on floodplains of major Mid-Atlantic rivers, including the Potomac, Shenandoah, James, Rappahannock, Monocacy, and Susquehanna, extending north to Massachusetts.

A3699 *Betula nigra - Platanus occidentalis* Appalachian-Piedmont Floodplain Forest Alliance

Alliance Summary Description: These forests are dominated by *Betula nigra* and *Platanus occidentalis* with a variety of other canopy species, including *Acer negundo, Acer saccharinum, Celtis laevigata, Liquidambar styraciflua, Liriodendron tulipifera, Populus deltoides*, and *Salix nigra*. The subcanopy or tall-shrub strata may include *Cornus florida* and *Carpinus caroliniana*, along with *Acer rubrum, Carya* spp., *Ilex opaca, Prunus serotina*, and *Ulmus alata*. The shrub layer is often sparse with such species as *Asimina triloba, Crataegus marshallii, Crataegus viridis*, and *Lindera benzoin* present. Vines include *Berchemia scandens, Bignonia capreolata, Campsis radicans, Parthenocissus quinquefolia, Toxicodendron radicans*, and *Vitis rotundifolia*. Herbaceous species include *Arundinaria gigantea, Boehmeria cylindrica, Chasmanthium latifolium (= Uniola latifolia), Elymus hystrix, Impatiens capensis, Pilea pumila, Podophyllum peltatum*, and *Stellaria pubera*. These forests are found in riverfronts areas from the Alleghany Plateau of Pennsylvania east through the Appalachians of West Virginia and Virginia, south to the Piedmont of the Carolinas and Georgia and north to New York and New Jersey. These riverfronts experience frequent, repeated, natural disturbance in the form of flooding. They occur more frequently on sandy soils than on heavier soils, and their most characteristic location is on levees. The soils are deep and well-drained with low organic matter content and are most commonly of the Orders Inceptisol and Entisol.

[CEGL003896] *Platanus occidentalis - Betula nigra - Salix (caroliniana, nigra)* Floodplain Forest

Translated Name: **American Sycamore - River Birch - (Coastal Plain Willow, Black Willow) Floodplain Forest**
Common Name: **Piedmont-Central Appalachian Sycamore - River Birch Floodplain Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Sugarberry - Sweetgum Floodplain Forest (G673)
Alliance	*Betula nigra - Platanus occidentalis* Appalachian-Piedmont Floodplain Forest Alliance (A3699)

ELEMENT CONCEPT

Global Summary: This early-successional woodland community of coarse-textured (cobbly / bouldery) to fine-textured (silty or muddy) depositional bars and islands occurs along rivers and large streams in the High Allegheny Plateau, Central Appalachians, and Lower New England ecoregions. It is subject to relatively frequent and powerful flooding and ice-scouring and has a highly variable physiognomy. It is dominated by stunted, usually battered and flood-trained trees (varying from <5 to >10 m tall) of *Platanus occidentalis* and *Betula nigra*. *Salix caroliniana* and

Salix nigra are dominant or codominant in a minority of stands. Other floodplain trees, particularly *Acer saccharinum* and *Fraxinus pennsylvanica*, may occur as minor associates. Shrub associates include *Cornus amomum, Salix sericea, Alnus serrulata*, and sometimes *Cephalanthus occidentalis* or *Physocarpus opulifolius*. The herbaceous layer ranges from sparse to moderately dense. Characteristic herbs include *Apocynum cannabinum, Polygonum virginianum, Polygonum hydropiper, Polygonum pensylvanicum, Polygonum hydropiperoides, Polygonum sagittatum, Polygonum pensylvanicum, Eupatorium serotinum, Asclepias incarnata, Pilea pumila, Hypericum* spp., *Bidens* spp., *Phalaris arundinacea, Dichanthelium clandestinum, Leersia virginica, Panicum virgatum*, and *Justicia americana*. Vines such as *Vitis riparia* and *Toxicodendron radicans* are often found throughout this association. Exotics such as *Lythrum salicaria, Microstegium vimineum, Polygonum cuspidatum, Coronilla varia*, and *Rosa multiflora* are frequent invaders.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This early-successional sycamore - birch floodplain community occurs on coarse-textured (cobbly / bouldery) to fine-textured (silty or muddy) depositional bars and islands occurring along rivers and large streams. It was sampled on a temporarily flooded gravel scour bar of the Potomac River at Harpers Ferry in Maryland. The area receives periodic scouring during flooding events. The soil is moderately well-drained sand. The unvegetated surface is dominated by small rocks with some downed wood. Exotic plants are common in this floodplain community.

Global Environment: This is an early-successional community of coarse-textured or fine-textured depositional bars and islands subject to frequent flooding. Two environmental / floristic variants of this type have been recognized across the upper Potomac River drainage: one occurring on cobbly and bouldery depositional bars and islands along high-gradient river stretches subject to frequent, high-energy flooding and ice-scouring; the other occurring on low, frequently flooded, muddy depositional bars and shorelines in relatively low-gradient (alluvial process control) river reaches. In the high-gradient variant, soils are usually sandy, periodically droughty when exposed, and tightly packed in a matrix of cobbles or boulders. In the low-gradient variant, soils have a significant silt component and are poorly drained even after long periods of exposure. Soils collected from plots of both variants were circumneutral (pH 7.0 to 7.2), with high calcium levels and 100% total base saturation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This early-successional community is composed of stunted and often battered and flood-trained *Platanus occidentalis* and *Betula nigra* trees (varying from less than 5 m tall to >10 m tall). *Acer saccharinum* and *Fraxinus pennsylvanica* can be minor associates in the canopy. There is a dense shrub layer with *Salix* spp. and *Cephalanthus occidentalis*. *Hibiscus laevis* is dominant in the herb layer along with *Chamaesyce humistrata, Eupatorium serotinum*, and *Acalypha rhomboidea*. Invasive exotics are common.

Global Vegetation: The physiognomy of this community is extremely variable, with recently disturbed stands often having the stature of shrublands, and older stands attaining more of a woodland form. The vegetation is dominated by stunted and often battered and flood-trained trees (varying from less than 5 m tall to >10 m tall) of *Platanus occidentalis* and *Betula nigra*. *Salix caroliniana* and *Salix nigra* are dominant or codominant in a minority of stands. Other floodplain trees, particularly *Acer saccharinum* and *Fraxinus pennsylvanica*, may occur as minor associates. Shrub associates include *Cornus amomum, Salix sericea, Alnus serrulata*, and sometimes *Cephalanthus occidentalis* or *Physocarpus opulifolius*. The herbaceous layer ranges from sparse to moderately dense. Characteristic herbs include *Apocynum cannabinum, Polygonum virginianum, Polygonum hydropiper, Polygonum pensylvanicum, Polygonum hydropiperoides, Polygonum sagittatum, Polygonum pensylvanicum, Asclepias incarnata, Eupatorium serotinum, Hypericum* spp., *Bidens* spp., *Artemisia annua, Cyperus* spp., *Boehmeria cylindrica, Phyla lanceolata, Hibiscus laevis, Ipomoea lacunosa, Acalypha rhomboidea, Phalaris arundinacea, Dichanthelium clandestinum, Leersia virginica, Panicum virgatum, Pilea pumila*, and *Justicia americana*. Vines such as *Vitis riparia* and *Toxicodendron radicans* are often found throughout this association. Exotics such as *Microstegium vimineum, Polygonum caespitosum var. longisetum, Lythrum salicaria*, and *Polygonum cuspidatum* are a frequent problem.

The two variants of this type in the Potomac drainage [see Environment] are similar in total floristic composition but may differ considerably in herbaceous density and the relative abundances of individual species. The high-gradient variant tends to have a sparse herb layer of somewhat stunted ruderal species, including *Apocynum cannabinum, Cyperus strigosus, Acalypha rhomboidea*, and *Eupatorium serotinum*. The low-gradient variant has a variable herb layer that includes flood-tolerant species such as *Pilea pumila, Leersia virginica, Leersia oryzoides, Scrophularia marilandica*, annual species of *Polygonum* (*Polygonum caespitosum var. longisetum, Polygonum punctatum, Polygonum sagittatum*), *Mimulus alatus, Mimulus ringens, Carex lurida, Carex frankii,*

Carex tribuloides, Eupatorium perfoliatum, Paspalum fluitans, Verbena hastata, and *Scutellaria lateriflora*. Exotics are common in both variants.

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (1-Dec-1997).

RELATED CONCEPTS

Global Similar Types:

- *Betula nigra - Platanus occidentalis / Impatiens capensis* Floodplain Forest (CEGL006184)
- *Platanus occidentalis - Acer saccharinum - Fraxinus pennsylvanica / Boehmeria cylindrica - Carex emoryi* Floodplain Forest (CEGL006476) is more restricted in its range, documented only from relatively stable, bedrock and high channel shelves along high-gradient stretches of the Potomac River in DC, MD, VA. It typically has a higher species richness, a higher percentage of perennial species and a more layered vegetation structure.
- *Platanus occidentalis - Betula nigra / Cornus amomum / (Andropogon gerardii, Chasmanthium latifolium)* Floodplain Forest (CEGL003725)
- *Platanus occidentalis / Dichanthelium clandestinum - Festuca subverticillata* Floodplain Forest (CEGL004031)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community occurs adjacent to Water-willow Rocky Bar and Shore (CEGL004286) along the Potomac River in Maryland.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Classification of this type was refined through analysis of data from 40 plots from the Potomac River across several physiographic provinces. *Salix interior*, a former nominal in the type, is listed as "rare" in Maryland and Virginia (Kartesz 1999).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs along rivers and large streams in the High Allegheny Plateau, Central Appalachians, and Lower New England. It was sampled along the Potomac River in Maryland at Potomac Wayside in Harpers Ferry.
Global Range: This association is found in the High Allegheny, Central Appalachian, Piedmont, and Lower New England ecoregions from West Virginia, Virginia, and Maryland north to New York. It is also attributed to the Western Allegheny Plateau. The low-gradient variant is widespread along major streams of the Piedmont Mesozoic Basins in northern Virginia and Maryland, and scattered along lower-gradient stretches of rivers and large streams in the Ridge and Valley province. It has been documented by plot data from the Potomac and Monocacy rivers and Antietam Creek in Maryland and Bull Run in Virginia. Its distribution is very likely much wider than existing data indicate.

A3701 *Platanus occidentalis - Fraxinus pennsylvanica - Liriodendron tulipifera* Central Appalachian-Piedmont Floodplain Forest Alliance

Alliance Summary Description: Stands are typically dominated by *Fraxinus pennsylvanica* and *Platanus occidentalis* with *Liquidambar styraciflua* and/or *Liriodendron tulipifera*. Other canopy and understory species that may be present include *Acer rubrum, Aesculus sylvatica* (within its range), *Alnus serrulata, Asimina triloba, Carpinus caroliniana, Cornus florida, Fagus grandifolia, Fraxinus americana*, and *Ulmus americana*, in the non-montane part of the distribution. Species present in the montane occurrences include *Betula alleghaniensis, Betula lenta, Liriodendron tulipifera*, and *Platanus occidentalis*, with *Betula nigra, Carpinus caroliniana, Fraxinus americana, Hamamelis virginiana, Liquidambar styraciflua, Pinus strobus, Pinus virginiana*, and *Tsuga canadensis*. *Euonymus americanus* is a typical shrub species in the lower elevation occurrences, while *Leucothoe fontanesiana* and *Rhododendron maximum* are common at higher elevations. These are high-energy floodplain forests of the Appalachian and Piedmont regions from Massachusetts, New York, and Connecticut south to Tennessee and Georgia. They typically occur on rocky streambeds and alluvial deposits of relatively high-gradient rivers.

[CEGL006575] *Fraxinus pennsylvanica - (Juglans nigra, Platanus occidentalis)* Floodplain Forest

Translated Name: **Green Ash - (Black Walnut, American Sycamore) Floodplain Forest**
Common Name: **Green Ash - Mixed Hardwood Floodplain Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Sugarberry - Sweetgum Floodplain Forest (G673)
Alliance	*Platanus occidentalis - Fraxinus pennsylvanica - Liriodendron tulipifera* Central Appalachian-Piedmont Floodplain Forest Alliance (A3701)

ELEMENT CONCEPT

Global Summary: This is a green ash - mixed hardwood floodplain forest of the northern Piedmont in the mid-Atlantic eastern United States. It occurs behind levees and on low terraces that are flooded annually for short durations (less than one week per year). Water table is high for the majority of the growing season. Soils are generally silts or clay loams but can have coarser substrates where flood water velocity is higher. The canopy is codominated by *Fraxinus pennsylvanica* with *Juglans nigra* and/or *Platanus occidentalis*. Additional associates include *Ulmus americana, Celtis occidentalis, Acer rubrum, Acer saccharinum*, and *Quercus palustris*. In some areas *Fraxinus americana* may be present in place of *Fraxinus pennsylvanica*. Subcanopy and shrub layers are sparse and generally composed of canopy species regeneration plus *Carpinus caroliniana, Carya cordiformis, Lindera benzoin, Cornus amomum, Viburnum prunifolium*, and *Viburnum dentatum*. The invasive shrubs *Rosa multiflora, Lonicera morrowii, Berberis thunbergii*, and *Lonicera japonica* can be problematic. Herbaceous species, where exotics are not rampant, can include *Impatiens pallida, Impatiens capensis, Laportea canadensis, Verbesina alternifolia, Thalictrum pubescens, Hydrophyllum canadense, Podophyllum peltatum, Symplocarpus foetidus, Circaea lutetiana, Boehmeria cylindrica, Onoclea sensibilis, Arisaema triphyllum*, and *Viola* spp. Woody vines include *Toxicodendron radicans* and *Parthenocissus quinquefolia*. Exotic species tend to dominate the herb layer, including *Alliaria petiolata, Glechoma hederacea*, and *Microstegium vimineum*. Diagnostic features of this floodplain forest include the presence of *Juglans nigra* and rich herbs.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This green ash - mixed hardwood floodplain forest occurs behind levees and on low or mid terraces that are flooded annually for short durations (less than one week per year). It occurs on islands, bars, and mid-terrace shorelines.

Global Environment: These floodplain forests occur behind levees and on low terraces or mid terraces that are flooded annually for short durations (less than one week per year). It also occurs on islands, bars, and mid-terrace shorelines. The water table is high for the majority of the growing season. Soils are generally silts, sandy loams, or clay loams but can have coarser substrates where floodwater velocity is higher.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This floodplain forest with mixed hardwoods is dominated by *Fraxinus pennsylvanica* and/or *Platanus occidentalis*, generally with other enrichment indicators such as *Juglans nigra*.

Global Vegetation: The canopy is codominated by *Fraxinus pennsylvanica* with *Juglans nigra* and/or *Platanus occidentalis*. Additional associates include *Ulmus americana, Celtis occidentalis, Acer rubrum, Acer saccharinum*, and *Quercus palustris*. Subcanopy and shrub layers are sparse and generally composed of canopy species regeneration plus *Carpinus caroliniana, Carya cordiformis, Lindera benzoin, Cornus amomum, Viburnum prunifolium*, and *Viburnum dentatum*. The invasive shrubs *Rosa multiflora, Lonicera morrowii, Berberis thunbergii*, and *Lonicera japonica* can be problematic. Herbaceous species, where exotics are not rampant, can include *Impatiens pallida, Impatiens capensis, Laportea canadensis, Verbesina alternifolia, Thalictrum pubescens, Hydrophyllum canadense, Podophyllum peltatum, Symplocarpus foetidus, Circaea lutetiana, Boehmeria cylindrica, Onoclea sensibilis, Arisaema triphyllum*, and *Viola* spp. Woody vines include *Toxicodendron radicans* and *Parthenocissus quinquefolia*. Exotic species tend to dominate the herb layer, including *Alliaria petiolata, Glechoma hederacea*, and *Microstegium vimineum*. Diagnostic features of this floodplain forest include the presence of *Juglans nigra* and rich herbs.

[CEGL006255] *Liriodendron tulipifera - Platanus occidentalis - Betula lenta / Lindera benzoin / Circaea lutetiana ssp. canadensis* Floodplain Forest

Translated Name: **Tuliptree - American Sycamore - Sweet Birch / Northern Spicebush / Broadleaf Enchanter's-nightshade Floodplain Forest**
Common Name: **Northern Blue Ridge Montane Alluvial Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Sugarberry - Sweetgum Floodplain Forest (G673)
Alliance	*Platanus occidentalis - Fraxinus pennsylvanica - Liriodendron tulipifera* Central Appalachian-Piedmont Floodplain Forest Alliance (A3701)

ELEMENT CONCEPT

Global Summary: This community type occupies montane alluvial floodplains along more-or-less high-gradient streams and small rivers at the foot of the Blue Ridge in Virginia and Maryland. It appears to be confined to floodplains with relatively fertile alluvial deposits derived from metabasalt (greenstone), pyroxene-rich granites, or metasiltstone/phyllite. These habitats are typically narrow, nearly flat, and have complex, coarse, bouldery or cobbly microtopography and rocky streambeds. Soils are well-drained and moderately fertile. Most of the lower streamside terraces are probably flooded briefly at least annually. Larger floods are rare. However, periodic catastrophic floods associated with hurricanes or exceptionally large rainfall events may be very destructive to stream channels and vegetation. Many of these sites were probably cleared and/or subjected to multiple historical disturbances, including grazing and cultivation . This forest is composed primarily of mesophytic upland species with some admixture of species characteristic of alluvial and wetland habitats. Vegetation is generally species-rich and heterogeneous, with composition frequently shifting in association with microhabitat conditions and disturbance histories. The overstory typically contains many tree species. However, *Liriodendron tulipifera* is generally a constant codominant, while *Platanus occidentalis* is usually scattered and occasionally abundant. Other species that are important in some stands include *Acer negundo, Acer rubrum, Acer saccharum, Betula alleghaniensis, Betula lenta, Betula nigra, Carya cordiformis, Carya ovata, Fagus grandifolia, Fraxinus americana, Fraxinus pennsylvanica, Juglans nigra, Nyssa sylvatica, Quercus alba, Quercus prinus, Quercus rubra, Tilia americana, Tsuga canadensis, Ulmus americana*, and *Ulmus rubra*. The understory contains saplings of the overstory species, along with *Asimina triloba, Carpinus caroliniana, Cornus florida, Corylus* spp., *Hamamelis virginiana, Lindera benzoin, Ostrya virginiana*, and *Viburnum prunifolium*. The herb layer is very diverse and dominated by numerous upland mesophytic species. Wet microhabitats typically support *Impatiens capensis, Carex intumescens, Carex tribuloides, Glyceria striata, Thalictrum pubescens, Viola cucullata*, and few other wetland plants.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This richer and more diverse small stream floodplain forest occurs in the Northern Blue Ridge near Roanoke, Virginia (and extending north to Catoctin Mountain, Maryland) and is confined to floodplains with relatively fertile base-rich alluvial deposits derived from metabasalt (greenstone), pyroxene-rich granites, or metasiltstone/phyllite.
Global Environment: This community type occupies montane alluvial floodplains along more-or-less high-gradient streams and small rivers at the foot of the Blue Ridge. It appears to be confined to floodplains with relatively fertile alluvial deposits derived from metabasalt (greenstone), pyroxene-rich granites, or metasiltstone/phyllite. These habitats are typically narrow, nearly flat, and have complex, coarse, bouldery or cobbly microtopography and rocky

streambeds. Soils are well-drained and moderately fertile. Most of the lower streamside terraces are probably flooded briefly at least annually. Larger floods are rare. However, periodic catastrophic floods associated with hurricanes or exceptionally large rainfall events may be very destructive to stream channels and vegetation. Many of these sites were probably cleared and/or subjected to multiple historical disturbances, including grazing and cultivation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated or codominated by *Liriodendron tulipifera* but with a mixture of other trees, including *Platanus occidentalis, Betula lenta, Acer saccharum var. saccharum, Acer rubrum, Carya cordiformis, Aesculus flava, Quercus* spp., *Fagus grandifolia*, and others. *Lindera benzoin* dominates the shrub layer, but it can also include *Asimina triloba, Carpinus caroliniana, Viburnum prunifolium*, and others. Vines may be common. The herb layer is very diverse and dominated by numerous upland mesophytic species; *Circaea lutetiana ssp. canadensis* is characteristic, and *Polygonatum biflorum var. commutatum, Mertensia virginica*, and *Eurybia divaricata* may be common.
Global Vegetation: This forest is composed primarily of mesophytic upland species with some admixture of species characteristic of alluvial and wetland habitats. Vegetation is generally species-rich and heterogeneous, with composition frequently shifting in association with microhabitat conditions and disturbance histories. The overstory typically contains many tree species. However, *Liriodendron tulipifera* is generally a constant codominant, while *Platanus occidentalis* is usually scattered and occasionally abundant. Other species that are important in some stands include *Acer negundo, Acer rubrum, Acer saccharum, Betula alleghaniensis, Betula lenta, Betula nigra, Carya cordiformis, Carya ovata, Fagus grandifolia, Fraxinus americana, Fraxinus pennsylvanica, Juglans nigra, Nyssa sylvatica, Quercus alba, Quercus prinus, Quercus rubra, Tilia americana, Tsuga canadensis, Ulmus americana*, and *Ulmus rubra*. OTHER NOTEWORTHY SPECIES

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3? (5-Aug-2004). There are probably hundreds of occurrences of this community along the length of the northern Blue Ridge. However, patches are relatively small and high-quality stands are uncommon.

RELATED CONCEPTS

Global Similar Types:
- *Acer saccharum - Liriodendron tulipifera / Galium concinnum - Carex laxiculmis* Forest (CEGL006473)
- *Liquidambar styraciflua - Liriodendron tulipifera - (Platanus occidentalis) / Halesia tetraptera / Amphicarpaea bracteata* Floodplain Forest (CEGL007880) occurs in similar southern Appalachian floodplains.
- *Liriodendron tulipifera - Pinus strobus - (Tsuga canadensis) / Carpinus caroliniana / Amphicarpaea bracteata* Forest (CEGL008405) similar Central Appalachian montane floodplain forest (primarily of shale and metasedimentary substrates) with a prominent coniferous component.
- *Platanus occidentalis - Liriodendron tulipifera - (Betula alleghaniensis) / Alnus serrulata - Leucothoe fontanesiana* Floodplain Forest (CEGL004691) occurs in similar southern Appalachian floodplains.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Global Classification Comments: Montane floodplain forests of the Appalachians are poorly inventoried. Based on existing data, this vegetation appears to represent a relatively cohesive, if variable, association-level unit.

ELEMENT DISTRIBUTION

Global Range: The type likely occurs along the foot of the northern Blue Ridge from near Roanoke, Virginia, to the north end of Catoctin Mountain, Maryland.

Alliance	*Platanus occidentalis - Fraxinus pennsylvanica - Liriodendron tulipifera* Central Appalachian-Piedmont Floodplain Forest Alliance (A3701)

ELEMENT CONCEPT

Global Summary: This association occupies the higher elevations of floodplains, floodplain berms, and low terraces of major Mid-Atlantic rivers (e.g., Potomac, Shenandoah, Monocacy, James) and as the main floodplain vegetation on medium-sized rivers draining areas of nutrient-rich substrates (e.g., Antietam Creek, Bull Run). Soil texture is variable, ranging from silty-clay loams to loams over much of the range, and samples collected from plots had high base status. This vegetation type is a closed forest with mixed overstory dominance by *Platanus occidentalis, Juglans nigra, Carya cordiformis, Celtis occidentalis, Ulmus americana*, and, locally, *Fraxinus pennsylvanica, Liriodendron tulipifera*, and *Quercus shumardii*. *Acer saccharinum* is codominant in a minority of

stands but absent or unimportant in many others. *Acer negundo* is strongly dominant in the subcanopy. *Asimina triloba* and/or *Lindera benzoin* dominate a moderately dense to dense shrub layer. The herb layer is rich in spring ephemerals and other nutrient-demanding species, including *Mertensia virginica, Asarum canadense, Chaerophyllum procumbens, Hydrophyllum canadense, Viola striata, Phlox divaricata, Podophyllum peltatum, Erythronium americanum, Dicentra canadensis, Sanicula odorata, Packera aurea (= Senecio aureus), Claytonia virginica, Festuca subverticillata, Carex jamesii, Carex grisea, Floerkea proserpinacoides, Osmorhiza longistylis*, and *Ranunculus abortivus*. Invasive exotics, especially *Alliaria petiolata, Veronica hederifolia, Duchesnea indica, Urtica dioica ssp. dioica, Microstegium vimineum*, and *Glechoma hederacea*, are usually abundant.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This rich floodplain forest occupies the higher elevations of floodplains, floodplain berms, and low terraces of major Mid-Atlantic rivers (Potomac, Shenandoah, Monocacy, Susquehanna) and as main floodplain vegetation on medium-sized rivers draining areas of nutrient-rich substrates (e.g., Antietam Creek, Bull Run, Blue Ridge Creeks in Pennsylvania). It was observed within the AT corridor in Giles and Bedford counties in Virginia and north in Washington County, along the Potomac River in Maryland and in Cumberland County, Pennsylvania. Soil texture is variable, ranging from silty-clay loams to loams over much of the range, but it can be sandy loams or sands along high-gradient reaches.

Global Environment: This association occupies the higher elevations of floodplains, floodplain berms, and low terraces of major Mid-Atlantic rivers (Potomac, Shenandoah, Monocacy) and as main floodplain vegetation on medium-sized rivers draining areas of nutrient-rich substrates (e.g., Antietam Creek, Bull Run). In the Potomac Gorge, average flood-return interval was from about 3 to 15 years. Soil texture is variable, ranging from silty-clay loams to loams over much of the range, but it can be sandy loams or sands along high-gradient reaches. Soil samples collected from plots have a mean pH of 6.1, high calcium content (mean about 2200 ppm), and 80-100% total base saturation.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by a mixture of *Platanus occidentalis, Juglans nigra, Carya cordiformis, Celtis occidentalis*, and *Ulmus americana*. *Acer negundo* is strongly dominant in the subcanopy. *Acer saccharinum* is codominant in a minority of stands but absent or unimportant in many others. *Asimina triloba* and/or *Lindera benzoin* dominate a moderately dense to dense shrub layer. This community is rich in spring ephemerals and nutrient-demanding species such as *Mertensia virginica, Asarum canadense, Chaerophyllum procumbens, Hydrophyllum canadense, Viola striata, Phlox divaricata, Podophyllum peltatum*, and others. Invasive exotics are typically abundant.

Global Vegetation: This vegetation type is a closed forest with mixed overstory dominance by *Platanus occidentalis, Juglans nigra, Carya cordiformis, Celtis occidentalis, Ulmus americana*, and, locally, *Fraxinus pennsylvanica, Liriodendron tulipifera*, and *Quercus shumardii*. *Acer saccharinum* is codominant in a minority of stands but absent or unimportant in many others. *Acer negundo* is strongly dominant in the subcanopy. *Asimina triloba* (usually on sites with coarser soil textures) and /or *Lindera benzoin* (on finer-textured substrates) dominate a moderately dense to dense shrub layer. Vines are common, with *Parthenocissus quinquefolia, Vitis vulpina*, and *Toxicodendron radicans* most frequent. The herb layer is rich in spring ephemerals and other nutrient-demanding species, including *Mertensia virginica, Asarum canadense, Chaerophyllum procumbens, Hydrophyllum canadense, Viola striata, Phlox divaricata, Podophyllum peltatum, Erythronium americanum, Dicentra canadensis, Sanicula odorata (= Sanicula gregaria), Packera aurea (= Senecio aureus), Claytonia virginica, Festuca subverticillata, Carex jamesii, Carex grisea, Floerkea proserpinacoides, Osmorhiza longistylis*, and *Ranunculus abortivus*. Invasive exotics may be abundant and are represented by *Alliaria petiolata, Veronica hederifolia, Duchesnea indica, Urtica dioica ssp. dioica, Microstegium vimineum*, and *Glechoma hederacea*.

Global: *Acer negundo*, *Asimina triloba*, *Juglans nigra*, *Mertensia virginica*, *Platanus occidentalis*, *Ulmus americana*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Phacelia covillei* (G3); **Invasive/Exotic Plants**: *Alliaria petiolata* (High/Medium), *Duchesnea indica* (Low/Insignificant), *Glechoma hederacea* (Low), *Microstegium vimineum* (High/Medium), *Urtica dioica* ssp. *dioica*, *Veronica hederifolia*

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (25-Jan-2005). The type is not rare but has a restricted geographic range, is confined to larger rivers in the Mid-Atlantic region, and is subject to continuing degradation by invasive species.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharinum - Acer negundo / Ageratina altissima - Laportea canadensis - (Elymus virginicus)* Floodplain Forest (CEGL006217)
- *Liriodendron tulipifera - Acer negundo - (Platanus occidentalis) / Carpinus caroliniana / Polygonum virginianum* Floodplain Forest (CEGL006492)
- *Platanus occidentalis - Acer saccharinum - Juglans nigra - Ulmus rubra* Floodplain Forest (CEGL007334) covers rich floodplain forest west of the Appalachians.
- *Platanus occidentalis - Fraxinus pennsylvanica / Carpinus caroliniana / Verbesina alternifolia* Floodplain Forest (CEGL006458)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This type was defined to cover rich large-stream floodplain forests of the Mid-Atlantic Piedmont and Central Appalachians.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: This type was defined to cover rich large-stream floodplain forests of the Mid-Atlantic Piedmont and Central Appalachians. It was split off from the more broadly defined *Platanus occidentalis - Acer saccharinum - Juglans nigra - Ulmus rubra* Floodplain Forest (CEGL007334). This type was classified through analysis of 36 plot samples from Virginia and Maryland and through consultation with ecologists from those states and West Virginia. It has also been confirmed for Pennsylvania.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs along major Mid-Atlantic rivers in Pennsylvania, Maryland, Virginia, and West Virginia. It was observed within the AT corridor in Giles and Bedford counties in Virginia and north in Washington County, along the Potomac River in Maryland and in Cumberland County, Pennsylvania.
Global Range: This community occurs on floodplains of large and medium-sized Mid-Atlantic rivers, including the Potomac, Shenandoah, James, Rappahannock, Monocacy, Clinch, and possibly others northward.

A3702 *Platanus occidentalis - Liquidambar styraciflua - Liriodendron tulipifera* Southern Appalachian Floodplain Forest Alliance

Alliance Summary Description: These are diverse floodplain forests with variable composition, typically dominated by some combination of *Celtis laevigata, Fraxinus pennsylvanica, Liquidambar styraciflua, Liriodendron tulipifera, Platanus occidentalis*, and *Ulmus americana*. Stands also probably include *Acer negundo, Carya cordiformis, Celtis occidentalis, Juglans nigra, Salix nigra*, and *Ulmus alata*. The understory may be dense and typically contains *Asimina triloba, Crataegus spathulata*, and *Lindera benzoin*. Examples are found in the interior south of the United States, including the Interior Low Plateau, southern Cumberlands/Ridge and Valley, the Piedmont, and the adjacent Southern Blue Ridge from Alabama north to the Carolinas and west to Kentucky and Tennessee. One association known from the Piedmont and the lower elevations of the adjacent Southern Blue Ridge may contain *Betula alleghaniensis* and/or *Betula lenta*.

[CEGL004691] *Platanus occidentalis - Liriodendron tulipifera - (Betula alleghaniensis) / Alnus serrulata - Leucothoe fontanesiana* Floodplain Forest

Translated Name: **American Sycamore - Tuliptree - (Yellow Birch) / Hazel Alder - Highland Doghobble Floodplain Forest**
Common Name: **Appalachian Montane Alluvial Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Floodplain Forest (M029)
Group	Silver Maple - Sugarberry - Sweetgum Floodplain Forest (G673)
Alliance	*Platanus occidentalis - Liquidambar styraciflua - Liriodendron tulipifera* Southern Appalachian Floodplain Forest Alliance (A3702)

ELEMENT CONCEPT

Global Summary: This association covers alluvial forests of Southern Blue Ridge and nearby portions of the inner Piedmont. This type is associated with narrow, rocky floodplains and islands in medium-sized rivers, typically at elevations below 915 m (3000 feet). It is more frequent below 610 m (2000 feet). Examples are known from the

Nantahala Gorge, Slickrock Creek, the South Toe River, and the Black and Craggy Mountains. Canopy composition of stands is variable but typical dominants are *Platanus occidentalis, Liriodendron tulipifera, Fraxinus americana, Betula alleghaniensis*, and *Betula lenta*. *Platanus* is characteristic, but not necessarily dominant in stands of this association. Other canopy/subcanopy trees can include *Carpinus caroliniana, Betula nigra, Acer rubrum, Pinus virginiana, Pinus strobus*, and *Tsuga canadensis*. In contrast to montane alluvial forests on the margins of the Southern Blue Ridge or on larger rivers, *Liquidambar styraciflua* is rare to absent in this type. The shrub stratum can be dense, often with local dominance by *Leucothoe fontanesiana* or *Rhododendron maximum*. Other characteristic shrubs include *Alnus serrulata, Xanthorhiza simplicissima, Corylus americana, Cornus amomum, Hamamelis virginiana, Euonymus americanus*, and *Hydrangea arborescens*. Vines can be prominent including *Aristolochia macrophylla, Parthenocissus quinquefolia, Smilax glauca, Smilax rotundifolia*, and *Vitis aestivalis*. Herbaceous species composition varies from site to site, and herbaceous strata can be quite patchy on the rocky substrate. Characteristic species known from these forests include *Amphicarpaea bracteata, Actaea racemosa (= Cimicifuga racemosa), Polystichum acrostichoides, Eurybia divaricata (= Aster divaricatus), Anemone quinquefolia, Athyrium filix-femina, Claytonia virginica, Erythronium americanum, Medeola virginiana, Packera aurea, Stellaria pubera, Tiarella cordifolia*, and *Viola blanda*. *Carex* species may be common (e.g., *Carex appalachica, Carex austrocaroliniana, Carex blanda, Carex digitalis, Carex plantaginea, Carex swanii, Carex torta*).

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This alluvial forest is associated with narrow, rocky floodplains and islands in medium-sized rivers.
Global Environment: This association covers alluvial forests of Southern Blue Ridge and nearby portions of the inner Piedmont. This type is associated with narrow, rocky floodplains and islands in medium-sized rivers, typically at elevations below 915 m (3000 feet). It is more frequent below 610 m (2000 feet). Examples are known from the Nantahala Gorge, Slickrock Creek (Newell et al. 1997), Great Smoky Mountains, the South Toe River, the Black Mountains, Craggy Mountains (McLeod and Ulrey unpubl. data), and the Chattahoochee National Forest of Georgia.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is typically dominated by *Platanus occidentalis, Liriodendron tulipifera, Fraxinus americana, Betula lenta*, and *Betula alleghaniensis*. Evergreen tree species are few to none. The shrub layer is often dense with *Rhododendron maximum* and *Leucothoe fontanesiana*. Other shrubs or small trees may include *Alnus serrulata, Xanthorhiza simplicissima, Carpinus caroliniana, Corylus americana, Cornus amomum, Hamamelis virginiana, Euonymus americanus*, and *Hydrangea arborescens*. Vine species such as *Parthenocissus quinquefolia, Aristolochia macrophylla, Smilax glauca*, and *Smilax rotundifolia* may occur.
Global Vegetation: Canopy composition of stands is variable but typical dominants are *Platanus occidentalis, Liriodendron tulipifera, Fraxinus americana, Betula alleghaniensis*, and *Betula lenta*. *Platanus* is characteristic but not necessarily present in all stands of this association. Other canopy/subcanopy trees can include *Carpinus caroliniana, Betula nigra, Acer rubrum, Pinus virginiana, Pinus strobus*, and *Tsuga canadensis*. In contrast to montane alluvial forests on the margins of the Southern Blue Ridge or on larger rivers, *Liquidambar styraciflua* is rare to absent in this type. The shrub stratum can be dense, often with local dominance by *Leucothoe fontanesiana* or *Rhododendron maximum*. Other characteristic shrubs include *Alnus serrulata, Xanthorhiza simplicissima, Corylus americana, Cornus amomum, Hamamelis virginiana, Euonymus americanus*, and *Hydrangea arborescens*. Vines can be prominent including *Aristolochia macrophylla, Parthenocissus quinquefolia, Smilax glauca, Smilax rotundifolia*, and *Vitis aestivalis*. Herbaceous species composition varies from site to site, and herbaceous strata can be quite patchy on the rocky substrate. Characteristic species known from these forests include *Amphicarpaea bracteata, Actaea racemosa (= Cimicifuga racemosa), Polystichum acrostichoides, Eurybia divaricata (= Aster divaricatus), Anemone quinquefolia, Athyrium filix-femina, Claytonia virginica, Erythronium americanum, Medeola virginiana, Packera aurea, Stellaria pubera, Tiarella cordifolia*, and *Viola blanda*. In addition, *Carex* species may be common (e.g., *Carex appalachica, Carex austrocaroliniana, Carex blanda, Carex digitalis, Carex plantaginea, Carex swanii, Carex torta*).

M503. Central Hardwood Swamp Forest

G597. Central Hardwood Flatwoods & Swamp Forest

Group Summary Description: This wooded wetland vegetation group encompasses various primarily non-alluvial wetlands of the central to east-central United States. It is a diverse group, containing types associated with ponds and depressions, as well as various kinds of flatwoods. Ponded examples vary from open water to herb-, shrub-, or tree-dominated. The vegetation may be zoned, with an outer ring of trees, a more interior ring of shrubs, herbs and vines, and possibly a deeper central area with or without standing water year-round depending on precipitation. *Quercus* species, including *Quercus bicolor* and *Quercus palustris*, dominate the canopy in many examples of this group. In addition, *Acer rubrum, Acer saccharinum, Fraxinus pennsylvanica, Nyssa* spp., *Platanus occidentalis, Ulmus americana*, or a combination of these, may dominate. *Cephalanthus occidentalis* is a typical shrub component in areas with a longer hydroperiod. The herbaceous layer is widely variable depending on geography and hydroperiod. In flatwoods examples, across the upper Midwest and Lower New England, *Quercus bicolor* and/or *Quercus palustris* are the common oak species. South of the glaciated Midwest (e.g., in the Ozarks), *Quercus stellata* is more common. Drier examples of flatwoods across the range of this group may have *Acer rubrum, Fagus grandifolia, Nyssa sylvatica, Quercus alba, Quercus rubra*, and *Quercus velutina*. Understory shrub and herbaceous species vary with moisture level and canopy density. Flooding, drought, and fire can impact examples of this vegetation. Fire is particularly important in flatwoods examples found in the south-central United States.

These wetland features are the result of topographic or edaphic circumstances that promote an enhanced hydroperiod at these sites, and this affects the vegetation and dynamics of these communities. The depressional swamps and flatwoods associations are found throughout the northern glaciated Midwest into the south-central United States ranging east into Lower New England. Stands of both types occur on flat to gently sloping to undulating surfaces, as well as in shallow to deep basins of sinkholes or other isolated depressions on uplands, as well as poorly drained uplands; glaciated examples occur in depressions associated with glacial features such as tillplains, lakeplains or outwash plains. Soils are poorly drained to very poorly drained, and surface water may be present for extended periods of time, rarely becoming dry. Soils often contain an impermeable clay layer or fragipan creating a shallow, perched water table. Saturation can vary, with ponding common during wetter seasons, and drought possible during the summer and autumn months.

The typical hydrology is seasonally flooded, but the hydroperiod may be of greater or lesser length, depending on the depth of the basin or depression feature and the annual rainfall. Water depth may vary greatly on a seasonal basis and may be a meter deep or more in the winter in longer hydroperiod examples. Some examples become dry in the summer. Soils may be deep (100 cm or more), consisting of poorly drained mineral soil, as well as of peat or muck, with parent material of peat, muck or alluvium. Microtopography and fluctuating moisture levels can lead to complexes of forest upland and wetland species occurring within this group.

A3408 *Quercus palustris - Quercus bicolor* Flooded & Swamp Forest Alliance

Alliance Summary Description: This floodplain forest occurs along smaller rivers in southern New England and the northern Piedmont, as well as in West Virginia. The setting can range from high terraces to any broad flat area with diffuse or braided drainage. The canopies of examples in New England and the northern Piedmont contain *Fraxinus pennsylvanica, Quercus palustris*, and *Ulmus americana*, with *Acer rubrum* and occasionally with *Quercus bicolor*. In addition, *Carya cordiformis, Fraxinus americana, Fraxinus nigra, Nyssa sylvatica*, and/or *Platanus occidentalis* may be present. West Virginia examples are dominated by *Quercus palustris* in association with *Acer rubrum, Carya ovata, Fraxinus americana, Fraxinus nigra, Nyssa sylvatica*, and *Quercus bicolor*. The shrub layer is dominated by *Carpinus caroliniana, Cornus amomum, Ilex verticillata, Lindera benzoin*, and *Viburnum dentatum*.

[CEGL006185] *Quercus palustris - Acer rubrum / Carex grayi - Geum canadense* Wet Forest

Translated Name: **Pin Oak - Red Maple / Gray's Sedge - White Avens Wet Forest**
Common Name: **Pin Oak Small River Floodplain Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Swamp Forest (M503)
Group	Central Hardwood Flatwoods & Swamp Forest (G597)
Alliance	*Quercus palustris* - *Quercus bicolor* Flooded & Swamp Forest Alliance (A3408)

ELEMENT CONCEPT

Global Summary: This freely drained floodplain forest occurs along smaller rivers in southern New England and the northern Piedmont. The setting can range from high terraces to any broad flat area with diffuse or braided drainage. The canopy is composed of *Quercus palustris, Fraxinus pennsylvanica, Acer rubrum, Ulmus americana*, and occasionally *Quercus bicolor, Fraxinus americana, Fraxinus nigra, Carya cordiformis, Nyssa sylvatica*, and/or *Platanus occidentalis*. More typically upland trees sometimes found on these terraces include *Quercus alba, Liriodendron tulipifera, Betula alleghaniensis, Pinus strobus*, and *Acer saccharum*. *Carpinus caroliniana* may be present as a small tree. The shrub layer includes *Lindera benzoin, Viburnum recognitum, Cornus amomum, Cornus obliqua*, or *Sambucus canadensis*. The herbaceous layer is variable in composition and usually dense. It can have abundant sedges, including *Carex lurida, Carex crinita, Carex intumescens, Carex rosea, Carex prasina, Carex lupulina*, or *Carex grayi*, with additional species such as *Cinna arundinacea, Leersia virginica, Panax trifolius, Symplocarpus foetidus, Geum canadense, Polygonum virginianum (= Tovara virginiana), Impatiens* spp., *Onoclea sensibilis, Athyrium filix-femina, Arisaema triphyllum, Iris versicolor, Viola sororia*, and *Toxicodendron radicans*. *Berberis thunbergii* and *Microstegium vimineum* are common invasive species in these forests.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This pin oak - red maple floodplain forest occurs in a temporarily flooded streambed. Evidence of disturbance includes the presence of exotic plants.

Global Environment: This forest occurs on alluvial deposits in the floodplain of small rivers. Flooding occurs during local events, especially during winter months. These areas can be seasonally, temporarily or intermittently flooded, often with networks of small drainages and pools throughout. Many of these areas were previously used as pasture.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This floodplain forest has abundant *Acer rubrum* and along with a significant component of *Quercus palustris*; canopy associates include *Fraxinus pennsylvanica, Ulmus americana, Salix nigra*, and occasionally *Quercus bicolor*. Shrubs include *Lindera benzoin, Rosa multiflora*, and other exotics. The herb layer is generally diverse with abundant *Carex* spp., *Impatiens capensis, Lysimachia nummularia* (exotic), and *Boehmeria cylindrica*. In addition, the site supports NJ state-critically imperiled *Cinna latifolia*.

Global Vegetation: The canopy is composed of *Quercus palustris, Fraxinus pennsylvanica, Acer rubrum, Ulmus americana*, and occasionally *Quercus bicolor, Fraxinus americana, Fraxinus nigra, Carya cordiformis, Nyssa sylvatica*, and/or *Platanus occidentalis*. More typically upland trees sometimes found on these terraces include *Quercus alba, Liriodendron tulipifera, Betula alleghaniensis, Pinus strobus*, and *Acer saccharum*. *Carpinus caroliniana* may be present as a small tree. The shrub layer includes *Lindera benzoin, Viburnum recognitum, Cornus amomum, Cornus obliqua*, or *Sambucus canadensis*. The herbaceous layer is variable in composition and usually dense. It can have abundant sedges, including *Carex lurida, Carex crinita, Carex intumescens, Carex rosea, Carex prasina, Carex lupulina*, or *Carex grayi*, with additional species such as *Cinna arundinacea, Leersia virginica, Panax trifolius, Symplocarpus foetidus, Geum canadense, Polygonum virginianum (= Tovara virginiana), Impatiens* spp., *Onoclea sensibilis, Athyrium filix-femina, Arisaema triphyllum, Iris versicolor, Viola sororia*, and *Toxicodendron radicans*. *Berberis thunbergii* and *Microstegium vimineum* are common invasive species in these forests.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (20-May-2011). Approximately 50 occurrences occupying 10,000 acres or less are estimated over a somewhat limited range from southern New England to central New Jersey. This vegetation has likely declined over the short term and long term due to a number of human activities. Since many occurrences are located not far from large urban centers, existing occurrences face continued threats of construction and agriculture and associated runoff, as well as from hydrological manipulations such as culverts.

G044. CENTRAL INTERIOR-APPALACHIAN SEEPAGE SWAMP

Group Summary Description: This group of deciduous acidic seepage swamp forest communities is found primarily in two distinctive cool temperate regions of eastern North America. One of these constitutes the broadly conceived Appalachian region, including the southern Piedmont, the Cumberland Plateau and Ridge and Valley regions, parts of the Central Appalachians, and portions of the Southern Blue Ridge including the flat metasedimentary upland surfaces of Chilhowee Mountain, Tennessee. Some of the associations from this region range peripherally into the adjacent Interior Low Plateau and coastal plains, but these areas are not part of the core area. The other part of the group's range includes the unglaciated Interior Low Plateau from Alabama to Kentucky, and the Ouachitas and Ozarks of Arkansas and Oklahoma. These wetland forests generally occur where the substrate is saturated to the surface for extended periods during the growing season, but where surface water is seldom present for more than short periods of time. For example, in the Cumberland Plateau, stands most often occur in streamhead swales or on broad sandstone ridges where soils are sandy and saturated due to a combination of perched water table and seepage flow. Examples range in condition from open woodlands to forests. Typical woody species include *Acer rubrum, Nyssa sylvatica, Liriodendron tulipifera, Liquidambar styraciflua, Ilex opaca var. opaca, Oxydendrum arboreum*, and *Viburnum nudum*. In the Piedmont, vegetation is variable within and among examples. Included are seepage-fed wetlands on gentle slopes, with substantial seepage flow and which may be influenced by wildland fire. In the Ouachita Mountains of central Arkansas, as well as on Mount Magazine and in the Ozarks, examples may be found along the bottom slopes of smaller valleys, as well as in the upper riparian zones of larger creeks, sometimes extending upslope along small ephemeral drainages. The soil remains saturated to very moist throughout the year. The vegetation is typically forested with highly variable canopy composition. *Acer rubrum var. trilobum, Nyssa sylvatica, Liquidambar styraciflua*, and *Quercus alba* are common and typical. Other canopy species may include *Fagus grandifolia* and *Magnolia tripetala*. Canopy coverage can be moderately dense to quite open. The subcanopy is often well-developed and characteristically includes *Ilex opaca var. opaca, Magnolia tripetala, Carpinus caroliniana*, and *Ostrya virginiana*. Individual occurrences of these forests tend to be small in extent and can provide habitat for rare plant and animal species.

A3358 *Acer rubrum / Alnus serrulata - Ilex verticillata* Appalachian-Piedmont Seepage Forest Alliance

Alliance Summary Description: Vegetation of this alliance is found in forested acidic seeps and saturated swamp forests of the southern Piedmont and Appalachian regions of the southeastern United States. Forests in this alliance have variable canopy composition, but *Acer rubrum* and *Nyssa sylvatica* are common components. Canopy composition differs from the surrounding upland and varies with geography. Typical canopy species across the range of this alliance include *Acer rubrum var. trilobum, Nyssa sylvatica*, and *Liriodendron tulipifera*. One association contains *Pinus strobus*. Understory and shrub species include *Alnus serrulata, Ilex opaca var. opaca, Ilex verticillata, Photinia pyrifolia (= Aronia arbutifolia), Rhododendron canescens*, and *Viburnum nudum var. nudum*. Characteristic herbaceous species include *Carex* spp., *Osmunda cinnamomea, Osmunda regalis*, and *Woodwardia areolata*. In addition, *Sphagnum* spp. are typical. These wetland forests generally occur where the soils are saturated to the surface for extended periods during the growing season, but where surface water is seldom present. These forested, primarily acidic seeps are found on hillsides, streamheads, floodplain edges, poorly drained depressions, and gentle slopes where saturated conditions influence the vegetation.

Alliance	*Acer rubrum / Alnus serrulata - Ilex verticillata* Appalachian-Piedmont Seepage Forest Alliance (A3358)

Element Concept

Global Summary: This community occurs on groundwater-saturated flats and low slopes along streams in the Ridge and Valley, northern Cumberland Plateau, Northern Blue Ridge, and western Piedmont at elevations of 200-900 m (700-2900 feet). Habitats are usually more-or-less narrow and elongate, with hummock-and-hollow microtopography, and frequently with a small ephemeral stream channel running through or adjacent to the community. Substrates are poorly drained mineral soils with numerous hydric indicators. The ground surface is slightly sloping, and drainage is usually via small, intricately braided channels with interspersed hummocks. The canopy is usually closed and consists of *Acer rubrum, Nyssa sylvatica*, and *Liriodendron tulipifera*. *Quercus alba* is an important associate in some areas, and *Ulmus rubra, Fraxinus americana*, and *Platanus occidentalis* are present in some stands. Minor or local tree species include *Magnolia acuminata, Tsuga canadensis, Betula lenta, Pinus rigida*, and *Pinus strobus*. The shrub stratum may be well-developed and includes *Ilex verticillata, Ilex opaca, Vaccinium corymbosum, Kalmia latifolia, Alnus serrulata, Viburnum nudum var. cassinoides, Viburnum dentatum, Smilax* spp., and, less consistently, *Carpinus caroliniana, Asimina triloba, Euonymus americanus, Lindera benzoin, Gaylussacia frondosa, Gaylussacia baccata, Menziesia pilosa, Vaccinium fuscatum, Chionanthus virginicus, Viburnum nudum var. nudum, Rhododendron viscosum*, and *Toxicodendron vernix*. *Rubus hispidus* is an abundant creeping vine in many stands. Typical herbaceous plants include *Osmunda cinnamomea, Carex gynandra, Carex lurida, Carex atlantica, Carex debilis, Thelypteris noveboracensis, Platanthera clavellata, Chelone glabra, Medeola virginiana, Dioscorea quaternata, Juncus effusus, Lycopus uniflorus, Lycopodium obscurum, Osmunda regalis var. spectabilis, Symplocarpus foetidus, Veratrum viride, Viola hastata*, and *Viola cucullata*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This narrow seepage swamp occurs on groundwater-saturated flats and low slopes along headwater streams at elevations of 200 to 900 m (700-2,900 feet) in areas underlain by acidic sedimentary and metamorphic rocks. One plot was sampled in Loudon County, Virginia, in the Central Appalachian project area. It is a small-patch community that is well-developed in the large alluvial fans along the western foot of the Northern Blue Ridge and in small-stream valleys and low-gradient plateau drainages of the Ridge and Valley province and parts of the Cumberland Plateau. Habitats are usually more-or-less narrow and elongate, with hummock-and-hollow microtopography, and frequently with a small ephemeral stream channel running through or adjacent to the community. Substrates are poorly drained mineral soils. The unvegetated surface is dominated by leaf litter.

Global Environment: This community occurs on groundwater-saturated flats along low- to middle-elevation streams and headwaters seeps in areas underlain by acidic sedimentary and metamorphic rocks. It is a small-patch type that is particularly frequent and well-developed in the large alluvial fans along the western foot of the Northern Blue Ridge and in small-stream valleys and low-gradient plateau drainages of the Ridge and Valley province and parts of the Cumberland Plateau. Outliers occur throughout the western Piedmont, particularly in districts underlain by acidic metasedimentary rocks. Habitats are usually more-or-less narrow and elongate, with hummock-and-hollow microtopography, and frequently with a small ephemeral stream channel running through or adjacent to the community. Substrates are poorly drained mineral soils with numerous hydric indicators, including saturated horizons, oxidized root channels, low chroma, gley, and mottles. Local areas of organic muck sometimes accumulate in depressions. The ground surface is slightly sloping, and drainage is usually via small, intricately braided channels with interspersed hummocks. Moss mats, predominantly of *Sphagnum* spp., are usually abundant and provide a rooting medium for herbaceous species. Soils collected from plot samples are very strongly acidic with moderately low to very low base status. Patches of this community are mostly shaded by overhanging trees, but sunny spots may be created by canopy gaps, and larger patches may have small open centers.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Acer rubrum* is dominant or codominant with *Nyssa sylvatica* in the canopy often with *Liriodendron tulipifera*. *Hamamelis virginiana, Amelanchier arborea, Chionanthus virginicus, Lindera benzoin*, and *Rubus hispidus* are common shrubs. *Osmunda cinnamomea var. cinnamomea* dominates the ground story with patches of *Symplocarpus foetidus* and *Thelypteris noveboracensis*. Other herbs include *Maianthemum canadense, Eurybia divaricata*, and *Viola cucullata*.
Global Vegetation: This forest association has an open to closed canopy of *Acer rubrum, Nyssa sylvatica*, and *Liriodendron tulipifera*. *Quercus alba* is an important associate in some areas, and *Ulmus rubra, Fraxinus americana*, and *Platanus occidentalis* are present in some stands. *Pinus rigida* is a frequent overstory associate in some Ridge and Valley and Blue Ridge stands, although its numbers have been recently reduced by southern pine beetle outbreaks. Minor tree species, especially at the higher elevations, include *Magnolia acuminata, Tsuga canadensis, Betula lenta*, and *Pinus strobus*. A single, anomalous stand in Augusta County, Virginia, contains an abundance of the disjunct Coastal Plain tree *Magnolia virginiana* (Carr 1939). *Amelanchier arborea* is usually common in the understory, along with reproduction of *Acer rubrum* and *Nyssa sylvatica*. The shrub stratum is often well-developed and includes *Ilex verticillata, Ilex opaca, Kalmia latifolia, Alnus serrulata, Viburnum dentatum, Photinia pyrifolia (= Aronia arbutifolia), Vaccinium corymbosum*, and *Smilax* spp. Less frequent, but locally important, shrubs include *Asimina triloba, Vaccinium fuscatum, Euonymus americanus, Toxicodendron vernix, Viburnum nudum var. nudum, Viburnum nudum var. cassinoides, Menziesia pilosa, Carpinus caroliniana, Chionanthus virginicus, Lindera benzoin, Gaylussacia frondosa, Rhododendron catawbiense, Rhododendron periclymenoides*, and *Rhododendron viscosum*. *Rubus hispidus* is an abundant creeping vine in many stands; *Smilax rotundifolia* may also be present. The most characteristic herbaceous plants are *Osmunda cinnamomea, Osmunda regalis var. spectabilis, Platanthera clavellata, Chelone glabra, Rubus hispidus, Viola cucullata, Carex gynandra, Carex lurida, Carex atlantica, Carex debilis, Oxypolis rigidior, Thelypteris noveboracensis, Athyrium filix-femina, Dioscorea quaternata, Juncus effusus, Lycopus uniflorus, Medeola virginiana, Polystichum acrostichoides, Potentilla simplex*, and *Viola hastata*. Where shrubs are sparse, as in most of the West Virginia occurrences, fern cover is typically extensive. Less frequent but typical herbs include *Parnassia asarifolia, Carex intumescens, Carex leptalea, Symplocarpus foetidus, Veratrum viride, Maianthemum canadense, Lycopodium obscurum, Onoclea sensibilis, Leersia virginica, Boehmeria cylindrica, Lycopus virginicus, Glyceria striata*, and *Dryopteris cristata*. Many additional herbaceous species, including several more typical of uplands, occur at low constancy and cover. The bryophyte layer may also be diverse; species of mosses and liverworts identified from plots include *Atrichum undulatum, Aulacomnium palustre, Bryhnia novae-angliae, Callicladium haldanianum, Campylium radicale, Dicranum scoparium, Hypnum imponens, Jungermannia gracillima, Leucobryum albidum, Mnium hornum, Pellia epiphylla, Plagiomnium ciliare, Platygyrium repens, Steerecleus serrulatus*, and *Thuidium delicatulum*. Mean vascular plant species richness of 37 plot-sampled stands in Virginia and West Virginia is 47 taxa per 400 square meters.

Global: Vulnerable Plants: *Eriocaulon decangulare* (G5, VA state-rare), *Helonias bullata* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (14-Feb-2012). This association has a narrow geographic range and is further limited by its requirement for special, localized wetlands. The type is confined to groundwater-saturated, nutrient-poor habitats that are large enough to support forest vegetation. February 2012: Two issues regarding the global rank have emerged since the analysis of this type using the rank calculator in 2008. The calculator produced a rank of G1. The rank of G1Q was assigned based on the taxonomic overlap with other associations of the alliance, especially *Acer rubrum - Nyssa sylvatica* High Allegheny Plateau-Central Appalachian Seep Forest (CEGL006132). However, after further discussion with ecologists in the Virginia Division of Natural Heritage, the suggested assigned rank is G2. This type occurs naturally in small patches, so that even a moderately large number of occurrences yields a low area of occupancy. The rank calculator assigns an automatic G1 for areas of occupancy <250 sq km regardless of the number of occurrences. The taxonomic status of the type is felt to be robust because its classification was the result of a regional analysis conducted for the vegetation classification and mapping of the National Capital Region parks.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: The one plot in Loudon County, Virginia, is located along a narrow feeder seep, where *Trientalis borealis* occurs at its lowest elevation in Virginia. The co-occurrence of this species with *Toxicodendron vernix*, a rarity in the mountainous portions of the state, is a notable floristic feature of the community.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Examples occur near the Maple Flats pond complex (Augusta County, Virginia). This community is also known from Massanutten Mountain (Lee District, George Washington National Forest), elsewhere along the foot of the Blue Ridge (north of Maple Flats), a site on the northern Blue Ridge in Loudoun County, Virginia (owned by The Appalachian Trail Club), and in the Bull Run Mountains of Virginia, an isolated Piedmont foothill in Fauquier and Prince William counties, Virginia; occurrences in the latter two areas do not have *Pinus rigida* (or much of it) but are otherwise very similar (Fleming 1998). Quantitative analysis of a 1300-plot regional dataset for the National Capital Region Parks Vegetation Mapping Project Phase I indicate that a portion of Gould and Berdine's (1998) "circumneutral" seepage swamp community from Catoctin Mountain, Maryland, also corresponds to this type. It has also been sampled in West Virginia, where occurrences generally lack a dense shrub layer and are characterized by heavy fern cover.

There are unresolved issues regarding conceptual overlap between this type and *Acer rubrum - Nyssa sylvatica* High Allegheny Plateau-Central Appalachian Seep Forest (CEGL006132). The latter type is a broadly defined community type that encompasses both seepage wetlands and poorly drained depressions. The community classified and described here for Virginia is limited conceptually to flow-through, groundwater-seepage wetlands. Communities with similar *Acer - Nyssa* canopies but occurring in saturated to seasonally flooded depression wetlands without apparent seepage inputs have been documented in Virginia but are not treated due to insufficient data. Nevertheless, they appear to warrant segregation from the seepage wetland communities because of their hydrologic regime, distinctly different herbaceous composition, and much lower species richness.

This type is currently under-represented by plot data, but observations suggest that it is relatively consistent in its composition and environmental affiliations. However, community characterization and nomenclature are

subject to change pending further data collection and analysis, ideally based on wider geographic sampling. The recognition of segregate associations, subassociations, or variants may also be warranted following additional assessment. Lower-elevation sites are characterized by *Amianthium muscitoxicum, Brachyelytrum erectum, Carex debilis, Carex intumescens, Cypripedium acaule, Gaylussacia frondosa, Lindera benzoin, Platanthera ciliaris, Platanthera clavellata, Uvularia sessilifolia, Viburnum nudum var. nudum*, and *Viola x primulifolia*. Middle-elevation sites are characterized by *Oclemena acuminata (= Aster acuminatus), Betula lenta, Magnolia acuminata, Pinus strobus, Rhododendron catawbiense*, and *Rhododendron viscosum*. A single site (Magnolia Swamp), possibly with boggier or more organic soils, is characterized by *Magnolia virginiana, Arethusa bulbosa, Dulichium arundinaceum, Juncus effusus, Parthenocissus quinquefolia, Triadenum virginicum*, and *Woodwardia areolata*.

This type is similar in many respects to, and intergrades with, Montane Basic Seepage Swamps that are situated on calcareous soils derived from metabasalt (greenstone) and carbonate rock substrates [see *Acer rubrum - Fraxinus nigra - Betula alleghaniensis / Veratrum viride - Carex bromoides* Seep Forest (CEGL008416)]. These environmentally disparate swamps share a surprising number of prominent species including *Acer rubrum, Symplocarpus foetidus, Veratrum viride, Osmunda cinnamomea, Osmunda regalis var. spectabilis, Carex leptalea*, etc. Acidic seepage swamps, however, have lower species richness and mostly lack distinctly base-loving species such as *Fraxinus americana, Fraxinus nigra, Caltha palustris, Carex bromoides, Saxifraga pensylvanica*, etc. *Sphagnum* mosses, as well as many vascular plants that characterize Acidic Seepage Swamps, are absent or unimportant in the calcareous swamps. Examples include *Pinus rigida, Nyssa sylvatica, Viburnum nudum, Parnassia asarifolia, Platanthera ciliaris, Platanthera clavellata, Rubus hispidus, Lycopodium obscurum, Carex debilis*, and *Carex folliculata* (Fleming and Van Alstine 1999).

Formerly a common canopy tree of this community type in certain localities (e.g., Maple Flats, Augusta County), *Pinus rigida* has been nearly eliminated from many stands by a recent outbreak of southern pine beetles (*Dendroctonus frontalis*).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from the Central Appalachians of Maryland and Virginia into the Cumberland Mountains in West Virginia. It was sampled at Piney Run West Branch in Loudon County, Virginia.
Global Range: The documented range of this community type encompasses the Central Appalachians of Maryland and Virginia, and the Cumberland Mountains in West Virginia. In Virginia, it is scattered throughout the mountains (Northern Blue Ridge) and, more locally, the western Piedmont (Allard and Leonard 1943).

Macrogroup	Central Hardwood Swamp Forest (M503)
Group	Central Interior-Appalachian Seepage Swamp (G044)
Alliance	*Acer rubrum / Alnus serrulata - Ilex verticillata* Appalachian-Piedmont Seepage Forest Alliance (A3358)

Element Concept

Global Summary: These forested acidic seeps occur in the Cumberland Plateau, the Ridge and Valley, areas of the western portions of the Southern Blue Ridge at lower elevations, as well as in the Appalachian Plateaus of Kentucky (Cliff section), and western Kentucky at the edge of the Shawnee Hills (Dripping Springs Escarpment). These forests are found primarily in streamhead swales on broad ridges on sandy, saturated soils derived from shales and sandstones. This community develops where a perched water table is present, as opposed to seepage from the base of a slope [for vegetation related to this latter condition, see *Acer rubrum var. trilobum - Nyssa sylvatica / Rhododendron canescens - Viburnum nudum var. nudum / Woodwardia areolata* Seep Forest (CEGL004425)]. Canopy coverage can be moderately dense to quite open. Canopy composition is highly variable, but *Acer rubrum var. trilobum, Nyssa sylvatica, Liriodendron tulipifera*, and *Liquidambar styraciflua* are common. Subcanopy trees can include *Ilex opaca var. opaca, Carpinus caroliniana*, and (within range) *Magnolia macrophylla*. Tall shrubs are scattered and may be locally dominant. Typical shrubs include *Ilex verticillata, Alnus serrulata, Rhododendron maximum, Photinia melanocarpa (= Aronia melanocarpa), Vaccinium simulatum, Viburnum nudum var. nudum*, and *Cornus foemina*. In examples from the Southern Blue Ridge, *Viburnum nudum var. cassinoides* will replace *Viburnum nudum var. nudum* in this type. Woody vines can be common and include *Toxicodendron radicans* and (especially towards the southern part of the association's distribution), *Decumaria barbara* and *Bignonia capreolata*. Typical herbaceous species include *Osmunda cinnamomea, Osmunda regalis var. spectabilis, Chasmanthium laxum, Thelypteris noveboracensis, Woodwardia areolata, Oxypolis rigidior, Carex intumescens, Carex debilis, Carex crinita, Medeola virginiana, Lobelia cardinalis, Juncus effusus var. pylaei, Scirpus polyphyllus, Rubus hispidus, Solidago patula var. patula, Athyrium filix-femina ssp. asplenioides*, and *Viola x primulifolia*. *Platanthera integrilabia* and *Platanthera clavellata* are also known from these forested seeps but are more typical in more open woodland seeps. Patches of *Sphagnum* spp. are common and *Sphagnum lescurii* is typical. In the Daniel Boone National Forest (Kentucky), some stands can contain *Tsuga canadensis* and be transitional to *Tsuga canadensis - Acer rubrum - (Nyssa sylvatica) / Rhododendron maximum / Sphagnum* spp. Seep Forest (CEGL007565).

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This small-patch forested seep community was observed at Dick's Creek Gap in Georgia at 900 m (2,950 feet) elevation. There is a stream flowing through it.
Global Environment: These forests are found primarily in streamhead swales on broad ridges on sandy, saturated soils derived from shales and sandstones. This community develops where a perched water table is present, as opposed to seepage from the base of a slope.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by *Nyssa sylvatica* over an understory dominated by *Rhododendron maximum*.
Global Vegetation: Canopy coverage can be moderately dense to quite open. Canopy composition is highly variable, but *Acer rubrum var. trilobum, Nyssa sylvatica, Liriodendron tulipifera*, and *Liquidambar styraciflua* are common. Subcanopy trees can include *Ilex opaca var. opaca, Carpinus caroliniana*, and (within range) *Magnolia macrophylla*. Tall shrubs are scattered and may be locally dominant. Typical shrubs include *Ilex verticillata, Alnus serrulata, Rhododendron maximum, Photinia melanocarpa (= Aronia melanocarpa), Photinia pyrifolia (= Aronia arbutifolia), Vaccinium simulatum, Viburnum nudum var. nudum, Arundinaria gigantea*, and *Cornus foemina*. In examples from the Southern Blue Ridge, *Viburnum nudum var. cassinoides* will replace *Viburnum nudum var. nudum* in this type. Woody vines can be common, and include *Toxicodendron radicans* and (especially towards the

southern part of the association's distribution), *Decumaria barbara* and *Bignonia capreolata*. Typical herbaceous species include *Osmunda cinnamomea, Osmunda regalis var. spectabilis, Chasmanthium laxum, Thelypteris noveboracensis, Woodwardia areolata, Woodwardia virginica, Oxypolis rigidior, Carex intumescens, Carex debilis, Carex crinita, Medeola virginiana, Lobelia cardinalis, Oxypolis rigidior, Juncus effusus var. pylaei, Scirpus polyphyllus, Rubus hispidus, Solidago patula var. patula, Lycopus uniflorus, Athyrium filix-femina ssp. asplenioides*, and *Viola x primulifolia*. *Platanthera integrilabia* and *Platanthera clavellata* are also known from these forested seeps but are more typical in more open woodland seeps. Patches of *Sphagnum* spp. are common and *Sphagnum lescurii* is typical. These forests are found primarily in streamhead swales on broad ridges on sandy, saturated soils derived from shales and sandstones. This community develops where a perched water table is present, as opposed to seepage from the base of a slope [for vegetation related to this latter condition, see *Acer rubrum var. trilobum - Nyssa sylvatica / Rhododendron canescens - Viburnum nudum var. nudum / Woodwardia areolata* Seep Forest (CEGL004425)]. In the Daniel Boone National Forest (Kentucky), some stands can contain *Tsuga canadensis*, and be transitional to *Tsuga canadensis - Acer rubrum - (Nyssa sylvatica) / Rhododendron maximum / Sphagnum* spp. Seep Forest (CEGL007565).

Global

Stratum	Lifeform	Species
Tree canopy	Broad-leaved deciduous tree	*Nyssa sylvatica*
Tall shrub/sapling	Broad-leaved evergreen shrub	*Rhododendron maximum*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Nyssa sylvatica*, *Rhododendron maximum*
Global: *Acer rubrum* var. *trilobum*, *Carex intumescens*, *Chasmanthium laxum*, *Nyssa sylvatica*, *Osmunda cinnamomea*, *Sphagnum lescurii*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Cypripedium kentuckiense* (G3), *Hexastylis contracta* (G3), *Hexastylis shuttleworthii* var. *harperi* (G4T3), *Platanthera integra* (G3G4), *Platanthera integrilabia* (G2G3), *Vaccinium hirsutum* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3? (30-Dec-2008). This association is restricted to a small-scale wetland habitat in a limited region. It is vulnerable to alteration or destruction by various anthropogenic activities, including hydrologic modifications. Most examples are on private land and remain unprotected.

RELATED CONCEPTS

Global Similar Types:
- *Acer rubrum var. trilobum - Nyssa sylvatica / Rhododendron canescens - Viburnum nudum var. nudum / Woodwardia areolata* Seep Forest (CEGL004425) is related to seepage at the base of a slope.
- *Acer rubrum var. trilobum / Alnus serrulata / Calamagrostis coarctata* Seep Woodland (CEGL003737) is more open and on coarser substrates.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: No plots or observation points were sampled for this community; however, it was observed by a NatureServe ecologist and the UMESC mapping team during the summer of 2010 during mapping reconnaissance.
Global Classification Comments: There is a good deal of variability in examples of saturated *Acer rubrum var. trilobum - Nyssa sylvatica* forests in this region, in terms of hydroperiod, extent, and environment. More typical examples exhibit dominance or at least codominance by *Osmunda cinnamomea*, but some apparently drier or shorter hydroperiod examples are dominated by *Thelypteris noveboracensis* instead, and often lack *Sphagnum* or have it at very low density. These are included here as marginal to the concept and may represent either part of the natural

variation or lower quality examples. Often this apparent variability is present within one stream reach. Some "examples" or parts of examples are very narrow bands along streams, and these are effectively below the minimum size for an occurrence, and thus would be mappable only at the very finest scales.

Examples are known from the Somerset and Stearns ranger districts of the Daniel Boone National Forest, in the Appalachian Plateaus, Cliff section of Kentucky. Similar seeps are known from western Kentucky, at the edge of the Shawnee Hills; they are included here for now. Related vegetation from the Cretaceous Gravel Hills of the Mississippi Embayment, which occurs at the bases of slopes rather than in streamheads on broad ridges, is accommodated in *Acer rubrum var. trilobum - Nyssa sylvatica / Rhododendron canescens - Viburnum nudum var. nudum / Woodwardia areolata* Seep Forest (CEGL004425). This association is known from Tennessee in the southwestern portion of the southern Blue Ridge. A similar woodland community is *Acer rubrum var. trilobum / Alnus serrulata / Calamagrostis coarctata* Seep Woodland (CEGL003737). In general, stands of this association (CEGL007443) have greater canopy cover and thereby denser shade, as well as being in a finer-textured, mucky substrate - in contrast to the more open canopy and coarser-textured, sandier substrate of CEGL003737.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was observed at Dick's Creek Gap in Georgia.
Global Range: This community is known from the Cumberland Plateau of Alabama, Tennessee and Kentucky, the adjacent Ridge and Valley, as well as lower elevation areas of the western portions of the Southern Blue Ridge in Tennessee and Georgia, the Appalachian Plateaus of Kentucky (Cliff section), and at the edge of the Shawnee Hills in western Kentucky.

[CEGL007565] *Tsuga canadensis - Acer rubrum - (Nyssa sylvatica) / Rhododendron maximum / Sphagnum* spp. Seep Forest

Translated Name: **Eastern Hemlock - Red Maple - (Blackgum) / Great Laurel / Peatmoss species Seep Forest**
Common Name: **Swamp Forest - Bog (Typic Type)**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Swamp Forest (M503)
Group	Central Interior-Appalachian Seepage Swamp (G044)
Alliance	*Acer rubrum / Alnus serrulata - Ilex verticillata* Appalachian-Piedmont Seepage Forest Alliance (A3358)

ELEMENT CONCEPT

Global Summary: This palustrine forest has a closed or open canopy and an open to dense shrub layer, interspersed with small *Sphagnum*-herb dominated depressions. These forests are found throughout the Southern Blue Ridge, and in the Cumberland Mountains and Cumberland Plateau, at elevations below 1200 m (4000 feet), in poorly drained bottomlands, generally with visible microtopography of ridges and sloughs or depressions. It often occurs near streams and is undoubtedly occasionally flooded. The canopy is composed of various mixtures of evergreen and deciduous species, often dominated by *Tsuga canadensis* and *Acer rubrum*, and less often by *Liriodendron tulipifera, Nyssa sylvatica, Pinus strobus*, or *Pinus rigida*. The dominant shrubs are usually *Rhododendron maximum, Kalmia latifolia*, and *Leucothoe fontanesiana*, but other shrubs include *Salix nigra, Alnus serrulata, Ilex montana, Cornus amomum, Viburnum nudum var. cassinoides*, and *Toxicodendron vernix*. Herbs in *Sphagnum*-herb dominated openings include *Solidago patula var. patula, Symphyotrichum puniceum (= Aster puniceus), Dalibarda repens, Osmunda cinnamomea, Carex folliculata, Carex gynandra, Carex scabrata, Carex leptalea, Carex stricta, Sarracenia purpurea, Sagittaria latifolia (= var. pubescens)*, and *Leersia virginica*. Herbs in the forested areas include *Glyceria melicaria, Lycopodium obscurum, Onoclea sensibilis, Maianthemum canadense, Thelypteris noveboracensis*, and *Osmunda regalis var. spectabilis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This uncommon acidic groundwater-influenced forested montane shrub-bog complex occurs in poorly drained, relatively flat to slightly concave depressions associated with streamheads and seeps at 1,094 m (3,589 feet) elevation.
Global Environment: The type occurs mostly at elevations below 1200 m (4000 feet), in poorly drained bottomlands, generally with visible microtopography of ridges and sloughs or depressions. It often occurs near streams and is undoubtedly occasionally flooded. In Virginia, habitats range from 790-1340 m (2600-4400 feet) elevation and are typically located along small, braided headwaters streams draining visible groundwater discharge. Soils are very strongly acidic (mean pH in plots = 4.8) with low base status.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This forest has a closed or open canopy and an open to dense shrub layer, interspersed with small *Sphagnum*- and herb-dominated depressions. The canopy is composed of various mixtures of evergreen and deciduous species, often dominated by *Tsuga canadensis* and *Acer rubrum*, and less often by *Liriodendron tulipifera, Nyssa sylvatica, Betula lenta, Pinus strobus*, or *Pinus rigida*. *Rhododendron maximum* may be common in the shrub layer. Common herbs include *Athyrium filix-femina ssp. asplenioides, Lycopus uniflorus, Oclemena acuminata*, and *Viola cucullata*.
Global Vegetation: This palustrine forest has a closed or open canopy and an open to dense shrub layer, interspersed with small *Sphagnum*- and herb-dominated depressions. The canopy is composed of various mixtures of evergreen and deciduous species, including *Tsuga canadensis, Acer rubrum, Liriodendron tulipifera, Nyssa sylvatica, Pinus strobus*, and *Pinus rigida*. Canopy dominants vary with elevation. Occurrences at lower elevations tend to be dominated by *Acer rubrum, Liriodendron tulipifera*, and/or *Nyssa sylvatica*, while examples at higher elevations are usually dominated by *Tsuga canadensis* and/or *Betula alleghaniensis*. *Picea rubens* is a minor canopy component at the highest elevations. The dominant shrubs are usually *Rhododendron maximum, Kalmia latifolia*, and *Leucothoe fontanesiana*, but other shrubs may include *Salix nigra, Alnus serrulata, Ilex montana, Cornus amomum, Viburnum nudum var. cassinoides*, and *Toxicodendron vernix*. Herbaceous species of sphagnous openings include *Solidago patula, Symphyotrichum puniceum (= Aster puniceus), Dalibarda repens, Osmunda cinnamomea, Carex folliculata, Carex gynandra, Carex scabrata, Carex leptalea, Carex stricta, Sarracenia purpurea, Sagittaria latifolia (= var. pubescens)*, and *Leersia virginica*. Herbs in more densely shaded areas include *Glyceria melicaria, Lycopodium obscurum, Onoclea sensibilis, Maianthemum canadense, Thelypteris noveboracensis*, and *Osmunda regalis var. spectabilis*.

Overstory composition of the very few documented examples in Virginia is somewhat heterogeneous and may represent an elevational gradient. The lowest-elevation stand (at 790 m or 2600 feet) in Carroll County (Southern Blue Ridge) is codominated by *Acer rubrum* and *Pinus strobus* with minor associates of *Betula alleghaniensis*, and *Tsuga canadensis*. A Giles County (Ridge and Valley) stand at 1160 m (3800 feet) has a mixed canopy of *Acer rubrum, Nyssa sylvatica, Picea rubens*, and *Pinus rigida*. The third stand, located at 1335 m (4380 feet) in Grayson County (Southern Blue Ridge) is overwhelmingly dominated by *Betula alleghaniensis*, with minor associates of *Acer rubrum* and *Picea rubens*. *Rhododendron maximum* is the dominant shrub, and *Osmunda cinnamomea* the dominant herb, at all three sites. Other species prominent in at least two of the three stands include *Kalmia latifolia, Hamamelis virginiana, Rhododendron viscosum, Rubus hispidus, Viola macloskeyi ssp. pallens, Carex trisperma, Glyceria melicaria, Lycopodium obscurum*, and *Carex intumescens*. *Dalibarda repens* is an

abundant herb at the Carroll County (lowest-elevation) site, while *Solidago rugosa, Carex ruthii*, and *Carex baileyi* are common at the Grayson County (highest-elevation) site. Mean species richness ranges from 30 to 46 taxa per 400 m2 (mean = 40).

Global Dynamics: The factors responsible for creating and maintaining this community are not well known, although beaver activity may play a role. The frequency and role of flooding is not known. This community may represent late successional stage of primary succession from once extensive, open bog areas and will remain in a forest condition unless the canopy is removed by tree blowdown, logging, or fire.

MOST ABUNDANT SPECIES

Global: *Carex folliculata*, *Carex ruthii*, *Carex trisperma*, *Dalibarda repens*, *Glyceria melicaria*, *Lycopodium obscurum*, *Osmunda cinnamomea*, *Rhododendron maximum*, *Rhododendron viscosum*, *Sphagnum* spp., *Viola macloskeyi* ssp. *pallens*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Carex ruthii* (G3), *Chelone cuthbertii* (G3, Southern Blue Ridge endemic), *Dalibarda repens* (G5, VA state-rare), *Helonias bullata* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (14-Dec-1998). This community is somewhat more common and secure than herbaceous and shrub-dominated nonalluvial wetlands of the Southern Blue Ridge, most of which are ranked G1. However, this community has been severely impacted by development, conversion to pasture and agriculture, and hydrologic alterations--changes which are concentrated in flat areas along streams in the steep landscapes of the Southern Blue Ridge. Most occurrences are small (less than 5 acres), very few are unaltered, and almost all have experienced alterations of hydrology, which makes their long-term viability questionable.

RELATED CONCEPTS

Global Similar Types:

- *Tsuga canadensis - Liriodendron tulipifera - Platanus occidentalis / Rhododendron maximum - Xanthorhiza simplicissima* Wet Forest (CEGL007143)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Also known as the Southern Appalachian "swamp forest - bog complex."
Global Classification Comments: Canopy dominants vary with elevation. Occurrences at lower elevations tend to be dominated by *Acer rubrum, Liriodendron tulipifera*, and/or *Nyssa sylvatica*, while examples at higher elevations are usually dominated by *Tsuga canadensis*. This community is naturally rare, due to the scarcity of flat, wet sites in the Blue Ridge Mountains and Cumberland Mountains. Its rarity is also due to anthropogenic factors, being located

in accessible, low-elevation sites which are prone to logging and agricultural activities. Most historic occurrences of this community have been destroyed or strongly altered by draining, impoundment, or conversion to pasture. This community extends to a few sites in the Appalachian Plateau of Kentucky, where similar seeps are known, but these lack *Leucothoe fontanesiana* and *Sarracenia purpurea*. Higher elevation bogs exist in the Smokies and other portions of the Blue Ridge [see *Calamagrostis cainii - Carex ruthii - Parnassia asarifolia / Sphagnum* spp. Herbaceous Seep (CEGL007877) and *Carex gynandra - Platanthera clavellata - Drosera rotundifolia - Carex ruthii / Sphagnum* spp. Herbaceous Seep (CEGL007697), for example], but they occur in much higher elevations, have a higher proportion of *Carex* spp., and occur within a matrix of spruce-fir or northern hardwood forests. Four plots (three from the Virginia and one from Cherokee National Forest, Tennessee) were classified as this association in the Appalachian Trail analysis (Fleming and Patterson 2009a). *Acer rubrum* and *Rhododendron maximum* are present and abundant in all the plot samples and species that are present in at least three of the four plots include *Athyrium filix-femina ssp. asplenioides, Hamamelis virginiana, Lycopus uniflorus, Oclemena acuminata, Osmunda cinnamomea, Tsuga canadensis, Vaccinium simulatum*, and *Viola cucullata*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This forested swamp-bog complex was documented at Lindy Creek Bog, Tennessee, and Big Wilson Creek, Virginia, in the AT corridor.
Global Range: This community is found in the Southern Blue Ridge and Ridge and Valley from Pennsylvania south to Georgia, ranging west into the Cumberland Mountains and Cumberland Plateau of Kentucky.

G667. NORTHEASTERN FOREST VERNAL POOL

Group Summary Description: This broadly defined group comprises sparsely vegetated northeastern vernal woodland pools that are important breeding habitats for amphibians and invertebrates; vegetation is widely variable. The association in this group is characterized by seasonally fluctuating water levels; the substrate may dry out completely in the summer. Hydrology may be affected by impermeable soils, seasonally high water tables, seasonal flooding in nearby streams and drainages, and/or impervious bedrock at or near the surface. The substrate is mineral soil with or without a layer of muck. The species composition is variable among sites, as well as annually and seasonally. Larger examples of this community type may exhibit strong zonation. Many smaller, shaded vernal ponds are unvegetated, their bottoms consisting of dead leaves and algae.

A3686 Eastern North American Vernal Pool Alliance

Alliance Summary Description: This broadly defined alliance comprises sparsely vegetated northeastern vernal woodland pools that are important breeding habitats for amphibians and invertebrates; vegetation is widely variable. The association in this alliance is characterized by seasonally fluctuating water levels; the substrate may dry out completely in the summer. Hydrology may be affected by impermeable soils, seasonally high water tables, seasonal flooding in nearby streams and drainages, and/or impervious bedrock at or near the surface. The substrate is mineral soil with or without a layer of muck. The species composition is variable among sites, as well as annually and seasonally. Larger examples of this community type may exhibit strong zonation. Many smaller, shaded vernal ponds are unvegetated, their bottoms consisting of dead leaves and algae.

Translated Name: **Eastern Woodland Vernal Pool**
Common Name: **Eastern Woodland Vernal Pool**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Central Hardwood Swamp Forest (M503)
Group	Northeastern Forest Vernal Pool (G667)
Alliance	Eastern North American Vernal Pool Alliance (A3686)

ELEMENT CONCEPT

Global Summary: This association is characterized by seasonally fluctuating water levels; it may dry out completely in the summer. Hydrology may be affected by impermeable soils, seasonally high water tables, seasonal flooding in nearby streams and drainages, and/or impervious bedrock at or near the surface. The substrate is mineral soil with or without a layer of muck. The species composition is variable among sites, as well as annually and seasonally. Larger examples of this community type may exhibit strong zonation. Many smaller, shaded vernal ponds are unvegetated, their bottoms consisting of dead leaves and algae.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This vernal pool community is characterized by seasonally fluctuating water levels with bottoms consisting of dead leaves and algae. It was sampled once in the Central Appalachian project area in a very poorly drained, seasonally flooded basin with silty clay soil. The unvegetated surface is covered by leaf litter and bare soil with some downed wood. Evidence of disturbance includes the natural seasonal fluctuations in the water table, freeze/thaw cycles, trails, and the presence of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This vernal pool community is characterized by seasonally fluctuating water levels with bottoms consisting of dead leaves and algae. Sites are seasonally flooded basins with very poorly drained muck soil occurring under the surrounding upland forest canopy. Evidence of disturbance includes a minor presence of exotic plants.

Global Environment: This association is characterized by seasonally fluctuating water levels; it may dry out completely in the summer. Hydrology may be affected by impermeable soils, seasonally high water tables, seasonal flooding in nearby streams and drainages, and/or impervious bedrock at or near the surface. The substrate in most vernal pools is mineral soil with or without a layer of muck, but some are boulder-filled depressions. Boulder vernal pools may dry out completely in the summer, and their hydrology is controlled by impervious bedrock below the boulderfield.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The species composition is variable among sites, variable annually, and variable seasonally. Larger examples may exhibit strong zonation. Many smaller, shaded vernal ponds are unvegetated, their bottoms consisting of dead leaves and algae. Cover may be sparse and often varies through the season. Most tree species overhang the pools occur in the adjacent forest association. Species composition is extremely variable, and many pools contain no vegetation. Of the species listed below, only a few are likely to be found on any one site. In the plot sampled, the vegetation includes *Platanus occidentalis, Acer saccharinum, Juglans nigra, Verbesina alternifolia, Alliaria petiolata*, and bryophytes.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The species composition is variable among sites, variable annually, and variable seasonally. Larger examples may exhibit strong zonation. Many smaller, shaded vernal ponds are unvegetated, their bottoms consisting of dead leaves and algae. Cover may

be sparse and often varies through the season. Most tree species occur in the adjacent forest association and overhang the pools. Species composition is extremely variable, and many pools contain no vegetation. Of the species listed below, only a few are likely to be found on any one site. In one sampled plot, the vegetation includes *Acer rubrum, Betula alleghaniensis, Picea rubens*, and *Tsuga canadensis*. Another site is dominated by bryophytes on rock with very small amounts of *Deschampsia caespitosa* and *Polygonum persicaria*.

Global Vegetation: The species composition is variable among sites, variable annually, and variable seasonally. Larger examples may exhibit strong zonation. Many smaller, shaded vernal ponds are unvegetated, their bottoms consisting of dead leaves and algae. Cover may be sparse and often varies through the season. Species composition is extremely variable, and of the species listed below, only a few are likely to be found on any one site. Typical representatives include *Dulichium arundinaceum, Glyceria* sp., *Leersia oryzoides, Scirpus cyperinus, Lycopus uniflorus, Polygonum* spp., *Thelypteris palustris, Carex gynandra, Carex crinita, Carex leptonervia, Carex stipata, Carex canescens, Carex vesicaria, Juncus effusus, Bidens* spp., *Hypericum mutilum, Hypericum canadense, Osmunda cinnamomea, Osmunda regalis, Agrostis scabra, Utricularia geminiscapa, Triadenum virginicum, Sagittaria* sp., and *Eleocharis* spp. Although this community type is predominantly herbaceous, shrubs and small trees may be present. Typical woody species include *Vaccinium corymbosum, Lyonia ligustrina, Quercus palustris, Nyssa sylvatica, Acer rubrum, Salix* spp., *Cephalanthus occidentalis*, and *Ilex verticillata*.

Global Dynamics: This community experiences seasonally fluctuating water levels; it may dry out completely in the summer. Hydrology may be affected by impermeable soils, seasonally high water tables, seasonal flooding in nearby streams and drainages, and/or impervious bedrock at or near the surface.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (23-May-2011). Despite large numbers of occurrences, vernal pools are small-patch isolated wetlands that are not protected by the EPA's Clean Water Act. As such, they are vulnerable to a host of threats, including outright destruction, as well as impacts of logging, development, overuse of ATVs, altered hydrology such as ditching, filling or impoundments, and pollution as a result of runoff from agriculture, development, road construction, etc.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Species are variable and many pools contain no vegetation. Many will also be below the minimum map unit size.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Species are variable and many pools contain no vegetation. Many will also be below the minimum map unit size. All vernal pools occur under the canopy of the surrounding upland forest canopy.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Recognition of vernal pool associations is complicated not only by the lack of good data but by the seasonal and spatial variability in composition. The largest factor, however, is that vernal pools are generally defined by their invertebrate and amphibian communities and often do not have characteristic suites of plant species. This type should be considered tentative pending more data.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs primarily in glaciated or periglacial areas, from Quebec and New Brunswick south through New York to northern Pennsylvania and northern New Jersey. It was sampled in Cumberland and Northampton counties in Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community occurs primarily in glaciated or periglacial areas, from Quebec and New Brunswick south through New York to northern Pennsylvania and northern New Jersey. It was sampled in Pennsylvania and at Kent Pond in Vermont.
Global Range: This association occurs in the northeastern U.S., and presumably in adjacent Canada, primarily in glaciated or periglacial areas, from Quebec and New Brunswick south through New York to northern Pennsylvania and northern New Jersey.

M504. Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest

G045. LAURENTIAN-ACADIAN-APPALACHIAN ACIDIC SWAMP

Group Summary Description: This group includes north-temperate acidic, nutrient-poor swamps of the northeastern U.S. and adjacent Canada, from southeastern Canada and New England to New York through the Central Appalachians south to Virginia and west to Ohio. They occur on mineral soils that are nutrient-poor; there may be an organic epipedon, and the substrate may be shallow to deep peat. Most are basin wetlands that remain saturated for all or nearly all of the growing season, and may have standing water seasonally. Some occur on gently sloping seepage lowlands, and even basin settings may have some seepage influence, especially near the periphery. *Acer rubrum* is a nearly constant and often dominant to codominant tree species. It may form a mostly deciduous canopy with *Fraxinus* spp., *Betula alleghaniensis*, or *Nyssa sylvatica*, or it may be mixed with conifers. *Tsuga canadensis* is the most widespread conifer in associations of this group. From central New England and New York north, *Picea rubens* is a characteristic associate (less commonly *Picea mariana*). *Larix laricina, Pinus strobus*, and *Abies balsamea* are occasional and in some places may be locally important. The herbaceous and shrub layers tend to be fairly species-poor. *Nemopanthus mucronatus, Viburnum nudum var. cassinoides, Ilex verticillata*, and *Vaccinium corymbosum* are typical shrubs through much of the range of this group, and *Rhododendron maximum* is often important in the central and southern portions of this group's range. Typical herbs include *Osmunda* spp., *Onoclea sensibilis, Dryopteris cristata, Carex folliculata, Carex intumescens, Carex stricta*, and *Carex scabrata*, among others. *Sphagnum* is an important component of the bryoid layer. In many swamps, species richness tends to be higher near the periphery where seepage waters influence the hydrology.

A3706 *Acer rubrum - Fraxinus pennsylvanica* Northeastern Swamp Forest Alliance

Alliance Summary Description: This alliance contains swamp forests in which *Fraxinus pennsylvanica* is characteristic, and *Acer rubrum* is nearly always present. Canopy composition differs sharply from the surrounding upland and varies with geography. It differs from associated temporarily flooded forests by the absence or unimportance of floodplain species such as *Acer saccharinum, Betula nigra, Platanus occidentalis*, and *Populus deltoides*. Other canopy species across the range of this alliance include *Betula lenta, Fraxinus americana, Liquidambar styraciflua, Liriodendron tulipifera, Quercus bicolor, Quercus palustris, Ulmus americana*, and *Ulmus rubra*. Understory and shrub species include *Alnus serrulata, Carpinus caroliniana, Cornus* spp., *Ilex verticillata, Lindera benzoin*, and *Vaccinium corymbosum*; *Nemopanthus mucronatus* often occurs in the northern portion of the range. Typical habitats include forested seeps on hillsides or along watercourses, edges and backswamps of floodplains that may be saturated by seepage from adjacent slopes, and other poorly drained depressions. Flooding occurs during the winter and spring and often extends into the growing season. Surface water is superficial, but the substrate is saturated to the surface by groundwater for extended periods during the growing season, or water may be ponded for most of the year. The substrate is generally muck rather than peat, overlying mineral soils.

[CEGL006406] *Acer rubrum - Fraxinus (pennsylvanica, americana) / Lindera benzoin / Symplocarpus foetidus* Swamp Forest

Translated Name: **Red Maple - (Green Ash, White Ash) / Northern Spicebush / Skunk-cabbage Swamp Forest**
Common Name: **Southern New England-Northern Piedmont Red Maple Seepage Swamp Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Acer rubrum - Fraxinus pennsylvanica* Northeastern Swamp Forest Alliance (A3706)

ELEMENT CONCEPT

Global Summary: This association is a seepage swamp dominated by *Acer rubrum* and ranging from southern New England south to the Piedmont of Virginia. It generally occurs in saturated situations on slightly sloping hillsides, along small streams, or in basins that receive overland flooding in addition to groundwater influence. In general, these swamps are moderately acidic to moderately basic and have some seepage indicators but are not particularly species-rich. Soils are shallow to moderately deep mucks over mineral soils. *Acer rubrum* dominates the canopy;

Fraxinus pennsylvanica or *Fraxinus americana* are usually also found in the canopy and can be codominant. *Fraxinus nigra* is not generally associated with this type at the northern portion of the range, and, if present, occurs only as scattered individuals, but this species does occur in this type in Pennsylvania. Other canopy or subcanopy associates may include *Liriodendron tulipifera, Quercus bicolor, Quercus palustris, Prunus serotina, Fagus grandifolia, Betula lenta, Ulmus americana*, and *Ulmus rubra*. Conifers such as *Tsuga canadensis* or *Pinus strobus* are generally absent or occur in very low abundance. The shrub layer may be fairly open to quite dense, depending on the amount of canopy closure. Shrub species commonly include *Ilex verticillata, Rhododendron viscosum, Clethra alnifolia, Lindera benzoin, Cornus amomum, Alnus serrulata*, and less commonly *Vaccinium corymbosum, Lyonia ligustrina, Ilex montana, Toxicodendron vernix, Viburnum dentatum*, and *Viburnum nudum var. cassinoides (= Viburnum cassinoides)*. The herbaceous layer is variable in cover; *Symplocarpus foetidus* and *Osmunda cinnamomea* are nearly always present. In some areas, tall ferns (*Osmunda cinnamomea, Onoclea sensibilis, Osmunda regalis, Thelypteris palustris, Thelypteris noveboracensis*) form an herbaceous canopy within which other species are scattered. Microtopography is generally pronounced, resulting from tip-ups. Tree seedlings and *Sphagnum* mosses are common on hummocks but do not in general form extensive carpets. Additional nonvascular species can include *Plagiomnium cuspidatum (= Mnium cuspidatum)* and *Calliergon* spp. Invasive shrubs and herbs, including *Berberis thunbergii, Rosa multiflora, Lonicera morrowii, Alliaria petiolata*, and *Microstegium vimineum*, may be abundant.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This red maple seepage swamp occurs in saturated settings on slightly sloping hillsides, along small streams, or in basins that receive overland flooding in addition to groundwater influence. It was sampled twice in northern Pennsylvania in the Central Appalachian project area on gently sloping, seasonally flooded alluvial plain/backswamps with hummock-and-hollow microtopography. Soils are very poorly to somewhat poorly drained silt loam and silty clay. The unvegetated surface at one site is dominated by leaf litter with some downed wood and considerable standing water. The other site has an equal mix of leaf litter and bare soil with some downed wood. Evidence of disturbance includes nearby roads/railroad tracks and the presence of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This red maple swamp forest receives considerable groundwater seepage (although not very enriched) and occurs in saturated settings, along small streams, or in basins that receive overland flooding in addition to groundwater influence. Sites are saturated flats with poorly to very poorly drained muck, sandy loam or clay loam soil. The unvegetated surface consists of leaf litter, downed wood, large/small rocks, bare soil, and/or standing water. Evidence of disturbance includes possible past grazing, trails, erosion and the presence of exotic plants.

Global Environment: This association is a seepage swamp dominated by *Acer rubrum* and ranging from southern New England to Virginia. It generally occurs in saturated soils on slightly sloping hillsides, along small headwater streams, or in depressions at the edges of floodplains that receive overland flooding in addition to groundwater inputs. In general, these swamps are moderately acidic to moderately basic and have some seepage indicators but are not particularly species-rich. Soils are shallow to moderately deep mucks over mineral soils. Microtopography is generally pronounced, resulting from tip-ups and the braided character of the drainage. Soil samples collected from 18 Maryland and Virginia plot samples are "intermediate" in chemistry, i.e., mean pH = 5.2, mean Ca = 1071 ppm, mean Mg = 195 ppm, mean total base saturation = 57%, but are more "basic" than "acidic" in their calcium and magnesium content.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Acer rubrum* is dominant or codominant in the canopy. *Fraxinus americana* and/or *Fraxinus pennsylvanica* is present, and *Fraxinus nigra* may be minor to absent (≤5%). *Betula alleghaniensis* may be common along with *Quercus palustris, Quercus bicolor*, and scattered *Ulmus americana, Pinus strobus*, and/or *Tsuga canadensis*. *Carpinus caroliniana* is typical in the understory. Shrubs are diverse and variable; *Lindera benzoin, Vaccinium corymbosum*, and *Ilex verticillata* are common. *Symplocarpus foetidus* and *Osmunda cinnamomea* are nearly always present in the herb layer; *Sphagnum* spp. may be common.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Acer rubrum* dominates the canopy; associates can include *Betula alleghaniensis* and *Fraxinus pennsylvanica*. The dense shrub layer is dominated by *Lindera benzoin* and may include *Ilex verticillata, Vaccinium corymbosum, Viburnum lentago*, and others. *Arisaema triphyllum, Athyrium filix-femina, Impatiens capensis, Onoclea sensibilis*, and *Symplocarpus foetidus* are common and/or abundant herbs. Mosses include *Mnium* spp. or *Calliergon* spp. Eight exotic taxa have

invaded these examples. In addition, this community supports NJ state-critically imperiled *Viburnum lantanoides* and NY state-critically imperiled *Viburnum nudum var. nudum*.

Global Vegetation: *Acer rubrum* dominates the canopy; *Fraxinus pennsylvanica* or *Fraxinus americana* are usually also found in the canopy and either can be codominant in the canopy. *Fraxinus nigra* is not generally associated with this type and, if present, occurs only as scattered individuals. Other canopy or subcanopy associates may include *Liriodendron tulipifera, Quercus bicolor, Quercus palustris, Prunus serotina, Fagus grandifolia, Betula lenta, Ulmus americana*, and *Ulmus rubra*. Conifers such as *Tsuga canadensis* or *Pinus strobus* are generally absent or occur in very low abundance. The shrub layer may be fairly open to quite dense, depending on the amount of canopy closure. Shrub species commonly include *Ilex verticillata, Rhododendron viscosum, Clethra alnifolia, Lindera benzoin, Cornus amomum, Alnus serrulata, Carpinus caroliniana*, and less commonly *Vaccinium corymbosum, Lyonia ligustrina, Ilex montana, Toxicodendron vernix, Viburnum dentatum*, and *Viburnum nudum var. cassinoides (= Viburnum cassinoides)*. The herbaceous layer is variable in cover; *Symplocarpus foetidus* and *Osmunda cinnamomea* are nearly always present. In some areas, tall ferns (*Osmunda cinnamomea, Onoclea sensibilis, Osmunda regalis, Thelypteris palustris, Thelypteris noveboracensis*) form an herbaceous canopy within which other species are scattered. These other herbaceous species include *Impatiens capensis, Galium aparine, Geum canadense, Arisaema triphyllum, Carex stricta, Carex gracillima, Carex intumescens, Carex radiata, Carex laevivaginata, Veratrum viride, Boehmeria cylindrica, Chelone glabra, Cardamine pensylvanica, Pilea pumila*, and *Glyceria* spp. At the southern end of the range in Maryland and Virginia, *Symplocarpus foetidus* is usually greatly dominant (>50% cover) early in the growing season, with *Saururus cernuus* frequently assuming patch-dominance during the summer. Tree seedlings and *Sphagnum* mosses are common on hummocks but do not in general form extensive carpets. Additional nonvascular species can include *Plagiomnium cuspidatum (= Mnium cuspidatum)* and *Calliergon* spp. Invasive shrubs and herbs, including *Berberis thunbergii, Rosa multiflora, Lonicera morrowii, Alliaria petiolata*, and *Microstegium vimineum*, may be abundant.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Acer rubrum*, *Carpinus caroliniana*, *Fraxinus americana*, *Lindera benzoin*, *Osmunda cinnamomea*, *Symplocarpus foetidus*, *Vaccinium corymbosum*
Appalachian National Scenic Trail (Lower New England Project Area): *Acer rubrum*, *Fraxinus pennsylvanica*, *Impatiens capensis*, *Lindera benzoin*, *Onoclea sensibilis*, *Symplocarpus foetidus*, *Vaccinium corymbosum*
Global: *Acer rubrum*, *Clethra alnifolia*, *Fraxinus americana*, *Fraxinus pennsylvanica*, *Lindera benzoin*, *Osmunda cinnamomea*, *Rhododendron viscosum*, *Symplocarpus foetidus*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Lonicera morrowii* (High/Medium), *Microstegium vimineum* (High/Medium), *Polygonum caespitosum*, *Rosa multiflora* (Medium/Low), *Rumex crispus* (Low/Insignificant)
Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Viburnum lantanoides* (G5, NJ state-critically imperiled), *Viburnum nudum* var. *nudum* (G5T5, NY state-critically imperiled);

Invasive/Exotic Plants: *Berberis thunbergii* (High/Medium), *Epipactis helleborine* (Medium/Low), *Lonicera morrowii* (High/Medium), *Malus pumila* (Medium/Insignificant), *Microstegium vimineum* (High/Medium), *Polygonum caespitosum*, *Rhamnus cathartica* (High/Medium), *Rosa multiflora* (Medium/Low), *Tussilago farfara* (Insignificant)
Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (30-Jan-2007). Although this is a small-patch community, its environmental requirements are quite general, and it occurs where acidic groundwater seepage emerges on the headwaters of stream drainages. The range extent crosses several ecoregions and 10 states. The major threat to this community is housing development, with disruption of groundwater source a lesser threat.

RELATED CONCEPTS

Global Similar Types:
- *Acer rubrum - Betula alleghaniensis / Lindera benzoin* Forest (CEGL006936)
- *Acer rubrum - Fraxinus nigra - (Tsuga canadensis) / Tiarella cordifolia* Swamp Forest (CEGL006502)
- *Acer rubrum - Fraxinus pennsylvanica - Liquidambar styraciflua* Floodplain Forest (CEGL006965)
- *Acer rubrum / Nemopanthus mucronatus - Vaccinium corymbosum* Swamp Forest (CEGL006220)
- *Acer rubrum / Rhododendron viscosum - Clethra alnifolia* Swamp Forest (CEGL006156)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is more common in the Lower New England project area, but it does extend south into the northern portion of the Central Appalachian project area in Pennsylvania.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: May be confused with Upland/Wetland Transitional Forest (CEGL006000) which is a forest that has upland *Quercus* spp. (*Quercus rubra, Quercus velutina*) in the canopy and a dense herb layer usually dominated by ferns. It is not saturated. The sites at Wawayanda State Park in New Jersey have canopies with high *Fraxinus pennsylvanica* cover, and *Lindera benzoin* is the dominant shrub.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Classification of this type at the southern end of the range is supported by analysis of a 1250-plot regional dataset compiled for the NCR and Mid-Atlantic national parks vegetation mapping project. In that analysis, this association was represented a group of 18 Maryland and Virginia plots.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from southern New England south to the Piedmont of Virginia. It was sampled in Perry and Cumberland counties in Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This red maple swamp was sampled at Housatonic Railroad Swamp Natural Heritage Site in Massachusetts; Upper Greenwood Lake West and Wawayanda State Park in New Jersey; and Nuclear Lake, West Mountain and Depot Hill in New York.
Global Range: This vegetation occurs in southern New England south through the mid-Atlantic states to Virginia.

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Acer rubrum - Fraxinus pennsylvanica* Northeastern Swamp Forest Alliance (A3706)

ELEMENT CONCEPT

Global Summary: This community occupies groundwater-saturated stream headwaters, large spring seeps and runs, and lateral areas in ravine and stream bottoms where groundwater emerges at the base of slopes. It is most frequent and best developed on Catoctin Formation metabasalt (greenstone) of the Northern Blue Ridge and other base-rich substrates. Soil chemistry data indicate moderately high calcium and magnesium levels. Overstory composition is mixed, with *Acer rubrum, Fraxinus americana*, and *Liriodendron tulipifera* the most abundant species. *Fraxinus nigra* is a frequent overstory associate but more abundant and sometimes dominant in the understory, along with young *Acer rubrum* and *Fraxinus americana*. With increasing elevation, *Betula alleghaniensis* becomes increasingly important, codominating most stands above 760 m (2500 feet) in Virginia and in the Catoctin Mountains of Maryland. Minor tree associates include *Betula lenta* and *Tilia americana*. Canopy closure is often incomplete (mean stratum cover = 60-80%), most evidently because of blowdowns. Very wet microhabitats that impede the establishment and firm rooting of trees may also contribute to a somewhat open canopy. Shrub stratum diversity is moderately high; *Lindera benzoin* is usually the most abundant species, and considerable stratum cover is contributed by tree saplings. Other frequently occurring true shrubs are *Alnus serrulata, Carpinus caroliniana, Hamamelis virginiana, Ilex verticillata*, and *Sambucus nigra ssp. canadensis*. Except in local areas where shrubs are dense, herbaceous cover is high (mean stratum cover = 90%). One or both of the early-maturing forbs *Symplocarpus foetidus* (mostly at lower elevations) and *Veratrum viride* are usually dominant over substantial areas. Because of microtopographic diversity, herbaceous patch-mosaics are typical in this vegetation. More-or-less constant,

sometimes locally abundant species include *Eurybia schreberi (= Aster schreberi), Caltha palustris, Carex bromoides, Carex gynandra, Carex prasina, Chelone glabra, Chrysosplenium americanum, Cinna arundinacea, Dryopteris carthusiana, Dryopteris goldiana, Glyceria striata, Impatiens capensis, Osmunda cinnamomea, Osmunda regalis var. spectabilis, Ranunculus recurvatus, Saxifraga pensylvanica, Packera aurea (= Senecio aureus), Sphenopholis pensylvanica, Thalictrum pubescens*, and *Viola cucullata*. Moss cover is often significant but only rarely includes *Sphagnum* spp. (not recorded in Virginia plots). Typical upland mesophytes commonly occur in well-drained hummock microhabitats and contribute to relatively high species-richness values for this type of wetland.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This basic seepage swamp occurs at groundwater-saturated stream headwaters, as large spring seeps and runs, and as lateral areas in ravine and stream bottoms where groundwater emerges at the bases of east- and south-facing gentle slopes. It was sampled at three locations in the park at low elevations (280-860 m). Soils are somewhat poorly drained to saturated. The unvegetated surface may be dominated by leaf litter or consist of a mix of exposed bedrock, large rocks, small rocks, downed wood, and/or standing water. Evidence of disturbance includes grazing/browsing, historic logging, and the presence of exotic plant species.

Global Environment: This community occupies groundwater-saturated stream headwaters, large spring seeps and runs, and lateral areas in ravine and stream bottoms where groundwater emerges at the base of slopes. Hydrologically, these habitats are classified as "groundwater slope wetlands," where seepage discharged at the ground surface is drained away as streamflow (Golet et al. 1993). Habitats are usually more-or-less narrow and elongate, with considerable exposed bouldery and cobble alluvium. Soils are predominantly mineral, but local areas of organic muck sometimes accumulate in depressions. The ground surface is slightly sloping (mean slope = 3°), and drainage is usually via small, intricately braided channels with intervening hummocks. Moss mats on boulders and cobble deposits commonly provide a rooting medium for herbaceous species, and "sedge tussocks" (especially of *Carex bromoides* and *Carex prasina*) are conspicuous features of these swamps. Soils collected from 25 Virginia and Maryland plot samples ranged from strongly acidic to neutral in pH, with moderately high calcium (mean = 1358 ppm) and magnesium (mean = 211 ppm) levels. This community is most frequent and best developed on Catoctin Formation metabasalt (greenstone) of the Northern Blue Ridge. There, it occurs locally in small patches (<12 ha [30 acres]) at elevations from about 275 to 850 m (900-2800 feet) and occasionally up to 975 m (3200 feet) (Ludwig et al. 1993). It has also been documented in northwestern Virginia in the Massanutten Mountains and western Ridge and Valley region, in the western Piedmont of both Virginia and Maryland and in Maryland's Allegheny Plateau in which stands observed and sampled occur at 800 m.. A somewhat isolated and disjunct occurrence is documented from the Dismal Creek valley in Giles County, in the southwestern Virginia Ridge and Valley. This is probably one of the southernmost occurrences for both the community type and *Fraxinus nigra*, a tree of pronounced northern distribution. The few known Ridge and Valley occurrences are associated with sites where Devonian or Silurian limestones are interbedded with sandstone and shale. While surficial outcrops of limestone are not evident at these sites, it is clear from both soil samples and floristic evidence that the wetlands are being supplied with calcium by groundwater.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Fraxinus americana* and/or *Fraxinus nigra* are characteristic in the canopy along with *Acer rubrum*. *Betula alleghaniensis* and/or *Liriodendron tulipifera* are common. *Lindera benzoin* is a constant shrub. *Asimina triloba* becomes common north of Maryland. *Chrysosplenium americanum, Veratrum viride, Carex bromoides, Collinsonia canadensis, Impatiens pallida, Osmunda cinnamomea var. cinnamomea*, and *Symplocarpus foetidus* are common in the diverse herbaceous layer. This community also supports VA-state imperiled *Trillium cernuum*.

Global Vegetation: Overstory composition is mixed, with *Acer rubrum, Fraxinus americana*, and *Liriodendron tulipifera* the most abundant species. *Fraxinus nigra* is a frequent overstory associate but more abundant and sometimes dominant in the understory, along with young *Acer rubrum* and *Fraxinus americana*. With increasing elevation, *Betula alleghaniensis* becomes increasingly important, codominating most stands above 760 m (2500 feet) in Virginia and in the Catoctin Mountains of Maryland. Minor tree associates include *Betula lenta* and *Tilia americana*. Almost all trees in plot-sampled stands were <50 cm dbh and most were <40 cm dbh; but scattered *Liriodendron* specimens >80 cm dbh occur, and in one plot such an individual tree accounts for the high canopy cover of this species. Canopy closure is often incomplete (mean stratum cover = 60-80%), most evidently because of blowdowns. Very wet microhabitats that impede the establishment and firm rooting of trees may also contribute to a somewhat open canopy. Shrub stratum diversity is moderately high; *Lindera benzoin* is usually the most abundant

species, and considerable stratum cover is contributed by tree saplings. Other frequently occurring true shrubs are *Alnus serrulata, Carpinus caroliniana, Hamamelis virginiana, Ilex verticillata*, and *Sambucus nigra ssp. canadensis*. Except in local areas where shrubs are dense, herbaceous cover is high (mean stratum cover = 90%). One or both of the early-maturing forbs *Symplocarpus foetidus* (mostly at lower elevations) and *Veratrum viride* are usually dominant over substantial areas. Because of microtopographic diversity, herbaceous patch-mosaics are typical in this vegetation. More-or-less constant, sometimes locally abundant species include *Eurybia schreberi (= Aster schreberi), Caltha palustris, Carex bromoides, Carex gynandra, Carex prasina, Chelone glabra, Chrysosplenium americanum, Cinna arundinacea, Dryopteris carthusiana, Dryopteris goldiana, Glyceria striata, Impatiens capensis, Osmunda cinnamomea, Osmunda regalis var. spectabilis, Ranunculus recurvatus, Saxifraga pensylvanica, Packera aurea (= Senecio aureus), Sphenopholis pensylvanica, Thalictrum pubescens*, and *Viola cucullata*. Moss cover is often significant, but only rarely includes *Sphagnum* spp. (not recorded in Virginia plots). Typical upland mesophytes commonly occur in well-drained hummock microhabitats and contribute to relatively high species richness values for this type of wetland (n = 60 taxa per 400 square meters for 25 plot samples).

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Trillium cernuum* (G5, VA state-imperiled); **Invasive/Exotic Plants**: *Alliaria petiolata* (High/Medium), *Microstegium vimineum* (High/Medium), *Rumex obtusifolius*, *Taraxacum officinale*

Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Euphorbia purpurea* (G3, Southern Blue Ridge endemic), *Platanthera grandiflora* (G5, VA state-rare), *Poa paludigena* (G3), *Symphyotrichum praealtum* var. *angustior* (G5T4, VA state-rare), *Trillium cernuum* (G5, VA state-rare)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (17-Apr-2000). This association has a narrow geographic range and is further limited by its small patch sizes and requirement for special, very localized wetlands. The type is confined to groundwater-saturated, base-rich habitats that are large enough to support forest vegetation.

RELATED CONCEPTS

Global Similar Types:

- *Acer rubrum - Fraxinus pennsylvanica / Lindera benzoin / Osmunda regalis - Pedicularis lanceolata* Seep Forest (CEGL007046)
- *Acer rubrum - Nyssa sylvatica / Ilex verticillata - Vaccinium fuscatum / Osmunda cinnamomea* Seep Forest (CEGL007853) acidic seepage swamp of the same Central Appalachian region; develops on sandstone and quartzite substrates and has higher component of acidophiles, e.g., *Nyssa sylvatica, Vaccinium* spp., *Pinus rigida, Rubus hispidus*, etc.; calciphilic species such as *Caltha palustris, Carex bromoides, Fraxinus nigra*, etc. are very sparse to absent.
- *Fraxinus nigra - Acer rubrum / Rhamnus alnifolia / Carex leptalea* Swamp Forest (CEGL007441) basic seepage swamp of the High Allegheny Mountains of Maryland, Pennsylvania, and West Virginia; more northern and fen-like compared to CEGL008416.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is most frequent and best developed on Catoctin Formation metabasalt (greenstone) of the Northern Blue Ridge. There, it occurs locally in small patches (<12 hectares [30 acres]) at elevations from about 275 to 850 m (900-2,800 feet) and occasionally up to 975 m (3,200 feet) (Ludwig et al. 1993). Distinct floristic features of calcareous seepage swamps include the prevalence of *Fraxinus* spp. (especially *Fraxinus nigra*) and nutrient-demanding species, among the most diagnostic of which are *Caltha palustris, Carex bromoides, Carex laevivaginata, Pilea fontana, Poa paludigena, Ranunculus hispidus var. caricetorum, Saxifraga pensylvanica*, and *Trillium cernuum*. These communities lack the *Sphagnum* mosses that characterize acidic groundwater wetlands.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Floristic diversity is increased by the presence of numerous terrestrial species growing on the hummocks.
Global Classification Comments: Classification of this type is supported by analysis of a 1250-plot regional dataset assembled for the NCR vegetation mapping project. In that analysis, this association is represented by 25 Virginia and Maryland plots that perform as a tight group in all analytical procedures. Distinct floristic features of calcareous seepage swamps include the prevalence of *Fraxinus* spp. (especially *Fraxinus nigra*) and nutrient-demanding species, among the most diagnostic of which are *Caltha palustris, Carex bromoides, Carex laevivaginata, Pilea fontana, Poa paludigena, Ranunculus hispidus var. caricetorum, Saxifraga pensylvanica*, and *Trillium cernuum*. These communities lack the *Sphagnum* mosses that characterize acidic groundwater wetlands. Moreover, many vascular plants that are common in or diagnostic of acidic seepage swamps are absent or unimportant (e.g., *Pinus rigida, Nyssa sylvatica, Viburnum nudum var. nudum, Parnassia asarifolia, Platanthera ciliaris, Platanthera clavellata, Rubus hispidus, Lycopodium obscurum, Carex debilis var. debilis*, and *Carex folliculata*) (Fleming and Van Alstine 1999).

Additionally, the spectrum of stands representing this association in Virginia shows a clear elevation gradient, with *Symplocarpus foetidus* and *Fraxinus nigra* decreasing in frequency and abundance and *Betula alleghaniensis* assuming codominance as elevation increases. In landscapes with suitably base-rich substrates such as Catoctin metabasalt, this type may intergrade with the higher elevation *Tsuga canadensis - Betula alleghaniensis / Veratrum viride - Carex scabrata - Oclemena acuminata* Swamp Forest (CEGL008533) in a transitional zone from about 760 to 900 m (2500-3000 feet) elevation.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the Central Appalachian region of Pennsylvania, Maryland, Virginia, and West Virginia. It was sampled in the northern Blue Ridge Mountains in Clarke (at Reservoir Hollow and Raven Rocks Hollow) and Augusta counties, Virginia.
Global Range: The probable range of this community encompasses the Central Appalachian region of Pennsylvania, Maryland, and Virginia, as well as Delaware and New Jersey. In Virginia, it is found primarily in the northern half of the mountains, apparently reaching its southern limits in Giles County. In Maryland, its distribution is centered in the Catoctin Mountains. The majority of occurrences are on the Northern Blue Ridge, but the type is also scattered in suitable habitats of the Ridge and Valley province, western Piedmont, and Maryland's Allegheny Plateau.

Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Acer rubrum - Fraxinus pennsylvanica* Northeastern Swamp Forest Alliance (A3706)

ELEMENT CONCEPT

Global Summary: This forested red maple swamp of stream drainages and wetland borders occurs in northern to central New England and New York, extending sporadically south to New Jersey. The hydrologic regime is variable among occurrences, generally influenced by seasonal flooding and often limited groundwater seepage. This association may occur in basins with little drainage, or on stream floodplains that remain saturated throughout most of the growing season. Soils vary according to setting; generally the substrate is mineral soil, acidic to weakly minerotrophic, but in some settings organic soil may be well-developed. The deciduous canopy ranges from closed to patchy, but the overall cover is that of a closed-canopy forest. The shrub layer, particularly in openings, is generally well-developed. The herb layer is usually fairly well-developed and may be extensive. The canopy is characteristically dominated by *Acer rubrum* with associates of *Fraxinus nigra, Fraxinus pennsylvanica, Betula alleghaniensis*, and *Ulmus americana*. *Tsuga canadensis, Picea rubens*, and *Abies balsamea*, while not abundant, characterize this association as one of cooler climates. (The *Picea* and *Abies* drop out in the southernmost occurrences of this type.) Typical shrubs include *Vaccinium corymbosum* (often dominant), *Ilex verticillata, Nemopanthus mucronatus, Lindera benzoin, Rosa palustris, Alnus incana, Viburnum nudum var. cassinoides*, and *Viburnum recognitum*. There is north-to-south variability in the shrub component as well, with *Nemopanthus* characteristic of all but the southernmost occurrences, and *Lindera* absent from more northerly occurrences. The herbaceous layer is often dominated by ferns, including *Osmunda cinnamomea, Osmunda regalis*, and *Osmunda claytoniana*. *Onoclea sensibilis, Dryopteris cristata*, and *Thelypteris palustris* are often present, though less abundant. *Carex stricta* may be locally dominant. Other species frequent in the herbaceous layer include *Impatiens capensis, Caltha palustris, Calamagrostis canadensis, Carex intumescens, Carex trisperma*, and *Arisaema triphyllum*. The bryophyte flora is not well documented; *Sphagnum* spp. and *Mnium* spp. are frequent, although not necessarily abundant. *Acer rubrum - Fraxinus (pennsylvanica, americana) / Lindera benzoin / Symplocarpus foetidus* Swamp Forest (CEGL006406) is distinguished by its greater abundance and extent of seepage indicators and its lacks lack of northern species such as *Picea rubens, Abies balsamea*, and *Nemopanthus mucronatus*. *Acer rubrum / Carex stricta - Onoclea sensibilis* Wet Woodland (CEGL006119) is also similar but has a more open canopy and typically a graminoid-dominated herbaceous layer. This association is also related to *Acer rubrum - Prunus serotina / Cornus amomum* Floodplain Forest (CEGL006503), which occurs along floodplains of major streams and minor rivers. While both can be dominated by red maple in the canopy, the understory vegetation

differs somewhat, with species more typical of floodplains (*Carpinus caroliniana, Cornus amomum, Prunus serotina*) in that type, and species typical of more constantly saturated conditions in this type.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This red maple swamp was sampled in New York and New Jersey in the Lower New England project area. One site is a flat basin with very poorly drained muck soil; the other is a very rocky, narrow, intermittent streambed with no water present but evidence of flow (wrack deposition). The unvegetated surface consists of leaf litter, with abundant downed wood and standing water possible. Evidence of disturbance includes alterations to hydrology (possible beaver activity), trails, and recreational use.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is only known from two locations in Maine and occurs along pond margins and streams feeding ponds. Elevations range from 200 to 400 m (655-1,310 feet). Positions are flat and saturated to permanently flooded. Soils are poorly to very poorly drained muck, silty clay loam and peat. Open water may be present part of the season or year-round.

Global Environment: This forested red maple swamp occupies stream drainages and wetland borders. The hydrologic regime is variable among occurrences, generally influenced both by groundwater seepage and seasonal flooding. This association may occur in basins with little drainage, or on stream floodplains that remain saturated throughout most of the growing season. Soils vary according to setting; generally the substrate is mineral soil, acidic to (less commonly) circumneutral, but in some settings organic soil may be well-developed.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These forested red maple swamps are dominated by *Acer rubrum* with many possible canopy associates. The shrub layer is dominated by *Clethra alnifolia, Vaccinium corymbosum, Ilex verticillata, Rhododendron viscosum*, and *Nemopanthus mucronatus*. The herb layer includes *Thelypteris palustris, Osmunda cinnamomea, Carex stricta, Triadenum virginicum*, and *Sphagnum* spp.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by open to closed deciduous forests and woodlands dominated by *Acer rubrum*. Canopy associates may include *Fraxinus nigra, Fraxinus pennsylvanica, Picea rubens, Pinus strobus, Ulmus americana*, and *Thuja occidentalis*. *Alnus incana* is the most characteristic dominant shrub, with *Ilex verticillata* codominating some sites. Other shrubs occurring at low cover may include *Rhododendron canadense, Spiraea alba, Viburnum nudum*, and *Viburnum recognitum*. The herbaceous layer may be dominated by ferns, graminoids or both, the most prominent being *Calamagrostis canadensis, Onoclea sensibilis*, and *Osmunda regalis*. Other common herbaceous associates include *Athyrium filix-femina, Carex stricta, Doellingeria umbellata, Iris versicolor, Lycopus uniflorus, Matteuccia struthiopteris, Osmunda cinnamomea, Rubus pubescens, Solidago rugosa*, and *Thalictrum pubescens*.

Global Vegetation: The deciduous canopy ranges from closed to patchy, but the overall cover is that of a closed-canopy forest. The shrub layer, particularly in openings, is generally well-developed. The herb layer is usually fairly well-developed and may be extensive. The canopy is characteristically dominated by *Acer rubrum* with associates of *Fraxinus nigra, Fraxinus pennsylvanica, Betula alleghaniensis*, and *Ulmus americana*. *Tsuga canadensis, Picea rubens*, and *Abies balsamea*, while not abundant, characterize this association as one of cooler climates. (The *Picea* and *Abies* drop out in the southernmost occurrences of this type.) Typical shrubs include *Vaccinium corymbosum* (often dominant), *Ilex verticillata, Nemopanthus mucronatus, Lindera benzoin, Rosa palustris, Alnus incana, Viburnum nudum var. cassinoides*, and *Viburnum recognitum*. There is north-to-south variability in the shrub component as well, with *Nemopanthus* characteristic of all but the southernmost occurrences, and *Lindera* absent from more northerly occurrences. The herbaceous layer is often dominated by ferns, including *Osmunda cinnamomea, Osmunda regalis*, and *Osmunda claytoniana*. *Onoclea sensibilis, Dryopteris cristata*, and *Thelypteris palustris* are often present, though less abundant. *Carex stricta* may be locally dominant. Other species frequent in the herbaceous layer include *Impatiens capensis, Caltha palustris, Calamagrostis canadensis, Carex intumescens, Carex trisperma*, and *Arisaema triphyllum*. The bryophyte flora is not well-documented; *Sphagnum* spp. and *Mnium* spp. are frequent, although not necessarily abundant.

Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Acer rubrum - Nyssa sylvatica* Swamp Forest Alliance (A2058)

ELEMENT CONCEPT

Global Summary: This blackgum basin swamp of the northeastern United States is found from the Central Appalachians north to central New England, at the northern range limit for *Nyssa sylvatica*. It occupies saturated or seasonally wet basins, often in perched basins in small watersheds within upland forests. It also occurs on hillsides and seepage areas. In most settings, the mineral soil is overlain with a shallow to deep peat layer. Conditions are highly acidic and nutrient-poor. The tree canopy varies from an open woodland to nearly complete. Shrubs are well-represented and may be locally dense. Herbs are likewise patchy, and the herb layer is usually dominated by only a few species. The bryoid layer varies but is often extensive. Hummock-and-hollow microtopography is often pronounced, with bryophytes common on the hummocks and in those hollows where water does not stand for long periods. The canopy is dominated by *Acer rubrum* and *Nyssa sylvatica*; however, even where red maple is more abundant, the longevity and stature of the blackgum trees give them a strong impact. *Betula alleghaniensis, Tsuga canadensis, Pinus strobus*, and occasionally *Picea rubens* or *Picea mariana* may be minor canopy associates. The most abundant shrubs are *Ilex verticillata* and *Vaccinium corymbosum*; associated shrub species include *Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Kalmia angustifolia, Gaylussacia baccata, Chamaedaphne calyculata, Lyonia ligustrina, Spiraea alba var. latifolia (= Spiraea latifolia)*, and *Cephalanthus occidentalis*. *Osmunda cinnamomea* is the characteristic dominant in the herb layer, with associates including *Osmunda regalis, Thelypteris palustris, Woodwardia virginica, Glyceria canadensis, Coptis trifolia, Carex atlantica, Carex trisperma, Carex folliculata, Carex intumescens, Calla palustris, Triadenum virginicum*, and *Symplocarpus foetidus*. Mosses are primarily *Sphagnum* spp., including *Sphagnum palustre* and *Sphagnum magellanicum*. These swamps are distinguished from other basin swamps in the Northern Appalachians by the presence of *Nyssa sylvatica*. They are distinguished from blackgum swamps further south by the absence of more Central Appalachian species such as *Liquidambar styraciflua, Rhododendron maximum, Rhododendron viscosum*, and *Magnolia virginiana*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This red maple - blackgum basin swamp occupies saturated or seasonally wet basins in upland forest settings. It was sampled at three locations in the Central Appalachian project area. Sites are seasonally flooded to saturated basin floors and seeps. Soils are very poorly to poorly drained muck, silt loam and sandy loam. The unvegetated surface is dominated by leaf litter along with lesser amounts of small rocks, downed wood, bare soil and occasional standing water. Up to 50% of the ground may be covered with sphagnum mosses. Evidence of disturbance includes trails, windthrow, and the presence of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This red maple - blackgum basin swamp occupies saturated or seasonally wet basins in upland forest settings. Sites are permanently flooded to saturated basin floors and depressions with very poorly drained muck or peat soil sometimes with hummock-and-hollow microtopography. The unvegetated surface is made up of leaf litter and standing water with some downed wood, bare soil and mosses. No evidence of disturbance was reported.

Global Environment: This blackgum basin swamp of the northeastern United States is found from the Central Appalachians north to central New England, at the northern range limit for *Nyssa sylvatica*. It occupies saturated or seasonally wet basins, typically perched basins in small watersheds within upland forests. In most settings, the mineral soil is overlain with a shallow to deep peat layer. Conditions are highly acidic and nutrient-poor.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Acer rubrum* is dominant or codominant with *Nyssa sylvatica*; *Betula alleghaniensis*, or *Pinus strobus* may also occur in the canopy. *Fraxinus* spp. are sparse to absent. *Ilex verticillata, Vaccinium corymbosum, Rhododendron viscosum*, and/or *Lindera benzoin* are common shrubs. *Sphagnum* spp., *Osmunda cinnamomea*, and occasionally *Symplocarpus foetidus* carpet the ground story; *Maianthemum canadense* and *Medeola virginiana* are also common.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This hardwood forested swamp is codominated by *Acer rubrum* and *Nyssa sylvatica* with *Betula alleghaniensis* common. The shrub layer is usually well-developed with *Ilex verticillata, Vaccinium corymbosum, Rhododendron viscosum, Rhododendron maximum*, and/or *Lindera benzoin*. *Carex* spp. are common herbs. A dense *Sphagnum* spp. carpet is characteristic.

Global Vegetation: The tree canopy varies from an open woodland to nearly complete. Shrubs are well-represented and may be locally dense. Herbs are likewise patchy, and the herb layer is usually dominated by only a few species. The bryoid layer varies but is often extensive. Hummock-and-hollow microtopography is often pronounced, with bryophytes common on the hummocks and in those hollows where water does not stand for long periods. The canopy is dominated by *Acer rubrum* and *Nyssa sylvatica*; however, even where red maple is more abundant, the longevity and stature of the blackgum trees give them a strong impact. *Betula alleghaniensis, Tsuga canadensis,*

Pinus strobus, and in the north *Picea rubens* may be minor canopy associates. The most abundant shrubs are *Ilex verticillata* and *Vaccinium corymbosum*; associated shrub species include *Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Kalmia angustifolia, Gaylussacia baccata, Chamaedaphne calyculata, Lyonia ligustrina, Spiraea alba var. latifolia (= Spiraea latifolia)*, and *Cephalanthus occidentalis*. *Osmunda cinnamomea* is the characteristic dominant in the herb layer, with associates including *Osmunda regalis, Thelypteris palustris, Woodwardia virginica, Glyceria canadensis, Coptis trifolia, Carex atlantica, Carex trisperma, Carex folliculata, Carex intumescens, Calla palustris, Triadenum virginicum*, and *Symplocarpus foetidus*. Mosses are primarily *Sphagnum* spp., including *Sphagnum palustre* and *Sphagnum magellanicum*.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (20-May-2011). Although there are a large number of occurrences occupying approximately 41 square km, this vegetation has declined substantially over the long term due to a number of human-caused disturbances. Commercial and residential development, road construction and its associated runoff, altered hydrology due to blocked culverts, impoundments, ditching and the like; logging and land clearing, and conversion to agriculture caused decline in this vegetation throughout its range over the long term. In recent decades, the establishment of wetland regulations led to protection of large occurrences by Federal and some state regulations, but other smaller occurrences, particularly those in isolated wetland basins, receive no wetlands

protection. Continued threats include residential and commercial development, establishment of culverts and impoundments, and in some cases invasive species.

A0653 *Acer rubrum* Swamp Woodland Alliance

Alliance Summary Description: This alliance includes tall graminoid marsh vegetation with a wooded canopy of variable closure. The understory is variable, usually characterized by *Carex stricta, Carex lacustris*, and a number of other graminoids and forbs, with a canopy of *Acer rubrum*. The vegetation is highly variable and dynamic, usually a successional stage resulting from disturbance, or occurring on the edges of larger wetlands. This alliance ranges broadly across the northeastern United States and southern Canada.

[CEGL006119] *Acer rubrum / Carex stricta - Onoclea sensibilis* Wet Woodland

Translated Name: **Red Maple / Upright Sedge - Sensitive Fern Wet Woodland**
Common Name: **Red Maple / Upright Sedge Wet Woodland**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Acer rubrum* Swamp Woodland Alliance (A0653)

Element Concept

Global Summary: This association is a partly wooded, deciduous-canopy wetland of the northeastern United States. It occurs on muck soils or mineral soils with a surface organic layer in poorly drained depressions influenced by groundwater. It is also common in those streamside and lakeside settings where the hydrology is that of a basin setting rather than a floodplain. The community is typically flooded in spring, with pools and small streams persisting throughout much of the growing season; soils may remain saturated or may become dry on the surface over the course of the growing season. Hummock-and-hollow topography may be pronounced. The canopy consists of scattered trees, with as little as 25% overall cover. The shrub layer is patchy and may be extensive in places. The herb layer is typically well-developed, with ferns and graminoids dominant. The bryophyte cover is variable. *Acer rubrum* is dominant in the canopy, often with many standing dead trees, and may be the only canopy species present. Associated trees may include *Fraxinus nigra, Ulmus americana*, and occasional *Pinus strobus, Tsuga canadensis*, or *Picea rubens*. The shrub layer is characterized by *Vaccinium corymbosum, Spiraea alba var. latifolia (= Spiraea latifolia)*, and *Ilex verticillata*. The herbaceous layer is typically dominated by the graminoids or the ferns. *Sphagnum* spp. are the characteristic bryophytes, with non-sphagnous mosses as associates. These woodlands are ecologically similar to both *Acer rubrum / Nemopanthus mucronatus - Vaccinium corymbosum* Swamp Forest (CEGL006220) and *Picea rubens - Acer rubrum / Nemopanthus mucronatus* Swamp Forest (CEGL006198), but those are closed-canopy wetlands. This association does not include red maple wooded wetlands on deeper peat soils [see *Acer rubrum / Alnus incana - Ilex verticillata / Osmunda regalis* Woodland (CEGL006395) and *Acer rubrum - Fraxinus nigra - (Larix laricina) / Rhamnus alnifolia* Swamp Forest (CEGL006009)].

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This red maple wooded marsh occurs on muck soils or mineral soils with a surface organic layer, in poorly drained depressions influenced by groundwater. Sites are intermittently to permanently flooded basins and flats with very poorly drained muck or clay soils. The unvegetated surface consists of leaf litter, standing water or a combination of both. Evidence of disturbance includes alterations to hydrology, trails, recreational use and exotic plants.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is a partly wooded, deciduous-canopy wetland of central and northern New England. It occurs on muck soils or mineral soils with a surface organic layer, in poorly drained depressions influenced by groundwater. It is also common in those streamside and lakeside settings where the hydrology is that of a basin setting rather than a floodplain. The community is typically flooded in spring, with pools and small streams persisting throughout much of the growing

season; soils may remain saturated, or may become dry on the surface, over the course of the growing season. Hummock-and-hollow topography may be pronounced.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Acer rubrum* dominates the canopy; *Fraxinus pennsylvanica* codominates in one example. *Rosa palustris, Vaccinium corymbosum*, and *Viburnum dentatum* are common shrubs. The herbaceous layer is strongly dominated by *Carex stricta*; other herbs may include forbs *Boehmeria cylindrica, Lycopus virginicus*, and *Symplocarpus foetidus*, and ferns *Onoclea sensibilis, Osmunda cinnamomea, Osmunda regalis*, and *Thelypteris palustris*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The canopy consists of scattered trees, with as little as 25% overall cover. The shrub layer is patchy and may be extensive in places. The herb layer is typically well-developed, with ferns and graminoids dominant. The bryophyte cover is variable. *Acer rubrum* is dominant in the canopy, often with many standing dead trees. Associated trees may include *Fraxinus nigra, Ulmus americana*, and occasional *Pinus strobus, Tsuga canadensis*, or *Picea rubens*. The shrub layer is characterized by *Vaccinium corymbosum, Spiraea alba var. latifolia (= Spiraea latifolia)*, and *Ilex verticillata*. Other shrubs may be locally common, including *Nemopanthus mucronatus, Viburnum nudum var. cassinoides, Viburnum dentatum, Lyonia ligustrina, Alnus incana, Ilex laevigata*, and creeping *Rubus hispidus*. The herbaceous layer is typically dominated by the graminoids *Carex stricta, Carex lacustris*, or *Calamagrostis canadensis* or the ferns *Onoclea sensibilis, Osmunda cinnamomea*, or *Osmunda claytoniana*. Less abundant herbs include *Carex intumescens, Carex folliculata, Carex canescens, Carex trisperma, Glyceria striata, Osmunda regalis, Dryopteris cristata, Thelypteris palustris, Lycopus uniflorus, Symplocarpus foetidus, Galium palustre, Cicuta bulbifera, Caltha palustris*, and *Impatiens capensis*. *Sphagnum* spp. are the characteristic bryophytes, with non-sphagnous mosses as associates.

A3416 *Betula alleghaniensis - Tsuga canadensis* Swamp Forest Alliance

Alliance Summary Description: This alliance includes swamp forests of the Great Lakes states and Northeast, ranging from southeastern Canada through New England to the Central Appalachians, Blue Ridge, and Ridge and Valley. Stands are often dominated by *Tsuga canadensis, Betula alleghaniensis*, and *Acer rubrum*, with closed to open canopies and an open to dense shrub layer, interspersed with small *Sphagnum* - herb-dominated depressions. Canopies are composed of various mixtures of evergreen and deciduous species. Minor canopy associates include *Acer rubrum, Fraxinus americana, Fraxinus pennsylvanica, Pinus strobus*, and *Nyssa sylvatica*; *Liriodendron tulipifera* may be a component at the southern limit, while *Picea rubens* may occur as scattered individuals in the north. Shrubs include *Acer pensylvanicum, Alnus incana ssp. rugosa, Hamamelis virginiana, Ilex montana, Ilex verticillata, Kalmia latifolia, Lindera benzoin, Nemopanthus mucronatus, Rhododendron maximum, Vaccinium corymbosum, Viburnum lantanoides*, and *Viburnum nudum var. cassinoides*. Herbs in the forested areas include *Coptis trifolia, Cornus canadensis, Glyceria melicaria, Lycopodium obscurum, Maianthemum canadense, Onoclea sensibilis, Osmunda regalis var. spectabilis*, and *Thelypteris noveboracensis*. Soils of this alliance vary from saturated muck to imperfectly drained mineral soils and are often acidic. Communities in this alliance occur in upland valleys created by bedrock depressions, on lower slopes, or adjacent to streams and lakes.

[CEGL006380] *Betula alleghaniensis - Acer rubrum - (Tsuga canadensis, Abies balsamea) / Osmunda cinnamomea* Swamp Forest

Translated Name: **Yellow Birch - Red Maple - (Eastern Hemlock, Balsam Fir) / Cinnamon Fern Swamp Forest**
Common Name: **Hardwood - Conifer Seepage Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Betula alleghaniensis - Tsuga canadensis* Swamp Forest Alliance (A3416)

Element Concept

Global Summary: This mixed forest type occurs in moist ecotonal areas between uplands and wetlands in New England and the Northern Appalachians. Settings include stream drainages, seepage channels, inactive river terraces, and slope bottoms, but not permanently saturated basins. Perennial seepage from upslope or an impervious soil layer keeps water near the surface. There is often pronounced hummock-and-hollow microtopography. The somewhat acidic to circumneutral mineral soils are typically saturated early in the season but may dry out as summer progresses. The canopy closure ranges from somewhat open to nearly closed. Shrubs are sparse; the herb layer is patchy and may be locally dense. The bryoid layer is typically fairly sparse. The canopy is codominated by *Tsuga canadensis* and mixed hardwoods such as *Betula alleghaniensis, Fraxinus americana*, and *Acer rubrum*. Less frequent species can include *Pinus strobus, Fraxinus pennsylvanica*, and *Fraxinus nigra*. *Picea rubens* may occur sporadically at the northern extent of this community, and *Nyssa sylvatica* may occur to the south. The shrub layer often includes *Lindera benzoin, Viburnum lantanoides (= Viburnum alnifolium)*, and *Acer pensylvanicum*. The herb layer reflects the underlying moisture gradients, with *Osmunda cinnamomea, Osmunda claytoniana, Geum rivale, Impatiens capensis, Thelypteris palustris, Arisaema triphyllum, Symplocarpus foetidus, Hydrocotyle americana*, and *Cardamine pensylvanica* in the more moist areas, and *Coptis trifolia, Thelypteris noveboracensis, Athyrium filix-femina, Oclemena acuminata (= Aster acuminatus), Dryopteris intermedia, Cornus canadensis, Aralia nudicaulis*, and *Clintonia borealis* typical of the areas grading to upland. Bryophyte cover is variable and often includes *Sphagnum girgensohnii, Thuidium delicatulum, Bazzania trilobata*, and *Mnium* spp. These forests are somewhat similar to *Tsuga canadensis - Betula alleghaniensis / Ilex verticillata / Sphagnum* spp. Swamp Forest (CEGL006226) but occur on mineral soils, not in peaty basins, and have understory species that indicate somewhat more nutrient-enriched conditions.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mixed hemlock - hardwood forest occurs on mineral-soil wetlands in seepage-influenced areas, at wetland-upland ecotones, along intermittent streams and on slopes rather than in basins. Sampled site elevations range from 295-611 m (968-2,000 feet). It occurs in moist ecotonal areas between uplands and wetlands in New England and the Northern Appalachians. Sites are typically gentle lower slopes with northern and western aspects. Soils are temporarily flooded to saturated and include very poorly to poorly drained peat and muck, as well as moderately well- to well-drained silt loam and loam. The unvegetated surface consists of leaf litter, with lesser amounts of large/small rocks, bare soil, downed wood, and/or standing water. Evidence of disturbance includes trails and powerline corridor, past logging and clearing, and the presence of exotic plants.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is only known from two locations in the Northern Appalachian project area and occurs in seepage areas and pond margins with flat to moderate slopes at elevation ranging from 200 to 650 m (655-2,130 feet). Soils are somewhat to very poorly drained with standing water occasionally present.

Global Environment: This mixed forest type occurs in moist ecotonal areas between uplands and wetlands in New England and the Northern Appalachians. Settings include stream drainages, seepage channels, inactive river terraces, and slope bottoms where an impervious soil layer keeps water near the surface, but not permanently saturated basins. The somewhat acidic to circumneutral mineral soils are typically saturated early in the season, but may dry out as summer progresses. There is often pronounced hummock-and-hollow microtopography.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy includes *Acer rubrum, Betula alleghaniensis, Acer saccharum*, and occasionally *Tsuga* spp. (≤25% of canopy). The herbaceous layer is more indicative of nutrient-enriched conditions with species such as *Geum rivale, Impatiens capensis,*

Thelypteris palustris, and *Arisaema triphyllum*. Common herbs from plots sampled in this area include *Athyrium filix-femina, Glyceria melicaria, Onoclea sensibilis, Osmunda cinnamomea*, and *Tiarella cordifolia*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy deciduous or mixed deciduous-evergreen forests dominated by *Betula alleghaniensis*. Canopy associates are variable and include *Abies balsamea, Acer rubrum, Fraxinus americana, Picea rubens*, and *Tsuga canadensis*. Shrub dominants include *Rubus pubescens* and *Viburnum lantanoides*. Herbaceous cover is variable. Characteristic species include *Carex leptonervia, Coptis trifolia, Dryopteris intermedia, Oclemena acuminata, Onoclea sensibilis, Oxalis montana, Phegopteris connectilis*, and *Trillium undulatum*. Bryophytes and lichens are often a prominent feature of the ground layer.

Global Vegetation: The canopy closure ranges from somewhat open to nearly closed. Shrubs are sparse; the herb layer is patchy and may be locally dense. The bryoid layer is typically fairly sparse. The canopy is codominated by *Tsuga canadensis* and mixed hardwoods such as *Betula alleghaniensis* and *Acer rubrum*. Less frequent species can include *Pinus strobus, Fraxinus pennsylvanica*, and *Fraxinus nigra*. *Picea rubens* and/or *Abies balsamea* may occur sporadically at the northern extent of this community, and *Nyssa sylvatica* may occur to the south. The shrub layer often includes *Lindera benzoin, Viburnum lantanoides (= Viburnum alnifolium)*, and *Acer pensylvanicum*. The herb layer reflects the underlying moisture gradients, with *Osmunda cinnamomea, Osmunda claytoniana, Geum rivale, Impatiens capensis, Thelypteris palustris, Arisaema triphyllum, Symplocarpus foetidus, Hydrocotyle americana*, and *Cardamine pensylvanica* in the more moist areas, and *Coptis trifolia, Thelypteris noveboracensis, Oclemena acuminata (= Aster acuminatus), Dryopteris intermedia, Cornus canadensis, Aralia nudicaulis*, and *Clintonia borealis* typical of the areas grading to upland. Bryophyte cover is spotty, and often includes *Sphagnum girgensohnii, Bazzania trilobata*, and *Mnium* spp.

RELATED CONCEPTS

Global Similar Types:

- *Tsuga canadensis - Betula alleghaniensis / Ilex verticillata / Sphagnum* spp. Swamp Forest (CEGL006226)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community is transitional between wetland and upland. Eastern hemlock is not always in the canopy of this community.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: At the Lower New England/Northern Appalachian AT classification meeting there was discussion about the richness of this association (CEGL006380); Vermont says yes, Maine says no. One sloping seepage swamp site in Shrewsbury, Vermont, has deep muck (60 cm+) rather than mineral soil.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Other Comments: None.
Global Classification Comments: Conifers are characteristic but not necessarily prominent. The more southerly examples have hemlock as an associate, while more northerly examples tend to have balsam fir.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Massachusetts (Beartown State Forest, Crystal Mountain Natural Heritage Site, October Mountain State Forest, Shaker Campsite Natural Heritage Site, Tully Mountain), New York (Sunken Mine Road North/Fahnestock State Park), and Vermont (Sherburne Pass, Shrewsbury, Stratton Pond vicinity).
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only known from two locations in Maine at Surplus Pond and Church Pond.
Global Range: This mixed forest type occurs in moist ecotonal areas between uplands and wetlands in New England and the Northern Appalachians, and adjacent Canada.

Translated Name: **Eastern Hemlock - Yellow Birch / Common Winterberry / Peatmoss species Swamp Forest**
Common Name: **Hemlock - Hardwood Swamp Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Betula alleghaniensis - Tsuga canadensis* Swamp Forest Alliance (A3416)

Element Concept

Global Summary: These hemlock-hardwood swamps are common throughout most of New England, New York and Pennsylvania, mostly in glaciated areas south of spruce-fir forest regions. Most are mixed-canopy wetland forests, but in some may be strongly coniferous. They occur in poorly drained basins over bedrock or compacted till. "Pocket swamps," small isolated basins in upland forests, are one setting, and these swamps also occur adjacent to streams and lakes in larger basins. The acidic, organic soils remain saturated for most or all of the growing season; they may partially dry out, particularly in smaller basins. Canopy closure is nearly complete, and shrubs are sparse. The herbaceous layer may be well-developed, with ferns especially characteristic. Bryophyte cover varies, but is usually extensive. *Tsuga canadensis* is either canopy dominant or is mixed with other trees including *Acer rubrum, Betula alleghaniensis, Pinus strobus, Nyssa sylvatica*, and *Fraxinus nigra*. Scattered shrubs include *Vaccinium corymbosum, Ilex verticillata, Lyonia ligustrina, Nemopanthus mucronatus*, and *Viburnum nudum var. cassinoides*. *Osmunda cinnamomea, Osmunda regalis*, and *Onoclea sensibilis* are prominent ferns; associated herbs include *Carex folliculata, Carex trisperma, Carex disperma, Maianthemum canadense, Coptis trifolia, Dryopteris cristata, Rubus pubescens*, and *Mitchella repens*. Bryophytes include *Sphagnum girgensohnii, Sphagnum palustre*, and other *Sphagnum* species, as well as *Pleurozium schreberi* and *Bazzania trilobata*. These forests lack the species of more southerly affinity, such as *Rhododendron maximum* or *Liriodendron tulipifera*, that characterize hemlock swamps to the south, which are covered by *Tsuga canadensis / Rhododendron maximum / Sphagnum* spp. Swamp Forest (CEGL006279). Mixed expression of these swamps may be similar in canopy composition to *Betula alleghaniensis - Acer rubrum - (Tsuga canadensis, Abies balsamea) / Osmunda cinnamomea* Swamp Forest (CEGL006380); those are mineral-soil wetlands in seepage-influenced areas, typically at wetland-upland ecotones, and usually occur on slopes rather than in basins. *Acer rubrum - Nyssa sylvatica - Betula alleghaniensis / Sphagnum* spp. Swamp Forest (CEGL006014) is ecologically similar but is more strongly deciduous, with limited hemlock.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: These mixed hemlock - hardwood basin swamps occur on saturated acidic, peaty, organic soils occupying poorly drained basins over bedrock or compacted till. Sites are saturated basins with very poorly drained muck soil. The unvegetated surface includes downed wood, bare soil, and mosses. Evidence of disturbance includes uprooted hemlocks due to poor root anchorage and a minor presence of exotic plants.
Global Environment: These hemlock-hardwood swamps are common throughout most of New England, New York and Pennsylvania, mostly in glaciated areas south of spruce-fir forest regions. Most are mixed-canopy wetland forests, but in some may be strongly coniferous. They occur in poorly drained basins over bedrock or compacted till. "Pocket swamps," small isolated basins in upland forests, are one setting, and these swamps also occur adjacent to streams and lakes in larger basins. The acidic, organic soils remain saturated for most or all of the growing season; they may partially dry out, particularly in smaller basins.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These forested wetlands are dominated by *Tsuga canadensis* in the canopy and subcanopy along with lesser amounts of *Acer rubrum, Betula alleghaniensis, Pinus strobus, Nyssa sylvatica*, and *Fraxinus* spp. Shrubs are sparse but may include *Ilex verticillata* and *Kalmia latifolia*. Herbs are often dense, especially *Osmunda cinnamomea* and several sedges, including *Carex folliculata, Carex trisperma*, and *Carex disperma*. Forbs may include *Aralia nudicaulis, Pilea pumila*, and *Tiarella cordifolia*. *Sphagnum* spp. tend to carpet the surface.
Global Vegetation: Canopy closure is nearly complete, and shrubs are sparse. The herbaceous layer may be well-developed, with ferns especially characteristic. Bryophyte cover varies, but is usually extensive. *Tsuga canadensis* is either canopy dominant or is mixed with other trees including *Acer rubrum, Betula alleghaniensis, Pinus strobus,*

Nyssa sylvatica, and *Fraxinus nigra*. Scattered shrubs include *Vaccinium corymbosum, Ilex verticillata, Lyonia ligustrina, Nemopanthus mucronatus*, and *Viburnum nudum var. cassinoides*. *Osmunda cinnamomea, Osmunda regalis*, and *Onoclea sensibilis* are prominent ferns; associated herbs include *Carex folliculata, Carex trisperma, Carex disperma, Maianthemum canadense, Coptis trifolia, Dryopteris cristata, Rubus pubescens*, and *Mitchella repens*. Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Betula alleghaniensis* - *Tsuga canadensis* Swamp Forest Alliance (A3416)

ELEMENT CONCEPT

Global Summary: This hemlock swamp of the Central Appalachians, southeastern New York and northern New Jersey occurs on saturated acidic muck to imperfectly drained mineral soils in upland valleys, bedrock depressions, low slopes, and adjacent to streams and lakes. Mounds and depressions caused by uprooted trees are typical. The tree canopy is closed or nearly closed and is dominated by *Tsuga canadensis* with associates including *Acer rubrum, Nyssa sylvatica, Pinus strobus*, and *Betula alleghaniensis*. The well-developed shrub layer is strongly dominated by *Rhododendron maximum*. Other shrubs may include *Ilex verticillata, Rhododendron viscosum, Vaccinium corymbosum*, and *Lindera benzoin*. The sparse herb layer includes a variety of sedges such as *Carex folliculata, Carex trisperma, Carex intumescens*, as well as ferns and forbs such as *Osmunda cinnamomea, Thelypteris palustris, Onoclea sensibilis, Maianthemum canadense, Cornus canadensis, Coptis trifolia, Symplocarpus foetidus, Trientalis borealis*, and *Calla palustris*. The bryophyte layer is well-developed and strongly dominated by *Sphagnum* mosses. Other mosses may include *Aulacomnium palustre, Hypnum imponens*, and *Leucobryum glaucum* on drier hummocks.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This hemlock / laurel swamp forest occurs on saturated acidic muck to imperfectly drained mineral soils in upland valleys, bedrock depressions, low slopes, and adjacent to streams and lakes. It was sampled on low hummocks in an intermittently flooded seep with somewhat poorly drained muck soil. The unvegetated surface is dominated by leaf litter with some small rocks, downed wood, bare soil, and standing water.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hemlock swamp forest occurs on saturated acidic muck to imperfectly-drained mineral soils. The sampled site has saturated poorly drained silt loam soil with hummock-and-hollow microtopography. Tip-up mounds and hummocks are vegetated, while hollows are largely unvegetated and are filled with litter and water.

Global Environment: This forest type occurs in saturated acidic muck to imperfectly drained mineral soils in upland valleys, bedrock depressions, low slopes, in small stream drainages, and adjacent to streams and lakes. The substrate is somewhat poorly to very poorly drained. Some areas are semipermanently to permanently flooded, especially where impacted by beaver or other impoundments, in which case the hemlocks may be in decline. The hemlocks may also be in decline due to hemlock woolly adelgid.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by *Tsuga canadensis* with *Pinus strobus* and *Acer rubrum* (not dominant). *Nyssa sylvatica, Betula alleghaniensis, Betula lenta*, and *Fraxinus nigra* are common in the subcanopy. Trees occur mostly on hummocks. *Rhododendron maximum* is dominant in the shrub layer. The herb layer is dominated by *Symplocarpus foetidus*. *Sphagnum* spp. are common.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Tsuga canadensis* is the sole canopy dominant with *Rhododendron maximum* dominant in the shrub layer. Hardwoods such as *Acer rubrum* and *Betula alleghaniensis* may also be present in canopy but low in cover (<25%). *Symplocarpus foetidus* and *Osmunda cinnamomea* are dominant herbs.

Global Vegetation: The tree canopy is closed or nearly closed (given healthy tress) and is dominated by *Tsuga canadensis* with associates including *Acer rubrum, Nyssa sylvatica, Pinus strobus*, and *Betula alleghaniensis*. (Actual foliar cover in stands where hemlocks are becoming defoliated due to hemlock woolly adelgid is much lower.) A subcanopy of *Tsuga canadensis* and *Acer rubrum* may be present. Mounds and depressions caused by uprooted trees are typical. The well-developed shrub layer is strongly dominated by *Rhododendron maximum*. Other shrubs may include *Ilex verticillata, Rhododendron viscosum, Hamamelis virginiana, Vaccinium corymbosum, Lindera benzoin*, and (in the northern part of the types range) *Nemopanthus mucronatus*. Herb cover varies from sparse to well-developed according to canopy closure and includes a variety of sedges such as *Carex folliculata, Carex trisperma, Carex disperma, Carex intumescens*, as well as ferns and forbs such as *Osmunda cinnamomea, Osmunda regalis, Thelypteris palustris, Onoclea sensibilis, Maianthemum canadense, Lycopus uniflorus, Cornus canadensis, Coptis trifolia, Symplocarpus foetidus, Trientalis borealis*, and *Calla palustris*. The bryophyte layer is well-developed and strongly dominated by *Sphagnum* mosses. Other mosses may include *Aulacomnium palustre, Hypnum imponens*, and *Leucobryum glaucum* on drier hummocks.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (19-Jun-2006). This association is well-distributed through its range, but hemlock woolly adelgid may be threatening this as a type.

RELATED CONCEPTS

Global Similar Types:
- *Tsuga canadensis - Betula alleghaniensis / Ilex verticillata / Sphagnum* spp. Swamp Forest (CEGL006226)
- *Tsuga canadensis - Betula alleghaniensis* Swamp Forest (CEGL005003)
- *Tsuga canadensis - Liriodendron tulipifera - Platanus occidentalis / Rhododendron maximum - Xanthorhiza simplicissima* Wet Forest (CEGL007143)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Hemlock woolly adelgid-induced hemlock mortality is evident in this community.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This community can occur in small patches across the landscape. Some examples along the Appalachian Trail may fall below the minimum map unit size.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This swamp is homogenous in the understory, but canopy dominance outside the plot seems to vary between *Tsuga canadensis* and *Acer rubrum*. This is a seepage swamp at the base of a slope surrounded by hemlock-northern hardwood forest in the uplands and shallow emergent marsh/sedge meadow to the east. Drainage in the landscape is affected by a railroad line to the east (bordering the shallow emergent marsh/sedge meadow); there are many exotics in the surrounding communities but none at the site.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is found in the Central Appalachians, southeastern New York and northern New Jersey. It was sampled in Cumberland County, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This hemlock swamp was sampled at Corbin Hill in New York.
Global Range: This association is found in the northeastern United States from New York south to West Virginia and west to Ohio.

A3418 *Picea rubens* Northern Appalachian Swamp Forest Alliance

Alliance Summary Description: This alliance includes swamp forests of the Northern Appalachians and southern Canada dominated by *Picea rubens*, often admixed with *Abies balsamea, Acer rubrum*, and *Betula alleghaniensis*. These swamp forests are generally not "boggy" in nature, and lack significant peat, although deep muck may overlie mineral soil. The shrub layer is characterized by *Nemopanthus mucronatus, Vaccinium corymbosum, Ilex verticillata*, and *Sorbus americana*. The herbaceous layer is characterized by *Carex trisperma, Clintonia borealis, Gaultheria hispidula*, and others of northern climates. This alliance includes red spruce-fir- or fir-dominated swamps of northern and/or montane regions of the eastern United States and Canada. Canopy associates may include *Acer rubrum, Betula alleghaniensis, Tsuga canadensis*, and *Larix laricina*. Communities of this alliance are "swamps" as opposed to "bog forests" in that they lack significant *Sphagnum* peat accumulation. Soils are saturated mucks over generally acidic outwash materials and other mineral soils in the glaciated and unglaciated portions of the range. Although *Picea rubens* is the predominant spruce, *Picea mariana* or *Picea glauca* are occasionally dominant in the northern portion of the range. Typical understory species include *Vaccinium corymbosum, Nemopanthus mucronatus, Viburnum nudum var. cassinoides (= Viburnum cassinoides)*, and, in the southern portion of the range, *Rhododendron maximum* or *Hypericum densiflorum*. Ground flora includes *Carex trisperma, Coptis trifolia, Cornus canadensis, Maianthemum canadense, Osmunda cinnamomea, Oxalis montana*, and *Gaultheria hispidula*. Feathermosses are common and *Sphagnum* is patchy.

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Picea rubens* Northern Appalachian Swamp Forest Alliance (A3418)

ELEMENT CONCEPT

Global Summary: This closed-canopy spruce-fir forest occurs in northern New England on imperfectly drained flats or stream drainages, often where cold air accumulates. This association is typically found along streams, swamp borders, low flats alongside lakes, or adjacent to boreal heathlands. Soils are acidic silts, loams, or sandy loams and imperfectly drained. In most settings they are seasonally wet; some may remain saturated. Only rarely are they peaty. The canopy is generally closed, but blowdown gaps are common. The dominant understory feature is the extensive bryoid layer. Shrubs are sparse, except in gaps. Herbs are well represented although rarely dense. The

canopy is dominated by some combination of *Picea rubens, Picea mariana*, and *Abies balsamea*. Associates include *Betula alleghaniensis, Abies balsamea, Acer rubrum*, or *Thuja occidentalis*. In the southern portion of this type's range, *Tsuga canadensis* and *Prunus serotina* may be present in the canopy. Characteristic shrubs include *Viburnum nudum var. cassinoides (= Viburnum cassinoides), Kalmia angustifolia, Amelanchier bartramiana, Vaccinium angustifolium*, and *Vaccinium myrtilloides*. The herbaceous layer is characterized by *Osmunda cinnamomea, Osmunda claytoniana, Gaultheria hispidula, Maianthemum canadense, Cornus canadensis, Coptis trifolia, Clintonia borealis*, and *Dalibarda repens*. A well-developed bryophyte layer is characteristic of this association and includes *Pleurozium schreberi, Hylocomium splendens, Ptilium crista-castrensis, Bazzania trilobata*, and species of *Sphagnum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This community occurs on imperfectly drained flats or stream drainages, where cold air accumulates.

Alliance	*Picea rubens* Northern Appalachian Swamp Forest Alliance (A3418)

ELEMENT CONCEPT

Global Summary: This black spruce bog association represents the southern range limit of the alliance, ranging from central New England to just south of the glacial border. This vegetation generally occurs in kettlehole basins and other well-defined topographic depressions and is characterized by relatively deep peat accumulation, indicating acidic, nutrient-poor conditions. The tree canopy ranges widely in closure. The dominant tree is *Picea mariana*, with associates including *Larix laricina* and *Abies balsamea*. The shrubs *Vaccinium corymbosum* and *Nemopanthus mucronatus* form a patchy tall-shrub layer. The dwarf-shrub layer is well-developed and characterized by a number of heaths including *Chamaedaphne calyculata, Gaylussacia baccata, Kalmia angustifolia*, and *Vaccinium angustifolium*. Common herbs may include *Carex trisperma, Rhynchospora alba, Drosera rotundifolia, Sarracenia purpurea, Eriophorum virginicum, Coptis trifolia*, and *Maianthemum trifolium*. The well-developed bryophyte layer is dominated by *Sphagnum magellanicum, Sphagnum girgensohnii, Bazzania trilobata, Aulacomnium palustre*, and *Pleurozium schreberi*. This association is further characterized by the presence of one or more tree or shrub species of more southern distribution, including *Betula populifolia, Tsuga canadensis, Pinus rigida, Alnus incana, Rhododendron viscosum, Photinia* spp. (= *Aronia* spp.), or *Lyonia ligustrina*. Additional species that further indicate southern range affinity or the influence of slightly higher nutrient levels from adjacent uplands may be present, including *Carex folliculata, Carex crinita, Carex stricta, Osmunda cinnamomea, Symplocarpus foetidus, Iris versicolor*, or *Calla palustris*. Northern species, such as *Rhododendron canadense* or *Eriophorum vaginatum var. spissum (= Eriophorum spissum)*, are generally lacking.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This black spruce woodland bog occurs in kettlehole basins and other well-defined topographic depressions. It is characterized by relatively deep peat accumulation, indicating acidic, nutrient-poor conditions.

Global Environment: This vegetation generally occurs in kettlehole basins and other well-defined topographic depressions and is characterized by relatively deep peat accumulation, indicating acidic, nutrient-poor conditions. The tree canopy ranges widely in closure.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This forested bog is dominated by *Picea mariana* over heath shrubs and sphagnum mosses.

Global Vegetation: The dominant tree is *Picea mariana*, with associates including *Larix laricina* and *Abies balsamea*. The shrubs *Vaccinium corymbosum* and *Nemopanthus mucronatus* form a patchy tall-shrub layer. [CEGL006312] *Picea rubens - Abies balsamea / Gaultheria hispidula / Osmunda cinnamomea / Sphagnum* spp. Swamp Forest

Translated Name: **Red Spruce - Balsam Fir / Creeping Snowberry / Cinnamon Fern / Peatmoss species Swamp Forest**
Common Name: **Northern Appalachian Spruce - Fir Swamp Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Picea rubens* Northern Appalachian Swamp Forest Alliance (A3418)

ELEMENT CONCEPT

Global Summary: These red spruce - balsam fir swamps occur on wetland flats and basins across the Northern Appalachians. They are typically found in small basins, or along the margins of larger drainage basins or lowland slopes, usually in areas with some surface seepage. The substrate is saturated mineral soils, sometimes with a shallow peat layer. Shrubs and herbs of boreal affinity reflect the cool environmental conditions. The canopy ranges from partial (50%) to dense, with shrub and herb layers sparse to well-developed depending on available light. Canopy gaps are common, and shrubs may be locally dense. The canopy is dominated by *Picea rubens* and *Abies balsamea*, with smaller amounts of *Picea mariana, Picea glauca*, or *Larix laricina*. *Abies balsamea* drops out at the southern end of the range. Characteristic shrubs are *Nemopanthus mucronatus, Sorbus americana, Alnus viridis*, and *Viburnum nudum var. cassinoides*. Heath shrubs such as *Gaultheria hispidula, Vaccinium angustifolium*, and *Kalmia angustifolia* are occasional, but not abundant. The most characteristic herb layer species are *Osmunda cinnamomea* and *Carex trisperma*; common associates include *Dalibarda repens, Coptis trifolia*, and *Clintonia borealis*. In coastal settings, *Symplocarpus foetidus* may be locally abundant. The bryophytes are dominated by *Sphagnum* spp. (typically including *Sphagnum girgensohnii*), but also include *Bazzania trilobata, Pleurozium schreberi*, and *Aulacomnium palustre*. This association is distinguished by the dominance of red spruce rather than black spruce, the mineral soil setting, and the low abundance of heath shrubs. *Picea mariana - Picea rubens / Pleurozium schreberi* Swamp Forest (CEGL006361) is similar, but has black spruce abundant and occurs in more boreal settings, on poorly drained but not usually saturated soils.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This Northern Appalachian red spruce - balsam fir swamp is peripheral to, but present in, Lower New England where it was sampled in Massachusetts and Vermont. The sites are flat basins that are semipermanently flooded or saturated. Soils are very poorly drained peat, muck and sandy loam. The unvegetated surface consists of leaf litter or sphagnum mosses, with standing water possible. Evidence of disturbance includes past logging, wind damage (tip-up mounds due to unstable saturated soil), and trampling.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is uncommon in the Northern Appalachian project area and occurs on gently sloping seepages and pond margins at elevations ranging from 450 to 1,000 m (1,475-3,280 feet). Soils are saturated to poorly drained organic matter and peat.

Global Environment: These red spruce - balsam fir swamps occur on wetland flats and basins across the Northern Appalachians. They are typically found in small basins, or along the margins of larger drainage basins or lowland slopes, usually in areas with some surface seepage. The substrate is saturated mineral soils, sometimes with a shallow peat layer. Shrubs and herbs of boreal affinity reflect the cool environmental conditions.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These red spruce - balsam fir swamps are codominated by *Picea rubens* and *Abies balsamea* with a continuous ground layer of *Sphagnum* spp. *Abies balsamea* is prevalent shrub tall shrub along with *Viburnum lantanoides, Nemopanthus mucronatus, Sorbus americana, Alnus viridis ssp. crispa*, and *Viburnum nudum var. cassinoides*. Characteristic herbs include *Carex disperma, Coptis trifolia, Cornus canadensis, Gaultheria hispidula, Oclemena acuminata*, and *Osmunda cinnamomea*. In addition, this community supports MA state-imperiled *Amelanchier bartramiana*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy evergreen forests dominated by *Picea rubens* and/or *Abies balsamea* with both species always at least present. Other canopy associates include *Acer rubrum, Betula alleghaniensis*, and *Betula papyrifera*. Shrubs are not a prominent feature of this association but may include *Ilex verticillata, Nemopanthus mucronatus, Vaccinium angustifolium*, and *Viburnum lantanoides* occurring at low cover. Herbaceous dominance is highly variable. Characteristic species include *Carex brunnescens, Carex disperma, Carex gynandra, Carex trisperma, Clintonia borealis, Coptis trifolia, Cornus canadensis, Dennstaedtia punctilobula, Dryopteris campyloptera, Dryopteris marginalis, Gaultheria hispidula, Maianthemum canadense, Oclemena acuminata*, and *Osmunda cinnamomea*. *Sphagnum* spp. often strongly dominate the ground layer with as much as >90% cover.

Global Vegetation: The canopy ranges from partial (50%) to dense, with shrub and herb layers sparse to well-developed depending on available light. Canopy gaps are common, and shrubs may be locally dense. The canopy is dominated by *Picea rubens* and *Abies balsamea*, with smaller amounts of *Picea mariana, Picea glauca*, or *Larix laricina*. Characteristic shrubs are *Nemopanthus mucronatus, Sorbus americana, Alnus viridis*, and *Viburnum nudum var. cassinoides*. Heath shrubs such as *Gaultheria hispidula, Vaccinium angustifolium*, and *Kalmia angustifolia* are occasional, but not abundant. The most characteristic herb layer species are *Osmunda cinnamomea*

and *Carex trisperma*; common associates include *Dalibarda repens, Coptis trifolia*, and *Clintonia borealis*. In coastal settings, *Symplocarpus foetidus* may be locally abundant. The bryophytes are dominated by *Sphagnum* spp. (typically including *Sphagnum girgensohnii*), but also include *Bazzania trilobata, Pleurozium schreberi*, and *Aulacomnium palustre*.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: GNR (1-Dec-1997).

RELATED CONCEPTS

Global Similar Types:

- *Picea mariana - Picea rubens / Pleurozium schreberi* Swamp Forest (CEGL006361) has black spruce abundant and occurs in more boreal settings, on poorly drained but not usually saturated soils.
- *Picea rubens - (Tsuga canadensis) / Rhododendron maximum* Swamp Forest (CEGL006277)
- *Picea rubens - Acer rubrum / Nemopanthus mucronatus* Swamp Forest (CEGL006198)
- *Picea rubens / Carex trisperma / Sphagnum* spp. - *Polytrichum* spp. Swamp Forest (CEGL006590)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Intact swamps are uncommon in Vermont where beaver have impounded many of these sites.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Other Comments: None.

Global Classification Comments: A continuum of Northern Appalachian acidic swamps, with very similar floristics, is expressed through three associations: the present type (coniferous), the mixed *Picea rubens - Acer rubrum / Nemopanthus mucronatus* Swamp Forest (CEGL006198), and the deciduous *Acer rubrum / Nemopanthus mucronatus - Vaccinium corymbosum* Swamp Forest (CEGL006220), with all gradations possible.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This spruce-fir forest was sampled at Saddleball Ridge Natural Heritage Site in Massachusetts and at Sunderland, Stratton, and Mt. Tabor South in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only known from near Lonesome Lake in New Hampshire and east of Wachipauka Pond and Surplus Pond in Maine.
Global Range: This community occurs in New England and adjacent Canada south to Pennsylvania.

[CEGL006198] *Picea rubens - Acer rubrum / Nemopanthus mucronatus* Swamp Forest

Translated Name: **Red Spruce - Red Maple / Catberry Swamp Forest**
Common Name: **Red Spruce - Red Maple Acidic Swamp Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Acidic Swamp (G045)
Alliance	*Picea rubens* Northern Appalachian Swamp Forest Alliance (A3418)

ELEMENT CONCEPT

Global Summary: This red spruce - red maple swamp occurs in the glaciated Northeast. It occurs most commonly in basins or low flats with poor drainage, characterized by soils that are poorly drained organic muck or shallow peat over clay loam. The substrate is characterized by pronounced hummock-and-hollow microtopography with abundant slowly decomposing leaf/needle litter. The tree canopy is closed to partly open, and the tall-shrub layer is often well-developed. Dwarf-shrubs are sparse, but herbs typically form high cover. The ground layer features extensive

Sphagnum and other bryophytes. The canopy is codominated by *Picea rubens* and *Acer rubrum*, in association with other trees such as *Betula alleghaniensis, Betula populifolia, Thuja occidentalis, Abies balsamea*, and, occasionally, *Tsuga canadensis*. The most abundant shrubs are *Vaccinium corymbosum, Nemopanthus mucronatus, Ilex verticillata, Spiraea alba*, and *Alnus incana*. The herbaceous layer is generally dominated by the ferns *Osmunda cinnamomea, Osmunda regalis, Onoclea sensibilis*, and *Thelypteris palustris*. Associated herbs include *Carex trisperma, Cornus canadensis, Doellingeria umbellata (= Aster umbellatus), Trientalis borealis, Oclemena acuminata (= Aster acuminatus), Carex intumescens*, and others. The bryophyte layer is dominated by *Sphagnum* spp. including *Sphagnum girgensohnii* and *Sphagnum magellanicum*. This association is differentiated from *Picea rubens - Abies balsamea / Gaultheria hispidula / Osmunda cinnamomea / Sphagnum* spp. Swamp Forest (CEGL006312) of the Northern Appalachian and adjacent ecoregions by its mixed canopy, lack of *Abies balsamea* and presence of *Vaccinium corymbosum* and *Ilex verticillata*. This association is differentiated from *Picea rubens - Acer rubrum / Ilex verticillata* Swamp Forest (CEGL006556) of the Central Appalachians by the presence of *Thuja occidentalis* and *Cornus canadensis*. Although *Nyssa sylvatica* may be present in some occurrences of the southern range limit, this species is not characteristic of this type. This association is differentiated from those of *Thuja occidentalis - Acer rubrum - Larix laricina* Swamp Forest Alliance (A3720) by its restriction to acidic wetlands and the lower importance of *Thuja occidentalis*. It can be compositionally similar to *Acer rubrum / Nemopanthus mucronatus - Vaccinium corymbosum* Swamp Forest (CEGL006220), except in the reduced amount of red maple and the increased amount of conifers in the present type.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: Sites of this red spruce basin swamp are saturated basins with very poorly drained peat or muck soils, sometimes with hummock-and-hollow microtopography. The unvegetated surface includes leaf litter or sphagnum mosses, with some downed wood and standing water possible. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is only known from several sites in the Northern Appalachian project area in basin floors, wet flats, headwaters and seepage slopes at elevations ranging from 500 to 750 m (1,640-2,460 feet). Soils are saturated peat.
Global Environment: This spruce - red maple swamp occurs in the glaciated Northeast. It occurs most commonly in basins or low flats with poor drainage, characterized by soils that are poorly drained organic muck or shallow peat over clay loam. The substrate is characterized by pronounced hummock-and-hollow microtopography with abundant slowly decomposing leaf/needle litter.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This basin swamp forest is dominated by *Picea rubens* with a mixed canopy that includes *Acer rubrum* and *Nyssa sylvatica*. *Abies balsamea* is generally lacking or very sparse. Shrubs include *Vaccinium corymbosum* and *Rhododendron maximum* (more common in southern examples), and *Nemopanthus mucronatus, Ilex verticillata*, and *Thuja occidentalis* (more common in northern examples). Herbs include *Carex trisperma, Osmunda cinnamomea, Gaultheria hispidula*, and *Carex folliculata*. *Sphagnum* spp. are common.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by open to closed mostly evergreen-dominated forests. Canopies are dominated by *Picea rubens* with minor amounts of *Acer rubrum* and *Tsuga canadensis*. The shrub layer is dominated by *Nemopanthus mucronatus*. Other shrubs present at low cover may include *Alnus incana ssp. rugosa, Amelanchier canadensis, Ilex verticillata*, and *Viburnum nudum var. cassinoides*. The herbaceous layer is typically dominated by the fern *Osmunda cinnamomea* in association with other forbs and graminoids, including *Aralia nudicaulis, Carex trisperma, Coptis trifolia*, and *Cornus canadensis*. *Sphagnum* spp. are prominent in the ground layer and may exceed 80% cover.
Global Vegetation: The tree canopy is closed to partly open, and the tall-shrub layer is often well-developed. Dwarf-shrubs are sparse, but herbs typically form high cover. The ground layer features extensive *Sphagnum* and other bryophytes. The canopy is codominated by *Picea rubens* and *Acer rubrum*, in association with other trees such as *Betula alleghaniensis, Betula populifolia, Thuja occidentalis, Abies balsamea*, and, occasionally, *Tsuga canadensis*. The most abundant shrubs are *Vaccinium corymbosum, Nemopanthus mucronatus, Ilex verticillata, Spiraea alba*, and *Alnus incana*. The herbaceous layer is generally dominated by the ferns *Osmunda cinnamomea, Osmunda regalis, Onoclea sensibilis*, and *Thelypteris palustris*. Associated herbs include *Carex trisperma, Cornus canadensis, Doellingeria umbellata (= Aster umbellatus), Trientalis borealis, Oclemena acuminata (= Aster acuminatus), Carex intumescens*, and others. The bryophyte layer is dominated by *Sphagnum* spp. including *Sphagnum girgensohnii* and *Sphagnum magellanicum*.

G046. LAURENTIAN-ACADIAN-APPALACHIAN ALKALINE SWAMP

Group Summary Description: These forested wetlands are found across the temperate regions of eastern to south-central Canada, southward from northern New England to the upper Midwest and down to the high plateau of the Allegheny Mountains. They occur in areas where circumneutral to alkaline pH and/or higher nutrient levels are associated with a rich flora. Examples of this group also occur within swales along the dunes of the Great Lakes. The substrate is typically mineral soil, but there may be extensive peat in examples occurring on the margins of peatland complexes. *Thuja occidentalis* is a diagnostic canopy species and may dominate the canopy or be mixed with other conifers or with deciduous trees, most commonly *Acer rubrum* or *Fraxinus nigra*. Some examples are strongly dominated by deciduous hardwoods, such as *Fraxinus nigra* (less often *Fraxinus americana*) and *Acer rubrum*. *Larix laricina*, a deciduous conifer, may dominate some stands within this group. Shrub species commonly occur and range in cover from sparse to dense depending on canopy cover. The herb layer tends to be more diverse than in acidic swamps and some examples may have extensive bryophytes. Examples of this group may occur on seepages, in a basin setting, or alluvial settings. A hummock-and-hollow topography is typical. Logging, especially of *Thuja occidentalis*, has influenced the structure and dominance of many examples of this group.

A0347 *Fraxinus nigra - Acer rubrum* Swamp Forest Alliance

Alliance Summary Description: This alliance, found in the upper midwestern and northeastern regions of the United States as well as parts of eastern temperate Canada, contains communities known as "calcareous seepage swamps," "hardwood swamps," and "red maple - black ash swamps" in which *Acer rubrum* and *Fraxinus nigra* are dominant or prominent canopy members. Total canopy cover ranges from nearly closed to open. Where the tree canopy is open, the understory vegetation is patchy, ranging from shrub-dominated patches to minerotrophic sedge meadows. Associated canopy trees are *Betula alleghaniensis, Ulmus rubra, Ulmus americana*, and *Pinus strobus*. Some examples are dominated by *Populus tremuloides* and *Populus balsamifera*. *Lindera benzoin* (east), *Toxicodendron vernix, Alnus incana* (north), *Salix* spp., and *Rhamnus alnifolia* often occur in the shrub layer. The herbaceous layer is often quite diverse. Stands are typically found in poorly drained depressions and in seepage zones. Soils are generally muck and, although *Sphagnum* spp. may occur, there is generally not substantial peat

development. Stands often occur in areas where soil pH is generally higher than that of other alliances containing *Acer rubrum*.

[CEGL006009] *Acer rubrum - Fraxinus nigra - (Larix laricina) / Rhamnus alnifolia* Swamp Forest

Translated Name: **Red Maple - Black Ash - (Tamarack) / Alderleaf Buckthorn Swamp Forest**
Common Name: **Red Maple - Black Ash Rich Seepage Swamp Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Alkaline Swamp (G046)
Alliance	*Fraxinus nigra - Acer rubrum* Swamp Forest Alliance (A0347)

Element Concept

Global Summary: These calcareous or circumneutral seepage swamps of the northeastern United States have moderate to closed canopies and a rich herb layer influenced by calcium-rich groundwater seepage. These can occur along streams or at headwaters in areas of calcareous bedrock. Soils are saturated, organic muck or peat that can be quite deep. The canopy is dominated by *Acer rubrum* and *Larix laricina*, with *Fraxinus nigra* sometimes prominent. Canopy associates include *Betula alleghaniensis, Tsuga canadensis, Pinus strobus, Carpinus caroliniana*, and *Picea rubens*, the latter especially in the north or at higher elevations. Shrub cover varies with canopy cover and can be quite dense; typical species include *Toxicodendron vernix, Rhamnus alnifolia, Cornus sericea, Salix candida, Ilex verticillata, Vaccinium corymbosum*, and occasionally *Dasiphora fruticosa ssp. floribunda* and *Betula pumila*. The diverse herb layer is characterized by *Saxifraga pensylvanica, Caltha palustris, Cardamine bulbosa, Geum rivale, Osmunda cinnamomea, Carex leptalea, Carex interior, Carex stricta, Carex lacustris, Carex flava, Solidago patula, Iris versicolor, Ranunculus hispidus var. caricetorum, Cardamine douglassii, Thelypteris palustris, Dryopteris cristata, Solidago patula, Packera aurea (= Senecio aureus*), and *Symplocarpus foetidus*; plus *Cypripedium reginae, Cypripedium parviflorum (= Cypripedium calceolus)*, and *Platanthera dilatata*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This enriched red maple - black ash seepage swamp occurs north of the extent of glaciation (an approximate line that runs roughly east-west through southern Pennsylvania and northern New Jersey). Sites are saturated basins with very poorly drained muck soil. The unvegetated surface includes leaf litter, with some downed wood and standing water possible. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These seepage swamps occur along streams or at headwaters in areas of calcareous bedrock. Soils are saturated organic muck or peat that can be quite deep. These swamps are influenced by calcium-rich groundwater seepage.
Global Environment: These forests occur along streams or at headwaters in areas of calcareous bedrock. Soils are saturated organic muck or peat that can be quite deep. These swamps are influenced by calcium-rich groundwater seepage.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Acer rubrum* and *Fraxinus nigra* codominate with *Larix laricina* and *Pinus strobus* in the canopy. *Alnus incana* and *Rhamnus alnifolia* may occur in the shrub layer. Enriched seepage indicators are frequent and often abundant, especially calciphiles such as *Saxifraga pensylvanica, Carex leptalea, Carex flava, Solidago patula*, and *Ranunculus hispidus var. caricetorum*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: Canopy associates include *Betula alleghaniensis, Tsuga canadensis, Pinus strobus, Carpinus caroliniana*, and *Picea rubens*, the latter especially in the north or at higher elevations. Shrub cover varies with canopy cover and can be quite dense; typical species include *Toxicodendron vernix, Rhamnus alnifolia, Cornus sericea, Salix candida, Ilex verticillata, Vaccinium corymbosum*, and occasionally *Dasiphora fruticosa ssp. floribunda* and *Betula pumila*. The diverse herb layer is characterized by *Saxifraga pensylvanica, Caltha palustris, Cardamine bulbosa, Geum rivale, Osmunda cinnamomea, Carex leptalea, Carex interior, Carex stricta, Carex lacustris, Carex flava, Solidago patula, Iris versicolor, Ranunculus hispidus var. caricetorum, Cardamine douglassii, Thelypteris palustris, Dryopteris cristata, Solidago patula, Packera aurea (= Senecio aureus*), and *Symplocarpus foetidus*, plus *Cypripedium reginae, Cypripedium parviflorum (= Cypripedium calceolus)*, and *Platanthera dilatata*.

Global Vegetation: The canopy is dominated by *Acer rubrum* and *Larix laricina*, with *Fraxinus nigra* sometimes prominent. Canopy associates include *Betula alleghaniensis, Tsuga canadensis, Pinus strobus, Carpinus caroliniana*, and *Picea rubens*, the latter especially in the north or at higher elevations. Shrub cover varies with canopy cover and can be quite dense; typical species include *Toxicodendron vernix, Rhamnus alnifolia, Cornus sericea, Salix candida, Ilex verticillata, Vaccinium corymbosum*, and occasionally *Dasiphora fruticosa ssp. floribunda* and *Betula pumila*. The diverse herb layer is characterized by *Saxifraga pensylvanica, Caltha palustris, Cardamine bulbosa, Geum rivale, Osmunda cinnamomea, Carex leptalea, Carex interior, Carex stricta, Carex lacustris, Carex flava, Solidago patula, Iris versicolor, Ranunculus hispidus var. caricetorum, Cardamine douglassii, Thelypteris palustris, Dryopteris cristata, Solidago patula, Packera aurea (= Senecio aureus*), and *Symplocarpus foetidus*; plus *Cypripedium reginae, Cypripedium parviflorum (= Cypripedium calceolus)*, and *Platanthera dilatata*.
Global Dynamics: The presence of *Larix laricina* indicates the maintenance of canopy gaps within these swamps.

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Alkaline Swamp (G046)
Alliance	*Fraxinus nigra - Acer rubrum* Swamp Forest Alliance (A0347)

ELEMENT CONCEPT

Global Summary: This is a northern hardwood-conifer seepage forest of central New England. It typically occurs in basins or along streamsides that are associated with groundwater discharge or seeps at the wetland margin; pH is often circumneutral or at least not highly acidic. Stands often form at stream headwaters. Soil substrate is well-decomposed peat or muck of variable thickness, ranging from 20 cm to several meters thick. The canopy is dominated by *Acer rubrum* or codominated with *Fraxinus nigra*, which is generally indicative of mineral enrichment from groundwater in this region. Typical canopy associates include *Betula alleghaniensis* and *Tsuga canadensis*; *Pinus strobus* and *Ulmus americana* may also be present. The shrub layer includes saplings of canopy tree species plus *Rhamnus alnifolia, Vaccinium corymbosum, Ribes americanum, Ilex verticillata*, and *Toxicodendron radicans*. In the southern extent of the range, *Toxicodendron vernix* and *Lindera benzoin* become more abundant. Common herbs include *Onoclea sensibilis, Osmunda cinnamomea, Impatiens capensis, Chrysosplenium americanum, Mitella nuda, Saxifraga pensylvanica, Rubus pubescens, Geum rivale, Tiarella cordifolia, Carex leptalea, Carex leptonervia, Carex interior, Glyceria striata*, and *Dryopteris cristata*. In some cases, the ferns form an herbaceous "canopy" with the forbs and graminoids scattered among and below them. The nonvascular layer is usually well-developed and includes *Thuidium delicatulum, Mnium* spp., *Rhytidiadelphus triquetrus*, and *Climacium dendroides* with *Calliergon cordifolium* in hollows.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This community is a seepage swamp with some enrichment. Sites are flat to gently sloping saturated basins with very poorly drained, unstable muck or loamy sand soil. The unvegetated surface includes leaf litter, with some downed wood. No evidence of disturbance was reported.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This seepage forest typically occurs in basins or along streamsides that are associated with groundwater discharge or seeps at the wetland margin. pH is often circumneutral or at least not highly acidic. Stands often form at stream headwaters. Soil substrate is well-decomposed peat of variable thickness, ranging from 20 cm to several meters thick.

Global Environment: Seepage forest that typically occurs in basins or along streamsides that are associated with groundwater discharge or seeps at the wetland margin. pH is often circumneutral or at least not highly acidic. Stands often form at stream headwaters. Soil substrate is well-decomposed peat of variable thickness, ranging from 20 cm to several meters thick.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: In the Vermont sites, *Tsuga canadensis* is dominant or codominant in the canopy with *Betula alleghaniensis, Fraxinus nigra, Tilia americana, Acer rubrum*, and *Ulmus americana* as canopy associates. Shrubs are sparse but include *Acer pensylvanicum, Acer rubrum, Alnus incana*, and *Picea rubens*. *Impatiens capensis, Onoclea sensibilis*, and *Osmunda cinnamomea* are the most abundant herbs. Mosses are various and abundant. In addition, this community supports VT state-critically imperiled *Stellaria alsine*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The canopy is dominated by *Acer rubrum* or codominated with *Fraxinus nigra*, which is generally indicative of mineral enrichment from groundwater in this region. Typical canopy associates include *Betula alleghaniensis* and *Tsuga canadensis*; *Pinus strobus* and *Ulmus americana* may also be present. The shrub layer includes saplings of canopy tree species plus *Rhamnus alnifolia, Vaccinium corymbosum, Ribes americanum, Ilex verticillata*, and *Toxicodendron radicans*. Alliance	*Fraxinus nigra - Acer rubrum* Swamp Forest Alliance (A0347)

ELEMENT CONCEPT

Global Summary: This open-canopy red maple wetland occurs as part of peatlands in central and northern New England. It occurs in basin peatlands at elevations below 305 m (1000 feet), typically in a peripheral area of a larger peatland. The soils are *Sphagnum*-derived organic soils that remain saturated. Some minerotrophy is evident; these are fens rather than true bogs. Canopy cover ranges from quite open to about 65%, and the shrub layer is generally well-developed. Herb cover varies, but may be as high as 80%. The bryoid layer is usually more-or-less continuous. *Acer rubrum* is the dominant tree; associates may include *Picea mariana, Abies balsamea*, and *Larix laricina*. *Larix laricina* may be codominant with *Acer rubrum*, or dominant in occasional cases. The shrub layer is dominated by *Ilex verticillata*, in variable association with other species such as *Nemopanthus mucronatus, Viburnum nudum var. cassinoides, Alnus incana, Myrica gale, Lyonia ligustrina*, and *Spiraea alba var. latifolia (= Spiraea latifolia)*. The herbaceous layer generally includes *Osmunda regalis, Osmunda cinnamomea, Coptis trifolia, Thelypteris palustris*, and *Onoclea sensibilis*. *Carex trisperma* is the most frequent and abundant sedge; *Carex canescens* is often present but less abundant. The bryophyte layer is characterized by *Sphagnum magellanicum, Sphagnum fimbriatum, Sphagnum centrale*, and others. This association is distinguished by its deep peat soils, peatland setting, open red maple-dominated canopy, and lack of any richness indicators.

A3720 *Thuja occidentalis - Acer rubrum - Larix laricina* Swamp Forest Alliance

Alliance Summary Description: This alliance is found in the upper midwestern and northeastern United States and eastern temperate Canada. The tree layer is dominated by a mix of conifers and deciduous species. Most of the deciduous species are not abundant, but taken together, they make up a substantial amount of the canopy. *Thuja occidentalis* is a consistently abundant tree. *Acer rubrum* can be absent to codominant. Other common trees include *Betula alleghaniensis, Fraxinus nigra*, and *Abies balsamea*. The shrub layer varies from sparse to moderately well-developed. The herbaceous layer can be diverse with a variable moss layer. Stands of this alliance are found on poorly drained, mostly mineral soils. It is commonly associated with wetlands influenced by calcareous groundwater, in poorly drained depressions with substantial peat accumulation, along streams, or on slopes with emergent groundwater seepage evident as rivulets at the surface. Soils range from organic to mineral. The groundwater is usually moderately to strongly minerotrophic and has circumneutral pH.

[CEGL006175] *Thuja occidentalis - (Picea rubens) / Tiarella cordifolia* Swamp Forest

Translated Name: **Northern White-cedar - (Red Spruce) / Heartleaf Foamflower Swamp Forest**
Common Name: **Northern White-cedar - Spruce Seepage Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Alkaline Swamp (G046)
Alliance	*Thuja occidentalis - Acer rubrum - Larix laricina* Swamp Forest Alliance (A3720)

Element Concept

Global Summary: These forests of northern white-cedar mixed with other boreal conifers are found on damp slopes in the cooler regions of the northeastern United States and adjacent Canada. They occur on gently sloping hillsides, or at slope bases, with significant seepage of cold calcium-enriched groundwater. The soils are mostly mineral, usually developed over circumneutral to calcareous bedrock, with little peat accumulation; peat is primarily sedge-derived. The canopy may be somewhat open but more often is closed (usually 65-95%), with a patchy shrub layer beneath. The herb layer is locally extensive and usually relatively species-rich. The bryoid layer is very well-developed, essentially continuous, with mossy hollows and hummocks of moss-covered decaying downed trees. The canopy may be strongly dominated by *Thuja occidentalis* or may be a mixture of *Thuja* with *Picea rubens*. Less abundant associates include *Abies balsamea, Acer rubrum, Fraxinus nigra*, and *Betula alleghaniensis*. Shrubs include *Lonicera canadensis, Lonicera oblongifolia, Viburnum nudum var. cassinoides*, and *Acer spicatum*. Particularly characteristic herbs are *Mitella nuda, Platanthera obtusata, Orthilia secunda (= Pyrola secunda)*, and *Dalibarda repens*; common associates in the herb layer include *Cornus canadensis, Clintonia borealis, Gaultheria hispidula, Coptis trifolia (= Coptis groenlandica), Oxalis montana, Linnaea borealis, Tiarella cordifolia*, and *Gymnocarpium dryopteris*. The bryophyte layer tends to have feathermosses (*Hylocomium splendens, Thuidium delicatulum*, and others), *Rhytidiadelphus triquetrus*, and *Bazzania trilobata* more abundant than *Sphagnum* spp., which are also present. This association is similar to *Thuja occidentalis / Sphagnum (girgensohnii, warnstorfii)* Swamp Forest (CEGL006007), but that type occurs in basins that have deeper peat soils and generally lacks the more upland herb species found in this type. A similar midwestern association, *Larix laricina - Thuja occidentalis* Swamp Forest (CEGL002455), lacks red spruce.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This northern white-cedar forest occurs on gentle to moderate slopes with groundwater seepage maintaining moist to saturated conditions. It is a small-patch swamp surrounded by lowland red spruce - balsam fir - northern hardwood forest. Soils are mineral with little peat accumulation and most often where the substrate is not strongly acidic. The sampled site is a gently sloping saturated flat with very poorly drained muck soil. There is a very slow current in the diffuse surface water. The unvegetated surface consists of leaf litter, with small amounts of downed wood and standing water. Scattered stumps from fairly recent logging were noted in the field.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is only known from two locations in the Northern Appalachian project area and occurs on gently sloping wetlands near ponds at 400 and 640 m (1,310-2,100 feet) in elevation. Soils are saturated poorly drained muck.
Global Environment: These forests of northern white-cedar mixed with other boreal conifers are found on damp slopes in the cooler regions of the northeastern United States and adjacent Canada. They occur on gently sloping hillsides, or at slope bases, with significant seepage of cold calcium-enriched groundwater. The soils are mostly mineral, usually developed over circumneutral to calcareous bedrock, with little peat accumulation; peat is primarily sedge-derived.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Thuja occidentalis* is mixed with *Picea rubens, Abies balsamea*, and *Acer rubrum* in the canopy. *Alnus incana* and *Spiraea alba* are dominant shrubs along with canopy species. Characteristic herbs include *Tiarella cordifolia, Ranunculus hispidus var. caricetorum, Solidago rugosa, Doellingeria umbellata, Chrysosplenium americanum*, and *Symphyotrichum puniceum*. Non-*Sphagnum* moss species are abundant.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is a closed-canopy evergreen forest dominated by *Thuja occidentalis* with *Abies balsamea, Acer rubrum, Betula papyrifera, Fraxinus pennsylvanica, Picea rubens*, and *Tsuga canadensis* occurring at lower cover. Shrub cover is low and varies among sites; species include *Acer pensylvanicum, Acer spicatum, Alnus incana, Corylus cornuta, Ilex verticillata, Lonicera canadensis*, and *Rubus pubescens*. Herbaceous species are also variable among sites without clear dominants. Species may include *Aralia nudicaulis, Calamagrostis canadensis, Carex debilis, Carex gracillima, Carex intumescens, Carex pedunculata, Carex trisperma, Dryopteris intermedia, Eupatorium maculatum, Maianthemum canadense, Onoclea sensibilis, Osmunda cinnamomea, Osmunda claytoniana, Thalictrum pubescens, Trientalis borealis, Trillium erectum*, and *Viola renifolia*. Mosses, including *Hylocomium splendens, Bazzania* spp., and *Sphagnum* spp., are abundant and may exceed 90% cover in the ground layer.
Global Vegetation: The canopy may be somewhat open but more often is closed (usually 65-95%), with a patchy shrub layer beneath. The herb layer is locally extensive and usually relatively species-rich. The bryoid layer is very well-developed, essentially continuous, with mossy hollows and hummocks of moss-covered decaying downed trees. The canopy may be strongly dominated by *Thuja occidentalis* or may be a mixture of *Thuja* with *Picea rubens*. Less abundant associates include *Abies balsamea, Acer rubrum, Fraxinus nigra*, and *Betula alleghaniensis*. Shrubs include *Lonicera canadensis, Lonicera oblongifolia, Viburnum nudum var. cassinoides*, and *Acer spicatum*. Particularly characteristic herbs are *Mitella nuda, Platanthera obtusata, Orthilia secunda (= Pyrola secunda)*, and *Dalibarda repens*; common associates in the herb layer include *Cornus canadensis, Clintonia borealis, Gaultheria hispidula, Coptis trifolia (= Coptis groenlandica), Oxalis montana, Linnaea borealis, Tiarella cordifolia*, and *Gymnocarpium dryopteris*. The bryophyte layer tends to have feathermosses (*Hylocomium splendens, Thuidium delicatulum*, and others), *Rhytidiadelphus triquetrus*, and *Bazzania trilobata* more abundant than *Sphagnum* spp., which are also present.

[CEGL006507] *Thuja occidentalis - Abies balsamea / Ledum groenlandicum / Carex trisperma* Swamp Woodland

Translated Name: **Northern White-cedar - Balsam Fir / Bog Labrador-tea / Three-seeded Sedge Swamp Woodland**
Common Name: **Northern White-cedar Wooded Fen**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Laurentian-Acadian-Appalachian Alkaline Swamp (G046)
Alliance	*Thuja occidentalis - Acer rubrum - Larix laricina* Swamp Forest Alliance (A3720)

Element Concept

Global Summary: These are northern white-cedar bog woodlands of basin peatlands in the northern Appalachian Mountains. They occur on shallow to deep peat in depressional wetlands in glacial till. The open canopy, usually under 60% closure, allows for development of fairly extensive dwarf-shrub and/or herbaceous layers. Tall shrubs are generally sparse, although they may be locally abundant. The bryoid layer is continuous. The partial canopy is dominated by *Thuja occidentalis*, in association with *Picea mariana, Larix laricina, Abies balsamea*, and *Acer rubrum*. The subcanopy contains a similar species array. The tall-shrub layer is characterized by *Alnus incana, Ilex verticillata*, and *Viburnum nudum*. Dwarf-shrubs typically include *Vaccinium angustifolium, Kalmia angustifolia*, and *Gaylussacia baccata*. *Morella pensylvanica (= Myrica pensylvanica)* is an associate at some coastal sites. The herbaceous layer includes *Maianthemum trifolium, Carex trisperma, Carex stricta, Calamagrostis canadensis, Osmunda cinnamomea, Coptis trifolia, Onoclea sensibilis*, and *Osmunda regalis*. The bryophyte layer is well-developed and characterized by *Sphagnum magellanicum, Sphagnum girgensohnii, Sphagnum papillosum, Sphagnum wulfianum, Sphagnum capillifolium, Sphagnum recurvum, Sphagnum compactum, Sphagnum flavicomans*, and *Pleurozium schreberi*. This association differs from northern white-cedar swamps, e.g., *Thuja occidentalis / Sphagnum (girgensohnii, warnstorfii)* Swamp Forest (CEGL006007), in its more open canopy and (typically) association with open peatlands; it also usually occurs on deeper peats than do the closed-canopy northern white-cedar swamps. These woodlands can grade into open fen vegetation with widely scattered *Thuja*.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is only known from three locations in the Northern Appalachian project area and occurs on wet flats near ponds and streams, as wells as basins at elevations ranging from 350 to 420 m (1,150-1,380 feet). Sites are saturated to semi-permanently flooded with soils composed of poorly drained peat and muck. Pockets of standing water may be present at some sites.
Global Environment: These are northern white-cedar bog woodlands of basin peatlands in the northern Appalachian Mountains. They occur on shallow to deep peat in depressional wetlands in glacial till.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is an open to closed-canopy evergreen forest and woodland where *Thuja occidentalis* is the most consistent dominant among sites. *Abies balsamea* and *Picea mariana* may codominate in some stands along with lesser amounts of *Acer rubrum*. The shrub layer may include significant regeneration of canopy species. Shrub species are inconsistent among stands, and local dominants may include *Alnus incana, Chamaedaphne calyculata, Myrica gale, Nemopanthus mucronatus*, and *Viburnum nudum*. The herbaceous layer is typically fern- or sedge-dominated by *Carex lasiocarpa, Carex stricta*, and/or *Osmunda cinnamomea*. Other herbaceous associates may include *Carex intumescens, Cornus canadensis, Dryopteris cristata, Gaultheria hispidula, Glyceria striata, Iris versicolor,*

Linnaea borealis, Lysimachia terrestris, Onoclea sensibilis, Osmunda regalis, Rubus pubescens, Symphyotrichum puniceum, Thalictrum pubescens, and *Triadenum virginicum*. Mosses are prevalent in the ground layer and may exceed 80% cover.

Global Vegetation: The open canopy, usually under 60% closure, allows for development of fairly extensive dwarf-shrub and/or herbaceous layers. Tall shrubs are generally sparse, although they may be locally abundant. The bryoid layer is continuous. The partial canopy is dominated by *Thuja occidentalis*, in association with *Picea mariana, Larix laricina, Abies balsamea*, and *Acer rubrum*. The subcanopy contains a similar species array. The tall-shrub layer is characterized by *Alnus incana, Ilex verticillata*, and *Viburnum nudum*. Dwarf-shrubs typically include *Vaccinium angustifolium, Kalmia angustifolia*, and *Gaylussacia baccata*. *Morella pensylvanica (= Myrica pensylvanica)* is an associate at some coastal sites. The herbaceous layer includes *Maianthemum trifolium, Carex trisperma, Carex stricta, Calamagrostis canadensis, Osmunda cinnamomea, Coptis trifolia, Onoclea sensibilis*, and *Osmunda regalis*. The bryophyte layer is well-developed and characterized by *Sphagnum magellanicum, Sphagnum girgensohnii, Sphagnum papillosum, Sphagnum wulfianum, Sphagnum capillifolium, Sphagnum recurvum, Sphagnum compactum, Sphagnum flavicomans*, and *Pleurozium schreberi*.

Alliance	*Thuja occidentalis - Acer rubrum - Larix laricina* Swamp Forest Alliance (A3720)

ELEMENT CONCEPT

Global Summary: These cedar swamps are closed-canopy forests in enriched peatland basins in the Northern Appalachians and possibly adjacent Canada. They typically occur in small forested basins, or along lakes or streams, but may rarely occur in the enriched portions of larger peatlands where there is an influence of minerotrophic groundwater. They often occur in areas of calcareous or at least circumneutral bedrock. The soils are organic and range widely in depth of the peat. Canopy closure ranges from somewhat open to closed, and the forest floor is typically dark and cool. Shrub and herb coverage may be sparse to locally dense, with increased cover in canopy gaps. Herbs are typically scattered thinly over the moss layer. Bryophytes are abundant and form a mossy carpet. *Thuja occidentalis* is the canopy dominant; associates include *Picea mariana, Abies balsamea*, and *Larix laricina*. *Tsuga canadensis, Picea rubens*, or *Pinus strobus* are occasionally present. Shrubs include *Lonicera canadensis, Ilex verticillata, Vaccinium corymbosum, Nemopanthus mucronatus*, and small amounts of *Kalmia angustifolia*. *Rhamnus alnifolia* is typical in the more enriched swamps. The herb layer is often diverse and features *Gaultheria hispidula, Carex trisperma, Carex disperma, Linnaea borealis, Mitella nuda, Mitella diphylla, Tiarella cordifolia, Orthilia secunda (= Pyrola secunda), Rumex acetosella, Gymnocarpium dryopteris, Phegopteris connectilis (= Thelypteris phegopteris), Chrysosplenium americanum, Moneses uniflora, Cornus canadensis, Trientalis borealis, Carex leptalea, Carex pedunculata*, and *Coptis trifolia (= Coptis groenlandica)*, with the uncommon *Calypso bulbosa, Cypripedium reginae*, and *Cypripedium parviflorum* in some swamps. *Sphagnum* mosses, especially *Sphagnum girgensohnii* and *Sphagnum warnstorfii*, form a mixed moss layer with *Hylocomium splendens, Pleurozium schreberi, Thuidium delicatulum, Rhytidiadelphus triquetrus*, and *Bazzania trilobata*, with *Calliergon cordifolium, Calliergon giganteum, Rhizomnium punctatum (= Mnium punctatum), Rhytidiadelphus squarrosus, Leptodictyum riparium (= Amblystegium riparium)*, and *Campylium stellatum* in wet hollows. This association is related to *Thuja occidentalis - (Picea rubens) / Tiarella cordifolia* Swamp Forest (CEGL006175), but occurs in basins rather than on slopes and has deeper peat soils.

G039. NORTHERN ATLANTIC COASTAL HARDWOOD - CONIFER SWAMP

Group Summary Description: This group encompasses coniferous to mixed swamp forests and wetland pine barrens on the northern Atlantic Coastal Plain, generally from Massachusetts south to Virginia. They occur on sandy, acidic, and nutrient-poor soils, mostly in settings that remain saturated throughout the growing season, but sometimes in settings that are only seasonally saturated. The characteristic overstory tree is either *Chamaecyparis thyoides* or *Pinus rigida*, generally not together. *Acer rubrum* can be an important associate, especially with *Chamaecyparis*, where cutting or other anthropogenic disturbance has altered the vegetation composition.

Associated shrubs and herbs indicative of the coastal plain setting include *Gaylussacia dumosa, Clethra alnifolia, Ilex glabra, Rhododendron viscosum, Leucothoe racemosa*, and *Carex striata*, as well as the more widespread *Vaccinium corymbosum, Gaylussacia baccata*, and *Chamaedaphne calyculata*. Fire has been an important ecological process in the vegetation of this group.

A3400 *Chamaecyparis thyoides* Northern Peat Swamp Forest Alliance

Alliance Summary Description: This alliance is characterized by peatlands dominated or codominated by *Chamaecyparis thyoides* occurring in saturated basins and, less commonly, along streamsides and seasonally flooded pondshores, from New Jersey north to southern Maine. Associates usually include *Acer rubrum, Clethra alnifolia*, and *Vaccinium corymbosum*. In the northern portion of the range, *Betula alleghaniensis, Larix laricina, Ledum groenlandicum, Nemopanthus mucronatus*, and *Picea rubens* may occur. In the south, *Rhododendron maximum, Ilex glabra*, and others are common associates. Gap succession is more important in this community than post-fire regeneration and accounts for the mixed, uneven-aged stands. Lightning strikes are the main cause of mortality in mature white-cedar trees within the range of this alliance. Atlantic white-cedar communities are early-successional but *Chamaecyparis thyoides* is a long-lived species (250+ years); gap regeneration is hypothesized to be the primary means of reproduction. The community often succeeds to itself following fire or other disturbance. In the absence of fire and adequate gap regeneration, Atlantic white-cedar forests may be replaced by bay forest. Known examples are generally neither flood-prone, nor exposed to frequent fire. One association is thought to become established following fire, with a return time of 25-100+ years.

[CEGL006189] *Chamaecyparis thyoides - (Tsuga canadensis, Betula alleghaniensis) / Clethra alnifolia* Swamp Forest

Translated Name: **Atlantic White-cedar - (Eastern Hemlock, Yellow Birch) / Coastal Sweet-pepperbush Swamp Forest**
Common Name: **Inland Atlantic White-cedar Swamp Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Northern Atlantic Coastal Hardwood - Conifer Swamp (G039)
Alliance	*Chamaecyparis thyoides* Northern Peat Swamp Forest Alliance (A3400)

Element Concept

Global Summary: An Atlantic white-cedar swamp that occurs on peat in poorly drained depressions of southern New England and the Hudson Highlands of New York. The canopy can be variable; it can be solely dominated by *Chamaecyparis thyoides* or mixed with *Acer rubrum, Betula alleghaniensis, Tsuga canadensis, Pinus strobus*, and occasionally *Nyssa sylvatica*. The shrub layer is diverse with *Ilex verticillata, Vaccinium corymbosum, Ilex laevigata, Rhododendron viscosum, Kalmia latifolia, Lyonia ligustrina, Viburnum nudum var. cassinoides*, and *Clethra alnifolia* common. Herbaceous cover is inversely proportional to canopy and shrub cover and commonly includes *Osmunda cinnamomea, Osmunda claytoniana, Osmunda regalis, Symplocarpus foetidus, Calla palustris, Trientalis borealis, Aralia nudicaulis, Coptis trifolia, Mitchella repens, Carex folliculata, Carex trisperma*, and occasionally *Carex intumescens* and *Carex stricta*. The nonvascular layer is usually well-developed and includes abundant *Sphagnum* including *Sphagnum angustifolium, Sphagnum palustre, Sphagnum fimbriatum, Sphagnum magellanicum, Thuidium delicatulum, Hypnum imponens*, and *Pallavicinia lyellii*. Localized seepage in these basins may be expressed with indicators such as *Lindera benzoin* and *Geum rivale*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This rare Atlantic white-cedar swamp occurs on inland ridgetops. The sampled site is a saturated basin with very poorly drained peat soil. The unvegetated surface includes mosses with abundant downed wood and standing water. No evidence of disturbance was reported.
Global Environment: This association occurs on peat in poorly drained depressions underlain by various glacial deposits such as sand and gravel outwash, glacial lake sediments, or till. It occurs across a relatively wide elevational range, from approximately 40-1100 m. There is typically standing water from surface water movement or seepage for a significant portion of the growing season. Water and soil are nutrient-poor, acidic, and high in iron.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Chamaecyparis thyoides* (NY state-imperiled) dominates the canopy solely and the subcanopy along with *Acer rubrum*. *Vaccinium corymbosum* is the dominant shrub, occurring along with *Clethra alnifolia, Ilex verticillata, Lyonia ligustrina*, and *Nemopanthus mucronatus*. The herb layer is very sparse, but *Sphagnum* spp. form a dense carpet on the ground surface.

Global Vegetation: The canopy can be variable; it can be solely dominated by *Chamaecyparis thyoides* or mixed with *Acer rubrum, Betula alleghaniensis, Tsuga canadensis, Pinus strobus*, and occasionally *Nyssa sylvatica*. The shrub layer is diverse with *Ilex verticillata, Vaccinium corymbosum, Ilex laevigata, Rhododendron viscosum, Kalmia latifolia, Lyonia ligustrina, Viburnum nudum var. cassinoides*, and *Clethra alnifolia* common. Herbaceous cover is inversely proportional to canopy and shrub cover and commonly includes *Osmunda cinnamomea, Osmunda claytoniana, Osmunda regalis, Symplocarpus foetidus, Calla palustris, Trientalis borealis, Aralia nudicaulis, Coptis trifolia, Mitchella repens, Carex folliculata, Carex trisperma*, and occasionally *Carex intumescens* and *Carex stricta*. The nonvascular layer is usually well-developed and includes abundant *Sphagnum* including *Sphagnum angustifolium, Sphagnum palustre, Sphagnum fimbriatum, Sphagnum magellanicum, Thuidium delicatulum, Hypnum imponens*, and *Pallavicinia lyellii*. Localized seepage in these basins may be expressed with indicators such as *Lindera benzoin* and *Geum rivale*.

Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Chamaecyparis thyoides* (G4, NY state-imperiled)

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (4-Feb-2009). This community has a restricted range, from southern Maine and New Hampshire to New York. About 100-150 occurrences are estimated to cover approximately 5000 acres rangewide. This association is likely to have declined from its historic abundance due to logging.

RELATED CONCEPTS

Global Similar Types:

- *Chamaecyparis thyoides - Acer rubrum / Lycopus* spp. Swamp Forest (CEGL006364) Atlantic white-cedar swamps in alluvial settings with robust and diverse herbaceous layer
- *Chamaecyparis thyoides - Picea rubens / Gaylussacia baccata / Gaultheria hispidula* Swamp Forest (CEGL006363) distinguished by presence of boreal species.
- *Chamaecyparis thyoides / Chamaedaphne calyculata* Swamp Woodland (CEGL006321) Atlantic white-cedar bog with sparse *Chamaecyparis thyoides* over dense heath shrubs, especially *Chamaedaphne calyculata*.
- *Chamaecyparis thyoides / Ilex glabra - Rhododendron viscosum* Swamp Forest (CEGL006188) distinguished by coastal plain indicators.

- *Chamaecyparis thyoides / Rhododendron maximum* Swamp Forest (CEGL006355) distinguished by dense *Rhododendron maximum* in shrub layer.

G653. SILVER MAPLE - GREEN ASH - BLACK ASH FLOODPLAIN FOREST

Group Summary Description: This group occurs in the northeastern U.S. and temperate regions of eastern Canada, west to the upper Great Lakes region of Minnesota and Ontario. Forest canopy dominants can vary but typically are a combination of *Acer rubrum, Acer saccharinum, Acer saccharum, Fraxinus americana, Fraxinus nigra, Fraxinus pennsylvanica, Prunus serotina, Quercus rubra*, and *Ulmus americana*. Northward stands with *Picea glauca* or *Populus balsamifera* may occur. Shrub layer ranges from dense in patches to sparse. The herbaceous layer is typically diverse. Some common species include *Boehmeria cylindrica, Matteuccia struthiopteris*, and *Onoclea sensibilis*. It occurs along small and large rivers on slightly elevated alluvial terraces and active floodplains, along streams with small watersheds (<2 square miles), high-gradient or submontane portions of major rivers, and beside lakes. Soils range from alluvial sands to sand and alluvial loams to silt loams. Flooding occurs during spring runoff periods and during other peak floods.

A3715 *Acer saccharinum - Acer rubrum - Ulmus americana* Floodplain Forest Alliance

Alliance Summary Description: Characteristic dominant species include *Acer rubrum, Acer saccharinum, Ulmus americana*, and occasionally *Fraxinus pennsylvanica*. In the northern Great Lakes region of the Midwest and Canada, *Fraxinus nigra* can be dominant. Shrub layer ranges from high in patches to generally sparse. *Onoclea sensibilis* and *Boehmeria cylindrica* are characteristic in the herb layer. This alliance occurs in the northeastern U.S. and temperate regions of eastern Canada, west to the upper Great Lakes region of Minnesota and Ontario. It includes communities along small and large rivers, on higher terraces of river bottoms and floodplains and beside lakes and larger streams. The terrain is relatively flat, and hummock-and-hollow microtopography is absent or poorly

developed. The soils are alluvial loams to silt loams typically temporarily inundated during spring floods. The soils are well-drained to imperfectly drained mineral soils but a limited organic horizon may occur in some examples.

[CEGL006001] *Acer saccharinum - Ulmus americana / Onoclea sensibilis* Floodplain Forest

Translated Name: **Silver Maple - American Elm / Sensitive Fern Floodplain Forest**
Common Name: **Northeastern Silver Maple - Elm Floodplain Forest**

USNVC Classification

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Silver Maple - Green Ash - Black Ash Floodplain Forest (G653)
Alliance	*Acer saccharinum - Acer rubrum - Ulmus americana* Floodplain Forest Alliance (A3715)

Element Concept

Global Summary: This floodplain forest is currently described from higher terraces along the lower reaches of larger rivers of the northeastern United States where flood depth and duration are relatively less than immediately adjacent to the river channel. The canopy is strongly dominated by *Acer saccharinum*. *Ulmus rubra, Ulmus americana, Prunus serotina*, and *Fraxinus pennsylvanica* can occur in the subcanopy. *Populus deltoides* can occur sporadically, generally identifying locations of former sandy, drainage channels. The shrub layer is present, unlike adjacent areas on lower terraces. Species include *Viburnum recognitum, Viburnum dentatum, Lindera benzoin*, and *Cornus sericea*. The herb layer is strongly dominated by *Onoclea sensibilis* interspersed with lesser amounts of *Cinna arundinacea, Geum canadense, Chelone glabra, Impatiens capensis, Carex crinita, Carex lupulina*, and *Carex grayi*. Often occurs in association with *Acer saccharinum - Populus deltoides* floodplain forests, or on larger rivers than those supporting the *Quercus palustris - Acer rubrum*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This silver maple floodplain forest is found higher in the floodplain (not immediately adjacent to river channel) of major rivers. It is associated with finer soils and relatively long flood duration.
Global Environment: This floodplain forest occurs on fine soils on upper terraces along the lower reaches of larger rivers of the northeastern United States where flood depth and duration are relatively less than immediately adjacent to the river channel.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This community represents *Acer saccharinum* floodplain forest from higher in the floodplain (not immediately adjacent to river channel) of major rivers with a well-developed shrub layer dominated by *Lindera benzoin*. *Onoclea sensibilis* dominates the lush herb layer along with *Cinna arundinacea, Geum canadense, Chelone glabra, Impatiens capensis, Carex lupulina, Carex crinita, Carex grayi*, and others. *Matteuccia struthiopteris* or *Laportea canadensis* are sparse, if present.
Global Vegetation: The canopy is strongly dominated by *Acer saccharinum*. *Ulmus rubra, Ulmus americana, Prunus serotina*, and *Fraxinus pennsylvanica* can occur in the subcanopy. *Populus deltoides* can occur sporadically, generally identifying locations of former sandy, drainage channels. The shrub layer is present, unlike adjacent areas on lower terraces. Species include *Viburnum recognitum, Viburnum dentatum, Lindera benzoin*, and *Cornus sericea*. The herb layer is strongly dominated by *Onoclea sensibilis* interspersed with lesser amounts of *Cinna arundinacea, Geum canadense, Chelone glabra, Impatiens capensis, Carex crinita, Carex lupulina*, and *Carex grayi*. Often occurs in association with *Acer saccharinum - Populus deltoides* floodplain forests, or on larger rivers than those supporting *Quercus palustris - Acer rubrum*.
Global Dynamics: This floodplain forest is found higher in the floodplain (not immediately adjacent to river channel) of major rivers.

Group	Silver Maple - Green Ash - Black Ash Floodplain Forest (G653)
Alliance	*Acer saccharinum - Acer rubrum - Ulmus americana* Floodplain Forest Alliance (A3715)

ELEMENT CONCEPT

Global Summary: These silver maple floodplain forests of the northeastern United States are typical of riverbottoms, lakeplains, and the inner floodplain of medium to large rivers, mostly at less than 245 m (800 feet) elevation. They are most typical of third- and fourth-order rivers. They are subjected to spring flooding of high frequency and duration; their soils are poorly drained and deep. They are generally associated with calcareous or sedimentary bedrock and with fine-grained surficial deposits but may occur in coarser soils or tills. The canopy ranges from closed to somewhat open (in small inclusions, it may be quite sparse) and is high and arching. Shrubs are few; the herb layer is very well-developed. Bryoids are minor. The overall effect is of tall, well-spaced trees over a lush carpet of herbs. The canopy is strongly dominated by *Acer saccharinum*. Associated trees include *Fraxinus pennsylvanica, Ulmus americana*, and occasionally *Quercus bicolor* or *Quercus macrocarpa*. *Prunus serotina, Picea glauca*, and *Acer rubrum* have been occasionally noted northward. The herb layer is seasonally variable, with spring ephemerals succeeded by dense cover of mixed ferns, forbs and graminoids. Summer-dominant herbs include *Onoclea sensibilis* and *Boehmeria cylindrica*. This type differs from *Acer saccharinum - (Populus deltoides) / Matteuccia struthiopteris - Laportea canadensis* Floodplain Forest (CEGL006147) in its somewhat more poorly drained soils, longer flood duration, and the reduced importance of *Matteuccia struthiopteris* relative to *Onoclea sensibilis* along with generally higher herb layer richness. It generally lacks *Populus deltoides* and *Salix nigra* in the canopy. It may be bordered on its upland edge by terrace forests dominated by *Acer saccharum*.

A3714 *Acer saccharum - Tilia americana* Mesic Floodplain Forest Alliance

Alliance Summary Description: The canopy dominants can vary from site to site but are usually some combination of *Acer saccharum, Tilia americana, Quercus rubra, Ulmus americana, Fraxinus americana, Fraxinus pennsylvanica*, and *Prunus serotina*. Shrubs are typically minor. The herbaceous layer is typically diverse and often features *Matteuccia struthiopteris* along with a variety of graminoids, ferns and forbs. This alliance ranges across the northeastern United States and the St. Lawrence and Atlantic regions of southern Canada. It occurs along slightly elevated alluvial terraces and active floodplains, streams with small watersheds (<2 square miles), high-gradient or submontane portions of major rivers. Soils range from alluvial sands to sand and silt loams.

[CEGL006114] *Acer saccharum - Fraxinus* spp. - *Tilia americana / Matteuccia struthiopteris - Ageratina altissima* Floodplain Forest

Translated Name: **Sugar Maple - Ash species - American Basswood / Ostrich Fern - White Snakeroot Floodplain Forest**
Common Name: **Terrace Hardwood Floodplain Forest**

USNVC CLASSIFICATION

Division	Eastern North American-Great Plains Flooded & Swamp Forest (1.B.3.Na)
Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Silver Maple - Green Ash - Black Ash Floodplain Forest (G653)
Alliance	*Acer saccharum* - *Tilia americana* Mesic Floodplain Forest Alliance (A3714)

ELEMENT CONCEPT

Global Summary: These rich floodplain forests are found on slightly elevated alluvial terraces and active floodplains of larger rivers throughout the glaciated Northeast. The setting is a raised river terrace; however, this forest may occur very close to the riverbank, if the water channel is well-entrenched, and may even be on sloping banks along some river reaches. The alluvial soils are coarse and less regularly inundated than the soils supporting silver maple floodplain forests. Many of our examples occur on circumneutral to slightly calcareous soils. The canopy is closed to somewhat open, and unlike lower elevation floodplain forests, a subcanopy is often present. Shrubs are occasional but do not form high cover. The herb layer is well-developed and seasonally variable, with spring ephemerals giving way to taller ferns, graminoids and forbs. Bryoids are very minor. The canopy dominants can vary from site to site but are usually some combination of *Acer saccharum, Tilia americana, Quercus rubra, Ulmus americana, Fraxinus americana, Fraxinus pennsylvanica*, and *Prunus serotina*. Minor canopy associates include *Acer saccharinum, Juglans cinerea, Fraxinus nigra*, and *Acer rubrum*. Shrubs include *Corylus americana, Viburnum lentago*, and *Prunus virginiana*; vines, such as *Toxicodendron radicans, Parthenocissus* spp., or *Vitis* spp., may be locally common. The herb layer usually features *Matteuccia struthiopteris* and a mixture of other ferns, forbs and graminoids. Characteristic species include *Ageratina altissima (= Eupatorium rugosum), Allium tricoccum, Allium canadense, Athyrium filix-femina, Caulophyllum thalictroides, Carex gracillima, Carex intumescens, Carex sprengelii, Deparia acrostichoides, Elymus virginicus, Elymus riparius, Elymus wiegandii (=*

Elymus canadensis var. wiegandii), Onoclea sensibilis, Sanguinaria canadensis, Solidago flexicaulis, Solidago rugosa, and *Solidago gigantea*, in addition to abundant spring ephemerals in the early growing season. Exotic species, such as *Lysimachia nummularia, Glechoma hederacea*, and *Hesperis matronalis*, may be abundant, especially in disturbed areas. These terrace forests are distinguished from lower floodplain forests by the reduced importance of *Acer saccharinum*; they differ from enriched northern hardwood forests, e.g., *Acer saccharum - Fraxinus americana / Acer spicatum / Caulophyllum thalictroides* Forest (CEGL006636) and *Acer saccharum - Tilia americana / Acer pensylvanicum / Caulophyllum thalictroides* Forest (CEGL006637), in their alluvial soils and flooding regime; also, *Matteuccia struthiopteris* is generally not found in enriched northern hardwood forests.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hardwood terrace floodplain forest of the glaciated Northeast occurs on slightly elevated alluvial terraces and active floodplains of medium and larger rivers ranging from Connecticut north to Maine.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association is known only from a few locations in the Northern Appalachian project area on intermittently flooded alluvial terraces and floodplains of rivers and streams. It occurs at low elevations ranging from 170 to 200 m (560-655 feet). Soils tend to be poorly drained silt loam and loamy sand.
Global Environment: These rich floodplain forests are found on slightly elevated alluvial terraces as well as active floodplains of larger rivers throughout the glaciated Northeast. The setting is a raised river terrace; however, this forest may occur very close to the riverbank if the water channel is well entrenched, and may even be on sloping banks along some river reaches. The alluvial soils are coarse and less regularly inundated than the soils supporting silver maple floodplain forests. Many of our examples occur on circumneutral to slightly calcareous soils.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is dominated by *Acer saccharum* with associates *Tilia americana, Quercus rubra, Ulmus americana, Fraxinus americana, Fraxinus pennsylvanica, Juglans cinerea*, and *Prunus serotina*. This community lacks southern species. Shrubs include *Corylus americana, Viburnum lentago*, and *Prunus virginiana*. The herb layer usually features *Matteuccia struthiopteris, Ageratina altissima, Allium tricoccum, Allium canadense, Athyrium filix-femina, Caulophyllum thalictroides, Carex gracillima, Carex intumescens, Carex sprengelii, Deparia acrostichoides, Elymus virginicus, Onoclea sensibilis, Sanguinaria canadensis, Solidago flexicaulis, Solidago rugosa*, and/or *Solidago gigantea*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy deciduous forests dominated by *Acer saccharum* and/or *Fraxinus americana*. Other canopy associates occurring at lower cover include *Acer rubrum, Betula alleghaniensis, Fagus grandifolia, Fraxinus nigra*, and *Tilia americana*. The shrub layer is mainly composed of saplings of canopy species, although *Corylus cornuta* occurs at low cover and appears diagnostic. The herbaceous layer is dominated by a mixture of the ferns *Matteuccia struthiopteris, Onoclea sensibilis*, and *Osmunda claytoniana*. Many forbs and graminoids may occur as associates, including *Anemone quinquefolia, Arisaema triphyllum, Brachyelytrum erectum, Carex gracillima, Carex intumescens, Carex projecta, Galium asprellum, Thalictrum pubescens, Tiarella cordifolia*, and *Uvularia sessilifolia*.
Global Vegetation: The canopy is closed to somewhat open, and unlike lower-elevation floodplain forests, a subcanopy is often present. Shrubs are occasional, but do not form high cover. The herb layer is well-developed and seasonally variable, with spring ephemerals giving way to taller ferns, graminoids, and forbs. Bryoids are very minor. The canopy dominants can vary from site to site, but are usually some combination of *Acer saccharum, Tilia americana, Quercus rubra, Ulmus americana, Fraxinus americana, Fraxinus pennsylvanica*, and *Prunus serotina*. Minor canopy associates include *Acer saccharinum, Juglans cinerea, Fraxinus nigra*, and *Acer rubrum*. Shrubs include *Corylus americana, Viburnum lentago*, and *Prunus virginiana*; vines such as *Toxicodendron radicans, Parthenocissus* spp., or *Vitis* spp. may be locally common. The herb layer usually features *Matteuccia struthiopteris* and a mixture of other ferns, forbs, and graminoids. Characteristic species include *Ageratina altissima (= Eupatorium rugosum), Allium tricoccum, Allium canadense, Athyrium filix-femina, Caulophyllum thalictroides, Carex gracillima, Carex intumescens, Carex sprengelii, Deparia acrostichoides, Elymus virginicus, Elymus riparius, Elymus wiegandii (= Elymus canadensis var. wiegandii), Onoclea sensibilis, Sanguinaria canadensis, Solidago flexicaulis, Solidago rugosa*, and *Solidago gigantea* in addition to abundant spring ephemerals in the early growing season. Exotic species, such as *Lysimachia nummularia, Glechoma hederacea*, and *Hesperis matronalis*, may be abundant, especially in disturbed areas.

Macrogroup	Laurentian-Acadian-North Atlantic Coastal Flooded & Swamp Forest (M504)
Group	Silver Maple - Green Ash - Black Ash Floodplain Forest (G653)
Alliance	*Acer saccharum* - *Tilia americana* Mesic Floodplain Forest Alliance (A3714)

ELEMENT CONCEPT

Global Summary: Flashy, sugar maple-dominated floodplain forests on high-gradient or submontane portions of major rivers in northern New England. Floods tend to be short-duration and high-disturbance events. Soils are alluvial sands or sandy loams over coarser substrates, sometimes interspersed with buried organic layers. *Acer saccharum* dominates the canopy, with other upland trees including *Quercus rubra* and *Betula alleghaniensis*. *Ostrya virginiana* is a common smaller tree. Shrubs are minor. The herb layer is lush, and features *Brachyelytrum erectum, Carex intumescens, Solidago caesia*, and *Danthonia spicata*. Unlike other floodplain forests, ferns are limited.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association occurs on intermittently flooded alluvial terraces levees and floodplains of rivers and streams. Elevation ranges from 170 to 500 m (560-1,640 feet) and slopes are flat to gentle. Soils may be moderately well-drained to poorly drained silt loams, sandy loams and loams. The unvegetated surface is primarily litter and duff.
Global Environment: These flashy, sugar maple-dominated floodplain forests occur on high-gradient or sub-montane portions of major rivers in northern New England. Floods tend to be short-duration and high-disturbance events. Soils are alluvial sands or sandy loams over coarser substrates, sometimes interspersed with buried organic layers.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by a closed-canopy deciduous forest with variable composition, the most constant dominant species being *Acer saccharum*. Species that may share the canopy include *Betula alleghaniensis, Fagus grandifolia, Fraxinus americana*, and *Fraxinus nigra*. *Acer pensylvanicum* may be prominent in the subcanopy. No shrub species occur with high constancy, and the shrub layer mostly consists of saplings of canopy species. The herbaceous layer is a variable mixture of ferns, forbs, clubmosses and graminoids, including *Aralia nudicaulis, Arisaema triphyllum, Athyrium filix-femina, Brachyelytrum erectum, Doellingeria umbellata, Dryopteris campyloptera, Dryopteris intermedia, Gymnocarpium dryopteris, Lycopodium dendroideum, Lycopodium digitatum, Maianthemum racemosum ssp. racemosum, Matteuccia struthiopteris, Oclemena acuminata, Onoclea sensibilis, Osmunda claytoniana, Polystichum acrostichoides, Prenanthes altissima, Thalictrum pubescens, Thelypteris noveboracensis*, and *Uvularia sessilifolia*.
Global Vegetation: *Acer saccharum* dominates the canopy, with other upland trees including *Quercus rubra* and *Betula alleghaniensis*. *Ostrya virginiana* is a common smaller tree. Shrubs are minor. The herb layer is lush, and features *Brachyelytrum erectum, Carex intumescens, Solidago caesia*, and *Danthonia spicata*. Unlike other floodplain forests, ferns are limited.

2. Shrub & Herb Vegetation

2.B.2. Temperate Grassland & Shrubland

2.B.2.NC. EASTERN NORTH AMERICAN GRASSLAND & SHRUBLAND

M506. Appalachian Rocky Felsic & Mafic Scrub & Grassland

G180. APPALACHIAN MAFIC GLADE

Group Summary Description: This group consists of vegetation associated with shallow soils over predominantly mafic and ultramafic bedrock substrates in the Piedmont and Blue Ridge, usually with significant areas of rock outcrop. Bedrock includes a variety of igneous and metamorphic rock types such as greenstone, shale, diabase, serpentine, and amphibolite. These areas on gentle to moderate slopes support a patchy mosaic of open woodland and grassy herbaceous vegetation sometimes with a predominant woody short-shrub community present. Shallow soils impede tree growth and help to distinguish this group from forests. The vegetation is structurally intermediate between other rock outcrop groups and forests. The unusual and extreme soil chemistry determines the special flora of the type. Most examples are open woodlands with *Pinus rigida, Pinus virginiana, Juniperus virginiana var. virginiana*, and/or *Quercus alba, Quercus marilandica*, and *Quercus stellata* in the often stunted canopy. Trees can include *Fraxinus americana, Ulmus alata*, and *Cercis canadensis* on basic soil examples. Shrubs may be dense, with species determined by soil chemistry. The herb layer is usually fairly dense and may be dominated by grasses or by a mix of grasses and forbs, both in treeless areas and beneath open canopies. The forbs include species characteristic of other rock outcrops and grassland species, with a smaller number of forest species present. Plant species richness may be fairly high. Extreme edaphic conditions lead to locally xerophytic growing conditions that contribute to relatively open canopies and a ground cover dominated by prairie grasses and a variety of forbs. Disjunct species from drier regions and some endemic plant taxa are often present.

A2074 *Fraxinus americana - Quercus stellata / Carex pensylvanica* Appalachian Mafic-Circumneutral Scrub Alliance

Alliance Summary Description: This Appalachian shale barrens vegetation is dominated by native graminoids such as *Andropogon* sp., *Carex pensylvanica, Danthonia spicata, Piptochaetium avenaceum, Schizachyrium scoparium*, and *Sporobolus compositus*, with some scattered *Juniperus virginiana var. virginiana, Quercus prinus, Quercus stellata*, and/or *Quercus velutina* in the open to sparse canopy. This alliance occurs on shale and other geologic substrates with high available base status. These substrates include shales, calcareous shales, calcareous Silurian sandstones, metabasalt (greenstone), diabase, charnockite, amphibolite, metasiltstone and phyllite. This vegetation is found in the Appalachian region of the eastern United States. The physiognomy is generally maintained in a relatively open condition by a combination of dry thin soils and management practices. The physiognomy may vary from entirely herbaceous to sparse scrub or woodland.

Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Appalachian Mafic Glade (G180)
Alliance	*Fraxinus americana - Quercus stellata / Carex pensylvanica* Appalachian Mafic-Circumneutral Scrub Alliance (A2074)

ELEMENT CONCEPT

Global Summary: This community is known only from the northern Virginia Blue Ridge and possibly the higher adjacent foothills, in areas underlain by Catoctin metabasalt (greenstone) and Middle Proterozoic plutonic rocks. Sites are located on steep (up to 37°), xeric, middle-elevation slopes where exposed outcrops effectively limit the establishment and normal development of trees. Underlying bedrock at most sites is metabasalt (greenstone). Three documented sites are underlain by charnockite, a pyroxene-bearing granitic rock, and it is likely that additional stands occur on this and related plutonic formations. Elevation of plot-sampled stands ranges from 543 to 1050 m (1782-3450 feet), with a mean of 835 m (2740 feet). Middle-slope topographic positions are typical, with slopes convex in at least one direction. Aspect varies from southeast to northwest, with westerly aspects prevalent. This vegetation type is dominated by herbaceous plants with scattered shrub patches and stunted trees. The herb layer usually ranges from 25-60% total cover (occasionally higher or lower), and from scattered to locally dense where soil and organic matter have accumulated. *Carex pensylvanica* and *Schizachyrium scoparium* are consistently dominant herbs. *Phacelia dubia* is an abundant spring ephemeral in about two-thirds of the plots, and this species may have been missed in late-season sampling of other plots.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This uncommon patchy herbaceous and scrub vegetation occurs on middle-elevation (550-1,050 m [1,800-3,450 feet]) metabasalt and calcium-bearing granitic outcrops. This community was sampled at four locations in the Central Appalachian project area. Sites are moderate to steep, lower to upper slopes with rapidly to well-drained silt, silt loam and loam soils. The unvegetated surface may be dominated by leaf litter or be codominated by leaf litter and exposed bedrock with some large/small rocks, downed wood and/or bare soil. Evidence of disturbance includes the presence of trails and exotic plant species.

Global Environment: Sites are located on steep (up to 37°), xeric, middle-elevation slopes where exposed outcrops effectively limit the establishment and normal development of trees. Underlying bedrock at most sites is metabasalt (greenstone). Three documented sites are underlain by charnockite, a pyroxene-bearing granitic rock, and it is likely that additional stands occur on this and related plutonic formations. Elevation of plot-sampled stands ranges from 543 to 1050 m (1782-3450 feet), with a mean of 835 m (2740 feet). Middle-slope topographic positions are typical, with slopes convex in at least one direction. Aspect varies from southeast to northwest, with westerly aspects prevalent. Surface cover of exposed outcrops and loose rocks averages >50% and soil development is limited to depositional crevices and thin veneers on ledges. Soil samples collected from plots are very strongly acidic (mean pH = 4.5), with substantial organic matter content (mean = 26%), but have moderately high levels of calcium (mean = 1185 ppm) and magnesium (mean = 174 ppm).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: Stunted *Fraxinus americana* is common but relatively sparse in the canopy. *Physocarpus opulifolius, Rosa carolina var. carolina* and *Rhus typhina* are common shrubs. *Symphyotrichum laeve var. concinnum* and *Hylotelephium telephioides* are usually present and characteristic herbs. *Carex pensylvanica, Danthonia spicata, Deschampsia flexuosa*, and/or *Schizachyrium scoparium* are common along with *Polygonatum biflorum, Carex pensylvanica, Heuchera americana*, and *Viola* spp. *Phacelia dubia* is common in the spring. Common herbs included here are known only from the northern Virginia Blue Ridge. One example of this community also supports VA-state critically imperiled *Heuchera caroliniana* and VA-state imperiled *Muhlenbergia glomerata*.

Global Vegetation: This vegetation type is dominated by herbaceous plants with scattered shrub patches and stunted trees. The herb layer usually ranges from 25-60% total cover (occasionally higher or lower), and from scattered to locally dense where soil and organic matter have accumulated. *Carex pensylvanica* and *Schizachyrium scoparium* are consistently dominant herbs. *Phacelia dubia* is an abundant spring ephemeral in about two-thirds of the plots, and this species may have been missed in late-season sampling of other plots. Other relatively frequent (>50% constancy) herbs are *Agrostis perennans, Allium cernuum, Ambrosia artemisiifolia, Danthonia spicata,*

Dichanthelium acuminatum, Elymus hystrix, Helianthus divaricatus, Hylotelephium telephioides (= Sedum telephioides), and *Polygonatum biflorum*. *Deschampsia flexuosa, Festuca rubra*, and *Symphyotrichum laeve var. concinnum (= Aster laevis var. concinnus)* are each common locally. Herbaceous species that are characteristic of gravelly or mossy crevices and depressions with ephemeral spring seepage or periodic moisture accumulation include *Draba ramosissima, Muhlenbergia glomerata, Polygonum tenue, Saxifraga virginiensis, Talinum teretifolium*, and *Woodsia ilvensis*. Stunted trees (<10 m tall) of *Fraxinus americana* are consistent features of the community type. *Physocarpus opulifolius* and *Rosa carolina* are the most frequent shrubs, but *Chionanthus virginicus, Rhus typhina, Juniperus virginiana, Amelanchier sanguinea, Ptelea trifoliata*, and *Spiraea alba var. latifolia* are each important in a subset of plots. Species richness of plot-sampled stands ranges from 28 to 58 taxa per 400 square meters (mean = 40).

Herb (field)	Graminoid	*Carex pensylvanica*, *Danthonia spicata*, *Deschampsia flexuosa*, *Schizachyrium scoparium*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Carex pensylvanica*, *Fraxinus americana*, *Hylotelephium telephioides*, *Phacelia dubia*, *Symphyotrichum laeve* var. *concinnum*
Global: *Allium cernuum*, *Amelanchier sanguinea*, *Carex pensylvanica*, *Chionanthus virginicus*, *Fraxinus americana*, *Hylotelephium telephioides*, *Phacelia dubia*, *Physocarpus opulifolius*, *Rhus typhina*, *Rosa carolina*, *Symphyotrichum laeve* var. *concinnum*, *Talinum teretifolium*, *Woodsia ilvensis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Heuchera caroliniana* (G3, globally vulnerable & VA state-critically imperiled), *Muhlenbergia glomerata* (G5, VA state-imperiled); **Invasive/Exotic Plants**: *Anthoxanthum odoratum*, *Berberis thunbergii* (High/Medium), *Digitaria ischaemum*, *Elaeagnus umbellata* (High), *Ligustrum sinense* (High/Medium), *Lonicera japonica* (High/Medium), *Lonicera morrowii* (High/Medium), *Myosotis stricta*, *Rosa multiflora* (Medium/Low), *Rubus phoenicolasius* (Medium), *Rumex acetosella* (Medium/Low), *Stellaria media* (Low), *Trifolium campestre*, *Trifolium repens* (Medium/Low), *Viburnum plicatum*, *Vicia sativa* ssp. *nigra*
Global: Vulnerable Plants: *Cuscuta coryli* (G5?, VA state-rare), *Heuchera caroliniana* (G3), *Liatris turgida* (G3), *Muhlenbergia glomerata* (G5, VA state-rare), *Paxistima canbyi* (G2), *Potentilla arguta* (G5, VA state-rare), *Taenidia montana* (G3), *Trillium rugelii* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (1-Feb-2008). This vegetation is naturally rare, being restricted to special edaphic habitats on metavolcanic and plutonic rocks of limited geographic extent. There are probably at least 20 occurrences in Virginia and globally. Patches are small (generally <0.5 ha), but there are few threats to this community since most occurrences are on steep, remote sites in federally protected areas.

RELATED CONCEPTS

Global Similar Types:
- *Fraxinus americana - Carya glabra / Muhlenbergia sobolifera - Helianthus divaricatus - Solidago ulmifolia* Woodland (CEGL003683)
- *Juniperus virginiana - Fraxinus americana / Carex pensylvanica - Cheilanthes lanosa* Open Woodland (CEGL006037)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: See Global Comments.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Although this community type has been referred to as a "greenstone glade" (Fleming 1993), this name is inappropriate given the occasional occurrence of the type on granitic rocks. Additional inventory and data collection are needed to determine the extent of this association on plutonic substrates. This community often occurs adjacent to, or nested within, a larger patch of *Fraxinus americana - Carya glabra / Muhlenbergia sobolifera - Helianthus divaricatus - Solidago ulmifolia* Woodland (CEGL003683). It is also similar to *Juniperus virginiana - Fraxinus americana / Carex pensylvanica - Cheilanthes lanosa* Open Woodland (CEGL006037), which occurs at lower elevations, on a wider variety of substrates (including calcareous shales), and has a large component of elevation-limited lithophytes absent from this association (CEGL008529).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled in Virginia at Oteen, French Broad River, Cedar Cliffs (Laurel Springs Gap), and Upper Rose River.
Global Range: This community is known only from the northern Virginia Blue Ridge and possibly the higher adjacent foothills, in areas underlain by Catoctin metabasalt (greenstone) and Middle Proterozoic plutonic rocks.

A3470 Southern Appalachian Mafic Shrubland Alliance

Alliance Summary Description: This shrub-dominated vegetation occurs on mafic rock outcrops or thin soil areas. Common shrubs include *Diervilla lonicera, Gaylussacia baccata, Kalmia latifolia, Philadelphus hirsutus, Photinia melanocarpa, Physocarpus opulifolius*, and *Ptelea trifoliata var. mollis*. Areas of bare rock outcrops and grassy areas with *Schizachyrium scoparium, Carex pensylvanica*, or *Deschampsia flexuosa* are scattered. These are found on montane slopes in the Appalachians, from the Blue Ridge of Virginia to Kennesaw Mountain in Georgia, and may also occur in Maryland, Pennsylvania, and West Virginia.

[CEGL008536] *Diervilla lonicera - Solidago simplex var. randii - Deschampsia flexuosa - Hylotelephium telephioides - Saxifraga michauxii* Grassland

Translated Name: **Northern Bush-honeysuckle - Rand's Goldenrod - Wavy Hairgrass - Allegheny Stonecrop - Michaux's Saxifrage Grassland**
Common Name: **High-Elevation Greenstone Barrens**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Appalachian Mafic Glade (G180)
Alliance	Southern Appalachian Mafic Shrubland Alliance (A3470)

ELEMENT CONCEPT

Global Summary: This association is known only from a few high-elevation mafic rock outcrops in the northern Virginia Blue Ridge. All known sites are located in Shenandoah National Park. This community type is associated with exposed rocky summits and upper slope outcrops of Catoctin Formation metabasalt (greenstone) at elevations from 870 to 1230 m (2860-4040 feet). Slope shape is typically convex in at least one direction, and aspect varies from west to north. The vegetation is characterized by a patchwork of shrub thickets (typically <25% cover), herbaceous mats (typically <40% cover), and crustose lichen colonies on exposed rock surfaces. The most frequent woody species include extremely stunted, wind-blasted specimens of the trees *Betula alleghaniensis* and *Sorbus americana*; characteristic shrubs and woody vines are *Diervilla lonicera, Physocarpus opulifolius, Prunus pensylvanica, Prunus virginiana, Kalmia latifolia*, and *Smilax tamnoides*. *Deschampsia flexuosa* and *Solidago simplex var. randii* are the most frequent dominant herbaceous species, but *Sibbaldiopsis tridentata, Saxifraga michauxii, Carex pensylvanica*, and *Hylotelephium telephioides* dominate in some areas.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This rare high-elevation barrens occurs on exposed rocky summits and upper-slope outcrops of Catoctin Formation metabasalt (greenstone) at elevations from 870 to 1,230 m (2,860-4,040 feet). It was sampled at eight locations in the park, all in the Central Appalachian project area. Sites are moderate to steep, mid to upper slopes and summits (bedrock outcrops) with mostly western or eastern aspects. Soils are well-drained. The unvegetated surface consists of a mix of exposed bedrock, large/small rocks, leaf litter, downed wood, and/or bare soil. Evidence of disturbance includes the presence of exotic plant species.

Global Environment: This community type is associated with exposed rocky summits and upper slope outcrops of Catoctin Formation metabasalt (greenstone) at elevations from 870 to 1230 m (2860-4040 feet). Mean elevation of nine plot-sampled stands is 1068 m (3506 feet); an exceptional occurrence on the north slope of Mount Marshall is situated at an unusually low elevation of 870 m (2860 feet). Slope shape is typically convex in at least one direction, and aspect varies from west to north. Mean surface cover of bedrock and loose rocks at sample sites is 69%, while mean lichen / moss cover on these rocks is 42%. The moisture regime of these sites is xeric, and soil development is limited to shallow accumulations of disintegrated rock and humus on shelves and in crevices. However, an ephemeral spring seep with seasonally wet moss mats is present at one site (Stony Man Mountain). These habitats are periodically exposed to extreme winter temperatures, high winds, and ice. Soil samples extracted from plot locations are extremely acidic (mean pH = 4.0) but often have moderately high levels of calcium, magnesium, and manganese and high levels of aluminum (mean = 1577 ppm).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This community is a patchwork of shrub thickets (typically <25% cover), herbaceous mats (typically <40% cover), and crustose lichen colonies. *Deschampsia flexuosa var. flexuosa, Sibbaldiopsis tridentata, Solidago simplex var. randii*, *Hylotelephium telephioides*, and *Polypodium appalachianum* are common species. Shrubs can include *Physocarpus opulifolius var. opulifolius, Diervilla lonicera, Kalmia latifolia*, and *Photinia melanocarpa*. Stunted trees may include *Betula alleghaniensis, Sorbus americana*, and *Prunus* spp. This community supports VA-state critically imperiled *Abies balsamea* and *Heuchera caroliniana* and VA-state imperiled *Huperzia appalachiana* and *Sibbaldiopsis tridentata*.

Global Vegetation: The vegetation is characterized by a patchwork of shrub thickets (typically <25% cover), herbaceous mats (typically <40% cover), and crustose lichen colonies on exposed rock surfaces. The most frequent woody species include extremely stunted, wind-blasted specimens of the trees *Betula alleghaniensis* and *Sorbus americana*; stunted trees of *Abies balsamea* also occur at several sites. Characteristic shrubs and woody vines are *Diervilla lonicera, Physocarpus opulifolius, Prunus pensylvanica, Prunus virginiana, Kalmia latifolia*, and *Smilax tamnoides*. *Deschampsia flexuosa* and *Solidago simplex var. randii* are usually the dominant herbaceous species, with mean cover in plot samples of 10-25% and 5-10%, respectively. *Sibbaldiopsis tridentata* is abundant (up to 25% cover) in a subset of sites but is absent from about half of the known sites. Other relatively constant and characteristic herbaceous species are *Campanula divaricata, Carex pensylvanica, Heuchera pubescens, Hylotelephium telephioides (= Sedum telephioides), Phlox subulata, Poa compressa, Polypodium appalachianum*,

and *Saxifraga michauxii*. Inconstant but locally prominent herbaceous species include *Allium cernuum, Angelica triquinata, Arabis lyrata, Houstonia longifolia, Danthonia spicata, Liatris turgida*, and *Saxifraga virginiensis*. The grass *Calamagrostis canadensis* is abundant in the local seepage area on Stony Man Mountain, Virginia. Mean species richness of 15 plot-sampled stands is 27 taxa per 100 square meters. Several boreal lichens, including *Melanelia stygia, Porpidia lowiana, Porpidia tuberculosa*, and *Rhizocarpon geographicum* occur abundantly on metabasalt outcrops within this community type. The following Virginia state-rare plants are associated with this community: *Abies balsamea, Clematis occidentalis, Conioselinum chinense, Gymnocarpium appalachianum, Huperzia appalachiana, Juncus trifidus, Rubus idaeus ssp. strigosus, Sibbaldiopsis tridentata, Solidago simplex var. randii*, and *Trisetum spicatum*.

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (3-Oct-2001). This is a naturally rare, small-patch community type limited by special habitat requirements. Currently, habitats supporting this unit are known from less than 20 discrete outcrops which together form five complexes or occurrences (Franklin Cliffs, Hawksbill, Crescent Rocks, Stony Man Mountain, Mount Marshall). Total coverage of all known occurrences is probably <12 hectares (30 acres). It is unlikely that any additional occurrences will be found, and these would not significantly increase the aggregate acreage of the type.

RELATED CONCEPTS

Global Similar Types:
- *Minuartia groenlandica - Paronychia argyrocoma - Saxifraga michauxii* Grassland (CEGL008509)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: See Global Comments.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: This type (CEGL008536) was formerly represented, in part, by the now-obsolete *Saxifraga michauxii - Solidago simplex var. randii - Sibbaldiopsis tridentata* Herbaceous Vegetation (CEGL004941). Recent multivariate analyses of a 956-plot dataset by the Virginia Dept. of Conservation / Division of Natural Heritage strongly supports the segregation of this type from vegetation documented south of Shenandoah National Park on the granitic summit of Spy Rock (Nelson County) and the amphibolite summit of Buffalo Mountain (Floyd County). The barrens of these two sites have been classified as *Minuartia groenlandica - Paronychia argyrocoma - Saxifraga michauxii* Grassland (CEGL008509). Several additional high-elevation greenstone outcrops in the park (e.g., Pass Mountain, Mount Marshall, Hightop) and elsewhere (e.g., Humpback Rocks, Nelson County) support *Photinia melanocarpa - Gaylussacia baccata / Carex pensylvanica* Shrubland (CEGL008508). Vegetation of CEGL008508 is characterized by rhizomatous colonies of the low shrubs *Photinia melanocarpa* and *Gaylussacia baccata* and has a lower herb diversity and overall species richness than CEGL008536. Vegetation of the Stony Man seepage area was formerly recognized as a distinct type, *Physocarpus opulifolius / Calamagrostis canadensis* Shrub Herbaceous Vegetation (CEGL004253) but is now regarded as a variant of CEGL008536.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: All known sites along the Appalachian Trail are located in Shenandoah National Park. It was sampled in Virginia at Crescent Rock, Franklin Cliffs, Hawksbill Mountain, and Stony Man.
Global Range: This association is known only from a few high-elevation mafic rock outcrops in the northern Virginia Blue Ridge. All known sites are located in Shenandoah National Park. Most occurrences are in the higher, central section of the park, from the Big Meadows Area on the south to Stony Man Mountain on the north. A somewhat disjunct stand occurs on Mount Marshall in the northern section of the park.

Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Appalachian Mafic Glade (G180)
Alliance	Southern Appalachian Mafic Shrubland Alliance (A3470)

ELEMENT CONCEPT

Global Summary: This community type is known from scattered localities along nearly the full length of the Blue Ridge in Virginia and could potentially occur in North Carolina, West Virginia, Maryland, and Pennsylvania. This vegetation type is associated with medium- to high-elevation exposed outcrops of igneous and metamorphic rocks, including metabasalt (greenstone), porphyritic leucocharnockite, amphibolite, and rhyolite. Elevation ranges from about 880 to 1400 m (2900-4600 feet). Habitats are typically on strongly convex, upper slopes and rocky summits with west to northwest or flat aspects. The community is a patchwork of shrub thickets, small herbaceous mats, and exposed, lichen-covered rock surfaces. *Photinia melanocarpa (= Aronia melanocarpa)* is the dominant shrub, or is codominant with *Gaylussacia baccata, Hamamelis virginiana, Smilax tamnoides*, and/or *Kalmia latifolia*. Minor woody components include *Sorbus americana, Rhododendron catawbiense*, and *Menziesia pilosa*, as well as severely stunted *Betula alleghaniensis* and *Quercus rubra*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This rare shrubland occurs on medium- to high-elevation igneous outcrop barrens and rocky summits from about 880 to 1,400 m (2,900-4,600 feet) elevation. It was sampled at six locations in the park. Sites are gentle to steep upper-slope and summit bedrock outcrops with northwestern and northeastern aspects. Soils are rapidly drained. The unvegetated surface is dominated by leaf litter and/or exposed bedrock with some downed wood and large rocks. Evidence of disturbance includes possible past logging, wind/ice damage, and the presence of exotic plant species.
Global Environment: This vegetation type is associated with medium- to high-elevation exposed outcrops of igneous and metamorphic rocks, including metabasalt (greenstone), porphyritic leucocharnockite, amphibolite, and rhyolite. The elevation range of plot-sampled stands is from about 880 to 1400 m (2900-4600 feet). Habitats are typically on strongly convex, upper slopes and rocky summits with west to northwest or flat aspects. Surface cover of bedrock and loose boulders in plot-sampled stands averages 80%, with mean lichen cover of 44% on these rocks. Soil development and moisture potential at these sites are minimal, and habitats may also be subject to severe winter temperatures, high winds, and ice.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This shrubland is dominated by *Photinia melanocarpa* and *Gaylussacia baccata*. *Kalmia latifolia* may be present but is not dominant. *Vaccinium pallidum* and *Sorbus americana* may be common. Herbaceous patches are usually sparse or limited. *Carex pensylvanica, Hylotelephium telephioides*, and *Maianthemum canadense* are most characteristic. Scattered *Quercus rubra* and/or *Betula alleghaniensis* are possible. This community also supports VA-state imperiled *Sibbaldiopsis tridentata*.
Global Vegetation: The community is a patchwork of shrub thickets, small herbaceous mats, and exposed, lichen-covered rock surfaces. *Photinia melanocarpa (= Aronia melanocarpa)* is the dominant shrub, or is codominant with *Gaylussacia baccata, Hamamelis virginiana, Smilax tamnoides*, and/or *Kalmia latifolia*. Minor woody components include *Sorbus americana, Rhododendron catawbiense*, and *Menziesia pilosa*, as well as severely stunted *Betula alleghaniensis* and *Quercus rubra*. The most frequent herbaceous species are *Carex pensylvanica, Saxifraga michauxii, Dennstaedtia punctilobula, Polypodium appalachianum, Agrostis perennans, Paronychia argyrocoma, Solidago simplex var. randii, Hylotelephium telephioides (= Sedum telephioides), Heuchera villosa, Campanula divaricata*, and *Danthonia spicata*. Species richness of plot-sampled stands ranges from 12 to 37 taxa per 100 square meters (mean = 22).

G670. CENTRAL & SOUTHERN APPALACHIAN ROCKY OUTCROP

Group Summary Description: These are treeless rock outcrops of the southern and central Appalachian Mountains, best developed in western North Carolina and eastern Tennessee. The vegetation is generally characterized by a mixture of low-growing lifeforms, especially lichens, mosses, and short-statured forbs. Less commonly, graminoids and low shrubs are encountered. Species common to all outcrop vegetation types include *Carex misera, Saxifraga michauxii*, and *Vaccinium corymbosum*. Outcrops may be vertical to horizontal, rugged or fractured rock outcrops of peaks, ridgetops, upper slopes, and other topographically exposed locations. Higher elevation examples occur from 1200 to 2030 m in elevation; other examples may be found at elevations of 305 m (1000 feet) or lower on foothills. These outcrops occur on felsic to mafic rocks and are distinguished from

surrounding systems by the prevalence of bare or lichen-encrusted rocks. This group unifies several vegetation types with widely differing physiognomies, ranging from woodland to low shrubland, to perennial grassland, to lichen-dominated with low vascular plant cover. They are unified by their common environments, which include rock outcrops, boulderfields, exfoliation outcrops, consolidated cliffs, unconsolidated bouldery talus, and rocky domes and summits in the Central and Southern Appalachians.

A1621 *Saxifraga michauxii - Carex misera - Schizachyrium scoparium* Rocky Grassland Alliance

Alliance Summary Description: This alliance consists of moderate- to high-elevation rocky summit communities of the Southern and Central Blue Ridge (metamorphic rock portions of the Southern and Central Appalachians), as well as in the adjacent southern Piedmont. The vegetation will typically have *Saxifraga michauxii* as a component; other species may include *Carex* spp., *Saxifraga micranthidifolia, Saxifraga virginiensis, Schizachyrium scoparium*, and others. There are several globally rare communities contained in this alliance. One association placed here is dominated by *Carex biltmoreana, Krigia montana, Pycnanthemum beadlei*, and *Saxifraga michauxii*. Examples are found on various rock types, including amphibolite, metabasalt (greenstone), gneiss, and others. It is found on steeply sloping outcrops of felsic to mafic rock, primarily south of the Asheville Basin, North Carolina. These are small exfoliated (spalled) outcrops surrounded by forests or woodlands.

Alliance	*Saxifraga michauxii - Carex misera - Schizachyrium scoparium* Rocky Grassland Alliance (A1621)

Element Concept

Global Summary: This association consists of rock outcrops with sparse vegetative cover of forbs, grasses and shrubs which are rooted in rock fissures. This vegetation occurs in the Southern Appalachians of Tennessee and North Carolina at 1350-1870 m elevation within a matrix of *Quercus rubra* forest or high-elevation grasslands and shrublands. Typical species include *Saxifraga michauxii, Danthonia spicata, Krigia montana, Carex misera, Angelica triquinata, Athyrium filix-femina ssp. asplenioides, Rhododendron catawbiense*, and *Heuchera villosa*. Other characteristic species are *Sanguisorba canadensis, Sibbaldiopsis tridentata, Hylotelephium telephioides (= Sedum telephioides), Houstonia purpurea var. montana, Geum radiatum, Solidago spithamaea*, and *Huperzia appalachiana*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation rocky summit type is found between 1,065 and 1,810 m (3,500-5,940 feet) elevation, occupying vertical to horizontal rock outcrops of peaks, ridges, upper slopes, and other topographically exposed positions, often with western aspects.

Global Environment: This association consists of rock outcrops with sparse vegetative cover of forbs, grasses and shrubs which are rooted in rock fissures. It occurs at 1350-1870 m elevation within a matrix of *Quercus rubra* forest or high-elevation grasslands and shrublands. The rock types on which it may occur include amphibolite, metabasalt, metagabbro, and metagraywacke.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: Short-statured herbs, mosses, and lichens are the most prevalent lifeforms in this community, with shrubs and graminoids sometimes encountered. Common and/or abundant herbs include *Agrostis perennans, Carex debilis, Danthonia spicata, Heuchera villosa var. villosa, Minuartia glabra, Minuartia groenlandica* (TN-state critically imperiled), *Potentilla canadensis, Saxifraga michauxii*, and *Sibbaldiopsis tridentata* (TN-state imperiled). *Rumex acetosella* is a

ubiquitous exotic weed. In addition, this community supports TN-state critically imperiled *Alnus viridis ssp. crispa* and *Krigia montana* (also a regional endemic) and TN-state imperiled *Ageratina altissima var. roanensis*.
Global Vegetation: Typical species in stands of this type include *Saxifraga michauxii, Danthonia spicata, Krigia montana, Carex misera, Angelica triquinata, Athyrium filix-femina ssp. asplenioides, Rhododendron catawbiense*, and *Heuchera villosa var. villosa*. Other characteristic species are *Sanguisorba canadensis, Sibbaldiopsis tridentata, Hylotelephium telephioides (= Sedum telephioides), Houstonia purpurea var. montana, Geum radiatum, Solidago spithamaea*, and *Huperzia appalachiana*. In addition, some examples contain *Agrostis perennans, Alnus viridis ssp. crispa, Carex debilis, Krigia montana, Minuartia glabra, Minuartia groenlandica*, and *Potentilla canadensis*.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Danthonia spicata*, *Micranthes petiolaris*, *Rumex acetosella*
Global: *Carex misera*, *Danthonia spicata*, *Krigia montana*, *Micranthes petiolaris*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4, TN state-imperiled), *Alnus viridis* ssp. *crispa* (G5T5, TN state-critically imperiled), *Krigia montana* (G3, TN state-critically imperiled), *Minuartia groenlandica* (G5, TN state-critically imperiled), *Sibbaldiopsis tridentata* (G5, TN state-critically imperiled), *Solidago glomerata* (G3, TN state-imperiled); **Invasive/Exotic Plants**: *Rumex acetosella* (Medium/Low)
Global: Vulnerable Plants: *Allium allegheniense* (G3?), *Carex misera* (G3), *Geum radiatum* (G2, Southern Appalachian endemic), *Gymnocarpium appalachianum* (G3), *Houstonia purpurea* var. *montana* (G5T2, Southern Blue Ridge endemic), *Krigia montana* (G3), *Liatris helleri* (G2Q, NC/Southern Appalachian endemic), *Prenanthes roanensis* (G3), *Solidago glomerata* (G3), *Solidago spithamaea* (G2)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (30-Apr-1998). This high-elevation community is associated with amphibolite, metabasalt, metagabbro, or metagraywacke bedrock outcrops in the Southern Appalachians of Tennessee and North Carolina. This community is naturally rare, representing a tiny fraction of the high-mountain landscape. It is known from scattered, small acreage occurrences. Heavy recreational use in these fragile communities has damaged, and continues to threaten, many examples. Additionally, atmospheric deposition of air pollutants may have an adverse effect on these high-elevation communities.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: *Carex misera* has very low constancy in plots.
Global Classification Comments: This community is associated with amphibolite, metabasalt, metagabbro, or metagraywacke bedrock. In an 1134-plot regional analysis (Georgia, North Carolina, Tennessee, Virginia) for the Southern Appalachian portion of the Appalachian Trail, nine plots were classified as this association (Fleming and Patterson 2009a). These plots are all from various localities on the Roan Mountain Massif (NC and TN), and five are located along the Appalachian Trail. The most constant species (>50%) in this group are *Danthonia spicata, Minuartia groenlandica, Rumex acetosella, Saxifraga michauxii, Heuchera villosa var. villosa, Athyrium filix-femina ssp. asplenioides, Sibbaldiopsis tridentata, Krigia montana, Solidago glomerata, Deschampsia flexuosa, Alnus viridis ssp. crispa* (seedlings), and *Rhododendron catawbiense* (seedlings).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled on Roan Mountain in Cherokee National Forest, North Carolina, and Pisgah National Forest, Tennessee.
Global Range: This high-elevation community is restricted to the Southern Appalachians of Tennessee and North Carolina.

Alliance	*Saxifraga michauxii - Carex misera - Schizachyrium scoparium* Rocky Grassland Alliance (A1621)

ELEMENT CONCEPT

Global Summary: This association covers high-elevation (greater than 1980 m) vegetated rock outcrops of highly fractured felsic to mafic bedrock of the southern Appalachian Mountains in North Carolina and Tennessee. The vegetative cover is sparse with grasses, forbs and shrubs rooted in rock fissures. Typical species in stands of this type are *Carex misera, Abies fraseri, Menziesia pilosa, Heuchera villosa, Rhododendron catawbiense, Saxifraga michauxii, Sorbus americana, Oclemena acuminata (= Aster acuminatus)*, and *Solidago glomerata*. This community occurs in a matrix of *Picea rubens - Abies fraseri* forest. Other characteristic species are *Minuartia glabra* and *Polypodium appalachianum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This sparsely vegetated community is found above 1,810 m (5,940 feet) elevation and occupies vertical to horizontal rock outcrops of peaks, ridges, upper slopes, and other topographically exposed positions. Sampled stands are north-facing.
Global Environment: This association covers high-elevation (greater than 1980 m) on rock outcrops of highly fractured felsic to mafic bedrock. This community occurs in a matrix of *Picea rubens - Abies fraseri* forest.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: Short-statured herbs, mosses, and lichens are the most prevalent lifeforms in this community, with shrubs and graminoids sometimes encountered. Common and/or abundant herbs include *Athyrium filix-femina ssp. asplenioides, Carex brunnescens ssp. sphaerostachya, Carex misera, Clintonia borealis, Oclemena acuminata, Oxalis montana*, and *Saxifraga michauxii*. Woody species include *Abies fraseri, Ribes glandulosum*, and *Sorbus americana*. This community also supports TN-state imperiled *Carex misera* and *Menziesia pilosa*.

Global Vegetation: Typical species in stands of this type are *Carex misera, Abies fraseri, Menziesia pilosa, Heuchera villosa, Rhododendron catawbiense, Saxifraga michauxii, Sorbus americana, Oclemena acuminata (= Aster acuminatus)*, and *Solidago glomerata*. Other characteristic species are *Minuartia glabra* and *Polypodium appalachianum*.

A3961 *Selaginella rupestris - Selaginella tortipila - Schizachyrium scoparium* Rocky Grassland Alliance

Alliance Summary Description: This vegetation is found on granitic exfoliation domes of the Piedmont and at lower, intermediate, and high elevations in the Southern Blue Ridge of the Carolinas and Georgia. It occurs on gently sloping to steep exposures of smooth, exfoliating granite or similar massive igneous or metamorphic rock, such as granitic gneiss. The sites are typically exposed and south-facing, with smooth, primarily steep to vertical exfoliation surfaces and few cracks or crevices for soil accumulation. Some flat areas may also be present. This community occurs in large patches, ranging in size from a few acres to over 100 acres. Vegetation consists primarily of lichens on bare rock or of shallow mats generally dominated by *Selaginella rupestris* occurring with other distinctive species.

[CEGL007690] *Selaginella rupestris - Schizachyrium scoparium - Hypericum gentianoides - Bulbostylis capillaris* Rocky Grassland

Translated Name: **Rock Spikemoss - Little Bluestem - Orange-grass - Dense-tuft Hairsedge Rocky Grassland**
Common Name: **Appalachian Low-Elevation Granitic Dome**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Central & Southern Appalachian Rocky Outcrop (G670)
Alliance	*Selaginella rupestris - Selaginella tortipila - Schizachyrium scoparium* Rocky Grassland Alliance (A3961)

ELEMENT CONCEPT

Global Summary: This association includes vegetation found on granitic exfoliation domes of the Piedmont and lower elevation portions of the Blue Ridge. It occurs on gently sloping to steep exposures of smooth, exfoliating granite or similar massive igneous or metamorphic rock, such as granitic gneiss. The substrate has few cracks or irregularities for soil accumulation, and most of the areal extent is bare rock. This association typically occurs at elevations below 915 m (3000 feet) but may be found at slightly higher elevations. This community occurs in large patches, ranging in size from a few acres to over 100 acres. Vegetation consists primarily of lichens on bare rock or of shallow mats generally dominated by *Selaginella rupestris* occurring with other distinctive species. Woody species from adjacent woodlands and shrublands may be scattered components, rooted in deeper soil pockets, older stable vegetation mats, and in marginal zones between the exposed rock and adjacent forests. *Selaginella rupestris* is almost always a major dominant of the vegetation mats. However, distribution of *Selaginella rupestris* can be spotty,

so there are examples of this association that do not contain this species. Other characteristic herbaceous species are *Baptisia tinctoria, Cheilanthes lanosa, Coreopsis major, Corydalis sempervirens, Danthonia sericea, Lindernia monticola, Phlox nivalis, Schizachyrium scoparium, Scleria triglomerata*, and *Talinum teretifolium*. Common woody species include *Carya pallida, Chionanthus virginicus, Fraxinus americana, Juniperus virginiana, Kalmia latifolia, Pinus echinata, Pinus rigida, Quercus prinus (= Quercus montana), Rhododendron minus, Ulmus alata*, and *Vaccinium stamineum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This sparse vegetation is found on granitic exfoliation domes. Sites are gently sloping ridgetops (including rock outcrops) with soils that may at times be very wet due to fog and rain or may be extremely dry during periods of drought. The unvegetated surface is dominated by exposed bedrock with small amounts of leaf litter, downed wood, small rocks and bare soil. Evidence of disturbance includes trails, impacts from hikers, and wind/ice damage due to exposure to severe weather.

Global Environment: This association occurs on gently sloping to steep exposures of smooth, exfoliating granite or similar massive igneous or metamorphic rock, such as granitic gneiss. The substrate has few cracks or irregularities for soil accumulation, and most of the areal extent is bare rock. This association typically occurs at elevations below 915 m (3000 feet) but may be found at slightly higher ones.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: Trees are at low cover (generally below 35%), and may be scattered individuals or small patches. Vegetation consists primarily of lichens on bare rock, or of shallow mats generally dominated by *Selaginella rupestris*. Other characteristic herbaceous species are *Baptisia tinctoria, Bulbostylis capillaris, Cheilanthes lanosa, Coreopsis major, Corydalis sempervirens, Croton elliottii* (regional endemic), *Danthonia sericea, Danthonia spicata, Deschampsia flexuosa, Juncus tenuis, Lindernia monticola, Phlox nivalis, Scleria triglomerata, Schizachyrium scoparium*, and *Talinum teretifolium*. Woody species are scattered but may include *Betula lenta, Carya pallida, Chionanthus virginicus, Fraxinus americana, Juniperus virginiana, Kalmia latifolia, Pinus rigida, Rosa carolina, Rubus flagellaris, Quercus alba*, and *Quercus prinus*. This community also supports GA-state critically imperiled *Paronychia argyrocoma* and *Sibbaldiopsis tridentata*.

Global Vegetation: In stands of this type, the vegetation consists primarily of lichens on bare rock, or of shallow mats generally dominated by *Selaginella rupestris* occurring with other distinctive species. Woody species from adjacent woodlands and shrublands may be scattered components, rooted in deeper soil pockets, older stable vegetation mats, and in marginal zones between the exposed rock and adjacent forests. *Selaginella rupestris* is almost always a major dominant of the vegetation mats. However, distribution of *Selaginella rupestris* can be spotty, so there are examples of this association that do not contain this species. Other characteristic herbaceous species are *Baptisia tinctoria, Cheilanthes lanosa, Coreopsis major, Corydalis sempervirens, Danthonia sericea, Lindernia monticola, Phlox nivalis, Schizachyrium scoparium, Scleria triglomerata*, and *Talinum teretifolium*. Common woody species include *Carya pallida, Chionanthus virginicus, Fraxinus americana, Juniperus virginiana, Kalmia latifolia, Pinus rigida, Quercus prinus (= Quercus montana), Rhododendron minus, Ulmus alata*, and *Vaccinium stamineum*.

In an example of this association in the Chattahoochee National Forest (upper Piedmont of Stephens County, Georgia, 231Ad34, ca. 303-350 m elev.), mats of *Selaginella rupestris* dominate the stand. Widely scattered trees include *Pinus virginiana* and *Quercus prinus*. A prevalent shrub is *Rhus aromatica*. Other herbs include *Ageratina aromatica, Agrostis perennans, Andropogon* sp. *Cheilanthes lanosa, Packera anonyma (= Senecio anonymus), Solanum ptychanthum*?, and the characteristic *Talinum teretifolium*. Examples of this association on granite gneiss at Carl Sandburg Home National Historic Site also contained patches of *Amelanchier laevis* and *Pinus virginiana* scattered in pockets of deeper soil.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Selaginella rupestris*
Global: *Selaginella rupestris*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Croton elliottii* (G3, globally imperiled), *Paronychia argyrocoma* (G4, GA state-critically imperiled), *Sibbaldiopsis tridentata* (G5, GA state-critically imperiled); **Invasive/Exotic Plants**: *Poa compressa* (High/Low), *Rumex acetosella* (Medium/Low)
Global: Vulnerable Plants: *Croton elliottii* (G3), *Krigia montana* (G3), *Packera millefolia* (G3), *Pycnanthemum curvipes* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (30-Apr-1998). Granitic domes are uncommon communities. Only 20 percent of the Piedmont Plateau is granite (Radford and Martin 1975), and only a small percentage of this granite occurs as massive, unweathered bodies that produce flatrocks and domes. Past quarrying has leveled many former granite domes (McVaugh 1943). This community provides open vistas that are attractive to humans, thus these fragile areas are threatened by pressures of recreational use. Given the island-like nature of this community, it is the habitat for many rare and endemic species and provides a unique contribution to biodiversity.

RELATED CONCEPTS

Global Similar Types:

- *Selaginella rupestris - Schizachyrium scoparium - Hylotelephium telephioides - Allium cernuum* Granitic Glade Vegetation (CEGL004991)
- *Selaginella tortipila - Krigia montana - Houstonia longifolia* Rocky Grassland (CEGL004283)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Two plots from gneissic outcrops on the Georgia Blue Ridge, both with somewhat sparse but grass-rich herbaceous vegetation. Additional plant species were added to the local description by map validation field crews.
Global Classification Comments: Occurrences of this community have structural and compositional similarities to *Selaginella tortipila - Krigia montana - Houstonia longifolia* Rocky Grassland (CEGL004283), which is typically at higher elevations (over 915 m [3000 feet]) and contains a suite of species not found at lower elevations. Occurrences vary locally based on slope steepness, aspect, age of vegetation mats, and smoothness of rock substrate. Some occurrences may be difficult to distinguish from *Selaginella rupestris - Schizachyrium scoparium - Hylotelephium telephioides - Allium cernuum* Granitic Glade Vegetation (CEGL004991), which is characterized by the presence of plants characteristic of higher pH conditions, better developed soils, and flat to gently sloping rock surfaces. This community is floristically similar to granitic flatrock communities which are scattered throughout the Piedmont from Virginia to Alabama. However, the steep domes described here lack the shallow pools and other microhabitats characteristic of the fractured rock in granitic flatrock communities, and thus have different vegetative components.

In an 1134-plot regional analysis (Georgia, North Carolina, Tennessee, Virginia) for the Southern Appalachian portion of the Appalachian Trail, two plots from Union County, GA, were classified as this association. Both plots are at an unusually high elevation for the type and may be transitional to a higher-elevation association, but contain the characteristic species *Selaginella rupestris, Schizachyrium scoparium*, and *Bulbostylis capillaris*, along with *Danthonia spicata, Deschampsia flexuosa, Hypericum prolificum*, and *Croton willdenowii* (Fleming and Patterson 2009a).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled on Chattahoochee National Forest in Georgia.
Global Range: This community is known from the Piedmont region of Georgia and North Carolina, and lower elevations of the Blue Ridge Mountains, where steep, dome-shaped outcrops of granitic rock occur. Notable examples are in DeKalb County, Georgia, and in Alexander County, North Carolina.

G789. NORTH-CENTRAL APPALACHIAN ACIDIC SCRUB & GRASSLAND

Group Summary Description: This group is characterized by non-forested vegetation of acidic / nutrient-poor acidic bedrock outcrops and summits, or dry, sandy, nutrient-poor soils occurring on barrens or on sandy eroding river bluffs. Physiognomy is variable, ranging from graminoid-dominated, to shrublands, with or without very scattered, usually stunted, trees. Vegetation is usually patchy, with bare, or lichen-covered substrate of variable cover. Vegetation includes "pine plains" dominated by a dwarf-shrub variant of *Pinus rigida* associated with pine barrens, as well as taller shrublands, often quite dense, dominated by *Quercus ilicifolia*. This group also includes "heathlands" comprising dwarf-shrublands of low ericaceous shrubs such as *Gaylussacia baccata, Vaccinium angustifolium*, and *Vaccinium pallidum*; *Vaccinium myrtilloides, Sibbaldiopsis tridentata (= Potentilla tridentata)*, and *Sorbus americana* also occur at higher elevations and in the north at lower elevations. Associations characterized by graminoids *Carex lucorum, Carex pensylvanica, Danthonia spicata, Deschampsia flexuosa*, or *Schizachyrium scoparium* are also included in this group. Although there is significant overlap in floristic composition, there are two distinct environmental settings supporting this group: acidic bedrock outcrops and summits, and relatively flat plains with dry to xeric sandy soils. This group also includes small mafic bedrock associations characterized by *Asplenium trichomanes, Adiantum aleuticum*, and *Cerastium arvense*, as well as vegetation occurring on sandy river bluffs characterized by widely scattered early-successional trees and dwarf-shrubs, including *Hudsonia ericoides*.

A3910 *Danthonia spicata - Deschampsia flexuosa - Deschampsia caespitosa* Bedrock Grassland Alliance

Alliance Summary Description: This alliance, ranging from the Great Lakes to the Appalachian Mountains, is characterized by acidic or serpentine bedrock outcrops supporting dry, patchy grasslands usually dominated by *Danthonia spicata, Deschampsia flexuosa, Poa compressa, Schizachyrium scoparium*, or *Deschampsia caespitosa*. It also includes mafic bedrock outcrops also characterized by these grasses but also supporting ferns and forbs such as *Asplenium trichomanes, Adiantum aleuticum*, and *Cerastium arvense*. The combination of sloping sites and thin soil lead to poor water retention and droughty conditions.

[CEGL006544] *Schizachyrium scoparium - Danthonia spicata - Carex pensylvanica / Cladonia* spp. Grassland

Translated Name: **Little Bluestem - Poverty Oatgrass - Pennsylvania Sedge / Cup Lichen species Grassland**
Common Name: **Low- to Mid-Elevation Little Bluestem - Poverty Oatgrass Outcrop Opening**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	North-Central Appalachian Acidic Scrub & Grassland (G789)
Alliance	*Danthonia spicata - Deschampsia flexuosa - Deschampsia caespitosa* Bedrock Grassland Alliance (A3910)

Element Concept

Global Summary: These grassy openings are found on rock outcrops and summits at 365-1220 m (1200-4000 feet) elevation in the Central Appalachians and adjacent regions. Settings include flat summits, outcrops, plateaus and southwest-facing upper slopes. Bare rock (acidic sandstone and conglomerates) typically makes up a large part of the cover. *Danthonia spicata, Schizachyrium scoparium*, and *Deschampsia flexuosa* are all typical. Total herbaceous cover is usually 25-50%. Other associates include *Carex pensylvanica, Piptatherum pungens (= Oryzopsis pungens), Piptatherum racemosum (= Oryzopsis racemosa), Prunus pumila, Rumex acetosella, Rubus* spp., *Sibbaldiopsis tridentata, Cladonia* sp., and *Umbilicaria* sp. There may be small patches of shrubs within the graminoid matrix, including *Vaccinium* spp., *Gaylussacia baccata*, and *Photinia melanocarpa (= Aronia melanocarpa)*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: These grassy openings are found on rock outcrops and summits at 365-1,220 m (1,200-4,000 feet) elevation in the Central Appalachians and adjacent regions. Settings include flat summits, outcrops, plateaus and southwest-facing upper slopes. Bare rock (acidic sandstone and conglomerates) typically makes up a large part of the cover.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: These grassy openings are found on rock outcrops and summits at 202 to 417 m (662-1,368 feet) elevation. Sites are gentle to steep upper slopes and summits (ridgetop bedrock outcrops) with north or southeast aspects. Soils are dry to xeric, rapidly drained sandy loam. The unvegetated surface includes exposed bedrock often with lesser amounts of large/small rocks, bare soil, leaf litter and/or downed wood. Lichens may cover much of the rock surfaces. No evidence of disturbance was reported.
Global Environment: This association occurs on rock outcrops and summits at 365-1220 m (1200-4000 feet) elevation in the Central Appalachians and adjacent regions. Settings include flat summits, outcrops, plateaus and southwest-facing upper slopes. Bare rock (acidic sandstone and conglomerates) typically makes up a large part of the cover.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Schizachyrium scoparium, Danthonia spicata, Deschampsia flexuosa*, and *Carex pensylvanica* are characteristic herbs. There is high *Cladonia* spp. cover on exposed rocks. Other associates include *Carex pensylvanica, Piptatherum pungens (= Oryzopsis pungens), Piptatherum racemosum (= Oryzopsis racemosa), Prunus pumila, Rumex acetosella, Rubus* spp., *Sibbaldiopsis tridentata, Cladonia* sp., and *Umbilicaria* sp. There may be small patches of shrubs within the graminoid matrix, including *Vaccinium* spp., *Gaylussacia baccata*, and *Photinia melanocarpa (= Aronia melanocarpa)*.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Deschampsia flexuosa, Schizachyrium scoparium, Danthonia spicata, Carex pensylvanica, Dichanthelium boscii*, and *Potentilla simplex* are dominant and/or characteristic herbs. *Vaccinium pallidum, Gaylussacia baccata, Rubus flagellaris*, and *Quercus ilicifolia* are characteristic short shrubs. Tall shrubs may include *Amelanchier* spp. and *Prunus serotina*. There is high cover of *Cladonia* spp. on exposed rocks.
Global Vegetation: *Danthonia spicata, Schizachyrium scoparium*, and *Deschampsia flexuosa* are all typical. Total herbaceous cover is usually 25-50%. Other associates include *Carex pensylvanica, Piptatherum pungens (= Oryzopsis pungens), Piptatherum racemosum (= Oryzopsis racemosa), Prunus pumila, Rumex acetosella, Rubus* spp., *Sibbaldiopsis tridentata, Cladonia* sp., and *Umbilicaria* sp. There may be small patches of shrubs within the

graminoid matrix, including *Vaccinium* spp., *Gaylussacia baccata*, and *Photinia melanocarpa (= Aronia melanocarpa)*.
Global Dynamics: This type is probably fire-initiated.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (20-May-2011). Although an estimated 385 occurrences occupy 3600 acres rangewide, there are substantial threats to this association. Fire suppression and utility lines, including cell phone towers, and possibly wind turbines, threaten this vegetation throughout its range. Where trails cross these grasslands, trampling also poses a threat.

A3909 *Quercus ilicifolia - Photinia melanocarpa* Bedrock Shrubland Alliance

Alliance Summary Description: This alliance, ranging from Pennsylvania and New Jersey discontinuously to southeastern Canada, includes shrublands dominated by *Quercus ilicifolia* occurring on rock outcrops and summits. *Quercus ilicifolia* occurs with variable cover depending on site conditions. Associated shrubs include low *Comptonia peregrina, Gaylussacia baccata, Kalmia angustifolia, Photinia melanocarpa (= Aronia melanocarpa), Prunus pumila, Salix humilis*, and *Vaccinium* spp. Herbaceous species are generally sparse, but include *Arctostaphylos uva-ursi, Carex pensylvanica, Comandra umbellata, Corydalis sempervirens, Danthonia spicata, Deschampsia flexuosa, Gaultheria procumbens, Hypericum gentianoides, Melampyrum lineare, Pteridium aquilinum, Schizachyrium scoparium, Sibbaldiopsis tridentata (= Potentilla tridentata)*, plus *Andropogon gerardii* at some sites. Scattered trees are common and include species from the surrounding ridgetop forests.

[CEGL006121] *Quercus ilicifolia - Prunus pumila* Shrubland

Translated Name: **Bear Oak - Sandcherry Shrubland**
Common Name: **Ridgetop Bear Oak Barrens**

USNVC CLASSIFICATION

Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	North-Central Appalachian Acidic Scrub & Grassland (G789)
Alliance	*Quercus ilicifolia - Photinia melanocarpa* Bedrock Shrubland Alliance (A3909)

ELEMENT CONCEPT

Global Summary: This *Quercus ilicifolia* shrubland occurs on ridgetops, summits and rock outcrops in the northeastern United States. It occurs on extremely shallow, stable acidic soils over bedrock. Open bedrock is common. This shrubland is dominated by *Quercus ilicifolia*, which occurs with variable cover depending on site conditions. Associated shrubs include *Vaccinium angustifolium, Vaccinium pallidum, Comptonia peregrina, Kalmia angustifolia, Gaylussacia baccata, Photinia melanocarpa (= Aronia melanocarpa), Quercus prinoides*, and *Prunus pumila*. The herbaceous layer varies from sparse to well-developed depending on the density of shrub cover. Typical herbs include *Deschampsia flexuosa, Carex pensylvanica, Danthonia spicata, Schizachyrium scoparium, Pteridium aquilinum, Gaultheria procumbens, Comandra umbellata, Melampyrum lineare, Hypericum gentianoides, Corydalis*

sempervirens, Sibbaldiopsis tridentata (= Potentilla tridentata), plus *Andropogon gerardii* or *Polygonatum biflorum* at some sites. Scattered and stunted trees are common and include species from the surrounding ridgetop forests, such as *Quercus prinus, Quercus rubra, Quercus alba, Pinus rigida, Populus tremuloides, Betula populifolia*, and *Carya glabra*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This bear oak barrens community occurs along ridgelines from southern New England south to interior New Jersey and Pennsylvania at elevations ranging from 347-448 m (1,138-1,470 feet). Plots were sampled at Delaware Water Gap and in New York in the Lower New England project area. Sites are moderate to steep upper slopes and ridges with northwest, north and southwest aspects. Soils are rapidly drained silt loam. The unvegetated surface includes leaf litter or rocks (rock outcrop), with small amounts of downed wood, bare soil, exposed bedrock and large/small rocks. These sites may burn on a regular basis. Evidence of disturbance includes the presence of exotic plants.
Global Environment: This shrubland occurs on extremely shallow, stable acidic soils over bedrock, typically on ridges. Open bedrock is common. Fire is a secondary influence.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Quercus ilicifolia* is dominant and may be stunted; associated shrubs include *Vaccinium angustifolium, Vaccinium pallidum, Gaylussacia baccata, Photinia melanocarpa, Quercus prinoides*, and/or *Amelanchier arborea*. Typical herbs include *Deschampsia flexuosa, Carex pensylvanica, Danthonia spicata, Schizachyrium scoparium*, and/or *Pteridium aquilinum*.
Global Vegetation: This shrubland is dominated by *Quercus ilicifolia*, which occurs with variable cover depending on site conditions. Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (20-May-2011). There are an estimated 100-105 occurrences of this vegetation rangewide, occupying an area of 6200 acres. The open, exposed rocky summits that support this association are attractive for cell phone tower and wind turbine construction. In addition, recreational hikers pose a threat of trampling, although this is mitigated somewhat by the density of this vegetation. More inventory and documentation of this association are required to determine the conservation status rank.

RELATED CONCEPTS

Global Similar Types:
- *Quercus ilicifolia - Quercus prinoides* Scrub (CEGL006111)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: One of the Delaware Water Gap sites is an open woodland to shrubland on top of the Kittatinny Ridge, and probably burns on a regular basis. The trees are very stunted. It is similar to Red Oak / Heath Woodland Rocky Summit (CEGL006134) which has more tree cover.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.

Common Name: **Central Appalachian Heath Barrens**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	North-Central Appalachian Acidic Scrub & Grassland (G789)
Alliance	*Vaccinium angustifolium - Vaccinium pallidum* Rocky Heath Alliance (A4111)

ELEMENT CONCEPT

Global Summary: This shrubland community is restricted to high-elevation, acidic bedrock exposures in the Central Appalachians of eastern West Virginia and northwestern Virginia. It occurs on upper-slope and ridgetop outcrops, pavements, and clifftops of acidic bedrock (quartzite and granitic) at elevations from about 950 to 1460 m (3100-4800 feet). Surface cover of bedrock and loose boulders averages about 80% in plot samples, and soil development is minimal. These habitats have distinctly xeric moisture regimes and are subject to year-round microclimatic extremes, including high solar exposure and temperatures in summer, high winds, periodic ice, and low winter temperatures. *Kalmia latifolia, Gaylussacia baccata*, and *Vaccinium* spp. are codominant shrubs in variable proportions, with *Vaccinium angustifolium* the principal species of high-elevation sites (all >1200 m [4000 feet]) in West Virginia and *Vaccinium pallidum* the characteristic species of somewhat lower-elevation (950-1200 [3100-4000 feet]) sites in Virginia. Other woody plants occurring frequently in the type include *Menziesia pilosa, Sorbus americana, Photinia melanocarpa (= Aronia melanocarpa), Gaultheria procumbens, Hamamelis virginiana, Prunus pensylvanica, Ilex montana, Nemopanthus mucronatus* (West Virginia only), and extremely stunted (<3 m tall) *Betula alleghaniensis*. Herbaceous plants are typically very sparse, but occasional dense colonies of *Deschampsia flexuosa* occur on open ledges with thin mats of moss and organic matter. The vegetation is floristically quite depauperate and plot-sampled stands have a mean species richness of only 15 vascular taxa.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This heath barrens shrubland occurs on upper-slope and ridgetop outcrops, pavements, and clifftops of acidic bedrock (quartzite and granitic) at elevations from about 950 to 1,460 m (3,100-4,800 feet). It was sampled at three locations within in the corridor. The sites range from moderate to steep bedrock outcrops with northern aspects. Soils are rapidly drained. The unvegetated surface is dominated by leaf litter and exposed bedrock with some large and small rocks. Evidence of disturbance includes wind/ice damage and the presence of exotic plant species.

Global Environment: Stands occur on nearly level to steeply sloping (>30°) outcrops, pavements, and clifftops of acidic bedrock, including Tuscarora quartzite, charnockite, leucocharnockite, Old Rag granite, and sandstones of the Allegheny Formation and Pottsville group. Habitats are situated on upper slopes and summits with south to northwest aspects, at elevations ranging from about 950 to 1460 m (3100-4800 feet) in the Central Appalachians. Surface cover of bedrock and loose boulders averages about 80% in plot samples, and lichen cover on exposed rock surfaces is generally >75%. Soil development is minimal, consisting of localized crevices and mats of disintegrated rock and organic matter. These habitats have distinctly xeric moisture regimes and are subject to year-round microclimatic extremes, including high solar exposure and temperatures in summer, high winds, periodic ice, and low winter temperatures.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This heath barrens community is dominated by *Kalmia latifolia*. *Sorbus americana* and *Vaccinium* spp. are common in the shrub layer. *Menziesia pilosa* and *Prunus pensylvanica* may also be present. Herbaceous patches may be absent or sparse. When present, *Carex pensylvanica* and *Dennstaedtia punctilobula* are common herbs. This community also supports VA-state imperiled *Aralia hispida* and *Huperzia appalachiana*.

Global Vegetation: Total vegetation cover varies from <25% to >75% and consists of dense shrub thickets and small herbaceous mats among the exposed rocks. *Kalmia latifolia, Gaylussacia baccata*, and *Vaccinium* spp. are codominant shrubs in variable proportions, with *Vaccinium angustifolium* the principal species of high-elevation sites (all >1200 m [4000 feet]) in West Virginia and *Vaccinium pallidum* the characteristic species of somewhat lower-elevation (950-1200 m [3100-4000 feet]) sites in Virginia. Patch-dominance of these ericads may occur in pronounced zonation or in extremely dense, stratified mixtures. Other woody plants occurring frequently in the type include *Menziesia pilosa, Sorbus americana, Photinia melanocarpa (= Aronia melanocarpa), Photinia pyrifolia* (West Virginia only), *Gaultheria procumbens, Hamamelis virginiana, Prunus pensylvanica, Rubus hispidus* (West Virginia only), *Ilex montana, Nemopanthus mucronatus* (West Virginia only), and extremely stunted (<3 m tall) *Betula alleghaniensis*. Additional stunted trees occasionally found in this type at low cover include *Acer rubrum, Amelanchier laevis, Amelanchier sanguinea, Betula lenta, Picea rubens* (West Virginia only), *Pinus rigida, Pinus*

pungens, Rhododendron prinophyllum, Quercus rubra, and *Tsuga canadensis*. Herbaceous plants are typically very sparse, but occasional dense colonies of *Deschampsia flexuosa* occur on open ledges with thin mats of moss and organic matter. Other herbs that are sometimes important in this type are *Aralia nudicaulis, Lysimachia quadrifolia, Maianthemum canadense, Polypodium appalachianum, Pteridium aquilinum var. latiusculum, Carex pensylvanica, Dennstaedtia punctilobula, Melampyrum lineare, Lycopodium annotinum, Lycopodium dendroideum* (West Virginia only), *Polygonum cilinode, Oryzopsis asperifolia, Carex polymorpha, Aralia hispida*, and *Paronychia argyrocoma*. Species richness of 13 Virginia and West Virginia plot samples ranges from 5 to 22 taxa per 100 square meters (mean = 15).

Global Dynamics: There are few threats to this vegetation at remote sites. However, several Virginia occurrences on public lands (e.g., Old Rag Mountain and Mary's Rock in Shenandoah National Park) have been significantly impacted by heavy trampling at high-elevation overlooks near trails. In addition, susceptible lichen species may have been eliminated from these sites due to air pollution, but no baseline data are available to document this.

Global: *Kalmia latifolia*, *Vaccinium angustifolium*, *Vaccinium pallidum*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Aralia hispida* (G5, VA state-imperiled), *Huperzia appalachiana* (G5, VA state-imperiled); **Invasive/Exotic Plants**: *Rumex acetosella* (Medium/Low)
Global: Vulnerable Plants: *Aralia hispida* (G5, VA state-rare), *Carex polymorpha* (G3, VA & WV state-rare), *Minuartia groenlandica* (G5, VA state-rare), *Oryzopsis asperifolia* (G5, VA & WV state-rare)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (18-Oct-2006). This small-patch community is restricted to high-elevation, acidic bedrock exposures in the Central Appalachians of eastern West Virginia and northwestern Virginia. There are fewer than 10 known occurrences, and the potential range and habitat of this community are both extremely limited. In addition, at least three of the occurrences are on national park land and are located at popular destinations for hikers, which has lead to significant trampling impacts and soil mat removal.

RELATED CONCEPTS

Global Similar Types:
- *Kalmia latifolia - Gaylussacia (baccata, brachycera)* Cumberland Shrubland (CEGL008470) of Kentucky and possibly Virginia and Tennessee.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: See Global Comments.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Classification of this type is based on analysis of 13 plot samples from Virginia and West Virginia. This community has some affinities to various Southern Appalachian heath bald communities in floristics, structure, and general edaphic conditions, but lacks many of the characteristic Southern Appalachian species such as *Rhododendron carolinianum, Rhododendron catawbiense, Rhododendron calendulaceum, Leucothoe recurva, Pieris floribunda*, and *Leiophyllum buxifolium*. Species of northern affinity not found in

Southern Appalachian heath balds (*Nemopanthus mucronatus, Vaccinium angustifolium, Lycopodium annotinum, Aralia hispida, Carex polymorpha, Oryzopsis asperifolia*) further differentiate this community, both from Southern Appalachian heath bald communities and from Kentucky examples of *Kalmia latifolia - Gaylussacia baccata*-dominated vegetation.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was observed in Shenandoah National Park in Rappahannock County, Virginia. It was also sampled along the Appalachian Trail at Marys Rock and the Pinnacle in Virginia.
Global Range: The type is known from scattered sites in the Northern Blue Ridge, Ridge and Valley, and Allegheny Mountains of eastern West Virginia and northwestern Virginia and Allegheny Plateau physiographic province in Maryland.

[CEGL003958] *Vaccinium (angustifolium, myrtilloides, pallidum)* Central Appalachian Dwarf-shrubland

Translated Name: **(Lowbush Blueberry, Velvetleaf Huckleberry, Blue Ridge Blueberry) Central Appalachian Dwarf-shrubland**
Common Name: **Central Appalachian Blueberry Dwarf-shrubland**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	North-Central Appalachian Acidic Scrub & Grassland (G789)
Alliance	*Vaccinium angustifolium - Vaccinium pallidum* Rocky Heath Alliance (A4111)

ELEMENT CONCEPT

Global Summary: This association occurs on mid- to high-elevation acidic rock outcrops or summits and is characterized by abundant dwarf *Vaccinium* spp. in areas with frequent fire and/or droughty soils. This community is dominated by heaths or heath-like shrubs (typically blueberries *Vaccinium angustifolium, Vaccinium myrtilloides, Vaccinium stamineum, Vaccinium pallidum (= Vaccinium vacillans)*) and is commonly referred to as "heath barrens." Soils are shallow accumulations of organic material on bedrock habitats. Small trees may be present but are very sparse. The herbaceous layer is usually sparse with low diversity. In addition to *Vaccinium*, the shrub layer typically contains other low shrubs such as *Gaylussacia baccata, Kalmia angustifolia, Lyonia ligustrina*, and *Comptonia peregrina*, with *Kalmia latifolia* present in some areas. *Quercus ilicifolia* is frequently present, with variable cover, above the low heaths. Herbaceous plants scattered among the shrubs include *Deschampsia flexuosa, Schizachyrium scoparium, Carex pensylvanica, Carex argyrantha, Danthonia spicata, Piptatherum pungens (= Oryzopsis pungens), Lysimachia quadrifolia, Rubus hispidus, Melampyrum lineare, Solidago canadensis, Lycopodium dendroideum*, and *Lycopodium digitatum*. Mosses (including *Polytrichum* spp.) and lichens usually are present.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: These blueberry heath balds are found on northern or high-elevation acidic rock outcrops or summits. The sampled site is a somewhat steep, east-facing upper-slope rock outcrop with dry, rapidly drained soil. The unvegetated surface includes leaf litter, with small amounts of exposed bedrock and large/small rocks. No evidence of disturbance was reported.
Global Environment: These patchy communities are typically found on higher-elevation acidic rock outcrops or summits. Along with bedrock outcrops, ledges, summits of igneous or metamorphic rock, this association is sometimes found in depressions on valley floor frost pockets. Soils are shallow accumulations of organic material on bedrock habitats.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This shrubland is characterized by abundant dwarf *Vaccinium* spp. with *Gaylussacia baccata, Quercus ilicifolia*, and *Kalmia angustifolia*. Widely scattered trees, including *Betula lenta* and *Quercus prinus*, and tall shrubs such as *Prunus serotina* and *Rhus glabra* are possible along with the very dense heath shrubs. Herbs are sparse but may include *Carex pensylvanica* and *Schizachyrium scoparium*.
Global Vegetation: This dwarf-shrubland is dominated by locally dense *Vaccinium* (*Vaccinium angustifolium, Vaccinium stamineum*, and/or *Vaccinium pallidum (= Vaccinium vacillans)*. Scattered small individuals of *Pinus strobus, Pinus rigida, Prunus serotina*, and/or *Betula populifolia* may occur where soil has accumulated. The herbaceous layer is usually sparse with low diversity. In addition to *Vaccinium*, the shrub layer typically contains other shrubs such as *Gaylussacia baccata, Kalmia angustifolia, Lyonia ligustrina*, and *Comptonia peregrina*, with *Kalmia latifolia* present in some areas. *Quercus ilicifolia* is frequently present, with variable cover, above the low heaths. Herbaceous plants scattered among the shrubs include *Deschampsia flexuosa, Schizachyrium scoparium, Carex pensylvanica, Carex argyrantha, Danthonia spicata, Piptatherum pungens (= Oryzopsis pungens), Lysimachia quadrifolia, Rubus hispidus, Melampyrum lineare, Solidago canadensis, Lycopodium dendroideum*, and *Lycopodium digitatum*. Mosses (including *Polytrichum* spp.) and lichens usually are present.
Global Dynamics: Fire is an important natural disturbance agent, but some areas may be edaphically maintained.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Lower New England Project Area)

Stratum	Lifeform	Species
Short shrub/sapling	Broad-leaved deciduous shrub	*Gaylussacia baccata*, *Vaccinium stamineum*
Short shrub/sapling	Broad-leaved evergreen shrub	*Kalmia angustifolia*

Global

Stratum	Lifeform	Species
Tall shrub/sapling	Broad-leaved deciduous shrub	*Quercus ilicifolia*
Short shrub/sapling	Broad-leaved deciduous shrub	*Comptonia peregrina*, *Gaylussacia baccata*, *Vaccinium angustifolium*, *Vaccinium pallidum*
Short shrub/sapling	Broad-leaved evergreen shrub	*Kalmia angustifolia*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): *Carex pensylvanica*, *Gaylussacia baccata*, *Schizachyrium scoparium*, *Vaccinium stamineum*
Global: *Comptonia peregrina*, *Deschampsia flexuosa*, *Gaylussacia baccata*, *Kalmia latifolia*, *Lysimachia quadrifolia*, *Melampyrum lineare*, *Quercus ilicifolia*, *Vaccinium angustifolium*, *Vaccinium pallidum*

OTHER NOTEWORTHY SPECIES

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (4-Aug-2010). This association is distributed in the Central Appalachians and adjacent ecoregions, but does not appear to be abundant in any of the states in which it occurs.

RELATED CONCEPTS

Global Similar Types:
- *Gaylussacia baccata - Vaccinium pallidum - Vaccinium corymbosum* Shrubland (CEGL006622) occurs on sandy plains and often features taller vegetation.
- *Vaccinium angustifolium - Sorbus americana / Sibbaldiopsis tridentata* Dwarf-shrubland (CEGL005094)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: The site in New York does not have any rock outcrops and has a very dense heath layer with widely scattered trees.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type shares many species and the general environmental setting with *Vaccinium angustifolium - Sorbus americana / Sibbaldiopsis tridentata* Dwarf-shrubland (CEGL005094), but it lacks species of more northern affinity such as *Picea* spp., *Abies* spp., and *Sorbus* spp., and is not characterized by *Sibbaldiopsis tridentata*. It results from frequent fires and droughty soils, with cold climate having less effect than in CEGL005094. Areas with similar floristics but occurring on sandplains, generally with a history of anthropogenic disturbance, are covered in *Gaylussacia baccata - Vaccinium pallidum - Vaccinium corymbosum* Shrubland (CEGL006622). In Maryland, this type is associated with "sandstone glades" over Potsville sandstone formations of the Allegheny Plateau. Stands are positioned on bedrock pavement on upper slopes, ridges, and crests at 820-855 m (2700-2800 feet). They are characterized by dense heaths of *Vaccinium pallidum* and/or *Gaylussacia baccata*. *Vaccinium angustifolium* and *Kalmia latifolia* are present in 50% of plots with mean cover (N=4 plots) ranging from 10-25% and 5-10%, respectively. Also reported are stunted *Quercus prinus (= Quercus montana)* and *Nyssa sylvatica* at low cover, in addition to an occasional *Sorbus americana*. Mean species richness among four plots is 25, homoteneity is 0.780, and Bray-Curtis similarity is 0.541.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Black Mountain - Harriman State Park in New York.
Global Range: This association is known from the mid-Atlantic states of Maryland, New Jersey, Pennsylvania and West Virginia, extending north to the Catskills.
Nations: US
States/Provinces: MD, NJ, NY, PA:S1, WV:S2?
TNC Ecoregions: 49:P, 59:C, 60:C, 61:C
USFS Ecoregions (1994/95): 212Fa:CCC, 212Fb:CCP, 212Fc:CCC, 212Fd:CCC, 212Ga:CCC, 212Gb:CCC, 221Bd:CCC, 221Ea:CCC, 221Fa:CCC, M212Ea:CCP, M212Eb:CCP, M221Ac:CCC
Federal Lands: NPS (Appalachian Trail [Lower New England], Delaware Water Gap, Upper Delaware); USFS (Monongahela)

A3913 *Vaccinium angustifolium - Vaccinium pallidum* Sandy Heath Alliance

Alliance Summary Description: This northeastern U.S. heath barrens alliance of dry, sandy, nutrient-poor soils is dominated by low, usually heath shrubs such as *Gaylussacia baccata, Vaccinium angustifolium*, and *Vaccinium pallidum*, and other low shrubs such as *Arctostaphylos uva-ursi* and *Comptonia peregrina*. Characteristic herbs and forbs include *Carex lucorum, Carex pensylvanica, Ionactis linariifolius, Pteridium aquilinum, Schizachyrium scoparium*, and *Sericocarpus asteroides*.

[CEGL006622] *Gaylussacia baccata - Vaccinium pallidum - Vaccinium corymbosum* Shrubland

Translated Name: **Black Huckleberry - Blue Ridge Blueberry - Highbush Blueberry Shrubland**
Common Name: **Successional Heath Shrubland**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	North-Central Appalachian Acidic Scrub & Grassland (G789)
Alliance	*Vaccinium angustifolium - Vaccinium pallidum* Sandy Heath Alliance (A3913)

ELEMENT CONCEPT

Global Summary: This native successional ericaceous shrub community occurs in woodland and forest openings on acidic, coarse-textured soils that have been burned or cleared in the Northeast. Shrub height ranges from less than 0.5 m to 5 m in height. Species composition varies based on geography and moisture regime, but dominant shrubs typically include *Gaylussacia baccata, Vaccinium pallidum, Vaccinium corymbosum, Kalmia angustifolia*, and/or *Kalmia latifolia*. Associate shrubs may include some combination of the following species: *Photinia melanocarpa, Amelanchier canadensis, Leucothoe racemosa (= Eubotrys racemosa), Gaylussacia frondosa* (in southern examples), *Vaccinium myrtilloides, Vaccinium stamineum, Lyonia mariana, Ilex glabra, Quercus ilicifolia, Morella pensylvanica*, and *Clethra alnifolia*. *Smilax rotundifolia* and *Smilax glauca* may also be present. Scattered regeneration trees are typical with less than 10% cover; *Pinus rigida* is the most common tree associate. Herbs are uncommon due to the dense shrub cover and may include *Pteridium aquilinum, Carex pensylvanica, Gaultheria procumbens, Comptonia peregrina, Epigaea repens, Danthonia spicata*, and *Deschampsia flexuosa*. Mosses and lichens can be present in abundance in some examples. Non-native plants are uncommon in this community.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This native successional ericaceous shrub community was sampled once in southern Pennsylvania in the Central Appalachian project area on a moderate northwest-facing midslope with dry, well-drained silt loam soil under a transmission right-of-way. The unvegetated surface is dominated by leaf litter with a few small rocks. Evidence of disturbance includes the presence of powerlines and exotic plant species.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This community usually occurs on acidic soils that have been cleared or burned, such as forest openings or powerlines.

Global Environment: This native successional ericaceous shrub community occurs in woodland and forest openings on acidic, coarse-textured soils that have been burned or cleared in the Northeast. Shrub height ranges from less than 0.5 m to 5 m in height.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This successional shrubland is dominated by native heath shrubs including *Gaylussacia* spp., *Vaccinium* spp. (including *Vaccinium stamineum*), and *Kalmia latifolia*. *Smilax rotundifolia, Comptonia peregrina*, and *Photinia melanocarpa* are also common. *Dennstaedtia punctilobula* is the dominant herb.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The dominant shrubs typically include *Gaylussacia baccata*, *Nemopanthus mucronatus,* and *Alnus incana. Calamagrostis canadensis* is a common herb.

Global Vegetation: Species composition varies based on geography and moisture regime, but dominant shrubs typically include *Gaylussacia baccata, Vaccinium pallidum, Vaccinium corymbosum, Kalmia angustifolia*, and/or *Kalmia latifolia*. Associate shrubs may include some combination of the following species: *Photinia melanocarpa, Amelanchier canadensis, Leucothoe racemosa (= Eubotrys racemosa), Gaylussacia frondosa* (in southern examples), *Vaccinium myrtilloides, Vaccinium stamineum, Lyonia mariana, Ilex glabra, Quercus ilicifolia, Morella pensylvanica*, and *Clethra alnifolia*. *Smilax rotundifolia* and *Smilax glauca* may also be present. Scattered regeneration trees are typical with less than 10% cover, and tree species vary from north to south (i.e., *Pinus rigida* in New Jersey and *Picea mariana* in Maine). Herbs are uncommon due to the dense shrub cover and may include *Pteridium aquilinum, Carex pensylvanica, Gaultheria procumbens, Comptonia peregrina, Epigaea repens, Danthonia spicata*, and *Deschampsia flexuosa*. Mosses and lichens can be present in abundance in some examples. Non-native plants are uncommon in this community.

Global Dynamics: This successional community regenerates from fire, clearing, or cutting. The dense cover of shrubs can limit the establishment of herbs and small tree seedlings. However, this community may be relatively short-lived as it gradually succeeds to forest over time unless managed. These barrens provide habitat for the upland sandpiper, whimbrel, and short-eared owl.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Cirsium vulgare* (Medium/Low), *Rumex acetosella* (Medium/Low), *Verbascum thapsus* (Medium)
Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (23-Nov-2009). This is a successional community that arises from anthropogenic disturbance. New York ranks it as G4S4.

RELATED CONCEPTS

Global Similar Types:

- *Elaeagnus umbellata - Cornus racemosa - Rosa multiflora - Juniperus virginiana* Ruderal Shrubland (CEGL006451) has more non-native shrubs.
- *Gaylussacia baccata - Vaccinium angustifolium - Arctostaphylos uva-ursi / Schizachyrium littorale* Dwarf-shrubland (CEGL006066) comprised of dwarf-shrubs and influenced by onshore winds and salt spray in coastal settings.
- *Vaccinium (angustifolium, myrtilloides, pallidum) - Cladina rangiferina* Dwarf-shrubland (CEGL006426) is more northern and with *Picea mariana* as the common tree associate.
- *Vaccinium (angustifolium, myrtilloides, pallidum)* Central Appalachian Dwarf-shrubland (CEGL003958) is floristically similar but on rocky hilltops.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community can be distinguished from Northeastern Ruderal Shrubland (CEGL006451) by the dominance of native ericaceous shrubs.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Without continual intervention by the electric company, the site would return to a native oak-heath forest type.
Global Classification Comments: Described from quick point data collected in New Jersey. Although this association is placed in a dwarf-shrubland alliance, this community is a taller shrubland.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled in Franklin County, Pennsylvania.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: No data are available.
Global Range: This shrubland has been documented from southern Maine to Pennsylvania and west to New York.

G657. SOUTHERN APPALACHIAN GRASS BALD

Group Summary Description: These densely vegetated herbaceous communities are found in the highest elevational zone of the Southern Appalachians, generally above 1524 m (5000 feet) but occasionally to 1220 m (4000 feet), and at slightly lower elevations at its northern limit in Virginia and West Virginia. The vegetation consists of dense herbaceous cover characteristically dominated by *Danthonia compressa* or *Carex* spp. Extensive areas have become dominated by *Rubus allegheniensis* and by mixtures of native grasses and exotic pasture grasses. Most examples of grassy balds have some invading shrubs and trees, often dense enough to threaten the herbaceous vegetation. The combination of high-elevation, non-wetland sites and dense herbaceous vegetation without appreciable rock outcrop conceptually distinguish this group from all others in the Southern Appalachians. However, the widespread areas of degraded spruce-fir with grass and/or shrub cover and the invasion of grassy balds by trees blur the distinction somewhat.

A2026 *Carex pensylvanica - Danthonia compressa - Hypericum mitchellianum* Grass Bald Alliance

Alliance Summary Description: This alliance includes montane grasslands dominated by *Danthonia compressa* and/or *Carex pensylvanica*. Some examples have significant cover of *Sibbaldiopsis tridentata* or *Rhododendron calendulaceum*. Species dominance is highly variable among and within occurrences. Associated species can include *Carex brunnescens, Carex debilis, Deschampsia flexuosa, Houstonia serpyllifolia, Oclemena acuminata (= Aster acuminatus), Prenanthes roanensis, Smilax herbacea, Solidago glomerata*, and *Stachys clingmanii*. Other associated species include *Ageratina altissima var. roanensis, Angelica triquinata, Bromus pubescens, Dennstaedtia punctilobula, Fragaria virginiana, Helenium autumnale*, and *Polytrichum commune*. The exotic *Rumex acetosella* may also be present. Typical shrubs are *Menziesia pilosa, Pieris floribunda, Rhododendron calendulaceum, Rhododendron catawbiense, Rubus canadensis, Vaccinium corymbosum*, and *Vaccinium simulatum*. Examples dominated by *Carex pensylvanica* are typically ungrazed grass balds with deep soil, and lack significant shrub cover. Grasslands in this alliance occur at the highest elevations of the southern Appalachian Mountains, often adjacent to montane shrublands or dwarfed forests dominated by *Fagus grandifolia* or *Quercus rubra*. These grasslands occur at high elevations (usually above 1200-1500 m [4000-5000 feet]) in the Southern Blue Ridge, often on south- to southwest-facing domes, ridgetops and gentle slopes. Strong winds, high rainfall, frequent fog, shallow, rocky soils, and extremes of temperature and moisture are characteristic of these environments.

[CEGL004094] *Carex pensylvanica* Grassland

Translated Name: **Pennsylvania Sedge Grassland**
Common Name: **Grassy Bald (Sedge Type)**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Southern Appalachian Grass Bald (G657)
Alliance	*Carex pensylvanica - Danthonia compressa - Hypericum mitchellianum* Grass Bald Alliance (A2026)

Element Concept

Global Summary: This association represents montane grasslands occurring over 1220 m (4000 feet) elevation in the southern Appalachian Mountains dominated by *Carex pensylvanica*. Associated species include *Carex debilis, Polytrichum commune, Helenium autumnale, Danthonia compressa, Sibbaldiopsis tridentata, Fragaria virginiana, Ageratina altissima var. roanensis, Angelica triquinata, Oclemena acuminata (= Aster acuminatus), Bromus pubescens*, *Dennstaedtia punctilobula,* and *Rumex acetosella* (exotic). Woody species such as *Rhododendron catawbiense, Pieris floribunda, Rubus canadensis*, and *Robinia hispida*, may have sparse coverage in some occurrences.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation grassy bald community generally occurs above 1,220 m (4,000 feet) elevation (but rarely down to 1,065 m [3,500 feet]). Sampled sites are gentle northwest- and west-facing ridgetops with mesic, well-drained loam and sandy loam soil. The unvegetated surface is dominated by a thick layer of leaf litter with some downed wood and rocks. Evidence of disturbance includes a catastrophic fire around the mid-1930s, trails, wind/ice damage, and possible impacts from ozone and nitrogen deposition.
Global Environment: Montane grasslands over 1220 m (4000 feet) elevation in the southern Appalachian Mountains.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This community is defined by its dense (up to 90% cover) herbaceous layer dominated by *Carex* spp., including *Carex debilis var. rudgei, Carex intumescens*, and particularly *Carex pensylvanica*. Additional common and/or abundant herbs include *Dennstaedtia punctilobula, Dryopteris campyloptera*, and *Luzula acuminata var. carolinae*. However, in addition, there may be a sparse (10%) emergent tree layer and/or fairly dense shrub layer that can include *Acer rubrum, Ilex montana, Magnolia fraseri, Picea rubens, Prunus pensylvanica*, and/or *Vaccinium simulatum*. This community also supports TN-state imperiled *Dicranodontium asperulum*.
Global Vegetation: This grassland is dominated by *Carex pensylvanica*. Associated species include *Carex debilis, Polytrichum commune, Helenium autumnale, Danthonia compressa, Sibbaldiopsis tridentata, Fragaria virginiana, Ageratina altissima var. roanensis, Angelica triquinata, Oclemena acuminata (= Aster acuminatus), Bromus pubescens, Dennstaedtia punctilobula*, and *Rumex acetosella* (exotic). Woody species, such as *Rhododendron catawbiense, Pieris floribunda, Rubus canadensis*, and *Robinia hispida*, may have sparse coverage in some occurrences.

Most Abundant Species

Appalachian National Scenic Trail (Southern Blue Ridge Project Area)

Stratum	Lifeform	Species
Shrub/sapling (tall & short)	Broad-leaved deciduous shrub	*Ilex montana*
Herb (field)	Graminoid	*Carex debilis* var. *rudgei*, *Carex intumescens*, *Carex pensylvanica*

Global

Stratum	Lifeform	Species
Herb (field)	Graminoid	*Carex pensylvanica*

Characteristic Species

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Carex pensylvanica*
Global: *Carex pensylvanica*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Dicranodontium asperulum* (G4G5, TN state-imperiled)
Global: Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Erythronium umbilicatum* ssp. *monostolum* (G5T3), *Gentiana austromontana* (G3), *Geum geniculatum* (G2), *Hypericum graveolens* (G3), *Hypericum mitchellianum* (G3), *Krigia montana* (G3), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic); **Invasive/Exotic Plants**: *Rumex acetosella* (Medium/Low)

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (15-Dec-1994). This community is known from the highest elevations of the southern Appalachian Mountains. It has a small range, few occurrences, and is rapidly disappearing due to vegetational succession. This community supports a diverse flora with many rare, unusual, and threatened species. It is threatened by high levels of recreational use and the introduction of exotic plant and animal species, and by successional trends of uncertain cause.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This community is a less common grassy bald type, with similar species as Grassy Bald (Southern Grass Type) (CEGL004242) but with *Carex pensylvanica* dominant. Small patches (below MMU) of *Carex* spp. may represent inclusions. (Not all *Carex* is *Carex pensylvanica*.)
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: A *Carex pensylvanica*-dominated grassy bald. Relatively high cover of forest trees and shrubs suggests successional advance toward forest is well underway.
Global Classification Comments: Three plots from Roan Mountain were classified as this association in the Appalachian Trail project (Fleming and Patterson 2009a), although two of the plots capture shrublands (heath thickets) with dense *Carex* below, or heath bald / grass bald transition areas. Species with a 100% constancy in the three plots include *Acer rubrum, Carex debilis var. rudgei, Carex pensylvanica, Dennstaedtia punctilobula, Ilex montana, Picea rubens, Prunus pensylvanica*, and *Vaccinium simulatum*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Documented along and near AT only from Unaka Mountain in Unicoi County, Tennessee.
Global Range: This community is known from the highest elevations of the southern Appalachian Mountains of North Carolina and Tennessee.
Nations: US
States/Provinces: NC:S1, TN
TNC Ecoregions: 51:C
USFS Ecoregions (1994/95): M221Dc:CCC, M221Dd:CC?

Translated Name: **Flattened Oatgrass - (Shrubby Fivefingers) Grassland**
Common Name: **Grassy Bald (Southern Grass Type)**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Southern Appalachian Grass Bald (G657)
Alliance	*Carex pensylvanica - Danthonia compressa - Hypericum mitchellianum* Grass Bald Alliance (A2026)

Element Concept

Global Summary: This community consists of graminoid-dominated vegetation with scattered shrubs, occurring on moderate to high-elevation peaks and saddles in the Southern Blue Ridge. Characteristically, this vegetation is strongly dominated by *Danthonia compressa*, or in some areas codominated by the subshrub *Sibbaldiopsis tridentata (= Potentilla tridentata)*. Other characteristic herbaceous species are *Angelica triquinata, Carex pensylvanica, Carex debilis, Carex intumescens, Carex brunnescens, Deschampsia flexuosa, Erythronium umbilicatum ssp. monostolum, Gentiana austromontana, Gentianella quinquefolia, Houstonia serpyllifolia, Ionactis linariifolius (= Aster linariifolius), Lysimachia quadrifolia, Oclemena acuminata (= Aster acuminatus), Potentilla canadensis, Prenanthes roanensis, Smilax herbacea, Solidago bicolor, Solidago glomerata, Stachys clingmanii*, and *Trautvetteria caroliniensis var. caroliniensis*. The floristic composition is a mixture of widespread species, northern disjunct species, such as *Agrostis mertensii, Carex siccata (= Carex aenea), Minuartia groenlandica, Packera schweinitziana (= Senecio schweinitzianus)*, and *Sibbaldiopsis tridentata*, and Southern Appalachian endemics, such as *Erythronium umbilicatum ssp. monostolum, Geum geniculatum, Geum radiatum, Houstonia serpyllifolia, Lilium grayi, Prenanthes roanensis, Solidago glomerata*, and *Stachys clingmanii*). Typical shrubs (which may occur as scattered individuals or as patches) are *Rhododendron calendulaceum, Rhododendron catawbiense, Menziesia pilosa, Vaccinium corymbosum*, and *Rubus canadensis*. Species indicative of past grazing include *Phleum pratense, Agrostis gigantea, Hieracium scabrum, Rumex acetosella*, and *Prunella vulgaris*. This community occurs on high-elevation (usually above 1350 m [4500 feet]), often south- to southwest-facing domes, ridgetops, and gentle slopes. Strong winds, high rainfall, frequent fog, shallow rocky soils, and extremes of temperature and moisture are characteristic of these environments. It is known from the highest elevations of the southern Appalachian Mountains. It is typically surrounded by dwarfed forests dominated by *Fagus grandifolia* or *Quercus rubra*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation grassy bald community generally occurs above 1,220 m (4,000 feet) elevation (but rarely down to 1,065 m [3,500 feet]). Sampled sites range from moderate to steep upper slopes and ridgetops with dry to mesic, rapidly drained to moderately well-drained loam and sandy loam soil. The unvegetated surface may be dominated by leaf litter or may be a mix of leaf litter, exposed bedrock, large/small rocks, and bare soil. These sites were likely historically grazed by sheep or cattle. Evidence of disturbance includes past fire (natural and prescribed), erosion, trails, wind/ice damage, frost heave, and the presence of exotic plants.

Global Environment: This community occurs on high-elevation (usually above 1350 m [4500 feet]), often south- to southwest-facing domes, ridgetops, and gentle slopes. Strong winds, high rainfall, frequent fog, shallow rocky soils, and extremes of temperature and moisture are characteristic of these environments. In North Carolina and Tennessee, this grassland vegetation is typically surrounded by dwarfed forests dominated by *Fagus grandifolia* or *Quercus rubra*. On Whitetop Mountain, Virginia, the type occurs at elevations from 1525-1655 m (5000-5430 feet), adjacent to both well-developed *Picea rubens*-dominated forests and stunted northern hardwoods. Soils are extremely acidic (pH = 3.8), with low (5%) base saturation, high aluminum levels (1600 ppm), and relatively high (27%) organic matter content.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This is the most common naturally occurring grassy bald type in the corridor. It usually has a high percentage of *Danthonia compressa*, though this grass may not be evident at all seasons of the year. Other native species that may be present include *Sibbaldiopsis tridentata* (VA- and TN-state imperiled), *Angelica triquinata, Carex pensylvanica, Carex debilis var. rudgei, Dennstaedtia punctilobula, Deschampsia flexuosa, Gentiana austromontana, Oclemena acuminata, Gentianella quinquefolia, Houstonia serpyllifolia, Lysimachia quadrifolia, Packera schweinitziana, Potentilla canadensis, Prenanthes roanensis, Solidago bicolor, Solidago glomerata, Stachys clingmanii, Saxifraga michauxii*,

and *Solidago rugosa*. There may also be a sparse shrub layer that can include *Rubus canadensis* or *Vaccinium pallidum*. This community also supports TN-state critically imperiled *Alnus viridis ssp. crispa, Carex folliculata*, and *Minuartia groenlandica* and TN-state imperiled *Hypericum mitchellianum*.

Global Vegetation: This vegetation is graminoid-dominated with scattered shrubs. Most occurrences are strongly dominated by *Danthonia compressa*, but some sites are codominated by the subshrub *Sibbaldiopsis tridentata (= Potentilla tridentata)*. Other characteristic herbaceous species are *Angelica triquinata, Carex pensylvanica, Carex debilis var. rudgei, Carex intumescens, Carex brunnescens ssp. sphaerostachya, Deschampsia flexuosa, Erythronium umbilicatum ssp. monostolum, Gentiana austromontana, Gentianella quinquefolia, Houstonia serpyllifolia, Ionactis linariifolius (= Aster linariifolius), Lysimachia quadrifolia, Oclemena acuminata (= Aster acuminatus), Potentilla canadensis, Prenanthes roanensis, Smilax herbacea, Solidago bicolor, Solidago glomerata, Stachys clingmanii*, and *Trautvetteria caroliniensis var. caroliniensis*. The floristic composition is a mixture of widespread species, northern disjunct species such as *Sibbaldiopsis tridentata*; and Southern Appalachian endemics such as *Houstonia serpyllifolia, Lilium grayi*, and *Prenanthes roanensis*. Typical shrubs, which may occur as scattered individuals or patches are *Rhododendron calendulaceum, Rhododendron catawbiense, Menziesia pilosa, Vaccinium corymbosum*, and *Rubus canadensis*. Invasive, introduced species indicative of past grazing include *Phleum pratense, Agrostis gigantea, Hieracium caespitosum, Poa compressa, Rumex acetosella*, and *Prunella vulgaris*.

In the least disturbed, most natural areas, the most abundant or characteristic herbaceous associates are *Carex brunnescens ssp. sphaerostachya, Carex debilis var. rudgei, Lysimachia quadrifolia, Dennstaedtia punctilobula, Carex pensylvanica, Potentilla canadensis, Prenanthes roanensis, Solidago rugosa, Ageratina altissima var. roanensis*, and *Hypericum mitchellianum*. Despite the exposed topography, atmospheric conditions create a very moist microclimate, as evidenced by large populations of species often associated with wetlands, including *Helenium autumnale, Packera aurea, Houstonia serpyllifolia, Solidago patula*, and *Carex intumescens*.

Rare or northern disjunct plant species reported from this community include *Agrostis mertensii, Alnus viridis ssp. crispa, Botrychium multifidum, Calamagrostis canadensis, Carex siccata (= Carex aenea), Carex cristatella, Carex misera, Delphinium exaltatum, Gentiana austromontana, Geum geniculatum, Houstonia purpurea var. montana, Huperzia selago, Hypericum buckleii, Lilium grayi, Lilium philadelphicum, Lycopodium dendroideum, Lycopodium hickeyi, Minuartia groenlandica, Monarda media, Phlox subulata, Platanthera grandiflora, Poa palustris, Prenanthes roanensis, Rhododendron cumberlandense, Rhododendron vaseyi, Packera schweinitziana (= Senecio schweinitzianus), Spiranthes ochroleuca*, and *Trisetum spicatum* (Schafale and Weakley 1990). Exotic species that occur, probably as a result of grazing, include *Prunella vulgaris, Phleum pratense*, and *Poa compressa*.

Global Dynamics: The origin and ecological dynamics of this vegetation type are not clear. Several disturbance mechanisms, both natural and anthropogenic, have been hypothesized, including fire, grazing, trampling, clearing, climatic change, windthrow, or some combination of these influences. The importance of megaherbivores in long-term bald maintenance has recently been proposed (Wiegl and Knowles 1999). It appears that new occurrences of this community are not being created, and that many existing ones are being encroached by shrub and tree species. The presence of northern disjunct species requiring open habitat suggests that some of these areas have been open since the Pleistocene. This is the case at Whitetop Mountain, Virginia, although there is little question that the original openings were greatly expanded during a long history of grazing and the development of a 19th century resort. A. Weakley (pers. comm. 2001) suggests that the balds of Roan Mountain, Tennessee, are primarily natural, whereas those farther north are of anthropogenic origin.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Abies fraseri* (G2, globally imperiled & TN-state critically imperiled), *Alnus viridis* ssp. *crispa* (G5T5, TN state-critically imperiled), *Carex folliculata* (G5, TN state-critically imperiled), *Hypericum mitchellianum* (G3, TN state-imperiled), *Minuartia groenlandica* (G5, TN state-critically imperiled), *Prenanthes roanensis* (G3), *Sibbaldiopsis tridentata* (G5, TN state-critically imperiled); **Invasive/Exotic Plants**: *Hieracium caespitosum* (Medium/Insignificant, invasive/exotic), *Phleum pratense* (Medium, invasive/exotic), *Potentilla inclinata* (invasive/exotic), *Rumex acetosella* (Medium/Low, invasive/exotic)
Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Agrostis mertensii* (G5, rare or northern disjunct), *Allium allegheniense* (G3?), *Alnus viridis* ssp. *crispa* (G5T5, rare or northern disjunct), *Botrychium multifidum* (G5, rare or northern disjunct), *Calamagrostis canadensis* (G5, rare or northern disjunct), *Carex cristatella* (G5, rare or northern disjunct), *Carex misera* (G3, rare or northern disjunct), *Carex siccata* (G5, rare or northern disjunct), *Cuscuta rostrata* (G4, VA state-rare), *Delphinium exaltatum* (G3, rare or northern disjunct), *Erythronium umbilicatum* ssp. *monostolum* (G5T3), *Gentiana austromontana* (G3), *Geum geniculatum* (G2), *Geum radiatum* (G2, Southern Appalachian endemic), *Houstonia purpurea* var. *montana* (G5T2, Southern Blue Ridge endemic), *Huperzia selago* (G5, rare or northern disjunct), *Hypericum buckleii* (G3, Southern Blue Ridge endemic), *Hypericum graveolens* (G3), *Hypericum mitchellianum* (G3), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Lilium philadelphicum* (G5, rare or northern disjunct), *Lycopodium dendroideum* (G5, rare or northern disjunct), *Lycopodium hickeyi* (G5, rare or northern disjunct), *Minuartia groenlandica* (G5, rare or northern disjunct), *Monarda media* (G4?, rare or northern disjunct), *Packera schweinitziana* (G5?, Rare or northern disjunct), *Phlox subulata* (G5, rare or northern disjunct), *Platanthera grandiflora* (G5, rare or northern disjunct), *Poa palustris* (G5, rare or northern disjunct), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Rhododendron cumberlandense* (G4?, rare or northern disjunct), *Rhododendron vaseyi* (G3, NC/Southern Blue Ridge endemic), *Solidago glomerata* (G3), *Spiranthes ochroleuca* (G4, rare or northern disjunct), *Stachys clingmanii* (G2), *Trisetum spicatum* (G5, rare or northern disjunct), *Vaccinium hirsutum* (G3); **Invasive/Exotic Plants**: *Agrostis gigantea* (Medium/Low), *Agrostis stolonifera* (Medium/Low), *Hieracium caespitosum* (Medium/Insignificant), *Phleum pratense* (Medium), *Poa compressa* (High/Low), *Prunella vulgaris* (weedy native), *Rumex acetosella* (Medium/Low); **Other Plants**: *Huperzia appalachiana* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (14-Dec-1998). This community has small range, few occurrences, and is rapidly disappearing due to vegetational succession. This community is threatened by high levels of recreational use and the introduction of exotic plant and animal species, as well as by successional trends of uncertain cause.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Some examples may contain *Phleum pratense*, but these should not be confused with *Phleum*-dominated pastures or hayfields of anthropogenic origin at lower elevations [see Grazed Montane Grassland / Fire Meadow (CEGL004018)]. Some examples may have tall herbs, *Rubus* spp., or other shrubs at less than 25% cover, perhaps confounding the determination and/or signature.
Global Classification Comments: Notable examples include various peaks of the Roan Mountain complex, Long Hope Valley, Shining Rock Wilderness, and Great Smoky Mountains National Park. The origin of this community is not clear, and in fact, several mechanisms, both natural and anthropogenic, have been proposed including fire, grazing, trampling, clearing, climatic change, windthrow, or some combination of these influences. The presence of northern disjunct species requiring open habitat may suggest that some of these areas have been open since the Ice Age. A. Weakley (pers. comm.) suggests that the balds of Roan Mountain, Tennessee, are primarily natural, whereas those farther north are of anthropogenic origin. It appears that new occurrences of this community are not being created, and those that exist are being encroached by shrub and tree species. Lindsay (1976) reported that examples of this community in Great Smoky Mountains National Park will have disappeared by the end of the century if management is not undertaken to halt invasion by woody plants. However, these balds are among those most likely to be of anthropogenic origin. Six plots from Roan Mountain, Whitetop Mountain, and Gregory Bald were classified as this association in the Appalachian Trail project (Fleming and Patterson 2009a). Several plots have high cover by shrubs (*Amelanchier laevis, Rhododendron catawbiense, Rubus canadensis, Vaccinium corymbosum, Vaccinium erythrocarpum, Vaccinium pallidum*) indicating woody encroachment or plot placement in an ecotone. Species that have $\geq$67% constancy are, in order of descending constancy, *Danthonia compressa, Sibbaldiopsis tridentata, Dennstaedtia punctilobula, Carex debilis var. rudgei, Rubus canadensis, Rumex acetosella*, and *Saxifraga michauxii*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled at three locations along and near the AT, from Whitetop Mountain (Virginia) to Great Smoky Mountains National Park in Tennessee.
Global Range: This montane sparse dwarf-shrubland is found in the high mountain areas of the Southern Appalachians. While the majority of examples occur in North Carolina, this community is also known from Tennessee and Virginia.

A0930 *Rubus allegheniensis - Rubus canadensis* Shrubland Alliance

Alliance Summary Description: This alliance encompasses *Rubus*-dominated areas at high elevations in the Southern Blue Ridge, as well as related stands dominated by *Prunus pensylvanica*. This includes grassy balds (open montane grasslands), areas where the balsam woolly adelgid has caused *Abies fraseri* death, or other disturbed areas such as landslide scars that create open conditions. Stands of this alliance are dominated by *Rubus allegheniensis, Rubus canadensis*, and *Rubus idaeus ssp. strigosus*. Examples in otherwise grassy balds may also contain trace amounts of other species from adjacent grasslands, such as *Athyrium filix-femina ssp. asplenioides, Agrostis perennans, Angelica triquinata, Carex debilis var. rudgei, Carex brunnescens, Carex intumescens (= var. fernaldii)*, and *Rumex acetosella* (exotic). Successional stands at high elevation resulting from severe disturbance of spruce-fir forests (i.e., balsam woolly adelgid-affected stands), as well as exposed sites with other frequent, natural disturbance (such as shrub invasion of grazed fire meadows), may contain dense *Athyrium filix-femina ssp. asplenioides* and *Solidago glomerata* (on more protected sites). Scattered living trees and shrubs of *Amelanchier laevis, Betula alleghaniensis, Picea rubens, Prunus pensylvanica*, and *Sorbus americana* may occur.

[CEGL003892] *Rubus allegheniensis - Rubus canadensis / Carex pensylvanica* Shrubland

Translated Name: **Allegheny Blackberry - Smooth Blackberry / Pennsylvania Sedge Shrubland**
Common Name: **Southern Appalachian Blackberry Bald**

USNVC Classification

Group	Southern Appalachian Grass Bald (G657)
Alliance	*Rubus allegheniensis* - *Rubus canadensis* Shrubland Alliance (A0930)

Element Concept

Global Summary: Areas within open montane grasslands dominated by *Rubus* spp. (*Rubus allegheniensis* and/or *Rubus canadensis*) at high elevations in the Southern Blue Ridge. These shrublands also contain trace amounts of other species from the surrounding grassland, such as *Athyrium filix-femina ssp. asplenioides, Agrostis perennans, Angelica triquinata, Carex debilis var. rudgei, Carex brunnescens, Carex intumescens (= var. fernaldii)*, and *Rumex acetosella* (exotic).

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: These blackberry thickets are found at high elevation (above 1,525 m [5,000 feet]), adjacent to or interspersed with natural grasslands. They arise from successional processes on natural grass balds following grazing or natural processes such as fire.
Global Environment: This deciduous shrubland typically occurs at elevations from 1500-1980 m (5000-6500 feet). The developmental and ecological dynamics of this vegetation are poorly understood. Occurrences are thought to result from successional processes on natural grass balds following grazing and other disturbances, or following the cessation of natural disturbance regimes (e.g., periodic fires). Habitats are in exposed, upper-slope to crest positions, where low winter temperatures, high winds, and ice storms are characteristic. Stands occur both on edges of the natural bald on Whitetop Mountain, and in artificial balds that resulted from intensive logging, fires, and grazing on Mount Rogers and Wilburn Ridge.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: These blackberry thickets are composed of *Rubus canadensis* and/or *Rubus allegheniensis*.
Global Vegetation: These shrublands are dominated by *Rubus allegheniensis* and *Rubus canadensis*, usually occurring within and on the edges of open montane grasslands at high elevations in the Southern Blue Ridge. Stands may contain large colonies of *Carex pensylvanica* under the dominant shrubs, as well as scattered individuals of other species from the surrounding grassland, such as *Athyrium filix-femina ssp. asplenioides, Agrostis perennans, Angelica triquinata, Carex debilis var. rudgei, Carex brunnescens ssp. sphaerostachya, Carex intumescens*, and

Rumex acetosella (exotic). Virginia examples of this community are heavily dominated by *Rubus canadensis* and contain a wide variety of minor associates.

CONSERVATION STATUS RANK

Global Rank & Reasons: GNR (6-Jan-2016). This community is known from the highest elevations of the southern Appalachian Mountains. It has a small range, few occurrences, and is rapidly disappearing due to vegetational succession. This community supports a diverse flora with many rare, unusual, and threatened species. It is threatened by high levels of recreational use, by the introduction of exotic plant and animal species, and by successional trends of uncertain cause. Sometimes this montane shrubland is regarded as a more advanced successional stage of *Carex pensylvanica* Grassland (CEGL004094) or *Danthonia compressa - (Sibbaldiopsis tridentata)* Grassland (CEGL004242). This modified vegetation is now a natural part of high-elevation landscapes in the Southern Blue Ridge and an important part of the functioning landscape, providing habitat for many Southern Appalachian species. For conservation planning purposes, examples of this community may be best considered lower quality occurrences of CEGL004094 or CEGL004242.

RELATED CONCEPTS

Global Similar Types:

- *Rubus canadensis - (Rubus idaeus ssp. strigosus) / Athyrium filix-femina - Solidago glomerata* Shrubland (CEGL003893) results from natural disturbance at higher elevations.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This community occurs only at the highest elevations of the Southern Appalachians in North Carolina, Tennessee, and Virginia. Occurrences in Virginia are known only from the upper slopes of Whitetop Mountain, Mount Rogers, and Wilburn Ridge in the Southern Blue Ridge.
Global Classification Comments: This vegetation type is thought to result from successional processes on natural grass balds following grazing and other disturbances, or following the cessation of natural disturbance regimes (e.g., periodic fires). This vegetation is now a natural part of high-elevation landscapes in the Southern Blue Ridge and an important part of the functioning landscape, but it is not a conservation target in and of itself.

Group	Southern Appalachian Grass Bald (G657)
Alliance	*Rubus allegheniensis - Rubus canadensis* Shrubland Alliance (A0930)

ELEMENT CONCEPT

Global Summary: This vegetation occurs at high elevations in the southern Appalachian Mountains of North Carolina, Tennessee, and Virginia. It is a successional type found on exposed sites with frequent or intense natural disturbances (such as shrub invasion of grazed fire meadows). Some examples result from severe disturbance of spruce-fir forests (including balsam woolly adelgid-affected stands and stands which were severely burned after logging). It occurs on exposed summits and high slopes, typically at elevations over 1830 m (6000 feet), but slightly lower in Virginia. This community includes high-elevation Appalachian *Rubus* thickets and differs from *Rubus* thickets on grassy balds by predominance of forbs rather than sedges and by frequent presence of *Rubus idaeus*. Vegetation is variously dominated by dense *Rubus canadensis* or by dense *Athyrium filix-femina ssp. asplenioides* and *Solidago glomerata* (on more-protected sites). In examples related to death of *Abies fraseri*, the standing dead *Abies fraseri* often tower above the shrubs and herbs, and there is usually much downed woody debris. There can be a large variation in the structural characteristics of these communities, and in some instances they may approach (or technically reach) a woodland condition with *Prunus pensylvanica* forming a scattered, open, low-canopy layer (<50% cover). In addition, *Sorbus americana, Ilex montana, Acer rubrum, Cornus alternifolia*, and *Vaccinium simulatum* are some other woody species that can occur as a part of this sparse canopy or tall-shrub layer. Other species present include *Agrostis perennans, Angelica triquinata, Oclemena acuminata (= Aster acuminatus), Carex brunnescens, Carex crinita, Carex intumescens, Carex debilis, Cinna latifolia, Clintonia borealis, Danthonia compressa, Diervilla sessilifolia, Oxalis montana*, and *Rugelia nudicaulis*. Scattered living *Picea rubens, Betula alleghaniensis*, and *Amelanchier laevis* may occur. The long-term future of this community is uncertain, but it appears to be fairly stable over periods of several decades. A variation of this community occurs in areas such as Shining Rock Wilderness and parts of the Great Smoky Mountains, where intense fires occurred after logging had taken place. These intense fires, due to the accumulated slash, burned down nearly to mineral soil. These areas do not have as much coarse woody debris from downed spruce or fir and often have a canopy approaching that of a woodland with sparse coverage of *Sorbus americana* and *Prunus pensylvanica*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: These blackberry thickets are found at high elevation (above 1,525 m [5,000 feet]) and adjacent to or interspersed with high-elevation forests. They arise from severe fire or extreme spruce-fir or beech die-off.

Global Environment: This successional vegetation occurs at high elevations in the southern Appalachian Mountains of North Carolina, Tennessee, and Virginia. It occurs on exposed sites with frequent or intense natural disturbances (such as shrub invasion of grazed fire meadows). Some examples result from severe disturbance of spruce-fir forests (including balsam woolly adelgid-affected stands and stands which were severely burned after logging). It occurs on exposed summits and high slopes, typically at elevations over 1830 m (6000 feet), slightly lower in Virginia.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: These blackberry thickets are composed of *Rubus canadensis* and/or *Rubus allegheniensis*. Examples can include an open, woodland canopy of *Prunus pensylvanica* covering up to 60% of the understory.

Global Vegetation: Stands of this vegetation are variously dominated by dense *Rubus canadensis* or by dense *Athyrium filix-femina ssp. asplenioides* and *Solidago glomerata* (on more protected sites). Other species present include *Agrostis perennans, Angelica triquinata, Oclemena acuminata (= Aster acuminatus), Carex brunnescens, Carex crinita, Carex intumescens, Carex debilis, Cinna latifolia, Clintonia borealis, Danthonia compressa, Diervilla sessilifolia, Oxalis montana, Prunus pensylvanica, Sorbus americana*, and *Rugelia nudicaulis*. Scattered living *Picea rubens, Betula alleghaniensis*, and *Amelanchier laevis* may occur. In examples related to death of *Abies fraseri*, the standing dead *Abies fraseri* often tower above the shrubs and herbs, and there is usually much downed woody debris. A variation of this community occurs in areas such as Shining Rock Wilderness and parts of the Great Smoky Mountains, where intense fires occurred after logging had taken place. These intense fires, due to the accumulated slash, burned down nearly to mineral soil. These areas do not have as much coarse woody debris from downed spruce or fir and often have a canopy approaching that of a woodland with sparse coverage of *Sorbus americana* and *Prunus pensylvanica*.

Global Dynamics: This is successional vegetation that results from frequent or intense natural disturbances (such as shrub invasion of grazed fire meadows). Some examples result from severe disturbance of spruce-fir forests (including balsam woolly adelgid-affected stands and stands which were severely burned after logging).

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area)

Stratum	Lifeform	Species
Shrub/sapling (tall & short)	Liana	*Rubus allegheniensis*, *Rubus canadensis*

Global

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Abies fraseri*
Tall shrub/sapling	Broad-leaved deciduous shrub	*Rubus canadensis*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Rubus allegheniensis*, *Rubus canadensis*

Global: *Athyrium filix-femina* ssp. *asplenioides*, *Diervilla sessilifolia*, *Rubus canadensis*, *Solidago glomerata*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Abies fraseri* (G2, dead; Southern Blue Ridge endemic), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Rugelia nudicaulis* (G3), *Solidago glomerata* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNR (6-Jan-2016). This community represents an altered vegetation type, modified by the effects of an alien pest species and/or the effects of past land use. Examples of this vegetation once represented what is now a globally rare and critically imperiled community that has an uncertain future. This modified vegetation is now a natural part of high-elevation landscapes in the Southern Blue Ridge and an important part of the functioning landscape, providing habitat for many Southern Appalachian species. For conservation planning purposes, examples of this community may be best considered low-quality occurrences of forests in *Picea rubens - Abies fraseri* Forest Alliance (A0136).

RELATED CONCEPTS

Global Similar Types:
- *Rubus allegheniensis - Rubus canadensis / Carex pensylvanica* Shrubland (CEGL003892) occurs within and adjacent to open natural montane grasslands.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Global Classification Comments: This community differs from *Rubus* thickets on grassy balds by predominance of forbs rather than sedges and by frequent presence of *Rubus idaeus*. This association does not include Grass Balds that have been invaded by *Rubus*; such situations are covered in *Rubus allegheniensis - Rubus canadensis / Carex pensylvanica* Shrubland (CEGL003892).

This is successional vegetation resulting from severe disturbance of spruce-fir forests. It appears to be fairly stable over periods of several decades. This vegetation is now a natural part of high-elevation landscapes in the Southern Blue Ridge and an important part of the functioning landscape, but it is not a conservation target in and of itself.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This vegetation occurs at high elevations in the Southern Appalachians of North Carolina and Tennessee.
Global Range: This vegetation occurs at high elevations in the Southern Appalachians of North Carolina, Tennessee, and Virginia.

G658. SOUTHERN APPALACHIAN SHRUB BALD

Group Summary Description: These dense shrubland communities are found in the highest elevational zone of the Southern Appalachians, generally above 1524 m (5000 feet) but occasionally to 1220 m (4000 feet), and at slightly lower elevations at its northern limit in Virginia and West Virginia, and in the Cumberland Mountains along the Virginia-Kentucky border. The vegetation consists of dense shrubby areas most often dominated by *Rhododendron catawbiense*, but substantial examples are also dominated by *Rhododendron carolinianum, Kalmia latifolia*, or a mixture of shrubs. One large (and unusual) example dominated by *Alnus viridis ssp. crispa* is also included. Heath balds may contain sparse stunted trees barely larger than the shrub canopy. This combination of high-elevation, non-wetland sites and dense shrub vegetation without appreciable rock outcrop conceptually distinguishes this group from all others in the Southern Appalachians. However, the widespread areas of degraded spruce-fir with grass and/or shrub cover and the invasion of balds by trees blur the distinction somewhat.

A0929 *Alnus viridis ssp. crispa* Shrub Bald Alliance

Alliance Summary Description: Stands of this primarily deciduous shrubland alliance are dominated by *Alnus viridis ssp. crispa*, typically 1.5-2 m in height, rarely producing a closed canopy but typically occurring as uniformly spaced clumps about 1 m apart. *Rubus allegheniensis* is often a codominant. Other shrub species occur with low coverage and include *Rhododendron catawbiense, Vaccinium corymbosum*, and *Crataegus* spp. Openings in the shrub canopy are dominated by herbs, mainly *Carex pensylvanica* and *Carex debilis var. rudgei* and in moister areas, bryophyte cover can be up to 75%, with *Polytrichum commune* typical. This shrubland alliance occurs at the highest elevations of the southern Appalachian Mountains (above 1750 m [5800 feet]) on summit ridges of the Roan Mountain massif.

[CEGL003891] *Alnus viridis ssp. crispa / Carex pensylvanica* Shrubland

Translated Name: **Mountain Alder / Pennsylvania Sedge Shrubland**
Common Name: **Southern Appalachian Alder Bald**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Southern Appalachian Shrub Bald (G658)
Alliance	*Alnus viridis ssp. crispa* Shrub Bald Alliance (A0929)

Element Concept

Global Summary: This mainly deciduous shrubland occurs at the highest elevations, greater than 1750 m (5800 feet) in the southern Appalachian Mountains on summit ridges of the Roan Mountain massif. It is dominated by *Alnus viridis ssp. crispa*, typically 1.5-2 m in height, rarely producing a closed canopy but typically occurring as uniformly spaced clumps about 1 m apart. *Rubus allegheniensis* is often a codominant with *Alnus viridis ssp. crispa*. Other shrub species occur with low coverage and include *Rhododendron catawbiense, Vaccinium corymbosum*, and *Crataegus* spp. Openings in the shrub canopy are dominated by herbs, mainly *Carex pensylvanica* and *Carex debilis var. rudgei* but also may include *Danthonia compressa, Deschampsia flexuosa, Viola blanda, Rumex acetosella* (exotic), and *Athyrium filix-femina ssp. asplenioides*. In moister areas, bryophyte cover can be up to 75%, with *Polytrichum commune* typical. This community can grade into or occur adjacent to high-elevation rock outcrop communities, montane grass-dominated communities, high-elevation herbaceous seeps, or forests dominated by stunted *Fagus grandifolia*. It may expand into montane grass-dominated communities and may eventually succeed to *Rhododendron catawbiense* Shrubland (CEGL003818).

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation alder bald community generally occurring above 1,220 m (4,000 feet) elevation (but rarely down to 1,065 m [3,500 feet]).
Global Environment: This community occurs on ridges and exposed slopes at elevations of 1770-1800 m (5800-5900 feet). Slope gradients range from 8-15°. Extreme cold, high precipitation, frequent fog, and desiccating winds in combination with the shallow, nutrient-poor soils are the key environmental factors influencing this community. This community occurs as disconnected patches on summit ridges, interrupted by grass-dominated vegetation. It can grade into or occur adjacent to high-elevation rock outcrop communities, montane grass-dominated communities, high-elevation herbaceous seeps, or forests dominated by stunted *Fagus grandifolia*. It often invades montane grass-dominated communities and may eventually succeed to *Rhododendron catawbiense* Shrubland (CEGL003818).

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This shrubland is mostly composed of *Alnus viridis ssp. crispa* (cover >35%); sometimes with *Rubus canadensis* codominant. Other common species include *Rhododendron catawbiense, Vaccinium corymbosum, Vaccinium simulatum, Vaccinium pallidum*, and *Crataegus* spp.
Global Vegetation: These montane, mainly deciduous shrublands are dominated by *Alnus viridis* typically 1.5-2 m in height, rarely producing a closed canopy but typically occurring as uniformly spaced clumps about 1 m apart. *Rubus allegheniensis* is often a codominant with *Alnus viridis ssp. crispa*. Other shrub species occur with low coverage and include *Rhododendron catawbiense, Vaccinium corymbosum*, and *Crataegus* spp. Openings in the shrub canopy are dominated by herbs, mainly *Carex pensylvanica* and *Carex debilis var. rudgei* but also may

include *Athyrium filix-femina ssp. asplenioides, Danthonia compressa, Deschampsia flexuosa, Viola blanda, Rumex acetosella* (exotic). In moister areas, bryophyte cover can be up to 75%, with *Polytrichum commune* typical.
Global Dynamics: This community may be damaged by lightning-caused fire or defoliating insects (Brown 1941). It is unclear if *Alnus viridis ssp. crispa* is able to expand into adjacent grassy balds or not. This shrubland may experience invasion by *Rhododendron catawbiense, Abies fraseri*, and *Picea rubens* and may succeed to vegetation dominated by these species.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area)

Stratum	Lifeform	Species

Herb (field)	Graminoid	*Carex debilis* var. *rudgei*, *Carex pensylvanica*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Alnus viridis* ssp. *crispa*
Global: *Alnus viridis* ssp. *crispa*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Krigia montana* (G3), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic); **Invasive/Exotic Plants**: *Rumex acetosella* (Medium/Low)

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (27-Oct-2010). This community occurs only in the Roan Mountain massif, Avery and Mitchell counties, North Carolina, and Carter County, Tennessee, where it occupies a total acreage of less than 500 hectares. It is a narrowly endemic community, naturally rare, but apparently stable.

RELATED CONCEPTS

Global Similar Types:
- *Rhododendron catawbiense* Shrubland (CEGL003818) may have up to 25% of the total shrub cover made up of *Alnus viridis ssp. crispa*.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This type should be generously applied in this local area; there may be confusion with shrublands dominated by *Rhododendron catawbiense*.
Global Classification Comments: Other communities dominated by *Alnus viridis ssp. crispa* may occur in the western and northeastern United States as well as in Canada. This community occurs as disconnected patches on summit ridges, interrupted by grass-dominated vegetation such as *Danthonia compressa - (Sibbaldiopsis tridentata)* Grassland (CEGL004242) or *Carex pensylvanica* Grassland (CEGL004094). Additionally, this community can grade into or occur adjacent to high-elevation rock outcrop communities, high-elevation herbaceous seeps, or forests dominated by stunted *Fagus grandifolia*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This shrubland has a limited distribution and occurs at and near Carvers Gap on Roan Mountain.
Global Range: This community occurs only in the Roan Mountain massif of the Southern Blue Ridge of North Carolina and Tennessee.
Nations: US
States/Provinces: NC:S1, TN

A0744 *Rhododendron catawbiense - Rhododendron carolinianum - Kalmia latifolia* Shrub Bald Alliance

Alliance Summary Description: This alliance includes evergreen shrublands occurring in the southern Appalachian Mountains. These shrublands are dominated by evergreen ericaceous species, most often *Rhododendron catawbiense, Rhododendron carolinianum*, or *Kalmia latifolia*. Deciduous shrubs may be present and even locally dominant. Openings in the shrub stratum may contain sparse herbaceous cover, including *Deschampsia flexuosa, Galax urceolata, Gaultheria procumbens, Goodyera pubescens, Melampyrum lineare, Mitchella repens, Pteridium aquilinum, Selaginella tortipila*, and *Zigadenus leimanthoides*. Mosses and lichens are also typical in more open occurrences. This evergreen, sclerophyllous vegetation is of low stature (<0.5 m) and occurs at the highest elevations in the southern Appalachian Mountains on steep, exposed slopes, ridges, thin soils and rock outcrops. It is typically found at elevations over 1770 m (5800 feet) in northwestern North Carolina and eastern Tennessee.

[CEGL003814] *Kalmia latifolia - Rhododendron catawbiense - (Gaylussacia baccata, Pieris floribunda, Vaccinium corymbosum)* Shrubland

Group	Southern Appalachian Shrub Bald (G658)
Alliance	*Rhododendron catawbiense* - *Rhododendron carolinianum* - *Kalmia latifolia* Shrub Bald Alliance

(A0744)

ELEMENT CONCEPT

Global Summary: This community occurs in the mountains of Georgia, North Carolina, Virginia, and Tennessee, on ridges and steep, rocky slopes at intermediate elevations (1220-1524 m [4000-5000 feet]). It also occurs in very small patches at elevations higher than 1035 m (3400 feet) in the Cumberland Mountains along the Virginia-Kentucky border. It is a mostly evergreen shrubland, although deciduous shrubs may be present and even locally dominant. Shrubs form a dense, sometimes impenetrable thicket, 1-4 m tall. The most typical shrub dominants are *Kalmia latifolia* and *Rhododendron catawbiense*, although *Gaylussacia baccata, Leiophyllum buxifolium, Pieris floribunda, Rhododendron carolinianum, Rhododendron maximum*, and *Vaccinium corymbosum* are dominant or have high coverage in some occurrences. Other shrubs include *Photinia melanocarpa (= Aronia melanocarpa), Clethra acuminata, Ilex montana, Vaccinium stamineum, Leucothoe recurva*, and *Viburnum nudum var. cassinoides*. Small openings in the shrub canopy are dominated by lichens, bare rock or herbs, with some occurrences having up to 60% exposed rock. Herb cover beneath the shrub canopy is absent or very sparse (<5%) and may include *Galax urceolata, Gaultheria procumbens, Goodyera pubescens, Melampyrum lineare, Mitchella repens*, and *Pteridium*

aquilinum. *Smilax rotundifolia* is a common vine. Small, scattered trees are possible (*Acer rubrum, Amelanchier laevis, Betula alleghaniensis, Ilex montana, Magnolia fraseri, Nyssa sylvatica, Oxydendrum arboreum, Picea rubens, Prunus pensylvanica, Quercus rubra*, and *Sorbus americana*) and may be more typical of shrublands resulting from intense fires on less exposed sites. Windfall, landslides, and small, localized, lightning-caused fires are important in the establishment and maintenance of these shrublands. This community can result from secondary succession after fire or logging or can occur as a topo-edaphic climax on steep or exposed sites.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation mixed ericaceous shrub bald community generally occurs on southerly exposed ridges and steep slopes typically below 1,525 m (5,000 feet) elevation. The sampled sites include a steep, south- and southwest-facing upper slope and gentle to moderately sloping ridgetops. Soils range from moderately well-drained sandy loam to rapidly drained sandy loam or rock with little soil development. The unvegetated surface may be dominated by leaf litter with some downed wood or be a mix of leaf litter, exposed bedrock and large rocks. Evidence of disturbance includes wind/ice damage resulting from harsh weather conditions.

Global Environment: This community occurs in the mountains of Georgia, North Carolina, Virginia, and Tennessee on ridges and steep, rocky slopes at intermediate elevations (1220-1524 m [4000-5000 feet]). It also occurs in very small patches at elevations higher than 1035 m (3400 feet) in the Cumberland Mountains along the Virginia-Kentucky border.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: These dense (up to 100% cover) mixed ericaceous shrub thickets (1-4 m tall) are mostly evergreen, but may have local dominance by deciduous shrubs. Dominant shrubs are *Kalmia latifolia, Rhododendron catawbiense*, or *Leucothoe recurva*. *Gaylussacia baccata, Pieris floribunda*, and *Vaccinium corymbosum* may also be present. Herbs are sparse and may include *Polypodium appalachianum*.

Global Vegetation: This association typically manifests as a mostly evergreen shrubland, although deciduous shrubs may be present and even locally dominant. These shrubs form a dense, sometimes impenetrable thicket, 1-4 m tall. The most typical shrub dominants are *Kalmia latifolia* and *Rhododendron catawbiense*, although *Gaylussacia baccata, Leiophyllum buxifolium, Pieris floribunda, Rhododendron carolinianum, Rhododendron maximum*, and *Vaccinium corymbosum* are dominant or have high coverage in some occurrences. Other shrubs include *Photinia melanocarpa (= Aronia melanocarpa), Clethra acuminata, Ilex montana, Vaccinium simulatum, Vaccinium stamineum, Leucothoe recurva*, and *Viburnum nudum var. cassinoides*. Small openings in the shrub canopy are dominated by lichens, bare rock or herbs, with some occurrences having up to 60% exposed rock. Herb cover beneath the shrub canopy is absent or very sparse (<5%) and may include *Galax urceolata, Gaultheria procumbens, Goodyera pubescens, Melampyrum lineare, Mitchella repens*, and *Pteridium aquilinum*. *Smilax rotundifolia* is a common vine. Small, scattered trees are possible (*Acer rubrum, Amelanchier laevis, Betula alleghaniensis, Ilex montana, Magnolia fraseri, Nyssa sylvatica, Oxydendrum arboreum, Prunus pensylvanica, Picea rubens, Quercus rubra*, and *Sorbus americana*) and may be more typical of shrublands resulting from intense fires on less exposed sites.

Global Dynamics: Windfall, landslides, and small, localized, lightning-caused fires are important in the establishment and maintenance of these shrublands. This community can result from secondary succession after fire or logging or can occur as a topo-edaphic climax on steep or exposed sites.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Kalmia latifolia*, *Leucothoe recurva*, *Rhododendron catawbiense*

Global: *Kalmia latifolia*, *Rhododendron catawbiense*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Glyceria nubigena* (G2G3, endemic to Great Smoky Mountains and adjacent areas near the park), *Hypericum buckleii* (G3, Southern Blue Ridge endemic), *Liatris helleri* (G2Q, NC/Southern Appalachian endemic), *Pseudevernia cladonia* (G2G4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (15-Feb-1999). This is a locally common heath bald type in parts of the Southern Blue Ridge and Cumberland Mountains. Some occurrences represent a topo-edaphic climax, while other areas require fire to maintain the physiognomy. Fire-maintained occurrences are threatened by general fire prevention in the mountains.

RELATED CONCEPTS

Global Similar Types:

- *Menziesia pilosa - Vaccinium (erythrocarpum, simulatum, corymbosum) - Sorbus americana* Shrubland (CEGL004819)
- *Rhododendron carolinianum - Rhododendron catawbiense - Leiophyllum buxifolium* Shrubland (CEGL007876)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This mixed ericaceous shrub bald is the most common bald type in the Southern Appalachian dataset.
Global Classification Comments: These shrublands possibly have a broader distribution and typically occur at lower elevations than other montane shrublands in *Rhododendron catawbiense - Rhododendron carolinianum - Kalmia latifolia* Shrub Bald Alliance (A0744). In the Southern Blue Ridge, this shrubland generally occurs at elevations over 1220 m (4000 feet) and grades into forests dominated by *Quercus coccinea, Pinus rigida, Pinus pungens*, and/or *Quercus rubra*. High-elevation occurrences may be compositionally similar to another heath bald community, *Rhododendron carolinianum - Rhododendron catawbiense - Leiophyllum buxifolium* Shrubland (CEGL007876).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is scattered within the AT corridor at high elevations from Union County, Georgia, to Carter County, Tennessee. It was sampled in Chattahoochee National Forest in Georgia, and in North Carolina.
Global Range: This community is found in the Blue Ridge Mountains of Georgia, North Carolina, and Tennessee. Examples in the Cumberlands of Kentucky, and Southern Blue Ridge and Ridge and Valley of Virginia are rare and of limited extent.

Translated Name: **Minniebush - (Southern Mountain Cranberry, Upland Highbush Blueberry, Highbush Blueberry) - American Mountain-ash Shrubland**
Common Name: **Southern Appalachian Deciduous Heath Bald**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Southern Appalachian Shrub Bald (G658)
Alliance	*Rhododendron catawbiense - Rhododendron carolinianum - Kalmia latifolia* Shrub Bald Alliance (A0744)

Element Concept

Global Summary: This deciduous shrubland is known from several exposed, rock outcrop promontories between 1500 and 1675 m (5000-5500 feet) elevation in the Mount Rogers - Whitetop massif of the southern Virginia Blue Ridge. The exposed sites are subject to low winter temperatures, high winds, and ice storms, as well as high solar irradiation and moisture evaporation during the growing season. Slope profiles are strongly convex and surface cover of exposed bedrock and boulders is >25% in plot samples. Soils are extremely acidic (mean pH = 3.9) and low in base status. Vegetation is a deciduous shrubland codominated by *Menziesia pilosa*, stunted *Sorbus americana*, and either *Vaccinium simulatum* or *Vaccinium erythrocarpum*, or both. Associated shrubs and tree saplings include *Rubus canadensis, Crataegus punctata, Amelanchier laevis, Ribes rotundifolium, Ribes cynosbati, Prunus pensylvanica, Rhododendron calendulaceum*, and *Smilax tamnoides*. The most frequent herbs are *Danthonia compressa, Athyrium filix-femina ssp. asplenioides, Oclemena acuminata, Carex debilis var. rudgei, Heuchera villosa, Saxifraga michauxii, Maianthemum canadense, Carex pensylvanica*, and *Carex brunnescens ssp. sphaerostachya*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation deciduous heath bald community occurs on acidic soils on exposed, convex, rocky summits and ridges between 1,500 and 1,675 m (5,000-5,500 feet) elevation. The exposed sites are subject to low winter temperatures, high winds, and ice storms, as well as high solar irradiation and moisture evaporation during the growing season.
Global Environment: Habitats are exposed, rocky summits and promontories between 1500 and 1675 m (5000-5500 feet) elevation. The exposed sites are subject to low winter temperatures, high winds, and ice storms, as well as high solar irradiation and moisture evaporation during the growing season. Slope profiles are strongly convex and surface cover of exposed bedrock and boulders is >25% in plot samples. Soils are extremely acidic (mean pH = 3.9) and low in base status.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This deciduous shrubland is codominated by *Menziesia pilosa*, stunted *Sorbus americana*, and either *Vaccinium simulatum* or *Vaccinium erythrocarpum*, or both. *Rubus canadensis* is another common shrub. The herb layer is typically very dense; common species include *Athyrium filix-femina ssp. asplenioides, Carex brunnescens ssp. sphaerostachya, Carex debilis var. rudgei, Danthonia compressa, Heuchera villosa var. villosa, Maianthemum canadense, Oclemena acuminata, Rumex acetosella*, and *Saxifraga michauxii*.
Global Vegetation: Vegetation is a deciduous shrubland that typically contains 10 to 75% cover of 0.5- to 1.5-m tall *Menziesia pilosa*, 10 to 50% of *Sorbus americana* >1.5 m tall, and up to 25% cover of either *Vaccinium simulatum* or *Vaccinium erythrocarpum*, or both. This community is slightly more diverse than associated shrublands with nearly monospecific dominance by *Rhododendron catawbiense*, with a mean species richness of 23 taxa per 100 m2 in three plot-sampled stands. Associated shrubs and tree saplings include *Rubus canadensis, Crataegus punctata, Amelanchier laevis, Ribes rotundifolium, Ribes cynosbati, Prunus pensylvanica, Rhododendron calendulaceum*, and *Smilax tamnoides*. Opportunities for herbaceous species appear to be somewhat greater in this all-deciduous shrubland than in the densely evergreen, *Rhododendron catawbiense* shrublands. The most common

and abundant herbs in known stands, averaging >5% cover in plots, are *Danthonia compressa, Athyrium filix-femina ssp. asplenioides*, and *Oclemena acuminata*. Other species that occur with lower cover in 50% or more of the plot samples are *Carex debilis var. rudgei, Heuchera villosa, Saxifraga michauxii, Maianthemum canadense, Carex pensylvanica*, and *Carex brunnescens ssp. sphaerostachya*.

Global Dynamics: Occurrences of this shrubland may result from secondary succession after fires and logging, but may also occur as topo-edaphic climaxes on exposed, rocky sites. At present, there is little evidence of successional advance at any of the three Virginia sites, although there are stunted, widely scattered specimens of *Abies fraseri* and a few *Picea rubens* seedlings in the largest stand on Wilburn Ridge near Mount Rogers. It is not clear whether the shrublands here originated from the nearly complete destruction of spruce-fir forests on this ridge, or whether the massive bedrock promontories have always supported edaphic shrublands or woodlands with a shrub understory similar to this vegetation. At this site, the deciduous shrublands co-occur with more extensive stands of *Rhododendron catawbiense*-dominated shrublands, although the two occupy discrete parts of the outcrops and do not intermingle.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (15-Oct-2014). This association is known from very few occurrences, and has a small to moderate area of potential occurrence. Existing occurrences appear stable and unthreatened. It occurs in the context of a globally rare, high-elevation ecosystem of the Southern Blue Ridge. The association may result from catastrophic disturbance of red spruce - Fraser fir forests. However, existing occurrences are persisting with a shrubland structure, with no invasion by tree-forming species. Although small spruce and fir saplings are scattered in the type, their growth is extremely slow, likely due to the massive rock outcrops and shallow soils of the habitats. This association is ranked lower than numbers of occurrences suggest, because of the likelihood of its occurrence at other high-elevation environments in the Appalachian Mountains, both south and north of Virginia.

RELATED CONCEPTS

Global Similar Types:

- *Kalmia latifolia - Rhododendron catawbiense - (Gaylussacia baccata, Pieris floribunda, Vaccinium corymbosum)* Shrubland (CEGL003814) occurs at lower elevation (1035-1525 m[3400-5000 feet]), and is mixed evergreen-deciduous.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Mixed deciduous shrublands on and around rocky summits in the Grayson Highlands area (Whitetop, Wilburn Ridge, Haw

Orchard Mountain), generally above 1,525 m (5,000 feet). Vegetation is primarily *Menziesia pilosa, Sorbus americana, Vaccinium* spp. with a number of herbs usually present at moderate cover underneath.
Global Classification Comments: This community type was initially classified in a 950-plot dataset analysis of Virginia montane plot data conducted for the George Washington and Jefferson national forests and NatureServe (Fleming and Coulling 2001). At that time, it was treated as a deciduous variant of *Rhododendron catawbiense* Shrubland (CEGL003818). The same group, with an additional plot sample, performed discretely in an analysis of 1050 plots of Southern Appalachian vegetation conducted for the Appalachian Trail vegetation mapping project in 2009 (Fleming and Patterson 2009a). This group (n= 4) shows close affiliation with CEGL003818 in cluster analysis, but this may be the result of spatial autocorrelation. In any case, treating these shrublands as one group produces a very awkward "type" that can vary from pure *Rhododendron catawbiense* to a mixed deciduous shrubland with no *Rhododendron catawbiense* at all. This association was placed within an evergreen formation, even though it is deciduous.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community occurs along and near the AT on three ridges of the Mount Rogers - Whitetop massif in southwestern Virginia.
Global Range: This community is known from three sites in the Mount Rogers - Whitetop (Balsam Mountains) massif of the southern Virginia Blue Ridge: Buzzard Rock near Whitetop, Wilburn Ridge near Mount Rogers, and Haw Orchard Mountain in Grayson Highlands State Park. It is likely in other high-elevation areas of the Appalachian Mountains.

[CEGL007876] *Rhododendron carolinianum - Rhododendron catawbiense - Leiophyllum buxifolium* Shrubland

Translated Name: **Carolina Azalea - Catawba Rosebay - Sand-myrtle Shrubland**
Common Name: **Southern Appalachian Heath Bald**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Southern Appalachian Shrub Bald (G658)
Alliance	*Rhododendron catawbiense - Rhododendron carolinianum - Kalmia latifolia* Shrub Bald Alliance (A0744)

ELEMENT CONCEPT

Global Summary: This high-elevation shrubland occurs in the Great Smoky Mountains of eastern Tennessee, on steep ridges, rock outcroppings, and landslides at elevations over 1676 m (5500 feet), in the Spruce-Fir zone. It has 25-100% shrub cover and may occur as a dense shrubland, 2-4 m tall, or as a shorter, more open shrubland with areas of exposed rock, scattered mats of prostrate vegetation, and isolated clumps of herbaceous species. The most common shrubs are *Rhododendron carolinianum, Rhododendron catawbiense*, and *Leiophyllum buxifolium*, locally

dominant in patches and forming a mosaic. Shrubs are less than 1 m tall on the steepest, rockiest, most exposed sites, and taller on gentle, more protected sites with greater soil development. Other associated shrubs with minor coverage may include *Abies fraseri, Photinia pyrifolia (= Aronia arbutifolia), Photinia melanocarpa (= Aronia melanocarpa), Diervilla sessilifolia, Ilex montana, Menziesia pilosa, Pieris floribunda, Prunus pensylvanica, Vaccinium corymbosum, Vaccinium erythrocarpum*, and *Viburnum nudum var. cassinoides*. Under tall, dense shrubs there is little herb cover, but in more open shrublands, on steep cliffs with seepage, herbaceous species may grow in dense patches on ledges and crevices. Herbaceous species such as *Calamagrostis cainii, Carex misera, Geum radiatum, Saxifraga michauxii, Solidago glomerata*, and *Trichophorum caespitosum (= Scirpus cespitosus)* are associated with this community on the summits of Mount LeConte. Thick hummocks of lichens and mosses can occur on flatter sites, and scattered wind-sheared trees of *Picea rubens* or *Abies fraseri* are possible in some examples. High solar irradiation and desiccating winds, in combination with the shallow, nutrient-poor soils, are key environmental factors influencing this community. Locally, vegetation is influenced by seepage areas on steep cliffs and ledges. It is known from areas of exposed slate on the steep ridges of Mount LeConte (Ramseur 1958).

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: Sites are typically above 1,525 m (5,000 feet) elevation, in the spruce-fir zone. The sampled sites include very steep ridges to steep rocky summits with northern aspects.

Global Environment: This association occurs on steep ridges, rock outcroppings, and landslides at elevations over 1676 m (5500 feet), in the Spruce-Fir zone.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This open to dense shrub-dominated vegetation ranges from 0.5 to 4 m tall. Dominant shrubs include *Rhododendron carolinianum, Rhododendron catawbiense*, and *Leiophyllum buxifolium*; additional shrubs may include *Vaccinium corymbosum, Vaccinium simulatum*, and *Vaccinium pallidum*. *Saxifraga michauxii* is common in the very sparse herb layer.

Global Vegetation: This association has 25-100% shrub cover and may occur as a dense shrubland, 2-4 m tall, or as a shorter, more open shrubland with areas of exposed rock, scattered mats of prostrate vegetation, and isolated clumps of herbaceous species. [CEGL003818] *Rhododendron catawbiense* Shrubland

Translated Name: **Catawba Rosebay Shrubland**
Common Name: **Southern Appalachian Catawba Rosebay Heath Bald**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Appalachian Rocky Felsic & Mafic Scrub & Grassland (M506)
Group	Southern Appalachian Shrub Bald (G658)
Alliance	*Rhododendron catawbiense - Rhododendron carolinianum - Kalmia latifolia* Shrub Bald Alliance (A0744)

Element Concept

Global Summary: This evergreen shrubland occurs at the highest elevations, typically 1500-1980 m (5000-6500 feet), in the southern Appalachian Mountains on steep, exposed slopes, ridges, and rock outcrops. It occurs primarily in the northern portion of the Southern Appalachians, north of the Asheville Basin, in mountain ranges lacking *Pieris floribunda* and *Rhododendron carolinianum*. Greater than 75% of the shrub cover is composed of evergreen species, and the predominant shrub is *Rhododendron catawbiense*. Scattered trees contribute less than 1% cover, typically *Photinia melanocarpa (= Aronia melanocarpa), Abies fraseri*, and *Picea rubens*. Small openings in the shrub canopy are dominated by rock or herbs. Herb cover beneath the shrub canopy is absent or very sparse (<5%) and may include *Gaultheria procumbens, Galax urceolata, Epigaea repens, Medeola virginiana, Trillium undulatum, Melampyrum lineare, Dryopteris campyloptera, Houstonia serpyllifolia, Viola* spp., and *Carex debilis var. rudgei*. Mosses may be locally dominant at the base of *Rhododendron* clumps, often *Polytrichum commune* or bryophytes from adjacent *Picea - Abies* communities. This community can result from secondary succession after fire or logging or can occur as a topo-edaphic climax on steep, exposed sites. Occurrences may range in size from 0.5-200 hectares. This community can grade into or occur adjacent to high-elevation rock outcrop communities, montane grass-dominated communities, or forests dominated by *Picea rubens, Abies fraseri*, and northern hardwood species such as *Fagus grandifolia, Acer saccharum*, and *Betula alleghaniensis*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation, evergreen ericaceous shrub bald thicket occurs at >1370 m (4500 feet) on Wilburn Ridge of Whitetop Mountain in Virginia. The sampled stand is on a moderate, east-facing upper slope with well-drained silt loam soil. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. The site may have experienced some disturbance of unknown origin in the past.
Global Environment: This evergreen shrubland occurs at the highest elevations, typically 1500-1980 m (5000-6500 feet), in the southern Appalachian Mountains on steep, exposed slopes, ridges, and rock outcrops. It occurs primarily in the northern portion of the Southern Appalachians, north of the Asheville Basin, in mountain ranges lacking *Pieris floribunda* and *Rhododendron carolinianum*. This community can result from secondary succession after fire or logging or can occur as a topo-edaphic climax on steep, exposed sites. Occurrences may range in size from 0.5-200 hectares. This community can grade into or occur adjacent to high-elevation rock outcrop communities, montane grass-dominated communities, or forests dominated by *Picea rubens, Abies fraseri*, and northern hardwood species such as *Fagus grandifolia, Acer saccharum*, and *Betula alleghaniensis*.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This evergreen shrubland is dominated by *Rhododendron catawbiense*; additional shrubs include *Vaccinium simulatum, Menziesia pilosa, Sorbus americana*, and *Vaccinium erythrocarpum*. Herbs are very sparse.
Global Vegetation: Greater than 75% of the shrub cover is composed of evergreen species, and the predominant shrub is *Rhododendron catawbiense*, which forms a continuous, dense shrub canopy from 1-4 m tall. On the most rugged, windswept sites, shrubs are stunted and gnarled. The occurrence and relative abundance of associated shrub species vary with elevation and adjacent vegetation. Scattered trees contribute less than 1% cover, typically *Photinia melanocarpa (= Aronia melanocarpa), Abies fraseri*, and *Picea rubens*. Small openings in the shrub canopy are dominated by rock or herbs. Herb cover beneath the shrub canopy is absent or very sparse (<5%) and may include *Gaultheria procumbens, Galax urceolata, Epigaea repens, Medeola virginiana, Trillium undulatum, Melampyrum lineare, Dryopteris campyloptera, Houstonia serpyllifolia, Viola* spp., and *Carex debilis var. rudgei*. Mosses may be locally dominant at the base of *Rhododendron* clumps, often *Polytrichum commune* or bryophytes from adjacent *Picea - Abies* communities. This community contains species endemic to the southern Appalachian Mountains, including *Abies fraseri, Fothergilla major, Galax urceolata, Geum radiatum, Houstonia purpurea var. montana,*

Houstonia serpyllifolia, Hudsonia montana, Hypericum buckleii, Liatris helleri, Lilium grayi, Menziesia pilosa, Pieris floribunda, Prenanthes roanensis, Rhododendron vaseyi, Rhododendron carolinianum, Photinia melanocarpa, and *Vaccinium erythrocarpum*. Species occurring disjunct from their typical northern distributions include *Alnus viridis ssp. crispa, Dryopteris campyloptera, Picea rubens*, and *Vaccinium corymbosum*.
Global Dynamics: Windfall, landslides, and small, localized and lightning-caused fires are important in the establishment and maintenance of this community. This community can result from secondary succession after fire or logging, in which case it is unstable and will eventually succeed to a forest community with a *Rhododendron* understory (e.g., *Picea rubens - (Abies fraseri) / (Rhododendron catawbiense, Rhododendron maximum)* Forest (CEGL007130)). When this community occurs on steep, exposed sites, where wind exposure, soil infertility, and drought maintain a scrubby shrub community, it is a topo-edaphic climax. According to Gant (1978) *Rhododendron catawbiense* heath balds represent stable communities that employ allelopathic interference to arrest succession and maintain themselves.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Menziesia pilosa*, *Rhododendron catawbiense*, *Sorbus americana*, *Vaccinium simulatum*
Global: *Menziesia pilosa*, *Rhododendron catawbiense*, *Sorbus americana*, *Vaccinium simulatum*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Abies fraseri* (G2, is a minor constituent of this community type and Southern Appalachian endemic), *Fothergilla major* (G3, Southern Appalachian endemic), *Geum radiatum* (G2, Southern Appalachian endemic), *Houstonia purpurea* var. *montana* (G5T2, Southern Blue Ridge endemic), *Hudsonia montana* (G1, NC/Southern Blue Ridge endemic), *Hypericum buckleii* (G3, Southern Blue Ridge endemic), *Liatris helleri* (G2Q, NC/Southern Blue Ridge endemic), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Rhododendron vaseyi* (G3, NC/Southern Blue Ridge endemic);
Other Plants: *Alnus viridis* ssp. *crispa* (G5T5, occurs disjunct from its typical northern distribution), *Dryopteris campyloptera* (G5, occurs disjunct from its typical northern distribution), *Galax urceolata* (G5, Southern Appalachian endemic), *Houstonia serpyllifolia* (G4?, Southern Blue Ridge endemic), *Photinia melanocarpa* (G5, Southern Appalachian endemic), *Picea rubens* (G5, occurs disjunct from its typical northern distribution), *Pieris floribunda* (G4, Southern Blue Ridge endemic), *Rhododendron carolinianum* (G4, Southern Blue Ridge endemic), *Vaccinium corymbosum* (G5, occurs disjunct from its typical northern distribution), *Vaccinium erythrocarpum* (G5, Southern Blue Ridge endemic), *Xerophyllum asphodeloides* (G4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (31-Dec-1997). This community occurs at the highest elevations (1500-1980 m [5000-6500 feet]) of the southern Appalachian Mountains in Virginia, North Carolina, and Tennessee. Although there are hundreds of occurrences, the total acreage of this community is limited since it occurs as scattered islands of shrubland at the highest elevations. Since this community generally occurs in inaccessible, well-protected sites, it is not highly threatened. Occurrences in areas of high recreation use may be threatened by trampling, while natural succession may threaten other sites.

RELATED CONCEPTS

Global Similar Types:
- *Alnus viridis ssp. crispa / Carex pensylvanica* Shrubland (CEGL003891)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: In the vicinity of Carvers Gap on Roan Mountain, there may be confusion with Southern Appalachian Alder Bald

(CEGL003891), and a stand containing a mixture of *Alnus* and *Rhododendron* should be interpreted as CEGL003891 unless it is clearly dominated by *Rhododendron* (>65% cover). Some examples of this community observed by the USGS mapping team were codominated by *Vaccinium simulatum*.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: Dense *Rhododendron catawbiense* shrublands growing on rocky promontories of the Grayson Highlands area.
Global Classification Comments: This community can grade into or occur adjacent to high-elevation rock outcrop communities, montane grass-dominated communities, or forests dominated by *Picea rubens, Abies fraseri*, and northern hardwood species such as *Fagus grandifolia, Acer saccharum*, and *Betula alleghaniensis*. A more open, low-growing, evergreen shrubland, *Leiophyllum buxifolium* Dwarf-shrubland (CEGL003951), is restricted to areas where *Leiophyllum buxifolium* dominates areas greater than 0.1 hectare. However, the species may be locally dominant as inclusions in this shrubland. Similar, but floristically different, ericaceous shrublands occur in the Mahoosuc Mountains of Maine (Fahey 1976). Exemplary occurrences are known from the Roan Mountain Massif, North Carolina and Tennessee, and Mount Rogers, Virginia.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This vegetation has been seen at Grayson Highlands State Park, Virginia, and could be present in other areas of the Rogers - Whitetop massif and other parts of the higher elevation (>1,370 m [4,500 feet]) Southern Blue Ridge as well. It was sampled on Wilburn Ridge and is known from Roan Mountain in Virginia.
Global Range: This community occurs primarily in the northern portion of the Southern Appalachians, north of the Asheville Basin, in North Carolina, Tennessee, and Virginia.

M123. Eastern North American Ruderal Grassland & Shrubland

G059. Eastern North American Ruderal Meadow & Shrubland

Group Summary Description: This group encompasses shrub or herb meadows or old fields in the northern and central regions of the eastern United States and adjacent Canada dominated by native and exotic forbs, grasses, ferns and shrubs that occur on sites that have been cleared and plowed (for farming or development), and then abandoned. Characteristics herbs and shrubs include three variants. Dry variants are less well-described. The mesic open old-field meadow variant has characteristic forbs that include *Asclepias syriaca, Cerastium arvense, Centaurea biebersteinii (= Centaurea maculosa), Daucus carota, Euthamia graminifolia, Fragaria virginiana, Oenothera biennis, Picris hieracioides, Potentilla simplex, Rudbeckia hirta, Solidago altissima, Solidago canadensis, Solidago nemoralis, Solidago rugosa, Solidago juncea, Symphyotrichum lateriflorum (= Aster lateriflorus)*, and *Symphyotrichum novae-angliae (= Aster novae-angliae)*. Common grasses include *Anthoxanthum odoratum, Bromus inermis, Dactylis glomerata, Elymus repens (= Agropyron repens), Phleum pratense, Poa compressa*, and *Poa pratensis*. Shrubs may be present, but collectively they have less than 25% cover. Characteristic shrubs include *Cornus amomum, Cornus racemosa (= Cornus foemina ssp. racemosa), Cornus sericea, Juniperus virginiana, Lonicera* spp., *Rubus* spp., *Rhus typhina, Rhus glabra*, and *Viburnum recognitum*. The mesic old-field shrubland variant includes *Amelanchier* spp., *Cornus racemosa, Cornus sericea, Crataegus* spp., *Prunus americana, Prunus virginiana, Rhus glabra, Rhus typhina, Rubus* spp., *Viburnum lentago*, and *Viburnum recognitum*. The exotic shrubs *Elaeagnus angustifolia, Lonicera* spp., *Rhamnus cathartica*, and *Rosa multiflora* may be invasive in some areas. The dry old-field grassland and shrubland is found on sandy or rock substrates and includes *Andropogon virginicus, Poa compressa, Solidago nemoralis, Schizachyrium scoparium*, and an assortment of dry weedy species such as *Centaurea biebersteinii*.

A1190 *Dactylis glomerata - Festuca* spp. - *Solidago canadensis* Ruderal Mesic Meadow Alliance

Alliance Summary Description: This broadly defined type includes mesic abandoned pastures and agricultural fields and is largely composed of non-native cool-season grasses and herbs (generally of European origin) in the early stages of succession. The fields are typically mowed every one to five years. Physiognomically, these grasslands are generally composed of mid-height (0.5 to 1 m tall) grasses and forbs, with occasional scattered shrubs (<25%). Species composition varies from site to site, depending on land-use history and perhaps soil type, but in general this vegetation is quite wide-ranging in northeastern and midwestern states and at higher elevations (610-1220 m [2000-4000 feet]) in the southeastern states. Dominant grasses vary from site to site but generally include the exotic grasses *Agrostis stolonifera, Agrostis hyemalis, Anthoxanthum odoratum, Bromus inermis, Bromus tectorum, Dactylis glomerata, Lolium arundinaceum (= Schedonorus arundinaceum), Lolium perenne, Phleum pratense* as well as weedy natives such as *Elymus repens, Poa pratensis*, and, less commonly, *Schizachyrium scoparium*. Forbs may be minor or dominant and include the exotic forbs *Achillea millefolium, Cerastium arvense* (and hybrids), *Daucus carota, Hieracium* spp., *Vicia cracca*, as well as weedy natives such as *Ambrosia artemisiifolia, Asclepias syriaca, Euthamia graminifolia, Oenothera biennis, Potentilla simplex, Solidago altissima, Solidago canadensis, Solidago juncea, Solidago nemoralis, Solidago rugosa, Trifolium* spp., *Symphyotrichum lanceolatum (= Aster simplex), Symphyotrichum lateriflorum (= Aster lateriflorus), Symphyotrichum novae-angliae (= Aster novae-angliae*), and many others. This vegetation is quite wide-ranging in northeastern and midwestern states and possibly occurs at higher elevations in the southeastern states and southern Canada.

[CEGL006107] *Dactylis glomerata - Phleum pratense - Festuca* spp. - *Solidago* spp. Ruderal Meadow

Translated Name: **Orchardgrass - Timothy - Fescue species - Goldenrod species Ruderal Meadow**
Common Name: **Northeastern Old-field Meadow**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)

Group	Eastern North American Ruderal Meadow & Shrubland (G059)
Alliance	*Dactylis glomerata - Festuca* spp. - *Solidago canadensis* Ruderal Mesic Meadow Alliance (A1190)

ELEMENT CONCEPT

Global Summary: This broadly defined vegetation type includes pastures and post-agricultural fields and is largely composed of non-native cool-season grasses and herbs (generally of European origin) in the early stages of succession. The fields are typically mowed at least annually. Physiognomically, these grasslands are generally composed of mid-height (1-3 feet tall) grasses and forbs, with occasional scattered shrubs. Species composition varies from site to site, depending on land-use history and perhaps soil type, but in general this vegetation is quite wide-ranging in northeastern and midwestern states and at higher elevations (610-1220 m [2000-4000 feet]) in the southeastern states. Dominant grasses vary from site to site but generally feature the nominal species. Other graminoid associates may include *Agrostis stolonifera, Agrostis hyemalis, Elymus repens, Bromus inermis, Bromus tectorum, Lolium perenne, Poa pratensis, Poa compressa, Schizachyrium scoparium* (not in abundance), and *Anthoxanthum odoratum*. Forbs scattered among the grasses are varied but include *Hieracium* spp., *Oxalis stricta, Achillea millefolium, Asclepias syriaca, Solidago rugosa, Solidago nemoralis, Solidago juncea, Solidago canadensis, Solidago altissima, Euthamia graminifolia, Cerastium arvense, Oenothera biennis, Potentilla simplex, Symphyotrichum lateriflorum (= Aster lateriflorus), Symphyotrichum novae-angliae (= Aster novae-angliae), Symphyotrichum lanceolatum (= Aster simplex), Daucus carota, Ambrosia artemisiifolia, Vicia cracca, Trifolium* spp., and many others.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This herbaceous-dominated old field and pasture vegetation has been anthropogenically altered and/or maintained over time. It was observed at seven locations in the Central Appalachian project area. Sites range from flat summits to gentle or moderate mid and upper slopes. Soils are dry, rapidly to well-drained silt loam, sandy loam, and loam. The unvegetated surface is typically entirely covered by leaf litter. Evidence of disturbance includes past logging, clearing, mowing, grazing, and the prevalence of exotic plant species.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: This herbaceous-dominated old field and pasture vegetation has been anthropogenically altered and/or maintained over time. These are highly disturbed sites with many exotic plant species present.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association occurs on pastures and land that has been tilled. Generally, the fields are mowed at least annually.
Global Environment: This association occurs on pastures and land that has been tilled. Generally the fields are mowed at least annually.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The dense herbaceous layer is dominated by mixtures of native and introduced grasses and forbs, including *Dactylis glomerata, Phleum pratense, Euthamia graminifolia, Lolium pratense, Festuca* spp., *Solidago rugosa, Trifolium* spp., *Medicago* spp., *Setaria* spp., *Trifolium* spp., *Tridens flavus*, and other grass and/or forb species. *Rubus allegheniensis* is a common shrub. Scattered early-successional trees such as *Betula populifolia* may be present.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The herbaceous layer varies in composition and can include or be dominated by one or more of the following species: *Dactylis glomerata, Phleum pratense, Anthoxanthum odoratum, Festuca* spp., *Dichanthelium clandestinum, Poa pratensis, Euthamia graminifolia, Dennstaedtia punctilobula, Solidago* spp., and other grass and forb species. Scattered trees such as *Juniperus virginiana* and shrubs such as *Rubus allegheniensis* are possible.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: In addition to *Dactylis glomerata* and *Phleum pratense*, these grassy fields are characterized by graminoids, including *Agrostis stolonifera, Agrostis hyemalis, Elymus repens, Bromus inermis, Bromus tectorum, Lolium perenne, Poa pratensis, Poa compressa, Schizachyrium scoparium* (not in abundance), and *Anthoxanthum odoratum*. Forbs scattered among the grasses are varied but include *Achillea millefolium, Ambrosia artemisiifolia, Asclepias syriaca, Cerastium arvense, Daucus carota, Dennstaedtia punctilobula, Euthamia graminifolia, Hieracium* spp., *Oenothera biennis, Oxalis stricta, Potentilla simplex, Pteridium aquilinum, Solidago altissima, Solidago canadensis, Solidago juncea, Solidago nemoralis, Solidago rugosa, Symphyotrichum lanceolatum (= Aster simplex), Symphyotrichum lateriflorum (= Aster lateriflorus), Symphyotrichum novae-angliae (= Aster novae-angliae), Trifolium* spp., *Vicia cracca*, and many others.
Global Vegetation: In addition to *Dactylis glomerata* and *Phleum pratense*, these grassy fields are characterized by graminoids including *Agrostis stolonifera, Agrostis hyemalis, Elymus repens, Bromus inermis, Bromus tectorum, Lolium perenne, Poa pratensis, Poa compressa, Schizachyrium scoparium* (not in abundance), and *Anthoxanthum odoratum*. Forbs scattered among the grasses are varied but include *Hieracium* spp., *Oxalis stricta, Achillea*

millefolium, Asclepias syriaca, Solidago rugosa, Solidago nemoralis, Solidago juncea, Solidago canadensis, Solidago altissima, Euthamia graminifolia, Cerastium arvense, Oenothera biennis, Potentilla simplex, Symphyotrichum lateriflorum (= Aster lateriflorus), Symphyotrichum novae-angliae (= Aster novae-angliae), Symphyotrichum lanceolatum (= Aster simplex), Daucus carota, Ambrosia artemisiifolia, Vicia cracca, Trifolium spp., and many others.

Global Dynamics: These pastures and post-agricultural fields are largely composed of non-native cool-season grasses and herbs (generally of European origin) in the early stages of succession. The fields are typically mowed at least annually.

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (8-Dec-2005). This vegetation type includes pasture and post-agricultural fields and is largely composed of non-native grasses and herbs (generally of European origin).

RELATED CONCEPTS

Global Similar Types:

- *Lolium (arundinaceum, pratense)* Ruderal Grassland (CEGL004048)
- *Panicum virgatum - (Andropogon virginicus)* Ruderal Meadow (CEGL006616)
- *Phleum pratense - Bromus pubescens - Helenium autumnale* Ruderal Meadow (CEGL004018)
- *Schizachyrium scoparium - (Andropogon virginicus) - Solidago* spp. Ruderal Meadow (CEGL006333) has a greater component of native species and occurs on drier soils.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: When shrub cover exceeds 50%, classify as Northeastern Ruderal Shrubland (CEGL006451).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: Powerline rights-of-way are kept artificially open, likely by herbicides in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: No plots or observation points were collected, but the UMESC mapping team reported it at low elevation in New Hampshire and then along the Kennebec River in Maine.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Other Comments: None.
Global Classification Comments: *Schizachyrium scoparium - (Andropogon virginicus) - Solidago* spp. Ruderal Meadow (CEGL006333) is similar to this type but is dominated by warm-season grasses.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was observed within the Appalachian Trail corridor at Bluff City North and in the Paris area in Virginia, at Reno Mountain Road in Maryland, and in Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Unionville West in New Jersey and in Vermont but is wide-ranging in northeastern states.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: No plots or observation points were collected, but the UMESC mapping team reported it at low elevation in New Hampshire and then along the Kennebec River in Maine.
Global Range: This vegetation is quite wide-ranging in northeastern and midwestern states and possibly occurs at higher elevations in the southeastern states.

Group	Eastern North American Ruderal Meadow & Shrubland (G059)
Alliance	*Dactylis glomerata* - *Festuca* spp. - *Solidago canadensis* Ruderal Mesic Meadow Alliance (A1190)

ELEMENT CONCEPT

Global Summary: This vegetation type is currently known from high-elevation pastures or grass balds in the Southern Appalachians but is possible throughout the United States and in southern Canada. It represents montane grasslands with many alien species, presumably planted or introduced by grazing animals. *Phleum pratense*, a native of Europe, is characteristic. Occurrences are variable and patchy, often with local dominance of tall forbs. Other characteristic species include *Hieracium caespitosum (= Hieracium pratense)* (alien), *Potentilla canadensis*, and

Ranunculus acris (alien). Stands of this type are maintained by periodic mowing or, in some instances, prescribed burning.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: These pastures occur at high elevation (above 915 m [3,000 feet]). They are anthropogenically disturbed/managed fields, created and maintained by yearly mowing or grazing. The single sampled stand is located on a moderate, northeast-facing upper slope with dry-mesic, moderately well-drained silt loam soil. The unvegetated surface is made up entirely of leaf litter (100% cover). Evidence of disturbance includes mowing, trails, and the presence of exotic species.
Global Environment: This vegetation type is currently known from high-elevation pastures or grass balds in the Southern Appalachians but is possible throughout the United States and in southern Canada.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: These herbaceous (greater than 50% herbaceous cover) pastures are dominated by *Phleum pratense* and *Bromus* spp. These are less diverse pastures of anthropogenic origin and lack native species characteristic of more natural Grassy Balds (CEGL004242).
Global Vegetation: Stands of this type are maintained by periodic mowing or, in some instances, prescribed burning. *Phleum pratense*, a native of Europe, is characteristic. Occurrences are variable and patchy, often with local dominance of tall forbs. Other characteristic species include *Hieracium caespitosum (= Hieracium pratense)* (alien), *Potentilla canadensis*, and *Ranunculus acris* (alien). The nominals *Bromus pubescens* and *Helenium autumnale* are indicative of grazing.

A3934 *Poa compressa - Solidago nemoralis - Centaurea biebersteinii* Ruderal Dry Meadow & Shrubland Alliance

Alliance Summary Description: This alliance includes three variants of dry ruderal grasslands: (1) Dry semi-natural grasslands found on sandy or rock substrates and includes weedy native grasses *Festuca* spp., *Poa compressa*, and *Schizachyrium scoparium*, and an assortment of dry invasive forbs such as *Centaurea biebersteinii (= Centaurea maculosa)* and *Solidago nemoralis*; (2) Vegetation dominated by the weedy native *Andropogon virginicus var. virginicus* that occurs on old fields, pastures, and rocky sites. Associated species vary with geography and habitat and include a mix of native and exotic species; and (3) Invasive grass dune vegetation, including stands of the non-native sedge *Carex kobomugi* that invades and overtakes coastal sand dunes dominated by *Ammophila breviligulata* and/or *Panicum amarum var. amarum*. It is reported along the central New Jersey coast and at First Landing/Seashore State Park in Virginia.

[CEGL006333] *Schizachyrium scoparium - (Andropogon virginicus) - Solidago* spp. Ruderal Meadow

Translated Name: **Little Bluestem - (Broomsedge Bluestem) - Goldenrod species Ruderal Meadow**
Common Name: **Little Bluestem Old-field Meadow**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Eastern North American Ruderal Grassland & Shrubland (M123)
Group	Eastern North American Ruderal Meadow & Shrubland (G059)
Alliance	*Poa compressa - Solidago nemoralis - Centaurea biebersteinii* Ruderal Dry Meadow & Shrubland Alliance (A3934)

ELEMENT CONCEPT

Global Summary: This broadly defined vegetation type includes old fields of well-drained soils, either sandy or shallow to bedrock. They are characterized by dominance of warm-season grasses. *Schizachyrium scoparium* is characteristic and nearly always present. Species composition is variable, depending on land-use history, but in general this vegetation is quite wide-ranging in northeastern and midwestern states. In addition to the nominal

species, other associates may include *Andropogon virginicus, Eragrostis spectabilis, Festuca rubra, Deschampsia flexuosa, Danthonia spicata, Nuttallanthus canadensis (= Linaria canadensis), Rubus flagellaris, Panicum virgatum, Dichanthelium depauperatum (= Panicum depauperatum), Potentilla simplex, Dichanthelium meridionale (= Panicum meridionale), Dichanthelium dichotomum (= Panicum dichotomum), Solidago rugosa*, and *Carex pensylvanica*. Scattered shrubs are often present, including *Comptonia peregrina, Morella pensylvanica, Gaylussacia baccata*, and scattered tree saplings, such as *Prunus serotina, Sassafras albidum*, and *Juniperus virginiana*. *Polytrichum juniperinum* and other *Polytrichum* spp. are common bryophytes.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This broadly defined old-field vegetation association occurs on well-drained soils, either sandy or shallow to bedrock.
Global Environment: This vegetation occurs on well-drained soils, either on sandy flats or on dry knolls with shallow soils. The vegetation arises spontaneously after soil disturbance.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Schizachyrium scoparium* is characteristic and nearly always present. Species composition is variable, depending on land-use history.
Global Vegetation: *Schizachyrium scoparium* is characteristic and nearly always present. Species composition is variable, depending on land-use history, but in general, this vegetation is quite wide-ranging in northeastern and midwestern states. In addition to the nominal species, other associates may include *Andropogon virginicus, Eragrostis spectabilis, Festuca rubra, Deschampsia flexuosa, Centaurea biebersteinii (= Centaurea maculosa), Danthonia spicata, Hypericum perforatum, Nuttallanthus canadensis (= Linaria canadensis), Rubus flagellaris, Panicum virgatum, Dichanthelium depauperatum (= Panicum depauperatum), Potentilla simplex, Dichanthelium meridionale (= Panicum meridionale), Dichanthelium dichotomum (= Panicum dichotomum), Solidago juncea, Solidago nemoralis, Solidago rugosa, Hieracium* spp., and *Carex pensylvanica*. Scattered shrubs are often present, including *Comptonia peregrina, Morella pensylvanica, Gaylussacia baccata*, and scattered tree saplings, such as *Prunus serotina, Sassafras albidum*, and *Juniperus virginiana*.

Most Abundant Species

Appalachian National Scenic Trail (Lower New England Project Area)

Stratum	Lifeform	Species
Herb (field)	Graminoid	*Schizachyrium scoparium*

Global

Stratum	Lifeform	Species
Short shrub/sapling	Dwarf-shrub	*Rubus flagellaris*
Herb (field)	Flowering forb	*Solidago juncea*, *Solidago nemoralis*, *Solidago rugosa*
Herb (field)	Graminoid	*Schizachyrium scoparium*

Characteristic Species

Appalachian National Scenic Trail (Lower New England Project Area): *Schizachyrium scoparium*
Global: *Andropogon virginicus*, *Dichanthelium* spp., *Schizachyrium scoparium*, *Solidago juncea*, *Solidago nemoralis*, *Solidago rugosa*

Other Noteworthy Species

Global: Other Plants: *Panicum virgatum* (G5)

Conservation Status Rank

Global Rank & Reasons: GNA (invasive) (19-Jan-2006). This vegetation type includes pasture and post-agricultural fields.

Related Concepts

Global Similar Types:
- *Dactylis glomerata - Phleum pratense - Festuca* spp. - *Solidago* spp. Ruderal Meadow (CEGL006107)
- *Lolium (arundinaceum, pratense)* Ruderal Grassland (CEGL004048)
- *Panicum virgatum - (Andropogon virginicus)* Ruderal Meadow (CEGL006616)
- *Phleum pratense - Bromus pubescens - Helenium autumnale* Ruderal Meadow (CEGL004018)

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community was not sampled in the field but is likely to occur within the corridor.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type is distinguished, in theory, from the very similar *Dactylis glomerata - Phleum pratense - Festuca* spp. - *Solidago* spp. Ruderal Meadow (CEGL006107) by the dominance of warm-season grasses as opposed to cool-season grasses (*Phleum, Festuca*) dominating CEGL006107. Additional data will be required to see how this distinction holds up and what geographic differences might accompany such a distinction.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: Not observed, but expected in the Lower New England AT corridor. It was mapped in a successional grass map class.
Global Range: This vegetation is quite wide-ranging in northeastern and midwestern states, and possibly occurs at higher elevations in the southeastern states.

A3935 *Rhamnus cathartica - Rosa multiflora - Elaeagnus umbellata* Ruderal Mesic Shrubland Alliance

Alliance Summary Description: This alliance is common in former agricultural areas in the northeastern and midwestern United States and temperate regions of eastern Canada. It comprises primarily shrubby old fields dominated by exotic shrubs, such as *Berberis thunbergii, Elaeagnus angustifolia, Euonymus alatus, Lonicera japonica, Lonicera morrowii, Ligustrum vulgare, Rhamnus cathartica*, and *Rosa multiflora*, as well as weedy natives, such as *Cornus racemosa, Rhus glabra, Rhus typhina*, and *Viburnum prunifolium* Less commonly, *Gaylussacia baccata, Vaccinium pallidum, Vaccinium stamineum*, and/or *Vaccinium angustifolium* may be dominant. Sapling or small trees are often present but form <10% cover; they include exotic trees such as *Robinia pseudoacacia*, and many weedy natives, such as *Acer rubrum, Betula populifolia, Cornus florida, Fraxinus americana, Juglans nigra, Juniperus virginiana, Populus deltoides, Prunus serotina*, and *Prunus virginiana*. The herbaceous layer is variable depending on the density of shrub cover. Common species include exotics such as *Achillea millefolium, Agrostis gigantea, Alliaria petiolata, Anthoxanthum odoratum, Bromus inermis, Centaurea* spp., *Daucus carota, Galium mollugo, Lolium arundinaceum (= Schedonorus arundinaceum), Trifolium repens*, as well as weedy natives such as *Euthamia graminifolia, Festuca rubra, Monarda fistulosa, Oxalis stricta, Poa pratensis, Solidago rugosa, Solidago gigantea*, and *Solidago nemoralis*, among many others. Vines can be absent or dominant, sometimes covering the tall and short shrubs. Common vines are exotic *Celastrus orbiculata* and *Lonicera japonica*, and weedy natives such as *Parthenocissus quinquefolia, Toxicodendron radicans, Vitis aestivalis*, and *Vitis labrusca*.

[CEGL006451] *Elaeagnus umbellata - Cornus racemosa - Rosa multiflora - Juniperus virginiana* Ruderal Shrubland

Translated Name: **Autumn-olive - Gray Dogwood - Multiflora Rose - Eastern Red-cedar Ruderal Shrubland**
Common Name: **Northeastern Ruderal Shrubland**

USNVC Classification

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Eastern North American Ruderal Grassland & Shrubland (M123)
Group	Eastern North American Ruderal Meadow & Shrubland (G059)
Alliance	*Rhamnus cathartica - Rosa multiflora - Elaeagnus umbellata* Ruderal Mesic Shrubland Alliance (A3935)

Element Concept

Global Summary: This association comprises shrubby old fields dominated by thickets of *Elaeagnus angustifolia, Cornus racemosa, Viburnum prunifolium, Lonicera japonica, Lonicera morrowii, Ligustrum vulgare, Euonymus alatus, Rosa multiflora, Rhus glabra*, and *Rhus typhina*, with patches of herbaceous vegetation among the shrubs. Shorter shrubs include *Berberis thunbergii* and *Rubus* spp., and in some fields *Gaylussacia baccata, Vaccinium pallidum, Vaccinium stamineum*, and/or *Vaccinium angustifolium*. Small trees are often present but form <25% cover; they include *Juniperus virginiana, Betula populifolia, Prunus virginiana, Cornus florida, Acer rubrum, Juglans nigra, Prunus serotina, Robinia pseudoacacia*, and *Fraxinus americana*. The herbaceous layer is variable depending on the density of shrub cover. Typical species are those associated with old fields, grasslands, and agricultural sites. Common species include *Solidago rugosa, Solidago gigantea, Solidago nemoralis, Monarda fistulosa, Anthoxanthum odoratum, Poa pratensis, Oxalis stricta, Viola sororia, Euthamia graminifolia, Festuca rubra, Schizachyrium scoparium, Pycnanthemum virginianum, Alliaria petiolata, Galium mollugo, Potentilla simplex, Achillea millefolium, Daucus carota, Trifolium repens, Bromus inermis, Agrostis gigantea*, and *Elymus repens (= Elytrigia repens)*, among many others. Vines can be absent or dominant, sometimes covering the tall and short shrubs. Common vines are *Vitis aestivalis, Vitis labrusca, Toxicodendron radicans, Celastrus orbiculata, Parthenocissus quinquefolia*, and *Lonicera japonica*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This tall, typically closed-canopy shrubland thicket occurs on old fields, pastures, or modified lands. It was sampled at 10 locations in the Central Appalachian project area. Sites range from gentle to moderate lower to upper slopes of any aspect. Soils are dry to dry-mesic, mostly well-drained clay loam, silt loam, sandy loam, and loam. The unvegetated surface may be made up entirely of leaf litter or consist of a mix of large and small rocks, downed wood and/or bare soil. Evidence of disturbance includes past logging/clearing and the presence of exotic plant species.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: This successional shrubland occurs on old fields, pastures, or modified lands. These are highly disturbed sites with many exotic plant species present.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association occurs on former agricultural lands and old fields that are no longer intensively mowed, plowed or managed. These sites contain moderately well-drained to well-drained soils. The shrublands are flat to gently sloping, often bounded by stonewalls or fencerows.
Global Environment: This association occurs on former agricultural lands and old fields that are no longer intensively mowed, plowed or managed. These sites contain moderately well-drained to well-drained soils. The shrublands are flat to gently sloping, often bounded by stonewalls or fencerows.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This association is dominated by an admixture of non-native and native shrubs and vines such as *Elaeagnus umbellata, Rubus allegheniensis, Smilax rotundifolia, Rosa multiflora, Lonicera morrowii, Celastrus orbiculata, Vitis labrusca, Parthenocissus quinquefolia, Lonicera japonica, Ligustrum vulgare, Juniperus virginiana*, and other early-successional trees (<25% in cover). Old-field grasses and forbs such as *Daucus carota* and *Euthamia graminifolia* are common in more open-canopied variants where tall and short shrubs cover at least 25% of the field.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These successional shrubland thickets are dominated by an admixture of non-native and native shrubs such as *Elaeagnus umbellata, Rubus allegheniensis, Rosa multiflora, Lonicera morrowii, Celastrus orbiculata, Lonicera japonica, Ligustrum*

vulgare, Juniperus virginiana, Prunus pensylvanica, Prunus serotina, Rhus typhina, Amelanchier arborea, and other small trees (<25% in cover). Old-field grasses, forbs, and ferns are common in more open-canopied variants where tall and short shrubs cover at least 25% of the field. *Lonicera morrowii* and *Schizachyrium scoparium* are the dominant shrub and herb, respectively, in the sampled plot along this section of the trail.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The structure of this association varies from open fields with scattered tall and short shrubs covering 25% of the field, with herbaceous vegetation in the interstices, to dense "closed-canopy" tall shrublands with sparse ground layer vegetation. Common shrubs include *Elaeagnus angustifolia, Cornus racemosa, Viburnum prunifolium, Lonicera japonica, Lonicera morrowii, Ligustrum vulgare, Euonymus alatus, Rosa multiflora, Rhus glabra*, and *Rhus typhina*, with patches of herbaceous vegetation among the shrubs. Shorter shrubs include *Berberis thunbergii* and *Rubus* spp., and in some fields, *Gaylussacia baccata, Vaccinium pallidum, Vaccinium stamineum*, and/or *Vaccinium angustifolium*. Small trees are often present but form <25% cover; they include *Juniperus virginiana, Betula populifolia, Prunus virginiana, Cornus florida, Acer rubrum, Juglans nigra, Prunus serotina, Robinia pseudoacacia*, and *Fraxinus americana*. The herbaceous layer is variable depending on the density of shrub cover. Typical species are those associated with old fields, grasslands, and agricultural sites. Common species include *Solidago rugosa, Solidago gigantea, Solidago nemoralis, Monarda fistulosa, Anthoxanthum odoratum, Poa pratensis, Oxalis stricta, Viola sororia, Euthamia graminifolia, Festuca rubra, Schizachyrium scoparium, Pycnanthemum virginianum, Alliaria petiolata, Galium mollugo, Potentilla simplex, Achillea millefolium, Daucus carota, Trifolium repens, Bromus inermis, Agrostis gigantea*, and *Elymus repens (= Elytrigia repens)*, among many others. Vines can be absent or dominant, sometimes covering the tall and short shrubs. Common vines are *Vitis aestivalis, Vitis labrusca, Toxicodendron radicans, Celastrus orbiculata, Parthenocissus quinquefolia*, and *Lonicera japonica*.

Global Vegetation: The structure of this association varies from open fields with scattered tall and short shrubs covering 25% of the field, with herbaceous vegetation in the interstices, to dense "closed-canopy" tall shrublands with sparse ground layer vegetation. Common shrubs include *Elaeagnus angustifolia, Cornus racemosa, Viburnum prunifolium, Lonicera japonica, Lonicera morrowii, Ligustrum vulgare, Euonymus alatus, Rosa multiflora, Rhus glabra*, and *Rhus typhina*, with patches of herbaceous vegetation among the shrubs. Shorter shrubs include *Berberis thunbergii* and *Rubus* spp., and in some fields *Gaylussacia baccata, Vaccinium pallidum, Vaccinium stamineum*, and/or *Vaccinium angustifolium*. Small trees are often present but form <25% cover; they include *Juniperus virginiana, Betula populifolia, Prunus virginiana, Cornus florida, Acer rubrum, Juglans nigra, Prunus serotina, Robinia pseudoacacia*, and *Fraxinus americana*. The herbaceous layer is variable depending on the density of shrub cover. Typical species are those associated with old fields, grasslands, and agricultural sites. Common species include *Solidago rugosa, Solidago gigantea, Solidago nemoralis, Monarda fistulosa, Anthoxanthum odoratum, Poa pratensis, Oxalis stricta, Viola sororia, Euthamia graminifolia, Festuca rubra, Schizachyrium scoparium, Pycnanthemum virginianum, Alliaria petiolata, Galium mollugo, Potentilla simplex, Achillea millefolium, Daucus carota, Trifolium repens, Bromus inermis, Agrostis gigantea*, and *Elymus repens (= Elytrigia repens)*, among many others. Vines can be absent or dominant, sometimes covering the tall and short shrubs. Common vines are *Vitis aestivalis, Vitis labrusca, Toxicodendron radicans, Celastrus orbiculata, Parthenocissus quinquefolia*, and *Lonicera japonica*.

Global Dynamics: This association develops as woody species colonize open fields, typically from the outer edges of the field into the center or as scattered clumps throughout the field.

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (23-Jun-2006).

Related Concepts

Global Similar Types:
- *Cornus (amomum, sericea) - Viburnum dentatum - Rosa multiflora* Ruderal Shrub Swamp (CEGL006576)
- *Gaylussacia baccata - Vaccinium pallidum - Vaccinium corymbosum* Shrubland (CEGL006622)

Classification

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community differs from Successional Heath Shrubland (CEGL006622) by the dominance of exotic shrubs and vines.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Some of the old-field sites in Vermont have been burned to keep them open and have since grown in with shrub vegetation.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: Limited to the Lower New England ecoregion (not project area), Successional Heath Shrubland (CEGL006622) was expanded to pickup the "native" successional shrublands in the Northern Appalachian project area. However, this is only in the Northern Appalachian project area since there was more than enough non-native invasion in the southern lobe of the Northern Appalachian Mountains ecoregion (Lower New England project area) to continue to use Northeastern Ruderal Shrubland (CEGL006451). I believe that we used Sanitorium Road - NH 25 as the official split between the two ecoregions in the Northern Appalachian project area.
Global Classification Comments: This is a broadly defined type intended for shrubby vegetation on abandoned cropland or pasture.

Element Distribution

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was observed within the AT corridor in Pennsylvania, Virginia (Front Royal), and West Virginia (Harpers Ferry).
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Housatonic Valley - Buck Hill in Connecticut but is wide-ranging in northeastern states.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is believed to occur in the Northern Appalachian project area, but no plots or observation points have been collected.
Global Range: This community is common in former agricultural areas in the northeastern U.S.
Nations: US
States/Provinces: CT, DE, MA, NJ, NY, PA, VA, WV

M505. Laurentian-Acadian Acidic Rocky Scrub & Grassland

G788. LAURENTIAN-ACADIAN ACIDIC SCRUB & GRASSLAND

Group Summary Description: This Laurentian and near-boreal outcrop group is found across central southern Canada and the upper Midwest of the United States. It is found on ridges or summits of resistant acidic bedrock at low to mid elevations with soils ranging from sands to loams. The vegetation is patchy, often a mosaic of woodlands and open glades and typically dominated by various conifers, including *Pinus banksiana* and *Picea mariana*, with occasional *Picea glauca* or *Populus tremuloides*. Hardwoods include *Quercus rubra, Quercus ellipsoidalis*, and *Populus tremuloides*. Structure can vary from treed to low heath shrubs to open lichen woodland. Common grass species include *Danthonia spicata, Oryzopsis asperifolia*, and *Poa compressa*. Dwarf-shrubs include *Comptonia peregrina, Juniperus* spp. and *Vaccinium* spp. *Pteridium aquilinum* may form an almost continuous canopy of fronds in some stands. Exposure and occasional fire are the major factors in keeping the vegetation relatively open.

A4110 *Vaccinium angustifolium - Vaccinium myrtilloides* Rocky Heath Alliance

Alliance Summary Description:

[CEGL005094] *Vaccinium angustifolium - Sorbus americana / Sibbaldiopsis tridentata* Dwarf-shrubland

Translated Name: **Lowbush Blueberry - American Mountain-ash / Shrubby Fivefingers Dwarf-shrubland**
Common Name: **Blueberry Granite Barrens**

USNVC CLASSIFICATION

Division	Eastern North American Grassland & Shrubland (2.B.2.Nc)
Macrogroup	Laurentian-Acadian Acidic Rocky Scrub & Grassland (M505)
Group	Laurentian-Acadian Acidic Scrub & Grassland (G788)
Alliance	*Vaccinium angustifolium - Vaccinium myrtilloides* Rocky Heath Alliance (A4110)

ELEMENT CONCEPT

Global Summary: This northern or high-elevation acidic rock heath barren occurs in the glaciated northeastern states on rocky ridges, outcrops and summits. It includes patches of shrub dominance as well as areas of bedrock-dominated sparse vegetation. The soils are shallow, well-drained, dry, acidic, coarse sands. Expanses of exposed bedrock are typical, with minimal soil development restricted to crevices or shelter areas. Elevations of known examples range from almost sea level on the Maine coast to about 825 m (2700 feet) inland. The physiognomy of this community is patchy and variable, ranging from woodland to shrubland to sparsely vegetated rock. A tree canopy is absent or poorly developed, usually consisting of scattered and stunted trees with less than 10% cover. Tall shrubs are scattered, mostly in somewhat protected areas. Dwarf-shrubs are the most extensive layer, with up to 75% cover. Herbs are sparse and confined to rock crevices and depressions. The bryoid layer varies from sparse to well-developed, with both lichens and mosses represented. Tree species include *Picea rubens, Abies balsamea, Quercus rubra, Pinus strobus, Betula papyrifera, Betula populifolia*, or *Acer rubrum*. Scattered tall shrubs include *Sorbus americana, Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Photinia melanocarpa (= Aronia melanocarpa), Comptonia peregrina*, or *Amelanchier* spp. Prominent dwarf heath shrubs include *Vaccinium angustifolium, Vaccinium myrtilloides, Vaccinium pallidum, Gaylussacia baccata, Arctostaphylos uva-ursi*, and *Kalmia angustifolia*. The sparse herb layer includes graminoids such as *Deschampsia flexuosa, Danthonia spicata, Carex lucorum, Schizachyrium scoparium*, and *Piptatherum pungens (= Oryzopsis pungens)*, and the forbs *Sibbaldiopsis tridentata, Solidago simplex var. randii, Minuartia glabra, Maianthemum canadense, Gaultheria procumbens, Trientalis borealis*, and *Pteridium aquilinum*. Abundant mosses and lichens form a bryophyte layer characterized by *Polytrichum commune, Polytrichum juniperinum, Polytrichum piliferum, Dicranum polysetum*, and *Cladonia* and *Cladina* lichens. These heath balds are distinguished by the presence of boreal species such as *Sorbus americana* and *Sibbaldiopsis tridentata* combined with temperate species such as *Quercus rubra, Quercus prinus, Carex pensylvanica, Carex lucorum*, and *Betula populifolia*. They can be floristically similar to *(Pinus strobus, Quercus rubra) / Danthonia spicata* Acidic Bedrock Scrub Grassland (CEGL005101), but those have more (albeit scattered) trees and graminoids more abundant than dwarf-shrubs.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is only known from one location in Maine at 370 m (1,215 feet) elevation on a moderately sloping bedrock outcrop with a southerly aspect. Soils are thin and rapidly drained.

Global Environment: This northern or high-elevation acidic rock heath barren occurs in the glaciated northeastern states on rocky ridges, outcrops and summits. It includes patches of shrub dominance as well as areas of bedrock-dominated sparse vegetation. The soils are shallow, well-drained, dry, acidic, coarse sands. Expanses of exposed bedrock are typical, with minimal soil development restricted to crevices or shelter areas. Elevations of known examples range from almost sea level on the Maine coast to about 825 m (2700 feet) inland.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only known occurrence of this association is a rock heath barren dominated by an open shrub layer of *Vaccinium myrtilloides* with saplings of *Betula papyrifera, Picea rubens*, and *Pinus strobus* scattered throughout the site. The herbaceous layer is dominated by the grass *Deschampsia flexuosa* with lesser amounts of *Aralia hispida* and *Maianthemum canadense*. The rock surfaces are strongly dominated by *Cladina* spp.

Global Vegetation: The physiognomy of this community is patchy and variable, ranging from woodland to shrubland to sparsely vegetated rock. A tree canopy is absent or poorly developed, usually consisting of scattered and stunted trees with less than 10% cover. Tall shrubs are scattered, mostly in somewhat protected areas. Dwarf-shrubs are the most extensive layer, with up to 75% cover. Herbs are sparse and confined to rock crevices and depressions. The bryoid layer varies from sparse to well-developed, with both lichens and mosses represented. Tree species include *Picea rubens, Abies balsamea, Quercus rubra, Pinus strobus, Betula papyrifera, Betula populifolia*, or *Acer rubrum*. Scattered tall shrubs include *Sorbus americana, Viburnum nudum var. cassinoides, Nemopanthus mucronatus, Photinia melanocarpa (= Aronia melanocarpa), Comptonia peregrina*, or *Amelanchier* spp. Prominent dwarf heath shrubs include *Vaccinium angustifolium, Vaccinium myrtilloides, Vaccinium pallidum, Gaylussacia baccata, Arctostaphylos uva-ursi*, and *Kalmia angustifolia*. The sparse herb layer includes graminoids such as *Deschampsia flexuosa, Danthonia spicata, Carex lucorum, Schizachyrium scoparium*, and *Piptatherum pungens (= Oryzopsis pungens)*, and the forbs *Sibbaldiopsis tridentata, Solidago simplex var. randii, Minuartia glabra, Maianthemum canadense, Gaultheria procumbens, Trientalis borealis*, and *Pteridium aquilinum*. Abundant mosses and lichens form a bryophyte layer characterized by *Polytrichum commune, Polytrichum juniperinum, Polytrichum piliferum, Dicranum polysetum*, and *Cladonia* and *Cladina* lichens.

2.B.2.NE. SOUTHEASTERN NORTH AMERICAN GRASSLAND & SHRUBLAND

M307. Southeastern Ruderal Grassland & Shrubland

G583. SOUTHEASTERN RUDERAL GRASSLAND & SHRUBLAND

Group Summary Description: This group comprises vegetation that occurs on disturbed sites that were cleared and the soils disturbed (e.g., old fields, abandoned quarries, old homesteads, etc.). Stands may be composed of native or exotic species, or combinations of these. These are combinations of taxa for which no natural analog exists. In the southeastern Piedmont, the herbs and grasses that dominate old fields undergo a rapid turnover in the first three years after abandonment. By the third year, *Andropogon virginicus* often is the dominant plant. Before it achieves dominance, *Ambrosia artemisiifolia, Conyza canadensis, Digitaria sanguinalis*, and *Symphyotrichum pilosum* may be more prominent. Other perennial grasses may include *Andropogon gyrans, Andropogon ternarius*, and *Dichanthelium dichotomum*. Shrubs and vines appear in these communities, and some genera may form stands, including the native genera *Baccharis, Cornus, Prunus, Rubus*, and *Sophora secundiflora* (in Texas), as well as the exotics *Ligustrum, Pueraria*, and *Wisteria*. This variation is accommodated at the alliance level within this group, as in the absence of disturbance, small trees rapidly overtake them and become dominant.

A3321 *Andropogon virginicus - Ambrosia artemisiifolia - Conyza canadensis* Eastern Ruderal Grassland Alliance

Alliance Summary Description: This alliance encompasses a variety of herbaceous vegetation that occurs in the eastern United States on sites that were cleared and the soils disturbed (e.g., old fields, abandoned quarries, old homesteads). Stands are composed of combinations of native and/or exotic species for which no natural analog exists. These species include *Ambrosia artemisiifolia, Andropogon virginicus var. virginicus, Conyza canadensis, Cynodon dactylon, Eremochloa ophiuroides, Eupatorium* spp., *Imperata cylindrica, Lolium arundinaceum, Lolium pratense, Paspalum notatum, Pennisetum glaucum, Solidago* spp., *Sorghum halepense, Stenotaphrum secundatum*, and *Urochloa ramosa*. Scattered shrubs may be present, including *Rhus copallinum*. In the southeastern Piedmont, the herbs and grasses that dominate old fields undergo a rapid turnover in the first three years after abandonment. By the third year, *Andropogon virginicus* often is the dominant plant. Before it achieves dominance, *Ambrosia artemisiifolia, Conyza canadensis, Digitaria sanguinalis*, and *Symphyotrichum pilosum* may be more prominent; other combinations of native and exotic species also may occur.

[CEGL004044] *Andropogon virginicus var. virginicus* Ruderal Grassland

Translated Name: **Broomsedge Bluestem Ruderal Grassland**
Common Name: **Broomsedge Old-field Grassland**

USNVC CLASSIFICATION

Division	Southeastern North American Grassland & Shrubland (2.B.2.Ne)
Macrogroup	Southeastern Ruderal Grassland & Shrubland (M307)
Group	Southeastern Ruderal Grassland & Shrubland (G583)
Alliance	*Andropogon virginicus - Ambrosia artemisiifolia - Conyza canadensis* Eastern Ruderal Grassland Alliance (A3321)

ELEMENT CONCEPT

Global Summary: This association includes herbaceous-dominated vegetation that has been anthropogenically altered and/or maintained, especially on old fields and pastures. Examples support predominately native species or a mixture of native and exotic species, one of the most dominant or characteristic species being *Andropogon virginicus var. virginicus*. *Lolium pratense (= Festuca pratensis)* can dominate fields early in the season. This is a very common and wide-ranging association that can be quite variable in terms of species composition. Additional components are other perennial grasses and herbaceous species, most with pioneer or weedy tendencies, the exact composition of which will vary with geography, management history, and habitat.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This vegetation typically occurs on old fields, pastures, and rocky sites. It will persist indefinitely under a regular mowing regime, e.g., in powerline corridors. It occurs at high elevations within the AT corridor. One site was observed in Giles County, Virginia, in the Central Appalachian project area.
Global Environment: This vegetation typically occurs on old fields, pastures, and rocky sites. It will persist indefinitely under a regular mowing regime, e.g., in powerline corridors.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: Old fields and pastures dominated by *Andropogon virginicus var. virginicus*. *Lolium pratense* can dominate fields early in the season.
Global Vegetation: Stands of this community are dominated by *Andropogon virginicus var. virginicus*, sometimes codominant with *Lolium pratense*. Associated species vary with geography and habitat and include typical pioneer species. Species with high cover values in plot samples attributed to this type include *Tridens flavus, Setaria parviflora (= Setaria geniculata), Eragrostis spectabilis*, and *Panicum anceps* (NatureServe Ecology unpubl. data). On the eastern Highland Rim of Tennessee (Arnold Air Force Base), associated species include *Diodia teres, Aristida dichotoma, Aristida oligantha, Packera anonyma (= Senecio anonymus), Paspalum laeve, Lespedeza virginica*, and *Plantago virginica*. *Rubus argutus* and *Smilax* spp. may be locally abundant but are not dominant. In clearcuts, *Schizachyrium scoparium, Danthonia spicata*, and *Dichanthelium* spp. are also common, as are occasional *Quercus* spp. and *Rubus argutus*. The plot at Shiloh National Military Park (western Tennessee) was a mowed field of mostly native species, dominated by *Andropogon virginicus var. virginicus*. *Paspalum setaceum* and *Tridens flavus* were codominant (with less cover). Other herbaceous plants with high cover values were *Setaria parviflora (= Setaria geniculata), Diodia teres, Schizachyrium scoparium*, and less common were *Packera anonyma, Sorghum halepense*, and *Cyperus retrorsus*. At less than 1% cover were *Polypremum procumbens, Oxalis stricta, Eragrostis spectabilis, Salvia lyrata, Solanum carolinense, Digitaria sanguinalis, Panicum anceps, Croton willdenowii (= Crotonopsis elliptica), Trifolium pratense, Kummerowia striata, Coreopsis pubescens, Plantago lanceolata*, and *Mecardonia acuminata*. At only a trace amount of cover were *Conyza canadensis, Acalypha virginica, Solidago* sp., *Erigeron annuus, Sida spinosa, Hypericum drummondii, Polygala verticillata, Eupatorium capillifolium, Passiflora incarnata*, and *Asclepias amplexicaulis*. In West Virginia, common associates include *Sorghastrum nutans, Dichanthelium clandestinum, Anthoxanthum odoratum, Phleum pratense, Dactylis glomerata, Daucus carota, Lotus corniculatus, Trifolium pratense, Leucanthemum vulgare, Solidago canadensis, Solidago rugosa*, and *Solidago nemoralis*.
Global Dynamics: This association may develop temporarily following clear-cutting, and will persist indefinitely under a regular mowing regime, e.g., in powerline corridors and maintained fields. If undisturbed, these grasslands will rapidly succeed to shrubs, and eventually to tree species.

Macrogroup	Southeastern Ruderal Grassland & Shrubland (M307)
Group	Southeastern Ruderal Grassland & Shrubland (G583)
Alliance	*Andropogon virginicus - Ambrosia artemisiifolia - Conyza canadensis* Eastern Ruderal Grassland Alliance (A3321)

ELEMENT CONCEPT

Global Summary: This association includes grassland pastures and hayfields, more-or-less cultural, though sometimes no longer actively maintained. It is currently defined for the Central and Southern Appalachians, Ozarks, Ouachita Mountains, and parts of the Piedmont and Interior Low Plateau, but it is possible throughout much of the eastern United States and southern Canada. The dominant species in this type are the European "tall or meadow fescues" (*Lolium* or *Schedonorus* spp.) of uncertain and controversial generic placement. Several other exotic grasses, including *Agrostis gigantea, Dactylis glomerata, Holcus lanatus, Phleum pratense*, and *Poa pratensis*, are common associates. These communities are sometimes nearly monospecific but can also be very diverse and contain many native as well as exotic species of grasses, sedges, and forbs. Exotic forbs include the legumes *Lespedeza cuneata, Trifolium campestre, Trifolium hybridum, Trifolium pratense*, and *Trifolium repens*, as well as *Achillea millefolium var. occidentalis, Calystegia sepium, Daucus carota, Leucanthemum vulgare, Oxalis stricta*, and *Plantago lanceolata*. Common native herbs include *Apocynum cannabinum, Desmodium canescens, Dichanthelium clandestinum, Erigeron annuus, Fragaria virginiana, Potentilla simplex, Solanum carolinense, Solidago canadensis*, and *Verbesina occidentalis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: Cultivated meadows occur at low to intermediate elevation (below 915 m [3,000 feet]). They are anthropogenically disturbed/managed fields, created and maintained by yearly mowing or grazing.

Global Environment: This association includes grassland pastures and hayfields, more-or-less cultural, though sometimes no longer actively maintained. It occurs in areas which have been cleared in the past, including abandoned farmlands, strip mines, and other areas disturbed by human activities.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This herbaceous association (greater than 50% herbaceous cover) is dominated by mixtures of introduced *Lolium (= Festuca)* spp. and other grasses and/or forb species.

Global Vegetation: This association represents early-successional herbaceous and herb-shrub vegetation dominated by or having a large component of exotic grasses and legumes. The dominant species in this association are the European "tall or meadow fescues" (*Lolium* or spp.). These communities are sometimes nearly monospecific but can also be very diverse and contain many native species of grasses, sedges, and forbs. Woody encroachment is restricted to low cover by *Toxicodendron radicans* and species of *Rubus*, both of which become more abundant in older stands. Scattered individuals of various shrubs may be present, including *Crataegus crus-galli, Fraxinus pennsylvanica, Fraxinus americana, Rosa multiflora, Robinia pseudoacacia, Cornus florida, Elaeagnus umbellata, Sambucus canadensis (= Sambucus nigra ssp. canadensis)*, and *Sassafras albidum*. In the Central Appalachians and northern Cumberlands, the dominant exotic grasses include *Agrostis gigantea, Dactylis glomerata, Holcus lanatus, Lolium pratense, Phleum pratense*, and *Poa pratensis*. Exotic forbs include the legumes *Lespedeza cuneata, Trifolium campestre, Trifolium hybridum, Trifolium pratense*, and *Trifolium repens*, as well as *Achillea millefolium var. occidentalis, Calystegia sepium, Daucus carota, Leucanthemum vulgare, Oxalis stricta*, and *Plantago lanceolata*. Common native herbs include *Apocynum cannabinum, Desmodium canescens, Dichanthelium clandestinum, Erigeron annuus, Fragaria virginiana, Potentilla simplex, Solanum carolinense, Solidago canadensis*, and *Verbesina occidentalis*. In the Black Belt region of Alabama and Mississippi, it is commonly found in mixture with *Paspalum dilatatum* (Bransby n.d.), and the exotic *Bromus tectorum* may be present in stands.

Global Dynamics: This association varies greatly depending upon past land use and recent history of the site. Some examples that have been recently farmed may be monocultures of *Lolium*, whereas other fields that were traditionally lightly grazed may have much higher diversity. If not grazed, periodically mowed or burned, vegetation will succeed towards woody physiognomy.

- *Schizachyrium scoparium* - *(Andropogon virginicus)* - *Solidago* spp. Ruderal Meadow (CEGL006333)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This association is currently documented from the southern half of the Central Appalachians through the Southern Appalachians.
Global Classification Comments: *Lolium pratense* and *Lolium arundinaceum* are two closely related species which were traditionally treated as *Festuca pratensis (= Festuca elatior)* and *Festuca arundinacea*, and could alternately be treated as *Schedonorus pratensis* and *Schedonorus arundinaceus*. Conversion to Kartesz (1999) standard has necessitated the shift to the *Lolium* names from *Festuca*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This association is currently documented from the southern half of the Central Appalachians through the Southern Appalachians.
Global Range: This association is currently documented from the southern half of the Central Appalachians through the Gulf Coastal Plain and west to the Ozarks and Ouachitas. It is possible throughout much of the eastern United States.

A4082 *Pueraria montana - Wisteria sinensis* Exotic Ruderal Vine-Shrubland Alliance

Alliance Summary Description: This alliance encompasses a variety of vine-dominated vegetation that occurs in the eastern United States on sites that were cleared and the soils disturbed (e.g., old fields, abandoned quarries, old homesteads). Stands may be composed of exotic vine species, particularly *Pueraria montana var. lobata* and *Wisteria sinensis*. These are combinations of taxa for which no natural analog exists in North America.

[CEGL003882] *Pueraria montana var. lobata* Ruderal Vine-Shrubland

Translated Name: **Kudzu Ruderal Vine-Shrubland**
Common Name: **Ruderal Kudzu Vineland**

USNVC CLASSIFICATION

Division	Southeastern North American Grassland & Shrubland (2.B.2.Ne)
Macrogroup	Southeastern Ruderal Grassland & Shrubland (M307)
Group	Southeastern Ruderal Grassland & Shrubland (G583)
Alliance	*Pueraria montana - Wisteria sinensis* Exotic Ruderal Vine-Shrubland Alliance (A4082)

ELEMENT CONCEPT

Global Summary: This vine-dominated vegetation is dominated by *Pueraria montana var. lobata*, a fast-growing vine native to Asia. The species was introduced into the United States in 1885, primarily as an ornamental and as a potential source for cattle forage. It was subsequently widely used for erosion control in the southeastern United States. This association occupies a variety of sites throughout most physiographic provinces in the Southeast, ranging in size from less than a hectare to 5-10 hectares or more. It chokes out existing vegetation. Edges of examples of this vegetation may consist of small to large trees in the process of being overwhelmed by kudzu. More than 2 million acres of forest land in Alabama, Georgia, Mississippi, Tennessee, North Carolina, and South Carolina are estimated to be infested with kudzu. This association is also known to occur north to central Kentucky, Virginia, and Maryland, and as far west as eastern Texas and Oklahoma.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This invasive community occurs on altered, plowed, farmed, and planted lands. It was observed in Amherst County, Virginia, in the Central Appalachian project area.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This non-native vegetation is expected to occur on disturbed sites, including parking and heavily used camping areas.
Global Environment: The association occupies a variety of sites throughout most physiographic provinces in the southeastern U.S., with examples ranging in size from less than one hectare to 5-10 hectares or more. It occurs on disturbed sites, including abandoned town sites and mine lands and on landslides. It chokes out existing vegetation. Edges of examples of this vegetation may consist of small to large trees in the process of being overwhelmed by kudzu. In West Virginia, *Pueraria montana var. lobata* may be limited in its ability to spread due to relatively cold climate.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This vegetation is dominated by *Pueraria montana var. lobata*.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This vine-shrubland vegetation is dominated almost exclusively by the invasive exotic *Pueraria montana*. Small to large trees in the process of being overwhelmed by kudzu may occur along stand edges.
Global Vegetation: This vine-dominated vegetation is dominated by *Pueraria montana var. lobata*, a fast-growing vine native to Asia.
Global Dynamics: This association chokes out existing vegetation.

A3322 *Rubus* spp. - *Prunus* spp. - *Cornus drummondii* Eastern Ruderal Shrubland Alliance

Alliance Summary Description: This alliance encompasses a variety of semi-natural native shrub-dominated vegetation that occurs in the eastern United States on sites that were cleared and the soils disturbed (e.g., old fields, abandoned quarries, old homesteads). Stands are primarily composed of native species. A variety of *Rubus* species (the taxa depending on biogeography) may be dominant in stands of one association, but other combinations of native species also occur, including *Baccharis halimifolia, Cornus drummondii, Prunus angustifolia*, other *Prunus* spp., and *Smilax* spp. These are combinations of taxa for which no natural analog exists.

[CEGL004732] *Rubus (argutus, trivialis) - Smilax (glauca, rotundifolia)* Ruderal Shrubland

Translated Name: **(Sawtooth Blackberry, Southern Dewberry) - (Cat Greenbrier, Roundleaf Greenbrier) Ruderal Shrubland**

Common Name: **Ruderal Blackberry - Greenbrier Shrub Thicket**

USNVC CLASSIFICATION

Division	Southeastern North American Grassland & Shrubland (2.B.2.Ne)
Macrogroup	Southeastern Ruderal Grassland & Shrubland (M307)
Group	Southeastern Ruderal Grassland & Shrubland (G583)
Alliance	*Rubus* spp. - *Prunus* spp. - *Cornus drummondii* Eastern Ruderal Shrubland Alliance (A3322)

ELEMENT CONCEPT

Global Summary: Stands of this successional community develop following disturbance (complete forest canopy removal). These stands are dominated by blackberries/dewberries (*Rubus argutus, Rubus trivialis*) and by greenbrier species (*Smilax glauca, Smilax rotundifolia*). Many examples include a great variety of tree saplings and other woody species (*Quercus* spp., *Liquidambar styraciflua, Acer rubrum, Diospyros virginiana, Juniperus virginiana var. virginiana, Rhus copallinum*), herbs (*Solidago* spp., Asteraceae spp., *Helianthus* spp., *Hypericum* spp., *Potentilla simplex*), and grasses (*Andropogon* spp., *Dichanthelium* spp., *Panicum* spp., *Schizachyrium scoparium, Lolium* spp., and *Sorghastrum nutans*). Communities that are surrounded by relatively intact ecosystems will tend to have more native species. In the Southern Blue Ridge, at intermediate elevations, *Rubus allegheniensis* may be a component. Those surrounded by old fields or fragmented by development tend to have *Lonicera japonica* and/or *Rosa multiflora* as a codominant vine overtopping much of the blackberry and greenbrier.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: These successional shrublands are found primarily on naturally disturbed areas (possibly managed), created and maintained by blowdowns, tree die-offs, and occasional mowing (on 3- to 6-year cycles). They are found at low to moderate elevation.

Global Environment: This community can exist in both lowlands and uplands that have been cleared but have not been further disturbed by continued mowing or plowing for 3-5 years.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This shrubland has *Rubus* spp. dominant or codominant (at least 25-50% cover; on the lower end if in a more diverse mixture of successional shrub and vine species). *Rubus* spp. include primarily *Rubus argutus*, also possibly *Rubus allegheniensis*. *Rosa multiflora, Smilax* spp., and other successional and exotic shrub and vine species may also be present.

Global Vegetation: Stands of this association are dominated by blackberries/dewberries (*Rubus argutus, Rubus trivialis*) and by greenbrier species (*Smilax glauca, Smilax rotundifolia*). In parts of the range, other *Rubus* species may be components (e.g., *Rubus allegheniensis* in the northern and eastern parts of the range). They also contain a great variety of tree saplings and other woody species (e.g., *Quercus* spp., *Liquidambar styraciflua, Acer rubrum, Rhus copallinum*). Some herbs in central Tennessee examples may include *Solidago* spp., Asteraceae spp., *Helianthus* spp., *Hypericum* spp., *Potentilla simplex*; grasses may include *Andropogon* spp., *Dichanthelium* spp., *Panicum* spp., *Schizachyrium scoparium, Lolium* spp., and *Sorghastrum nutans*. Communities that are surrounded by relatively intact ecosystems will tend to have more native species. Those surrounded by old fields or fragmented by development tend to have *Lonicera japonica* and/or *Rosa multiflora* as a codominant vine overtopping much of the blackberry and greenbrier.

Global Dynamics: Stands of this successional community develop following disturbance (complete forest canopy removal) followed by a period of no disturbance of 3-5 years.

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (1-Oct-2001). This type represents ruderal successional vegetation dominated by species native to North America.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This ruderal successional vegetation, dominated by species native to North America, was not sampled; however, it is known to occur within the AT corridor in the Southern Blue Ridge project area and was observed by the UMESC mapping team during the summer of 2010.
Global Classification Comments: In sandy parts of the southeastern U.S. Coastal Plain (e.g., Fort Benning, Georgia) the common blackberry is *Rubus cuneifolius*, and it does not form monocultural stands worthy of recognition as a vegetation type. At Arnold Air Force Base, Coffee and Franklin counties, Tennessee, this community is often found in powerline corridors and other areas that have experienced total canopy removal.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This ruderal successional vegetation is common along the AT in the Southern Appalachians.
Global Range: This ruderal successional vegetation could be found throughout the upper southern United States.

2.C.2. Temperate to Polar Bog & Fen

2.C.2.NA. NORTH AMERICAN BOG & FEN

M877. North American Boreal & Sub-boreal Alkaline Fen

G185. EASTERN NORTH AMERICAN SUB-BOREAL ALKALINE FEN

Group Summary Description: [The content for this group summary is under review with Canadian ecologists; the current text overlaps with Eastern North American Boreal Alkaline Fen Group (G804)]. These fens, distributed across glaciated eastern and central sub-boreal (Laurentian-Acadian) regions of North America, develop in open basins where lateral groundwater flow through circumneutral to calcareous parent materials creates moderately to strongly alkaline conditions. They are found on level to gently sloping surfaces, or in closed wet depressions (sometimes as floating mats), and along wetland margins and lake and river shores. The shore fens are occasionally flooded, and so are included here because flooding tends to create moderately alkaline conditions. The vegetation may be graminoid-dominated, shrub-dominated, or a patchwork of the two, with broad-leaved non-ericaceous shrubs typically dominant. There is a discontinuous to absent layer of *Sphagnum* peatmoss (<80% cover), with brown mosses (*Drepanocladus, Calliergon, Tomentypnum, Campylium*) present to dominant. Broad-leaved non-ericaceous shrubs (*Myrica gale, Dasiphora fruticosa ssp. floribunda, Betula pumila, Betula glandulosa, Salix* spp., *Alnus incana, Rhamnus alnifolia*) exceed cover of ericaceous shrubs, although some shore fens may be dominated by *Chamaedaphne calyculata*. Thin-leaved graminoids include *Carex lasiocarpa, Carex livida, Carex interior, Carex limosa, Muhlenbergia glomerata, Trichophorum alpinum*, and *Eriophorum viridicarinatum*. A wide diversity of herbs is found, especially *Menyanthes trifoliata, Equisetum fluviatile, Sarracenia purpurea, Triantha glutinosa (= Tofieldia glutinosa)*, and *Triglochin maritima*. In the tree layer, *Picea mariana* is rare to absent, *Larix laricina* is variable, and other conifers and hardwoods may be present (e.g., *Acer rubrum, Thuja occidentalis*). Minerotrophic *Sphagnum* dominates the substrate among medium fens, but brown mosses become increasingly common under richer conditions. *Campylium stellatum* is an indicator brown moss bryophyte.

A3477 *Betula pumila - Chamaedaphne calyculata - Myrica gale* Shrub Fen Alliance

Alliance Summary Description: This moderately rich shrub fen is found across the eastern boreal region of Canada and the adjacent U.S., including in the northern Great Lakes region. The shrub cover is at least 25%, dominated by a combination of *Betula pumila, Myrica gale*, and ericaceous shrubs, including low to moderate cover of *Andromeda polifolia, Chamaedaphne calyculata, Ledum groenlandicum*, and *Vaccinium oxycoccos*. Other minerotrophic shrubs include *Lonicera villosa, Rhamnus alnifolia, Rubus arcticus ssp. acaulis (= Rubus acaulis), Rubus pubescens*, and *Salix pedicellaris*. Scattered, small (2-10 m) tree stems of *Larix laricina, Picea mariana*, and *Thuja occidentalis* are present at low cover. There is diverse forb, graminoid, and moss cover, at least in the richer examples of this type. The graminoids include *Carex chordorrhiza, Carex lasiocarpa, Carex leptalea*, and *Eriophorum viridicarinatum*. Forbs include *Comarum palustre (= Potentilla palustris), Drosera rotundifolia, Equisetum fluviatile, Maianthemum trifolium, Menyanthes trifoliata, Sarracenia purpurea*, and *Solidago uliginosa*. The moss layer contains *Aulacomnium palustre, Pleurozium schreberi, Sphagnum angustifolium*, and *Sphagnum capillifolium*. Less frequent are *Campylium stellatum, Sphagnum fuscum*, and *Tomentypnum nitens*. Stands are found on the margins of water tracks of large peatlands, or in the interior of small basins that are relatively isolated from runoff, or on shores of northern and boreal rivers, with occasional flooding.

[CEGL006302] *Myrica gale - Chamaedaphne calyculata / Carex (lasiocarpa, utriculata) - Utricularia* spp. Fen

Translated Name: **Sweetgale - Leatherleaf / (Woolly-fruit Sedge, Northwest Territory Sedge) - Bladderwort species Fen**

Common Name: **Medium Fen**

USNVC CLASSIFICATION

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Alkaline Fen (M877)
Group	Eastern North American Sub-boreal Alkaline Fen (G185)
Alliance	*Betula pumila - Chamaedaphne calyculata - Myrica gale* Shrub Fen Alliance (A3477)

ELEMENT CONCEPT

Global Summary: This fen vegetation is found in peatlands and peaty lakesides of the northeastern United States. It occurs in acidic waters receiving weakly minerotrophic input from surface water inflow or seepage from surrounding uplands. The substrate may be flooded at high water, and remains saturated through the growing season. pH is acidic to circumneutral, 4.8-6.8. Tall, rhizomatous sedges dominate the vegetation, with shrubs often shorter than the graminoids. Bryophyte cover is variable. Scattered shrubs of *Alnus incana* and *Spiraea alba* may protrude above the graminoid cover; shorter shrubs such as *Myrica gale, Andromeda polifolia var. glaucophylla (= Andromeda glaucophylla), Vaccinium macrocarpon*, and *Chamaedaphne calyculata* grow among the sedges. The dominant sedges are usually *Carex lasiocarpa* or *Carex utriculata*; associates include *Carex oligosperma, Carex exilis, Carex vesicaria, Carex limosa, Carex canescens, Carex lacustris, Carex stricta* (non-tussock form), *Carex oligosperma, Rhynchospora alba, Calamagrostis canadensis, Cladium mariscoides, Eriophorum angustifolium, Eriophorum virginicum*, and *Dulichium arundinaceum*. Forbs include *Lysimachia terrestris, Triadenum virginicum, Osmunda regalis, Comarum palustre (= Potentilla palustris), Drosera intermedia, Utricularia intermedia*, and *Pogonia ophioglossoides*. The bryophyte layer is dominated by species of *Sphagnum*, including *Sphagnum fallax, Sphagnum papillosum, Sphagnum cuspidatum, Sphagnum fimbriatum, Sphagnum centrale, Sphagnum lescurii*, and others. This fen vegetation is distinguished by the dominance of *Carex lasiocarpa* and the absence of any richness indicators such as *Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda)*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This peatland association is known from elevations ranging from 150 to 750 m (490-2,460 feet) on flat to gently sloping basin floors, pond edges and occasionally on alluvial flats. Soils are intermittently flooded to saturated peat.

Global Environment: This fen vegetation is found in peatlands and peaty lakesides of the northeastern United States. It occurs in acidic waters receiving weakly minerotrophic input from surface water inflow or seepage from surrounding uplands. The substrate may be flooded at high water, and remains saturated through the growing season. pH is acidic to circumneutral, 4.8-6.8. Peat tends to be shallow.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association has variable physiognomic structure with combinations of ericaceous shrubs and sedges. Sedges tend to have the highest overall cover, ranging upward of 80% Dominant species include *Carex stricta, Carex utriculata*, and *Rhynchospora alba*. The dominant shrubs growing among the sedges include *Chamaedaphne calyculata, Myrica gale*, and *Vaccinium macrocarpon* which range from sparse to 40% cover. The bryophyte layer is dominated by species of *Sphagnum* and may have cover as high as 80%.

Global Vegetation: Tall, rhizomatous sedges dominate the vegetation, with shrubs often shorter than the graminoids. Bryophyte cover is variable. Scattered shrubs of *Alnus incana* and *Spiraea alba* may protrude above the graminoid cover; shorter shrubs such as *Myrica gale, Andromeda polifolia var. glaucophylla (= Andromeda glaucophylla), Vaccinium macrocarpon*, and *Chamaedaphne calyculata* grow among the sedges. The dominant sedges are usually *Carex lasiocarpa* or *Carex utriculata*; associates include *Carex oligosperma, Carex exilis, Carex vesicaria, Carex limosa, Carex canescens, Carex lacustris, Carex stricta* (non-tussock form), *Rhynchospora alba, Calamagrostis canadensis, Cladium mariscoides, Eriophorum angustifolium, Eriophorum virginicum*, and *Dulichium arundinaceum*. Forbs include *Lysimachia terrestris, Triadenum virginicum, Osmunda regalis, Comarum palustre (= Potentilla palustris), Drosera intermedia, Utricularia intermedia*, and *Pogonia ophioglossoides*. The bryophyte layer is dominated by species of *Sphagnum*, including *Sphagnum fallax, Sphagnum papillosum, Sphagnum cuspidatum, Sphagnum fimbriatum, Sphagnum centrale, Sphagnum lescurii*, and others.

Macrogroup	North American Boreal & Sub-boreal Alkaline Fen (M877)
Group	Eastern North American Sub-boreal Alkaline Fen (G185)
Alliance	*Betula pumila - Chamaedaphne calyculata - Myrica gale* Shrub Fen Alliance (A3477)

Element Concept

Global Summary: This association is a mixed shrub fen in the Northern Appalachians region of the northeastern United States and adjacent Canada. It occurs in weakly to moderately minerotrophic settings, i.e., stream, lake or pond margins, adjacent to marshes, peatlands, or swamps, or on wet acidic colluvium at the base of slopes. The slowly moving, open water associated with this type creates somewhat minerotrophic conditions even though the pH is low (around 4.5 on average). The substrate is well-decomposed peat or muck overlying mineral soils; at most sites, standing water is present through most or all of the growing season. The shrub stratum is the dominant layer, usually with over 80% cover. The herb layer varies from sparse to well-developed. Bryophyte cover may be sparse overall, but bryophytes are locally extensive in the openings among the shrubs. Characteristic shrubs are *Myrica gale, Spiraea alba, Spiraea tomentosa*, and *Chamaedaphne calyculata*, in association with others, such as *Rhododendron canadense, Kalmia angustifolia, Alnus incana, Rosa palustris*, and saplings of *Acer rubrum, Larix laricina*, or, less commonly, *Picea mariana*. The herbaceous layer is relatively diverse, and may include *Calamagrostis canadensis, Carex stricta, Carex utriculata, Carex lasiocarpa, Carex canescens, Carex oligosperma, Oclemena nemoralis, Osmunda regalis, Typha latifolia, Triadenum virginicum, Triadenum fraseri, Dulichium arundinaceum, Juncus canadensis, Comarum palustre (= Potentilla palustris)*, and *Lysimachia terrestris*. The bryophyte layer is characterized by *Sphagnum fimbriatum, Sphagnum fallax, Sphagnum magellanicum, Sphagnum subsecundum, Sphagnum teres*, and others. The dense shrub cover of about 1 meter high, with *Myrica gale* and *Spiraea* spp. as important components, is diagnostic.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mixed shrub fen occurs in standing shallow water. The sampled site is the saturated shoreline of Gore Pond. The water level of the pond was very low during the time of sampling, probably because of a breakage in a beaver dam. The unvegetated surface includes one large glacial erratic, with small amounts of downed wood and bare soil. Evidence of disturbance includes alterations to hydrology and recreational use impacts (trash).
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This peatland association is found locally throughout the Northern Appalachian project area in flat to gently sloping basin floors often along pond margins at elevations ranging from 200 to 850 m (655-2,790 feet). Soils are saturated to permanently flooded peat. Most sites are beaver-influenced.
Global Environment: This association is a mixed shrub fen in the Northern Appalachians region of the northeastern United States and adjacent Canada. It occurs in weakly to moderately minerotrophic settings, i.e., stream, lake or pond margins, adjacent to marshes, peatlands, or swamps, or on wet acidic colluvium at the base of slopes. The slowly moving, open water associated with this type creates somewhat minerotrophic conditions even though the pH is low (around 4.5 on average). The substrate is well-decomposed peat or muck overlying mineral soils; at most sites, standing water is present through most or all of the growing season.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This mixed, relatively tall (often >1 m) shrub fen is codominated by *Myrica gale, Spiraea tomentosa, Chamaedaphne calyculata*, and/or *Spiraea alba var. latifolia*. *Dulichium arundinaceum* and *Juncus* spp. are the dominant herbs.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association consists primarily of an open to very dense shrub stratum dominated by ericaceous shrubs with a sparse to dense sedge-dominated herbaceous layer. The dominant shrubs are *Chamaedaphne calyculata* and *Myrica gale*. *Spiraea alba* may dominate or codominate at some sites. Additional shrub associates occurring at lower cover may include *Alnus incana, Kalmia angustifolia, Kalmia polifolia, Ledum groenlandicum*, and *Rhododendron canadense*. Saplings of *Abies balsamea, Acer rubrum, Betula papyrifera, Larix laricina, Picea rubens, Pinus strobus*, and *Thuja occidentalis* are frequent at low cover. The herbaceous layer is overwhelmingly dominated by *Carex stricta*. Other common herbaceous associates include *Calamagrostis canadensis, Carex echinata, Chamaedaphne calyculata, Drosera rotundifolia, Gaultheria hispidula, Osmunda regalis, Rhynchospora alba, Sarracenia purpurea*, and *Triadenum virginicum*. Nonvascular cover by species of *Sphagnum* may range as high as 90%.
Global Vegetation: The shrub stratum is the dominant layer, usually with over 80% cover. The herb layer varies from sparse to well-developed. Bryophyte cover may be sparse overall, but bryophytes are locally extensive in the openings among the shrubs. Characteristic shrubs are *Myrica gale, Spiraea alba, Spiraea tomentosa*, and *Chamaedaphne calyculata*, in association with others, such as *Rhododendron canadense, Kalmia angustifolia, Alnus incana, Rosa palustris*, and saplings of *Acer rubrum, Larix laricina*, or, less commonly, *Picea mariana*. The herbaceous layer is relatively diverse, and may include *Calamagrostis canadensis, Carex stricta, Carex utriculata, Carex lasiocarpa, Carex canescens, Carex oligosperma, Oclemena nemoralis, Osmunda regalis, Typha latifolia, Triadenum virginicum, Triadenum fraseri, Dulichium arundinaceum, Juncus canadensis, Comarum palustre (= Potentilla palustris)*, and *Lysimachia terrestris*. The bryophyte layer is characterized by *Sphagnum fimbriatum, Sphagnum fallax, Sphagnum magellanicum, Sphagnum subsecundum, Sphagnum teres*, and others.

G805. NORTH-CENTRAL INTERIOR & APPALACHIAN ALKALINE FEN

Group Summary Description: This group encompasses shrub and herbaceous fen vegetation in the northeastern temperate region, including Allegheny Plateau and much of New York and New England, as well as the tallgrass prairie and southern Great Lakes regions of the north-central Midwest. Associations may be shrub-dominated, a mixture of shrubs and herbs, or herb-dominated. Characteristic species include the shrubs *Dasiphora fruticosa ssp. floribunda, Cornus amomum, Cornus racemosa, Cornus sericea*, prairie grasses such as *Andropogon gerardii* and *Spartina pectinata*, sedges, including *Carex flava, Carex sterilis, Carex prairea, Carex stricta*, and other graminoids such as *Trichophorum alpinum*, and forbs such as *Lobelia kalmii, Packera aurea, Symplocarpus foetidus, Rhynchospora* spp., and *Triantha glutinosa (= Tofieldia glutinosa)*. Less commonly, *Cladium mariscoides* may be a dominant. Vegetation develops on shallow to deep peat over a gently sloping or level substrate, where the groundwater, typically minerotrophic and slightly alkaline, provides nutrients. In glaciated areas, they are characteristically in pitted outwash or in kettle lakes associated with kettle-kame-moraine topography.

A3703 *Dasiphora fruticosa ssp. floribunda - Carex sterilis - Carex flava* Alkaline Shrub Fen Alliance

Alliance Summary Description: This alliance includes calcareous sedge fens of the northeastern United States and possibly adjacent eastern Canada. This alliance brings together a suite of spring-fed herbaceous vegetation occurring on shallow peat and irrigated by base-rich surface discharge or groundwater. The vegetation has a consistent set of characteristic species but a locally variable set of associates, many of which are uncommon within the region. Occurrences are generally small, local and restricted to a rather particular set of conditions. The prominent architectural elements of this alliance include a well-developed herbaceous layer dominated by short cespitose sedges, a ground layer of bulky "brown" mosses, and clumped or scattered shrubs (generally restricted to micro-hummocks). Typically there is no clear dominant species allowing for a highly variable compositional and structural aspect from occurrence to occurrence. The cespitose, short shrub *Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda)* is perhaps the most characteristic species of the alliance although it is rarely present in the Northern Appalachian examples. *Rhamnus alnifolia* is another characteristic and much more spreading short shrub, which may be quite extensive in some examples. Additionally, tall branching shrubs such as *Cornus sericea, Salix discolor, Salix bebbiana, Salix candida, Salix lucida, Salix serissima*, and others are very typical and often form a fringe around the lower slope of the fen. *Juniperus virginiana* occurs as scattered individuals in some stands. Common herbs include *Andropogon gerardii, Carex lasiocarpa, Carex sterilis, Carex prairea, Cladium mariscoides, Eleocharis quinqueflora, Lobelia kalmii, Rhynchospora capillacea, Schoenoplectus americanus (= Scirpus americanus)*, and *Triglochin maritima*, which are all abundant in parts of the alliance.

[CEGL006326] *Dasiphora fruticosa ssp. floribunda / Carex (sterilis, hystericina, flava)* Fen

Translated Name: **Shrubby-cinquefoil / (Dioecious Sedge, Bottlebrush Sedge, Yellow Sedge) Fen**
Common Name: **Lower New England Sloping Fen**

USNVC Classification

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Alkaline Fen (M877)
Group	North-Central Interior & Appalachian Alkaline Fen (G805)
Alliance	*Dasiphora fruticosa ssp. floribunda - Carex sterilis - Carex flava* Alkaline Shrub Fen Alliance (A3703)

Element Concept

Global Summary: Spring-fed herbaceous vegetation occurring on shallow peat and irrigated by base rich surface discharge or groundwater. Occurrences are generally small, local and restricted to a rather particular set of conditions. They are often on gentle slopes and in headwater positions. The community comprises a well-developed, very diverse herbaceous layer dominated by short cespitose sedges (*Carex hystericina, Carex leptalea, Carex interior, Carex flava, Carex sterilis*) and grasses such as *Muhlenbergia glomerata, Glyceria striata* and *Bromus kalmii* are common. Other characteristic herbs include *Packera aurea (= Senecio aureus), Parnassia glauca, Solidago patula, Solidago uliginosa, Geum rivale, Equisetum* spp., *Spiranthes romanzoffiana, Symplocarpus foetidus, Drosera rotundifolia, Iris versicolor, Lobelia kalmii, Lycopus uniflorus, Thelypteris palustris*, and *Thalictrum pubescens*. Many additional associated wetland species also occur. The bryophyte layer is well-developed and composed of bulky "brown" mosses (*Campylium stellatum, Limprichtia revolvens (= Drepanocladus revolvens), Calliergonella cuspidata, Aulacomnium palustre, Climacium* spp., *Tomentypnum nitens, Philonotis fontana, Bryum pseudotriquetrum, Scorpidium scorpioides*). Shrubs are variable in cover and generally include *Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda), Rhamnus alnifolia*, and *Salix* spp.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This calcareous sloping fen is often found in headwater positions fed by enriched groundwater seepage. Peat depth is relatively shallow (<50 cm).Sites are gently sloping saturated to seasonally flooded basins. Soils are somewhat to very poorly drained peat. The unvegetated surface is dominated by leaf litter, with very small amounts of downed wood, bare soil and standing water. One site is a former pasture that is now a gas pipeline corridor maintained by mowing. Evidence of disturbance includes an ATV track and the presence of exotic plants.
Global Environment: Spring-fed herbaceous vegetation occurring on shallow peat over mineral soil and irrigated by base rich surface discharge or groundwater. They are often on gentle slopes and in headwater positions. Occurrences are generally small, local and restricted.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The vegetation is strongly dominated by short *Carex* spp. and brown mosses. Species composition is very diverse, including numerous enrichment indicators such as *Parnassia glauca, Packera aurea, Lobelia kalmii*, and *Geum rivale*; other characteristic herbs include *Equisetum* spp., *Eupatorium maculatum, Galium tinctorium*, and *Scirpus microcarpus*. *Frangula alnus* and *Salix sericea* are characteristic shrubs.
Global Vegetation: The community comprises a well-developed, very diverse herbaceous layer dominated by short cespitose sedges (*Carex hystericina, Carex leptalea, Carex interior, Carex flava, Carex sterilis*). Other characteristic herbs include *Muhlenbergia glomerata, Glyceria striata, Bromus kalmii, Packera aurea (= Senecio aureus), Parnassia glauca, Solidago patula, Solidago uliginosa, Geum rivale, Equisetum* spp., *Spiranthes romanzoffiana, Symplocarpus foetidus, Drosera rotundifolia, Iris versicolor, Lobelia kalmii, Lycopus uniflorus, Thelypteris palustris*, and *Thalictrum pubescens*. Many additional associated wetland species also occur. The bryophyte layer is well-developed and composed of bulky "brown" mosses (*Campylium stellatum, Limprichtia revolvens (= Drepanocladus revolvens), Calliergonella cuspidata, Aulacomnium palustre, Climacium* spp., *Tomentypnum nitens, Philonotis fontana, Bryum pseudotriquetrum, Scorpidium scorpioides*). Shrubs are variable in cover and generally include *Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda), Rhamnus alnifolia*, and *Salix* spp.
Global Dynamics: This community is found in headwater positions fed by enriched groundwater seepage.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (11-Jan-1998). This "fen" vegetation type is restricted in distribution to calcareous or limestone areas in the southern Green Mountains, Connecticut River valley, and the Northwest Highlands region of Massachusetts, Connecticut and New York. There are less than 50 known occurrences of this vegetation, and the occurrences are generally very small in size, often only an acre or two. Some, however, are considerably larger and these are often associated with areas of grazing or pasture. In areas where grazing has been discontinued the fens are often rapidly filling with shrubs, particularly *Cornus sericea*. In other areas, disruptions in local hydrology, caused by nearby development, has had a negative effect on the condition of some occurrences. These have become increasingly shrubbier and contain many weedy species both native and exotic.

Alliance	*Dasiphora fruticosa ssp. floribunda* - *Carex sterilis* - *Carex flava* Alkaline Shrub Fen Alliance (A3703)

ELEMENT CONCEPT

Global Summary: This association is a saturated wetland of turfy mineral soil occurring over calcareous bedrock, a fen supporting a number of calciphitic species. It occurs in New York, New Jersey and Pennsylvania. It varies in appearance from an open shrubland to open herbaceous vegetation. The tall-shrub layer, when present, is 2-5 m in height with 20% cover or less. Typical tall shrubs include *Cornus amomum, Juniperus virginiana*, and *Toxicodendron vernix*. Typical short shrubs include *Dasiphora fruticosa ssp. floribunda, Spiraea tomentosa, Spiraea alba var. latifolia*, and *Lyonia ligustrina*. Other characteristic, often calciphilic, shrubs include *Salix candida* and *Salix discolor*. Invasive shrubs may be locally abundant in some fens, especially *Rosa multiflora* and *Elaeagnus umbellata*. The herbaceous layer is greater than 75% cover (often near 100%). Dominant herb species include *Packera aurea (= Senecio aureus), Parnassia glauca, Thelypteris palustris, Pycnanthemum tenuifolium, Onoclea sensibilis, Juncus subcaudatus, Solidago rugosa, Carex stricta, Dryopteris cristata*, and *Juncus dudleyi*. Other associates include *Juncus nodosus, Equisetum fluviatile, Sisyrinchium angustifolium, Solidago uliginosa,*

Eupatorium maculatum, Liatris spicata, Spiranthes lucida, Rudbeckia fulgida, Pedicularis canadensis, and *Pedicularis lanceolata*. A number of calciphilic herb species are often present at low cover values, including *Lobelia kalmii, Epilobium strictum, Carex tetanica, Carex flava, Juncus brachycephalus, Bromus kalmii, Cypripedium parviflorum, Geum rivale*, and *Castilleja coccinea*. *Lythrum salicaria* can be an abundant weed species in some fens. This vegetation has been generally affected by grazing in the past, which in some cases continues to the present, and as such this vegetation is known locally as a pasture fen.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This rich fen has turfy mineral soil occurring over calcareous bedrock. The sampled site is a groundwater-fed weedy rich fen on a slight slope. The soil is poorly drained silt loam, and the unvegetated surface is made up of leaf litter, small rocks, bare soil, and standing water. Evidence of disturbance includes the presence of exotic plants.

Global Environment: These wetlands occur as small patches where calcareous groundwater discharges to the surface. They typically occur along the toeslope of ridges, in association with limestone and calcareous siltstone. Soils vary from silt loams to shallow mucky peat.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This fen has a canopy of scattered *Juniperus virginiana* and often *Cornus amomum, Toxicodendron vernix*, and the dwarf-shrub *Dasiphora fruticosa ssp. floribunda*. *Packera aurea, Carex flava, Parnassia glauca, Equisetum arvense*, and *Carex tetanica* are characteristic herbs. *Rhamnus cathartica, Morella pensylvanica, Rosa multiflora*, and *Elaeagnus umbellata* are common shrubs. Evidence of grazing may be evident; exotic species such as *Lythrum salicaria* may be present in quantity.

Global Vegetation: This association varies in appearance from an open shrubland to open herbaceous vegetation. The tall-shrub layer, when present, is 2-5 m in height with 20% cover or less. Typical tall shrubs include *Cornus amomum, Juniperus virginiana*, and *Toxicodendron vernix*. Typical short shrubs include *Dasiphora fruticosa ssp. floribunda, Spiraea tomentosa, Spiraea alba var. latifolia*, and *Lyonia ligustrina*. Other characteristic, often calciphilic, shrubs include *Salix candida* and *Salix discolor*. Invasive shrubs may be locally abundant in some fens, especially *Rosa multiflora* and *Elaeagnus umbellata*. The herbaceous layer is greater than 75% cover (often near 100%). Dominant herb species include *Packera aurea (= Senecio aureus), Parnassia glauca, Thelypteris palustris, Pycnanthemum tenuifolium, Onoclea sensibilis, Juncus subcaudatus, Solidago rugosa, Carex stricta, Dryopteris cristata*, and *Juncus dudleyi*. Other associates include *Juncus nodosus, Equisetum fluviatile, Sisyrinchium angustifolium, Solidago uliginosa, Eupatorium maculatum, Liatris spicata, Spiranthes lucida, Rudbeckia fulgida, Pedicularis canadensis*, and *Pedicularis lanceolata*. A number of calciphilic herb species are often present at low cover values, including *Lobelia kalmii, Epilobium strictum, Carex tetanica, Carex flava, Juncus brachycephalus, Bromus kalmii, Cypripedium parviflorum, Geum rivale*, and *Castilleja coccinea*. *Lythrum salicaria* can be an abundant weed species in some fens.

Global Dynamics: This vegetation has been generally affected by grazing in the past, which in some cases continues to the present, and as such this vegetation is known locally as a pasture fen.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): *Carex flava*, *Dasiphora fruticosa* ssp. *floribunda*, *Juniperus virginiana*, *Packera aurea*, *Rhamnus cathartica*
Global: *Carex tetanica*, *Castilleja coccinea*, *Cornus amomum*, *Dasiphora fruticosa* ssp. *floribunda*, *Juniperus virginiana*, *Lobelia kalmii*, *Packera aurea*, *Spiraea tomentosa*, *Toxicodendron vernix*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Invasive/Exotic Plants: *Berberis thunbergii* (High/Medium), *Galium mollugo*, *Rhamnus cathartica* (High/Medium), *Rosa multiflora* (Medium/Low)
Global: Vulnerable Plants: *Trollius laxus* ssp. *laxus* (G5T3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G1G2 (23-Jan-1998). This association is restricted to saturated wetlands of turfy mineral soil occurring over calcareous bedrock in New Jersey, Pennsylvania, and possibly New York. There are 10-20 estimated occurrences in New Jersey and possibly the same number from Pennsylvania. These fens are 0.1-1.5 acres in size, with a total of 20-40 acres known from New Jersey. The total potential acreage of this type is well below 200 acres rangewide.

RELATED CONCEPTS

Global Similar Types:
- *Morella pensylvanica - Dasiphora fruticosa ssp. floribunda / Carex sterilis - Carex flava* Fen (CEGL006103) has active marl deposition and lower herbaceous cover.
- *Vernonia noveboracensis - Thelypteris palustris - Symplocarpus foetidus* Seepage Meadow (CEGL006448) has fewer calciphilic species.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This vegetation has been generally affected by grazing in the past, which in some cases continues to the present, and as such this vegetation is known locally as a pasture fen. Many exotics may be present.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Edinger et al.'s (2002) Rich Shrub Fen has been crosswalked to this association (as well as four others), in which case the range would extend to New York.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Hammersley Ridge in New York.
Global Range: This association occurs in New Jersey, Pennsylvania, and New York.

M876. North American Boreal & Sub-boreal Bog & Acidic Fen

G748. EASTERN NORTH AMERICAN BOREAL BOG & ACIDIC FEN

Group Summary Description: These acidic peatlands are found in eastern boreal regions of central and eastern Canada and southward into adjacent sub-boreal regions of northeast and north-central United States. Climates are cold enough to allow the rate of peat accumulation to exceed its decomposition. They contain a continuous (>80% cover) layer of *Sphagnum* mosses (sometimes submerged in bog pools), to depths exceeding 40 cm, with ericaceous dwarf-shrubs and thin-leaved graminoids >25% cover. Scrub trees <2 m may be common, but trees >5 m are <10% cover. Acidic peatlands range from strictly ombrotrophic bog (isolated from groundwater, precipitation fed) to weakly minerotrophic poor fen. They occur in extensive areas of low flats, or develop in open or closed, relatively shallow basins with nutrient-poor and acidic conditions. Many occur in association with larger lakes or streams. Some occur as kettlehole fens (usually called kettlehole "bogs") associated with eskers or other glacial deposits. Poor fens often develop adjacent to open water and may form a floating mat over water. The surface morphology of a bog may be more-or-less level, domed, or eccentric, but typically is above the water table. As peat accumulates, ridges may form, which can be relatively dry compared to the flat areas. Secondary bog pools (schlenke) may be present in the raised portions of the peatlands. *Sphagnum* mosses play a key role in these systems because they trap base cations, causing the organic soils to acidify, and they retain moisture, thus slowing the decomposition rate and promoting peat accumulation. Species diversity is low. Dwarf-shrubs include *Chamaedaphne calyculata, Ledum groenlandicum, Kalmia polifolia, Andromeda polifolia, Vaccinium oxycoccos, Vaccinium macrocarpon*, occasionally *Gaultheria hispidula* or *Betula pumila*. Rarely, tall ericaceous shrubs such as *Vaccinium corymbosum* are dominant. Common sedges include *Carex oligosperma, Carex chordorrhiza, Carex magellanica ssp. irrigua (= Carex paupercula), Carex limosa*, and *Carex lasiocarpa*. Other herbs include *Eriophorum vaginatum, Eriophorum virginicum, Drosera rotundifolia, Menyanthes trifoliata, Sarracenia purpurea*, and *Scheuchzeria palustris*. When present, stunted *Picea mariana* and *Larix laricina* are the dominant trees. Dominant mosses include *Sphagnum fuscum* and *Sphagnum magellanicum*, and less commonly *Sphagnum angustifolium*. *Pleurozium schreberi* can be common on raised mats.

In the Atlantic region, from Labrador to Downeast Maine, acidic peatlands take a somewhat different characteristics. In basins, they develop raised plateaus with undulating sedge and dwarf-shrub vegetation. *Trichophorum caespitosum* may form sedge lawns on the raised plateau. The system may also occur as "blanket bogs" over a sloping rocky substrate in extreme maritime settings; here, dwarf-shrubs and *Sphagnum* are the dominant cover. Species characteristic of this maritime setting include *Empetrum nigrum* and *Rubus chamaemorus*. Typical bog heaths such as *Kalmia angustifolia, Kalmia polifolia, Gaylussacia baccata, Ledum groenlandicum*, and *Gaylussacia dumosa* are also present. Morphological characteristics and certain coastal species distinguish these from more inland acidic peatlands.

A3836 *Picea mariana / Sphagnum* spp. Eastern Boreal Treed Bog Alliance

Alliance Summary Description: This bog forest alliance is found in the Great Lakes and northeastern parts of the United States and the Ontario and Quebec boreal region in Canada (excluding Atlantic boreal region). Tree canopy cover is variable but generally exceeds 10%. Stunted *Picea mariana* trees (<10 m tall) dominate the canopy, which may also include scattered *Larix laricina*. The dwarf-shrub layer is dominated by ericaceous species, such as *Andromeda polifolia var. glaucophylla (= Andromeda glaucophylla), Chamaedaphne calyculata, Kalmia polifolia*, and *Ledum groenlandicum*. *Kalmia angustifolia* is common in the eastern part of the range (Quebec). Herbaceous species include *Carex trisperma* and *Eriophorum vaginatum*. *Sphagnum* mosses (usually *Sphagnum fuscum, Sphagnum angustifolium*, and *Sphagnum magellanicum*) cover the ground layer, with scattered feathermosses *Pleurozium schreberi, Dicranum undulatum*, and *Polytrichum strictum*. This alliance is best developed on the crests and upper slopes of raised bogs within bog complexes, but is also found in basin bogs and occasionally on shores (but isolated from groundwater contact). Here, sphagnum mosses can prevent most tree reproduction except that of *Picea mariana* and *Larix laricina*, which can reproduce by layering. The substrate consists of deep, fibric peat.

USNVC CLASSIFICATION

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Bog & Acidic Fen (M876)
Group	Eastern North American Boreal Bog & Acidic Fen (G748)
Alliance	*Picea mariana / Sphagnum* spp. Eastern Boreal Treed Bog Alliance (A3836)

ELEMENT CONCEPT

Global Summary: This black spruce-dominated raised bog community type is found in the sub-boreal to boreal regions of the Great Lakes, elsewhere in the boreal region of central Canada, and across to Maine. Stands are typically on the crests of raised bog landforms in large peatland complexes, as well as in basin bogs. Sites are poorly drained, with wet organic substrates. Tree cover forms at least 25% canopy (and may be very dense), varying in height from 3 m to over 10 m. *Picea mariana* is often the sole species in the canopy. *Larix laricina* may occasionally occur. The dwarf-shrub layer is dominated by *Ledum groenlandicum* and other ericaceous shrubs, such as *Chamaedaphne calyculata, Vaccinium myrtilloides, Vaccinium oxycoccos, Kalmia polifolia, Kalmia angustifolia, Gaultheria hispidula*, and *Andromeda polifolia*. *Picea mariana* may also be found in scrub form in this layer. Ground cover consists of a species-poor herb layer, with *Carex trisperma, Eriophorum vaginatum*, and *Maianthemum trifolium* most prevalent. Moss cover is a *Sphagnum* carpet with patches of feathermoss (especially *Pleurozium schreberi*) and conifer litter beneath the trees. Dominant sphagnum species include *Sphagnum magellanicum, Sphagnum fuscum, Sphagnum recurvum*, and *Sphagnum angustifolium*, and less commonly, *Sphagnum capillifolium (= Sphagnum nemoreum)* and *Sphagnum girgensohnii*. Minerotrophic indicators, such as *Betula pumila, Carex stricta*, and *Carex aquatilis*, are absent.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This forest association is only known from one location in New Hampshire occurring in a mountain basin at 700 m (2,300 feet) elevation. No other supplemental environmental data were collected from this site.

Global Environment: Stands are typically on the crests of raised bog landforms in large peatland complexes, as well as in basin bogs. Sites are poorly drained, with wet organic substrates (Sims et al. 1989, MNNHP 1993, McCarthy et al. 1994, Harris et al. 1996).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only occurrence of this association is a closed-canopy evergreen forest dominated by *Picea mariana* with no other canopy associates. The understory is shrub-dominated with low cover of *Kalmia angustifolia, Myrica gale, Nemopanthus mucronatus*, and *Vaccinium oxycoccos*. Herbaceous species also occur at low cover and include *Cornus canadensis, Eriophorum vaginatum, Linnaea borealis, Lysimachia terrestris*, and *Maianthemum trifolium*.

Global Vegetation: Trees cover at least 25% of the canopy (and may be very dense), varying in height from 3 m to over 10 m. *Picea mariana* is often the sole species in the canopy. *Larix laricina* may occasionally occur. The dwarf-shrub layer is dominated by *Ledum groenlandicum* and other ericaceous shrubs, such as *Chamaedaphne calyculata, Vaccinium myrtilloides, Vaccinium oxycoccos, Kalmia polifolia, Gaultheria hispidula*, and *Andromeda polifolia*. *Picea mariana* may also be found in scrub form in this layer. Ground cover consists of a species-poor herb layer, with *Carex trisperma, Eriophorum vaginatum*, and *Maianthemum trifolium* most prevalent. Moss cover is a *Sphagnum* carpet with patches of feathermoss (especially *Pleurozium schreberi*) and conifer litter beneath the trees. Dominant *Sphagnum* species include *Sphagnum magellanicum, Sphagnum fuscum*, and *Sphagnum angustifolium*, and less commonly, *Sphagnum capillifolium (= Sphagnum nemoreum*) and *Sphagnum girgensohnii*. Minerotrophic indicators, such as *Betula pumila, Carex stricta*, and *Carex aquatilis*, are absent (Sims et al. 1989, MNNHP 1993, McCarthy et al. 1994, Harris et al. 1996).

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (3-Oct-1996).

RELATED CONCEPTS

Global Similar Types:

- *Picea mariana - (Larix laricina) / Ledum groenlandicum / Sphagnum* spp. Swamp Forest (CEGL005271) Treed bogs in smaller basins that are closed canopy may key to this type, a black spruce poor swamp type more typically found in basins. It may be that, apart from peatland setting (i.e., open peatland complex vs. closed basin), these two types are vegetationally indistinguishable.
- *Picea mariana / Chamaedaphne calyculata / Sphagnum* spp. Open Bog Woodland (CEGL005218)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Other Comments: None.
Global Classification Comments: This type is conceptually a raised bog in a large peatland complex, with a more open-treed canopy. It includes both raised and intermediate bogs as described by the MNNHP (1993); however, Minnesota's intermediate bog may also overlap in part with *Picea mariana - (Larix laricina) / Ledum groenlandicum / Sphagnum* spp. Swamp Forest (CEGL005271), a black spruce poor swamp type). Based on work at Voyageurs National Park, Minnesota, and work in Ontario, closed stands of black spruce bog may key here or to CEGL005271, a black spruce poor swamp type more typically found in basins. It may be that, apart from peatland setting (i.e., open peatland complex vs. closed basin), these two types are vegetationally indistinguishable. This type is not expected in Wisconsin (E. Epstein pers. comm. 1999). This type extends to the Northern Appalachians in the larger peatland complexes.

ELEMENT DISTRIBUTION

G745. EASTERN NORTH AMERICAN SUB-BOREAL BOG & ACIDIC FEN

Group Summary Description: These *Sphagnum* and shrub peatlands occur in basins and open peatlands in the Laurentian-Acadian region down to near the glacial boundary in the northeastern and north-central U.S. Unlike the true raised bogs of boreal regions, the vegetation is rarely or not raised above the groundwater level. The nutrient-poor substrate and the reduced throughflow of water create oligotrophic conditions fostering the development of *Sphagnum* peat and the growth of peatland vegetation. Major physiognomic types include two primary types. First, the ericaceous dwarf-shrub bog, often dominated by *Chamaedaphne calyculata* (sometimes with distinctive southern and coastal elements such as *Gaylussacia dumosa, Ilex glabra*, and *Morella pensylvanica*). Second, tall-shrub thicket peatlands are dominated by deciduous ericaceous shrubs, especially *Vaccinium corymbosum* (*Ilex verticillata* can dominate on shallower peat and near the bog border). Graminoids such as *Carex oligosperma, Carex magellanica ssp. irrigua (= Carex paupercula), Eriophorum angustifolium, Eriophorum virginicum*, and *Eriophorum vaginatum* are most common, and together these graminoids have greater cover than medium to rich fen graminoid indicators (*Carex lasiocarpa, Carex livida, Carex interior, Carex limosa, Muhlenbergia glomerata, Trichophorum alpinum, Eriophorum viridicarinatum*). Transitional poor to medium sites may include *Myrica gale* and *Dulichium arundinaceum*. Some peatlands may have a sparse tree layer (<10% cover), and stunted (<2 m) trees may be common, usually *Picea mariana, Larix laricina*, and *Acer rubrum*. These peatlands are found in colder regions, mostly in areas where glacial stagnation left coarse deposits and glacial depressions (many are "kettleholes"). The basins are generally closed, i.e., without inlets or outlets of surface water, and typically small in area. In deeper basins, the vascular vegetation grows on a *Sphagnum* mat over water, with no mineral soil development. Species diversity is typically low. Although these peatlands are often called bogs, in most cases they are technically "poor fens," as the vegetation remains in contact with the weakly minerotrophic (nutrient-poor) groundwater.

A3450 *Chamaedaphne calyculata / Carex lasiocarpa* Sub-boreal Acidic Shrub Bog & Fen Alliance

Alliance Summary Description: This acidic peatland alliance is found in the sub-boreal regions of the midwestern and northeastern United States, as well as extreme southern Ontario in Canada. Commonly called bogs and poor fens, stands occur in areas that are at best weakly influenced by groundwater. The ground layer is dominated by ericaceous dwarf-shrubs (>25%) and sphagnum. The moss layer has a continuous mat of sphagnum mosses, usually dominated by *Sphagnum magellanicum, Sphagnum fuscum*, or *Sphagnum angustifolium*. In the north, scattered and stunted (<5 m tall) *Picea mariana* and *Larix laricina* may be present, but tree cover over 5 m is less than 10%. The ericaceous shrub layer is dominated by *Chamaedaphne calyculata*, with *Kalmia polifolia* and *Andromeda polifolia var. glaucophylla (= Andromeda glaucophylla)* typical associates. Characteristic herbaceous species are *Drosera rotundifolia* and *Sarracenia purpurea*. Other characteristic species include *Calamovilfa brevipilis, Carex striata var. striata, Eriophorum virginicum, Lysimachia asperulifolia, Rhynchospora alba, Utricularia subulata*, and *Vaccinium macrocarpon*.

[CEGL006008] *Chamaedaphne calyculata - (Gaylussacia dumosa) - Decodon verticillatus / Woodwardia virginica* Acidic Peatland

Translated Name: **Leatherleaf - (Dwarf Huckleberry) - Swamp-loosestrife / Virginia Chainfern Acidic Peatland**

Common Name: **Southern New England Bog**

USNVC Classification

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Bog & Acidic Fen (M876)
Group	Eastern North American Sub-boreal Bog & Acidic Fen (G745)
Alliance	*Chamaedaphne calyculata / Carex lasiocarpa* Sub-boreal Acidic Shrub Bog & Fen Alliance (A3450)

Element Concept

Global Summary: This dwarf-shrub quaking or floating bog occurs in the southern portion of the glaciated Northeast, extending west to the Western Allegheny Plateau. It occupies oligotrophic, peat-accumulating basins. *Chamaedaphne calyculata* is strongly dominant, with associate species including *Kalmia angustifolia, Kalmia polifolia, Vaccinium oxycoccos, Vaccinium macrocarpon, Gaylussacia dumosa* (on the coast), and *Gaylussacia baccata*. Associate shrubs generally occur with low cover, although they may be locally common. Scattered tall shrubs, such as *Vaccinium corymbosum, Rhododendron viscosum, Larix laricina, Picea mariana*, and *Acer rubrum*, may occur but always with low cover. Herbaceous cover is quite low but can include *Carex trisperma, Pogonia ophioglossoides, Calopogon tuberosus (= Calopogon pulchellus), Eriophorum virginicum, Drosera rotundifolia, Drosera intermedia, Sarracenia purpurea*, and *Woodwardia virginica* scattered throughout and with *Carex canescens, Carex limosa, Glyceria canadensis, Triadenum virginicum, Utricularia cornuta, Rhynchospora alba*, and sometimes *Scheuchzeria palustris* occurring in wetter fen windows. Edges of floating mats tend to receive more nutrient enrichment and support such species as *Peltandra virginica, Decodon verticillatus*, and *Dulichium arundinaceum*. The bryophyte layer is well-developed, dominated by *Sphagnum capillifolium, Sphagnum magellanicum, Sphagnum rubellum*, and *Sphagnum fuscum* with *Sphagnum bartlettianum, Sphagnum cuspidatum, Sphagnum fallax*, and *Sphagnum recurvum* also occurring in some examples.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This dwarf-shrub quaking or floating sphagnum bog occurs in the southern portion of the glaciated Northeast. One sampled site is a permanently flooded depression between two small ridges; another borders a bog lake. Soils are very poorly drained. The unvegetated surface includes standing water, small amounts of leaf litter, downed wood and/or bare soil. No evidence of disturbance was reported.

Global Environment: This dwarf-shrub quaking or floating bog occupies oligotrophic, peat-accumulating basins.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This dwarf-shrubland is strongly dominated by *Chamaedaphne calyculata* and *Sphagnum* spp. Other shrubs, such as *Myrica gale, Kalmia angustifolia, Vaccinium corymbosum*, or *Gaylussacia baccata*, may be present and locally common, including *Decodon verticillatus* along fringes of a peat mat. Herbs are generally very sparse and comprised of oligotrophic indicator species such as *Carex trisperma, Eriophorum* spp., *Drosera* spp., and *Sarracenia purpurea*.

Global Vegetation: *Chamaedaphne calyculata* is strongly dominant, with associate species including *Kalmia angustifolia, Kalmia polifolia, Vaccinium oxycoccos, Vaccinium macrocarpon, Gaylussacia dumosa* (near the coast), and *Gaylussacia baccata*. Associate shrubs generally occur with low cover, although they may be locally common. Scattered tall shrubs, such as *Vaccinium corymbosum, Rhododendron viscosum, Lyonia ligustrina, Larix laricina, Picea mariana*, and *Acer rubrum*, may occur but always with low cover. Herbaceous cover is quite low but can include *Carex trisperma, Pogonia ophioglossoides, Calopogon tuberosus (= Calopogon pulchellus), Eriophorum virginicum, Decodon verticillatus, Drosera rotundifolia, Drosera intermedia, Sarracenia purpurea*, and *Woodwardia virginica* scattered throughout and with *Carex canescens, Carex limosa, Carex folliculata, Carex atlantica, Glyceria canadensis, Triadenum virginicum, Utricularia cornuta, Rhynchospora alba*, and sometimes *Scheuchzeria palustris* occurring in wetter fen windows. Edges of floating mats tend to receive more nutrient enrichment and support such species as *Peltandra virginica, Decodon verticillatus*, and *Dulichium arundinaceum*. The bryophyte layer is well-developed, dominated by *Sphagnum capillifolium, Sphagnum magellanicum, Sphagnum*

rubellum, and *Sphagnum fuscum* with *Sphagnum bartlettianum, Sphagnum cuspidatum, Sphagnum fallax*, and *Sphagnum recurvum* also occurring in some examples.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: The New Jersey site has patchy dominance of several shrub species as well as a more open area dominated by sphagnum. The New York site is a wet leatherleaf dwarf-shrub bog bordering a bog lake. This area has some sphagnum coverage, but the presence of *Nuphar* indicates channels with very deep water.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community occurs in the southern portion of the glaciated Northeast. It was sampled in New Jersey and at Harriman State Park in New York.
Global Range: This dwarf-shrubland occurs in the southern portion of the glaciated Northeast, extending west to the Western Allegheny Plateau, from Maine to Ohio and Ontario, Canada.

USNVC Classification

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Bog & Acidic Fen (M876)
Group	Eastern North American Sub-boreal Bog & Acidic Fen (G745)
Alliance	*Chamaedaphne calyculata / Carex lasiocarpa* Sub-boreal Acidic Shrub Bog & Fen Alliance (A3450)

Element Concept

Global Summary: These nutrient-poor fens are found across the glaciated northeastern United States and likely adjacent Canada. Physiognomy is that of a dwarf-shrubland of variable cover over a bryophyte carpet. They occur as floating or quaking mats in peat-accumulating basins, either closed basins or, if in open basins, with very restricted water movement. Kettleholes in glacial deposits are a classic setting. Conditions are acidic, with pH averaging about 4.0, and nutrient availability is very limited. Often referred to as "bogs," these are technically fens since the vegetation is in contact with groundwater. Trees and tall shrubs, if present, are sparse, and the vegetation is dominated by bryophytes and the dwarf-shrub layer, the latter typically with 40-80% cover. Herb cover is variable but is less than the dwarf-shrub cover. The bryophyte layer is essentially continuous. *Chamaedaphne calyculata* dominates the dwarf-shrub layer; *Andromeda polifolia var. glaucophylla (= Andromeda glaucophylla)* is usually present, a good indicator, and may occasionally approach codominance. *Myrica gale, Kalmia polifolia, Ledum groenlandicum*, and *Kalmia angustifolia* are frequent, although not at high cover. Scattered tall shrubs (usually near the upland margin) and stunted trees may include *Gaylussacia baccata, Lyonia ligustrina, Picea mariana*, and *Larix laricina*. Prominent sedges are *Eriophorum vaginatum var. spissum* (on hummocks), *Eriophorum virginicum*, and *Rhynchospora alba* (on *Sphagnum* mats), and, under the wettest conditions, *Eriophorum angustifolium*. *Carex oligosperma, Carex utriculata*, or *Carex pauciflora* may also be present. *Vaccinium oxycoccos* grows as a trailing shrub on the *Sphagnum* mats, where *Sphagnum rubellum (= Sphagnum capillifolium var. tenellum)* and/or *Sphagnum magellanicum* usually dominate. Other common *Sphagnum* spp. include *Sphagnum fallax* and *Sphagnum angustifolium*. Diagnostic characteristics include the dominance of *Chamaedaphne calyculata* and presence of *Vaccinium oxycoccos* in a setting that is not a raised bog, with lower abundance of graminoids than shrubs, and without species of somewhat southerly affinity such as *Decodon verticillatus* and *Peltandra virginica*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This acidic (poor) fen was sampled in Vermont in the Lower New England project area. The sites are flat with very poorly drained peat substrate. The unvegetated surface includes leaf litter and standing water. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is known from only two locations in Maine on permanently flooded or semipermanently flooded pond margins. Elevations are 400 and 720 m (1,310-2,360 feet) and positions can be flat or gently sloping. Soils are very poorly drained muck and standing water is common.
Global Environment: These nutrient-poor dwarf-shrub fens are found across the glaciated northeastern United States and likely adjacent Canada. They occur as floating or quaking mats in peat-accumulating basins, either closed basins or, if in open basins, with very restricted water movement. Kettleholes in glacial deposits are a classic setting. Conditions are acidic, with pH averaging about 4.0, and nutrient availability is very limited. Often referred to as "bogs," these are technically fens since the vegetation is in contact with groundwater.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Chamaedaphne calyculata* dominates the dwarf-shrub layer (>25% cover). *Andromeda polifolia* is usually present, and *Myrica gale, Kalmia angustifolia*, and *Ledum groenlandicum* are frequent. *Carex* spp., *Equisetum arvense, Lysimachia terrestris*, and *Triadenum virginicum* are characteristic herbs. *Sphagnum* spp. mats are typical.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This fen community is codominated by the dwarf-shrubs *Chamaedaphne calyculata* and *Myrica gale*. Other common shrubs include *Ledum groenlandicum, Kalmia angustifolia*, and *Rhododendron canadense*. Herbaceous composition is variable and some sites may have an open to dense layer of sedges, including *Carex stricta* and *Carex utriculata*, with the forb *Iris versicolor* typically present at low cover. *Sphagnum* mosses often form dense mats throughout sites.
Global Vegetation: Trees and tall shrubs, if present, are sparse, and the vegetation is dominated by the dwarf-shrub layer, typically with 40-80% cover. Herb cover is variable, but is less than the dwarf-shrub cover. The bryophyte layer is essentially continuous. *Chamaedaphne calyculata* dominates the dwarf-shrub layer; *Andromeda polifolia var. glaucophylla (= Andromeda glaucophylla)* is usually present, a good indicator, and may occasionally approach codominance. *Myrica gale, Kalmia polifolia, Ledum groenlandicum*, and *Kalmia angustifolia* are frequent, although not at high cover. Scattered tall shrubs (usually near the upland margin) and stunted trees may include *Gaylussacia baccata, Lyonia ligustrina, Picea mariana*, and *Larix laricina*. Prominent sedges are *Eriophorum vaginatum var. spissum* (on hummocks), *Eriophorum virginicum*, and *Rhynchospora alba* (on *Sphagnum* mats), and, under the wettest conditions, *Eriophorum angustifolium*. *Carex oligosperma, Carex utriculata*, or *Carex pauciflora* may also be present. *Vaccinium oxycoccos* grows as a trailing shrub on the *Sphagnum* mats, where *Sphagnum rubellum (= Sphagnum capillifolium var. tenellum)* and/or *Sphagnum magellanicum* usually dominate. Other common *Sphagnum* include *Sphagnum fallax* and *Sphagnum angustifolium*.

- *Chamaedaphne calyculata / Carex oligosperma / Sphagnum* spp. Poor Fen (CEGL005277)
- *Rhododendron canadense - Chamaedaphne calyculata* Acidic Peatland (CEGL006514)
- *Sphagnum (cuspidatum, torreyanum) - Vaccinium macrocarpon* Fen (CEGL006394)

Classification

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Other Comments: None.
Global Classification Comments: This northeastern type appears very similar to the Midwest's *Chamaedaphne calyculata / Carex oligosperma - Eriophorum virginicum* Acidic Peatland (CEGL005092), but additional data from the Canadian range of these boggy fens is needed, followed by a rangewide review to determine if the two should be combined. In the Northeast, this type is related to the dwarf-shrub bog types *Rhododendron canadense - Chamaedaphne calyculata* Acidic Peatland (CEGL006514) and *Kalmia angustifolia - Chamaedaphne calyculata - (Picea mariana) / Cladina* spp. Acidic Peatland (CEGL006225), both of which can feature *Chamaedaphne calyculata* but are in more ombrotrophic (raised bog) settings; it is also related to the more minerotrophic *Carex (oligosperma, exilis) - Chamaedaphne calyculata* Shrub Acidic Peatland (CEGL006524), which differs in having graminoids more abundant than dwarf-shrubs. Similar quaking "bogs" in more southerly portions of the glaciated Northeast are placed in *Chamaedaphne calyculata - (Gaylussacia dumosa) - Decodon verticillatus / Woodwardia virginica* Acidic Peatland (CEGL006008), and have species of somewhat more southern affinity such as *Decodon verticillatus* and *Peltandra virginica*.

Element Distribution

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community occurs throughout the glaciated Northeast. It was sampled in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from two locations at Jones Pond and Ethel Pond in Maine.
Global Range: This type is found from Maine west to the Great Lakes, and probably in adjacent Canada.

Alliance	*Chamaedaphne calyculata / Carex lasiocarpa* Sub-boreal Acidic Shrub Bog & Fen Alliance (A3450)

Element Concept

Global Summary: These are the true ombrotrophic dwarf-shrub bogs of northern New England and Canada, occurring on the raised and relatively well-drained portions of raised peatlands. Peat accumulation has caused plant growth to be raised above the water table, and virtually all nutrients come from precipitation and deposition. The peat is typically saturated with water throughout the growing season, although standing water is often not apparent. Conditions are highly acidic, pH usually between 3.8-4.8. The classic vegetation pattern is drier hummocks and wet hollows across the peatland surface. Dwarf-shrubs dominate the vegetation, with overall heights usually 0.3-0.6 m. Trees are sparse and stunted; tall shrubs, if present, are usually confined to pockets near the peatland's upland border. Herb cover is low, usually <25%. The bryoid layer is very well-developed and forms the substrate for the vascular plants. *Kalmia angustifolia* is a constant and usually dominant shrub; *Gaylussacia baccata* may be important in some peatlands. Other important dwarf-shrubs include *Ledum groenlandicum, Rhododendron canadense*, and *Chamaedaphne calyculata*. *Kalmia polifolia, Vaccinium angustifolium*, and *Vaccinium oxycoccos* are often present but less abundant. Scattered stunted trees of *Picea mariana* (or, less commonly, *Larix laricina* or *Pinus strobus*) may be present, and there are often circular islands of shrub-form *Picea mariana* that has reproduced by layering. Frequent herbs include *Sarracenia purpurea, Drosera rotundifolia, Carex trisperma*, and *Eriophorum vaginatum var. spissum*. *Calopogon tuberosus (= Calopogon pulchellus)* is a typical orchid. *Sphagnum fuscum* is the diagnostic and usually dominant moss; others include *Sphagnum magellanicum* and *Sphagnum capillifolium*. *Polytrichum strictum* is common on the hummocks. In the drier portions of the raised heath, fruticose lichens may be important, including *Cladina rangiferina, Cladina mitis*, and *Cladonia* spp. (*Cladonia crispata, Cladonia cristatella, Cladonia cervicornis ssp. verticillata (= Cladonia verticillata), Cladonia uncialis*, and others). This association is distinguished from other dwarf-shrub bog associations by the raised bog setting, greater importance of *Kalmia angustifolia* compared to *Chamaedaphne*, and usual absence of maritime indicators such as *Rubus chamaemorus* and *Gaylussacia dumosa*.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is only known from one location in Maine in a flat basin wetland at 490 m (1,610 feet) elevation. Soils are saturated and composed primarily of peat.
Global Environment: These are the true ombrotrophic dwarf-shrub bogs of northern New England and Canada, occurring on the raised and relatively well-drained portions of raised peatlands. Peat accumulation has caused plant growth to be raised above the water table, and virtually all nutrients come from precipitation and deposition. The peat is typically saturated with water throughout the growing season, although standing water is often not apparent. Conditions are highly acidic, pH usually between 3.8-4.8. The classic vegetation pattern is drier hummocks and wet hollows across the peatland surface.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only known location of this fen community is dominated by a mix of dwarf heath species and short-statured trees that form a dense thicket. Species include *Chamaedaphne calyculata, Kalmia angustifolia, Kalmia polifolia, Larix laricina, Ledum groenlandicum, Myrica gale, Picea mariana, Picea rubens*, and *Vaccinium oxycoccos*. The understory is largely

dominated by *Sphagnum* spp. which form deep mats. Few herbaceous species occur and include *Drosera rotundifolia, Eriophorum virginicum*, and *Sarracenia purpurea*.

Global Vegetation: Dwarf-shrubs dominate the vegetation, with overall heights usually 0.3-0.6 m. Trees are sparse and stunted; tall shrubs, if present, are usually confined to pockets near the peatland's upland border. Herb cover is low, usually <25%. The bryoid layer is very well-developed and forms the substrate for the vascular plants. *Kalmia angustifolia* is a constant and usually dominant shrub; *Gaylussacia baccata* may be important in some peatlands. Other important dwarf-shrubs include *Ledum groenlandicum, Rhododendron canadense*, and *Chamaedaphne calyculata*. *Kalmia polifolia, Vaccinium angustifolium*, and *Vaccinium oxycoccos* are often present, but less abundant. Scattered stunted trees of *Picea mariana* (or, less commonly, *Larix laricina* or *Pinus strobus*) may be present, and there are often circular islands of shrub-form *Picea mariana* that has reproduced by layering. Frequent herbs include *Sarracenia purpurea, Drosera rotundifolia, Carex trisperma*, and *Eriophorum vaginatum var. spissum*. *Calopogon tuberosus (= Calopogon pulchellus)* is a typical orchid. *Sphagnum fuscum* is the diagnostic and usually dominant moss; others include *Sphagnum magellanicum* and *Sphagnum capillifolium*. *Polytrichum strictum* is common on the hummocks. In the drier portions of the raised heath, fruticose lichens may be important, including *Cladina rangiferina, Cladina mitis*, and *Cladonia* spp. (*Cladonia crispata, Cladonia cristatella, Cladonia cervicornis ssp. verticillata (= Cladonia verticillata), Cladonia uncialis*, and others).

Global Dynamics: Intentional or unintentional fires occur occasionally in the central portions of raised bogs and can cause lichen cover to increase.

Common Name: **Near-Boreal Dwarf-shrub Poor Fen**

USNVC CLASSIFICATION

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Bog & Acidic Fen (M876)
Group	Eastern North American Sub-boreal Bog & Acidic Fen (G745)
Alliance	*Chamaedaphne calyculata / Carex lasiocarpa* Sub-boreal Acidic Shrub Bog & Fen Alliance (A3450)

ELEMENT CONCEPT

Global Summary: These open dwarf-shrub bogs are associated with peatlands in the northeastern U.S. and adjacent Canada. Though highly acidic (pH usually in the range of 3.8-4.6), they occur in oligotrophic to weakly minerotrophic conditions, such as on the sideslopes of a raised bog formation or along the margins of water tracks. The somewhat higher nutrient status compared to ombrotrophic bog communities is reflected in the abundance of *Rhododendron canadense*; in some areas, *Myrica gale* is also present, also indicating weak minerotrophy. The structure of this association is primarily dwarf-shrubs of 0.5-0.8 m tall forming a fairly uniform layer. Graminoids and forbs are sparse. The bryoid layer is essentially continuous, with some development of hummocks and hollows. *Chamaedaphne calyculata* and *Rhododendron canadense* are the dominant shrubs, with lesser contributions from *Myrica gale, Kalmia angustifolia, Kalmia polifolia*, and *Ledum groenlandicum*. *Eriophorum virginicum* is a characteristic sedge; others include *Eriophorum vaginatum var. spissum* and *Carex pauciflora*. *Drosera rotundifolia* is often present on the surface of the bryophyte layer. Prominent *Sphagnum* spp. are *Sphagnum magellanicum, Sphagnum recurvum*, and *Sphagnum capillifolium*; *Sphagnum fuscum* may be present but is less abundant than in more ombrotrophic associations (cf. CEGL006225). This association is intermediate in nutrient status and wetness between the drier ombrotrophic dwarf-shrub bog type *Kalmia angustifolia - Chamaedaphne calyculata - (Picea mariana) / Cladina* spp. Acidic Peatland (CEGL006225) and the wetter poor fen type *Chamaedaphne calyculata / Eriophorum virginicum / Sphagnum rubellum* Acidic Peatland (CEGL006513). The presence of *Rhododendron canadense* (and sometimes *Myrica gale* or *Carex stricta*) in an otherwise typical raised dwarf-shrub bog community is diagnostic.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These open dwarf-shrub bogs are associated with peatlands in the northeastern U.S. and adjacent Canada. Though highly acidic (pH usually in the range 3.8-4.6), they occur in slightly minerotrophic conditions, such as on the sideslopes of a raised bog formation or along the margins of water tracks. The somewhat higher nutrient status compared to ombrotrophic bog communities is reflected in the abundance of *Rhododendron canadense*; in some areas, *Myrica gale* is also present, also indicating weak minerotrophy.

A3452 *Dulichium arundinaceum - Carex canescens* Sub-boreal Acidic Graminoid Fen Alliance

Alliance Summary Description: This alliance contains basins, swales, moats of bog mats, and pondshores typically dominated by *Dulichium arundinaceum*. Communities in this alliance typically occur in basins of porous substrate where the water level drops significantly during dry years. Substrate is variously mucky or sandy. Typical communities also contain a mix of low grasses, sedges, rushes, and scattered shrubs. This vegetation type occurs as a narrow zone in semipermanently flooded or saturated conditions along pond borders, bog moats, and other areas where minerotrophic conditions exist. Associated species are variable depending upon ecological and geographic conditions, but often include *Bidens* spp., *Carex canescens, Carex lasiocarpa, Carex stricta, Carex utriculata, Dulichium arundinaceum, Juncus pelocarpus*, and other *Juncus* spp. *Sphagnum* mosses (*Sphagnum cuspidatum, Sphagnum papillosum*, or *Sphagnum torreyanum*) generally form a continuous, often monotypic carpet. This alliance may also occur in seasonally flooded vegetation, and in this setting extends from New England southward. In these seasonally flooded situations, the vegetation is dominated by *Dulichium arundinaceum* in association with sedges and grasses. Aquatic species *Sphagnum cuspidatum* and/or *Sphagnum fallax* form a pronounced nonvascular layer overlying peat of variable depth. Associated species include *Carex canescens, Eriophorum virginicum, Glyceria acutiflora, Glyceria obtusa, Triadenum fraseri*, and *Triadenum virginicum*.

A1018 *Vaccinium corymbosum* Peat Shrubland Alliance

Alliance Summary Description: This alliance, found in the eastern midwestern and northeastern United States and probably many of the eastern Canadian provinces, contains tall-shrub swamps dominated by *Vaccinium corymbosum*. This tall-shrub bog thicket occurs on oligotrophic to weakly minerotrophic peat soils, commonly as a border thicket around more open dwarf heath shrub peatlands or within small, isolated basins. Significant seasonal water level fluctuation can occur, especially in isolated basins without inlet or outlet streams. A tall-shrub layer is characterized by abundant *Vaccinium corymbosum*, with *Chamaedaphne calyculata, Gaylussacia baccata, Kalmia angustifolia, Lyonia ligustrina, Nemopanthus mucronatus*, and *Rhododendron canadense* in more northern or cooler microclimates, and *Ilex verticillata* and *Rhododendron viscosum* in the south. In locally wetter areas, *Cephalanthus occidentalis* or *Decodon verticillatus* can occur. Coastal occurrences may have additional shrub species such as *Leucothoe racemosa, Clethra alnifolia*, and *Gaylussacia dumosa*. Sparse, scattered trees may occur, including *Acer rubrum, Betula populifolia, Larix laricina, Nyssa sylvatica, Picea mariana, Pinus rigida*, or *Pinus strobus*, with species dependent on environmental setting. The herbaceous layer tends to be sparse, although can be locally abundant. Common herbs include *Carex trisperma, Maianthemum trifolium, Osmunda cinnamomea, Sarracenia purpurea, Thelypteris palustris, Triadenum virginicum*, and *Woodwardia virginica*. *Sphagnum* mosses blanket well-developed hummocks and hollows, including *Sphagnum capillifolium, Sphagnum centrale, Sphagnum fimbriatum, Sphagnum fuscum, Sphagnum magellanicum*, and *Sphagnum rubellum*. These tall shrublands can occur at margins of kettles in glaciated regions, and in basins or at the heads of streams throughout the range. Soils are usually deep peats or mucks, and the water is often acidic.

[CEGL006158] *Alnus incana ssp. rugosa - Nemopanthus mucronatus / Sphagnum* spp. Acidic Peatland

Translated Name: **Speckled Alder - Catberry / Peatmoss species Acidic Peatland**
Common Name: **Northern Peatland Shrub Swamp**

USNVC CLASSIFICATION

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Bog & Acidic Fen (M876)
Group	Eastern North American Sub-boreal Bog & Acidic Fen (G745)
Alliance	*Vaccinium corymbosum* Peat Shrubland Alliance (A1018)

ELEMENT CONCEPT

Global Summary: This alder-dominated community is associated with peatlands across northern New England and adjacent Canada. It is most often found at the landward edge of acidic peat mats (i.e., the lagg), where it receives slightly more enriched waters than those of the adjacent oligotrophic or ombrotrophic peatland. Nitrogen levels are higher than in other peatland communities, presumably as a result of nitrogen fixing by the alders. Occasionally, it occurs in a montane setting (>730 m [2400 feet]) on thin organic soils over coarse cryic soils. Tall shrubs are the dominant physiognomy, with at least 50% cover; trees may be present but are sparse. Herb cover varies from sparse to extensive depending on the shrub cover. The bryophyte layer is well-developed, usually with at least 50% cover. *Alnus incana ssp. rugosa (= Alnus rugosa)* is the dominant or characteristic tall shrub; *Ilex verticillata* or *Nemopanthus mucronatus* are often present and sometimes abundant. Other shrubs include *Alnus viridis, Viburnum nudum var. cassinoides (= Viburnum cassinoides), Vaccinium corymbosum*, or *Spiraea tomentosa*. A tree canopy is lacking, but there may be scattered trees of *Acer rubrum, Picea mariana, Thuja occidentalis*, or *Abies balsamea*. Dwarf-shrub cover is variable, with *Rhododendron canadense* and *Chamaedaphne calyculata* the most typical, and *Kalmia angustifolia, Gaylussacia baccata*, and *Ledum groenlandicum* often also present. (*Nemopanthus mucronatus, Picea mariana, Thuja occidentalis, Abies balsamea*, and *Ledum groenlandicum* drop out at the southern extent of the range.) The most characteristic herbs are *Carex trisperma, Calla palustris*, and *Osmunda cinnamomea*; other species include *Triadenum virginicum, Carex intumescens, Carex magellanica ssp. irrigua (= Carex paupercula), Doellingeria umbellata (= Aster umbellatus), Iris versicolor, Gaultheria hispidula, Lysimachia terrestris, Maianthemum trifolium, Onoclea sensibilis, Sarracenia purpurea, Thalictrum pubescens*, and *Trientalis borealis*. The bryoid layer consists of *Sphagnum* spp., including *Sphagnum recurvum, Sphagnum palustre, Sphagnum fallax*, and *Sphagnum magellanicum*. The combination of *Alnus incana* dominance with *Nemopanthus mucronatus* and understory plants characteristic of peatlands is diagnostic.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This peatland association is only known from one location in New Hampshire in a basin floor at 700 m (2,300 feet)elevation. Soils are saturated peat.

Global Environment: This alder-dominated community is associated with peatlands across northern New England and adjacent Canada. It is most often at the landward edge of acidic peat mats (i.e., the lagg), where it receives slightly more enriched waters than those of the adjacent oligotrophic or ombrotrophic peatland. Nitrogen levels are higher than in other peatland communities, presumably as a result of nitrogen fixing by the alders. Occasionally, it occurs in a montane setting (>730 m [2400 feet]) on thin organic soils over coarse cryic soils.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only occurrence of this association is a open shrubland not exceeding 20% cover and codominated by *Alnus incana* and *Viburnum nudum var. cassinoides*. Other shrub species present include *Kalmia angustifolia, Larix laricina, Nemopanthus mucronatus, Spiraea alba*, and *Vaccinium myrtilloides*. Scattered saplings of tree species are present in the shrub layer, including *Abies balsamea, Larix laricina*, and *Picea rubens*. The herbaceous layer is open and dominated by *Eriophorum virginicum*. No other herbaceous species have substantial cover, but include *Calamagrostis canadensis, Carex echinata, Carex gynandra, Drosera rotundifolia, Gaultheria hispidula, Glyceria canadensis, Juncus brevicaudatus, Oclemena acuminata, Osmunda cinnamomea, Rubus pubescens, Scirpus atrocinctus*, and *Thalictrum pubescens*. The nonvascular layer is heavily dominated by *Sphagnum* spp. at >90%.

Global Vegetation: Tall shrubs are the dominant physiognomy, with at least 50% cover; trees may be present but are sparse. Herb cover varies from sparse to extensive depending on the shrub cover. The bryophyte layer is well-developed, usually with at least 50% cover. *Alnus incana ssp. rugosa (= Alnus rugosa)* is the dominant or characteristic tall shrub; *Ilex verticillata* or *Nemopanthus mucronatus* are often present and sometimes abundant. Other shrubs include *Alnus viridis, Viburnum nudum var. cassinoides (= Viburnum cassinoides), Vaccinium corymbosum*, or *Spiraea tomentosa*. A tree canopy is lacking, but there may be scattered trees of *Acer rubrum, Picea mariana, Thuja occidentalis*, or *Abies balsamea*. Dwarf-shrub cover is variable, with *Rhododendron canadense* and *Chamaedaphne calyculata* the most typical, and *Kalmia angustifolia, Gaylussacia baccata*, and *Ledum*

groenlandicum often also present. The most characteristic herbs are *Carex trisperma, Calla palustris*, and *Osmunda cinnamomea*; other species include *Triadenum virginicum, Carex intumescens, Carex magellanica ssp. irrigua (= Carex paupercula), Doellingeria umbellata (= Aster umbellatus), Iris versicolor, Gaultheria hispidula, Lysimachia terrestris, Maianthemum trifolium, Onoclea sensibilis, Sarracenia purpurea, Thalictrum pubescens*, and *Trientalis borealis*. The bryoid layer consists of *Sphagnum* spp., including *Sphagnum recurvum, Sphagnum palustre, Sphagnum fallax*, and *Sphagnum magellanicum*.

Alliance	*Vaccinium corymbosum* Peat Shrubland Alliance (A1018)

Element Concept

Global Summary: This is a tall-shrub swamp of seasonally flooded basins in the eastern United States. It occurs in small open basins, closed sandplain basins, and seasonally flooded zones within larger wetlands. It may also form as a result of beaver activity. This vegetation can occur on the margins of Coastal Plain ponds. This community is influenced by a strongly fluctuating water table with flooded conditions in spring and early summer followed by a drop in the water table below soil surface usually by late summer. There is usually a shallow organic layer often over sand. Dominant shrubs include *Vaccinium corymbosum, Ilex verticillata*, and *Rhododendron viscosum*. Scattered *Acer rubrum* are not uncommon. *Lyonia ligustrina* and *Cephalanthus occidentalis* are characteristic although not necessarily dominant. Associated shrub species may include *Clethra alnifolia, Spiraea tomentosa, Chamaedaphne calyculata, Ilex glabra, Leucothoe racemosa, Decodon verticillatus, Kalmia angustifolia, Alnus serrulata, Myrica gale*, and *Photinia* spp. (= *Aronia* spp.). Herbaceous composition is variable; some of the more typical species include *Osmunda cinnamomea, Osmunda regalis, Thelypteris palustris, Onoclea sensibilis, Calla palustris, Lycopus uniflorus, Triadenum virginicum, Glyceria striata, Leersia oryzoides, Dulichium arundinaceum, Juncus effusus*, and *Woodwardia virginica*. A layer of peatmoss is common and varies in cover; species include *Sphagnum fimbriatum, Sphagnum rubellum, Sphagnum magellanicum, Sphagnum fallax*, and *Sphagnum viridum*.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (20-May-2011). This association is considered moderately vulnerable to extinction. There are an estimated 1000 occurrences of this association rangewide. As a small-patch wetland community occurring in many cases in isolated wetland settings, it is not always afforded Federal protection under the Clean Water Act.

RELATED CONCEPTS

Global Similar Types:
- *Vaccinium corymbosum / Sphagnum* spp. Acidic Peatland (CEGL006190)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community (CEGL006371) may be confused with Highbush Blueberry Bog Thicket (CEGL006190), but it occurs in seasonally flooded basins, closed sandplain basins, and seasonally flooded zones within larger wetlands, while CEGL006190 is a peat bog occurring on oligotrophic to weakly minerotrophic peat soils, commonly as a border thicket around more open dwarf heath shrub peatlands or within small, isolated basins.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: More inland examples of this association may lack some characteristically Coastal Plain species such as *Clethra alnifolia* and *Ilex glabra*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was observed in south-central New York just to the east of the Hudson River on the trail. There are likely more examples in this region. It most likely does not occur north of the NY-CT stateline.
Global Range: This type occurs from New Hampshire south to New Jersey and possibly Delaware over an estimated range of 388,000 square km (total acreage of subsections of occurrence).

[CEGL006190] *Vaccinium corymbosum / Sphagnum* spp. Acidic Peatland

Translated Name: **Highbush Blueberry / Peatmoss species Acidic Peatland**
Common Name: **Highbush Blueberry Bog Thicket**

USNVC CLASSIFICATION

Division	North American Bog & Fen (2.C.2.Na)
Macrogroup	North American Boreal & Sub-boreal Bog & Acidic Fen (M876)
Group	Eastern North American Sub-boreal Bog & Acidic Fen (G745)
Alliance	*Vaccinium corymbosum* Peat Shrubland Alliance (A1018)

ELEMENT CONCEPT

Global Summary: Highbush blueberry peat bog of glaciated regions in the eastern and northeastern United States. This tall-shrub bog thicket occurs on oligotrophic to weakly minerotrophic peat soils, commonly as a border thicket around more open dwarf heath shrub peatlands or within small, isolated basins. Significant seasonal water level fluctuation can occur, especially in isolated basins without inlet or outlet streams. A tall-shrub layer is characterized by abundant *Vaccinium corymbosum* plus *Gaylussacia baccata, Chamaedaphne calyculata, Kalmia angustifolia, Rhododendron canadense, Lyonia ligustrina*, and *Nemopanthus mucronatus* in more northern or cooler microclimates, and *Ilex verticillata* and *Rhododendron viscosum* in the south. In locally wetter areas, *Cephalanthus occidentalis* or *Decodon verticillatus* can occur. Coastal occurrences may have additional shrub species such as *Leucothoe racemosa, Clethra alnifolia*, and *Gaylussacia dumosa*. Sparse, scattered trees may occur, including *Acer rubrum, Picea mariana, Larix laricina, Pinus strobus, Pinus rigida, Betula populifolia*, or *Nyssa sylvatica*, with species dependent on environmental setting. The herbaceous layer tends to be sparse, although can be locally abundant. Common herbs include *Osmunda cinnamomea, Woodwardia virginica, Carex trisperma, Sarracenia purpurea, Thelypteris palustris, Triadenum virginicum*, and *Maianthemum trifolium*. *Sphagnum* mosses blanket well-developed hummocks and hollows, including *Sphagnum magellanicum, Sphagnum centrale, Sphagnum rubellum, Sphagnum capillifolium, Sphagnum fimbriatum*, and *Sphagnum fuscum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This highbush blueberry peat bog was sampled once in the Central Appalachian project area in a deep, seasonally flooded basin with saturated muck soil. It occurs within a mosaic of dry oak types (dry oak-heath, dry oak-mixed hardwoods). The unvegetated surface is dominated by leaf litter with some downed wood. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: This highbush blueberry peat bog occurs as a peat bog and/or border thicket around more open dwarf heath shrub peatlands or within small isolated basins. Sites are saturated, semipermanently or permanently flooded basins and depressions. Soils are poorly to very poorly drained peat or muck. The unvegetated surface includes leaf litter, standing water or a combination of both, sometimes with small amounts downed wood or bare soil. Evidence of disturbance includes wind/ice damage and a minor presence of exotic plants.
Global Environment: This tall-shrub bog thicket occurs on oligotrophic to weakly minerotrophic peat soils, commonly as a border thicket around more open dwarf heath shrub peatlands or within small, isolated basins. Significant seasonal water level fluctuation can occur, especially in isolated basins without inlet or outlet streams.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This bog thicket is dominated by *Vaccinium corymbosum*. Other common shrubs include *Rhododendron viscosum, Clethra alnifolia, Gaylussacia baccata, Kalmia angustifolia*, and *Ilex verticillata*. The herb layer is sparse but there is thick cover of *Sphagnum* spp.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Vaccinium corymbosum* is dominant. Other common shrubs include *Nemopanthus mucronatus, Ilex verticillata, Photinia melanocarpa, Kalmia latifolia, Rhododendron viscosum, Clethra alnifolia, Gaylussacia baccata, Kalmia angustifolia*, and/or *Lyonia ligustrina*. Scattered trees may include *Tsuga canadensis, Nyssa sylvatica*, and/or *Acer rubrum*. The herb layer is sparse but may include *Carex trisperma, Carex canescens, Osmunda regalis, Osmunda cinnamomea, Thelypteris palustris, Drosera rotundifolia*, and usually a thick *Sphagnum* spp. mat.
Global Vegetation: A tall-shrub layer is characterized by abundant *Vaccinium corymbosum* plus *Gaylussacia baccata, Chamaedaphne calyculata, Kalmia angustifolia, Rhododendron canadense, Lyonia ligustrina*, and *Nemopanthus mucronatus* in more northern or cooler microclimates, and *Ilex verticillata* and *Rhododendron viscosum* in the south. In locally wetter areas, *Cephalanthus occidentalis* or *Decodon verticillatus* can occur. Sparse, scattered trees may occur, including *Acer rubrum, Picea mariana, Larix laricina, Pinus strobus, Pinus rigida, Betula populifolia*, or *Nyssa sylvatica*, with species dependent on environmental setting. The herbaceous layer tends to be sparse, although can be locally abundant. Common herbs include *Osmunda cinnamomea, Woodwardia virginica, Carex trisperma, Sarracenia purpurea, Thelypteris palustris, Triadenum virginicum*, and *Maianthemum trifolium*. *Sphagnum* mosses blanket well-developed hummocks and hollows, including *Sphagnum magellanicum, Sphagnum centrale, Sphagnum rubellum, Sphagnum capillifolium, Sphagnum fimbriatum*, and *Sphagnum fuscum*.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (20-May-2011). There are an estimated 1200 occurrences of this small-patch vegetation type throughout the northeastern U.S. from New Jersey to southern Maine. Although larger examples are protected by some state laws, smaller examples, and those in isolated basins, do not receive Federal protection under the Clean Water Act. Much of this vegetation continues to be threatened by adjacent development and runoff associated with these activities, as well as hydrological manipulations such as ditching and filling, or flooding by beaver dams.

RELATED CONCEPTS

Global Similar Types:
- *Vaccinium corymbosum - Gaylussacia baccata - Photinia melanocarpa / Calla palustris* Acidic Peatland (CEGL005085)
- *Vaccinium corymbosum - Rhododendron viscosum - Clethra alnifolia* Acidic Peatland (CEGL006371)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: These small-patch isolated wetlands may occur on the landscape below the minimum map unit.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Some of the New York sites have high *Acer rubrum* and *Nyssa sylvatica* cover and are verging on forested wetlands. Not all sites had dense *Sphagnum* spp. cover.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: This community (CEGL006190) maybe confused with Blueberry Wetland Thicket (CEGL006371), a tall-shrub swamp dominated by *Vaccinium corymbosum* that occurs in seasonally flooded basins, closed sandplain basins, and seasonally flooded zones within larger wetlands.
Global Classification Comments: These tall heath shrub bog thickets tend to occur in wetter, more minerotrophic settings relative to dwarf heath shrub bogs.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the glaciated regions in the eastern and northeastern United States. It was sampled in Northampton County, Pennsylvania. It is peripheral in the Central Appalachian project area and more common in the Lower New England project area.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut; at Culvers Gap North and High Point South in New Jersey; and at Bearfort Mountain, Bellvale Mountain South, Canopus Lake North/Fahnestock State Park, Hammersley Ridge, Harriman State Park, Nuclear Lake, and West Mountain - Bear Mountain State Park in New York.
Global Range: This association occurs from Pennsylvania and New Jersey north to New Hampshire, Maine and possibly Vermont.

2.C.4. Temperate to Polar Freshwater Marsh, Wet Meadow & Shrubland

2.C.4.ND. EASTERN NORTH AMERICAN TEMPERATE & BOREAL FRESHWATER MARSH, WET MEADOW & SHRUBLAND

M061. Eastern North American Cool Temperate Seep

G184. CENTRAL & SOUTHERN APPALACHIAN SEEP

Group Summary Description: Vegetation of this group is associated with wetlands typically found on flat to gently sloping sites in the Southern Blue Ridge, Cumberland Mountains, upper Piedmont, Ridge and Valley, and parts of the Central Appalachians. These wetlands are found over a wide range of elevations and a variety of substrate types, including low-elevation limestone and ultramafic rocks as well as high-elevation acidic rocks. These sites occur at elevations below 1220 m (4000 feet) in poorly drained bottomlands on soils which are often saturated and mucky. Wetness results from a combination of groundwater input, seepage from adjacent slopes, rainfall and impeded drainage. The amount of seepage water input is variable among examples. In a hydrogeomorphic sense these wetlands would be regarded as primarily a slope type, although typically on very gentle slopes. The vegetation is at least partially open, with herbaceous-dominated areas as well as shrub thickets and often forested zones, exhibiting a complex of zones or patches with a mix of physiognomies. The wettest areas have herbaceous vegetation dominated by *Carex* spp., usually with abundant *Sphagnum*. Scattered trees and shrubs may be present in the herbaceous zones. Most examples also have a dense shrub zone around the edges. Some examples have forested zones, as well, around the edges or as a matrix in which numerous small herbaceous openings are embedded. Characteristic tree species include *Acer rubrum, Nyssa sylvatica, Picea rubens, Pinus rigida*, and *Tsuga canadensis*. Characteristic shrubs include *Alnus serrulata, Toxicodendron vernix*, and *Viburnum nudum var. cassinoides*.

A3381 *Carex atlantica - Solidago patula - Parnassia asarifolia* Seep Alliance

Alliance Summary Description: This alliance accommodates shrub- and herb-dominated vegetation of Southern Appalachian "bogs," seeps or poor fens, found at a variety of elevations. Physiognomy is variable and may include herbaceous-dominated patches, shrubby areas, and areas with an open canopy of trees. There may be a mosaic or zoned pattern of shrub thickets and herb-dominated areas, much of it underlain by *Sphagnum* mats. The shrub stratum is open to dense, and is dominated by *Alnus serrulata, Kalmia latifolia, Lindera benzoin var. benzoin, Lyonia ligustrina, Rhododendron maximum*, and *Vaccinium fuscatum*. Typical herbaceous species include *Carex atlantica, Carex folliculata, Carex gynandra, Carex leptalea, Impatiens capensis, Juncus gymnocarpus, Mimulus ringens, Osmunda cinnamomea, Oxypolis rigidior, Rhynchospora capitellata, Rudbeckia laciniata var. laciniata, Scirpus georgianus, Scutellaria lateriflora, Solidago patula var. patula*, and *Thelypteris noveboracensis*. *Sphagnum* species include *Sphagnum affine (= Sphagnum imbricatum), Sphagnum bartlettianum, Sphagnum palustre*, and *Sphagnum recurvum*. If a tree canopy is present, it will be open and contain species such as *Acer rubrum var. trilobum, Betula lenta, Magnolia tripetala*, and *Nyssa sylvatica*. Examples can be physiognomically mixed or variable, with shrubby examples interspersed with small to moderately large herbaceous openings. Examples may occur in stream headwaters and on the edges of small stream floodplains where groundwater seepage emerges and provides a relatively constant flow and saturated conditions. Examples also occur on slight to fairly steep slopes (1-15%) on shallow soils over bedrock.

[CEGL003909] *Alnus serrulata - Lindera benzoin / Scutellaria lateriflora - Thelypteris noveboracensis* Seepage Shrubland

Translated Name: **Hazel Alder - Northern Spicebush / Blue Skullcap - New York Fern Seepage Shrubland**
Common Name: **Montane Low-Elevation Seep**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Cool Temperate Seep (M061)
Group	Central & Southern Appalachian Seep (G184)
Alliance	*Carex atlantica* - *Solidago patula* - *Parnassia asarifolia* Seep Alliance (A3381)

ELEMENT CONCEPT

Global Summary: This low-elevation seep is known from low elevations in the Southern Blue Ridge of North Carolina and Georgia, but is likely more widespread. The type may need substantial revision as more information is collected. This community occurs in stream headwaters and on the edges of small stream floodplains, where groundwater seepage emerges and provides a relatively constant flow and saturated conditions. A small streamlet (less than 1 m wide) flows through the community, and saturated and upland conditions form a mosaic through the remainder of the community. Physiognomy is variable, and may include herbaceous-dominated patches, shrubby areas, and areas with an open canopy of trees. The open to scattered canopy includes species such as *Betula lenta, Magnolia tripetala, Acer rubrum var. trilobum*, and *Nyssa sylvatica*. The shrub stratum is open to dense, and is dominated by *Alnus serrulata, Lyonia ligustrina, Kalmia latifolia, Lindera benzoin var. benzoin*, and *Vaccinium fuscatum*. Typical herbaceous species include *Scutellaria lateriflora, Thelypteris noveboracensis, Mimulus ringens, Osmunda cinnamomea, Ludwigia palustris, Apios americana, Oxypolis rigidior, Leersia virginica, Galium obtusum, Viola cucullata, Lycopus virginicus, Vernonia noveboracensis, Boehmeria cylindrica, Solidago canadensis, Impatiens capensis, Scirpus georgianus, Hypericum mutilum, Rhexia virginica, Ludwigia alternifolia, Solidago patula var. patula, Rudbeckia laciniata var. laciniata, Carex gynandra*, and *Juncus gymnocarpus*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This community is associated with low-elevation stream headwater seeps.

Global Environment: This community occurs in stream headwaters and on the edges of small stream floodplains, where groundwater seepage emerges and provides a relatively constant flow and saturated conditions. A small streamlet (less than 1 m wide) flows through the community, and saturated and upland conditions form a mosaic through the remainder of the community.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The shrub stratum is open to dense, and is dominated by *Alnus serrulata*. Physiognomy is variable and may include herbaceous-dominated patches, shrubby areas, and areas with an open canopy of trees. *Rubus argutus* is common; other shrubs include *Lyonia ligustrina, Kalmia latifolia, Lindera benzoin var. benzoin*, and *Vaccinium fuscatum*. *Carex gynandra, Juncus effusus*, and *Impatiens capensis* dominate the herb layer; other herbaceous species include *Scutellaria lateriflora, Thelypteris noveboracensis, Mimulus ringens, Osmunda cinnamomea*, and *Ludwigia palustris*.

Global Vegetation: Physiognomy is variable and may include herbaceous-dominated patches, shrubby areas, and areas with an open canopy of trees. The open to scattered canopy includes species such as *Betula lenta, Magnolia tripetala, Acer rubrum var. trilobum*, and *Nyssa sylvatica*. The shrub stratum is open to dense, and is dominated by *Alnus serrulata, Lyonia ligustrina, Kalmia latifolia, Lindera benzoin var. benzoin*, and *Vaccinium fuscatum*. Group	Central & Southern Appalachian Seep (G184)
Alliance	*Carex atlantica - Solidago patula - Parnassia asarifolia* Seep Alliance (A3381)

ELEMENT CONCEPT

Global Summary: This community includes non-alluvial, wetland vegetation at very high elevations (1170-1490 m [3850-4900 feet]) in the southern Appalachian Mountains. It is known only from the valley of Long Hope Creek, Ashe and Watauga counties, North Carolina, where about 20 examples occur, and from Mount Rogers, Grayson County, Virginia. This palustrine shrubland is known to occur over amphibolite (a mafic metamorphic rock) and over rhyolite (a felsic igneous rock), on slight to fairly steep slopes (1-15%), is slightly to strongly seepage-fed, and generally has shallow soils over bedrock. Examples are structurally variable, but usually have greater than 25% shrub cover (ranges to 100%). The vegetation generally consists of a mosaic of shrub thickets and small herb-dominated areas, much of it underlain by *Sphagnum* mats. *Sphagnum* coverage is 50-100%. Trees such as *Picea rubens, Abies fraseri, Pinus strobus*, and *Tsuga canadensis* may be scattered throughout or may dominate in patches or on the edges. Dominant shrubs include *Salix sericea, Viburnum nudum var. cassinoides, Ilex collina, Rhododendron catawbiense*, and *Rhododendron maximum*. Other characteristic species include *Taxus canadensis* (Long Hope Valley only), *Picea rubens, Rosa palustris, Salix humilis, Carex atlantica, Carex baileyi, Carex echinata, Carex gynandra, Carex leptalea, Carex lurida, Carex trisperma, Eriophorum virginicum, Galium asprellum, Houstonia serpyllifolia, Juncus effusus, Osmunda cinnamomea, Oxypolis rigidior, Rhynchospora capitellata, Scirpus cyperinus, Scirpus expansus, Scirpus polyphyllus, Packera aurea (= Senecio aureus), Solidago patula var. patula, Sphagnum fuscum, Sphagnum recurvum*, and *Rhizomnium appalachianum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This uncommon bog community was sampled once in the park on basic substrate. The site is a gently sloping, northeast-facing, semipermanently flooded braided seep with floristic diversity increased by the presence of numerous terrestrial species growing on the hummocks. The soil is somewhat poorly drained and extremely stony. The unvegetated surface is a mix of large and small rocks, litter/duff, downed wood, standing water, and bare soil. No evidence of disturbance was reported.

Global Environment: The type occupies non-alluvial wetland habitats at high elevations (1170-1490 m [3850-4900 feet]) in the southern Appalachian Mountains. North Carolina sites occur over amphibolite (a mafic metamorphic rock), while Virginia sites are underlain by rhyolite (a felsic igneous rock) and sandstone. Habitats are situated on slight to moderate slopes (1-10°), sometimes shallow to bedrock, or in shallow, concave basins along seepage-fed headwaters streams. Percent organic matter in soil samples from Virginia plots varies from <2% in gravelly/sandy seepage rills to >45% on hummocks. These soils are very strongly acidic (mean pH = 4.8) with low base status. Surface cover of bryophytes, especially *Sphagnum* spp. is typically >70%.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: *Picea rubens, Abies fraseri, Pinus strobus*, and *Tsuga canadensis* may be scattered throughout or may dominate in patches or on the edges. Dominant shrubs include *Salix sericea, Viburnum nudum var. cassinoides, Ilex collina, Rhododendron catawbiense, Rhododendron maximum*, and *Rosa palustris*. Characteristic herbs include *Carex atlantica, Carex baileyi, Carex echinata, Carex gynandra, Carex leptalea, Carex lurida, Carex trisperma, Eriophorum virginicum, Galium asprellum, Houstonia serpyllifolia, Juncus effusus, Osmunda cinnamomea, Oxypolis rigidior, Rhynchospora capitellata, Scirpus cyperinus, Scirpus expansus, Scirpus polyphyllus, Packera aurea*, and *Solidago patula var. patula*. Nonvascular taxa include *Sphagnum fuscum, Sphagnum recurvum*, and *Rhizomnium appalachianum*. In addition, this community supports VA-state imperiled *Epilobium ciliatum ssp. ciliatum* and *Epilobium leptophyllum*.

Global Vegetation: Examples are structurally variable, but usually have >25% shrub cover and occasionally have nearly 100% shrub cover. The vegetation generally consists of a mosaic of shrub thickets and small herb-dominated areas, much of it underlain by *Sphagnum* mats. Trees such as *Picea rubens, Abies fraseri, Pinus strobus*, and *Tsuga canadensis* may be scattered throughout or may dominate in patches or on the edges. Dominant shrubs include *Salix sericea, Viburnum nudum var. cassinoides, Ilex collina, Rhododendron catawbiense*, and *Rhododendron maximum*. Other characteristic woody species include *Taxus canadensis* (North Carolina only), *Picea rubens, Vaccinium simulatum, Rosa palustris*, and *Salix humilis*. Characteristic herbs include *Carex atlantica, Carex baileyi, Carex*

echinata, Carex gynandra, Carex leptalea, Carex lurida, Carex trisperma, Eriophorum virginicum, Galium asprellum, Houstonia serpyllifolia, Juncus effusus, Juncus subcaudatus, Lycopus uniflorus, Osmunda cinnamomea, Oxypolis rigidior, Rhynchospora capitellata, Scirpus cyperinus, Scirpus expansus, Scirpus polyphyllus, Packera aurea (= Senecio aureus), Solidago patula, Solidago rugosa, and *Viola macloskeyi ssp. pallens*. *Sphagnum fuscum, Sphagnum recurvum*, and *Rhizomnium appalachianum* are typical bryophytes. Species richness of six plot-sampled Virginia stands ranges from 20 to 40 taxa per 100 m2 (mean = 31).

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (22-Oct-2002). This community includes non-alluvial, wetland vegetation influenced by circumneutral seepage, in the southern Appalachian Mountains. It is definitely known only from the valley of Long Hope Creek, Ashe and Watauga counties, North Carolina. There are 25 known examples, totaling 40-80 hectares (100-200 acres) in a 13-square-kilometer (5-square-mile) area. Additionally, in the Mount Rogers area, Grayson County, Virginia, there are three known examples, totaling about 11 hectares (26 acres) in a 6-square-kilometer (2.5-square-mile) area; and at Mann's Bog (headwaters of Stony Creek) on Salt Pond Mountain, Giles County, Virginia, there is a single occurrence covering about 0.4 hectare (1 acre). Stands may be threatened by alteration of the natural hydrologic regime in terms of the amount, seasonality, and chemistry of water. Grazing of cattle can also be destructive to this community, resulting in trampling and nutrient inputs. These lead to detrimental modification of hydrologic regimes and promote rapid succession by woody species.

RELATED CONCEPTS

Global Similar Types:

- *Carex atlantica - Rhynchospora alba - Parnassia asarifolia / Sphagnum warnstorfii* Herbaceous Seep (CEGL004157) are these 2 associations redundant?

CLASSIFICATION

Status: Standard

Classification Confidence: 1 - Strong

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: A rare Southern Appalachian bog known from Long Hope Valley, North Carolina, the Grayson Highlands area, and Salt Pond Mountain in Virginia.

Global Classification Comments: In North Carolina, this shrubland often occurs in association with *Carex atlantica - Rhynchospora alba - Parnassia asarifolia / Sphagnum warnstorfii* Herbaceous Seep (CEGL004157) and

is surrounded by *Picea rubens - (Tsuga canadensis) / Rhododendron maximum* Swamp Forest (CEGL006277) or forests dominated by *Fagus grandifolia, Betula alleghaniensis, Picea rubens*, and *Quercus rubra*, or land cleared from these communities. Most of the Grayson Highlands State Park occurrences are surrounded by cleared lands or northern hardwood forests, while the Giles County occurrence is associated with *Quercus rubra*-dominated slope forest and acidic cove forests dominated by *Tsuga canadensis, Betula alleghaniensis*, and *Rhododendron maximum*. Six plots, all from Virginia, were classified as this association in the Appalachian Trail project (Fleming and Patterson 2009a). Species with 100% constancy include *Acer rubrum, Carex trisperma var. trisperma, Eriophorum virginicum, Juncus subcaudatus var. subcaudatus, Kalmia latifolia, Osmunda cinnamomea, Picea rubens, Vaccinium simulatum*, and *Viola macloskeyi ssp. pallens*. Less constant species that have high cover in these plots include *Carex atlantica ssp. atlantica, Juncus effusus, Rhododendron catawbiense, Rhododendron maximum, Rhynchospora capitellata, Scirpus cyperinus*, and *Solidago rugosa*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is known from near Mount Rogers in Grayson Highlands State Park, Virginia.
Global Range: This community is restricted to high elevations in the southern Appalachian Mountains of North Carolina and Virginia.

Alliance	*Carex atlantica - Solidago patula - Parnassia asarifolia* Seep Alliance (A3381)

ELEMENT CONCEPT

Global Summary: This wetland shrubland with saturated substrates is found on mountain stream floodplains. This association includes some bogs in the Southern Appalachians and does not extend into the Piedmont. Stands are dominated by *Rhododendron maximum* with *Kalmia latifolia* and *Ilex opaca*. There may be limited coverage by *Sphagnum* spp., but peat development is typical. In addition, *Chelone* sp. may be present in the ground layer.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This large shrub-dominated seepage-fed saturated wetland occurs at 1,005 m (3,300 feet) elevation in the Southern Blue Ridge project area. It has peaty soils with fine sediment.
Global Environment: This shrubland occurs on saturated substrates within mountain stream floodplains.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This seepage-fed wetland community is dominated by *Rhododendron maximum, Kalmia latifolia*, and *Ilex opaca*, without much sphagnum but a lot of peat and *Chelone* sp. in the ground layer.
Global Vegetation: Stands are dominated by *Rhododendron maximum* with *Kalmia latifolia* and *Ilex opaca*. There may be limited coverage by *Sphagnum* spp., but peat development is typical. In addition, *Chelone* sp. may be present in the ground layer.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3Q (31-Dec-1997). Bogs, in general, are uncommon and highly threatened in the Southern Blue Ridge. Few examples remain, and many of these are in degraded condition. Threats include grazing, agricultural inputs, aerial deposition of air pollutants, and watershed alteration, including road building and development, all which can alter the natural hydrologic regime. This association needs further taxonomic assessment in order to better distinguish it from other bog communities.

A3382 *Carex gynandra - Glyceria melicaria - Glyceria striata* Seep Alliance

Alliance Summary Description: These are Southern Appalachian, primarily high-elevation seeps and other non-alluvial wetlands found on a variety of sites associated with groundwater seepage. Some characteristic herbaceous species include *Calopogon* sp., *Carex atlantica, Carex gynandra, Carex leptalea ssp. harperi, Carex lurida, Carex scoparia var. scoparia, Carex stipata, Chelone glabra, Doellingeria umbellata (= Aster umbellatus), Dryopteris cristata, Eriophorum virginicum, Glyceria melicaria, Glyceria striata, Impatiens capensis, Lycopus virginicus, Lygodium palmatum, Platanthera clavellata, Platanthera flava var. flava, Pogonia ophioglossoides, Osmunda cinnamomea, Osmunda regalis var. spectabilis, Oxypolis rigidior, Polygonum sagittatum, Solidago patula var. patula, Solidago rugosa*, and *Solidago uliginosa*. *Sphagnum* spp. may occur in mats and include *Sphagnum palustre* and *Sphagnum recurvum*. Shrubs can occur as scattered clumps or zones and include *Hypericum densiflorum, Ilex opaca, Kalmia latifolia, Photinia pyrifolia (= Aronia arbutifolia), Rhododendron maximum, Salix sericea*, and *Viburnum nudum var. cassinoides*. At higher elevations, component species may include *Calamagrostis cainii, Carex debilis, Carex misera, Carex ruthii, Dennstaedtia punctilobula, Gentiana linearis, Glyceria nubigena, Hypericum graveolens, Krigia montana, Parnassia asarifolia*, and *Solidago glomerata*. Woody species in these examples include *Abies fraseri, Picea rubens, Prunus pensylvanica, Rhododendron catawbiense, Rubus canadensis*, and *Vaccinium erythrocarpum*. Sites are influenced by high rainfall and low evaporation rates in the mountainous landscapes. Examples may be small-scale patches. These non-alluvial wetlands are generally graminoid-dominated but may have significant coverage by trees or shrubs, especially around their edges. Particularly small examples may be completely shaded by trees within the community occurrence and in the adjacent forests. Examples of this alliance may occur on a variety of sites associated with groundwater seepage. These include areas of flat to very gently sloping topography (0-2°) located near streams, in flats away from the immediate streambed, along wetland margins, and in seepage-fed oxbow fens. These small palustrine, open seeps generally occur at higher elevations, greater than 1200 m [4000 feet]), on upper slopes and ridgetops. Some associations occur on pronounced slopes at elevations over 1525 m (5000 feet).

[CEGL007697] *Carex gynandra - Platanthera clavellata - Drosera rotundifolia - Carex ruthii / Sphagnum* spp. Herbaceous Seep

Alliance	*Carex gynandra - Glyceria melicaria - Glyceria striata* Seep Alliance (A3382)

ELEMENT CONCEPT

Global Summary: This association accommodates sedge-dominated, seepage slopes scattered throughout the high elevations (>1524 m [5000 feet]) of the Southern Blue Ridge. This non-alluvial wetland is generally graminoid-dominated but may have significant coverage by trees or shrubs, especially around the edges. Particularly small

examples may be completely shaded by trees in the community and in the adjacent forests. Typically this community has well-developed *Sphagnum* mats. Characteristic species include *Carex gynandra, Carex ruthii, Carex atlantica, Carex debilis var. rudgei (= Carex flexuosa), Glyceria striata, Glyceria melicaria, Hypericum graveolens, Hypericum mitchellianum, Hypericum mutilum, Chelone lyonii, Platanthera clavellata*, and *Drosera rotundifolia*. Occurrences of this community are surrounded by or were formerly surrounded by forests dominated by *Abies fraseri* and *Picea rubens* or by the highest northern hardwood forests (forests dominated by *Fagus grandifolia, Betula alleghaniensis*, and *Aesculus flava*). They are influenced by the high rainfall and low evaporation rates in these high mountain landscapes.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: Nearly flat seep around Icewater Springs at Mt. LeConte in Tennessee occurring at 1,798 m elevation.
Global Environment: These seepage slopes are scattered throughout the high elevations (>1525 m [>5000 feet]) of the Southern Blue Ridge. They are influenced by the high rainfall and low evaporation rates in these high mountain landscapes. This non-alluvial wetland is generally graminoid-dominated but may have significant coverage by trees or shrubs, especially around the edges. Particularly small examples may be completely shaded by trees in the community and in the adjacent forests.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: *Ageratina altissima var. roanensis, Chelone obliqua, Carex ruthii, Carex gynandra*, and *Sphagnum* spp. are common.
Global Vegetation: Characteristic species in stands of this type include *Carex gynandra, Carex ruthii, Carex atlantica, Carex debilis var. rudgei (= Carex flexuosa), Glyceria striata, Glyceria melicaria, Hypericum graveolens, Hypericum mitchellianum, Hypericum mutilum, Chelone lyonii, Platanthera clavellata*, and *Drosera rotundifolia*. Typically this community has well-developed *Sphagnum* mats.

Group	Central & Southern Appalachian Seep (G184)
Alliance	*Carex gynandra - Glyceria melicaria - Glyceria striata* Seep Alliance (A3382)

ELEMENT CONCEPT

Global Summary: This acidic seep occurs as small-scale patches along streams in the Southern Appalachians. Occurrences are nearly always less than 0.4 hectare (1 acre) in size. Hydrology is seepage-fed, and these sites may also receive short-term flooding from adjacent streams. Characteristic species include *Glyceria striata, Glyceria melicaria, Osmunda cinnamomea, Carex gynandra, Symphyotrichum puniceum (= Aster puniceus), Solidago patula var. patula, Chelone glabra*, and *Sphagnum recurvum*. Most occurrences are herbaceous-dominated, though scattered shrubs and trees may occur, and trees rooted outside the community sometimes provide substantial shade.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: These herb-dominated saturated seepage wetlands are found on slopes and some flat areas near small to large creeks and are best developed below 1,100 m (3,600 feet) elevation, although some apparent examples may occur at higher elevation. The sampled stands occur on moderate to gently sloping seepages with saturated, poorly to very poorly drained muck soils. The unvegetated surface is dominated by leaf litter with some large and small rocks, wood, bare soil, and standing water.
Global Environment: This acidic seep occurs as small-scale patches along streams in the Southern Appalachians. Occurrences are nearly always less than 0.4 hectare (1 acre) in size. Hydrology is seepage-fed, and these sites may also receive short-term flooding from adjacent streams.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: Characteristic species in the dense (up to 90% cover) herbaceous layer include *Glyceria striata, Glyceria melicaria* (GA-state critically imperiled), *Osmunda cinnamomea, Carex gynandra, Symphyotrichum puniceum, Solidago patula var. patula, Chelone glabra*, and *Sphagnum recurvum*. Additional abundant and/or common species include *Carex ruthii* (GA-state vulnerable), *Carex scabrata* (GA-state imperiled), *Parnassia asarifolia, Oxypolis rigidior, Rudbeckia laciniata, Scirpus polyphyllus*, and *Thalictrum clavatum*.
Global Vegetation: The physiognomic structure of this community type is variable. Most occurrences are herbaceous-dominated, though scattered shrubs and trees may occur, and trees rooted outside the community sometimes provide substantial shade. The most characteristic species include *Glyceria striata, Glyceria melicaria, Osmunda cinnamomea, Carex gynandra, Symphyotrichum puniceum (= Aster puniceus), Solidago patula var. patula, Chelone glabra*, and *Sphagnum recurvum*. Other species reported from some occurrences include *Betula lenta, Liriodendron tulipifera, Pinus strobus, Acer rubrum, Kalmia latifolia, Lyonia ligustrina var. ligustrina, Vaccinium fuscatum, Oxypolis rigidior, Athyrium filix-femina ssp. asplenioides, Salix nigra, Salix sericea*, and *Laportea canadensis*.
Global Dynamics: These communities appear to be relatively stable. They can be affected by beaver activity.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area)

Stratum	Lifeform	Species
Herb (field)	Flowering forb	*Solidago patula*
Herb (field)	Graminoid	*Glyceria melicaria*

Global

Stratum	Lifeform	Species
Herb (field)	Flowering forb	*Solidago patula* var. *patula*
Herb (field)	Graminoid	*Carex gynandra*, *Glyceria melicaria*, *Glyceria striata*
Herb (field)	Fern (Spore-bearing forb)	*Osmunda cinnamomea*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Carex gynandra*, *Chelone glabra*, *Glyceria melicaria*, *Osmunda cinnamomea*, *Solidago patula*
Global: *Carex gynandra*, *Chelone glabra*, *Glyceria melicaria*, *Glyceria striata*, *Osmunda cinnamomea*, *Solidago patula* var. *patula*, *Symphyotrichum puniceum*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Carex ruthii* (G3, GA state-imperiled), *Carex scabrata* (G5, GA state-imperiled), *Glyceria melicaria* (G5, GA state-critically imperiled)
Global: Vulnerable Plants: *Carex ruthii* (G3); **Other Plants**: *Sphagnum recurvum* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (26-Jun-2001). This community is rather widespread but always occurs in very small patches.

RELATED CONCEPTS

Global Similar Types:

- *Carex gynandra - Scirpus cyperinus - Eriophorum virginicum - Osmunda cinnamomea* Herbaceous Seep (CEGL007771) is associated with smaller streams in the Cumberland Plateau from Virginia south possibly to Tennessee.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Woodland seep.
Global Classification Comments: These communities are sometimes regarded as "poorly-developed bogs." This type needs additional study and reconciliation against communities in North Carolina currently treated as forests ("Swamp Forest - Bog Complexes"). Three plots from North Carolina and Georgia (APPA.545, APPA.652, and CVS plot 020-03-0351) in the Appalachian Trail study (Fleming and Patterson 2009a) were classified as this association. While the composition of these samples varies, *Carex gynandra, Chelone glabra*, and *Oxypolis rigidior* are 100% constant and have 2-25% coverage in the samples. Other species that have high diagnostic value are *Carex ruthii, Juncus gymnocarpus, Parnassia asarifolia, Scirpus polyphyllus*, and *Solidago patula var. patula*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled on Chattahoochee National Forest, Georgia, and in Graham and Macon counties in North Carolina, including at Standing Indian Mountain in Nantahala National Forest.
Global Range: This community was defined from the western fringe of the Southern Blue Ridge in northern Georgia, eastern Tennessee, and western North Carolina, but likely extends into adjacent areas of Alabama, Kentucky, and South Carolina.
Nations: US
States/Provinces: AL?, GA, NC, SC, TN
TNC Ecoregions: 50:P, 51:C
USFS Ecoregions (1994/95): 231Dc:CCC, 231De:CCP, M221Dd:CCC
Federal Lands: BIA (Eastern Band of Cherokee); NPS (Appalachian Trail [Southern Blue Ridge], Blue Ridge Parkway?, Great Smoky Mountains); USFS (Chattahoochee, Chattahoochee (Southern Blue Ridge), Cherokee, Nantahala, Sumter (Mountains)?)

Translated Name: **(Jewelweed, Pale Touch-me-not) - Scarlet Beebalm - Greenhead Coneflower Herbaceous Seep**
Common Name: **Rich Montane Seep (High-Elevation Type)**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Cool Temperate Seep (M061)
Group	Central & Southern Appalachian Seep (G184)
Alliance	*Carex gynandra - Glyceria melicaria - Glyceria striata* Seep Alliance (A3382)

ELEMENT CONCEPT

Global Summary: This association covers forb-dominated palustrine vegetation occurring as small wetlands at high elevations (greater than 1200 m [4000 feet]), on upper slopes and ridgetops in the Southern Blue Ridge ecoregion. These areas lack extensive *Sphagnum* and are typically open, without shading from a forest canopy. Typical dominant species include *Impatiens capensis, Impatiens pallida, Monarda didyma*, and *Rudbeckia laciniata var. humilis*. Other characteristic species include *Aconitum reclinatum, Cardamine clematitis, Carex leptonervia, Carex debilis var. rudgei (= Carex flexuosa), Carex ruthii, Chelone lyonii, Cicuta maculata, Claytonia caroliniana, Conioselinum chinense, Euonymus obovatus, Geum geniculatum, Helenium autumnale, Houstonia serpyllifolia, Lilium superbum, Lilium grayi, Packera aurea (= Senecio aureus), Solidago patula, Thalictrum clavatum, Trautvetteria caroliniensis, Veratrum viride, Viola cucullata*, and *Viola macloskeyi ssp. pallens*. This vegetation is often associated with boulderfield forests or other northern hardwood forests [see *Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)].

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This herbaceous association is found on slopes from 1,100 to 1,525 m (3,600-5,000 feet) elevation, primarily in open seeps that are small patches within a matrix of rich coves and rich northern hardwood forests. These montane seeps were sampled at four locations in the park. Sites range from steep to moderate mid and upper slopes with saturated, poorly drained silt loam and sandy soils. The unvegetated surface is typically dominated by leaf litter (up to 80% cover) but may include exposed bedrock, large and small rocks, downed wood, and standing water. No evidence of disturbance was reported at these sites.

Global Environment: Stands of this association are forb-dominated palustrine vegetation occurring as small wetlands at high elevations (greater than 1200 m [4000 feet]), on upper slopes and ridgetops in the Southern Blue Ridge ecoregion. These areas lack extensive *Sphagnum* and are typically open, without shading from a forest canopy. This vegetation is often associated with boulderfield forests or other northern hardwood forests.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The moderately dense (up to 70% cover) herbaceous layer is dominated by forbs including *Impatiens pallida, Monarda didyma*, and *Rudbeckia laciniata*. Additional common and/or abundant herbs may include *Chelone glabra, Chelone lyonii, Dryopteris carthusiana* (NC-state imperiled), *Impatiens capensis, Laportea canadensis*, and *Packera aurea*. Mosses may have up to 20% cover. No exotic species were reported from the four sampled plots.

Global Vegetation: Typical dominant species include *Impatiens capensis, Impatiens pallida, Monarda didyma*, and *Rudbeckia laciniata var. humilis*. Other characteristic species include *Aconitum reclinatum, Cardamine clematitis, Carex leptonervia, Carex debilis var. rudgei (= Carex flexuosa), Carex ruthii, Chelone lyonii, Cicuta maculata, Claytonia caroliniana, Conioselinum chinense, Euonymus obovatus, Geum geniculatum, Helenium autumnale, Houstonia serpyllifolia, Lilium superbum, Lilium grayi, Packera aurea (= Senecio aureus), Solidago patula, Thalictrum clavatum, Trautvetteria caroliniensis, Veratrum viride, Viola cucullata*, and *Viola macloskeyi ssp. pallens*. These stands lack extensive cover by *Sphagnum* spp., and are typically open, without shading from a forest canopy.

Global: *Impatiens capensis*, *Impatiens pallida*, *Monarda didyma*, *Rudbeckia laciniata* var. *humilis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Dryopteris carthusiana* (G5, NC state-imperiled)
Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Cardamine clematitis* (G3), *Carex bromoides* ssp. *montana* (G5T3?), *Carex ruthii* (G3), *Geum geniculatum* (G2), *Glyceria nubigena* (G2G3, endemic to Great Smoky Mountains and adjacent areas near the park), *Hypericum mitchellianum* (G3), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Rudbeckia laciniata* var. *humilis* (G5T3?)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (14-Dec-1998). This community occurs at moderate to high elevations of the southern Blue Ridge Mountains of western North Carolina, eastern Tennessee, southwestern Virginia, northern Georgia, and probably northwestern South Carolina. It occurs as a small patch community, embedded in a variety of regional forest types. While restricted in range and of small size, the community is relatively frequent within its range, many examples are protected, and threats are relatively few and minor.

RELATED CONCEPTS

Global Similar Types:
- *Caltha palustris - Impatiens capensis - Viola cucullata* Seepage Meadow (CEGL006258)
- *Carex gynandra - Platanthera clavellata - Drosera rotundifolia - Carex ruthii / Sphagnum* spp. Herbaceous Seep (CEGL007697)
- *Diphylleia cymosa - Saxifraga micranthidifolia - Laportea canadensis* Forested Herbaceous Seep (CEGL004296) typically occurs at lower elevations and is associated with cove forests.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: The four sampled sites are from the Nantahala Mountains in North Carolina.
Global Classification Comments: Four plots were classified as this association in the Appalachian Trail project (Fleming and Patterson 2009a). Three plots are in the vicinity of Standing Indian (Nantahala Mountains, North Carolina) and one is on the slopes of Whitetop (Jefferson National Forest, Virginia); both sites are above 1220 m (4000 feet) elevation. The plots sampled forested seeps that vary in their physiognomy and composition; most have significant cover by woody species and are likely shaded by the forest canopy. *Chelone glabra* and *Tiarella cordifolia* are present in all plots. Species with 75% constancy include *Aesculus flava, Athyrium filix-femina ssp. asplenioides, Betula alleghaniensis, Eurybia chlorolepis, Fraxinus americana, Houstonia serpyllifolia, Monarda didyma, Packera aurea, Veratrum viride*, and *Viola cucullata*.

Diphylleia cymosa - Saxifraga micranthidifolia - Laportea canadensis Forested Herbaceous Seep (CEGL004296), another high-elevation herbaceous seep association known from the Southern Appalachians, typically occurs at lower elevations and is associated with cove forests.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: The four sampled sites are from the Nantahala Mountains in North Carolina.
Global Range: This community occurs at moderate to high elevations in the southern Blue Ridge Mountains of western North Carolina, eastern Tennessee, southwestern Virginia, northern Georgia, and northwestern South Carolina. It is not found in West Virginia (E. Byers pers. comm.).

A1688 *Diphylleia cymosa - Saxifraga micranthidifolia* Seep Alliance

Alliance Summary Description: This alliance consists of moderate- to high-elevation, forested (shaded) seeps in the Southern Blue Ridge. *Diphylleia cymosa, Laportea canadensis*, and *Saxifraga micranthidifolia* are characteristic and often dominant. Other characteristic species include *Boykinia aconitifolia, Cardamine clematitis, Chelone glabra, Chelone lyonii, Chrysosplenium americanum, Cicuta maculata, Geum geniculatum, Houstonia serpyllifolia, Laportea canadensis, Lilium grayi, Oxypolis rigidior, Parnassia asarifolia, Stellaria corei, Thalictrum clavatum, Tiarella cordifolia, Trautvetteria caroliniensis, Viola cucullata*, and *Viola macloskeyi ssp. pallens*. Occurrences are typically small, but can be extensive (to more than a hectare in size). Vegetation of this alliance has a strong component of species endemic to the Southern Blue Ridge.

[CEGL004296] *Diphylleia cymosa - Saxifraga micranthidifolia - Laportea canadensis* Forested Herbaceous Seep

Translated Name: **American Umbrella-leaf - Lettuceleaf Saxifrage - Canadian Woodnettle Forested Herbaceous Seep**
Common Name: **Rich Montane Seep (Cove Type)**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Cool Temperate Seep (M061)
Group	Central & Southern Appalachian Seep (G184)
Alliance	*Diphylleia cymosa - Saxifraga micranthidifolia* Seep Alliance (A1688)

ELEMENT CONCEPT

Global Summary: This community occurs at moderate to high elevations of the southern Blue Ridge Mountains of western North Carolina, eastern Tennessee, southwestern Virginia, northern Georgia, and probably northwestern South Carolina. It is a characteristic association of shaded seeps of the southern Appalachian Mountains, usually with overhanging canopies, though trees are not rooted in the seep itself. They often are not large enough to be readily mappable, but they are a distinctive habitat for many plants, invertebrate and vertebrate animals. Stands typically contain *Diphylleia cymosa, Saxifraga micranthidifolia*, and *Laportea canadensis*. Other characteristic species include *Cardamine clematitis, Chelone lyonii, Chelone glabra, Chrysosplenium americanum, Boykinia aconitifolia, Cicuta maculata, Houstonia serpyllifolia, Viola cucullata, Viola macloskeyi ssp. pallens, Lilium grayi, Oxypolis rigidior, Parnassia asarifolia, Tiarella cordifolia, Thalictrum clavatum, Trautvetteria caroliniensis, Stellaria corei*, and *Geum geniculatum*. Occurrences associated with more acidic soil conditions often contain *Juncus gymnocarpus*. This association often occurs in cove forests, and the canopy species may include *Liriodendron tulipifera, Tilia americana, Fraxinus americana, Acer saccharum*, and *Aesculus flava*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This more-or-less forested seep association is found on mid and lower slopes and some flat areas and is best developed below 1,100 m (3,600 feet) elevation, although some apparent examples may occur at higher elevation. These seepages occur on

mid and lower slopes in a matrix of cove forests. They are perennial seeps coming from highly fractured gneissic rock. The unvegetated surface is a mix of exposed bedrock, large and small rocks, litter/duff, downed wood, standing water, and bare soil. Evidence of disturbance includes some impacts from hikers.
Global Environment: This association often occurs in cove forests. It is a characteristic association of shaded seeps of the southern Appalachian Mountains, usually with overhanging canopies though trees not rooted in the seep itself. Often not large enough to be readily mappable, but a distinctive habitat for many plants, invertebrate and vertebrate animals.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy of this seep community is either partially or fully covered by cove forest trees from adjacent communities. Canopy species may include *Liriodendron tulipifera, Tilia americana, Fraxinus americana, Acer saccharum*, and *Aesculus flava*. Characteristic and dominant species within the seep include *Diphylleia cymosa, Saxifraga micranthidifolia, Laportea canadensis*, and *Impatiens pallida*. Additional herbs include *Actaea podocarpa (= Cimicifuga americana), Dryopteris intermedia, Dryopteris marginalis, Thalictrum clavatum, Chelone lyonii, Caulophyllum thalictroides*, and *Viola canadensis*, among others.
Global Vegetation: Stands typically contain *Diphylleia cymosa, Saxifraga micranthidifolia*, and *Laportea canadensis*. Other characteristic species include *Cardamine clematitis, Chelone lyonii, Chelone glabra, Chrysosplenium americanum, Boykinia aconitifolia, Cicuta maculata, Houstonia serpyllifolia, Viola cucullata, Viola macloskeyi ssp. pallens, Lilium grayi, Oxypolis rigidior, Parnassia asarifolia, Tiarella cordifolia, Thalictrum clavatum, Trautvetteria caroliniensis, Stellaria corei*, and *Geum geniculatum*. Occurrences associated with more acidic soil conditions often contain *Juncus gymnocarpus* (G. Kauffman pers. comm.). Canopy species may include *Liriodendron tulipifera, Tilia americana, Fraxinus americana, Acer saccharum*, and *Aesculus flava*.

Global: *Diphylleia cymosa*, *Micranthes micranthidifolia*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Cardamine clematitis* (G3), *Geum geniculatum* (G2), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Rudbeckia laciniata* var. *humilis* (G5T3?)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (14-Dec-1998). This community occurs at moderate to high elevations of the southern Blue Ridge Mountains of western North Carolina, eastern Tennessee, southwestern Virginia, northern Georgia, and probably northwestern South Carolina. It occurs as a small patch community, embedded in a variety of regional forest types. While restricted in range and of small size, the community is relatively frequent within its range, many examples are protected, and threats are relatively few and minor.

RELATED CONCEPTS

Global Similar Types:
- *Caltha palustris - Impatiens capensis - Viola cucullata* Seepage Meadow (CEGL006258)
- *Carex gynandra - Platanthera clavellata - Drosera rotundifolia - Carex ruthii / Sphagnum* spp. Herbaceous Seep (CEGL007697)
- *Impatiens (capensis, pallida) - Monarda didyma - Rudbeckia laciniata var. humilis* Herbaceous Seep (CEGL004293)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This type definitely occurs along and near the AT in the Mount Rogers - Whitetop massif, but has not been documented by plot samples there. *Diphylleia cymosa* may occur up to 1,585 m (5,200 feet) elevation.
Global Classification Comments: The nominal species *Diphylleia cymosa*, is a conspicuous component of this association, but may also be found in seeps of varying canopy closure at middle and high elevations. The associated nominal species, *Saxifraga micranthidifolia* and *Laportea canadensis*, are indicative of shaded seeps (G. Kauffman pers. comm.). Another high-elevation herbaceous seep association known from the Southern Appalachians, *Impatiens (capensis, pallida) - Monarda didyma - Rudbeckia laciniata var. humilis* Herbaceous Seep (CEGL004293), often occurs on boulderfields or in northern hardwood forests, at higher elevations than the association defined here. Four plots (three from the Great Smoky Mountains National Park and one from Towns County, Georgia) were classified as this association in the Appalachian Trail analysis (Fleming and Patterson 2009a). *Diphylleia cymosa* and *Laportea canadensis* are present and abundant in all the plot samples, and *Saxifraga micranthidifolia* is present in two of the plots, but otherwise, the samples varied in species composition.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: One stand is located in Chattahoochee National Forest, Georgia and the other is in Yancey County, North Carolina.
Global Range: This community is found at moderate to high elevations of the southern Blue Ridge Mountains of western North Carolina, eastern Tennessee, southwestern Virginia, northern Georgia, and probably northwestern South Carolina.

G189. NORTH-CENTRAL & NORTHEASTERN SEEP

Group Summary Description: This group contains primarily herbaceous-dominated seep vegetation of the north-central and northeastern United States from Maryland and Pennsylvania north to Maine, Vermont, Wisconsin, and into adjacent Canada. This vegetation is primarily dominated by tall and short forbs, as well as by graminoids and *Sphagnum* mosses in some associations. These seepage-fed wetlands are found on gentle slopes. Examples are linear, non-peaty, non-sphagnous, often rocky, groundwater slope wetlands that are embedded in an upland forest setting. Some smaller examples may be nearly or fully shaded by overhanging trees rooted in the adjacent forest, but others are open. Stands of this group are dominated by a wetland flora, but with a lack of species characteristic of floodplains and true bogs (some bog-related species may occasionally be present). Trees may be present on the edges of stands, or often overhanging, but are not characteristic. Shrub species are typically sparse and most typically mesophytic, rather than obligate wetland species. They may form dense zones around the edge but are not characteristic. The herb layer is generally well-developed, and is usually dominated either by characteristic forbs such as *Chelone* spp., *Impatiens capensis, Impatiens pallida, Rudbeckia laciniata*, and *Symplocarpus foetidus*, and/or with presence of *Carex* spp. and other graminoids, including *Eriophorum virginicum* and *Glyceria striata*. In

addition, *Sphagnum* spp. may occur in a minority of examples, but it is more characteristic of vegetation in the other groups within this macrogroup.

A1685 *Carex scabrata - Chrysosplenium americanum* Seep Alliance

Alliance Summary Description: This alliance accommodates small herbaceous seepages with scattered cover of *Carex scabrata* and small forbs, including *Chrysosplenium americanum, Cardamine clematitis, Circaea alpina*, and usually also with the moss *Rhizomnium appalachianum*. Vegetation in this alliance is normally over-shaded by trees rooted in adjacent (non-wetland) communities. The spatial extent of this alliance is small, with individual occurrences normally much less than a hectare in size. Despite its small spatial scale, this alliance is an important component of the diversity of the landscapes in which it occurs. The alliance is distributed primarily in the Appalachian Mountains from New Hampshire and Vermont south to West Virginia, and possibly in adjacent Canada.

[CEGL006193] *Chrysosplenium americanum* Seepage Meadow

Translated Name: **American Golden-saxifrage Seepage Meadow**
Common Name: **Golden-saxifrage Forested Seep**

USNVC Classification

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Cool Temperate Seep (M061)
Group	North-Central & Northeastern Seep (G189)
Alliance	*Carex scabrata - Chrysosplenium americanum* Seep Alliance (A1685)

Element Concept

Global Summary: This type includes small herbaceous seepage areas with scattered cover of forbs. Herbs are strongly dominant and tend to be relatively diverse, especially where there is greater enrichment. Characteristic species can include *Chrysosplenium americanum, Cardamine bulbosa, Circaea alpina, Viola cucullata, Chelone glabra, Glyceria melicaria, Glyceria striata, Cinna arundinacea, Impatiens capensis, Poa paludigena, Carex scabrata, Mimulus ringens, Symplocarpus foetidus, Pilea pumila, Galium triflorum, Saxifraga pensylvanica, Thelypteris noveboracensis, Veratrum viride, Hydrocotyle americana, Onoclea sensibilis, Laportea canadensis, Arisaema triphyllum, Tiarella cordifolia, Carex gynandra, Geum rivale*, and the mosses *Rhizomnium punctatum (= Mnium punctatum), Rhizomnium appalachianum, Brachythecium rivulare, Thuidium delicatulum, Steerecleus serrulatus (= Rhynchostegium serrulatum)*, and *Bryhnia novae-angliae*. Typically the community is over-topped by trees and shrubs from the surrounding forest, although large examples will be open.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: One forest seep occurring in a small basin along a seepage drainage was sampled in Vermont in the Lower New England project area. It is a small (1-6 acres) herbaceous seepage area with scattered cover of forbs. The community is over-topped by trees and shrubs from the surrounding forest. The seep lacks a defined channel and only irregularly has surface flow. There are a couple of patchy non-vegetated areas of exposed muck which appear to be the result of intermittent spring flow (surface groundwater).
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association occurs as small herbaceous seepage areas typically within the greater matrix forest.
Global Environment: This type includes small herbaceous seepage areas with scattered cover of forbs. Herbs are strongly dominant and tend to be relatively diverse, especially where there is greater enrichment.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The Vermont seep is dominated by *Chrysosplenium americanum, Impatiens capensis*, and *Glyceria melicaria*. Other common species include *Scutellaria lateriflora, Dryopteris intermedia, Thuidium delicatulum, Cinna latifolia, Osmunda cinnamomea*, and *Chelone glabra*. It is fully shaded by overhanging *Betula alleghaniensis*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: Typically the community is over-topped by trees and shrubs from the surrounding forest, although large examples will be open. Characteristic species can include *Carex scabrata, Oclemena acuminata (= Aster acuminatus), Rubus pubescens, Thelypteris*

noveboracensis, Osmunda claytoniana, Chrysosplenium americanum, Viola cucullata, Glyceria striata, Cinna arundinacea, Impatiens capensis, Mimulus ringens, Symplocarpus foetidus, Pilea pumila, Galium triflorum, Veratrum viride, Hydrocotyle americana, Onoclea sensibilis, Laportea canadensis, Arisaema triphyllum, Tiarella cordifolia, Geum rivale, and the mosses *Rhizomnium punctatum (= Mnium punctatum), Rhizomnium appalachianum, Brachythecium rivulare, Thuidium delicatulum, Steerecleus serrulatus (= Rhynchostegium serrulatum)*, and *Bryhnia novae-angliae*.

Global Vegetation: Characteristic species can include *Chrysosplenium americanum, Cardamine bulbosa, Circaea alpina, Viola cucullata, Chelone glabra, Glyceria melicaria, Glyceria striata, Cinna arundinacea, Impatiens capensis, Poa paludigena, Carex scabrata, Mimulus ringens, Symplocarpus foetidus, Pilea pumila, Galium triflorum, Saxifraga pensylvanica, Thelypteris noveboracensis, Veratrum viride, Hydrocotyle americana, Onoclea sensibilis, Laportea canadensis, Arisaema triphyllum, Tiarella cordifolia, Carex gynandra, Geum rivale*, and the mosses *Rhizomnium punctatum (= Mnium punctatum), Rhizomnium appalachianum, Brachythecium rivulare, Thuidium delicatulum, Steerecleus serrulatus (= Rhynchostegium serrulatum)*, and *Bryhnia novae-angliae*.

A3373 *Eriophorum virginicum - Dulichium arundinaceum - Carex echinata* Seep Alliance

Alliance Summary Description: This alliance accommodates acidic herbaceous fen or "bog" vegetation from the Allegheny Mountains region of Virginia, West Virginia and Maryland as well as related areas of New York and Pennsylvania. Typical components of this community type include *Carex echinata, Carex folliculata, Dulichium arundinaceum, Eriophorum virginicum, Juncus brevicaudatus, Juncus canadensis, Juncus subcaudatus*, and *Solidago uliginosa*. Other common herbs include *Carex gynandra, Carex trisperma, Doellingeria umbellata (= Aster umbellatus), Drosera rotundifolia var. rotundifolia, Epilobium leptophyllum, Galium tinctorium, Juncus effusus, Osmunda cinnamomea, Scirpus cyperinus, Sparganium erectum ssp. stoloniferum*, and *Viola cucullata*. *Sphagnum* spp. (*Sphagnum recurvum, Sphagnum magellanicum, Sphagnum fallax*, and others) may also be present. Patches of low shrubs and stunted trees are also present in some examples, particularly *Picea rubens* and *Acer rubrum*. Shrubs may include *Menziesia pilosa, Kalmia latifolia, Vaccinium angustifolium*, and *Vaccinium myrtilloides*. The dwarf-shrubs *Vaccinium oxycoccos, Vaccinium macrocarpon*, and *Rubus hispidus* may be present in some associations. This vegetation is found on flat to gently sloping topography of terraces, toeslopes, shallow headwater basins, swales, moats of bog mats, and pondshores. Some older stands typically occur over shallow bedrock, where they are kept open by high water tables. Some habitats typically have pronounced hummock-and-hollow microtopography. Groundwater discharge may be barely perceptible, or may appear as flowing seeps and braided streamlets. The underlying bedrock may consist of acidic sandstone, shale or limestone. The substrate is poorly to very poorly drained shallow peat or muck or sand.

[CEGL006552] *Dulichium arundinaceum - Carex folliculata - Juncus* spp. Seepage Meadow

Translated Name: **Threeway Sedge - Northern Long Sedge - Rush species Seepage Meadow**
Common Name: **Threeway Sedge Basin Marsh**

USNVC Classification

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Cool Temperate Seep (M061)
Group	North-Central & Northeastern Seep (G189)
Alliance	*Eriophorum virginicum - Dulichium arundinaceum - Carex echinata* Seep Alliance (A3373)

Element Concept

Global Summary: This community occurs in shallow basins, swales, moats of bog mats, and pondshores, sometimes with a porous substrate, where the water level drops significantly during dry years. Substrate is variously peat, muck or sandy soil. The vegetation is dominated by a mix of low grasses, sedges, rushes, and scattered shrubs such as *Dulichium arundinaceum, Rubus hispidus, Carex folliculata, Juncus canadensis, Juncus brevicaudatus*, and *Juncus subcaudatus*. Other associates include *Leersia oryzoides, Scirpus cyperinus, Osmunda cinnamomea var. cinnamomea, Triadenum fraseri, Lycopodiella inundata (= Lycopodium inundatum), Eriophorum virginicum, Drosera* spp., *Rhynchospora alba*, and *Sphagnum* spp.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This herbaceous community occurs in shallow basins, swales, moats of bog mats, and pondshores in peat, muck or sandy soils. One site was sampled in the Central Appalachian project area in a semipermanently flooded depression with some surface water and very poorly drained muck soil. The pool is surrounded by white pine - dry oak / heath forest on all sides. The unvegetated surface is dominated by leaf litter with some downed wood and standing water. No evidence of disturbance was reported.

Global Environment: This community occurs in shallow basins with sometimes porous substrate, where the water level drops significantly during dry years. Substrate is variously peat, muck or sandy soil. In West Virginia, this herbaceous fen occurs on temporarily flooded, semipermanently flooded, or saturated peat in the Allegheny Mountains and Ridge and Valley regions at elevations between 620 and 1150 m. It is a small-patch type that occupies flat-lying land in headwater basins. Many stands occur in beaver-influenced wetlands, either on the margins of active beaver ponds, or on sites that are slowly drying above abandoned beaver dams. The type also occurs on the margins of alluvial wetland mosaics, where seepage is impounded behind natural stream levees. Snags are present and indicate that some sites were formerly forested wetlands, while others are temporarily invaded by woody species during dry years and periods of reduced beaver activity. Hummock-and-hollow microtopography is moderately well-developed, with hummocks ranging from 10-20 cm in height. Bedrock is typically acidic sandstone and, less commonly, shale. The substrate is poorly to very poorly drained peat, varying in depth from 25 cm to more than 120 cm, generally underlain by deposits of sand, silt, or clay loam. Hydric soil indicators include histisol, histic epipedon, black histic, hydrogen sulphide, and depleted matrix. Mean soil pH is 4.2 (n=4), mean pore water pH is 4.6 (n=6), and electrical conductivity averages 35 micromhos/cm (n=6). Soil chemistry is characterized by high Fe; moderate Al, B, Cu, Mg, Na, exchangeable nitrogen, and total exchange capacity; and low Ca, K, Mn, S (n=4). Organic matter, phosphorus and zinc are variable, ranging from 3%-68%, 11-102 ppm, and 1-95 ppm respectively. The unvegetated surface is predominantly litter, with an average of 14% standing water and 1% downed wood (Byers et al. 2007).

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Dulichium arundinaceum, Sparganium americanum*, and *Scirpus cyperinus* dominate these naturally occurring marshes and seeps. Scattered trees and shrubs such as *Acer rubrum, Lyonia lucida* and *Vaccinium corymbosum* may overhang the pool.

Global Vegetation: Vegetation is dominated by a mix of low grasses, sedges, rushes, and scattered shrubs such as *Dulichium arundinaceum, Carex folliculata, Juncus canadensis, Juncus brevicaudatus*, and *Juncus subcaudatus*. Other associates include *Lycopodiella inundata (= Lycopodium inundatum), Eriophorum virginicum, Drosera* spp., *Rhynchospora alba*, and *Sphagnum* spp. In West Virginia, this type is an herbaceous peatland that typically has a few stunted trees and shrubs on hummock tops, including *Picea rubens, Hypericum densiflorum, Rhododendron maximum, Ilex verticillata, Alnus incana ssp. rugosa*, and *Kalmia latifolia*. *Rubus hispidus* has high constancy and moderate cover in this type. The herbaceous layer is dominated by *Dulichium arundinaceum*. Other common

herbaceous species include *Eriophorum virginicum, Leersia oryzoides, Scirpus cyperinus, Juncus brevicaudatus, Osmunda cinnamomea var. cinnamomea, Triadenum fraseri, Drosera rotundifolia var. rotundifolia, Juncus effusus, Carex canescens, Rhynchospora alba, Agrostis hyemalis, Carex atlantica, Sparganium* spp., and *Juncus subcaudatus var. subcaudatus*. Nonvascular plants are dominated by *Sphagnum* spp. (*Sphagnum fallax, Sphagnum recurvum, Sphagnum magellanicum, Sphagnum cuspidatum*, and *Sphagnum papillosum*) and generally include moderate cover by *Polytrichum* spp. (*Polytrichum commune, Polytrichum pallidisetum*). Mean species richness of all vascular plants and any nonvascular plants with cover >1% is 21 taxa per 400 square meters for 9 plots in West Virginia (Byers et al. 2007).

A3374 *Impatiens capensis - Symplocarpus foetidus - Caltha palustris* Seep Alliance

Alliance Summary Description: These circumneutral or slightly calcareous groundwater seeps are typically dominated by forbs, including *Angelica atropurpurea, Caltha palustris, Impatiens capensis*, and *Symplocarpus foetidus*. Other species that may be found include *Carex lacustris, Carex stricta, Glyceria striata*, and *Thelypteris palustris*. This type is found throughout the Central Appalachian, northeastern and north-central United States and eastern temperate Canada. Stands are found on lower slopes of glacial moraines, ravines, and terraces around seepage areas, where circumneutral or slightly calcareous groundwater seeps to the surface. Peat sometimes accumulates to a depth of 1 m. Other sites have little organic material, with groundwater typically welling up through carbonate-encrusted gravel.

[CEGL006567] *Symplocarpus foetidus - Impatiens capensis* Seepage Meadow

Translated Name: **Skunk-cabbage - Jewelweed Seepage Meadow**
Common Name: **Skunk-cabbage - Jewelweed Seep**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Cool Temperate Seep (M061)
Group	North-Central & Northeastern Seep (G189)
Alliance	*Impatiens capensis* - *Symplocarpus foetidus* - *Caltha palustris* Seep Alliance (A3374)

ELEMENT CONCEPT

Global Summary: This small seepage wetland vegetation occurs in low-lying areas such as streamheads, lower slope drainages, and the borders of small streams where groundwater emerges. The substrate is mucky, with rocks and boulders often visibly protruding above the surface. Little quantitative data exist for this vegetation, although it appears to be quite common in the northeastern United States. Typically, this vegetation is shaded by tree species of higher ground and surrounding edges of the community, but these species are not characteristic of the vegetation and vary widely among occurrences. *Lindera benzoin* may occur, particularly at the edges. Characteristic herbaceous species are *Symplocarpus foetidus, Impatiens capensis*, and *Arisaema triphyllum*. Other common associates are variable but may include *Veratrum viride, Pilea pumila, Cardamine pensylvanica, Saxifraga pensylvanica, Carex canescens, Caltha palustris*, and *Viola sororia*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This small seepage wetland vegetation occurs in low-lying areas such as streamheads, lower slope drainages, and the borders of small streams where groundwater emerges.

Element Concept

Global Summary: These small wetlands (<1-6 acres) occur as patches within the forest matrix where calcareous groundwater discharge is present throughout the growing season. The substrate may vary from mineral soils to sapric peat (muck). Peat deposits, when present, are generally thin (<50 cm). This association is characterized by a highly variable species composition. *Juniperus virginiana* may be present, and tall shrubs may be present at low cover (<10%) and include *Salix* spp., *Lindera benzoin*, and *Toxicodendron vernix*. The short-shrub layer is also sparse and often dominated by willows. *Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda)* is not a typical associate, and if present, is at low cover. The shrub layers may contain invasive shrubs, especially *Rosa multiflora, Lonicera morrowii*, and *Berberis thunbergii*. Open sites with little or no woody plant cover often are dominated by graminoids, while more shaded sites have a higher cover of forb species. Herbaceous vegetation typically exceeds 90% and may reach 2 m in height in some forb species. Typical forb species include *Vernonia noveboracensis, Thelypteris palustris, Viola* spp., *Packera aurea (= Senecio aureus), Symplocarpus foetidus, Arisaema triphyllum, Hydrocotyle americana, Eupatorium* spp., *Impatiens* spp., *Pycnanthemum verticillatum, Amphicarpaea bracteata, Mitella diphylla*, *Solidago uliginosa, Drosera rotundifolia, Parnassia glauca,* and *Chelone glabra*. Typical graminoid species include *Carex leptalea, Carex granularis, Carex atlantica, Carex debilis, Leersia oryzoides*, *Muhlenbergia glomerata, Rhynchospora alba,* and *Poa palustris*. The invasive plants *Lythrum salicaria* and *Microstegium vimineum* may be present, the former particularly in more open seeps. Mosses are usually present but are typically <5% of total vegetation cover.

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (23-May-2011). This small-patch association is restricted to seepage areas in calcareous bedrock. It has a narrow range extent, occurring in only three states, and occurrences are only a few acres in size. This association is vulnerable to runoff from development and road construction, logging and other activities adjacent to the fen. This vegetation is prone to invasive species incursion, and is threatened by altered hydrology, both human-induced and that caused by beavers.

A3372 *Prunus virginiana - Acer spicatum - Cornus sericea* Seep Alliance

Alliance Summary Description: This alliance accommodates shrubby to herbaceous seepage swamps known only from high elevations (>915 m [3000 feet]) in Vermont. Characteristic tall shrubs include *Prunus virginiana, Acer spicatum*, and *Sambucus racemosa*. *Cornus sericea* may also be important. *Ribes triste* is a relatively constant short shrub. Other shrubs may include *Viburnum opulus var. americanum* and *Ribes lacustre*, along with saplings of upland species which are common in the surrounding forest. Herbaceous species may include *Ageratina altissima, Athyrium filix-femina, Chelone glabra, Dryopteris campyloptera, Glyceria striata, Laportea canadensis, Ranunculus recurvatus, Solidago rugosa*, and *Tiarella cordifolia*. These stands occupy small openings ranging from several hundred square meters to several hectares on moderate to somewhat steep slopes within a matrix of *Abies balsamea*-dominated forest. They are most likely maintained by groundwater seepage. The locations in Vermont include the Coolidge Range of the Green Mountains in central Vermont, as well as possibly from Mansfield Mountain, Bolton Mountain, Haystack Mountain in Lowell; Spruce Mountain in Plainfield; and Signal Mountain in Groton.

Group	North-Central & Northeastern Seep (G189)
Alliance	*Prunus virginiana - Acer spicatum - Cornus sericea* Seep Alliance (A3372)

ELEMENT CONCEPT

Global Summary: These shrubby to herbaceous seepage swamps are currently known only from high elevations (>915 m [3000 feet]) in the northern Appalachian Mountains of Vermont, possibly New Hampshire and Maine. More specifically it occurs in the Coolidge Range of the Green Mountains in central Vermont. They occupy small openings ranging from several hundred square meters to several hectares on moderate to somewhat steep slopes within a matrix of *Abies balsamea*-dominated forest, i.e., *Abies balsamea - (Betula papyrifera var. cordifolia)* Forest

(CEGL006112). They are most likely maintained by groundwater seepage. The ground surface is mostly mineral soil, with little to no peat accumulation. The shrub- and herb-dominance and relatively high species richness contrast with the surrounding conifer-dominated forest. Many species are nutrient-demanding and are unusual at high elevations. The shrub layer is somewhat open to relatively dense and up to 5 m in height. *Prunus virginiana, Acer spicatum*, and *Sambucus racemosa* are relatively constant to codominant medium to tall shrubs. *Cornus sericea* is important in one sampled plot. *Ribes triste* is a relatively constant short shrub. Other shrubs may include *Viburnum opulus var. americanum* and *Ribes lacustre*, along with saplings of upland species which are common in the surrounding forest, such as *Abies balsamea* and *Betula papyrifera var. cordifolia*. The herb layer is moderately dense to dense under the shrubs or in openings. *Angelica atropurpurea, Heracleum maximum, Hydrophyllum virginianum, Impatiens capensis, Thalictrum pubescens, Tiarella cordifolia*, and *Veratrum viride* are constant to codominant herbs. Relatively constant herbs present at lower cover include *Laportea canadensis, Solidago macrophylla, Symphyotrichum puniceum, Dryopteris campyloptera, Milium effusum, Rubus pubescens, Trillium erectum, Actaea pachypoda, Carex leptonervia, Dicentra cucullaria, Erythronium americanum*, and *Phegopteris connectilis*. In addition to these species, *Cornus amomum, Amelanchier bartramiana, Sorbus americana, Sorbus decora, Chamerion angustifolium, Platanthera dilatata, Rubus idaeus*, and *Saxifraga pensylvanica* are characteristic of the largest known stand. Some of these seeps are enhanced by natural disturbance (blowdowns) and others by timber harvest.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: These shrubby to herbaceous seepage swamps or glades are known from high elevations (>776 m [2,545 feet]) in the Coolidge Range of the Green Mountains in central Vermont, occupying small openings on moderate to somewhat steep slopes within a matrix of balsam fir-dominated forest. Soils are mineral with little to no peat accumulation. Sites are saturated seeps located on gentle to moderate upper slopes with north, northwest and west aspects. Soils are poorly drained sandy loam or muck. The unvegetated surface consists of leaf litter, with small amounts of downed wood, large rocks, ledge, talus, bare soil and/or standing water. Heavy moose traffic and browse were reported at one site.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These shrublands occur on moderately steep slopes near ridgetops within a matrix of balsam fir-dominated forest, at elevations from 1020 to 1230 m (3,300-4,000 feet). They appear to be maintained by groundwater seepage near or at the ground surface. The soil is damp at the surface in mid-June and small flowing rivulets occur within stands. The Vermont Nongame and Natural Heritage Program (VNNHP 1991) describe this vegetation as a "circumneutral seep."
Global Environment: These shrublands occur on moderately steep slopes near ridgetops within a matrix of balsam fir-dominated forest, at elevations from 1020 to 1230 m (3300-4000 feet). They appear to be maintained by groundwater seepage near or at the ground surface. The soil is damp at the surface in mid-June and small flowing rivulets occur within stands. The Vermont Nongame and Natural Heritage Program (VNNHP 1991) describe this vegetation as a "circumneutral seep."

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The open to dense shrub layer is up to 5 m in height and dominated by *Prunus virginiana, Acer spicatum*, and *Sambucus racemosa*. *Ribes triste* is a constant short shrub. The herb layer includes some combination of *Angelica atropurpurea, Heracleum maximum, Hydrophyllum virginianum, Impatiens capensis, Thalictrum pubescens, Tiarella cordifolia, Ageratina altissima, Glyceria striata, Solidago rugosa, Athyrium filix-femina, Chelone glabra, Dryopteris campyloptera, Ranunculus recurvatus, Tiarella cordifolia, Veratrum viride, Laportea canadensis, Solidago macrophylla, Symphyotrichum puniceum, Dryopteris campyloptera, Milium effusum, Rubus pubescens, Trillium erectum, Actaea pachypoda, Carex leptonervia, Dicentra cucullaria, Erythronium americanum*, and *Phegopteris connectilis*. In addition, this community supports VT state-critically imperiled *Blephilia hirsuta*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: *Prunus virginiana, Acer spicatum*, and *Sambucus racemosa* are relatively constant to codominant medium to tall shrubs. *Cornus sericea* may also be important. *Ribes triste* is a relatively constant short shrub. Other shrubs may include *Viburnum opulus var. americanum* and *Ribes lacustre*, along with saplings of upland species which are common in the surrounding forest, such as *Abies balsamea* and *Betula papyrifera var. cordifolia*. The herb layer is moderately dense to dense under the shrubs or in openings. *Angelica atropurpurea, Heracleum maximum, Hydrophyllum virginianum, Impatiens capensis, Thalictrum pubescens, Tiarella cordifolia*, and *Veratrum viride* are constant to codominant herbs. Relatively constant herbs present at lower cover include *Laportea canadensis, Solidago macrophylla, Symphyotrichum puniceum, Dryopteris campyloptera, Milium effusum, Rubus pubescens, Trillium erectum, Actaea pachypoda, Carex leptonervia, Dicentra cucullaria, Erythronium americanum*, and *Phegopteris connectilis*. In

addition to these species recorded in plot-sampling, the Vermont Nongame and Natural Heritage Program (VNNHP 1991) reported *Cornus amomum, Amelanchier bartramiana, Sorbus americana, Sorbus decora, Chamerion angustifolium, Platanthera dilatata, Rubus idaeus*, and *Saxifraga pensylvanica* as being characteristic of the largest known stand.

Global Vegetation: *Prunus virginiana, Acer spicatum*, and *Sambucus racemosa* are relatively constant to codominant medium to tall shrubs. *Cornus sericea* may also be important. *Ribes triste* is a relatively constant short shrub. Other shrubs may include *Viburnum opulus var. americanum* and *Ribes lacustre*, along with saplings of upland species which are common in the surrounding forest, such as *Abies balsamea* and *Betula papyrifera var. cordifolia*. The herb layer is moderately dense to dense under the shrubs or in openings. *Angelica atropurpurea, Heracleum maximum, Hydrophyllum virginianum, Impatiens capensis, Thalictrum pubescens, Tiarella cordifolia*, and *Veratrum viride* are constant to codominant herbs. Relatively constant herbs present at lower cover include *Laportea canadensis, Solidago macrophylla, Symphyotrichum puniceum, Dryopteris campyloptera, Milium effusum, Rubus pubescens, Trillium erectum, Actaea pachypoda, Carex leptonervia, Dicentra cucullaria, Erythronium americanum*, and *Phegopteris connectilis*. In addition to these species recorded in plot-sampling, the Vermont Nongame and Natural Heritage Program (VNNHP 1991) reported *Cornus amomum, Amelanchier bartramiana, Sorbus americana, Sorbus decora, Chamerion angustifolium, Platanthera dilatata, Rubus idaeus*, and *Saxifraga pensylvanica* as being characteristic of the largest known stand.

Global Dynamics: The processes that maintain these shrublands of comparatively nutrient-demanding, typically low-elevation, and diverse species within a typical high-elevation balsam fir-dominated forest are uncertain and somewhat enigmatic. It is likely that periodic soil saturation at least inhibits conifer invasion; the wetland indicator status of many species and seepages within the stands support this. Stands occur too high on slopes and on too moderate slopes for avalanches to be a factor.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (14-Aug-2013). About six stands, ranging from about 1/20 hectare to several hectares in size, occur along approximately 2 km of the Appalachian Trail on the ridge between Killington and Snowden peaks in the Coolidge Range (C. Lea pers. obs. 2009). The largest stand evidently was noted and briefly described by the Vermont Nongame and Natural Heritage Program (VNNHP 1991). Several more kilometers of ridge in the range have not been searched, and more stands are probably present farther from the trail and possibly at lower elevations in the range. The unusual setting (high-elevation, nutrient-rich seeps), the small-patch nature of stands, and the lack of observations of even somewhat similar vegetation elsewhere strongly suggest that this community type is quite rare and restricted, regardless of its distribution. However, due to its small size and high-elevation locations, it has likely been overlooked at other sites. It was originally thought to be endemic to the Coolidge Range, but Andy Cutko in Maine has confirmed it in Maine and the UMESC mapping team discovered it in southern New Hampshire during reconnaissance work.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Sites are all open seepage wetlands typically occurring on gentle slopes with shallow muck soils.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: No plots or observation points, but observed by the UMESC mapping team in southern New Hampshire and Andy Cutko of Maine Natural Heritage Program says this occurs in Maine.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Other Comments: None.
Global Classification Comments: From their unusual composition and setting, with no other similar types described in the USNVC, these stands seem to represent a distinct community type that seems not closely related to any previously recognized. Within this small range, it is an easily recognized, repeating, and very distinctive assemblage. Other stands in the Coolidge Range should be plot-sampled and described, more stands should be sought (using remote sensing, as needed), and similar vegetation might be sought elsewhere in the Green Mountains or in the Taconics or Berkshires, where nutrient-rich substrates occur at higher elevations. The current alliance assignment is a rather poor fit, but is probably the closest that can accommodate this vegetation at present. Brett Engstrom (pers. comm. 2012) has seen these in the northern Green Mountains, higher elevations in northeast Vermont, and above the 45th parallel in New Hampshire.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: These shrubby to herbaceous seepage swamps are currently known only from high elevations (>915 m [3000 feet]) in the Coolidge Range of the Green Mountains in central Vermont. M069. Eastern North American Marsh, Wet Meadow & Shrubland

G125. Eastern North American Freshwater Marsh

Group Summary Description: These freshwater emergent marshes are dominated by herbaceous vegetation, primarily graminoids. *Schoenoplectus* spp., *Typha* spp., and *Zizania* spp. are common dominants though other species can be abundant or even form nearly monotypic stands. They are common throughout the northern half of the eastern United States and adjacent Canadian provinces. Freshwater marshes occur in closed or open basins that are generally flat and shallow and are always or nearly always flooded. Water depths range from a few centimeters to approximately 1 m. They are associated with lakes, ponds, slow-moving streams, and/or impoundments or ditches. These marshes include those along the shores and estuaries of the Great Lakes. Dominant vegetation tends to be 1-2 m tall and cover varies from moderate to dense. Scattered shrubs may be present but total less than 25% cover. Trees are generally absent and, if present, are scattered. The substrate is typically muck over mineral soil, though where waves or currents are stronger or in some low-nutrient sites, the mineral soil may be exposed.

A3669 *Peltandra virginica - Pontederia cordata - Sagittaria* spp. Marsh Alliance

Alliance Summary Description: This alliance includes very wet or partially submerged forb vegetation in the northeastern and midwestern United States and adjacent Canada. Dominants vary depending on water levels, recent disturbances, etc. A wide variety of forbs can dominate, including *Peltandra virginica, Polygonum amphibium, Polygonum hydropiper, Carex emoryi, Impatiens capensis, Pontederia cordata, Bidens cernua*, and *Verbena hastata*. Typical associates include *Nuphar* ssp., *Glyceria striata, Polygonum sagittatum, Schoenoplectus tabernaemontani (= Scirpus validus), Schoenoplectus americanus (= Scirpus americanus)*, and *Sagittaria latifolia*. Stands occur on the banks of rivers and lakes and sometimes of artificial ponds and impoundments.

Element Concept

Global Summary: This variable wetland type occurs in depressions, drainages, and basins that contain ponded water throughout the year. In general, waterflow out of the sites is restricted, either due to naturally occurring depressions or from beaver activity, roads, or berms. The vegetation is dominated by species that are tolerant of standing water, and species composition is extremely variable among sites. Common species may include *Eleocharis acicularis, Verbena hastata, Bidens cernua, Eupatorium maculatum, Leersia oryzoides, Polygonum hydropiper, Polygonum sagittatum, Equisetum arvense, Symphyotrichum novae-angliae, Schoenoplectus americanus, Carex stipata, Carex vulpinoidea, Eupatorium perfoliatum, Poa trivialis, Ludwigia palustris*, and/ or *Toxicodendron radicans*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mixed forb marsh occurs in depressions, drainages, and basins that contain ponded water throughout the year. In general, waterflow out of the sites is restricted, either due to naturally occurring depressions or from beaver activity, roads or berms. The vegetation is often restricted to the edges of the basins, with open water remaining in the center. These wetlands typically occur on very poorly drained soils such as mucky silt loam, shallow mucky peat, and, less occasionally, on ponded gravelly sand.
Global Environment: This variable wetland type occurs in depressions, drainages, and basins that contain ponded water throughout the year. A1436 *Typha angustifolia - Typha latifolia - Schoenoplectus* spp. Deep Marsh Alliance

Alliance Summary Description: This alliance, found across the eastern half of the United States and southern Canada, contains stands dominated or codominated by *Typha angustifolia* and/or *Typha latifolia*, either alone or in combination with other tall emergent marsh species. *Typha* often occurs in pure stands, and can colonize areas recently exposed by either natural or human causes. *Lythrum salicaria*, an exotic species from Europe, has become a common associate of many eastern *Typha* marshes. In the Southeast, this alliance is widespread and currently representative of a wide variety of mixed marshes with no clear dominants. Vegetation in this alliance may be natural or semi-natural and includes mixed stands of the nominal species, as well as essentially monospecific stands of *Typha latifolia*. Occurrences may display areas of open water, but emergent vegetation dominates. Vegetative diversity and density are highly variable in response to water depth, water chemistry, and natural forces. Associated species vary widely; in the Midwest they include many sedges such as *Carex aquatilis, Carex pellita (= Carex lanuginosa), Carex rostrata*, bulrushes such as *Schoenoplectus acutus (= Scirpus acutus), Schoenoplectus americanus (= Scirpus americanus)*, and *Schoenoplectus heterochaetus (= Scirpus heterochaetus)*, and broad-leaved herbs such as *Asclepias incarnata, Hibiscus moscheutos, Impatiens capensis, Sagittaria latifolia, Scutellaria lateriflora, Sparganium eurycarpum, Thelypteris palustris*, and *Verbena hastata*. Floating aquatics such as *Lemna minor* may predominate in deeper zones. This alliance is found most commonly along lake margins and in shallow basins, and occasionally in river backwaters. Lacustrine cattail marshes typically have a muck-bottom zone bordering the shoreline, where cattails are rooted in the bottom substrate, and a floating mat zone, where the roots grow suspended in a buoyant peaty mat. These marshes have hydric soils and are flooded with water levels ranging from several centimeters to more than 1 m for a significant part of the growing season. Soils which support this community can be mineral or organic but are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper part.

[CEGL006153] *Typha (angustifolia, latifolia) - (Schoenoplectus* spp.) Eastern Marsh

Translated Name: **(Narrowleaf Cattail, Broadleaf Cattail) - (Bulrush species) Eastern Marsh**
Common Name: **Eastern Cattail Marsh**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Eastern North American Freshwater Marsh (G125)
Alliance	*Typha angustifolia - Typha latifolia - Schoenoplectus* spp. Deep Marsh Alliance (A1436)

ELEMENT CONCEPT

Global Summary: These tall emergent marshes are common throughout the northeastern United States and adjacent Canadian provinces. They occur in permanently flooded basins, often as part of a larger wetland mosaic and associated with lakes, ponds, or slow-moving streams. The substrate is muck over mineral soil. Lacustrine cattail marshes typically have a muck-bottom zone bordering the shoreline, where cattails are rooted in the bottom substrate, and a floating mat zone, where the roots grow suspended in a buoyant peaty mat. Tall graminoids dominate the vegetation; scattered shrubs are often present (usually totaling less than 25% cover) and are frequently shorter than the graminoids. Trees are absent. Bryophyte cover varies and is rarely extensive; bryophytes are mostly confined to the hummocks. *Typha angustifolia, Typha latifolia*, or their hybrid *Typha x glauca* dominate, either alone or in combination with other tall emergent marsh species. Associated species vary widely; sedges, such as *Carex aquatilis, Carex lurida, Carex pellita (= Carex lanuginosa), Carex rostrata, Carex stricta, Scirpus cyperinus*, and bulrushes, such as *Schoenoplectus americanus (= Scirpus americanus)* and *Schoenoplectus acutus (= Scirpus acutus)*, occur along with patchy grasses, such as *Calamagrostis canadensis*. Broad-leaved herbs include *Asclepias incarnata, Calla palustris, Impatiens capensis, Onoclea sensibilis, Sagittaria latifolia, Scutellaria lateriflora, Sparganium eurycarpum, Symplocarpus foetidus, Thelypteris palustris*, and *Verbena hastata*. Floating aquatics, such as *Lemna minor*, may be common in deeper zones. Shrub species vary across the geographic range of this type; in the northern part of its range, *Myrica gale, Ilex verticillata*, and *Spiraea alba* are common. The invasive exotic plants *Lythrum salicaria* and *Phragmites australis* may be abundant in parts of some occurrences. This association is distinguished from other northeastern freshwater marshes by the strong dominance of *Typha* spp.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: One example was sampled in Cumberland County, Pennsylvania, where the Hogestown Run intersects the Appalachian Trail in the Central Appalachian project area. This marsh is situated on limestone bedrock. The drainage is surrounded by farmland, residential areas and highly modified shrubland and forest along the edge of the creek.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This cattail marsh occurs in permanently flooded basins, often as part of a larger wetland mosaic and associated with lakes, ponds, or slow-moving streams. It is very common throughout the Northeast. Sites are saturated to semipermanently flooded basins and flats with very poorly drained muck soils. The unvegetated surface consists of standing water. Evidence of disturbance includes alterations to hydrology (man-made and beaver dams) and the presence of exotic plants.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This herbaceous wetland is only known from one location in New Hampshire in a basin floor at 250 m (820 feet) elevation. Soil is saturated muck.

Global Environment: These tall emergent marshes are common throughout the northeastern United States and adjacent Canadian provinces. They occur in permanently flooded basins, often as part of a larger wetland mosaic and associated with lakes, ponds, or slow-moving streams. The substrate is muck over mineral soil. Lacustrine cattail marshes typically have a muck-bottom zone bordering the shoreline, where cattails are rooted in the bottom substrate, and a floating mat zone, where the roots grow suspended in a buoyant peaty mat. This association is often found in impounded waters.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Phalaris arundinacea* is the dominant along the creek berm and slightly drier areas of the marsh while *Typha latifolia* dominates the wetter center.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This tall emergent marsh is dominated by *Typha angustifolia* or *Typha latifolia*. Other common and/or abundant species may include *Dulichium arundinaceum, Impatiens capensis, Iris versicolor, Juncus canadensis, Ludwigia palustris, Pilea pumila, Sparganium americanum*, and *Thelypteris palustris*. These marshes have become heavily invaded by the exotic *Lythrum salicaria*. In addition, this community supports NJ state-critically imperiled *Acorus americanus* and MA state-imperiled *Lobelia kalmii*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only known occurrence of this association is an herbaceous wetland dominated by *Typha angustifolia* and *Lysimachia terrestris*. Total herbaceous cover is 80% and shrubs are absent. Other herbaceous associates include *Carex canescens, Carex scoparia, Cicuta bulbifera, Frangula alnus, Glyceria canadensis, Scirpus cyperinus, Spiraea tomentosa*, and *Triadenum fraseri*. Nonvascular cover is >80% and dominated by *Sphagnum* spp.

Global Vegetation: Tall graminoids dominate the vegetation; scattered shrubs are often present (usually totaling less than 25% cover) and are frequently shorter than the graminoids. Trees are absent. Bryophyte cover varies and is

rarely extensive; bryophytes are mostly confined to the hummocks. *Typha angustifolia, Typha latifolia*, or their hybrid *Typha x glauca* dominate, either alone or in combination with other tall emergent marsh species. Associated species vary widely; sedges, such as *Carex aquatilis, Carex lurida, Carex pellita (= Carex lanuginosa), Carex rostrata, Carex stricta, Scirpus cyperinus*, and bulrushes, such as *Schoenoplectus americanus (= Scirpus americanus)* and *Schoenoplectus acutus (= Scirpus acutus)*, occur along with patchy grasses, such as *Calamagrostis canadensis*. Broad-leaved herbs include *Asclepias incarnata, Calla palustris, Impatiens capensis, Onoclea sensibilis, Sagittaria latifolia, Scutellaria lateriflora, Sparganium eurycarpum, Symplocarpus foetidus, Thelypteris palustris*, and *Verbena hastata*. Floating aquatics, such as *Lemna minor*, may be common in deeper zones. Shrub species vary across the geographic range of this type; in the northern part of its range, *Myrica gale, Ilex verticillata*, and *Spiraea alba* are common. The invasive plants *Lythrum salicaria* and *Phragmites australis* may be abundant in parts of some occurrences.

Global Dynamics: This association is often found in impounded waters.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is interdigitated with Eastern Ruderal Reed Canarygrass Marsh (CEGL006044) in the example sampled at Hogestown Run in Pennsylvania.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: In the Unionville West site in New Jersey, the cattail marsh is a bit more diverse than just cattails. It is surrounded by a shrub swamp and Red Maple / Upright Sedge Wet Woodland (CEGL006119).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: *Typha angustifolia* can grow in deeper water compared to *Typha latifolia*, although both species reach maximum growth at a water depth of 50 cm (Grace and Wetzel 1981). *Typha* often occurs in pure stands and can colonize areas recently exposed by either natural or human causes.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: One example was sampled in Cumberland County, Pennsylvania, where the Hogestown Run intersects the Appalachian Trail in the Central Appalachian project area.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Lake Buel Road Wetlands Natural Heritage Site in Massachusetts, Parker Lake and Unionville West in New Jersey, and at Lottery Road Swamp in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only known from one location southeast of Balch Hill in New Hampshire.
Global Range: This association occurs throughout the northeastern U.S. from Maine to Virginia and possibly North Carolina.

G167. EASTERN NORTH AMERICAN SHRUB SWAMP

Group Summary Description: This group encompasses mineral-soil wetlands dominated by tall shrubs in the northeastern and north-central United States and adjacent Canada. It is best developed in glaciated territory but extends southward in the mountains to West Virginia. These shrublands develop in poorly drained basins and along smaller low-gradient streams, on mineral soils with or without a well-decomposed muck layer. The classic physiognomy is a dense cover of shrubs over 1 m tall, and often over 2 m tall. Trees may be scattered but form less than 25% cover. Herb cover varies depending on how much light reaches the ground. The most common dominant is *Alnus*, either *Alnus incana ssp. rugosa* or *Alnus serrulata*. Other important species include *Cornus sericea* and *Spiraea alba*. Associates include *Ilex verticillata, Viburnum nudum var. cassinoides*, and *Salix* spp. This group also includes wetlands where the above species may be only incidental, if present at all, with dominance by *Cephalanthus occidentalis* or, less commonly, *Vaccinium corymbosum*. Typical herbs of these swamps include *Calamagrostis canadensis, Thelypteris palustris, Eupatorium maculatum, Lycopus uniflorus, Impatiens capensis, Chelone glabra*, and *Onoclea sensibilis*. This group includes wetlands that are more-or-less stable shrub swamps, as well as shrub swamps on formerly cleared lands that may be developing into wooded swamps.

A3684 *Alnus incana - Cornus amomum* Alluvial & Tidal Shrub Swamp Alliance

Alliance Summary Description: This alliance comprises tall alluvial and freshwater tidal shrublands in the northeastern and north-central United States and temperate regions of eastern Canada. These tall shrublands are dominated or characterized by *Alnus serrulata, Alnus incana*, or *Alnus maritima ssp. maritima* and *Cornus amomum* or *Cornus sericea*. The substrate can be muck overlying mineral soils or cobble, gravel and sandy silt to silt mixes. The soils tend to dry out over the course of the year.

[CEGL006062] *Alnus incana - Cornus (amomum, sericea) / Clematis virginiana* Shrub Swamp

Translated Name: **Gray Alder - (Silky Dogwood, Red-osier Dogwood) / Devil's Darning-needles Shrub Swamp**
Common Name: **Alluvial Alder Thicket**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Eastern North American Shrub Swamp (G167)
Alliance	*Alnus incana - Cornus amomum* Alluvial & Tidal Shrub Swamp Alliance (A3684)

ELEMENT CONCEPT

Global Summary: These shrublands occur along large streams and rivers in New England, northern New York and western Pennsylvania. They are found on river-margin alluvial deposits of moderate-energy reaches, where the flooding regime prevents forests from developing. The setting can range from flats to moderately steep banks; soils are usually sandy or silty and have little organic matter. Most are temporarily flooded, and the soils may not remain saturated through the entire growing season. Tall shrubs (1.5-3 m in height) dominate the vegetation, usually forming at least 50% cover and often creating a dense thicket. The amount of lower shrub and herb vegetation varies inversely with the tall-shrub canopy. Bryophytes are usually sparse but may be locally abundant in some settings.

Alnus incana is a constant and usually dominant shrub. In some cases, *Alnus serrulata* (in more temperate settings) or *Alnus viridis* (in more boreal settings) may occur with or in place of *Alnus incana*. The ability of alders to bend under strong currents and their nitrogen-fixing root nodules may give alders a competitive advantage over other shrubs in this setting. *Cornus sericea* or *Cornus amomum*, along with *Salix* spp., are frequent associates and may dominate in some areas. *Viburnum nudum var. cassinoides* is occasional but not abundant. *Acer rubrum, Prunus serotina, Ulmus americana*, and/or *Acer saccharinum* may be present, as sparse individuals; in more southerly examples of this type, *Acer negundo* and *Salix nigra* may occur. *Spiraea alba* is usually present and may be abundant as a lower shrub. *Clematis virginiana* is a typical vine, often clambering in tangles on the shrubs. This type is distinguished from other northeastern *Alnus*-dominated associations by its alluvial setting. Although common, this association is little studied and comprehensive surveys have yet to be undertaken.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This riparian shrubland occurs on river-margin alluvial deposits of moderate- to high-energy river reaches, where the flooding regime prevents forests from developing. The sampled site is a temporarily alluvial flat with very poorly drained soil. The unvegetated surface is entirely standing water. Evidence of disturbance includes a minor presence of exotic plants.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This shrubland association occurs locally throughout the Northern Appalachian project area in intermittently to seasonally flooded low level positions at elevations ranging from 500 to 1,600 m (1,640-5,250 feet). Positions are typically flat, but may occasionally have gentle slopes. Soils are poorly drained silt loam and silty clay loam.
Global Environment: These shrublands occur along large streams and rivers in New England, northern New York and western Pennsylvania. They are found on river-margin alluvial deposits of moderate-energy reaches, where the flooding regime prevents forests from developing. The setting can range from flats to moderately steep banks; soils are usually sandy or silty. Most are temporarily flooded, and the soils may not remain saturated through the entire growing season.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The tall-shrub layer is dominated by *Alnus incana, Crataegus* sp., and *Salix sericea*; *Spiraea alba* is present as a short shrub. The herb layer is dominated by *Onoclea sensibilis, Lysimachia nummularia* (exotic), and *Solidago* sp.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by open to dense shrub thickets dominated by *Alnus incana*. *Rubus idaeus* is codominant at some sites. Total shrub cover ranges from 50-80%. Other shrub associates include *Cornus sericea, Corylus cornuta, Sambucus nigra*, and *Viburnum nudum*. Herbaceous cover is variable, may be open to very dense and typically is dominated by the graminoid *Calamagrostis canadensis*. Other herbaceous associates include *Eupatorium maculatum, Galium asprellum, Oclemena acuminata, Onoclea sensibilis, Solidago rugosa*, and *Thalictrum pubescens*. *Clematis virginiana, Boehmeria cylindrica, Matteuccia struthiopteris, Elymus virginicus*, and *Osmunda claytoniana* are characteristic. Floodplain trees such as *Ulmus americana* may be occasional.
Global Vegetation: Tall shrubs (1.5-3 m in height) dominate the vegetation, usually forming at least 50% cover and often creating a dense thicket. The amount of lower shrub and herb vegetation varies inversely with the tall-shrub canopy. Bryophytes are usually sparse but may be locally abundant in some settings. *Alnus incana* is a constant and usually dominant shrub. In some cases, *Alnus serrulata* (in more temperate settings) or *Alnus viridis* (in more boreal settings) may occur with or in place of *Alnus incana*. The ability of alders to bend under strong currents and their nitrogen-fixing root nodules may give alders a competitive advantage over other shrubs in this setting. *Cornus sericea* or *Cornus amomum*, along with *Salix* spp., are frequent associates and may dominate in some areas. *Viburnum nudum var. cassinoides* is occasional but not abundant. *Acer rubrum, Prunus serotina, Ulmus americana*, and/or *Acer saccharinum* may be present as sparse individuals; in more southerly examples of this type, *Acer negundo* and *Salix nigra* may occur. *Spiraea alba* is usually present and may be abundant as a lower shrub. *Clematis virginiana* is a typical vine, often clambering in tangles on the shrubs. Common herbs include *Doellingeria umbellata (= Aster umbellatus), Calamagrostis canadensis, Boehmeria cylindrica, Elymus riparius, Elymus virginicus, Eupatorium maculatum, Iris versicolor, Lycopus uniflorus, Lysimachia ciliata, Lysimachia terrestris, Osmunda claytoniana, Matteuccia struthiopteris, Muhlenbergia glomerata, Onoclea sensibilis*, and *Thalictrum pubescens*.
Global Dynamics: On river reaches subject to ice-scour, the shrubs may be regularly killed back almost to their roots and may be shorter than 1.5 m in at least the first year of regrowth.

Herb (field)	Fern (Spore-bearing forb)	*Onoclea sensibilis*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): *Alnus incana*
Appalachian National Scenic Trail (Northern Appalachian Project Area): *Alnus incana*, *Calamagrostis canadensis*
Global: *Alnus incana*, *Clematis virginiana*, *Cornus amomum*, *Cornus sericea*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Invasive/Exotic Plants: *Lysimachia nummularia* (Medium/Low)
Appalachian National Scenic Trail (Northern Appalachian Project Area): Invasive/Exotic Plants: *Galeopsis tetrahit* (exotic/invasive), *Rubus idaeus*, *Vicia cracca* (exotic/invasive)
Global: Vulnerable Plants: *Pedicularis furbishiae* (G1G2)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (1-Dec-1997).

RELATED CONCEPTS

Global Similar Types:

- *Alnus (incana ssp. rugosa, serrulata)* - *Cornus amomum* Tidal Shrub Swamp (CEGL006337) freshwater tidal settings.
- *Alnus incana* - *Viburnum recognitum / Calamagrostis canadensis* Shrub Swamp (CEGL006546)
- *Alnus incana* Shrub Swamp (CEGL002381) saturated basin swamp settings.
- *Alnus incana ssp. rugosa* - *Nemopanthus mucronatus / Sphagnum* spp. Acidic Peatland (CEGL006158) peatland settings.
- *Cornus (amomum, sericea)* - *Viburnum dentatum* - *Rosa multiflora* Ruderal Shrub Swamp (CEGL006576)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This is an alluvial community associated with moderate- to high-velocity rivers. Alder swamps of saturated basins, beaver-impacted wetlands and small, low-velocity streams dominated by *Alnus incana* are classified as Gray Alder Shrub Swamp (CEGL002381).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type is currently broadly defined, as detailed studies of riparian shrublands in the Northeast are few. Stands dominated by *Alnus* versus those dominated by *Salix* and *Cornus* appear different and may be separable as distinct types with additional survey data. Likewise, higher-energy *Alnus* thickets close to the channel may be distinct from lower-energy thickets in alluvium that is further removed from the channel, but additional data are needed.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Upper Ottauquechee Shrub Meadows in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from Caratunk, Baxter State Park, Jones Pond, Crawford Notch and Black Brook in Maine.
Global Range: This shrub swamp of moderate- to high-energy floodplains occurs in New England and south to Pennsylvania.
Nations: US
States/Provinces: CT, MA, ME:S2, NH, NY, PA, RI, VT

A3685 *Alnus* spp. - *Salix* spp. Lakeshore & Depression Shrub Swamp Alliance

Alliance Summary Description: This alliance contains tall-shrub swamps in the northeastern and north-central United States and eastern temperate Canada in a variety of non-alluvial topographic depressions. The vegetation is dominated by *Alnus incana, Alnus serrulata, Salix sericea*, or *Hypericum densiflorum*. Associates may include *Cornus sericea, Rosa palustris, Spiraea alba var. alba, Spiraea alba var. latifolia (= Spiraea latifolia), Viburnum nudum var. cassinoides*, and others. These wetlands are often successional following disturbance. They are found in beaver meadows, lakeshores, headwater wetlands, and basin wetlands, as well as backwater floodplains of streams and rivers. Soils vary from deep organic mucks to mineral soils with high organic content (muck), and are saturated for much of the year.

[CEGL002381] *Alnus incana* Shrub Swamp

Translated Name: **Gray Alder Shrub Swamp**
Common Name: **Gray Alder Shrub Swamp**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Eastern North American Shrub Swamp (G167)
Alliance	*Alnus* spp. - *Salix* spp. Lakeshore & Depression Shrub Swamp Alliance (A3685)

ELEMENT CONCEPT

Global Summary: This alder swamp community is widespread in the midwestern and northeastern United States and southern Canada. Stands occur on shores, edges of beaver meadows in stream floodplains, swales associated with small streams in peatlands, or upland forests. Soils are well-decomposed peat, muck or mineral soils. The hydrology is typically seasonally flooded, with most sites remaining saturated. The vegetation is dominated by tall shrubs, 2-8 m in height, with a moderately open to dense shrub canopy. There is an understory of shorter shrubs and herbaceous species. The density of the understory varies inversely with the tall-shrub canopy. The overstory is usually overwhelmingly dominated by *Alnus incana*, but in the more southeastern portions of this type's range, *Alnus serrulata* can occur with *Alnus incana*. Where alder is not as dominant, other shrubs, such as *Cornus sericea, Ilex verticillata, Rubus idaeus, Salix* spp., *Spiraea alba, Spiraea tomentosa*, and *Viburnum* spp., can be found. At the southern range limit of this type in West Virginia, shrub layers may by be dominated or codominated by the Central Appalachian endemic *Ilex collina*. The herbaceous layer contains species such as *Symphyotrichum lanceolatum var. lanceolatum (= Aster simplex), Symphyotrichum puniceum (= Aster puniceus), Calamagrostis canadensis, Caltha palustris, Carex lacustris, Carex prairea, Carex trisperma, Doellingeria umbellata (= Aster umbellatus), Eupatorium maculatum, Glyceria melicaria, Glyceria striata, Impatiens capensis, Lycopus uniflorus, Onoclea sensibilis, Osmunda cinnamomea, Rubus pubescens, Scirpus atrovirens, Symplocarpus foetidus, Thelypteris palustris, Typha* spp., and *Viola* spp. Mosses include *Climacium dendroides* and *Sphagnum* spp. Where the tall-shrub canopy is open, graminoids can become dense. Scattered trees are found in many stands, including *Acer rubrum, Fraxinus nigra*, and *Thuja occidentalis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: These alder swamps occur in saturated basins, beaver-impacted wetlands and along small, low-velocity streams. It commonly occurs in the Northern Appalachian project area. Sites are saturated to intermittently flooded basins with very poorly drained muck soils. The unvegetated surface consists of leaf litter. Evidence of disturbance includes alterations to hydrology (beaver activity), past clearing and a minor presence of exotic plants.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This shrubland association occurs occasionally throughout the Northern Appalachian project area in intermittently and seasonally flooded basin floors and channel beds at elevations ranging from 250 to 1,200 m (820-3,940 feet). Positions are typically flat but may be gently sloping. Soils are variable and may consist of silt loam, clay loam, muck or organic material. The hydrologic regime may be heavily influenced by beaver activity.

Global Environment: Sites are typically along streams, lakeshores, edges of beaver meadows, swales associated with small streams in peatlands or upland forests, or near seeps. Most have little to no slope, but some sites are on moderate slopes. Hydrologic conditions can range from temporarily flooded to seasonally flooded, or even saturated, but are typically seasonally flooded/saturated. The water ranges from non-stagnant, nutrient-rich, and often slightly calcareous (Curtis 1959) to rather stagnant and nutrient-poor where over acidic bedrock or till. Soils are wet, often mucks or peats (Anderson 1982, Chapman et al. 1989). In the upper Midwest, this community is found on Precambrian Shield bedrock that is overlaid with sandy loam soils, which are moderately well-drained and deep (>60 cm). In northeastern Minnesota stands can occur on northeast- and south-facing slopes that are moderate to steep, with slopes ranging from 4 to 45% (Ohmann and Ream 1971). The climate is highly variable, with temperature extremes between -46° and 38°C and 58-91 cm precipitation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These swamps are dominated by *Alnus incana ssp. rugosa*. Northern species such as *Nemopanthus mucronatus* and *Myrica gale* differentiate this type. Other shrubs, such as *Cornus sericea, Rubus idaeus, Salix* spp., *Spiraea alba, Spiraea tomentosa*, and *Viburnum* spp., are may occur. Common and/or abundant herbs may include *Calamagrostis canadensis, Carex lurida, Eupatorium maculatum, Impatiens capensis, Juncus effusus, Leersia oryzoides*, and *Onoclea sensibilis*. Mosses, including *Sphagnum centrale* and *Sphagnum girgensohnii*, may carpet the ground. In addition, this community supports MA state-critically imperiled *Agrimonia parviflora* and *Carex lupuliformis*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by open to dense thickets of *Alnus incana* with cover typically exceeding 50%. Other shrub associates include *Ilex verticillata, Salix sericea, Spiraea alba, Viburnum dentatum, Viburnum nudum*, and *Viburnum recognitum*. The herbaceous layer may be open to very dense and may be dominated by graminoids or ferns. The most consistent dominant species include *Calamagrostis canadensis, Carex stricta*, and *Onoclea sensibilis*. Other herbaceous associates include *Arisaema triphyllum, Carex echinata, Carex intumescens, Carex leptalea, Carex*

stipata, Dryopteris cristata, Galium asprellum, Impatiens capensis, Lysimachia terrestris, Osmunda cinnamomea, Solidago rugosa, Thalictrum pubescens, and *Triadenum virginicum*.

Global Vegetation: The vegetation is dominated by tall shrubs, 2-8 m in height, with a moderately open to dense shrub canopy. There is an understory of shorter shrubs and herbaceous species. The density of the understory varies inversely with the tall-shrub canopy. The overstory is usually overwhelmingly dominated by *Alnus incana*, but in the more southeastern portions of this type's range, *Alnus serrulata* can occur with *Alnus incana*. Where alder is not as dominant, other shrubs, such as *Cornus sericea, Ilex verticillata, Rubus idaeus, Salix* spp., *Spiraea alba, Spiraea tomentosa*, and *Viburnum* spp., can be found. The herbaceous layer contains species such as *Symphyotrichum lanceolatum var. lanceolatum (= Aster simplex), Symphyotrichum puniceum (= Aster puniceus), Calamagrostis canadensis, Caltha palustris, Carex lacustris, Carex prairea, Carex trisperma, Doellingeria umbellata (= Aster umbellatus), Eupatorium maculatum, Impatiens capensis, Lycopus uniflorus, Onoclea sensibilis, Osmunda cinnamomea, Rubus pubescens, Scirpus atrovirens, Symplocarpus foetidus, Thelypteris palustris, Typha* spp., and *Viola* spp. Mosses include *Climacium dendroides* and *Sphagnum* spp. Where the tall-shrub canopy is open, the graminoids can become dense. Scattered trees are found in many stands, including *Acer rubrum, Fraxinus nigra*, and *Thuja occidentalis* (Curtis 1959, Anderson 1982, MNNHP 1993, Harris et al. 1996, Sperduto 2000b, Thompson and Sorenson 2000, Gawler 2002). Where stands border on saturated conditions with peaty soils, peatland species such as *Chamaedaphne calyculata, Rhododendron canadense*, and *Sphagnum* spp. may be present.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Agrimonia parviflora* (G5, MA state-critically imperiled), *Carex lupuliformis* (G4, MA state-critically imperiled);
Invasive/Exotic Plants: *Lonicera morrowii* (High/Medium)
Appalachian National Scenic Trail (Northern Appalachian Project Area): Invasive/Exotic Plants: *Frangula alnus* (High/Medium, exotic/invasive)
Global: Vulnerable Plants: *Ilex collina* (G3, Southern Blue Ridge endemic), *Polemonium vanbruntiae* (G3G4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (23-Jun-2006). This association is widely distributed and considered secure in many states.

RELATED CONCEPTS

Global Similar Types:
- *Alnus incana - Cornus (amomum, sericea) / Clematis virginiana* Shrub Swamp (CEGL006062)
- *Alnus incana ssp. rugosa - Nemopanthus mucronatus / Sphagnum* spp. Acidic Peatland (CEGL006158)
- *Alnus serrulata / Calamagrostis canadensis* Shrub Swamp (CEGL005082)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This is an alder swamp of saturated basins, beaver-impacted wetlands, and small, low-velocity streams. Alluvial alder swamps associated with moderate- to high-velocity rivers are classified as Alluvial Alder Thicket (CEGL006062).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Type has a very broad distribution, and there may be a need to separate a northern (more boreal) type from a southern (more temperate) type, or perhaps an enriched versus lower-nutrient type, based on floristic differences. Hydrology may be quite variable, ranging from temporarily flooded to semipermanently flooded. In Ohio, this association sometimes merges with *Alnus serrulata* stands in *Alnus serrulata / Calamagrostis canadensis* Shrub Swamp (CEGL005082); that association is distinguished by somewhat more southern associates, including *Rhododendron viscosum, Lindera benzoin, Peltandra virginica*, etc.. With increasing tree canopy cover, this association can be similar to *Larix laricina* forest types, *Thuja occidentalis* saturated forest types, and *Fraxinus nigra - Acer rubrum* saturated forest types.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Hubbard Brook Natural Heritage Site in Massachusetts and at Mt. Tabor South in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from southeast of Balch Hill in New Hampshire and Caratunk, West Branch Penobscot River, Nahmakanta Lake, North Pond, east of Upper Baker Pond, Bog Brook and Joe's Hole in Maine.
Global Range: This alder swamp shrubland is widespread in the midwestern and northeastern United States and southern Canada, ranging from Maine west to Manitoba, south to Iowa, and east to New York and perhaps northern New Jersey.

A3670 *Cephalanthus occidentalis - Decodon verticillatus* Shrub Swamp Alliance

Alliance Summary Description: The alliance is wide-ranging, throughout glaciated regions of the midwestern and northeastern United States and adjacent Canada. The vegetation is characterized by *Cephalanthus occidentalis* or *Decodon verticillatus* and occurs in depressions, oxbow ponds, and backwater sloughs of stream and river floodplains in waters 1-2 m deep. Occasional shrub associates include any number of *Salix* spp. or *Cornus* spp., as well as *Ilex verticillata, Rosa palustris, Vaccinium corymbosum*, and *Viburnum dentatum*. Floating aquatics, such as *Lemna* spp., can be common in deepwater habitats, whereas a variety of forbs and graminoids are associates under less flooded conditions. These include *Bidens tripartita, Boehmeria cylindrica, Glyceria* spp., *Leersia oryzoides, Polygonum* spp., *Scutellaria lateriflora, Sium suave*, and a wide variety of *Carex* spp. Inundation is usually continuous throughout the year, but these sites can become dry in mid or late summer or during periods of prolonged drought.

[CEGL006069] *Cephalanthus occidentalis - Decodon verticillatus* Shrub Swamp

Translated Name: **Common Buttonbush - Swamp-loosestrife Shrub Swamp**
Common Name: **Northeastern Buttonbush Shrub Swamp**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Eastern North American Shrub Swamp (G167)
Alliance	*Cephalanthus occidentalis - Decodon verticillatus* Shrub Swamp Alliance (A3670)

ELEMENT CONCEPT

Global Summary: This buttonbush swamp occurs in the northeastern United States. These swamps experience prolonged or semipermanent flooding for much of the growing season, with water tables receding below the soil surface only during drought or very late in the growing season. They occur in a variety of environmental settings, including backwater sloughs or oxbow ponds, wet swales in floodplains, pond and lake borders, and small, isolated depressions where water levels recede very slowly, such as those with perched water tables. The substrate is typically loose muck. *Cephalanthus occidentalis* is dominant and often monotypic. Occasional associates depend on the environmental setting and most often occur in drier areas. They include *Vaccinium corymbosum, Rhododendron viscosum, Acer rubrum, Cornus* spp. closer to upland borders, or *Acer saccharinum, Fraxinus pennsylvanica*, and *Viburnum dentatum* where adjacent to floodplains, or *Decodon verticillatus, Chamaedaphne calyculata*, and *Spiraea alba var. latifolia* in more stagnant basins. Herbaceous species tend to be sparse but can include *Glyceria canadensis, Dulichium arundinaceum, Carex stricta, Scirpus cyperinus, Thelypteris palustris, Leersia oryzoides, Acorus calamus, Alisma plantago-aquatica, Polygonum* spp., *Sparganium* spp., and floating or submerged aquatic species such as *Lemna minor, Potamogeton natans*, and *Nuphar variegata (= Nuphar lutea ssp. variegata)*. Bryophytes, if present, cling to shrub bases and include *Warnstorfia fluitans (= Drepanocladus fluitans), Drepanocladus aduncus*, or *Sphagnum fallax*. In disturbed areas, these wetland may be invaded by *Lythrum salicaria*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This buttonbush swamp occurs in a variety of environmental settings, including backwater sloughs or oxbow ponds, wet swales in floodplains, pond and lake borders, and small, isolated depressions throughout the northeastern United States. Sites are seasonally to permanently flooded depressions with very poorly drained organic/muck or silt loam soils. The unvegetated surface is made up of various combinations of leaf litter, downed wood, and/or standing water. One site may be an old quarry pit. Evidence of disturbance includes a minor presence of exotic plants.
Global Environment: This association includes buttonbush swamps that experience prolonged or semipermanent flooding for much of the growing season with water tables receding below the soil surface only during drought or very late in the growing season. They occur in a variety of environmental settings including backwater sloughs or oxbow ponds, wet swales in floodplains, pond and lake borders, and small, isolated depressions where water levels recede very slowly, such as those with perched water tables. Soils are often organic mucks or silt loams.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This shrub swamp is dominated by *Cephalanthus occidentalis*. *Rhododendron* spp. and *Vaccinium corymbosum* may be present at much lower cover. Common and/or abundant herbs include *Bidens connata, Boehmeria cylindrica, Carex comosa, Carex stricta, Lycopus uniflorus*, and *Sium suave*. In addition, this community supports PA state-imperiled *Galium trifidum*.
Global Vegetation: This association includes buttonbush swamps of the eastern and northeastern United States. These swamps experience prolonged or semipermanent flooding for much of the growing season with water tables receding below the soil surface only during drought or very late in the growing season. They occur in a variety of environmental settings including backwater sloughs or oxbow ponds, wet swales in floodplains, pond and lake borders, and small isolated depressions where water levels recede very slowly, such as those with perched water tables. *Cephalanthus occidentalis* is dominant and often monotypic. Scattered *Acer rubrum* trees may be present in the wetland. Occasional associates depend on the environmental setting, and some only occur in drier areas. They include *Vaccinium corymbosum, Rhododendron viscosum, Acer rubrum, Salix* spp., *Cornus amomum* or *Cornus sericea* closer to upland borders, or *Acer saccharinum, Fraxinus pennsylvanica*, or *Viburnum dentatum* where adjacent to floodplains, or *Decodon verticillatus, Chamaedaphne calyculata*, and *Spiraea alba var. latifolia* in more stagnant basins. Herbaceous species tend to be sparse but can include *Glyceria canadensis, Dulichium arundinaceum, Carex stricta, Scirpus cyperinus, Osmunda regalis, Thelypteris palustris, Bidens* spp., *Sium suave, Scutellaria lateriflora, Alisma plantago-aquatica, Polygonum* spp., *Sparganium* spp., and floating or submerged aquatic species such as *Lemna minor, Potamogeton natans*, and *Nuphar variegata (= Nuphar lutea ssp. variegata)*. Bryophytes, if present, cling to shrub bases and include *Warnstorfia fluitans (= Drepanocladus fluitans), Drepanocladus aduncus*, or *Sphagnum fallax*.

[CEGL005089] *Decodon verticillatus* Shrub Swamp

Translated Name: **Swamp-loosestrife Shrub Swamp**
Common Name: **Swamp-loosestrife Shrub Swamp**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Eastern North American Shrub Swamp (G167)
Alliance	*Cephalanthus occidentalis* - *Decodon verticillatus* Shrub Swamp Alliance (A3670)

ELEMENT CONCEPT

Global Summary: This shrub border occurs as a fringe along aquatic edges of lakes and streams in the northeastern states. *Decodon verticillatus* forms a dense, often monotypic, tangle. *Cephalanthus occidentalis* can occur, but with less abundance than *Decodon verticillatus*. Herbaceous species vary widely, but may include *Nuphar variegata (= Nuphar lutea ssp. variegata), Nymphaea odorata, Peltandra virginica, Pontederia cordata, Utricularia* spp., and *Potamogeton* spp. Where *Decodon*-dominated vegetation occurs adjacent to bog mats, it is considered a part of *Chamaedaphne calyculata - (Gaylussacia dumosa) - Decodon verticillatus / Woodwardia virginica* Acidic Peatland (CEGL006008).

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This community forms a shrub border that occurs as a fringe along aquatic edges of lakes and streams. The sampled site is a saturated depression with very poorly drained soil. No evidence of disturbance was reported.
Global Environment: Vegetation forms as a fringe along aquatic edges of lakes and streams.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Decodon verticillatus* forms a dense, often monotypic tangle. *Cephalanthus occidentalis* can occur, but with less abundance than *Decodon verticillatus*. Other shrubs include *Chamaedaphne calyculata, Clethra alnifolia, Spiraea tomentosa*, and *Vaccinium corymbosum*. Herbs include *Hypericum canadense, Peltandra virginica*, and *Thelypteris palustris*.
Global Vegetation: *Decodon verticillatus* forms a dense, often monotypic, tangle. *Cephalanthus occidentalis* can occur, but with less abundance than *Decodon verticillatus*. Herbaceous species vary widely, but may include *Nuphar variegata (= Nuphar lutea ssp. variegata), Nymphaea odorata, Peltandra virginica, Pontederia cordata, Utricularia* spp., and *Potamogeton* spp.

A3656 *Cornus sericea - Salix* spp. Shrub Swamp Alliance

Alliance Summary Description: This alliance, which is widespread in the midwestern and northeastern United States and eastern temperate Canada, is a wet shrub swamp with organic or mineral soils. Stands are dominated by deciduous shrubs 1-2 m tall with a moderate to nearly continuous shrub canopy. Dominant shrubs are *Cornus sericea, Salix bebbiana, Salix discolor*, and *Salix exigua*. *Vaccinium corymbosum* is codominant in some stands. Other common shrubs include *Alnus incana, Alnus serrulata, Cornus racemosa, Cornus amomum, Sambucus canadensis*, and *Spiraea alba*. Herbaceous and woody vines may be abundant. Typical ground layer species include *Asclepias incarnata, Calamagrostis* spp., *Carex* spp., *Clematis virginiana, Parthenocissus vitacea, Toxicodendron radicans*, and *Typha latifolia*. Scattered trees, such as *Acer* spp., *Fraxinus pennsylvanica*, and *Ulmus americana*, can occasionally be found in this alliance. It is usually found on organic soils, either consolidated peats or mucks. Some stands are on mineral substrates. These sites are usually inundated for part of the growing season and remain wet for most of the year, except in drought years.

[CEGL006576] *Cornus (amomum, sericea) - Viburnum dentatum - Rosa multiflora* Ruderal Shrub Swamp

Translated Name: **(Silky Dogwood, Red-osier Dogwood) - Southern Arrow-wood - Multiflora Rose Ruderal Shrub Swamp**
Common Name: **Ruderal Dogwood - Arrow-wood Shrub Swamp**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Eastern North American Shrub Swamp (G167)
Alliance	*Cornus sericea - Salix* spp. Shrub Swamp Alliance (A3656)

ELEMENT CONCEPT

Global Summary: This tall successional shrub community typically floods early in the growing season and may be saturated to near the surface for some of the growing season, but it is generally dry for much of the year. It typically occurs in low-lying areas of old fields or pastures, or the edges of beaver-impacted wetlands or impoundments. The vegetation is dominated by tall shrubs, usually 2-4 m in height. This is a successional community in transition between a successional old field and a modified successional forest. Vegetation can be highly variable, and no one species is dominant. *Cornus amomum, Cornus sericea, Viburnum dentatum, Spiraea alba var. latifolia, Rosa multiflora, Rubus allegheniensis*, and *Rubus hispidus* are all typically present and abundant. *Salix* spp. may also be present but are less common. Scattered individuals of *Acer rubrum* or *Fraxinus pennsylvanica* may also occur within the shrubland. Herbaceous species are inversely proportional to shrub cover; they can be dense where the shrub canopy is open. Species can include *Solidago rugosa, Solidago gigantea, Eupatorium maculatum, Phragmites australis, Phalaris arundinacea, Apocynum cannabinum, Vernonia* sp., and *Onoclea sensibilis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This wet successional shrubland occurs in low-lying areas of old fields or pastures that typically flood early in the growing season and may be saturated to near the surface for some of the growing season, but are generally dry for much of the year. One example was sampled in Cumberland County, Pennsylvania, where the Hogestown Run intersects the Appalachian Trail in the Central Appalachian project area.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This tall successional shrub swamp (2-4 m) occurs in low-lying areas of old fields or pastures, or the edges of beaver-impacted wetlands or impoundments.

Global Environment: This tall, modified, wet successional shrubland occurs in low-lying areas of old fields or pastures, or the edges of beaver-impacted wetlands and impoundments. It typically floods early in the growing season and may be saturated to near the surface for some of the growing season, but it is generally dry for much of the year.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: At Hogestown Run in Pennsylvania, this shrub swamp has almost 100% cover of *Cornus amomum* roughly 2 m tall along with scattered seedlings of *Lonicera morrowii, Geum* sp., *Carex* sp., and other graminoids.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The vegetation in this tall successional shrub swamp (2-4 m) is highly variable with *Cornus amomum, Cornus sericea, Viburnum dentatum, Spiraea alba var. latifolia, Rosa multiflora* (exotic), *Rubus allegheniensis*, and *Rubus hispidus* typically present and abundant. *Salix* spp. may also be present but are less common.

Global Vegetation: The structure of this association varies from abandoned wet fields with tall and short shrubs (>25% cover) with herbaceous vegetation in the interstices (<25% cover), to dense "closed-canopy" tall shrublands with sparse ground-layer vegetation. Vegetation can be highly variable, and no one species is dominant. *Cornus amomum, Cornus sericea, Viburnum dentatum, Spiraea alba var. latifolia, Rosa multiflora, Rubus allegheniensis*, and *Rubus hispidus* are all typically present and abundant. *Salix* spp. may also be present but are less common. Scattered individuals of *Acer rubrum* or *Fraxinus pennsylvanica* may also occur within the shrubland but form less than 25% cover. Herbaceous species are inversely proportional to shrub cover; they can be dense where the shrub canopy is open. Species can include *Solidago rugosa, Solidago gigantea, Eupatorium maculatum, Phragmites australis, Phalaris arundinacea, Apocynum cannabinum, Vernonia* sp., and *Onoclea sensibilis*.

Global Dynamics: This community is in transition between a wet successional old field and a modified wet successional forest.

Global: Invasive/Exotic Plants: *Rosa multiflora* (Medium/Low)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (12-Feb-2007). This association is a successional community occurring on abandoned old fields and pastures and, therefore, does not receive a conservation status rank.

RELATED CONCEPTS

Global Similar Types:

- *Alnus incana* - *Cornus (amomum, sericea) / Clematis virginiana* Shrub Swamp (CEGL006062) is an alluvial shrub swamp type with a prominent alder component.
- *Cornus amomum* - *Salix* spp. - *Toxicodendron vernix* - *Rhamnus lanceolata* Fen (CEGL005087) is a tall shrub fen.
- *Cornus sericea* - *Cornus amomum* - *Photinia melanocarpa* - *Viburnum lentago* Fen (CEGL005088) is a tall shrub fen.
- *Cornus sericea* - *Salix* spp. - (*Rosa palustris*) Shrub Swamp (CEGL002186) is a midwestern circumneutral shrub swamp type that does not contain alder and is dominated by *Salix* spp. and *Cornus sericea*.
- *Elaeagnus umbellata* - *Cornus racemosa* - *Rosa multiflora* - *Juniperus virginiana* Ruderal Shrubland (CEGL006451) is an upland successional shrubland occurring on abandoned old fields and pastures.
- *Spiraea tomentosa* - *Rubus* spp. / *Phalaris arundinacea* Ruderal Wet Shrubland (CEGL006571) is a successional wet meadow that has shrub-dominated and herb-dominated expressions, but because the shrubs are usually only about 1 m tall, this gives the impression of a wet meadow type rather than a shrubland. *Cornus* can occur in both types but is not dominant in the *Spiraea* - *Rubus* type.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This type (CEGL006576) differs from Ruderal Steeplebush / Reed Canarygrass Wet Shrubland (CEGL006571) by the dominance of wetland shrubs that are 2+ m in height. CEGL006571 is successional wet meadow that has shrub-dominated and herb-dominated expressions, but because the shrubs are usually only about 1 m tall, this gives the impression of a wet meadow type rather than a shrubland. *Cornus* spp. can occur in both associations but is not dominant in CEGL006571.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: One observation point was sampled in Rutland, Vermont. Not very common, but observed in New Jersey, New York, Connecticut, and Massachusetts by the UMESC mapping team in summer 2012.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.

G771. LAURENTIAN-NORTHEASTERN WET MEADOW

Group Summary Description: This group is found in the Laurentian region of the Great Lakes and the northeastern United States and adjacent Canada north from West Virginia. It is characterized by wet-mesic to wet sites and can be dominated by a variety of graminoids and forbs. Common abundant species include the graminoids *Calamagrostis canadensis, Carex lacustris, Carex stricta, Carex vesicaria, Carex utriculata, Glyceria striata, Leersia oryzoides*, and *Scirpus cyperinus*. Forbs that may be common or dominant include *Boltonia asteroides var. asteroides, Eupatorium fistulosum, Eupatorium perfoliatum, Impatiens capensis, Impatiens pallida, Mentha arvensis, Sagittaria latifolia, Solidago canadensis, Solidago rugosa, Symphyotrichum racemosum*, and *Verbesina alternifolia*. Sites are found in basins or along slow-moving rivers and streams and are flooded or saturated for at least some of the growing season but rarely more than 0.3 m deep.

A4107 *Carex* spp. - *Calamagrostis canadensis* Eastern Wet Meadow Alliance

Alliance Summary Description: This wet meadow alliance is found in the northeastern United States and Great Lakes region and adjacent Canada. It is dominated by medium to medium-tall graminoids, usually with moderate to dense cover. Dominant species are *Calamagrostis canadensis* and *Carex* spp., usually *Carex lacustris, Carex stricta, Carex vesicaria*, and *Carex utriculata*, but sometimes others. Sites are flooded or saturated for at least part of the growing season but surface water may be gone later in the growing season. Soils tend to be fine-textured and often have muck or sedge peat accumulated from decaying organic matter.

[CEGL005448] *Calamagrostis canadensis - Carex* spp. Laurentian & Northeast Wet Meadow

Translated Name: **Bluejoint - Sedge species Laurentian & Northeast Wet Meadow**
Common Name: **Laurentian & Northeast Bluejoint Wet Meadow**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Laurentian-Northeastern Wet Meadow (G771)
Alliance	*Carex* spp. - *Calamagrostis canadensis* Eastern Wet Meadow Alliance (A4107)

ELEMENT CONCEPT

Global Summary: This wet meadow vegetation is widespread in the Laurentian-Acadian and northeast regions of Canada and the United States. Stands occur on the floodplains of small streams, in poorly drained depressions, beaver meadows, levees and lakeshores. Soils are typically mineral soil or well-decomposed peat, with a thick root mat. Water regime varies between temporarily and seasonally flooded. Graminoid cover is typically dense and can form hummocky microtopography. *Calamagrostis canadensis* is dominant, often occurring in almost pure stands or with tall sedges, such as *Carex aquatilis, Carex lacustris, Carex utriculata*, and *Carex stricta*. In fen transitions, *Carex lasiocarpa* can be present. *Agrostis gigantea (= Agrostis alba), Glyceria grandis, Poa palustris, Poa compressa, Scirpus cyperinus*, and *Typha latifolia* are sometimes abundant. Forbs include *Campanula aparinoides, Epilobium leptophyllum, Eupatorium maculatum, Eupatorium perfoliatum, Impatiens capensis, Iris versicolor, Polygonum amphibium*, and *Comarum palustre (= Potentilla palustris)*. Scattered shrubs, such as *Viburnum nudum, Viburnum dentatum, Spiraea alba, Cornus amomum, Alnus incana*, or *Alnus serrulata*, may be present. *Phalaris arundinacea* and/or *Lythrum salicaria* may be present, especially in disturbed examples.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: No data are available.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This community occurs in alluvial settings.
Global Environment: Stands occur on the floodplains of small streams, in poorly drained depressions, beaver meadows, levees and lakeshores. Soils are typically mineral soil or well-decomposed peat or peat silt loam with a thick root mat. Water regime varies between temporarily and seasonally flooded.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Calamagrostis canadensis* is dominant.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: *Calamagrostis canadensis* is the sole dominant.
Global Vegetation: Graminoid cover is typically dense and can form hummocky microtopography. *Calamagrostis canadensis* is dominant, often occurring in almost pure stands or with tall sedges, such as *Carex aquatilis, Carex lacustris, Carex rostrata*, and *Carex stricta*. In fen transitions, *Carex lasiocarpa* can be present. *Agrostis gigantea (= Agrostis alba), Glyceria grandis, Poa palustris, Poa compressa, Scirpus cyperinus*, and *Typha latifolia* are sometimes abundant. Forbs include *Campanula aparinoides, Epilobium leptophyllum, Eupatorium maculatum, Eupatorium perfoliatum, Iris versicolor, Polygonum amphibium*, and *Comarum palustre (= Potentilla palustris)*. Scattered shrubs, such as *Viburnum nudum, Viburnum dentatum, Spiraea alba, Cornus amomum, Alnus incana*, or *Alnus serrulata*, may be present. *Lythrum salicaria* may be present, especially in disturbed examples.

- *Carex stricta - Carex* spp. Wet Meadow (CEGL002258)
- *Carex utriculata - Carex lacustris - (Carex vesicaria, Carex stricta)* Wet Meadow (CEGL002257)
- *Phalaris arundinacea* Eastern Ruderal Marsh (CEGL006044)
- *Phalaris arundinacea* Western Marsh (CEGL001474)
- *Phleum pratense - (Calamagrostis canadensis)* Ruderal Meadow (CEGL005249)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Global Classification Comments: This type can grade into sedge meadows. A guideline of <50% sedges may be suggested as a criterion for the definition of this type compared to sedge meadow types. Harris et al. (1996) suggest that the bluejoint meadow type is drier than sedge meadows and less peaty than shore fens.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: No data are available.
Global Range: This wet meadow vegetation is widely distributed in the Laurentian-Acadian and northeast regions of northeastern and midwestern U.S. and adjacent Canada.

[CEGL006519] *Calamagrostis canadensis - Scirpus* spp. - *Dulichium arundinaceum* Wet Meadow

Translated Name: **Bluejoint - Bulrush species - Threeway Sedge Wet Meadow**
Common Name: **Mixed Graminoid Wet Meadow**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Laurentian-Northeastern Wet Meadow (G771)
Alliance	*Carex* spp. - *Calamagrostis canadensis* Eastern Wet Meadow Alliance (A4107)

ELEMENT CONCEPT

Global Summary: These are seasonally flooded, mixed-composition wetland meadows of the northeastern United States. They occur on flats, floodplains of small streams, beaver meadows, and lakeshores. The substrate is muck or well-decomposed peat overlying mineral soil, usually slightly acidic (pH 5.0-6.0). After spring flooding, many sites will dry to exposed soil during the summer; others remain well saturated. The vegetation is dominated by robust graminoids or graminoids mixed with shrubs. Shrub cover can range up to 50%, but graminoid cover typically exceeds woody cover, and in some cases, shrubs are absent. The herbaceous layer is well-developed, often over 40% cover and up to nearly 100% cover. Bryophyte cover is usually little to none but may occasionally be extensive. The herbaceous layer is often dominated by some combination of *Calamagrostis canadensis, Scirpus* spp. (including *Scirpus cyperinus, Scirpus expansus*, and *Scirpus atrovirens*), and *Dulichium arundinaceum*. Other locally common species may include *Acorus calamus, Agrostis gigantea (= Agrostis alba), Carex lacustris, Carex lupulina, Carex lupuliformis, Carex lurida, Carex stricta, Carex utriculata, Glyceria canadensis, Glyceria grandis, Iris versicolor, Hypericum ellipticum, Juncus canadensis, Leersia oryzoides, Leersia virginica, Lysimachia terrestris, Onoclea sensibilis, Osmunda regalis, Phalaris arundinacea, Poa palustris*, and *Triadenum fraseri*. *Typha latifolia* may occasionally be present, but these wetlands are usually slightly higher (relative to the water table) than typical cattail marsh. *Lythrum salicaria* may be locally invasive. Shrub species typically include *Spiraea alba* and *Salix* spp. Other shrub constituents vary from site to site and may include *Alnus incana, Alnus serrulata, Cephalanthus occidentalis, Cornus sericea, Ilex verticillata, Myrica gale, Salix pedicellaris, Spiraea tomentosa, Vaccinium corymbosum*, or *Viburnum dentatum*. This association is related to other regional wet meadow types but differs in not being almost monotypically dominated by *Carex stricta, Calamagrostis canadensis*, or *Phalaris arundinacea*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mixed graminoid vegetation occurs in seasonally flooded wet meadows. Sites are saturated to intermittently flooded basins with very poorly drained muck soil, sometimes with hummock-and-hollow microtopography. The unvegetated surface is made up of various combinations of leaf litter, downed wood, bare soil, and/or standing water. Evidence of disturbance includes alterations to hydrology (both presence and removal of beaver activity), fire, browsing, and the presence of exotic plants.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association occurs occasionally throughout the Northern Appalachian project area in basin floors and pond margins at elevations ranging from 370 to 1,000 m (1,215-3,280 feet) in elevation. Sites are saturated to semipermanently flooded with poorly drained soils composed of muck, silt loam, silty clay loam and peat. The hydrologic regime of some sites may be heavily influenced by beaver activity.

Global Environment: These are seasonally flooded, mixed-composition wetland meadows of the northeastern United States. They occur on flats, floodplains of small streams, beaver meadows, and lakeshores. The substrate is muck or well-decomposed peat overlying mineral soil, usually slightly acidic (pH 5.0-6.0). After spring flooding, many sites will dry to exposed soil during the summer.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These wet meadows contain some combination of *Calamagrostis canadensis, Scirpus cyperinus*, and/or *Schoenoplectus* spp., as well as *Leersia oryzoides, Carex stricta, Juncus* spp., *Lysimachia terrestris, Dulichium arundinaceum, Lycopus uniflorus, Glyceria canadensis*, and *Carex echinata*. In addition, this community supports MA state-critically imperiled *Carex tuckermanii* and VT state-critically imperiled *Stellaria alsine*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by herbaceous vegetation dominated by graminoids. The most dominant is *Calamagrostis canadensis*; however, *Carex utriculata, Carex stricta*, and *Glyceria canadensis* may be codominant to dominant at some sites. Total herbaceous cover ranges from 40-80%. Shrubs such as *Alnus incana, Spiraea tomentosa*, and *Chamaedaphne calyculata* are common at low cover. Other herbaceous species include *Carex echinata, Lysimachia terrestris,*

Onoclea sensibilis, Thelypteris palustris, and *Triadenum virginicum*. *Sphagnum* spp. dominate the nonvascular layer and may exceed 90% cover.

Global Vegetation: The vegetation is dominated by robust graminoids or graminoids mixed with shrubs. Shrub cover can range up to 50%, but graminoid cover typically exceeds woody cover, and in some cases, shrubs are absent. The herbaceous layer is well-developed, often over 40% cover and up to nearly 100% cover. Bryophyte cover is usually little to none but may occasionally be extensive. The herbaceous layer is often dominated by some combination of *Calamagrostis canadensis, Scirpus* spp. (including *Scirpus cyperinus, Scirpus expansus*, and *Scirpus atrovirens*), and *Dulichium arundinaceum*. Other locally common species may include *Acorus calamus, Agrostis gigantea (= Agrostis alba), Carex lacustris, Carex lupulina, Carex lupuliformis, Carex lurida, Carex stricta, Carex utriculata, Glyceria canadensis, Glyceria grandis, Iris versicolor, Hypericum ellipticum, Juncus canadensis, Leersia oryzoides, Leersia virginica, Lysimachia terrestris, Onoclea sensibilis, Osmunda regalis, Phalaris arundinacea, Poa palustris*, and *Triadenum fraseri*. *Typha latifolia* may occasionally be present, but these wetlands are usually slightly higher (relative to the water table) than typical cattail marsh. *Lythrum salicaria* may be locally invasive. Shrub species typically include *Spiraea alba* and *Salix* spp. Other shrub constituents vary from site to site, and may include *Alnus incana, Alnus serrulata, Cephalanthus occidentalis, Cornus sericea, Ilex verticillata, Myrica gale, Salix pedicellaris, Spiraea tomentosa, Vaccinium corymbosum*, or *Viburnum dentatum*.

[CEGL006412] *Carex stricta - Carex vesicaria* Wet Meadow

Translated Name: **Upright Sedge - Blister Sedge Wet Meadow**
Common Name: **Eastern Upright Sedge Wet Meadow**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Laurentian-Northeastern Wet Meadow (G771)
Alliance	*Carex* spp. - *Calamagrostis canadensis* Eastern Wet Meadow Alliance (A4107)

ELEMENT CONCEPT

Global Summary: These tussock sedge meadows are distributed across the northeastern United States. They occur in seasonally flooded basins or on stream or lake margins. The substrate is peat or muck of variable depth overlying mineral soil. Standing water may be present only at the beginning of, or through much of, the growing season depending on the site and the year's precipitation; even when the water drops, the soils remain saturated. Microtopography is characterized by large tussocks, particularly when the hydroperiod is extended. The physiognomy is strongly herbaceous or, in some cases, herbs mixed with shrubs (up to 25% shrub cover); trees are absent. Bryophyte cover is usually sparse but may occasionally reach over 50%. *Carex stricta*, in its tussock form, is the usual dominant. *Carex vesicaria, Carex utriculata*, and *Calamagrostis canadensis* may also be locally abundant. Associated graminoids include *Carex atlantica, Carex canescens, Carex comosa, Carex folliculata, Carex scoparia, Carex stipata, Carex vulpinoidea, Glyceria canadensis, Dulichium arundinaceum, Juncus effusus, Leersia oryzoides*, and *Scirpus cyperinus*; forbs and ferns include *Asclepias incarnata, Thelypteris palustris, Eupatorium maculatum, Campanula aparinoides, Osmunda regalis, Comarum palustre (= Potentilla palustris), Lysimachia terrestris, Angelica atropurpurea, Eupatorium perfoliatum, Lycopus americanus, Polygonum hydropiperoides, Galium obtusum, Polygonum sagittatum, Galium tinctorium*, and others. *Lythrum salicaria* may be invasive in some settings. Shrub associates vary with geography. In the northern part of the range, *Alnus incana, Myrica gale, Ilex verticillata, Chamaedaphne calyculata*, and *Spiraea alba* are often present. Bryophytes, where present, include *Sphagnum magellanicum, Sphagnum girgensohnii, Sphagnum palustre, Drepanocladus aduncus*, and others. This association is differentiated from other wet meadows by the strong dominance of *Carex stricta*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This sedge meadow occurs in seasonally flooded basins or on stream or lake margins. Substrates are muck or peat of variable depth overlying mineral soil. Sites are saturated basins with very poorly drained muck or peat soils. The unvegetated surface consists of various combinations of leaf litter, downed wood, bare soil, and/or standing water. Evidence of disturbance includes the presence of exotic plants.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This herbaceous association occurs occasionally throughout the Northern Appalachian project area in gently sloping fens, basins and floodplains at elevations ranging from 150 to 750 m (490-2,460 feet). Soils are saturated and poorly drained. The hydrologic regime of some sites may be heavily influenced by beaver activity.

Global Environment: These tussock sedge meadows are distributed across the northeastern United States. They occur in seasonally flooded basins or on stream or lake margins. The substrate is peat or muck of variable depth overlying mineral soil. Standing water may be present only at the beginning of, or through much of, the growing season depending on the site and the year's precipitation; even when the water drops, the soils remain saturated. Microtopography is characterized by large tussocks, particularly when the hydroperiod is extended.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These marshes are dominated by *Carex stricta* (>15% coverage). Other common herbaceous species include *Scirpus cyperinus, Carex canescens, Galium palustre, Triadenum virginicum*, and *Sparganium americanum*. Scattered *Vaccinium corymbosum, Lyonia ligustrina*, and other wetland shrubs are possible. *Sphagnum* spp. may carpet much of the ground.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This herbaceous association is dominated by dense stands of *Carex stricta* and/or *Carex vesicaria*. An assortment of other herbaceous species may occur, including *Agrostis gigantea, Calamagrostis canadensis, Carex lasiocarpa, Carex stricta, Carex vesicaria, Dulichium arundinaceum, Fragaria virginiana, Juncus brevicaudatus, Lysimachia terrestris, Osmunda regalis, Polygonum amphibium, Scirpus atrocinctus, Scirpus cyperinus, Scirpus microcarpus, Scirpus pedicellatus, Solidago rugosa, Spiraea alba*, and *Thelypteris palustris*.

Global Vegetation: The physiognomy is strongly herbaceous, or in some cases herbs mixed with shrubs (up to 25% shrub cover); trees are absent. Bryophyte cover is usually sparse but may occasionally reach over 50%. *Carex stricta*, in its tussock form, is the usual dominant. *Carex vesicaria, Carex utriculata*, and *Calamagrostis canadensis* may also be locally abundant. Associated graminoids include *Carex atlantica, Carex canescens, Carex comosa, Carex folliculata, Carex scoparia, Carex stipata, Carex vulpinoidea, Glyceria canadensis, Dulichium arundinaceum, Juncus effusus, Leersia oryzoides*, and *Scirpus cyperinus*; forbs and ferns include *Asclepias incarnata, Thelypteris palustris, Eupatorium maculatum, Campanula aparinoides, Osmunda regalis, Comarum palustre (= Potentilla palustris), Lysimachia terrestris, Angelica atropurpurea, Eupatorium perfoliatum, Lycopus americanus, Galium obtusum, Polygonum sagittatum, Galium tinctorium*, and others. *Lythrum salicaria* may be

invasive in some settings. Shrub associates vary with geography. In the northern part of the range, *Alnus incana, Myrica gale, Ilex verticillata, Chamaedaphne calyculata*, and *Spiraea alba* are often present. Bryophytes, where present, include *Sphagnum magellanicum, Sphagnum girgensohnii, Sphagnum palustre, Sphagnum affine, Drepanocladus aduncus*, and others.
Global Dynamics: Some of these sedge meadows may be associated with beaver impoundments.

[CEGL002257] *Carex utriculata - Carex lacustris - (Carex vesicaria, Carex stricta)* Wet Meadow

Translated Name: **Northwest Territory Sedge - Lake Sedge - (Blister Sedge, Upright Sedge) Wet Meadow**
Common Name: **Northern Sedge Wet Meadow**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Marsh, Wet Meadow & Shrubland (M069)
Group	Laurentian-Northeastern Wet Meadow (G771)
Alliance	*Carex* spp. - *Calamagrostis canadensis* Eastern Wet Meadow Alliance (A4107)

ELEMENT CONCEPT

Global Summary: This northern tall sedge community is found in the mixed conifer - hardwood zone of the Great Lakes region and north into the boreal regions of eastern Canada. Sites are found on floodplains, shallow bays of lakes and streams, beaver meadows, ditches, and occasionally in isolated basins, or on semi-floating mats. Hydrology is seasonally to semipermanently flooded. Substrate is mineral soil or well-decomposed peat. Tall coarse-leaved sedges dominate the vegetation layer, often creating a tussocky hummock microtopography. Shrubs can cover up to 25% of the area. Pools with submergents may also be present. Dominant graminoids include a number of Carices, including *Carex aquatilis, Carex lacustris, Carex lasiocarpa, Carex rostrata, Carex utriculata, Carex vesicaria*, and locally *Carex stricta*. Other graminoids include *Calamagrostis canadensis, Scirpus atrovirens, Scirpus cyperinus*, and in wetter areas, *Eleocharis palustris (= Eleocharis smallii)* and *Equisetum fluviatile*. Forbs include *Acorus calamus, Symphyotrichum lanceolatum var. lanceolatum (= Aster simplex), Campanula aparinoides, Eupatorium maculatum, Iris virginica var. shrevei (= Iris shrevei), Lycopus uniflorus, Poa palustris, Polygonum*

amphibium, Comarum palustre (= Potentilla palustris), and others. Diagnostic features include the general dominance by coarse-leaved sedges, wet, somewhat peaty soil conditions, and the mix of sub-boreal herbs with more temperate herbs.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This seasonally flooded, poorly drained, mixed graminoid wet meadow occurs in a saddle bottom with muck soils. One observation point was sampled at Harmon Hill in Bennington, VT.

Global Environment: Sites are found on floodplains, shallow bays of lakes and streams, beaver meadows, ditches, and occasionally in isolated basins, or on semi-floating mats. Hydrology is seasonally to semipermanently flooded. Substrate is mineral soil or well-decomposed peat (Curtis 1959, Harris et al. 1996).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This community is dominated by *Carex utriculata*. *Glyceria canadensis* and *Triadenum virginicum (= Hypericum virginicum)* are also common. *Spiraea tomentosa* and *Ilex verticillata* are scattered shrubs. All of the graminoids and shrubs grow on a *Sphagnum* spp. mat. Other areas of the meadow include *Scirpus microcarpus, Carex gynandra, Carex stricta, Calamagrostis canadensis*, and *Carex echinata*.

Global Vegetation: Dominant graminoids include a number of Carices, including *Carex aquatilis, Carex lacustris, Carex lasiocarpa, Carex utriculata, Carex vesicaria*, and locally *Carex stricta*. Other graminoids include *Calamagrostis canadensis, Carex rostrata, Scirpus atrovirens, Scirpus cyperinus*, and in wetter areas, *Eleocharis palustris (= Eleocharis smallii)* and *Equisetum fluviatile*. Forbs include *Acorus calamus, Symphyotrichum lanceolatum var. lanceolatum (= Aster simplex), Campanula aparinoides, Eupatorium maculatum, Iris virginica var. shrevei (= Iris shrevei), Lycopus uniflorus, Poa palustris, Polygonum amphibium, Comarum palustre (= Potentilla palustris)*, and others (Curtis 1959, Harris et al. 1996).

Global Dynamics: Stands often have a fluctuating hydrology, leading in some years to fairly deep (>1 m) flooding and in other years to little or no flooding. Beavers can also increase flooding in these stands.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: The example at Harmon Hill in Bennington, VT, has 100% sphagnum cover and was referred to as a "boggy beaver meadow" with old conifer snags scattered throughout the meadow and two possible outlets.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Expansion of the range of this type eastward to Massachusetts and West Virginia is based on the presence of *Carex utriculata*. Taxonomy and distribution of *Carex utriculata* versus *Carex rostrata* has been confused in the past. Gleason and Cronquist (1991), BONAP (2010), and FNA Editorial Committee (2002b) all treat *Carex rostrata* as circumboreal and extending southward to northern Michigan, Wisconsin and northern Minnesota (e.g., in Wisconsin *Carex rostrata* has been reported from extreme northern Wisconsin, on the Apostle Islands (E. Judziewicz pers. comm. 1999)). By contrast, *Carex utriculata* is boreal but extends south to Delaware, Indiana, Nebraska, New Mexico and California. (*Carex vesicaria* has a similar distribution to *Carex utriculata*). However, older atlases and floras in the Midwest (Voss 1972, Mohlenbrock and Ladd 1978, Ownbey and Morley 1991) only use *Carex rostrata*. Curtis (1959) suggested that differential species for northern sedge meadows in Wisconsin may be *Symphyotrichum puniceum (= Aster puniceus), Campanula aparinoides, Glyceria canadensis, Scirpus atrovirens*, and *Solidago uliginosa*, among others, but this list needs further study. *Carex stricta* is restricted to eastern North American temperate and boreal regions.

M881. Eastern North American Riverscour Vegetation

G792. Laurentian-Acadian Riverscour Vegetation

Group Summary Description: This rivershore group occurs in the northeastern United States, adjacent southeastern Canada, and the western Great Lakes along rivers where flooding and ice-scour affect the vegetation. Vegetation is often patchy and can be dominated by shrubs, graminoids, or forbs. A wide variety of species can be common, including *Alnus incana, Alnus viridis, Cornus sericea, Dasiphora fruticosa ssp. floribunda, Argentina anserina, Apocynum cannabinum, Carex stricta, Deschampsia caespitosa, Desmodium canadense, Iris versicolor, Parnassia glauca, Rhynchospora capillacea, Rhynchospora capitellata, Spartina pectinata*, and *Thalictrum pubescens*. Sites occur on sand, gravel, cobble, or bedrock and may be calcareous.

A3830 *Alnus incana / Dasiphora fruticosa ssp. floribunda* Riverscour Alliance

Alliance Summary Description: This alliance comprises riparian vegetation occurring on rocky, sandy, or cobbly substrates. High base status caused by groundwater seepage or calcareous parent materials, is typical. Graminoids and forbs are common, and shrubs are often present. Characteristic species include some combination of *Alnus incana, Alnus viridis, Cornus sericea, Dasiphora fruticosa ssp. floribunda, Triantha glutinosa, Doellingeria umbellata*, multiple species of *Carex* (often *Carex stricta*), *Thalictrum pubescens*, and *Deschampsia caespitosa*. Species richness is relatively high, with the presence of a number of calciphilic plants. This vegetation occurs in New England, New York and northern New Jersey, with disjunct locations in West Virginia and possibly Pennsylvania.

[CEGL006142] *Triantha glutinosa - Carex garberi* Riverscour Wet Meadow

Translated Name: **Sticky Bog-asphodel - Elk Sedge Riverscour Wet Meadow**
Common Name: **Boreal Circumneutral Riverside Seep**

USNVC Classification

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Riverscour Vegetation (M881)
Group	Laurentian-Acadian Riverscour Vegetation (G792)
Alliance	*Alnus incana / Dasiphora fruticosa ssp. floribunda* Riverscour Alliance (A3830)

Element Concept

Global Summary: This is a herb-dominated seepage community that develops on discharge areas of the shores of larger rivers in the glaciated northeastern United States and adjacent Canada. Semi-open conditions are maintained by ice-scouring and floodwaters. The circumneutral groundwater discharge supports a fen-like aspect, but on mineral rather than peat soils. The periodic disturbance and enriched nutrient conditions contribute to the high species richness of these seeps. The shore substrate may be sandy, gravelly, sometimes interspersed with bedrock. In some areas, the substrate is unconsolidated glacial material; in others, the substrate is sand and cobble held together by a tightly woven root mass. The vegetation is dominated by low to medium-height herbs, with cover usually 60-90%. Shrubs are usually present, but are often reduced to sprouts only one or a few years old due to the annual disturbance. The bryophyte layer may be locally well-developed, although not extensive overall. Characteristic herbaceous species include *Lobelia kalmii, Parnassia glauca, Platanthera dilatata, Packera paupercula (= Senecio pauperculus), Triantha glutinosa (= Tofieldia glutinosa), Spiranthes lucida, Spiranthes romanzoffiana, Carex garberi, Carex viridula, Carex flava, Carex buxbaumii, Rhynchospora capillacea, Rhynchospora capitellata, Mentha arvensis, Equisetum arvense, Calamagrostis canadensis, Rubus pubescens, Doellingeria umbellata (= Aster umbellatus), Thalictrum pubescens*, and *Glyceria septentrionalis*. Common shrubs include *Alnus incana, Alnus viridis, Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda), Myrica gale, Spiraea alba, Salix eriocephala* and other *Salix* species, and *Cornus sericea*. Bryophytes have not been well sampled across this type's range; known bryophytes include many non-sphagnous species typical of fen conditions, including *Bryum pseudotriquetrum, Campylium stellatum, Philonotis fontana*, and *Drepanocladus* spp. The invasive exotics *Tussilago farfara* and *Lythrum salicaria* may occur in these seeps.

ENVIRONMENTAL DESCRIPTION

G754. NORTHEASTERN RIVERSCOUR BARRENS & PRAIRIE

Group Summary Description: This group consists of sparsely vegetated barren riverscour. Character species (variously differential with other groups) might include *Calamagrostis canadensis, Campanula rotundifolia, Deschampsia caespitosa, Doellingeria umbellata, Hypericum prolificum, Packera paupercula, Prunus pumila, Solidago simplex, Spartina pectinata*, and/or *Triantha glutinosa*. It is found in northeastern North America from Pennsylvania to Quebec, Canada.

A3826 *Andropogon gerardii - Anemone virginiana var. alba* Riverscour Alliance

Alliance Summary Description: This alliance includes scoured riverbank "prairies" in the northeastern United States, which may be called "riverside prairies," "linear prairies," "rivershore grasslands," or "scoured riverine bluff prairie." Vegetation occurs on bedrock outcrops or sandy point bars or receiving flood-scour. The vegetation is highly variable in substrate, cover, and composition, but is characterized by *Andropogon gerardii, Anemone virginiana var. alba, Prunus pumila, Solidago simplex, Arabis lyrata*, and *Solidago simplex*. This vegetation ranges from Pennsylvania and New Jersey to northern New England and southern Quebec.

[CEGL006284] *Andropogon gerardii - Campanula rotundifolia - Solidago simplex* Riverscour Sparse Vegetation

Translated Name: **Big Bluestem - Bluebell Bellflower - Sticky Goldenrod Riverscour Sparse Vegetation**
Common Name: **Northern Riverscour Rock Outcrop**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Riverscour Vegetation (M881)
Group	Northeastern Riverscour Barrens & Prairie (G754)
Alliance	*Andropogon gerardii - Anemone virginiana var. alba* Riverscour Alliance (A3826)

ELEMENT CONCEPT

Global Summary: This riverside rock outcrop community of the northeastern U.S. occurs on open flood-scoured bedrock exposures of major rivers, typically along river narrows. Emergent seepage is absent. Typically a gradient from dry acidic conditions higher on the bank to moist, fairly enriched conditions lower down may exist at any one site. This community is prone to flooding in the upper regions and deposition in the topographically lower areas. It is also prone to severe drought periods that may stress or kill some vegetation. Within the community, the species are

distributed patchily, probably due to microsite conditions. The variability in species composition has not been measured, but it shows substantial variation from site to site and from year to year. Vegetation is typically sparse and occurs in the cracks and crevices of the bedrock. Typical vegetation is a mixture of riparian species, xeric-loving crevice plants, and calciphiles. Characteristic species include *Andropogon gerardii, Schizachyrium scoparium, Campanula rotundifolia, Solidago simplex, Toxicodendron radicans, Ionactis linariifolius, Sisyrinchium montanum, Packera paupercula (= Senecio pauperculus)*, and *Prunus pumila*. Other associates include *Anemone virginiana var. alba (= Anemone virginiana var. riparia), Symphyotrichum lateriflorum, Carex crawei, Carex crawfordii, Potentilla arguta, Campanula rotundifolia, Arabis lyrata, Aquilegia canadensis, Cornus amomum, Euthamia graminifolia, Juncus debilis*, and *Eupatorium perfoliatum*, among others. *Astragalus robbinsii var. jesupii* occurs in limited areas along the upper Connecticut River. These sites are susceptible to invasion by *Lythrum salicaria* and *Melilotus officinalis (= Melilotus alba)*. This association is more temperate than the related *Campanula rotundifolia - Packera paupercula - (Aquilegia canadensis)* Riverscour Sparse Vegetation (CEGL006532), which occurs on near-boreal rivers and lacks prairie elements such as *Andropogon gerardii*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This vegetation is found on open flood-scoured bedrock exposures of major rivers, typically along river narrows. This community was sampled at West Hartford Bridge along the White River in Vermont.

Global Environment: This sparse vegetation occurs on open flood-scoured bedrock exposures of major rivers, typically along river narrows. Emergent seepage is absent. Typically a gradient from dry acidic conditions higher on the bank to moist, fairly enriched conditions lower down may exist at any one site. This community is prone to flooding in the upper regions and deposition in the topographically lower areas. It is also prone to severe drought periods that may stress or kill some vegetation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Patchy vegetation includes *Andropogon gerardii, Schizachyrium scoparium, Solidago juncea, Packera paupercula, Solidago nemoralis, Dichanthelium acuminatum, Campanula rotundifolia, Houstonia caerulea, Fragaria virginiana*, and others. Scattered tree seedlings include *Populus deltoides* and *Ulmus americana*. *Vaccinium* spp. are absent.

Global Vegetation: This community is essentially a rock outcrop with a bit of soil development in the lower reaches. Within the community, the species are distributed patchily, probably due to microsite conditions. The variability in species composition has not been measured but shows substantial variation both spatially and temporally. Vegetation is typically sparse and occurs in the cracks and crevices of the bedrock. Typical vegetation is a mixture of riparian species, xeric-loving crevice plants, and calciphiles. Characteristic species include *Andropogon gerardii, Schizachyrium scoparium, Campanula rotundifolia, Solidago simplex, Toxicodendron radicans, Ionactis linariifolius, Sisyrinchium montanum, Packera paupercula (= Senecio pauperculus)*, and *Prunus pumila*. Other associates include *Anemone virginiana var. alba (= Anemone virginiana var. riparia), Symphyotrichum lateriflorum, Carex crawei, Carex crawfordii, Potentilla arguta, Campanula rotundifolia, Arabis lyrata, Aquilegia canadensis, Cornus amomum, Euthamia graminifolia, Juncus debilis*, and *Eupatorium perfoliatum*, among others. *Astragalus robbinsii var. jesupii* occurs in limited areas along the upper Connecticut River. These sites are susceptible to invasion by *Lythrum salicaria* and *Melilotus officinalis (= Melilotus alba)*.

Global Dynamics: Winter ice-scour that removes tall vegetation and woody plants maintains predominantly herbaceous vegetation. The early-successional floristic assemblages include species able to regenerate from buried rootstocks or from seeds dispersed along the shoreline. Seasonal and annual variation in water levels is also an important process affecting the vegetation.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): *Andropogon gerardii*, *Campanula rotundifolia*, *Packera paupercula*, *Schizachyrium scoparium*, *Solidago juncea*, *Solidago nemoralis*
Global: *Allium schoenoprasum* var. *sibiricum*, *Andropogon gerardii*, *Astragalus robbinsii* var. *jesupii*, *Campanula rotundifolia*, *Ionactis linariifolius*, *Packera paupercula*, *Prunus pumila*, *Schizachyrium scoparium*, *Solidago simplex*, *Toxicodendron radicans*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Astragalus robbinsii* var. *jesupii* (G5T1)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (17-Nov-1997). There are probably fewer than 20 occurrences of this community rangewide. Individual occurrences tend to be small, so there are probably fewer than 500 acres rangewide. Currently five occurrences are documented in New Hampshire, with a total acreage of less than 20 acres. Similar vegetation is reported from Vermont, Maine, and New York, but these still need confirmation. This community is restricted to calcareous or basic bedrock outcrops along ice-scoured upper reaches of major rivers such as the Connecticut River in New Hampshire and Vermont, the Kennebec River in Maine, the Hudson River in New York, and the Delaware River in New Jersey.

RELATED CONCEPTS

Global Similar Types:
- *(Hypericum prolificum, Leucothoe racemosa) / Schizachyrium scoparium - Solidago simplex var. racemosa - Ionactis linariifolius* Riverscour Sparse Vegetation (CEGL006491)
- *Campanula rotundifolia - Packera paupercula - (Aquilegia canadensis)* Riverscour Sparse Vegetation (CEGL006532)
- *Deschampsia caespitosa - Carex viridula* Riverscour Wet Meadow (CEGL006969)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: The Vermont example was intensely scoured by Tropical Storm Irene in 2011.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This community may occur in conjunction with seep communities. However, emergent seepage is absent as are the corresponding seepage and wetland plants found in riverside seeps. Sedges are notably lacking. This community differs from rock outcrop/rocky summit communities by the paucity of lichen and woody species intolerant of flooding and the presence of flood-tolerant species on lower, somewhat enriched reaches of the community, where regular erosion and deposition of silty sediments occur.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at West Hartford Bridge along the White River in Vermont.
Global Range: This community is reported from Vermont, New Hampshire, Maine, Connecticut, New Jersey, Pennsylvania, and New York. It may also occur in Massachusetts.

Macrogroup	Eastern North American Riverscour Vegetation (M881)
Group	Northeastern Riverscour Barrens & Prairie (G754)
Alliance	*Andropogon gerardii - Anemone virginiana var. alba* Riverscour Alliance (A3826)

Element Concept

Global Summary: These are tall alluvial grasslands in the temperate region of the northeastern United States. They are found on sandy point bars and linear deposits along semi-stable rivershores subject to periodic flooding. Ice build-up during the winter can scour the rivershore in spring, limiting woody growth. The substrate is cobble, gravel or coarse sediment with interstices of alluvial sand and silt. Bare cobble is exposed in some areas. Herbaceous plants dominate, and may form a dense cover; scattered shrubs may grow among them, but are generally kept short by the annual flooding. Bryophytes are absent or at most sparse. The dominant plants are tall grasses such as *Sorghastrum nutans, Andropogon gerardii, Schizachyrium scoparium*, and *Panicum virgatum*. Characteristic herbs include *Helianthemum canadense, Helianthus divaricatus, Asclepias tuberosa*, and *Lespedeza capitata*. *Spiraea alba, Rosa virginiana, Quercus ilicifolia, Betula nigra*, and *Prunus pumila* are common shrubs. Other herbaceous associates include *Anemone virginiana, Calamagrostis canadensis, Eupatorium maculatum, Solidago rugosa, Solidago nemoralis, Solidago gigantea, Spartina pectinata, Achillea millefolium, Baptisia tinctoria, Asclepias syriaca, Dichanthelium clandestinum, Euthamia graminifolia, Apocynum androsaemifolium, Thelypteris palustris, Lycopus uniflorus, Phalaris arundinacea, Scleria triglomerata*, and *Symphyotrichum novi-belgii*. This association differs from more northerly riverside ice meadows in being dominated by prairie grasses (*Andropogon gerardii, Sorghastrum nutans)* rather than by *Calamagrostis canadensis*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This riverside grassland generally occurs along major rivers in flood-scoured areas. The sampled site is a small linear patch along a river.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These are tall alluvial grasslands in the temperate region of the northeastern United States. They are found on sandy point bars and linear deposits along semi-stable rivershores subject to periodic flooding. Ice build-up during the winter can scour the rivershore in spring, limiting woody growth. The substrate is cobble, gravel or coarse sediment with interstices of alluvial sand and silt. Bare cobble is exposed in some areas.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (20-May-2011). Although there are likely well over 300 occurrences of this vegetation rangewide, many occurrences are very small patch, especially in the northern portions of the range. This vegetation is vulnerable to shoreline development, bank stabilization, invasive species, and some minor impacts as a result of recreational activities (trampling, boat ramp building, etc.)

RELATED CONCEPTS

CLASSIFICATION

Status: Standard

Classification Confidence: 3 - Weak

Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: The sampled observation point site in Vermont is a riverwash herbaceous association with few tall graminoids and some *Salix* sp. It is higher and drier than Northeastern Temperate Cobble Scour Rivershore (CEGL006536) and without *Carex torta*. It is small-patch and linear (below MMU).

Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.

ELEMENT DISTRIBUTION

M880. Eastern North American Wet Shoreline Vegetation

G755. Eastern North American Riverine Wetland Vegetation

Group Summary Description: This eastern North American group consists of riverine wetlands. Even with this reduced concept, composition is variable enough that individual character species are somewhat difficult to isolate, but some reasonably constant species might include *Alnus serrulata, Carex torta, Elymus* spp., *Eupatorium* spp., *Panicum virgatum, Salix caroliniana, Salix interior* (more Midwest), *Solidago gigantea*, and others.

A0943 *Alnus serrulata* Riverscour Shrubland Alliance

Alliance Summary Description: This alliance includes temporarily flooded shrub thickets characterized by high-energy flooding events along rivers and streams on rocky shoals and gravel bars in the Appalachians and Interior Highlands. *Alnus serrulata* is characteristic; other common species include *Cephalanthus occidentalis, Cornus amomum, Cornus obliqua (= Cornus amomum ssp. obliqua), Cornus foemina, Hypericum prolificum, Lyonia ligustrina, Viburnum nudum, Physocarpus opulifolius, Amorpha fruticosa, Xanthorhiza simplicissima*, and others.

[CEGL003895] *Alnus serrulata - Xanthorhiza simplicissima* Wet Shrubland

Translated Name: **Hazel Alder - Yellowroot Wet Shrubland**
Common Name: **Rocky Bar and Shore (Alder - Yellowroot Type)**

USNVC Classification

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	*Alnus serrulata* Riverscour Shrubland Alliance (A0943)

Element Concept

Global Summary: This association includes shrublands on rocky or gravelly substrates along narrow river margins in the southeastern Blue Ridge Escarpment gorges, ranging elsewhere on the Southern Blue Ridge and into the Cumberland Plateau. Vegetation composition, density, and height vary with frequency of flooding, substrate, and soil depth. *Alnus serrulata* and *Xanthorhiza simplicissima* are common and characteristic but not always dominant. Other shrubs may include *Arundinaria gigantea, Diervilla sessilifolia, Salix nigra, Salix sericea, Rhododendron arborescens, Rhododendron viscosum, Rhododendron maximum, Rhododendron periclymenoides, Kalmia latifolia, Leucothoe fontanesiana, Cornus foemina, Cornus amomum, Physocarpus opulifolius, Itea virginica*, and *Viburnum nudum var. cassinoides*. Arborescent species that occur as tall shrubs (or as occasional trees, less than 10% cover) include *Acer rubrum, Carpinus caroliniana, Diospyros virginiana, Liquidambar styraciflua, Liriodendron tulipifera, Platanus occidentalis*, and *Tsuga canadensis*. Open areas dominated by grasses and forbs include species such as *Agrostis perennans, Boykinia aconitifolia, Carex torta, Eupatorium fistulosum, Lycopus virginicus, Trautvetteria caroliniensis, Houstonia serpyllifolia, Impatiens capensis, Hypericum mutilum, Viola x primulifolia*, and *Holcus lanatus* (exotic). Adjacent alluvial forests in the Blue Ridge are dominated by *Tsuga canadensis, Liriodendron tulipifera, Betula lenta*, and, at lower elevations, below 610 m (2000 feet), *Platanus occidentalis* and *Liquidambar styraciflua*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This shrubland occurs on rocky or gravelly substrates along narrow river margins and is subject to periodic flooding. Soils are moderately well-drained sandy loam. The unvegetated surface is dominated by leaf litter with some wood and bare soil. Evidence of disturbance includes the presence of trails and the abundance of exotic plant species.
Global Environment: This association includes shrublands on rocky or gravelly substrates along narrow river margins in the southeastern Blue Ridge Escarpment gorges, ranging elsewhere on the Southern Blue Ridge and into the Cumberland Plateau. Vegetation composition, density, and height vary with frequency of flooding, substrate, and soil depth. The occurrences can be in very narrow bands of 1-2 m or wider bars of up to 10-20 m wide adjacent to large creeks and small rivers.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: Characteristic species are *Alnus serrulata* and *Xanthorhiza simplicissima*, but they may not always be dominant. Other species may include *Arundinaria gigantea, Diervilla sessilifolia, Salix nigra, Salix sericea, Rhododendron arborescens, Rhododendron viscosum, Rhododendron maximum, Rhododendron periclymenoides, Kalmia latifolia, Leucothoe fontanesiana, Cornus foemina, Cornus amomum, Physocarpus opulifolius, Itea virginica*, and *Viburnum nudum var. cassinoides*. Tree species present may include *Platanus occidentalis, Ulmus* spp., and *Carpinus caroliniana*. Common and/or abundant herbs include *Andropogon gerardii, Solidago roanensis*, and *Solidago rugosa*. Repeated flooding has allow a large number (34 taxa in 2 sampled plots) of exotic species to become established.
Global Vegetation: *Alnus serrulata* and *Xanthorhiza simplicissima* are common shrubs and characteristic but not always dominant. Other shrubs may include *Arundinaria gigantea, Diervilla sessilifolia, Salix nigra, Salix sericea, Rhododendron arborescens, Rhododendron viscosum, Rhododendron maximum, Rhododendron periclymenoides, Kalmia latifolia, Leucothoe fontanesiana, Cornus foemina, Cornus amomum, Physocarpus opulifolius, Itea virginica*, and *Viburnum nudum var. cassinoides*. Arborescent species that occur as tall shrubs (or as occasional trees, less than 10% cover) include *Acer rubrum, Carpinus caroliniana, Diospyros virginiana, Liquidambar styraciflua, Liriodendron tulipifera, Platanus occidentalis*, and *Tsuga canadensis*. Open areas dominated by grasses and forbs include species such as *Agrostis perennans, Boykinia aconitifolia, Carex torta, Eupatorium fistulosum, Lycopus virginicus, Trautvetteria caroliniensis, Houstonia serpyllifolia, Impatiens capensis, Hypericum mutilum, Viola x primulifolia*, and *Holcus lanatus* (exotic). Adjacent alluvial forests in the Blue Ridge are dominated by *Tsuga canadensis, Liriodendron tulipifera, Betula lenta*, and, at lower elevations, below 610 m (2000 feet), *Platanus occidentalis* and *Liquidambar styraciflua*

Global: Vulnerable Plants: *Diervilla rivularis* (G3), *Spiraea virginiana* (G2); **Invasive/Exotic Plants**: *Holcus lanatus* (High/Medium)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (17-Dec-1999). This community is naturally restricted in terms of geography and habitat, thus could be vulnerable to elimination. However, this community is often overlooked in inventories or not separately distinguished, and is likely much more common than the number of documented occurrences suggests. Threats to this community include alteration of the natural flooding regime due to damming of rivers and invasion by exotic species carried on river courses.

RELATED CONCEPTS

Global Similar Types:

- *Platanus occidentalis / Dichanthelium clandestinum - Festuca subverticillata* Floodplain Forest (CEGL004031)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Species-rich, somewhat weedy vegetation apparently representing riparian streambank / shrubland vegetation. Assigned to this shrubland type (CEGL003895) despite the presence of some trees. Doubtfully mappable.
Global Classification Comments: This association is known from the Bankhead National Forest, Alabama, but further inventory is needed to fully describe the variation of this type on the Bankhead and elsewhere in the Cumberland Plateau. In the Appalachian Trail study (Fleming and Patterson 2009a), four plots from North Carolina, Tennessee, and Virginia were classified as this association. Species that are 100% constant are *Alnus serrulata, Apios americana, Dichanthelium clandestinum, Rudbeckia laciniata, Solidago rugosa, Toxicodendron radicans, Verbesina alternifolia*, and *Viola sororia*; species that are 75% constant include *Ambrosia artemisiifolia, Amphicarpaea bracteata, Carpinus caroliniana, Clematis virginiana, Cryptotaenia canadensis, Impatiens capensis,* and *Xanthorhiza simplicissima*. Exotic species that may be present (at 75% constancy) include *Holcus lanatus, Microstegium vimineum,* and *Rosa multiflora*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: The two sampled plots are in Carter and Unicoi counties in Tennessee, including along the Nolichucky River in Pisgah National Forest.
Global Range: This association is found along montane rivers in the Southern Blue Ridge and Cumberlands. Occurrences in adjacent regions are possible.

A3647 *Carex torta* Riverbed Alliance

Alliance Summary Description: This herbaceous vegetation occurs on large coarse substrates deposited along medium- to high-energy river channels and, less frequently, exposed lakeshores with heavy wave action. Seasonal flooding and ice-scour maintain the open nature of these communities; generally, they develop in areas of the active channel that are exposed at low water or in drought years. Vegetation can be sparse to dense depending on degree of flooding and length of exposure. Characteristic perennial species that tolerate inundation and flood-scouring include *Carex torta* and low *Salix* spp. Associated species tend to vary widely from site to site, can be diverse, and may be sparse. Associated species vary with geography. In the Allegheny Mountains, associated species include *Doellingeria umbellata (= Aster umbellatus), Dichanthelium clandestinum, Solidago rugosa ssp. aspera, Juncus effusus var. solutus, Scirpus expansus, Scirpus cyperinus (= var. pelius), Equisetum arvense, Onoclea sensibilis, Vernonia noveboracensis, Lycopus virginicus, Scutellaria lateriflora*, and *Salix sericea*. In Southern Appalachian gorges, this vegetation often is associated with *Alnus serrulata - Xanthorhiza simplicissima* Wet Shrubland (CEGL003895). In the Cumberland Plateau of Alabama, herbaceous components may include *Lobelia cardinalis, Symphyotrichum dumosum (= Aster dumosus), Lycopus virginicus, Osmunda regalis*, and *Hypericum mutilum*. Physiognomy varies from strictly herbaceous to shrubby to wooded herbaceous. Scattered shrubs and small, battered specimens of *Platanus occidentalis, Betula nigra, Cornus amomum, Alnus serrulata*, and *Carpinus caroliniana* are present in some stands. Stands in disturbed landscapes may be heavily invaded by *Microstegium vimineum, Polygonum caespitosum var. longisetum*, and other weedy exotics.

[CEGL006536] *Carex torta - Apocynum cannabinum - Cyperus* spp. Riverbed Vegetation

Translated Name: **Twisted Sedge - Indian-hemp - Flatsedge species Riverbed Vegetation**
Common Name: **Northeastern Temperate Cobble Scour Rivershore**

USNVC Classification

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	*Carex torta* Riverbed Alliance (A3647)

Element Concept

Global Summary: This herbaceous vegetation occurs on large coarse substrates deposited along medium- to high-energy river channels and, less frequently, exposed lakeshores with heavy wave action. Seasonal flooding and ice-scour maintain the open nature of these communities; generally, they develop in areas of the active channel that are exposed at low water or in drought years. Vegetation can be sparse to dense depending on degree of flooding and length of exposure. Characteristic perennial species that tolerate inundation and flood scouring include *Carex torta* and low *Salix* spp. Associated species tend to vary widely from site to site, can be diverse, and may be sparse; they include *Apocynum cannabinum, Verbena hastata, Symphyotrichum puniceum (= Aster puniceus), Doellingeria umbellata (= Aster umbellatus), Solidago rugosa, Solidago canadensis, Solidago gigantea, Calamagrostis canadensis, Phalaris arundinacea, Scirpus expansus, Scirpus cyperinus, Thelypteris palustris, Scutellaria lateriflora, Agrostis stolonifera, Dichanthelium clandestinum, Eupatorium maculatum, Eupatorium perfoliatum, Elymus riparius, Cyperus strigosus* and other *Cyperus* spp., *Eleocharis* spp., *Lobelia cardinalis, Onoclea sensibilis, Viola* spp., *Clematis virginiana, Polygonum amphibium, Polygonum hydropiper, Polygonum pensylvanicum, Polygonum sagittatum, Polygonum persicaria, Polygonum punctatum, Polygonum lapathifolium, Schizachyrium scoparium, Andropogon gerardii*, and occasionally *Sanguisorba canadensis*. Battered and stunted shrubs and trees can occur, including *Salix sericea, Salix eriocephala, Cornus amomum, Betula nigra, Populus deltoides*, and *Platanus occidentalis*. Nonvascular plants can be sparse, but where present can include *Bryum* spp. Invasive, exotic species can be problematic in these areas, especially *Tussilago farfara, Lythrum salicaria, Polygonum cuspidatum, Polygonum persicaria*, and in the southern portion of the range *Microstegium vimineum*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This herbaceous vegetation occurs on large coarse substrates deposited along medium- to high-energy river channels and, less frequently, exposed lakeshores with heavy wave action. Seasonal flooding and ice-scour maintain the open nature of this community. The sampled site is a small linear feature.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This small-patch herbaceous community is only known from two locations in Maine on seasonally flooded channel beds at elevations of 420 and 470 m (1,380-1,540 feet). Substrates are sandy and unvegetated surfaces are mostly comprised of large rocks and cobbles.
Global Environment: This community occurs on cobble, gravel, and sand bars or banks of streams and rivers with medium to high gradients. Seasonal flooding and ice-scour maintain the open nature of these communities.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Carex torta* is dominant. Characteristic perennial species that tolerate inundation and flood scouring include *Carex torta* and low *Salix* spp. Associated species tend to vary widely from site to site, can be diverse, and may be sparse.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This herbaceous association has a highly variable composition of flood- and scour-tolerant species. Total cover may be sparse to open, and the most consistent dominant species is the sedge *Carex torta*. Associated herbaceous species include *Agrostis perennans, Carex scabrata, Cinna latifolia, Doellingeria umbellata, Glyceria melicaria, Oclemena acuminata, Solidago rugosa*, and *Thalictrum pubescens*. Shrubs and tree saplings may form a sparse low-shrub layer. Species include *Alnus incana ssp. rugosa, Betula alleghaniensis, Populus tremuloides*, and *Rubus idaeus ssp. strigosus*. In some stands, *Rubus pubescens* may attain high cover and form a shrub-herbaceous community.
Global Vegetation: Vegetation can be sparse to dense depending on degree of flooding and length of exposure. Characteristic perennial species that tolerate inundation and flood scouring include *Carex torta* and low *Salix* spp. Associated species tend to vary widely from site to site, can be diverse, and may be sparse; they include *Apocynum cannabinum, Verbena hastata, Symphyotrichum puniceum (= Aster puniceus), Doellingeria umbellata (= Aster umbellatus), Solidago rugosa, Solidago canadensis, Solidago gigantea, Calamagrostis canadensis, Phalaris arundinacea, Scirpus expansus, Scirpus cyperinus, Thelypteris palustris, Scutellaria lateriflora, Agrostis stolonifera, Dichanthelium clandestinum, Eupatorium maculatum, Eupatorium perfoliatum, Elymus riparius, Cyperus strigosus* and other *Cyperus* spp., *Eleocharis* spp., *Lobelia cardinalis, Onoclea sensibilis, Viola* spp., *Clematis virginiana, Polygonum amphibium, Polygonum hydropiper, Polygonum pensylvanicum, Polygonum sagittatum, Polygonum persicaria, Polygonum punctatum, Polygonum lapathifolium, Schizachyrium scoparium, Andropogon gerardii*, and occasionally *Sanguisorba canadensis*. Battered and stunted shrubs and trees can occur, including *Salix sericea, Salix eriocephala, Cornus amomum, Betula nigra, Populus deltoides*, and *Platanus occidentalis*. Nonvascular plants can be sparse, but where present can include *Bryum* spp. Invasive, exotic species can be problematic in these areas, especially *Tussilago farfara, Lythrum salicaria, Polygonum cuspidatum, Polygonum persicaria*, and in the southern portion of the range *Microstegium vimineum*.
Global Dynamics: These are highly dynamic communities with regular disturbance from flooding and ice-scour. Vegetation cover can be inversely proportional to inundation and scour.

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (2-Feb-2005). This community is common in tributaries in the upper portions of watersheds. The rank within Pennsylvania is S3; considering its whole range, its rank should probably be changed to G5.

RELATED CONCEPTS

Global Similar Types:
- *Carex torta* Riverbed Vegetation (CEGL004103)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This is a small and linear association and usually occurs on the landscape in small patches well below the minimum map unit size.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type was originally developed for the Northern Appalachians but later extended south to Pennsylvania. This is a very heterogeneous type, but analysis of the Pennsylvania data failed to reveal any consistent variants. Ongoing work (as of 2005) in the National Capital Region (Virginia, Maryland, West Virginia) is generating some plot data that may help determine if a different temporarily flooded herbaceous river-scour association is needed for that region. If so, the transition area from this more northern type to the more southern type will need to be defined, and that may alter the range of this type.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from two locations at Dunn Falls and Bemis Stream in Maine.
Global Range: This association is found from New England south through New York and Pennsylvania.

[CEGL004103] *Carex torta* Riverbed Vegetation

Translated Name: **Twisted Sedge Riverbed Vegetation**
Common Name: **Rocky Bar and Shore (Twisted Sedge Type)**

USNVC Classification

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	*Carex torta* Riverbed Alliance (A3647)

Element Concept

Global Summary: This association accommodates herbaceous alluvial wetlands in which *Carex torta* is a dominant or characteristic species. It occupies sand, gravel, and rock bars along small rivers and streams in valleys and gorges in the Southern Appalachians, ranging west into the Cumberland Plateau and the Interior Low Plateau, and north into the Central Appalachians, Allegheny Mountains, and Piedmont. This association is characterized by light-requiring, tough-rooted herbaceous perennials tolerant of frequent inundation and flood-scouring. *Carex torta* often forms dense, extensive colonies. Associated species vary with geography but can include *Polygonum sagittatum, Dichanthelium clandestinum, Solidago rugosa ssp. aspera, Juncus effusus, Equisetum arvense, Onoclea sensibilis, Vernonia noveboracensis, Lycopus virginicus, Lobelia cardinalis, Symphyotrichum dumosum (= Aster dumosus), Lycopus virginicus, Osmunda regalis, Hypericum mutilum, Eupatorium fistulosum, Solidago patula, Boehmeria cylindrica, Amphicarpaea bracteata, Acalypha rhomboidea, Hypericum mutilum, Impatiens capensis, Leersia oryzoides*, and *Symphyotrichum lateriflorum (= Aster lateriflorus)*. Physiognomy of this type varies from strictly herbaceous to wooded herbaceous to shrubby. Scattered shrubs and small, battered specimens of *Platanus occidentalis, Betula nigra, Cornus amomum, Alnus serrulata*, and *Carpinus caroliniana* are present in some stands. An overhanging canopy may include *Platanus occidentalis, Betula alleghaniensis var. alleghaniensis*, or *Acer rubrum*. Overhanging shrubs often include *Rhododendron maximum*. Stands in disturbed landscapes may be heavily invaded by *Microstegium vimineum, Polygonum caespitosum var. longisetum*, and other weedy exotics.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This twisted sedge-dominated vegetation occurs on rock, gravel and sand bars, and active channel shelves of high-gradient streams and small rivers, often forming small, discontinuous, linear patches along waterways. It was sampled once in Maryland in the Central Appalachian project area on a gently sloping small scour area along a creekbed which receives occasional high-energy flow. The stream is covered with large boulders and the soil is very poorly drained. No evidence of disturbance was reported.

Global Environment: This association occupies boulder and gravel bars on the frequently flooded, active channel shelves of high-gradient streams and small rivers, often forming small, discontinuous, linear patches. It is subject to frequent, high-energy inundation and flood-scouring, which can occur at any time of year. Flooding duration is probably similar to that documented along Passage Creek in Shenandoah County, Virginia, by Hupp (1982). In that drainage, the channel shelf was inundated approximately 15% of the time. Elevations in West Virginia range from 390-1200 m. Soils are moderately to poorly drained sand with pH averaging 6.5 (n=5). Organic soils are not present. Soil chemistry is characterized by high Cu, Mn; moderate B, Ca, Mg; and low Al, ENR, Fe, H, K, Na, P, S, TEC, Zn, and organic matter (n=3).

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Carex torta* dominates this herbaceous, flood-scoured community. Many other species can co-occur and stands can be relatively diverse floristically. *Boehmeria cylindrica* and *Lycopus virginicus* are characteristic. Physiognomy of this type varies from strictly herbaceous to wooded herbaceous to shrubby. Scattered shrubs and small, battered specimens of *Platanus occidentalis, Betula nigra, Cornus amomum, Alnus incana ssp. rugosa*, and *Carpinus caroliniana* are present in some stands. An overhanging canopy of these or other riparian species is also possible.

Global Vegetation: Vegetation is characterized by light-demanding, tough-rooted herbaceous perennials tolerant of frequent inundation and flood-scouring. *Carex torta* is usually the dominant species and typically forms dense,

extensive colonies. Associated species vary with geography. *Polygonum sagittatum, Solidago rugosa*, and *Dichanthelium clandestinum* are typical; others include *Acalypha rhomboidea, Amphicarpaea bracteata, Boehmeria cylindrica, Equisetum arvense, Eupatorium fistulosum, Euthamia graminifolia var. graminifolia, Juncus effusus, Hypericum mutilum, Hypericum perforatum, Impatiens capensis, Leersia oryzoides, Lobelia cardinalis, Lycopus virginicus, Onoclea sensibilis, Osmunda regalis, Prunella vulgaris, Solidago patula, Symphyotrichum dumosum (= Aster dumosus), Symphyotrichum lateriflorum (= Aster lateriflorus), Symphyotrichum prenanthoides, Thalictrum* spp., *Trautvetteria caroliniensis var. caroliniensis, Verbesina alternifolia*, and *Vernonia noveboracensis*. Cover by nonvascular plants is insignificant. Physiognomy of this type varies from strictly herbaceous to wooded herbaceous to shrubby. Scattered shrubs and small, battered specimens of *Platanus occidentalis, Betula nigra, Cornus amomum, Alnus serrulata*, and *Carpinus caroliniana* are present in some stands. An overhanging canopy with an average cover of 20% may include *Platanus occidentalis, Betula alleghaniensis var. alleghaniensis*, or *Acer rubrum*. Sparse overhanging shrubs often include *Rhododendron maximum*. Stands in disturbed landscapes may be heavily invaded by *Microstegium vimineum, Polygonum caespitosum var. longisetum*, and other weedy exotics. Mean species richness of vascular plants in six West Virginia plots was 36 taxa per 400 square meters, with most of the diversity in the herbaceous stratum.

Global Dynamics: Periodic large or severe floods transport and deposit large numbers of cobbles, stones, and even boulders in characteristic bars both within the channel (islands) and along its edges (streambanks). These bars provide a matrix for deposition of finer alluvium and habitats for the establishment of tough, adaptable herbaceous plants, which in turn stabilize the bars with massive networks of perennial rootstocks. Regular flood-scouring batters or removes woody plants which take root in these habitats, maintaining open-canopy conditions. These habitats are highly dynamic, with conditions more or less constantly shifting in response to an irregular but powerful disturbance regime. While some of the bar habitats may be damaged or removed by severe floods, others may accrete or be newly deposited during the same events (Hupp 1982). Successionally, this unit can be considered a pioneering type on new, coarse alluvial land, but it is also more or less permanently maintained by natural disturbances.

Global: *Carex torta*, *Polygonum sagittatum*, *Solidago rugosa*

OTHER NOTEWORTHY SPECIES

Global: Other Plants: *Dichanthelium clandestinum* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (21-Jan-2000). This community is found as small-patch linear occurrences along waterways in the Southern Appalachians, west into the Cumberland Plateau and the Interior Low Plateau, and north into the Central Appalachians, Allegheny Mountains, and Piedmont. Although this community has a moderately large geographic range, it is uncommon within its range and occurrences are small. This community is more common than the number of documented occurrences would suggest, since it is often overlooked in inventories.

A2078 *Eupatorium serotinum - Verbesina alternifolia* Depositional Bar Alliance

Alliance Summary Description: This alliance consists of vegetation of active shorelines and depositional bars of streams and rivers in the Central Appalachians and Interior Low Plateau. Examples occur on sandy riverbanks and depositional bars, as well as in sand deposits on bedrock floodplains and boulder bars. The vegetation is maintained by periodic flooding, and flood dynamics vary from low to high rates of sediment erosion and turnover. These habitats experience high rates of sediment erosion and turnover during even moderate floods and are inundated for 3-12% of the year, but are generally exposed for most of the growing season. Vegetation may be sparse during years of more continuous high water during the growing season. In normal growing seasons, the vegetation is a dense growth of tall (1-2 m), fast-growing annual and perennial forbs. There may be some spatial separation within stands between perennial forbs, found on more stable shores and bars, and weedy annuals, found on high-gradient reaches that experience high rates of sediment erosion and turnover. Examples may have a very high cover of weedy and invasive species. Some typical components include *Amaranthus spinosus, Artemisia annua, Datura stramonium, Eupatorium serotinum, Polygonum lapathifolium, Polygonum pensylvanicum, Polygonum punctatum, Teucrium*

canadense, Verbesina alternifolia, and *Verbena urticifolia*, which are relatively constant and generally contribute most of the cover. Additional, less constant or abundant species include *Polygonum caespitosum var. longisetum, Conoclinium coelestinum (= Eupatorium coelestinum), Perilla frutescens, Chenopodium ambrosioides, Mollugo verticillata, Solanum ptychanthum, Verbena hastata, Urtica dioica ssp. dioica, Solanum carolinense*, and *Hibiscus laevis*. Herbaceous vines may also be numerous, with *Calystegia sepium, Cynanchum laeve*, and *Cuscuta gronovii* most frequent. Scattered individuals of shrubby to full-sized flood-tolerant trees (e.g., *Platanus occidentalis, Acer saccharinum*), as well as saplings of *Betula nigra* may be present.

[CEGL006481] *Eupatorium serotinum - Polygonum (lapathifolium, punctatum, pensylvanicum)* Riverbar Wet Meadow

Translated Name: **Late-flowering Thoroughwort - (Curlytop Knotweed, Dotted Smartweed, Pennsylvania Smartweed) Riverbar Wet Meadow**

Common Name: **Piedmont-Central Appalachian Scour Bar Wet Meadow**

USNVC Classification

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	*Eupatorium serotinum - Verbesina alternifolia* Depositional Bar Alliance (A2078)

Element Concept

Global Summary: This association is known only from the Potomac River in the Piedmont and mountain provinces of Maryland, Virginia, and West Virginia. Well-documented occurrences are concentrated in high-gradient reaches of the Potomac, particularly near the fall-line (Potomac Gorge) and at Harpers Ferry. The type occurs on sandy riverbanks and depositional bars, as well as in sand deposits on bedrock floodplains and boulder bars. These habitats experience high rates of sediment erosion and turnover during even moderate floods and are inundated for 3-12% of the year, but are generally exposed for most of the growing season. Vegetation may be sparse during years of more continuous high water during the growing season. In normal growing seasons, the type is a dense growth of tall (1-2 m), predominantly annual herbs. Some weedy, fast-growing perennials are also characteristic. *Artemisia annua, Amaranthus spinosus, Datura stramonium, Eupatorium serotinum, Polygonum lapathifolium, Polygonum pensylvanicum, Polygonum punctatum*, and *Verbena urticifolia* are relatively constant and generally contribute most of the cover. Additional, less constant or abundant species include *Chenopodium ambrosioides, Conoclinium coelestinum (= Eupatorium coelestinum), Hibiscus laevis, Mollugo verticillata, Perilla frutescens, Polygonum caespitosum var. longisetum, Solanum carolinense, Solanum ptychanthum, Teucrium canadense, Urtica dioica ssp. dioica, Verbena hastata*, and *Verbesina alternifolia*. Herbaceous vines may also be numerous, with *Calystegia sepium, Cynanchum laeve*, and *Cuscuta gronovii* most frequent. Scattered individuals of shrubby to full-sized flood-tolerant trees (e.g., *Platanus occidentalis, Acer saccharinum*) may be present.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This scour bar herbaceous annual vegetation occurs on sand deposits on bedrock floodplains and depositional and boulder bars. It experiences high rates of sediment erosion and turnover during floods, and sediment deposition is frequent. It was sampled once in the park at Harpers Ferry in West Virginia along a small, temporarily flooded sandy beach with well-drained sand soil. The unvegetated surface is dominated by bare sand with small amounts of exposed bedrock, large/small rocks, leaf litter, and Corbicula shells. Evidence of disturbance includes plantings to stabilize the bank, pedestrian traffic (heavy to moderate use), and the abundance of exotic plant species.

Global Environment: The type occurs on sandy riverbanks and depositional bars, as well as in sand deposits on bedrock floodplains and boulder bars. These habitats experience high rates of sediment erosion and turnover during even moderate floods and are inundated for 3-12% of the year (Lea 2000), but are generally exposed for most of the growing season.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This community is dominated by *Chamaesyce humistrata, Artemisia annua, Cyperus squarrosus, Datura stramonium*, and *Eragrostis* spp. *Eupatorium serotinum* and one or more *Polygonum* spp. can be patch dominants. *Salix nigra* may also be

present. Diversity is high in the sampled plot; 56 taxa were reported, but 21 of these are considered invasive exotics. This community also supports WV-state imperiled *Hibiscus laevis*.

Global Vegetation: Vegetation may be sparse during years of more continuous high water during the growing season. In normal growing seasons, the type is a dense growth of tall (1-2 m) predominantly annual herbs. Some weedy, fast-growing perennials are also characteristic. These include *Amaranthus spinosus, Artemisia annua, Datura stramonium, Eupatorium serotinum, Polygonum lapathifolium, Polygonum pensylvanicum, Polygonum punctatum, Teucrium canadense, Verbesina alternifolia*, and *Verbena urticifolia*, which are relatively constant and generally contribute most of the cover. Additional, less constant or abundant species include *Chenopodium ambrosioides, Conoclinium coelestinum (= Eupatorium coelestinum), Hibiscus laevis, Mollugo verticillata, Perilla frutescens, Polygonum caespitosum var. longisetum, Solanum carolinense, Solanum ptychanthum, Teucrium canadense, Urtica dioica ssp. dioica, Verbena hastata*, and *Verbesina alternifolia*. Herbaceous vines may also be numerous, with *Calystegia sepium, Cynanchum laeve*, and *Cuscuta gronovii* most frequent. Scattered individuals of shrubby to full-sized flood-tolerant trees (e.g., *Platanus occidentalis, Acer saccharinum*) may be present.

Global Dynamics: In habitats occupied by this community, sediment deposition is apparently frequent enough and sediment turnover extensive enough during even relatively small floods that most established perennial species are quickly buried or scoured away. These conditions favor the prevalence of annual herbs and rapidly growing perennials, both of which probably produce extensive seedbanks. It is uncertain whether this association is fully natural, as approximately 30% of its characteristic species are not indigenous to the region. While it is likely that this vegetation has been altered in both composition and distribution by anthropogenic watershed changes increasing the frequency and level of floods on the Potomac (favoring annual species and exotics), it also seems reasonable to presume that some similar form of low, frequently flooded depositional bar originally occurred along higher gradient stretches of the very powerful Potomac River. For now, the type is classified as a natural type that, like most floodplain communities, has been altered to a considerable degree by post-settlement disturbances. Multi-year research would be needed to elucidate competitive dynamics of this community type and to fully evaluate its conservation value.

CONSERVATION STATUS RANK

Global Rank & Reasons: GNR (1-Jun-2007). More data on the global range and dynamics are needed to rank this community.

RELATED CONCEPTS

Global Similar Types:

- *Verbesina alternifolia - Elymus riparius - Solidago gigantea - (Teucrium canadense)* Riverbar Wet Meadow (CEGL006480) of more stable riverbanks and depositional bars with low sediment turnover during floods and prevalence of perennial herbs.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Approximately 30% of this community's characteristic species are weedy exotics.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Classification is supported by analysis of data from 19 plots sampled throughout the known range. Currently, the type is classified as natural that, like most floodplain communities in the Mid-Atlantic region, has been altered to a considerable degree by post-settlement disturbances. However, approximately 30% of this community's characteristic species are weedy exotics, and further study is needed to determine whether this vegetation should be considered a natural or modified type.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the Piedmont and mountain provinces of Maryland, Virginia, and West Virginia. It was sampled near Virginicus Island along the Shenandoah River in Jefferson County, West Virginia.
Global Range: This association is known only from the Potomac River in the Piedmont and mountain provinces of Maryland, Virginia, and West Virginia. Well-documented occurrences are concentrated in high-gradient reaches of this river, particularly near the fall-line (Potomac Gorge) and at Harpers Ferry.

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	*Eupatorium serotinum* - *Verbesina alternifolia* Depositional Bar Alliance (A2078)

ELEMENT CONCEPT

Global Summary: This tall herb-dominated association is known from the shores of rivers and large streams in the Piedmont and mountain regions of Maryland and West Virginia, as well as from the Green River of Kentucky. It occupies well-drained riverbanks and, less commonly, depositional bars or alluvial fans of medium-sized to large rivers that experience low rates of sediment erosion and turnover during small to moderate floods. Heavy annual deposits of alluvial sediments inhibit tree establishment. The type typically occurs as a narrow, linear strip along the outer edge of a floodplain forest. Occurrences have high solar exposure, though they may experience partial shading from adjacent (landward) forests. Vegetation is characterized by a dense growth of tall (1-3 m), light-demanding, native perennial herbs. The most characteristic species across the range are *Chasmanthium latifolium, Dichanthelium clandestinum, Verbesina alternifolia, Elymus* spp. (*Elymus riparius, Elymus canadensis, Elymus villosus, Elymus virginicus*), *Conoclinium coelestinum (= Eupatorium coelestinum)*, several species of *Eupatorium* (*Eupatorium fistulosum, Eupatorium perfoliatum, Eupatorium serotinum*), *Rudbeckia laciniata, Solidago gigantea, Calystegia sepium*, and *Verbena urticifolia*. Along the Potomac in the Great Valley of Virginia downstream to the fall line, *Teucrium canadense* and *Scrophularia marilandica* are also abundant; less abundant species include *Ageratina altissima, Helianthus decapetalus, Oenothera biennis, Phytolacca americana*, and *Monarda fistulosa*.. Along the New and Bluestone rivers in West Virginia, additional characteristic species include *Amphicarpaea bracteata, Apios americana, Helenium autumnale, Helianthus strumosus, Heliopsis helianthoides, Packera aurea, Phlox paniculata, Polygonum scandens, Polygonum virginianum, Senna hebecarpa, Solanum carolinense, Solidago canadensis, Symphyotrichum lanceolatum, Symphyotrichum lateriflorum, Tradescantia ohiensis, Tripsacum dactyloides, Verbesina occidentalis*, and *Vernonia noveboracensis*. Tall annual species characteristically dominant on less stabilized bars may be present but generally do not dominate. Woody vines are often common and include *Toxicodendron radicans, Vitis riparia*, and *Vitis vulpina*. Scattered shrubby or occasionally full-sized trees of flood-tolerant species may occur, with *Acer saccharinum, Platanus occidentalis, Fraxinus pennsylvanica, Betula nigra*, and *Acer negundo* the most frequent. *Lindera benzoin* may be present as a shrub. This type often has a number of invasive exotic weeds, including *Polygonum cuspidatum, Polygonum perfoliatum, Lolium arundinaceum (= Festuca arundinacea), Phalaris arundinacea, Humulus japonicus, Glechoma hederacea, Microstegium vimineum*, and *Stellaria media*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This tall riverbank herbaceous community occupies higher parts of riverbanks along the edge of floodplain forests. It experiences lower rates of sediment erosion and turnover during small to moderate floods. It was sampled once along the Shenandoah River at Harpers Ferry in West Virginia along a sloping, south-facing riverbank consisting of sand, gravel, and cobble alluvium on top of a bedrock channel shelf. The site is temporarily flooded, and the soil consists of well-drained sand. The unvegetated surface is a mix of small rocks, sand and leaf litter. Evidence of disturbance includes the presence of exotic plant species.

Global Environment: This community occupies well-drained riverbanks and, less commonly, depositional bars of medium-sized to large rivers that experience low rates of sediment erosion and turnover during small to moderate floods. The type typically occurs as a narrow, linear strip along the outer edge of a floodplain forest, where heavy annual deposits of alluvial sediments inhibit tree establishment. Along the Potomac River in the Potomac River Gorge west of Washington, DC, habitats are inundated for 1-4% of the full year and are generally exposed for nearly all of the growing season in most years (Lea 2000). Hydrologic regime is best described as temporarily flooded. Substrates in the Potomac River Gorge are sandy loams or loamy sands (Lea 2000). Samples collected from 10 plots in the Potomac drainage had 100% total base saturation, high pH, and very high calcium levels. Along the New and Bluestone rivers, West Virginia, patches typically occur along slow, straight reaches of river with high banks, as well as on eroded alluvial fans at the mouths of small drainages. Soils are deep alluvial sands with little horizon development. Soils in seven plots along the Bluestone River are described as temporarily flooded, deep, moderately well-drained to well-drained, stone-free or slightly stony sand and loamy sand. They tested medium to slightly acidic (mean pH = 5.8) with relatively high levels of Ca, Cu, Mg, Mn, and Zn, and relatively low levels of organic

matter, estimated N release, S, Al, B, Fe, K, Na, and P compared to average values in the area. Elevations range from near sea level on the Potomac River to 506 m on the Bluestone River.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This tall riverbank herbaceous vegetation is dominated by *Eupatorium fistulosum, Tripsacum dactyloides, Solidago altissima (= Solidago canadensis var. scabra)*, and *Solidago gigantea*. *Apios americana, Elymus canadensis, Helianthus decapetalus*, and *Asclepias syriaca* may be common. Shrubs and vines can include *Fraxinus pennsylvanica, Platanus occidentalis, Salix caroliniana, Salix nigra*, and *Vitis riparia*. Exotics are common. This community also supports WV-state imperiled *Hibiscus laevis* and *Smallanthus uvedalius*.

Global Vegetation: This association represents vegetation consisting of a dense growth (90% cover) of tall (1-3 m), light-demanding, native perennial herbs. Scattered shrubby or occasionally full-sized trees of flood-tolerant species may occur, with *Acer saccharinum, Platanus occidentalis, Betula nigra, Liriodendron tulipifera, Fraxinus pennsylvanica*, and *Acer negundo* the most frequent. Along the Potomac River in the Great Valley of Virginia downstream to the fall line, the most abundant herbs are *Verbesina alternifolia, Teucrium canadense, Elymus riparius, Verbena urticifolia, Conoclinium coelestinum (= Eupatorium coelestinum)*, several species of *Eupatorium* (*Eupatorium fistulosum, Eupatorium perfoliatum, Eupatorium serotinum*), *Dichanthelium clandestinum, Scrophularia marilandica*, and *Chasmanthium latifolium*. Less abundant species include *Ageratina altissima, Elymus villosus, Elymus virginicus, Helianthus decapetalus, Oenothera biennis, Phytolacca americana, Monarda fistulosa, Rudbeckia laciniata, Calystegia sepium*, and *Solidago gigantea*. Tall annual species characteristically dominant on less stabilized bars may be present but generally do not dominate. Woody vines are often common and include *Toxicodendron radicans*, and *Vitis riparia*. Along the New and Bluestone rivers in West Virginia, herbs with high constancy and/or cover include *Amphicarpaea bracteata, Apios americana, Boehmeria cylindrica, Chasmanthium latifolium, Conoclinium coelestinum, Dichanthelium clandestinum, Elymus canadensis, Elymus riparius, Elymus virginicus, Eupatorium fistulosum, Eupatorium serotinum, Helenium autumnale, Helianthus strumosus, Heliopsis helianthoides, Leersia virginica, Packera aurea, Phlox paniculata, Polygonum scandens, Polygonum virginianum, Rudbeckia laciniata, Senna hebecarpa, Solanum carolinense, Solidago canadensis, Solidago gigantea, Symphyotrichum lanceolatum, Symphyotrichum lateriflorum, Tradescantia ohiensis, Tripsacum dactyloides, Verbena urticifolia, Verbesina alternifolia, Verbesina occidentalis*, and *Vernonia noveboracensis*. Vascular plant richness is generally high: in West Virginia plots, values range from 41-80 species per 400 square meters, averaging 44.6 (Vanderhorst et al. 2008). This type often has a number of invasive exotic weeds, including *Polygonum cuspidatum, Polygonum perfoliatum, Lolium arundinaceum (= Festuca arundinacea), Phalaris arundinacea, Humulus japonicus, Glechoma hederacea, Microstegium vimineum, Urtica dioica*, and *Stellaria media*. In some locations, non-native species may out-compete the native herbs in this association and form large monospecific patches in floodplain openings, especially those affected by reservoir backup. On the Potomac River above the Great Valley, on the Monocacy River, and on smaller streams outside the Great Valley, several of the more characteristic species for the Shenandoah River, Antietam Creek, and the rest of the Potomac are apparently rare or absent, particularly *Rudbeckia laciniata* and *Solidago gigantea*. These differences may reflect the influence of more calcareous substrates and/or stream order on the communities. *Hasteola suaveolens, Sida hermaphrodita, Iresine rhizomatosa, Rumex altissimus*, and *Ruellia strepens* are Maryland rare species known from this type. Some examples at Mammoth Cave National Park, Kentucky also contain *Xanthium strumarium, Vernonia gigantea ssp. gigantea (= Vernonia altissima), Echinochloa muricata, Dipsacus fullonum (= Dipsacus sylvestris)*, and *Setaria parviflora*, in addition to many of the species recorded at other sites.

Global Dynamics: During years of more continuous high water during the growing season, vegetation may be sparse. Comparison of the frequency of this type at New River Gorge and nearby Bluestone National Scenic River noted that "the rate and extent of sedimentation has been greatly increased by flooding of Bluestone Lake, probably increasing the extent of this association. It can also occur as successional vegetation on floodplains previously cleared for agriculture" (Vanderhorst et al. 2008).

Global Rank & Reasons: GNR (2-Aug-2006). More data on the global distribution are needed to determine a conservation rank for this community.

RELATED CONCEPTS

Global Similar Types:

- *Eupatorium serotinum - Polygonum (lapathifolium, punctatum, pensylvanicum)* Riverbar Wet Meadow (CEGL006481)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This is a small-patch community and some occurrences may fall below the minimum map unit size.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: The classification of this type was based, in part, on analysis of data from 10 plots collected during the National Capital Region Parks project, with an additional 10 plots from the New River Gorge and Bluestone River in West Virginia. Although some plots of this type performed convincingly as a discrete group in the National Capital Region analysis, others could not be separated from a group representing the Central Appalachian silver maple floodplain forest, with which this type frequently co-occurs. These results suggest that this type is weakly distinct floristically, sharing many species with the silver maple forest and varying from it along a gradual cline of (presumed) light exposure and increased stress from flooding near the channel. Because the type also tends to occur in small patches, it might, therefore, be considered an ecotonal expression of the silver maple forest. However, it also has similar classification issues with other floodplain forest and woodland types, and the distinctiveness of its physiognomy and habitat (open canopy which promotes rank growth of herbs adapted to full sunlight), its occurrence adjacent to various floodplain forest associations, as well as floristic similarity of stands across a broad range, and certain conservation issues supports its recognition.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs on the shores of rivers and large streams in the Piedmont and mountain regions of Maryland, Virginia, and West Virginia. It was sampled at Virginicus Island along the Shenandoah River at Harpers Ferry in West Virginia.
Global Range: This community is known from the shores of rivers and large streams in the Piedmont and mountain regions of Maryland and West Virginia and the Interior Low Plateau in Kentucky. It has been documented by plots or observed on the Potomac, Shenandoah, New, Bluestone, and Monocacy rivers and Antietam Creek (Maryland). Small-stream analogues or variants have been observed on Fifteen Mile Creek (Maryland) and on the South Fork of Quantico Creek (Virginia). Potential habitat for this association is widespread, and the type is likely to have a wider geographic range than current documentation indicates.

A1657 *Justicia americana* Riverbed Alliance

Alliance Summary Description: This alliance covers rocky river shoals dominated by *Justicia americana* with *Leersia* spp., *Saururus cernuus*, and others. It occurs in the Piedmont, Central Appalachians, Cumberland Plateau, Interior Low Plateau, Ozarks, Ouachita Mountains, and adjacent provinces. There is some apparent regional variation in the associated species. More Appalachian examples may contain *Orontium aquaticum* as a codominant. In parts of the Ridge and Valley and Piedmont, *Hymenocallis caroliniana (= Hymenocallis coronaria)* is codominant.

[CEGL004286] *Justicia americana* Riverbed Vegetation

Translated Name: **American Water-willow Riverbed Vegetation**
Common Name: **Water-willow Rocky Bar and Shore**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	*Justicia americana* Riverbed Alliance (A1657)

ELEMENT CONCEPT

Global Summary: This widespread association is found primarily in the Piedmont, Central Appalachians, Cumberland Plateau, Interior Low Plateau, Ozarks, Ouachita Mountains, and adjacent provinces. Stands occur on the shoals or bars of rocky streams and riverbeds, where they are subject to frequent high-energy floods. Slopes range from level to moderate but are typically gentle. The substrate is a variable mixture of sand, gravel and cobbles, often with deposits of silt and muck. Rooting occurs in the interstices between cobbles and boulders. *Justicia americana* is the characteristic dominant. *Saururus cernuus* is often present and may be codominant. Other

herbaceous species that may be present include *Bidens* spp., *Cyperus* spp., *Diodia teres, Elodea* sp., *Eleocharis* spp., *Equisetum arvense, Gratiola brevifolia, Leersia oryzoides, Leersia virginica, Lemna minor, Orontium aquaticum, Physostegia virginiana, Podostemum ceratophyllum, Polygonum caespitosum var. longisetum, Scirpus* spp., *Schoenoplectus pungens, Schoenoplectus tabernaemontani*, and *Xyris difformis var. difformis*. Exotics include *Lythrum salicaria* and *Lysimachia vulgaris*; where present, these are sparse. Some stands have low cover by scattered flood-suppressed trees or an overhanging canopy. Trees in plots include *Acer saccharinum, Betula nigra, Carpinus caroliniana, Fraxinus pennsylvanica*, and *Platanus occidentalis*. Scattered shrub seedlings of *Salix nigra, Salix caroliniana, Betula nigra, Cephalanthus occidentalis, Acer saccharinum*, or *Platanus occidentalis* may also be present. This association provides habitat in some portions of its range for globally rare dragonflies and herbs.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This American water-willow association occurs on shoals or bars of rocky streams and riverbeds and is entirely submerged by most flood events. It was sampled at four locations in the Central Appalachian project area. Sites are intermittently to semipermanently flooded channel beds, bars, bedrock ledges, and stream terraces. Soils range from rapidly drained to very poorly drained sandy loam and sand. The unvegetated surface consists of a mix of exposed bedrock, large/small rocks, sand, leaf litter, downed wood, and/or standing water. Evidence of disturbance includes the presence of exotic plant species.

Global Environment: This association occurs on the shoals or bars of rocky streams and riverbeds, on bedrock, boulders, cobble, gravel, and sands. They are subject to frequent high-energy floods, and are entirely submerged by most flood events. During extreme low water periods, the substrate can be exposed, showing a varied mixture of sand, gravel and cobbles, often with deposits of silt and muck. Rooting occurs in the interstices between cobbles and boulders. Stands commonly occur on the edge of the river and at the heads and tails of islands and may sometimes occur on deposition bars in the middle of the river. Substrate pH is circumneutral (mean = 6.0) in four samples. Slopes range from level to moderate but are typically gentle. Elevations of West Virginia stands range from 73 to at least 654 m; the type occurs at lower elevations in the Piedmont and Coastal Plain.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Justicia americana* is the dominant (and sometimes the only) species, forming lawnlike stands in shallow reaches of rivers. *Saururus cernuus* is often present and may be codominant. Additional species may include *Boehmeria cylindrica, Eupatorium pilosum, Hibiscus laevis, Leersia oryzoides*, and *Phalaris arundinacea*. Exotics are common in this community.

Global Vegetation: *Justicia americana* is the dominant (and sometimes the only) species, forming lawnlike stands in shallow reaches of rivers. Cover by *Justicia americana* ranges from 40 to 85%. *Saururus cernuus* is often present and may be codominant. Other herbaceous species may be present but rarely achieve more than 2% cover; they include *Bidens* spp., *Cyperus* spp., *Diodia teres, Elodea* sp., *Eleocharis* spp., *Equisetum arvense, Gratiola brevifolia, Leersia oryzoides, Leersia virginica, Lemna minor, Orontium aquaticum, Physostegia virginiana, Podostemum ceratophyllum, Polygonum caespitosum var. longisetum, Scirpus* spp., *Schoenoplectus pungens, Schoenoplectus tabernaemontani*, and *Xyris difformis var. difformis*. Exotics include *Lythrum salicaria* and *Lysimachia vulgaris*; they have not been observed in abundance in this community, possibly due to intolerance of high-energy flooding. In some areas, *Justicia* usually grows in nearly pure patches, so that few other species are associated with it. *Cuscuta gronovii, Mimulus ringens, Polygonum* spp., *Rumex* spp., and *Salix interior* can also occur (Anderson 1982). Some stands have low cover by scattered flood-suppressed trees or an overhanging canopy. Trees in plots include *Acer saccharinum, Betula nigra, Carpinus caroliniana, Fraxinus pennsylvanica*, and *Platanus occidentalis*. Scattered shrub seedlings of *Salix nigra, Salix caroliniana, Betula nigra, Cephalanthus occidentalis, Acer saccharinum*, or *Platanus occidentalis* may also be present. In the Cumberland Plateau of Alabama, *Justicia americana* is present in dense patches with some interspersion of other species, including *Pilea pumila, Boehmeria cylindrica, Eclipta prostrata (= Eclipta alba), Juncus coriaceus, Mikania scandens, Ludwigia palustris, Leersia* sp., and *Bidens* sp. Schmalzer and DeSelm (1982) discuss *Orontium aquaticum* growing along streambanks or in shallow riffles "along or with" *Justicia americana* in the Obed River in the Cumberland Plateau of Tennessee. In 29 plots sampled in the Potomac River watershed (Piedmont, Blue Ridge and Ridge and Valley provinces), *Justicia* was overwhelmingly dominant (50-75% mean cover), and no associated species occurred in more than 48% of the plots. Vascular plant species richness in sampled plots is low (typically 6-14 taxa).

Global Dynamics: Stands in some situations may be obliterated by ongoing river channeling. Anderson (1982) describes some of the life-history characteristics of *Justicia americana* that allow it to persist in river channels.

Global: Vulnerable Plants: *Marshallia trinervia* (G3), *Ptilimnium nodosum* (G2), *Sagittaria secundifolia* (G1); **Invasive/Exotic Plants**: *Lysimachia vulgaris*, *Lythrum salicaria* (High), *Polygonum caespitosum* var. *longisetum*; **Other Plants**: *Boehmeria cylindrica* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (2-Oct-2012). The range of this type is huge, and a more careful analysis might turn up differences based on associated species that warrant splitting the type, but we may not have sufficiently detailed data rangewide to do so.

RELATED CONCEPTS

Global Similar Types:
- *Hymenocallis coronaria - Justicia americana* Riverbed Vegetation (CEGL004285)
- *Justicia americana - Peltandra virginica* Tidal Marsh (CEGL006579) occurs in freshwater tidal habitats.
- *Peltandra virginica - Saururus cernuus - Boehmeria cylindrica / Climacium americanum* Marsh (CEGL007696)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community was observed along the Shenandoah River, the C&O Canal, and the Conodoguinet River in Pennsylvania.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: In Ohio this type often forms pure patches, but consistent identification may require a simple cutoff rule, such as at least 50% cover of *Justicia* (Anderson 1982). However, Anderson (1996) no longer recognizes this type.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from the Piedmont and Central Appalachians to the Southern Appalachians. It was sampled in Maryland (near the C&O Canal), Pennsylvania (Conodoguinet River), and West Virginia (Shenandoah River).
Global Range: This type is found primarily in the Piedmont, Interior Low Plateau, Cumberland Plateau, Ozarks, Ouachita Mountains, Central Appalachians, and adjacent provinces. It ranges from Alabama, Georgia and the Carolinas west to Arkansas and Oklahoma and north to Ohio, New York, and New Jersey, with possible outliers north to southern Quebec.

A0948 *Salix nigra* Riverscour Scrub Alliance

Alliance Summary Description: This alliance is composed of vegetation occurring on sand and gravel rivershores receiving high-energy flood-scour. The physiognomy is best characterized as scrub, formed by intermittent flood-scour. *Salix nigra* is characteristic, but floristic composition and structure is widely variable. Other species of *Salix* may co-occur, as well as *Alnus serrulata, Cornus sericea*, and a variety of herbaceous species that tolerate flood disturbance. Alluvial tree saplings often occur as well, including *Acer saccharinum, Populus deltoides*, and others. This alliance occurs throughout the eastern United States and possibly adjacent Canada.

[CEGL006065] *Salix nigra / Phalaris arundinacea - Apocynum cannabinum* Wet Shrubland

Translated Name: **Black Willow / Reed Canarygrass - Indian-hemp Wet Shrubland**
Common Name: **Black Willow Riverbar Shrubland**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	*Salix nigra* Riverscour Scrub Alliance (A0948)

ELEMENT CONCEPT

Global Summary: This community is a willow shrubland of low riverbanks along moderate- to high-energy rivers in the northeastern U.S. and High Allegheny Plateau. It occurs on cobble substrates with sand and gravel in areas that are flooded only during high-water events, but receive winter ice-scour. It occupies an intermediate position along a disturbance gradient between open, herbaceous cobble shores and higher floodplain forests. *Salix nigra* is often dominant or codominant with other willows or dogwoods forming a dense shrub layer. Less frequent shrubs and tree saplings include *Salix eriocephala, Salix lucida, Salix sericea, Alnus incana, Alnus serrulata, Cornus amomum, Cornus sericea (= Cornus stolonifera), Spiraea alba var. latifolia, Platanus occidentalis, Acer rubrum, Acer saccharinum*, and *Populus deltoides*. The herbaceous layer is often sparse but variable in cover and composition, including *Carex torta, Panicum dichotomiflorum, Panicum virgatum, Dichanthelium clandestinum (=*

Panicum clandestinum), Echinochloa crus-galli, Elymus virginicus, Justicia americana, Boehmeria cylindrica, Polygonum amphibium, Phalaris arundinacea, Calamagrostis canadensis, Apocynum cannabinum (= Apocynum sibiricum), Agrostis spp., *Solidago gigantea, Solidago rugosa, Eupatorium maculatum, Rorippa islandica, Lysimachia terrestris, Polygonum* spp., and *Bidens* spp. Invasive, exotic species can be problematic in this community, including *Polygonum cuspidatum, Lythrum salicaria, Tussilago farfara*, and *Cynanchum louiseae*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This early-successional shrubland occurs on floodplains and river gravel bars and islands.
Global Environment: This community occurs on low riverbanks along moderate- to high-energy rivers on cobble substrates within a sand or gravel matrix.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This shrubland is dominated by *Salix* spp. *Salix nigra* is often dominant or codominant with other willows or dogwoods forming a dense shrub layer. It lacks *Betula nigra*. The herbaceous layer is often sparse but variable in cover and composition.
Global Vegetation: *Salix nigra* is often dominant or codominant with other willows or dogwoods forming a dense shrub layer. Less frequent shrubs and tree saplings include *Salix eriocephala, Salix lucida, Salix sericea, Alnus incana, Alnus serrulata, Cornus amomum, Cornus sericea (= Cornus stolonifera), Spiraea alba var. latifolia, Platanus occidentalis, Acer rubrum, Acer saccharinum*, and *Populus deltoides*. The herbaceous layer is typically sparse with variable composition, including *Carex torta, Panicum dichotomiflorum, Panicum virgatum, Dichanthelium clandestinum (= Panicum clandestinum), Echinochloa crus-galli, Elymus virginicus, Phalaris arundinacea, Calamagrostis canadensis, Apocynum cannabinum (= Apocynum sibiricum), Agrostis* spp., *Solidago gigantea, Solidago rugosa, Eupatorium maculatum, Rorippa islandica, Lysimachia terrestris, Polygonum* spp., and *Bidens* spp. Invasive, exotic species can be problematic in this community, including *Polygonum cuspidatum, Lythrum salicaria, Tussilago farfara*, and *Cynanchum louiseae*.
Global Dynamics: It occurs on cobble substrates with sand and gravel in areas that are flooded only during high-water events, but receive winter ice-scour. It occupies an intermediate position along a disturbance gradient between open, herbaceous cobble shores and higher floodplain forests.

A4152 Mid-Atlantic Piedmont & Mountain Riverscour Annual Vegetation Alliance

Alliance Summary Description:

[CEGL006483] *Eragrostis hypnoides - Ludwigia palustris - Lindernia dubia - Cyperus squarrosus* Riverbar Wet Meadow

Translated Name: **Teal Lovegrass - Marsh Seedbox - Yellowseed False Pimpernel - Bearded Flatsedge Riverbar Wet Meadow**
Common Name: **Appalachian-Atlantic Riverbar Drawdown Shore**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern North American Wet Shoreline Vegetation (M880)
Group	Eastern North American Riverine Wetland Vegetation (G755)
Alliance	Mid-Atlantic Piedmont & Mountain Riverscour Annual Vegetation Alliance (A4152)

ELEMENT CONCEPT

Global Summary: This association occurs along major rivers in the Piedmont and mountains of Maryland, Virginia, West Virginia, and the District of Columbia. It occupies the lowest parts of riverbanks or very low rivershore depositional bars in areas that receive essentially full sunlight. These habitats are inundated for most of the winter and spring and are generally consistently exposed only from early summer to early autumn (i.e., the "drawdown" zone). During wet years they may be nearly continuously inundated. The type usually occurs as a narrow strip (frequently <2 m wide) along the shoreline. This association may also develop, sometimes as very large (>1 ha) patches, on the drawdown shores and seasonally exposed islands of impounded rivers. Vegetation of stands

varies from sparse to dense (10-80% cover) and is characterized by low-growing mats of predominantly annual species, with some low, fast-growing perennials also present. *Eragrostis hypnoides, Ludwigia palustris, Lindernia dubia var. dubia*, and *Cyperus squarrosus* are constant and often abundant. Other characteristic annuals (and biennials) are *Acalypha rhomboidea, Ammannia coccinea, Artemisia annua, Bidens frondosa, Chamaesyce humistrata, Chamaesyce maculata, Chenopodium ambrosioides, Cyperus bipartitus, Cyperus odoratus, Diodia virginiana, Echinochloa crus-galli, Eclipta prostrata, Elsholtzia ciliata, Eragrostis frankii, Fimbristylis autumnalis, Hypericum mutilum, Lindernia dubia var. anagallidea, Lindernia dubia var. dubia, Lipocarpha micrantha, Mollugo verticillata, Panicum dichotomiflorum var. dichotomiflorum, Panicum gattingeri (= Panicum philadelphicum ssp. gattingeri), Paspalum fluitans, Polygonum caespitosum var. longisetum, Rorippa palustris ssp. fernaldiana, Rotala ramosior, Solanum ptychanthum*, and *Xanthium strumarium*. Frequent perennials include *Boehmeria cylindrica, Cyperus strigosus, Leersia virginica, Justicia americana, Lycopus americanus, Mimulus alatus, Penthorum sedoides, Phyla lanceolata, Rorippa sylvestris*, and *Samolus valerandi ssp. parviflorus*. Stranded mats of *Heteranthera dubia (= Zosterella dubia)* are also frequent. Seedlings of taller annuals and perennials such as *Hibiscus laevis, Eupatorium* spp., and *Polygonum* spp. are also frequent but rarely reach full stature. Overhanging trees of *Platanus occidentalis* and *Acer saccharinum* may be present, as well as saplings of *Betula nigra*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This river bar drawdown shore occupies the lowest parts of riverbanks, wet beaches, and/or very low rivershore depositional bars in areas that receive essentially full sunlight. It occurs as a narrow strip (frequently <2 m wide) along the shoreline and may also occur in back channels and sloughs. It was sampled once in Maryland in the Central Appalachian project area on a depositional bar on a bank of the Potomac River which is frequently under water. Soil is poorly drained clay. The unvegetated surface is dominated by bare soil with a few small rocks. Evidence of disturbance includes the presence of exotic plant species. The short periods of exposure and heavy disturbance regime select for opportunistic, non-competitive annual species and low, short-lived, fast-growing perennials, all of which can grow and reproduce quickly.

Global Environment: Natural occurrences of this community occupy the lowest parts of riverbanks or very low rivershore depositional bars in areas that receive essentially full sunlight. It occurs on eroded riverbanks and wet beaches and may also occur in back channels and sloughs. These habitats are inundated for most of the winter and spring and are generally consistently exposed only from early summer to early autumn (i.e., the "drawdown" zone). During wet years they may be nearly continuously inundated. The type usually occurs as a narrow strip (frequently <2 m wide) along the shoreline. Though more frequently flooded than higher depositional bars that support tall annual or perennial herbaceous vegetation, the habitats of this type probably experience lesser amounts of sediment turnover (erosion and deposition) during a flood of a given magnitude (i.e., are less stochastically disturbed). Soils are usually deep to somewhat shallow sandy loams, loamy sands, or silt loams that are likely saturated to near the surface throughout the growing season. They would likely be classified as Entisols and generally have high pH (7.0), high calcium levels, and are 100% base-saturated. Mean particle size (phi) of samples collected from several Potomac River sites is 2.7 to 1.9. This association may also develop, sometimes as very large (>1 ha) patches, on the drawdown shores and seasonally exposed islands of impounded rivers, e.g., at the upper end of the John H. Kerr Reservoir on the Roanoke River in Halifax, Mecklenburg, and Charlotte counties, Virginia.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Eragrostis hypnoides, Ludwigia palustris, Rotala ramosior, Cyperus strigosus*, and *Cyperus squarrosus* are often abundant. Other herbs include *Verbena hastata, Chamaesyce maculata, Eupatorium serotinum*, and *Lindernia dubia*. The vegetation is characterized by low-growing mats of predominantly annual species.

Global Vegetation: With the exception of several semi-aquatic perennial species, the short periods of exposure and heavy disturbance regime select for opportunistic, non-competitive annual species and low, short-lived, fast-growing perennials, all of which can grow and reproduce quickly. It would be expected that many species in this community type have relatively long-lived seedbanks and, possibly, specialized germination requirements. Vegetation of stands varies from sparse to dense (10-80% cover) and is characterized by low-growing mats of predominantly annual species. *Eragrostis hypnoides, Ludwigia palustris, Lindernia dubia var. dubia*, and *Cyperus squarrosus* are constant and often abundant. Other characteristic annuals (and biennials) are *Acalypha rhomboidea, Ammannia coccinea, Artemisia annua, Bidens frondosa, Chamaesyce humistrata, Chamaesyce maculata, Chenopodium ambrosioides, Cyperus bipartitus, Cyperus odoratus, Diodia virginiana, Echinochloa crus-galli, Eclipta prostrata, Elsholtzia ciliata, Eragrostis frankii, Fimbristylis autumnalis, Hypericum mutilum, Lindernia dubia var. anagallidea, Lindernia dubia var. dubia, Lipocarpha micrantha, Mollugo verticillata, Panicum dichotomiflorum var.*

dichotomiflorum, Panicum gattingeri (= Panicum philadelphicum ssp. gattingeri), Paspalum fluitans, Polygonum caespitosum var. longisetum, Rorippa palustris ssp. fernaldiana, Rotala ramosior, Solanum ptychanthum, and *Xanthium strumarium*. Frequent perennials include *Boehmeria cylindrica, Cyperus strigosus, Leersia virginica, Justicia americana, Lycopus americanus, Mimulus alatus, Penthorum sedoides, Phyla lanceolata, Rorippa sylvestris*, and *Samolus valerandi ssp. parviflorus*. Stranded mats of *Heteranthera dubia (= Zosterella dubia)* are also frequent. Seedlings of taller annuals and perennials such as *Hibiscus laevis, Eupatorium* spp., and *Polygonum* spp. are also frequent but rarely reach full stature. A variant of this community in the Potomac River drainage is characterized primarily by low, rhizomatous colonies of *Eleocharis tenuis*. Species that are more characteristic of the James River and Roanoke River occurrences in central and southern Virginia include *Cyperus flavicomus, Cyperus erythrorhizos, Ludwigia decurrens, Paspalum dissectum, Rorippa sessiliflora*, and *Sagittaria calycina var. calycina*. Overhanging trees of *Platanus occidentalis* and *Acer saccharinum* may be present, as well as saplings of *Betula nigra*.

Global Dynamics: Patches may be highly ephemeral, but this association will likely persist on the landscape under natural or altered flooding regimes.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (29-Sep-2006). Although natural stands occur in very small, somewhat ephemeral patches, this type is widely distributed along major rivers in the greater Mid-Atlantic Piedmont and mountain region and is adaptable to artificial drawdown shores, where it sometimes occurs in extensive patches.

RELATED CONCEPTS

Global Similar Types:

- *Eragrostis hypnoides - Micranthemum umbrosum - Lipocarpha micrantha - (Juncus repens)* Wet Meadow (CEGL004341) on drawdown shores of Coastal Plain rivers.

CLASSIFICATION

Status: Standard

Classification Confidence: 2 - Moderate

Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Data for this community came from the Harpers Ferry (Maryland) vegetation classification. It occurs along the Potomac River. Many occurrences are below the minimum map unit size.

Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: The classification is supported by analysis of data from 25 plots collected for the National Capital Region Parks project, three plots collected along the Roanoke River in southern Virginia, and one plot from the New River in West Virginia. Many of the annual species which characterize this association are also common in *Salix nigra - Betula nigra / Schoenoplectus pungens* Riverscour Shrubland (CEGL006463) and *Peltandra virginica - Saururus cernuus - Boehmeria cylindrica / Climacium americanum* Marsh (CEGL007696), and distinction between these types may depend on the size of the sampled patch.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs along major rivers in the Piedmont and mountains of Maryland, Virginia, West Virginia, and the District of Columbia. It was sampled at Potomac Wayside in Washington County, Maryland.
Global Range: This community occurs along major rivers in the Piedmont and mountains of Maryland, Virginia, West Virginia, and the District of Columbia. It is definitely known from the Potomac, Shenandoah, Monocacy, New, James, and Roanoke rivers, and likely occurs in other drainages of the region.

M303. Eastern-Southeastern North American Ruderal Marsh, Wet Meadow & Shrubland

G556. EASTERN RUDERAL WET MEADOW & MARSH

Group Summary Description: This group includes heavily disturbed marshes and wet meadows in the eastern half of the United States north of a line running from North Carolina to Arkansas, which are usually dominated or at least have a strong component of exotic species. This group is composed of herbaceous-dominated, seasonal to semipermanently flooded wetlands. Sites often have a history of significant disturbance such as heavy pasturing, chemical and soil run-off from nearby fields or developed areas, or alteration in hydrologic regimes. Along with the wide range in flooding regimes, there can be a wide variety of dominant species, some of which can form near monocultures. Some common dominants include *Lythrum salicaria, Phalaris arundinacea, Phragmites australis, Polygonum cuspidatum*, and *Typha* spp.

A1381 *Phalaris arundinacea* Eastern Ruderal Marsh Alliance

Alliance Summary Description: This alliance is found throughout the northeastern and midwestern United States, but its distribution as a natural type is complicated elsewhere. Stands are typically minerotrophic wetlands rather than river shores. Stands are dominated by *Phalaris arundinacea*, which tends to occur in monocultures or associated with *Calamagrostis canadensis*. Other associates in the Northeast include *Agrostis gigantea, Alnus incana* or *Alnus serrulata, Viburnum dentatum*, and *Viburnum nudum*. Western stands tend to be monotypic. Further work is required to resolve the natural versus introduced nature of this type in North America before a thorough alliance description can be completed.

Alliance	*Phalaris arundinacea* Eastern Ruderal Marsh Alliance (A1381)

ELEMENT CONCEPT

Global Summary: This association is found throughout the northeastern United States and Canada, but its distribution as a natural type is complicated elsewhere. *Phalaris arundinacea* is native to the United States and Canada but is now more widely distributed and abundant because of local introductions from both local and European populations. The introduced strains may be more aggressive ecotypes than native strains. Stands are found in both minerotrophic basin wetlands as well as rivershores. *Phalaris arundinacea* has been widely used as a forage and hay crop, especially in marshes and floodplains, and it is used for wildlife food and for shoreline and ditch stabilization. Stands are dominated by *Phalaris arundinacea*, a 0.5- to 2-m tall perennial grass, which tends to occur in monocultures or associated with *Calamagrostis canadensis*. Associates in the glaciated Northeast include *Viburnum nudum, Alnus incana* or *Alnus serrulata, Viburnum dentatum*, and *Agrostis gigantea*. In Central Appalachian bottomland old fields, characteristic associates include *Verbesina alternifolia* (which may be codominant), *Solidago rugosa, Boehmeria cylindrica*, and *Euthamia graminifolia*, along with exotic species such as *Glechoma hederacea, Coronilla varia, Rosa multiflora*, and *Elaeagnus umbellata*. Midwest associates include species characteristic of wet meadows. *Phalaris arundinacea* can displace native species over time. Further work is required to resolve the natural versus introduced nature of this type in the Southeast before a description can be completed.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This reed canarygrass-dominated vegetation is found in both basin wetlands and along rivershores. It was sampled four times in Pennsylvania in the Central Appalachian project area on cobbly/sandy gravel bars of alluvial flats which flood

frequently. Soils are well-drained sandy loam. The unvegetated surface consists of a mix of large and small rocks, leaf litter, downed wood, and/or bare soil. Evidence of disturbance includes a nearby powerline right-of-way and farmland, frequent flooding, and the abundance of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This reed canarygrass-dominated vegetation is found in both basin wetlands and along rivershores. Sites include seasonally flooded depressions and saturated alluvial flats. Soils are poorly to very poorly drained muck. The unvegetated surface consists of leaf litter, with standing water possible. Evidence of disturbance includes alterations to hydrology (beaver activity), past clearing, minor recreational use and the presence of exotic plants.

Global Environment: Stands are found in both minerotrophic basin wetlands as well as rivershores. The dominant species has been widely used as a forage and hay crop, especially in marshes and floodplains, and it is used for wildlife food and for shoreline and ditch stabilization (Barnes 1999).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This perennial herbaceous wetland community is composed of near-monocultural stands of the invasive native grass *Phalaris arundinacea*. Additional taxa found in much smaller amounts include *Bidens frondosa, Leersia oryzoides, Polygonum cuspidatum, Polygonum hydropiper, Polygonum pensylvanicum, Polygonum persicaria*, and *Rumex crispus*, most of which are invasive exotics.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Phalaris arundinacea* is clearly dominant in these marshes. Other species present may include *Solidago canadensis, Boehmeria cylindrica, Impatiens capensis, Onoclea sensibilis, Polygonum hydropiperoides, Euthamia graminifolia*, and *Eupatorium maculatum*. Several exotic species have invaded these sites. In addition, this community supports MA state-critically imperiled *Agrimonia parviflora*.

Global Vegetation: Stands are dominated by *Phalaris arundinacea*, a 0.5- to 2-m tall perennial grass that is native to the United States and Canada, but which has also been introduced from European strains. The introduced strains may be more aggressive ecotypes than native strains (Barnes 1999). It tends to occur in monocultures or associated with *Calamagrostis canadensis* or, less commonly, with a mixture of forbs equaling the graminoid cover. Associates in the glaciated Northeast include *Viburnum nudum, Salix* spp., *Alnus incana* or *Alnus serrulata, Viburnum dentatum, Poa palustris, Mentha arvensis, Leersia virginica, Lythrum salicaria*, and *Agrostis gigantea*. In Central Appalachian bottomland old fields, characteristic associates include *Verbesina alternifolia* (which may be codominant), *Solidago rugosa, Boehmeria cylindrica*, and *Euthamia graminifolia*, along with exotic species such as *Glechoma hederacea, Coronilla varia, Rosa multiflora*, and *Elaeagnus umbellata*. Midwest associates include species characteristic of wet meadows. *Phalaris arundinacea* can displace native species over time (Apfelbaum and Sams 1987, Barnes 1999, and references therein). Further work is required to resolve the natural versus introduced nature of this type in the Southeast.

Global Dynamics: Shoreline habitats can be temporarily or seasonally flooded in spring. *Phalaris arundinacea* may respond well to summer drawdowns (Barnes 1999).

Global

Stratum	Lifeform	Species
Herb (field)	Graminoid	*Phalaris arundinacea*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Phalaris arundinacea*
Appalachian National Scenic Trail (Lower New England Project Area): *Impatiens capensis*, *Phalaris arundinacea*, *Polygonum hydropiperoides*
Global: *Phalaris arundinacea*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Polygonum cuspidatum* (High/Medium), *Polygonum hydropiper*, *Polygonum persicaria*, *Rumex crispus* (Low/Insignificant)
Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Agrimonia parviflora* (G5, MA state-critically imperiled); **Invasive/Exotic Plants**: *Agrostis gigantea* (Medium/Low), *Lythrum salicaria* (High), *Microstegium vimineum* (High/Medium), *Pennisetum glaucum*, *Polygonum caespitosum*, *Rumex obtusifolius*, *Taraxacum officinale*
Global: Invasive/Exotic Plants: *Coronilla varia* (High), *Elaeagnus umbellata* (High), *Glechoma hederacea* (Low), *Phalaris arundinacea* (High), *Rosa multiflora* (Medium/Low)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (invasive) (1-Dec-1997). *Phalaris arundinacea* is native to the United States and Canada but is now more widely distributed and abundant because of local introductions from both local and European populations (Apfelbaum and Sams 1987). It can invade a variety of habitats.

RELATED CONCEPTS

Global Similar Types:
- *Calamagrostis canadensis* - *Carex* spp. Laurentian & Northeast Wet Meadow (CEGL005448)
- *Calamagrostis canadensis* North-Central Wet Meadow (CEGL005449)
- *Phalaris arundinacea* Western Marsh (CEGL001474)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is common on the Delaware River in Pennsylvania.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Ruderal Steeplebush / Reed Canarygrass Wet Shrubland (CEGL006571), Eastern Cattail Marsh (CEGL006153), and/or Eastern Ruderal Common Reed Marsh (CEGL004141) often occur adjacent to or interdigitated with this community.

Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: In New York, *Phalaris arundinacea* is native.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Type has a broad distribution; in fact, it is widespread throughout temperate areas of the northern hemisphere. It is native to the United States and Canada, but is now more widely distributed and abundant because of local introductions from both local and European populations (Apfelbaum and Sams 1987). It can invade a variety of habitats, suggesting that little unites these stands apart from the dominance of *Phalaris arundinacea*. However, that may be the only reasonable way to describe this type. This vegetation is documented from Shady Valley TNC Preserve, Johnson County, Tennessee, where it occupies channelized streams, impoundments, and fen restoration sites. In these examples, characteristic associates include *Juncus effusus, Carex lurida, Carex gynandra*, and *Alnus serrulata*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled in Cumberland and Perry counties in Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Hubbard Brook Natural Heritage Site in Massachusetts, Pochuck Creek and Wawayanda State Park in New Jersey, and in New York.
Global Range: This association is found throughout the northeastern United States and Canada, but its distribution as a natural type is complicated elsewhere. It currently ranges from Virginia north to Vermont, east to Minnesota and south to Tennessee.
Nations: CA, US
States/Provinces: CT, DE, IA, IN, MA, MD, ME, MN, NH, NJ, NY, OH, ON, PA, QC, RI, TN, VA, VT, WI?, WV

A1431 *Phragmites australis ssp. australis* Ruderal Marsh Alliance

Alliance Summary Description: This alliance consists of non-tidal *Phragmites australis ssp. australis* marshes with semipermanently or, rarely, seasonally flooded hydrology, occurring either in depressions or along rivers with seasonal fluctuation in water level throughout the United States and adjacent Canada. This includes semipermanently flooded marshes, ditches, impoundments, etc., which are strongly dominated by essentially monospecific stands of *Phragmites australis*, which is rapidly spreading in disturbed areas and excluding native vegetation. Stands may be composed entirely of *Phragmites australis*, with few or no other vascular plants present.

[CEGL004141] *Phragmites australis ssp. australis* Eastern Ruderal Marsh

Translated Name: **European Common Reed Eastern Ruderal Marsh**
Common Name: **Eastern Ruderal Common Reed Marsh**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern-Southeastern North American Ruderal Marsh, Wet Meadow & Shrubland (M303)
Group	Eastern Ruderal Wet Meadow & Marsh (G556)
Alliance	*Phragmites australis ssp. australis* Ruderal Marsh Alliance (A1431)

ELEMENT CONCEPT

Global Summary: This reed marsh type is found across the east-temperate regions of the United States and Canada. Stands occur in semipermanently flooded marshes, ditches, impoundments, etc., that have often been disturbed by human activity. The vegetation is variable, as *Phragmites australis* will often invade into existing natural or semi-natural communities present on the site. Once firmly established, this community is usually strongly dominated by *Phragmites australis ssp. australis*, with few or no other vascular plants present.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: Stands occur in a variety of disturbed, wet settings including semipermanently flooded marshes, ditches and impoundments.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: This common reed marsh is found on sites that are saturated basins with very poorly drained muck soil. The unvegetated surface includes leaf litter, standing water or a combination of both. No evidence of disturbance was reported.
Global Environment: Stands occur in semipermanently flooded marshes, ditches, impoundments, etc. that have often been disturbed by human activity.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Phragmites australis* is dominant, typically forming a monoculture.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Phragmites australis* dominates these marshes. Additional herbs are sparse and variable but may include *Boehmeria cylindrica, Calamagrostis canadensis, Carex stricta, Osmunda cinnamomea, Polygonum amphibium*, and *Thelypteris palustris*, among others. Scattered trees such as *Acer rubrum* and shrubs, including *Spiraea* spp., may also occur.
Global Vegetation: The vegetation is often variable, as *Phragmites australis ssp. australis* will often invade into existing natural or semi-natural communities present on the site. Once firmly established, this community is usually strongly dominated by *Phragmites australis*, with few or no other vascular plants present.

Stratum	Lifeform	Species
Herb (field)	Graminoid	*Phragmites australis*

Global

Stratum	Lifeform	Species
Herb (field)	Graminoid	*Phragmites australis* ssp. *australis*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Phragmites australis*
Appalachian National Scenic Trail (Lower New England Project Area): *Phragmites australis*
Global: *Phragmites australis* ssp. *australis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Phragmites australis* (High)
Appalachian National Scenic Trail (Lower New England Project Area): Invasive/Exotic Plants: *Phragmites australis* (High)
Global: Invasive/Exotic Plants: *Phragmites australis* ssp. *australis*

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (invasive) (23-Nov-1997). Although almost always occurring as a naturalized type that arises from human disturbance, some stands in northern Minnesota and further north in Canada may be native. If so, they should be tracked as a separate type, dominated instead by *Phragmites australis ssp. americanus*.

RELATED CONCEPTS

Global Similar Types:
- *Phragmites australis* Western Ruderal Wet Meadow (CEGL001475)
- *Phragmites australis ssp. australis* Tidal Ruderal Marsh (CEGL004187)
- *Typha* spp. - *(Phragmites australis)* - *Carex* spp. Floating Marshy Fen (CEGL002541) from Canada, is perhaps dominated by the native *Phragmites australis ssp. americanus*.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: See Global Comments.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This is not a native community but is the result of the invasion of alien *Phragmites australis ssp. australis* into natural or semi-natural vegetation. The vegetation has variable hydrology and, unless *Phragmites* is clearly dominant, is often treated as part of other marsh and meadow types. The geographic distribution of the type is arbitrarily limited to Bailey's Humid Temperate Domain in eastern North America (Bailey 1997, 1998). Stands in northern Minnesota and farther north in Canada may represent native stands. If so, they should be tracked as a different type. Tidal vegetation of the Gulf Coast of Louisiana and Texas dominated by *Phragmites australis* is classified in *Sagittaria lancifolia* Gulf Coast Tidal Freshwater Marsh Alliance (A1987).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is highly likely in disturbed wetland settings along the AT in the Central Appalachian project area. The UMESC mapping team observed it in Northampton County, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Canopus Lake South and Sunken Mine Road North in Fahnestock State Park, New York.
Global Range: This reed marsh type is found across the east-temperate regions of the United States and Canada, ranging from Maine west to the eastern Dakotas and Manitoba, south to Texas and east to Florida.

A4106 *Spiraea tomentosa - Rubus* spp. Ruderal Wet Shrubland Alliance

Alliance Summary Description: This wet meadow vegetation of the northeastern states is complex and variable, ranging from shrub thicket to herbaceous meadow with scattered shrubs. Shrub species usually include *Spiraea tomentosa, Spiraea alba var. alba, Cornus amomum, Rubus allegheniensis, Rubus hispidus, Salix* spp., and others. *Hypericum densiflorum* often occurs in the Central Appalachians. The invasive exotic shrubs *Lonicera morrowii* and *Rosa multiflora* may be locally abundant. Associated herbaceous species are also variable in composition, depending on land-use history. Commonly seen are *Calamagrostis canadensis, Carex folliculata, Carex lupulina, Carex lurida, Carex scoparia, Carex trichocarpa, Carex vulpinoidea, Eleocharis* spp., *Eupatorium maculatum, Impatiens capensis, Juncus effusus, Leersia oryzoides, Lycopus uniflorus, Onoclea sensibilis, Phalaris arundinacea, Polygonum sagittatum, Scirpus cyperinus, Scirpus expansus, Solidago canadensis, Solidago gigantea, Solidago rugosa, Thelypteris palustris, Triadenum virginicum, Vernonia noveboracensis*, and others. The invasive species *Microstegium vimineum, Lythrum salicaria*, and *Phragmites australis* can be abundant or form monocultures in these wetlands. Successional wet meadows in the Atlantic Coastal Plain of New Jersey can include scattered patches of *Liquidambar styraciflua* and *Morella pensylvanica*, and more predominantly grassy patches of *Andropogon virginicus, Panicum rigidulum, Panicum virgatum*, and *Spiraea tomentosa*. The alliance occurs in a variety of settings, most frequently in low-lying areas of old fields or pastures, headwater basins, or beaver-impacted wetlands.

[CEGL006571] *Spiraea tomentosa - Rubus* spp. / *Phalaris arundinacea* Ruderal Wet Shrubland

Translated Name: **Steeplebush - Blackberry species / Reed Canarygrass Ruderal Wet Shrubland**
Common Name: **Ruderal Steeplebush / Reed Canarygrass Wet Shrubland**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)

Group	Eastern Ruderal Wet Meadow & Marsh (G556)
Alliance	*Spiraea tomentosa - Rubus* spp. Ruderal Wet Shrubland Alliance (A4106)

ELEMENT CONCEPT

Global Summary: This wet meadow vegetation of the northeastern states occurs in a variety of settings, most frequently in low-lying areas of old fields or pastures, headwater basins, or beaver-impacted wetlands. The physiognomy is complex and variable, ranging from shrub thicket to herbaceous meadow with scattered shrubs. Shrub species usually include *Spiraea tomentosa, Spiraea alba var. alba, Cornus amomum, Rubus allegheniensis, Rubus hispidus, Salix* spp., and others. *Hypericum densiflorum* often occurs in the Central Appalachians. The invasive exotic shrubs *Lonicera morrowii* and *Rosa multiflora* may be locally abundant. Associated herbaceous species are also variable in composition, depending on land-use history. Commonly seen are *Phalaris arundinacea, Solidago rugosa, Solidago gigantea, Solidago canadensis, Juncus effusus, Scirpus cyperinus, Scirpus expansus, Leersia oryzoides, Calamagrostis canadensis, Carex scoparia, Carex folliculata, Carex lurida, Carex lupulina, Carex vulpinoidea, Carex trichocarpa, Vernonia noveboracensis, Triadenum virginicum, Lycopus uniflorus, Impatiens capensis, Eupatorium maculatum, Polygonum sagittatum, Thelypteris palustris, Onoclea sensibilis, Eleocharis* spp., and others. The invasive species *Microstegium vimineum, Lythrum salicaria*, and *Phragmites australis* can be abundant or form monocultures in these wetlands. Successional wet meadows in the Coastal Plain of New Jersey can include scattered patches of *Liquidambar styraciflua* and *Morella pensylvanica*, and more predominantly grassy patches of *Andropogon virginicus, Panicum rigidulum, Panicum virgatum*, and *Spiraea tomentosa*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This disturbed, successional wet meadow occurs in a variety of settings including agricultural and residential areas. Wetland species are often intermixed with upland species. These "wet old fields" may be mowed annually and referred to as "wet old fields."

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This disturbed, successional wet meadow occurs in low-lying areas of old fields or pastures, headwater basins, or beaver-impacted wetlands. Wetland species are often intermixed with upland species.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This shrub and herbaceous meadow occurs on temporarily flooded, flat to gently sloping alluvial terraces at elevations ranging from 500 to 740 m (1,640-2,427 feet). Soils are poorly drained silt loam or muck.

Global Environment: This wet meadow vegetation of the northeastern states occurs in a variety of settings, most frequently in low-lying areas of old fields or pastures, headwater basins, or beaver-impacted wetlands. These wetlands typically flood early in the growing season and may be saturated to near the surface for some of the growing season, but they are generally dry for much of the year. The substrate is typically mineral soil with a layer of muck at the surface.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This successional wet meadow is dominated by an admixture of upland and wetland old-field species. It may also contain successional shrubs (<50% cover). Commonly seen are *Phalaris arundinacea, Solidago rugosa, Solidago gigantea, Solidago canadensis, Juncus effusus, Scirpus cyperinus, Scirpus expansus, Leersia oryzoides, Calamagrostis canadensis, Carex scoparia, Carex folliculata, Carex lurida, Carex lupulina, Carex vulpinoidea, Carex trichocarpa, Vernonia noveboracensis, Triadenum virginicum, Lycopus uniflorus, Impatiens capensis, Eupatorium maculatum, Polygonum sagittatum, Thelypteris palustris, Onoclea sensibilis, Eleocharis* spp., and others.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These wet meadows range from shrub thickets to herbaceous meadows with scattered shrubs dominated by *Spiraea* spp. and *Rubus* spp. with variable combinations of wetland old-field species such as *Phalaris arundinacea, Juncus effusus, Thelypteris palustris, Onoclea sensibilis, Solidago* spp., *Impatiens capensis, Lycopus uniflorus*, and *Lythrum salicaria* (exotic).

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is physiognomically variable and may be herb- or shrub-dominated. Dominant shrubs may include *Clematis virginiana, Viburnum lantanoides, Rubus allegheniensis, Alnus incana*, and *Salix bebbiana*. Dominant herbaceous species may include *Galium boreale, Matteuccia struthiopteris, Muhlenbergia glomerata, Onoclea sensibilis*, and *Veronica verna*.

Global Vegetation: The physiognomy is complex and variable, ranging from shrub thicket to herbaceous meadow with scattered shrubs. Within each wetland, species may be locally abundant and often have patchy distribution. Shrub species usually include *Spiraea tomentosa, Spiraea alba var. alba, Cornus amomum, Rubus allegheniensis, Rubus hispidus, Salix* spp., and others. *Hypericum densiflorum* often occurs in the Central Appalachians. The invasive exotic shrubs *Lonicera morrowii* and *Rosa multiflora* may be locally abundant. Associated herbaceous species are also variable in composition, depending on land-use history. Commonly seen are *Phalaris arundinacea, Solidago rugosa, Solidago gigantea, Solidago canadensis, Juncus effusus, Scirpus cyperinus, Scirpus expansus, Leersia oryzoides, Calamagrostis canadensis, Carex scoparia, Carex folliculata, Carex lurida, Carex lupulina, Carex vulpinoidea, Carex trichocarpa, Vernonia noveboracensis, Triadenum virginicum, Lycopus uniflorus, Impatiens capensis, Eupatorium maculatum, Polygonum sagittatum, Thelypteris palustris, Onoclea sensibilis, Eleocharis* spp., and others. *Sphagnum* spp. are often abundant along with lesser amounts of other nonvascular species. The invasive species *Microstegium vimineum, Lythrum salicaria*, and *Phragmites australis* can be abundant or form monocultures in these wetlands. Successional wet meadows in the Coastal Plain of New Jersey can include scattered patches of *Liquidambar styraciflua* and *Morella pensylvanica*, and more predominantly grassy patches of *Andropogon virginicus, Panicum rigidulum, Panicum virgatum*, and *Spiraea tomentosa*.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Northern Appalachian Project Area): Invasive/Exotic Plants: *Hypericum perforatum* (High/Medium, exotic/invasive), *Veronica verna* (exotic/invasive), *Vicia cracca* (exotic/invasive)
Global: Invasive/Exotic Plants: *Lonicera morrowii* (High/Medium), *Rosa multiflora* (Medium/Low); **Other Plants**: *Thelypteris palustris* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (15-Jul-2013).

RELATED CONCEPTS

Global Similar Types:
- *Cornus (amomum, sericea)* - *Viburnum dentatum* - *Rosa multiflora* Ruderal Shrub Swamp (CEGL006576)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This is a successional wet meadow that has shrub-dominated and herb-dominated expressions, but because the shrubs are usually only about 1 m tall, this gives the impression of a wet meadow rather than a shrubland. *Cornus* can be present but is not dominant. Ruderal Dogwood - Arrow-wood Shrub Swamp (CEGL006576) is a successional wet shrubland dominated by shrubs over 2 m in height.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Observed in New Jersey by the mapping reconnaissance team during the summer of 2012.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This ruderal vegetation occurs in disturbed wet meadow areas along the Appalachian Trail. It was observed in Warren County, Virginia, and Hogestown Run in Cumberland Valley, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This ranges from New Jersey north through New England.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from Wyman Mountain, Kennebec River and Nahmakanta Lake.
Global Range: Although this vegetation is widespread, its range has not been evaluated. It is known from the Central Appalachian ecoregion, the High Alleghany Plateau, Western Alleghany Plateau, North Atlantic Coast, and the Lower New England / Northern Piedmont ecoregions, and is likely in others.

G557. SOUTHEASTERN RUDERAL MARSH, WET MEADOW & SHRUBLAND

Group Summary Description: These are herbaceous wetlands which are characterized by ruderal conditions or dominance by exotic plant species. Also included here are wetlands which may have been severely disturbed by vehicles or equipment, such as coastal plain depressions which have been subjected to intensive forest management

(i.e., bedded and site-prepped) and ponds used by recreational off-road vehicles. These ruderal herbaceous and shrub wetlands tend to be dominated by *Andropogon glomeratus, Juncus effusus*, and exotic plant species, such as the exotic shrub *Ligustrum sinense* or exotic grasses *Pennisetum purpureum* or *Arundo donax*.

A3412 *Juncus effusus - Andropogon glomeratus var. pumilus - Saccharum giganteum* Ruderal Marsh Alliance

Alliance Summary Description: These disturbed marshes and other open wetlands are dominated by native graminoid plants, and have few or no trees. These areas may be dominated by *Andropogon glomeratus var. pumilus, Juncus effusus, Saccharum giganteum, Scirpus cyperinus, Typha* spp., or other graminoid plants. This alliance is found in the southern and eastern United States, from Maryland and West Virginia, south to Florida and Texas. This vegetation occurs in disturbed wetland sites, such as old fields (particularly old fields in bottomlands), as well as low areas and ditches in old fields.

[CEGL004112] *Juncus effusus* Marsh

Translated Name: **Common Rush Marsh**
Common Name: **Common Rush Marsh**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Freshwater Marsh, Wet Meadow & Shrubland (2.C.4.Nd)
Macrogroup	Eastern-Southeastern North American Ruderal Marsh, Wet Meadow & Shrubland (M303)
Group	Southeastern Ruderal Marsh, Wet Meadow & Shrubland (G557)
Alliance	*Juncus effusus - Andropogon glomeratus var. pumilus - Saccharum giganteum* Ruderal Marsh Alliance (A3412)

ELEMENT CONCEPT

Global Summary: This broadly defined type represents freshwater marsh vegetation dominated by *Juncus effusus*. Additional types may be developed as more information becomes available. This vegetation may occur in natural or artificial ponds, including beaver-enhanced ones. In various parts of its broad range as currently defined, associated species may include *Andropogon glomeratus, Cyperus* spp., *Typha latifolia, Scirpus cyperinus, Triadenum walteri, Apios americana*, and *Galium aparine*. This type includes seasonally to temporarily flooded vegetation dominated or codominated by *Juncus effusus* in the Central and Southern Appalachians.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This is a seasonally (to temporarily) flooded marsh vegetation community; it may occur in natural or artificial ponds, including beaver-enhanced ponds, artificial waterways (wet ditches), and disturbed wet fields.
Global Environment: This is a seasonally (to temporarily) flooded marsh vegetation type; it may occur in natural or artificial ponds, including beaver-enhanced ponds, artificial waterways (wet ditches), and disturbed wet fields.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This type is currently broadly and literally defined, based on dominance by *Juncus effusus*. In various parts of its broad range as currently defined, associated species may include *Andropogon glomeratus, Carex* spp., *Cyperus* spp., other *Juncus* spp., *Typha latifolia, Scirpus cyperinus, Triadenum walteri, Apios americana*, and *Galium aparine*.
Global Vegetation: This type is currently broadly and literally defined, based on dominance by *Juncus effusus*. In various parts of its broad range as currently defined, associated species may include *Andropogon glomeratus, Carex* spp., *Cyperus* spp., other *Juncus* spp., *Typha latifolia, Scirpus cyperinus, Triadenum walteri, Apios americana*, and *Galium aparine*. In Georgia, Wharton (1978) cites *Carex rostrata, Carex stipata, Schoenoplectus pungens (= Scirpus americanus)*, and *Sagittaria latifolia* as associates of beaver pond vegetation containing *Juncus effusus*.

4. Polar & High Montane Scrub, Grassland & Barrens

4.B.1. Temperate & Boreal Alpine Tundra

4.B.1.Na. Eastern North American Alpine Tundra

M131. Eastern North American Alpine Tundra

G108. Eastern Alpine Cliff, Scree & Rock Vegetation

Group Summary Description: This group encompasses lithomorphic sparse or nonvascular vegetation above treeline in alpine areas of Eastern North America. It includes lichen-dominated expanses known as felsenmeer ("sea of rocks") as well as alpine cliffs where the near-vertical exposure prevents much vegetation growth. On flat or gently-sloped tablelands and ridgelines, felsenmeer develops where freeze-thaw cycles have broken rocks into variously-sized fragments. Crustose, umbilicate, and foliose lichens dominate. Scattered vascular plants such as *Juncus trifidus, Minuartia groenlandica*, and *Carex bigelowii* occur where patches of soil have accumulated. On alpine cliffs, the patchy vegetation is concentrated in areas kept wet by runoff and is dominated by bryophytes and certain alpine vascular plants. Some plants on the cliffs, such as *Juncus trifidus, Minuartia groenlandica, Vaccinium uliginosum, Ledum groenlandicum*, and *Agrostis mertensii*, can be found in other types of northeastern alpine vegetation. Others are more-or-less restricted to these alpine cliffs: these include *Polygonum viviparum (= Persicaria vivipara), Festuca prolifera, Saxifraga cernua, Saxifraga paniculata (= Saxifraga aizoon), Cardamine bellidifolia, Carex scirpoidea, Pinguicula vulgaris*, and *Phleum alpinum*.

A4003 *Rhizocarpon geographicum - Umbilicaria hyperborea* Eastern Alpine Fell-field Alliance

Alliance Summary Description: This alliance occurs at high elevations on Northern Appalachian and eastern Canadian summits. Serpentine mountains often develop fell-fields. Sites are near or above treeline and are generally windswept and exposed to high solar radiation. Lichens are the dominant vegetation; vascular plants may occur in very sparse abundance, confined to sheltered crevices. Typically, the rock surfaces are covered with various lichen species, including *Rhizocarpon geographicum, Arctoparmelia centrifuga*, and *Umbilicaria hyperborea*. Various dwarf-shrubs and herbs may occur in sheltered areas, and where soil areas are more extensive, dwarf-shrub heath types may be found. Patterned ground caused by frost action is common, with rocks sorting by size classes in polygons, in flat areas, or in stripes, on slopes.

[CEGL006420] *Arctoparmelia centrifuga - Rhizocarpon geographicum* Nonvascular Vegetation
Translated Name: **Concentric-ring Lichen - World Map Lichen Nonvascular Vegetation**
Common Name: **Eastern Lichen Fell-field**

USNVC Classification

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Cliff, Scree & Rock Vegetation (G108)
Alliance	*Rhizocarpon geographicum - Umbilicaria hyperborea* Eastern Alpine Fell-field Alliance (A4003)

Element Concept

Global Summary: These fell-fields are blocky boulderfields on ridges and flats above treeline in the Northern Appalachians. Vascular vegetation is very sparse, confined to pockets among the rocks. Nonvascular species dominate, with a prominent cover of crustose lichens. Dominant lichens include *Rhizocarpon geographicum, Arctoparmelia centrifuga (= Parmelia centrifuga)*, and *Umbilicaria hyperborea*. Vascular plants scattered in protected pockets include *Juncus trifidus, Carex bigelowii, Sibbaldiopsis tridentata, Diapensia lapponica, Picea mariana, Abies balsamea*, and *Betula* spp.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: The only sampled occurrence of this association is located on a steep southwest-facing midslope at 630 m (2,065 feet) in elevation. The substrate is composed entirely of rapidly drained large boulders.
Global Environment: This association is found on windswept barrens above treeline (1000-1900 m [3300-6200 feet]) in the Northern Appalachians. Moisture is derived from snow, rain and fog.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This sparsely vegetated association is dominated by lichens with trace amounts of tree saplings.
Global Vegetation: Nonvascular species dominate, with a prominent cover of crustose lichens. Dominant lichens include *Rhizocarpon geographicum, Arctoparmelia centrifuga (= Parmelia centrifuga)*, and *Umbilicaria hyperborea*. Vascular plants scattered in protected pockets include *Juncus trifidus, Carex bigelowii, Sibbaldiopsis tridentata, Diapensia lapponica, Picea mariana, Abies balsamea*, and *Betula* spp.
Global Dynamics: This association is not well-studied. Hiker traffic is a management concern in some locations.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (17-Jul-2009). This association is very limited in distribution (but may be locally extensive) in the northeastern United States. It is believed to occur in adjacent Canada, where distribution is not well-known.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Global Classification Comments: Vegetation studies focusing on vascular plants generally fail to document this association. Appalachian Mountain Club alpine vegetation mapping project has this type mapped [see http://appalachia.outdoors.org/mapping/ and follow links to alpine areas]. This is clearly a distinct type, just poorly documented.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is has only been sampled from one location near Ethel Pond in Maine. It is likely to occur elsewhere in the Northern Appalachian project area but is undersampled.
Global Range: This association is known to occur, but not well-documented, in the higher peaks of the Northern Appalachians from New York east to Maine, and presumably into adjacent Canada.
Nations: CA?, US

G104. EASTERN ALPINE TUNDRA

Group Summary Description: This dwarf-shrub-, herb-, or lichen-dominated vegetation occurs above treeline on northeastern mountains of North America, where wind, snow, and cloud-cover fog limit plant growth. Sites encompass the ancient and weathered summits and plateaus of the Canadian Shield and the northern Appalachian Mountains. Most of the cover is dwarf-shrubland or lichen-dominated; islands of taller shrubs or small graminoid meadows may occur in protected spots. The dominant plants are ericads: *Vaccinium uliginosum* is diagnostic and often dominant, and *Vaccinium vitis-idaea* is often common. Other alpine-restricted heaths such as *Phyllodoce caerulea, Rhododendron lapponicum, Arctostaphylos alpina*, and *Loiseleuria procumbens* are present, with composition generally varying by microsite characteristics. Other low shrubs include dwarf birches, alders and willows, such as *Betula minor, Betula glandulosa, Alnus viridis, Salix uva-ursi*, and *Salix argyrocarpa*. *Diapensia lapponica* is a characteristic cushion-plant, especially in highly exposed flats. *Carex bigelowii* is a characteristic and locally dominant sedge, *Agrostis mertensii* and *Hierochloe alpina* are characteristic grasses, and *Juncus trifidus* is a dominant rush. Forbs are comparatively scarce (except in snowbank settings), with characteristic species including *Solidago cutleri, Minuartia groenlandica, Prenanthes boottii*, and in a few locations, *Geum peckii* and *Potentilla robbinsiana*.

A3285 *Betula papyrifera var. cordifolia - Betula glandulosa - Alnus viridis* Alpine Shrubland Alliance

Alliance Summary Description: Thickets are dominated by *Betula papyrifera var. cordifolia (= Betula cordifolia), Betula glandulosa*, and *Alnus viridis*. Other shrub associates include *Amelanchier bartramiana* and *Viburnum edule*. The birch-alder alpine shrubland is found on mid-elevation slopes and ravines of many of the northern ranges. These communities can cover hundreds of hectares in the alpine areas of the Canadian Shield, and are abundant on north-facing slopes of Tuckerman Ravine in the Presidential Range of New Hampshire.

[CEGL006064] *Alnus viridis ssp. crispa - Spiraea alba / Solidago macrophylla* Shrubland

Translated Name: **Mountain Alder - White Meadowsweet / Largeleaf Goldenrod Shrubland**
Common Name: **Alpine Slope Shrub Thicket**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Betula papyrifera var. cordifolia - Betula glandulosa - Alnus viridis* Alpine Shrubland Alliance (A3285)

ELEMENT CONCEPT

Global Summary: These alder-birch shrublands are found in the subalpine to lower alpine zones of the higher mountains in the Northern Appalachians. They typically develop in somewhat unstable settings such as avalanche paths, old landslides, or cirque walls. The most common setting is on a steep, concave slope, although they may also occur on flats. Deciduous shrubs averaging 1-2 m tall dominate and may form thickets. Herb cover is best developed

in openings among the shrubs, and so is patchy. Dwarf-shrubs are a minor component, and bryophytes are sparse. The dominant species are *Alnus viridis ssp. crispa* and *Betula papyrifera* (possibly including the subalpine var. *cordifolia*). *Diervilla lonicera* may be locally abundant, especially in somewhat drier microsites. Stunted *Picea mariana* and *Abies balsamea* may occur with the shrubs. *Viburnum edule* is often present, although in very low numbers. Herbs include *Solidago macrophylla, Prenanthes trifoliolata, Eurybia radula (= Aster radula), Sibbaldiopsis tridentata* (in drier openings), *Dryopteris campyloptera, Dryopteris intermedia, Athyrium filix-femina*, and *Calamagrostis canadensis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is known from one location on a snowbank on a steep, southeast-facing slope at 1475 m (4,840 feet) in elevation. Soils are completely organic.

Global Environment: These shrublands occur on somewhat unstable settings such as avalanche paths, old landslides, or cirque walls. The most common setting is on a steep, concave slope between treeline and the true dwarf-shrub alpine zone. Slope can vary, however, from essentially vertical to nearly flat. Elevation ranges from 800 to 1600 m (2600-5300 feet).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This dense shrubland snowbank community is dominated by *Alnus viridis ssp. crispa*. Other shrub associates include *Betula minor, Betula nana*, and *Vaccinium caespitosum*. The herbaceous layer is open and dominated by *Phegopteris connectilis*. Other herbaceous associates include *Houstonia caerulea, Symphyotrichum puniceum var. puniceum, Trichophorum caespitosum*, and *Veratrum viride*.

Global Vegetation: Deciduous shrubs averaging 1-2 m tall dominate, and may form thickets. Herb cover is best developed in openings among the shrubs, and so is patchy. Dwarf-shrubs are a minor component, and bryophytes are sparse. The dominant species are *Alnus viridis ssp. crispa* and *Betula papyrifera* (possibly including the subalpine var. *cordifolia*). *Diervilla lonicera* may be locally abundant, especially in somewhat drier microsites. Stunted *Picea mariana* and *Abies balsamea* may occur with the shrubs. *Viburnum edule* is often present, although in very low numbers. Herbs include *Solidago macrophylla, Prenanthes trifoliolata, Eurybia radula (= Aster radula), Sibbaldiopsis tridentata* (in drier openings), *Dryopteris campyloptera, Dryopteris intermedia, Athyrium filix-femina*, and *Calamagrostis canadensis*.

A1295 *Carex bigelowii* Alpine Meadow Alliance

Alliance Summary Description: This alliance includes alpine meadows above timberline the Northern Appalachians and adjacent Canada, dominated by *Carex bigelowii* and/or *Juncus trifidus*. Associated species include *Minuartia groenlandica, Sibbaldiopsis tridentata (= Potentilla tridentata)*, and *Vaccinium vitis-idaea*. Soils are typically thin, acidic and have a low moisture-holding capacity. Low temperatures, heavy fog and high winds result in a unusually severe climate. Alpine areas in this region have greater floristic affinities with arctic areas in Canada, Alaska and Greenland than with alpine areas of the western United States.

[CEGL006081] *Carex bigelowii* Alpine Meadow

Translated Name: **Bigelow's Sedge Alpine Meadow**
Common Name: **Bigelow's Sedge Alpine Meadow**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Carex bigelowii* Alpine Meadow Alliance (A1295)

ELEMENT CONCEPT

Global Summary: These alpine meadows are restricted to the highest elevations of the Northern Appalachians. Low temperatures, heavy fog and high winds result in an unusually severe climate. These meadows are typically found at the highest elevations, generally over 1460 m (4800 feet), on north and west slopes, where there is both high moisture intercept (from precipitation or fog) and lower snow cover than in some other alpine habitats. The soils are typically thin, acidic and have a low moisture-holding capacity, consisting of organic turf over stone, gravel or coarse sediment. The ground cover is graminoid litter. Graminoids, almost entirely *Carex bigelowii*, dominate the vegetation. Associated species include *Minuartia groenlandica, Sibbaldiopsis tridentata (= Potentilla tridentata)*, and minor amounts of *Vaccinium vitis-idaea* or other heaths. This association may grade into the more widespread alpine sedge-rush-heath association, *Vaccinium uliginosum - Rhododendron lapponicum / Juncus trifidus* Dwarf-shrubland (CEGL006298), but is distinguished by the greater abundance of *Carex bigelowii* than of all other species combined.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These high-elevation alpine meadows usually occur at over 1,463 m (4,800 feet) elevation, on north and west slopes, where there is both high moisture intercept (from precipitation or fog) and lower snow cover than other alpine habitats. Soils are typically thin, acidic and have a low moisture-holding capacity, consisting of organic turf over stone, gravel or coarse sediment.

A1120 *Diapensia lapponica* - Mixed Alpine Dwarf-shrubland Alliance

Alliance Summary Description: Alpine tundra community of exposed wind-blown areas where snow cover is slight or absent. Sites are dominated by *Diapensia lapponica*, along with *Juncus trifidus, Rhododendron lapponicum, Loiseleuria procumbens*, and *Vaccinium uliginosum*. Herbs include *Agrostis mertensii, Carex bigelowii, Juncus trifidus, Minuartia groenlandica*, and *Solidago multiradiata*.

[CEGL006322] *Diapensia lapponica* Dwarf-shrubland

Translated Name: **Pincushion Plant Dwarf-shrubland**
Common Name: **Windswept Alpine Ridge**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Diapensia lapponica* - Mixed Alpine Dwarf-shrubland Alliance (A1120)

ELEMENT CONCEPT

Global Summary: These alpine barrens are found on extremely exposed areas above treeline on the highest peaks of the northern Appalachian Mountains. They occur on relatively flat, windswept areas where snow cover is slight or absent, at elevations of 1220 to 1675 m (4000-5500 feet). The soils are minimally developed, well-drained gravels, where frost heaving and winter freezing is characteristic. Dwarf-shrub cushion plants are the dominant feature of the vegetation, which is often less than 10 cm high; herbs and lichens are sparse. Between the plants, the ground cover is bare gravel. The dominant shrub is *Diapensia lapponica* forming low domes. Associated shrubs, in compact mats, include *Vaccinium uliginosum* and *Empetrum nigrum*, and, at the higher elevations, *Rhododendron lapponicum, Loiseleuria procumbens*, and *Arctostaphylos alpina*. Herbs include *Juncus trifidus, Carex bigelowii, Solidago multiradiata, Minuartia groenlandica*, and *Agrostis mertensii*. This association is differentiated from co-occurring alpine vegetation (primarily *Vaccinium uliginosum - Rhododendron lapponicum / Juncus trifidus* Dwarf-shrubland (CEGL006298)) by the greater dominance of *Diapensia*, which in most cases has higher cover than any other shrub species.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This alpine dwarf-shrub association is restricted to the highest elevations of the White Mountains of New Hampshire above 1,300 m (4,265 feet). Positions are extremely exposed and windswept. Slopes are variable from gentle to very steep.
Global Environment: These alpine barrens are found on extremely exposed areas above treeline on the highest peaks of the northern Appalachian Mountains. They occur on windswept areas where snow cover is slight or absent, at elevations of 1220 to 1675 (4000-5500 feet). The soils are minimally developed, well-drained gravels, where frost heaving and winter freezing is characteristic.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This dwarf-shrub association is dominated by *Diapensia lapponica* which ranges from open to dense cover in association with *Vaccinium uliginosum*. Herbaceous cover is typically sparse to open. Species may include *Agrostis mertensii, Carex*

bigelowii, Huperzia selago, Juncus trifidus, Minuartia glabra, Minuartia groenlandica, and *Sibbaldiopsis tridentata*. A variety of lichen and moss species may be interspersed among the herbs and shrubs.
Global Vegetation: Dwarf-shrub cushion plants are the dominant feature of the vegetation, which is often less than 10 cm high; herbs and lichens are sparse. Between the plants, the ground cover is bare gravel. The dominant shrub is *Diapensia lapponica* forming low domes. Global:

Conservation Status Rank

Global Rank & Reasons: G2G3 (18-Nov-1997). In the northern Appalachian Mountains there are less than 100 high-elevation bare summits that exhibit alpine conditions. Of these, a much smaller pool have extensive windswept ridges where this community, in some cases consisting of only Diapensia, thrives. Although alpine sites have received considerable attention, examples of this particular community was not tracked by most state natural heritage programs until the late 1990s. This association appears to be far more limited than the typical northeastern alpine ridge community (CEGL006298). The combined factors of small size, rarity, specialized conditions and the relative isolation of these communities from each other make them vulnerable conservation targets.

Related Concepts

Global Similar Types:
- *Vaccinium uliginosum - Diapensia lapponica* Dwarf-shrub Tundra (CEGL002540) may be floristically similar but is open tundra, in a lowland formation, not alpine.

A3286 *Ledum groenlandicum / Trichophorum caespitosum / Sphagnum* spp. Alpine Bog & Fen Alliance

Alliance Summary Description: This alliance encompasses alpine bogs and fens occurring on northern Newfoundland and Quebec, and on slopes and concavities at high elevations in New England and the Adirondack Mountains. It is dominated by *Sphagnum* spp., other mosses and lichens, and vascular plants such as *Andromeda polifolia, Betula glandulosa, Chamaedaphne calyculata, Ledum groenlandicum (= Rhododendron groenlandicum), Rubus chamaemorus*, and *Vaccinium* spp. Herbs include *Eriophorum* spp. and *Trichophorum caespitosum*.

[CEGL006140] *Empetrum nigrum - Vaccinium uliginosum - Vaccinium oxycoccos / Rubus chamaemorus* Dwarf-shrubland

Translated Name: **Black Crowberry - Bog Blueberry - Small Cranberry / Cloudberry Dwarf-shrubland**
Common Name: **Black Crowberry Wet Alpine Bog**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Ledum groenlandicum / Trichophorum caespitosum / Sphagnum* spp. Alpine Bog & Fen Alliance (A3286)

ELEMENT CONCEPT

Global Summary: These heath-sedge bogs occur in alpine and subalpine depressions in the montane regions of the northeastern United States. Found at elevations above 1067 m (3500 feet), these peatlands form where bedrock basins retain water (or ice) through all or most of the year. The bog vegetation covers the flat portion of the basin and may also creep upslope on the margins. The bogs may receive small amounts of runoff from upslope bedrock, but conditions are extremely nutrient-poor. Combined with the cold temperatures and frequent clouds and fog, this creates conditions suitable for only a limited number of subalpine and boreal species. The substrate is acidic, permanently saturated organic soil, where lenses of peat beneath the surface may remain frozen through much of the growing season. Trees are generally absent, although a few small islands of stunted *Picea mariana* and *Abies balsamea* may occur. Dwarf-shrubs are the dominant vascular layer, with coverage of up to about 50%. Among the dwarf-shrubs, herbs (primarily sedges) are scattered, with up to 20% cover. Bryoids are generally more extensive than the vascular vegetation, approaching 100% cover. The dwarf-shrub cover is generally a mixture of *Vaccinium uliginosum, Empetrum nigrum, Chamaedaphne calyculata, Ledum groenlandicum, Kalmia polifolia, Kalmia angustifolia*, and *Vaccinium oxycoccos*. *Eriophorum vaginatum var. spissum* and *Trichophorum caespitosum (= Scirpus cespitosus)* are typically the most abundant graminoids; *Carex magellanica ssp. irrigua (= Carex paupercula), Carex canescens*, and *Carex pauciflora* may be present in lower abundance. *Rubus chamaemorus* is a diagnostic herb, although it may not always be present. *Sphagnum* spp. are the most abundant bryophytes, particularly *Sphagnum capillifolium, Sphagnum fuscum, Sphagnum fallax*, and *Sphagnum magellanicum*. The combination of subalpine species such as *Vaccinium uliginosum* and bog species such as *Eriophorum vaginatum var. spissum* is diagnostic. This community is related to, and may be adjacent to, *(Picea mariana, Abies balsamea) / Kalmia angustifolia - Ledum groenlandicum* Dwarf-shrubland (CEGL006031); that association is less wet and lacks the true bog species such as *Eriophorum vaginatum var. spissum, Chamaedaphne calyculata*, and *Sphagnum* spp. It is also related to *Kalmia angustifolia - Chamaedaphne calyculata / Rubus chamaemorus / Cladina* spp. Dwarf-shrubland (CEGL006425), but that type is not constantly saturated and occurs on subalpine or alpine slopes rather than basins.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These heath sedge bogs are restricted to elevations above 1,000 m (3,280 feet) in the White Mountains of New Hampshire and occasionally in Maine. Slopes are flat to moderate with saturated substrates composed of organic material or peat.
Global Environment: These heath-sedge bogs occur in alpine and subalpine depressions in the montane regions of the northeastern United States. Found at elevations above 3500 feet, these peatlands form where bedrock basins retain water (or ice) through all or most of the year. The bog vegetation covers the flat portion of the basin, and may also creep upslope on the margins. The bogs may receive small amounts of runoff from upslope bedrock, but conditions are extremely nutrient-poor. Combined with the cold temperatures and frequent clouds and fog, this creates conditions suitable for only a limited number of subalpine and boreal species. The substrate is acidic, permanently saturated organic soil, where lenses of peat beneath the surface may remain frozen through much of the growing season.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by an assortment of dwarf heath species with sedges interspersed among them. Overall shrub cover is typically dense. Characteristic species include *Chamaedaphne calyculata, Empetrum nigrum, Eriophorum vaginatum, Kalmia angustifolia, Kalmia polifolia, Ledum groenlandicum, Vaccinium oxycoccos*, and *Vaccinium uliginosum*. The dominant sedges are *Eriophorum vaginatum* and *Trichophorum caespitosum*. Other herbaceous associates may include *Carex bigelowii, Carex trisperma var. trisperma, Coptis trifolia, Deschampsia flexuosa, Drosera rotundifolia, Gaultheria hispidula, Geum peckii, Maianthemum trifolium*, and *Melampyrum lineare*. Nonvascular vegetation cover is typically high and dominated by *Sphagnum* spp.
Global Vegetation: Trees are generally absent, although a few small islands of stunted *Picea mariana* and *Abies balsamea* may occur. Dwarf-shrubs are the dominant vascular layer, with coverage of up to about 50%. Among the dwarf-shrubs, herbs (primarily sedges) are scattered, with up to 20% cover. A3360 *Picea mariana* Krummholz Alliance

Alliance Summary Description: This alliance is composed of severely wind-pruned, stunted *Picea mariana, Abies balsamea*, and boreal heathland thickets bordering the treeline and true alpine vegetation. The vegetation ranges from dense thickets to patches interspersed with deciduous dwarf-shrubs, forbs, mosses, and lichens. The canopy is characterized by stunted *Picea mariana* and *Abies balsamea*, sometimes in association with *Picea rubens, Betula papyrifera var. cordifolia (= Betula cordifolia)*, and *Sorbus americana*. Shrubs may form a distinct layer where stunted trees are scattered, or as distinct patches in association. Characteristic shrubs are ericaceous species such as *Ledum groenlandicum, Kalmia angustifolia, Vaccinium vitis-idaea, Vaccinium uliginosum, Rhododendron canadense*, as well as *Empetrum nigrum* and *Sibbaldiopsis tridentata*, and are of variable closure, but may be patchy and interspersed with expanses of bare or lichen-covered bedrock. Herbaceous species, such as *Paronychia argyrocoma (= var. albimontana)* and *Juncus trifidus*, are usually confined to crevices. *Pleurozium schreberi* and *Dicranum scoparium* are characteristic mosses. This alliance occurs at high elevations, usually just above tree line, where cool temperatures and high winds prevail. Snow tends to accumulate in and around the stunted trees creating a protected environment. This alliance occurs in Maine, New Hampshire, Vermont, and New York. It is also likely to occur in Canada.

Alliance	*Picea mariana* Krummholz Alliance (A3360)

Element Concept

Global Summary: This heathland occurs in subalpine regions of northern New England and adjacent Canada, or at lower elevations in boreal coastal regions. It is found on acidic rock outcrops, upper ridges, or summits; a common subalpine setting is between the open alpine ridges and the lower-elevation forest. Exposed bedrock is typical; soil development is restricted to crevices or sheltered areas, where shallow organic accumulation occurs over thin a mineral layer, with shallow peat accumulating in depressions. The organic horizon may be saturated by fog in spring and fall but dry in summer. Soils are shallow, stony, coarse gravels and sands over gravel, scree or bedrock. Elevations range from 550-1435 m (1800-4700 feet) inland to near sea level in coastal regions. Physiognomy of this community is variable, ranging from sparse woodland to shrubland to sparsely vegetated rock; many occurrences will have patches of all three. The tree canopy is sparse, averaging less than 20%, and individuals are stunted. Most trees in this community actually fall into the "tall shrub" physiognomic form. Tall shrubs may be scattered, or form patches in somewhat protected areas. The dwarf-shrub layer is very well-developed, and the dominant feature of the vegetation. Herbs are sparse. The bryoid layer is variable but is often extensive, with both bryophytes and lichens. The most typical trees are *Picea mariana* and *Picea rubens*; associates include *Abies balsamea, Betula papyrifera var. cordifolia, Betula papyrifera var. papyrifera*, and occasionally *Acer rubrum*. Characteristic tall shrubs are *Nemopanthus mucronatus, Sorbus americana, Sorbus decora*, and *Viburnum nudum var. cassinoides*. *Kalmia angustifolia* and *Ledum groenlandicum* are prominent dwarf heaths, in association with others such as *Vaccinium angustifolium, Vaccinium myrtilloides, Vaccinium uliginosum, Vaccinium vitis-idaea, Gaylussacia baccata, Rhododendron canadense, Empetrum nigrum*, and *Empetrum eamesii ssp. atropurpureum*. At the higher elevations (>1220 m [4000 feet]), *Kalmia angustifolia* drops out, and *Picea mariana* replaces *Picea rubens*. Herbs include *Sibbaldiopsis tridentata, Maianthemum canadense, Deschampsia flexuosa*, and *Geocaulon lividum*. The bryoid layer includes *Pleurozium schreberi, Polytrichum commune, Leucobryum glaucum*, and *Cetraria, Cladina*, and *Cladonia* lichens. This community is distinguished from other northeastern subalpine/alpine types by the prevalence of dwarf-shrubs (rather than tree species or bare rock) and the lack of true alpine plants (*Diapensia lapponica, Carex bigelowii*, etc.). It differs from more temperate dwarf-shrublands in the presence of some more northern or boreal species, such as *Ledum groenlandicum* and *Empetrum* spp., and the absence of temperate bald species such as *Quercus rubra* and *Betula populifolia*.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association occurs throughout the subalpine zones of the Northern Appalachian project area at elevations ranging from 850 to 1500 m (2,790-4,920 feet) on exposed high slopes ridges and summits. Slopes are gentle to steep on all aspects. Soils are well-drained to rapidly drained.

Global Environment: This heathland occurs in subalpine regions of northern New England and adjacent Canada, or at lower elevations in boreal coastal regions. It is found on acidic rock outcrops, upper ridges, or summits; a common subalpine setting is between the open alpine ridges and the lower-elevation forest. Exposed bedrock is typical; soil development is restricted to crevices or sheltered areas, where shallow organic accumulation occurs over thin a mineral layer, with shallow peat accumulating in depressions. The organic horizon may be saturated by fog in spring and fall but dry in summer. Soils are shallow, stony, coarse gravels and sands over gravel, scree or bedrock. Elevations range from 550-1435 m (1800-4700 feet) inland to near sea level in coastal regions.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is dominated by a combination of stunted, dwarf evergreen trees and heath shrubs. Canopy composition is highly variable. Trees typically occur as tall shrubs and may dominate singly or in combination with *Picea mariana, Abies balsamea*, and *Betula papyrifera var. cordifolia*. The shrub layer is highly variable and may be open to dense; height

may be tall to dwarf. Dominant species include *Kalmia angustifolia, Ledum groenlandicum, Rhododendron canadense, Vaccinium angustifolium, Vaccinium boreale, Vaccinium uliginosum*, and *Vaccinium vitis-idaea*. Herbaceous species are few, inconsistent and typically sparse. Species may include *Carex bigelowii, Carex deflexa, Cornus canadensis, Gaultheria hispidula, Melampyrum lineare, Minuartia glabra, Minuartia groenlandica*, and *Ptilidium ciliare*.

Global Vegetation: The tree canopy is sparse, averaging less than 20%, and individuals are stunted. Most trees in this community actually fall into the "tall shrub" physiognomic form. Tall shrubs may be scattered, or form patches in somewhat protected areas. The dwarf-shrub layer is very well-developed, and the dominant feature of the vegetation. Herbs are sparse. The bryoid layer is variable but is often extensive, with both bryophytes and lichens. The most typical trees are *Picea mariana* and *Picea rubens*; associates include *Abies balsamea, Betula papyrifera var. cordifolia, Betula papyrifera var. papyrifera*, and occasionally *Acer rubrum*. Characteristic tall shrubs are *Nemopanthus mucronatus, Sorbus americana, Sorbus decora*, and *Viburnum nudum var. cassinoides*. *Kalmia angustifolia* and *Ledum groenlandicum* are prominent dwarf heaths, in association with others such as *Vaccinium angustifolium, Vaccinium myrtilloides, Vaccinium uliginosum, Vaccinium vitis-idaea, Gaylussacia baccata, Rhododendron canadense, Empetrum nigrum*, and *Empetrum eamesii ssp. atropurpureum*. At the higher elevations (>4000 feet), *Kalmia angustifolia* drops out, and *Picea mariana* replaces *Picea rubens*. Herbs include *Sibbaldiopsis tridentata, Maianthemum canadense, Deschampsia flexuosa*, and *Geocaulon lividum*. The bryoid layer includes *Pleurozium schreberi, Polytrichum commune, Leucobryum glaucum*, and *Cetraria, Cladina*, and *Cladonia* lichens.

[CEGL006038] *Picea mariana - Abies balsamea / Sibbaldiopsis tridentata* Shrubland

Translated Name: **Black Spruce - Balsam Fir / Shrubby Fivefingers Shrubland**
Common Name: **Black Spruce Krummholz**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Picea mariana* Krummholz Alliance (A3360)

ELEMENT CONCEPT

Global Summary: This shrubby alpine krummholz occurs at high elevations in the Northern Appalachians of the northeastern United States and adjacent Canada. The setting is high, wind-exposed alpine peaks and exposed high-elevation summits, usually from 1067-1494 m (3500-4900 feet) elevation. Soils are thin organic Histosols or peat. The stunted trees form matted, wind-pruned alpine conifer thickets, usually of 60-100% cover. Dwarf-shrubs and herbs are occasional in openings among the shrubby trees. Bryoids, also in the openings, are sparse; decomposing organic litter makes up the remainder of the ground cover. The krummholz is dominated by a variable mixture of *Picea mariana, Abies balsamea*, and *Betula papyrifera var. cordifolia*. Dwarf-shrubs and herbs include *Ledum groenlandicum, Vaccinium uliginosum, Empetrum nigrum, Vaccinium vitis-idaea, Clintonia borealis, Cornus canadensis, Sibbaldiopsis tridentata, Trientalis borealis, Gaultheria hispidula*, and *Solidago macrophylla*. This association shares many species with subalpine spruce-fir forests (e.g., *Abies balsamea - (Betula papyrifera var. cordifolia)* Forest (CEGL006112)), but the low stature and matted form of the trees is distinctive.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This near-treeline krummholz association is known from high elevations ranging from 1,000 to 1,200 m (3,280-3,940 feet) on exposed, windswept high slopes and summits. Slopes range from flat to steep on southeast and southwest aspects. Soils are poorly developed, rapidly drained organic material, sand and gravel. Exposed bedrock is common.

Global Environment: This shrubby alpine krummholz occurs at high elevations in the Northern Appalachians of the northeastern United States and adjacent Canada. The setting is high, wind-exposed alpine peaks and exposed high-elevation summits, usually from 1067-1494 m (3500-4900 feet) elevation. Soils are thin organic Histosols or peat.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is dominated by stunted, dwarf evergreen trees that form dense mats. *Abies balsamea* and *Picea mariana* are both consistently present in stands, typically with one dominating over the other. *Betula papyrifera var. cordifolia* and *Sorbus americana* may occur at low cover. Heath species predominate within openings between tree species, including *Ledum groenlandicum, Vaccinium angustifolium, Vaccinium myrtilloides, Vaccinium uliginosum*, and *Vaccinium vitis-idaea*. Herbaceous species occur with low cover and frequency, but may include *Carex bigelowii, Clintonia borealis, Coptis trifolia, Linnaea borealis, Lycopodium annotinum, Lycopodium lagopus, Maianthemum canadense, Oclemena acuminata, Oxalis montana*, and *Trientalis borealis*.
Global Vegetation: The stunted trees form matted, wind-pruned alpine conifer thickets, usually of 60-100% cover. Dwarf-shrubs and herbs are occasional in openings among the shrubby trees. Bryoids, also in the openings, are sparse; decomposing organic litter makes up the remainder of the ground cover. The krummholz is dominated by a variable mixture of *Picea mariana, Abies balsamea*, and *Betula papyrifera var. cordifolia*. Dwarf-shrubs and herbs include *Ledum groenlandicum, Vaccinium uliginosum, Empetrum nigrum, Vaccinium vitis-idaea, Clintonia borealis, Cornus canadensis, Sibbaldiopsis tridentata, Trientalis borealis, Gaultheria hispidula*, and *Solidago macrophylla*.

Common Name: **Cold Air Talus Heathland**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Picea mariana* Krummholz Alliance (A3360)

ELEMENT CONCEPT

Global Summary: This boreal heathland community develops at the base of some talus slopes in the northeastern United States and (possibly) adjacent Canada. Cold air draining to the base of the slope allows ice to persist in crevices through most of the growing season, even at these moderate elevations (215-670 m [700-2200 feet]). This creates a cold microclimate, and the vegetation features many species with affinities to boreal or higher-elevation settings. As with talus slopes in general, soil development is extremely limited, although in this type there may be some patches of peaty soils developing among the boulders. The vegetation is predominantly dwarf-shrubs and stunted shrub-like conifers, in patches among the talus, with a scattered and broken tree canopy. Herbs are sparse. The bryoid layer is typically very well-developed, with mats of reindeer lichens undulating across the talus and higher bryophyte cover than in other talus settings. The scattered trees are typically *Picea mariana, Picea rubens*, and *Betula papyrifera*. *Abies balsamea* and (in relatively southern examples) *Tsuga canadensis* are occasional. *Sorbus americana* or *Sorbus decora* may occur as scattered shrubs. Dwarf-shrubs characteristically include *Ledum groenlandicum, Gaultheria hispidula, Vaccinium angustifolium, Vaccinium myrtilloides, Vaccinium vitis-idaea, Kalmia angustifolia*, and, in the more northerly occurrences, *Vaccinium uliginosum* and *Empetrum nigrum*. Herbs may include *Polypodium virginianum* and/or *Polypodium appalachianum* and *Mitella nuda*. Typical bryoids are *Cladina* spp., *Cladonia* spp., *Hylocomium splendens, Pleurozium schreberi, Sphagnum capillifolium, Polytrichum strictum*, and *Bazzania trilobata*. The combination of setting and flora make this type distinctive.

A3287 *Salix herbacea / Trichophorum caespitosum - Carex bigelowii* Alpine Snowbed Alliance

Alliance Summary Description: Dwarf-shrubs such as *Vaccinium uliginosum* are often a component, but the differential species are the graminoids and forbs. *Trichophorum caespitosum, Carex scirpoidea*, and *Carex bigelowii* are the characteristic graminoids and are usually locally dominant. *Deschampsia flexuosa* and *Carex brunnescens* are also typical although less abundant. Forbs include species also found at lower elevations, such as *Campanula rotundifolia, Clintonia borealis, Platanthera dilatata, Solidago macrophylla*, and *Veratrum viride*, as well as those restricted to higher elevations (at this latitude) such as *Polygonum viviparum* and *Prenanthes boottii*. In Canada, species include *Lycopodium alpinum (= Diphasiastrum alpinum), Sibbaldia procumbens*, and the dwarf-shrubs *Salix herbacea, Harrimanella hypnoides*, and *Phyllodoce caerulea*. This herb-dominated alpine vegetation is found in moist and somewhat protected spots above 1430 m (4700 feet) elevation in the Northern Appalachians, and lower elevations northward in eastern Canada. Constant moisture is provided by nearby streams or late-melting snowbeds or snowbanks.

[CEGL006423] *Trichophorum caespitosum - Calamagrostis pickeringii* Alpine Snowbed

Translated Name: **Tufted Bulrush - Pickering's Reedgrass Alpine Snowbed**
Common Name: **Northern Appalachian Alpine Bulrush Cliff**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Salix herbacea / Trichophorum caespitosum - Carex bigelowii* Alpine Snowbed Alliance (A3287)

ELEMENT CONCEPT

Global Summary: This graminoid-dominated association occurs on wet, sloping brows of alpine or subalpine cliffs in the Northern Appalachians. *Calamagrostis pickeringii* is the diagnostic and dominant herb, and *Trichophorum caespitosum* is often codominant. Dwarf-shrubs among the herbs include *Vaccinium uliginosum* and some typical bog ericads such as *Chamaedaphne calyculata, Kalmia polifolia*, and *Ledum groenlandicum*. Associated forbs include *Drosera rotundifolia, Gentiana linearis*, and *Huperzia appalachiana*. The vascular plants develop on a base of *Sphagnum* mosses, including *Sphagnum compactum* and several unusual species such as *Sphagnum lindbergii, Sphagnum tenellum*, and *Sphagnum pylaesii*. The liverwort *Scapania nemorosa* is also characteristic. Occurrences of this association may be short-lived (compared to other alpine vegetation types), as portions may become

oversaturated and slide off of the rock substrate; however, the average return interval of this major disturbance factor has been reported to be as long as 500 years. Although the graminoid dominance is characteristic of the association as a whole, it may occur as a mosaic of herb-dominated patches, shrub clusters, bryophyte carpets, and exposed bedrock.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This mixed graminoid association is uncommon in the Northern Appalachian project area and only known from one location. The occurrence is a moderate to gentle west-facing slope ranging from 780 to 800 m (2,560-2,625 feet) elevation. Soils are saturated peat.
Global Environment: Stands are found on exposed alpine or subalpine slopes (3000-4900 feet elevation), generally on cliff brows or other expanses of consolidated rock. Slope ranges from 5-35%. Water comes from runoff from higher elevations as well as local seeps.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is a mixed shrub - herbaceous wetland dominated by *Rhododendron canadense* and *Viburnum nudum var. cassinoides*, shrubby *Picea mariana* and *Picea rubens*, with *Calamagrostis pickeringii* dominating the herbaceous layer. Other shrubs present at lower cover include *Alnus viridis ssp. crispa, Amelanchier bartramiana, Chamaedaphne calyculata, Kalmia angustifolia, Ledum groenlandicum, Nemopanthus mucronatus, Photinia melanocarpa, Vaccinium myrtilloides*, and *Vaccinium oxycoccos*. Herbaceous associates include *Carex echinata, Carex pauciflora, Carex trisperma var. trisperma, Cornus canadensis, Dalibarda repens, Eriophorum virginicum, Gaultheria hispidula, Sarracenia purpurea*, and *Solidago uliginosa var. linoides*.
Global Vegetation: *Calamagrostis pickeringii* is the diagnostic and dominant herb, and *Trichophorum caespitosum* is often codominant. Dwarf-shrubs among the herbs include *Vaccinium uliginosum* and some typical bog ericads such as *Chamaedaphne calyculata, Kalmia polifolia*, and *Ledum groenlandicum*. Associated forbs include *Drosera rotundifolia, Gentiana linearis*, and *Huperzia appalachiana*. The vascular plants develop on a base of *Sphagnum* mosses, including *Sphagnum compactum* and several unusual species such as *Sphagnum lindbergii, Sphagnum tenellum*, and *Sphagnum pylaesii*. The liverwort *Scapania nemorosa* is also characteristic.
Global Dynamics: Occurrences of this association may be short-lived (compared to other alpine vegetation types), as portions may become oversaturated and slide off of the rock substrate; however, the average return interval of this major disturbance factor has been reported to be as long as 500 years. Although the graminoid dominance is characteristic of the association as a whole, it may occur as a mosaic of herb-dominated patches, shrub clusters, bryophyte carpets, and exposed bedrock.

Translated Name: **Tufted Bulrush - Northern Single-spike Sedge - Bigelow's Sedge Alpine Snowbed**
Common Name: **Alpine Herbaceous Wet Meadow**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Salix herbacea / Trichophorum caespitosum - Carex bigelowii* Alpine Snowbed Alliance (A3287)

ELEMENT CONCEPT

Global Summary: This herb-dominated alpine vegetation is found in moist and somewhat protected spots above 1430 m (4700 feet) elevation in the Northern Appalachians. Constant moisture is provided by nearby streams or late-melting snowbanks. Dwarf-shrubs such as *Vaccinium uliginosum* are often a component, but the differential species are the graminoids and forbs. *Trichophorum caespitosum, Carex scirpoidea*, and *Carex bigelowii* are the characteristic graminoids, and are usually locally dominant. *Deschampsia flexuosa* and *Carex brunnescens* are also typical although less abundant. Forbs include species also found at lower elevations, such as *Veratrum viride, Solidago macrophylla, Platanthera dilatata, Clintonia borealis*, and *Campanula rotundifolia*; as well as those restricted to higher elevations (at this latitude) such as *Polygonum viviparum* and *Prenanthes boottii*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This herbaceous association occurs above treeline at elevations above 800 m (2,625 feet) on gently to steeply sloping positions with variable aspects. Sites include saturated headwalls, stream margins and snowbanks with organic soils.
Global Environment: This association occurs in moist and somewhat protected spots above 1430 m (4700 feet) elevation in the Northern Appalachians. Constant moisture is provided by nearby streams or late-melting snowbanks. The streamside or snowbank setting has been used to distinguish two subtypes.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is highly variable in in composition. It is typically herb-dominated, but some sites may have a strong shrub component. The herbaceous layer is dense and the most consistent dominants include *Deschampsia flexuosa, Geum peckii*, and

Veratrum viride. Other herbaceous associates include *Athyrium filix-femina ssp. angustum, Calamagrostis canadensis, Calamagrostis pickeringii, Carex bigelowii, Clintonia borealis, Coptis trifolia, Cornus canadensis, Houstonia caerulea, Lonicera villosa, Phegopteris connectilis, Prenanthes trifoliolata, Solidago macrophylla, Symphyotrichum puniceum var. puniceum*, and *Trichophorum caespitosum*. Shrub cover is variable and may exceed 50% total cover on some sites. Dominants include *Alnus viridis ssp. crispa, Betula nana, Salix argyrocarpa, Spiraea alba var. latifolia*, and *Vaccinium uliginosum*.

Global Vegetation: Dwarf-shrubs such as *Vaccinium uliginosum* are often a component, but the differential species are the graminoids and forbs. *Trichophorum caespitosum, Carex scirpoidea*, and *Carex bigelowii* are the characteristic graminoids, and are usually locally dominant. *Deschampsia flexuosa* and *Carex brunnescens* are also typical although less abundant. Forbs include species also found at lower elevations, such as *Veratrum viride, Solidago macrophylla, Platanthera dilatata, Clintonia borealis*, and *Campanula rotundifolia*; as well as those restricted to higher elevations (at this latitude) such as *Polygonum viviparum* and *Prenanthes boottii*.

A1116 *Vaccinium uliginosum* - Mixed Alpine Heath Alliance

Alliance Summary Description: This alliance includes alpine dwarf-shrublands generally characterized by *Vaccinium uliginosum*, often mixed with other dwarf-shrubs and lesser amounts of graminoids and forbs. Other species associated with this alliance include *Betula glandulosa, Empetrum nigrum, Ledum groenlandicum, Rhododendron lapponicum, Salix uva-ursi, Vaccinium vitis-idaea*, and the herbs *Carex bigelowii, Cornus canadensis, Juncus trifidus, Minuartia groenlandica, Sibbaldiopsis tridentata (= Potentilla tridentata)*, and *Solidago multiradiata*. These communities are restricted to alpine areas in the Northern Appalachian and eastern alpine regions on the Canadian Shield. Typically they occur above timberline on exposed, windswept mountain summits, ridges, and bedrock-dominated tablelands.

[CEGL006425] *Kalmia angustifolia - Chamaedaphne calyculata / Rubus chamaemorus / Cladina* spp. Dwarf-shrubland

Translated Name: **Sheep Laurel - Leatherleaf / Cloudberry / Reindeer Lichen species Dwarf-shrubland**
Common Name: **Subalpine Slope Bog**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Vaccinium uliginosum* - Mixed Alpine Heath Alliance (A1116)

ELEMENT CONCEPT

Global Summary: This dwarf-shrub vegetation resembles that of a northeastern North American peat bog, but instead of a basin setting, it is on subalpine to alpine slopes, near or above treeline. While moist, the substrate is not constantly saturated as it would be in high-elevation basin bogs. The slope can range from moderate to very steep. Peat accumulation is deeper than in other alpine or subalpine heath settings, with depths of 25-80+ cm. The vegetation is dominated by a dense layer of dwarf ericaceous shrubs, with widely scattered taller shrubs or stunted trees. Herbs are sparse. The bryoid layer is very well-developed with both mosses and lichens prominent. *Kalmia angustifolia, Chamaedaphne calyculata*, and *Ledum groenlandicum* are dominant. Less abundant shrubs and small trees may include *Alnus viridis ssp. crispa, Betula papyrifera var. cordifolia, Viburnum edule, Vaccinium uliginosum*, and *Rhododendron canadense*. Krummholz-form *Picea mariana, Abies balsamea*, and, occasionally *Larix laricina* and *Thuja occidentalis* may be present. Herbs include widespread species like *Cornus canadensis* and *Coptis trifolia* along with the more restricted *Rubus chamaemorus, Geocaulon lividum*, and *Huperzia appalachiana*. The bryoid layer is dominated by *Sphagnum* spp., with abundant fruticose lichens including *Cladina rangiferina* and *Cetraria islandica*. This association is distinguished from the more widespread subalpine heath association *(Picea mariana, Abies balsamea) / Kalmia angustifolia - Ledum groenlandicum* Dwarf-shrubland (CEGL006031) by the accumulation of *Sphagnum* peat; it is distinguished from the alpine bog *Empetrum nigrum - Vaccinium uliginosum - Vaccinium oxycoccos / Rubus chamaemorus* Dwarf-shrubland (CEGL006140), which is somewhat wetter, by the paucity of graminoids and the slope as opposed to basin setting.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This dwarf-shrub association occurs at elevations >1000 m (3,280 feet) above treeline on moderate to steep slopes with variable aspects.
Global Environment: This association occurs in subalpine to alpine settings above 610 m (2000 feet) elevation, on moderate to steep slopes. Settings include talus rockslides and moist slopes near treeline.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is typically heath-dominated, but on some sites krummholz of *Picea mariana* and *Abies balsamea* may be prominent. Dominant heath species include *Chamaedaphne calyculata, Empetrum nigrum, Kalmia angustifolia*, and *Ledum groenlandicum* and may form dense thickets. Herbaceous composition is inconsistent and cover is low, but species may include *Carex brunnescens, Carex debilis, Carex gracillima, Carex gynandra, Carex trisperma, Coptis trifolia, Cornus canadensis, Cypripedium acaule, Deschampsia flexuosa*, and *Gaultheria hispidula*. The nonvascular layer is dominated by *Sphagnum* spp. and may exceed 90% cover.

[CEGL006155] *Vaccinium uliginosum - Harrimanella hypnoides - Loiseleuria procumbens* Dwarf-shrubland

Translated Name: **Bog Blueberry - Mossplant - Alpine-azalea Dwarf-shrubland**
Common Name: **Alpine Heath Snowbank**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Vaccinium uliginosum* - Mixed Alpine Heath Alliance (A1116)

ELEMENT CONCEPT

Global Summary: This alpine heath snowbank community occurs at the higher elevations above treeline in alpine regions of the northern New England Appalachians. It is most typical just below the rims of alpine cirques or over the brow of alpine cliffs, where significant snow accumulates on the lee side of rocks and ledges, and is the last snow to melt in the spring. Elevations are above 1400 m (4600 feet). Soils are moderately well-drained, but thin and gravelly. The dwarf-shrub layer is dominant, with 65-90% cover. Herbs are scattered in openings among the shrubs, and may be locally abundant on rock shelves. Dominant species include the dwarf-shrubs *Vaccinium caespitosum, Vaccinium uliginosum, Ledum groenlandicum*, and *Empetrum nigrum*. Particularly characteristic, although not necessarily dominant, are *Harrimanella hypnoides, Phyllodoce caerulea*, and *Loiseleuria procumbens*. Important herbs include *Deschampsia flexuosa, Carex bigelowii*, and *Solidago macrophylla*. Lower-elevation herbs may also be present here, including *Maianthemum canadense* and *Cornus canadensis*. The particular setting and the presence of alpine species *Harrimanella hypnoides, Loiseleuria procumbens*, and *Phyllodoce caerulea* differentiate this community from other alpine heathlands and krummholz communities.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This dwarf-shrub association is known from elevations greater than 1300 m (4,265 feet) above treeline where snow accumulation is substantial.
Global Environment: This alpine heath snowbank community occurs at the higher elevations above treeline in alpine regions of the northern New England Appalachians. It is most typical just below the rims of alpine cirques or over the brow of alpine cliffs, where significant snow accumulates on the lee side of rocks and ledges, and is the last snow to melt in the spring. Elevations are above 1400 m (4600 feet). Soils are moderately well-drained, but thin and gravelly.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by low, dwarf ericaceous shrubs. Dominant species include *Ledum groenlandicum, Vaccinium uliginosum*, and *Vaccinium vitis-idaea*. The herbaceous layer may be sparse to open and dominated by the sedge *Carex bigelowii* or the liverwort *Ptilidium ciliare*. The nonvascular layer is dominated by the moss *Cetraria islandica*.
Global Vegetation: The dwarf-shrub layer is dominant, with 65-90% cover. Herbs are scattered in openings among the shrubs, and may be locally abundant on rock shelves. Dominant species include the dwarf-shrubs *Vaccinium caespitosum, Vaccinium uliginosum, Ledum groenlandicum*, and *Empetrum nigrum*. CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (9-Dec-1998). In the northern Appalachian Mountains there are less than 100 high-elevation bare summits which exhibit alpine conditions. Of these, probably most above 1400 m (4600 feet) have some form of this alpine snowbank community, although many may consist of very small undeveloped fragments. Examples of this association have, until the late 1990s, been inventoried as part of a more broadly defined "alpine community" by most state natural heritage programs. Work in New Hampshire and Maine detailed this type, but still the exact extent and typical size of this association are relatively unknown. Nevertheless, the combined factors of rarity, specialized conditions and the relative isolation of these communities from each other make them vulnerable conservation targets.

[CEGL006298] *Vaccinium uliginosum - Rhododendron lapponicum / Juncus trifidus* Dwarf-shrubland

Translated Name: **Bog Blueberry - Lapland Rosebay / Highland Rush Dwarf-shrubland**
Common Name: **Alpine Heath Meadow**

USNVC Classification

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Vaccinium uliginosum* - Mixed Alpine Heath Alliance (A1116)

Element Concept

Global Summary: Alpine meadows of matted shrubs, sedges, and rushes are the dominant vegetation above treeline on the highest peaks of the northern Appalachian Mountains. Typically they occur above 1370 m (4500 feet) (occasionally lower) on exposed mountain summits, ridges, and bedrock-dominated tablelands. The substrate ranges from gravelly flats to jumbled rocks to stone pavements, with limited soils: basically well-drained gravels and stones with shallow organic accumulation. Protected spots may have continuous atmospheric moisture. The short snow-free season, frequent fog, cutting winds, and intense solar radiation are hallmarks of this environment. The vegetation is often patchy, with some areas shrub-dominated and other patches graminoid-dominated, but overall, dwarf-shrubs predominate. Shrub cover is usually 40-60%; herb cover is typically less, but may be up to 50% in some spots. Tree species may be present in shrub form in scattered, somewhat sheltered pockets. Bryophytes are very limited, but lichens may be abundant. Characteristic dwarf-shrubs are *Vaccinium uliginosum*, ubiquitous in this association, with *Vaccinium vitis-idaea, Vaccinium boreale, Betula glandulosa, Empetrum nigrum, Empetrum eamesii ssp. atropurpureum, Rhododendron lapponicum, Diapensia lapponica, Salix uva-ursi*, and *Arctostaphylos uva-ursi*. Graminoids scattered among the shrubs, and in places codominant, are primarily *Juncus trifidus* and *Carex bigelowii*. *Sibbaldiopsis tridentata (= Potentilla tridentata)* is a common forb, as is *Minuartia groenlandica*, which typically grows in the more gravelly substrates, often along trails. Herbs that are not abundant, but characteristic, include *Solidago multiradiata, Hierochloe alpina, Agrostis mertensii, Prenanthes boottii*, and *Huperzia appalachiana*. The combination of alpine heath shrubs in a mosaic with alpine graminoids is diagnostic. This is the above-treeline "matrix" type in which other, more limited and specialized alpine associations found on the more extensive summits are embedded. These include *Diapensia lapponica* Dwarf-shrubland (CEGL006322), *Vaccinium uliginosum - Harrimanella hypnoides - Loiseleuria procumbens* Dwarf-shrubland (CEGL006155), *Carex bigelowii* Alpine Meadow (CEGL006081) and *Empetrum nigrum - Vaccinium uliginosum - Vaccinium oxycoccos / Rubus chamaemorus* Dwarf-shrubland (CEGL006140).

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This dwarf-shrub association occurs in the White Mountains of New Hampshire and occasionally in Maine above treeline at elevations greater than 1,100 m (3,610 feet). Positions are summits and ridges with moderate to steep slopes.
Global Environment: Alpine meadows of matted shrubs, sedges, and rushes are the dominant vegetation above treeline on the highest peaks of the northern Appalachian Mountains. Typically they occur above 1370 m (4500 feet) (occasionally lower) on exposed mountain summits, ridges, and bedrock-dominated tablelands. The substrate ranges from gravelly flats to jumbled rocks to stone pavements, with limited soils: basically well-drained gravels and stones with shallow organic accumulation. Protected spots may have continuous atmospheric moisture. The short snow-free season, frequent fog, cutting winds, and intense solar radiation are hallmarks of this environment.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is dominated by dwarf heath shrubs, including *Vaccinium uliginosum* and *Vaccinium vitis-idaea*. Other shrubs occurring at lower cover and frequency include *Diapensia lapponica, Kalmia angustifolia, Ledum groenlandicum, Ribes glandulosum, Vaccinium angustifolium*, and *Vaccinium boreale*. The herbaceous layer is open and dominated by *Carex bigelowii* and *Juncus trifidus*. Other herbaceous associates include *Cornus canadensis, Lycopodium annotinum, Minuartia glabra, Minuartia groenlandica, Sibbaldiopsis tridentata*, and *Trichophorum caespitosum*. Lichens and mosses are prominent and may have dense cover.
Global Vegetation: The vegetation is often patchy, with some areas shrub-dominated and other patches graminoid-dominated, but overall, dwarf-shrubs predominate. Shrub cover is usually 40-60%; herb cover is typically less, but may be up to 50% in some spots. Tree species may be present in shrub form in scattered, somewhat sheltered

pockets. Bryophytes are very limited, but lichens may be abundant. Short shrub/sapling	Broad-leaved deciduous shrub	*Rhododendron lapponicum*, *Vaccinium uliginosum*
Herb (field)	Graminoid	*Carex bigelowii*, *Juncus trifidus*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Northern Appalachian Project Area): *Juncus trifidus*, *Vaccinium vitis-idaea*
Global: *Carex bigelowii*, *Juncus trifidus*, *Rhododendron lapponicum*, *Vaccinium uliginosum*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Northern Appalachian Project Area): Vulnerable Plants: *Carex bigelowii* (G5, ME & NH state-imperiled), *Diapensia lapponica* (G4G5, ME & NH state-imperiled), *Geum peckii* (G2, NH state-imperiled), *Hierochloe alpina* (G5, ME state-critically imperiled & NH state-imperiled), *Minuartia glabra* (G4, NH state-critically imperiled), *Vaccinium boreale* (G4G5, ME & NH state-imperiled)
Global: Vulnerable Plants: *Geum peckii* (G2), *Prenanthes boottii* (G2)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (13-Nov-1997). In the northern Appalachian Mountains there are fewer than 100 high-elevation bare summits that exhibit alpine conditions. Of these, a much smaller pool have well-developed heath communities, although a systematic inventory of all the lesser peaks has not been performed. The 20 or so examples currently tracked by the state natural heritage programs range in size from 1 to about 50 acres. The larger examples in the well known Presidential Range in the White Mountains, the Katahdin region of Maine, Camels Hump area of Vermont and the Mt. Marcy region of the Adirondacks all receive considerable foot travel, and there is evidence that some trampling degradation has occurred. The combined factors of small size, rarity, and relative isolation of these communities make them vulnerable conservation targets.

RELATED CONCEPTS

Global Similar Types:
- *Vaccinium uliginosum - Harrimanella hypnoides - Loiseleuria procumbens* Dwarf-shrubland (CEGL006155)
- *Vaccinium uliginosum / Sibbaldiopsis tridentata* Sparse Vegetation (CEGL006533)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Global Classification Comments: This association includes several dominance types that have been segregated as separate communities (e.g., see Bliss 1963, Doyle et al. 1987); recent field studies show these to generally occur in a fine-scale mosaic, and they are treated here as one association.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from Franconia Ridge in the White Mountains of New Hampshire, as well as Saddleback Mountain and West Peak in Maine.

Global Range: This community is found above treeline on the highest peaks of the northern Appalachian Mountains from New York to Maine and possibly Quebec.

[CEGL006533] *Vaccinium uliginosum / Sibbaldiopsis tridentata* Sparse Vegetation

Translated Name: **Bog Blueberry / Shrubby Fivefingers Sparse Vegetation**
Common Name: **Subalpine Rock Bald**

USNVC CLASSIFICATION

Division	Eastern North American Alpine Tundra (4.B.1.Na)
Macrogroup	Eastern North American Alpine Tundra (M131)
Group	Eastern Alpine Tundra (G104)
Alliance	*Vaccinium uliginosum* - Mixed Alpine Heath Alliance (A1116)

ELEMENT CONCEPT

Global Summary: These sparsely vegetated rocky balds are found on subalpine and alpine summits of the northern Appalachian Mountains. They are on dry acidic rocky summits, ridges and outcrops composed of resistant granitic bedrock, mostly at elevations between 915 and 1525 m (3000-5000 feet), sometimes as low as 550 m (1800 feet). Soil development is minimal, with vascular vegetation confined to crevices. Expanses of bare rock with crustose lichens predominate. Vascular vegetation is usually less than 25% cover overall, although in patches coverage may approach 70%. The dominant plants are *Vaccinium uliginosum, Vaccinium vitis-idaea, Empetrum nigrum, Empetrum eamesii ssp. atropurpureum*, and *Sibbaldiopsis tridentata*. *Juncus trifidus* and, at higher elevations, *Carex bigelowii* may be present, but in far lower abundance than they are seen in alpine habitats. This association is related to the alpine *Vaccinium uliginosum - Rhododendron lapponicum / Juncus trifidus* Dwarf-shrubland (CEGL006298), but occurs at lower elevations and lacks characteristic alpine plants such as *Diapensia lapponica, Agrostis mertensii, Rhododendron lapponicum*, etc. It differs from lower elevation open summits in the presence of subalpine *Vaccinium uliginosum* (and sometimes *Juncus trifidus* or *Carex bigelowii*).

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association is known from areas above treeline at elevations greater than 1,000 m (3,280 feet) on summits with gentle to moderate slopes.
Global Environment: These sparsely vegetated rocky balds are found on subalpine and alpine summits of the northern Appalachian Mountains. They are on dry acidic rocky summits, ridges and outcrops composed of resistant

granitic bedrock, mostly at elevations between 3000-5000 feet, sometimes as low as 1800 feet. Soil development is minimal, with vascular vegetation confined to crevices.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by an open to dense layer of dwarf ericaceous shrubs dominated by *Vaccinium uliginosum*. Few other shrub species occur, but may include *Empetrum eamesii ssp. atropurpureum* and *Vaccinium vitis-idaea*. Scattered trees including *Abies balsamea, Betula papyrifera var. cordifolia* and *Picea rubens* are common. Herbaceous cover is very low and no species have high consistency, but may include *Agrostis mertensii, Deschampsia flexuosa, Juncus trifidus, Minuartia glabra, Minuartia groenlandica, Sibbaldiopsis tridentata*, and *Solidago simplex ssp. randii*. Lichens and mosses are prominent and may have dense cover.
Global Vegetation: Expanses of bare rock with crustose lichens predominate. Vascular vegetation is usually less than 25% cover overall, although in patches coverage may approach 70%. The dominant plants are *Vaccinium uliginosum, Vaccinium vitis-idaea, Empetrum nigrum, Empetrum eamesii ssp. atropurpureum*, and *Sibbaldiopsis tridentata*. *Juncus trifidus* and, at higher elevations, *Carex bigelowii* may be present, but in far lower abundance than they are seen in alpine habitats.

5. Aquatic Vegetation

5.B.2. Temperate to Polar Freshwater Aquatic Vegetation

5.B.2.Na. North American Freshwater Aquatic Vegetation

M108. Eastern North American Freshwater Aquatic Vegetation

G114. Eastern North American Freshwater Aquatic Vegetation

Group Summary Description: Submergent marshes can be found across a large part of North America, ranging from boreal, interior Canada (Saskatchewan, Manitoba, Ontario) south through the Great Plains to the Gulf Coastal Plain in Texas and east to the Atlantic from Virginia to Maine. Stands in this group have rooted aquatic herbaceous vegetation, are permanently flooded with water generally less than 2 m deep, and are subject to low to moderate waves and currents. Water salinity varies from fresh to saline, with the saline and brackish sites tending to occur in the Great Plains. Submergent and floating-leaved aquatics dominate submergent marshes. Emergent vegetation has <10% total cover. Total vegetation cover ranges from sparse to dense.

A4147 *Lemna* spp. - *Wolffia* spp. - *Spirodela polyrrhiza* Aquatic Vegetation Alliance

Alliance Summary Description: This aquatic association of floating vegetation is known to occur throughout temperate eastern North America. *Lemna* spp. *Spirodela polyrrhiza*, and *Wolffia* spp. typically dominate but may be mixed with other plant taxa. These small plants may float on the water's surface or become stranded and possibly rooted during drawdown periods. The composition of examples varies across this wide distributional range. Associated rooted floating aquatics include *Potamogeton* spp., *Sagittaria* spp., or *Polygonum* spp. While these latter species are rooted submerged species, and technically not part of the strictly floating community, they do intermingle. Biomass can be abundant under eutrophic conditions. This alliance occupies wetlands that are permanently, semipermanently or seasonally flooded. Water chemistry is fresh. The standing water habitat is relatively shallow, generally less than 2-4 m and occurs as ponds, lakes, ditches, stock ponds, and backwater sloughs of river and stream channels. Standing water for much or most of the growing season is characteristic. Depth of the water is of no consequence to floating plants; they occur where the wind pushes them.

[CEGL005451] *Lemna* spp. Eastern North American Aquatic Vegetation

Translated Name: **Duckweed species Eastern North American Aquatic Vegetation**
Common Name: **Eastern North America Duckweed Pond**

USNVC Classification

Division	North American Freshwater Aquatic Vegetation (5.B.2.Na)
Macrogroup	Eastern North American Freshwater Aquatic Vegetation (M108)
Group	Eastern North American Freshwater Aquatic Vegetation (G114)
Alliance	*Lemna* spp. - *Wolffia* spp. - *Spirodela polyrrhiza* Aquatic Vegetation Alliance (A4147)

Element Concept

Global Summary: This aquatic association of floating vegetation is known to occur throughout temperate eastern North America. *Lemna* spp. typically dominate but may be mixed with other plant taxa floating on the water surface. *Lemna*-dominated aquatic vegetation occupies wetlands that are permanently, semipermanently or seasonally flooded. These small plants may float on the water's surface or become stranded and possibly rooted during drawdown periods. Water chemistry is fresh. The standing water habitat is relatively shallow, generally less than 2-4 m (6.6-13.1 feet) and occurs as ponds, lakes, ditches, stock ponds, and backwater sloughs of river and stream channels. Standing water for much or most of the growing season is characteristic. Depth of the water is of no consequence to floating plants; they occur where the wind pushes them. The composition of examples varies across this wide distributional range. *Lemna* taxa that may be present in eastern North America include *Lemna*

aequinoctialis (southwest U.S. as well as southeast U.S.), *Lemna minor* (widespread across temperate North America), *Lemna minuta* (widespread across southern U.S.), *Lemna obscura* (eastern-southeastern U.S.), *Lemna perpusilla* (eastern U.S.), *Lemna trisulca* (widespread temperate and boreal, but not southeast U.S.), *Lemna turionifera* (widespread temperate and boreal, but not southeast U.S.), and *Lemna valdiviana* (southeast U.S., and spotty in the southwest U.S.). Other species present may include *Spirodela polyrrhiza* (widespread temperate U.S.), *Spirodela punctata* (southeastern U.S.), *Azolla mexicana, Azolla filiculoides, Wolffiella lingulata* (rare), *Wolffiella oblonga* (extreme southwest and southeast U.S.), *Wolffiella gladiata* (southeast coastal plain), *Wolffia brasiliensis* (eastern temperate U.S.), *Wolffia borealis* (west coast temperate and eastern temperate U.S., but not coastal plain), *Wolffia globosa* (eastern temperate U.S.), and *Wolffia columbiana* (eastern temperate U.S.), as well as *Riccia* spp. (aquatic liverworts). Associated rooted floating aquatics include *Potamogeton* spp., *Sagittaria* spp., or *Polygonum* spp. may also be present s. While these latter species are rooted submerged species, and technically not part of the strictly floating community, they do intermingle. Biomass can be abundant under eutrophic conditions.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This aquatic vegetation occurs in ponds.
Global Environment: *Lemna*-dominated aquatic vegetation occupies wetlands that are permanently flooded, semi-permanently flooded to seasonally flooded. Water chemistry is fresh. The standing water habitat is relatively shallow, generally less than 2-4 m (6.6-13.1 feet) and occurs as ponds, lakes, ditches, stock ponds, and backwater sloughs of river and stream channels. Standing water for much or most of the growing season is characteristic. Depth of the water is of no consequence to floating plants; they occur where the wind pushes them. Community composition may change hour to hour, yet the environment, only the top few centimeters of water, is homogeneous. Biomass can be abundant under eutrophic conditions.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Lemna* spp. are dominant.
Global Vegetation: The composition of examples varies across the wide distributional range of this community. *Lemna* taxa that may be present in eastern North America include *Lemna aequinoctialis* (southwest and southeast U.S.), *Lemna minor* (widespread across temperate North America), *Lemna minuta* (widespread across southern U.S.), *Lemna obscura* (eastern-southeastern U.S.), *Lemna perpusilla* (eastern U.S.), *Lemna trisulca* (widespread temperate and boreal, but not southeast U.S.), *Lemna turionifera* (widespread temperate and boreal, but not southeast U.S.), and *Lemna valdiviana* (southeast U.S., and spotty in southwest U.S.). Other species present may include *Spirodela polyrrhiza* (widespread temperate U.S.), *Spirodela punctata* (southeastern U.S.), *Azolla mexicana, Azolla filiculoides, Wolffiella lingulata* (rare), *Wolffiella oblonga* (extreme southwest and southeast U.S.), *Wolffiella gladiata* (southeast coastal plain), *Wolffia brasiliensis* (eastern temperate U.S.), *Wolffia borealis* (west coast temperate and eastern temperate U.S., but not coastal plain), *Wolffia globosa* (eastern temperate U.S.), and *Wolffia columbiana* (eastern temperate U.S.).
Global Dynamics: Because the biomass of floating organisms is generally not great, they do not have an important influence on the accumulation of organic matter on the pond bottom. However, a study comparing Rocky Mountain with Illinois pond communities found that similar types in Illinois ponds have twice the number of species and biomass found in Colorado ponds (Fuller 1930).

Most Abundant Species

Appalachian National Scenic Trail (Central Appalachian Project Area)

Stratum	Lifeform	Species

Appalachian National Scenic Trail (Central Appalachian Project Area): *Lemna* spp.
Global: *Lemna aequinoctialis*, *Lemna minor*, *Lemna minuta*, *Lemna obscura*, *Lemna perpusilla*, *Lemna trisulca*, *Lemna turionifera*, *Lemna valdiviana*

OTHER NOTEWORTHY SPECIES

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (11-Jul-2013). If this community is widespread across eastern North America, it is ranked G5. Even if it is subdivided into "division-level" subunits, and it is likely to be secure.

RELATED CONCEPTS

Global Similar Types:

- *Lemna minor* Aquatic Vegetation (CEGL003305)
- *Lemna* spp. North American Boreal Aquatic Vegetation (CEGL005452)
- *Lemna* spp. Western North American Aquatic Vegetation (CEGL005450)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Global Classification Comments: It is possible that a coastal plain *Lemna* association could be recognized based on the restricted distribution of many *Lemna* spp. *Lemna* and other characteristic wetland taxa that comprise floating, submerged and aquatic rooted associations are not well-reported in the literature, but they are known to occur in the field. *Lemna* and *Azolla* will be easy to distinguish from each other; some *Lemna* taxa may be less easy to distinguish from *Spirodela, Wolffiella*, and *Wolffia*.

ELEMENT DISTRIBUTION

A4064 *Nymphaea odorata - Nuphar* spp. - *Brasenia schreberi* Aquatic Vegetation Alliance

Alliance Summary Description: This alliance, common throughout most of the eastern and central United States and adjacent Canadian provinces, contains vegetation which may occur in a variety of slow-moving waterbodies, including rivers, millponds, streams, shallow ponds or lakes, or on shores of deeper waterbodies including freshwater tidal areas. Stands are dominated by hydromorphic-rooted aquatic plants, typically *Nuphar* spp., with or without *Nymphaea odorata* and *Nymphoides aquatica*. Emergent vegetation is less than 25%, and typically plant species diversity is low. Other species present may include *Utricularia* spp., *Potamogeton* spp., and others. In the north, *Brasenia schreberi* may be locally dominant. Other characteristic northern species include *Nymphaea tetragona* and *Potamogeton amplifolius*. Associates found in the Midwest include *Polygonum amphibium*. Stands of this alliance are permanently to semipermanently flooded, and water depth is generally greater than 0.5 m and up to 2 m.

[CEGL002386] *Nuphar advena - Nymphaea odorata* Aquatic Vegetation

Translated Name: **Broadleaf Pond-lily - American White Water-lily Aquatic Vegetation**
Common Name: **Water-lily Aquatic Wetland**

USNVC Classification

Division	North American Freshwater Aquatic Vegetation (5.B.2.Na)
Macrogroup	Eastern North American Freshwater Aquatic Vegetation (M108)
Group	Eastern North American Freshwater Aquatic Vegetation (G114)
Alliance	*Nymphaea odorata - Nuphar* spp. - *Brasenia schreberi* Aquatic Vegetation Alliance (A4064)

Element Concept

Global Summary: This rooted aquatic or open marsh community occupies shallow-water depressions, oxbow ponds, backwater sloughs of river floodplains, slow-moving streams, ponds, and small lakes throughout the central and eastern United States. It is dominated by rooted, floating-leaved aquatic species, with both submergent and emergent aquatics also present. *Nuphar advena (= Nuphar lutea ssp. advena)* and *Nymphaea odorata* are dominants, either in combination together, or each singly. Other species present include *Brasenia schreberi*, various *Potamogeton* and *Stuckenia* spp., *Eleocharis robbinsii* and other *Eleocharis* spp., *Polygonum amphibium, Polygonum amphibium var. emersum (= Polygonum coccineum), Sparganium americanum, Lemna* spp., *Spirodela polyrrhiza, Typha latifolia*, and *Saururus cernuus*. Submerged aquatics more common in the southern part of the range include *Cabomba caroliniana, Ceratophyllum demersum*, and *Heteranthera dubia*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This aquatic pond vegetation occurs in a basin setting in Parker Lake in New Jersey. Another site is a lagoon off of the Connecticut River in Norwich, Vermont. Both examples are permanently flooded with very poorly drained muck soil and standing water. No evidence of disturbance was reported at either site.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association was only sampled in the Northern Appalachian project area from Jones Pond at 400 m (1,310 feet) elevation. The site is beaver-influenced and permanently flooded. Soils are organic muck.
Global Environment: This community occupies shallow-water depressions, oxbow ponds, sluggish streams, and backwater sloughs of river floodplains, ponds (natural and artificial), and small lakes. In pools and slow-flowing stretches of river, at Obed River (TN), *Nuphar advena* is rooted in sandy substrate (Schmalzer and DeSelm 1982).

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Dominant species include submerged macrophytes or floating-leaved pondweeds. *Brasenia schreberi, Lemna minor, Nuphar variegata (= Nuphar lutea ssp. variegata)*, and *Potamogeton natans* are the most common species.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only sampled occurrence of this association is dominated by the floating aquatic species *Nuphar variegata (= Nuphar lutea ssp. variegata)*. *Potamogeton natans* and *Utricularia* sp. are also present at lower cover.
Global Vegetation: This community is dominated by rooted, floating-leaved aquatic species, with both submergent and emergent aquatics also present. *Nuphar advena (= Nuphar lutea ssp. advena)* and *Nymphaea odorata* are dominants, either in combination together, or each singly. Other species present include *Brasenia schreberi*, various

Potamogeton and *Stuckenia* spp., *Eleocharis robbinsii* and other *Eleocharis* spp., *Polygonum amphibium, Polygonum amphibium var. emersum (= Polygonum coccineum), Sparganium americanum, Lemna* spp., *Spirodela polyrrhiza, Typha latifolia*, and *Saururus cernuus* (Anderson 1982, G. Fleming pers. comm.). Submerged aquatic species more common in the southern part of the range include *Cabomba caroliniana, Ceratophyllum demersum*, and *Heteranthera dubia*. This broadly conceived type may include ponds, or zones of ponds, dominated by *Nymphaea odorata*, with or without *Nuphar advena*.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (15-Oct-2002). The dominant species in stands of this vegetation are widespread across the eastern and central United States and adjacent Canada. This is not a rare or imperiled vegetation type, even though its occurrence is poorly documented. Stands may occur in natural lakes and ponds or in artificial impoundments.

RELATED CONCEPTS

Global Similar Types:
- *Equisetum fluviatile - (Eleocharis palustris)* Marsh (CEGL005258)
- *Nuphar advena* Tidal Marsh (CEGL004472)
- *Nuphar polysepala* Aquatic Vegetation (CEGL002001)
- Semipermanent Impoundment (CEPS006581)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: The Vermont example consists primarily of standing water with low vegetation cover. *Nuphar variegata* is the only species present and it covers less than 2% of the site.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Can occur in mostly natural ponded wetlands as well as artifactual ones such as borrow pits. On the Conecuh National Forest (Alabama), vegetation of this association occurs in Gum Pond and Open Pond as a mix of *Nymphaea odorata* and *Nuphar advena*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Parker Lake in New Jersey and along the Connecticut River in Windsor County, Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only sampled from Jones Pond in Maine. It is likely far more common but undersampled.
Global Range: This rooted aquatic community occupies shallow, quiet waters throughout the central and eastern United States, extending from Maine to Ontario and Minnesota, south to Oklahoma and east to Georgia.

A4066 *Potamogeton* spp. - *Ceratophyllum* spp. - *Elodea* spp. Aquatic Vegetation Alliance

Alliance Summary Description: This alliance is widespread in the eastern United States and adjacent Canada from the western tallgrass prairies to the Atlantic Coast. Submergent vegetation dominates. Typical dominants are *Potamogeton* spp., including *Potamogeton natans, Potamogeton zosteriformis*, and *Potamogeton richardsonii*; *Ceratophyllum* spp., including *Ceratophyllum demersum*; *Elodea* spp., including *Elodea canadensis*; and *Myriophyllum* spp., including *Myriophyllum verticillatum*. Other associated species include emergents such as *Zizania palustris, Utricularia macrorhiza, Nuphar* spp., *Ranunculus longirostris, Chara* spp., *Lemna* spp., *Spirodela polyrrhiza*, and *Vallisneria americana*. This common alliance is found in permanently flooded wetlands with water usually less than 2 m deep.

[CEGL006431] *Elodea canadensis - Potamogeton* spp. Eastern Aquatic Vegetation

Translated Name: **Canadian Waterweed - Pondweed species Eastern Aquatic Vegetation**
Common Name: **Eastern Waterweed - Pondweed Aquatic Vegetation**

USNVC Classification

Division	North American Freshwater Aquatic Vegetation (5.B.2.Na)
Macrogroup	Eastern North American Freshwater Aquatic Vegetation (M108)
Group	Eastern North American Freshwater Aquatic Vegetation (G114)
Alliance	*Potamogeton* spp. - *Ceratophyllum* spp. - *Elodea* spp. Aquatic Vegetation Alliance (A4066)

Element Concept

Global Summary: This is a broadly conceived type that encompasses northeastern aquatic vegetation found in higher pH waters. The dominants are usually submerged macrophytes or floating-leaved pondweeds. Indicator species include *Elodea canadensis, Potamogeton robbinsii, Potamogeton vaseyi, Stuckenia filiformis, Potamogeton friesii*, and *Potamogeton strictifolius*. *Vallisneria americana* is often present. *Nymphaea odorata* and *Nuphar* spp. are often present but are not abundant. This vegetation is found in quiet waters at 0.5-2 m depth. In Maine, alkalinity is relatively high for ponds of the glaciated Northeast, with conductivity readings usually exceeding 50 uMHOs/cm. More intensive sampling that extends over a broader geographic range is needed to determine if particular associations within this concept should be segregated.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: The spring-fed pond is a shallow artificial millpond occurring within a presettlement karst feature. The water is derived from high-volume limestone springs within and above the pond so the pH is high. There is a dam at one end and the pond is used for fishing.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: No local data were collected.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This aquatic vegetation of occurs in ponds with circumneutral water.
Global Environment: This vegetation is found in quiet waters at 0.5-2 m depth. Alkalinity is relatively high for ponds of the glaciated Northeast, with conductivity readings usually exceeding 50 uMHOs/cm.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The floating-leaved aquatic vegetation on the pond is dominated by *Elodea canadensis* and *Potamogeton crispus*. *Myriophyllum* spp. are also present.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: No local data were collected.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: *Nymphaea odorata* and *Nuphar* spp. are often present but not abundant. Submerged macrophytes or floating-leaved pondweeds dominate, including *Elodea canadensis, Potamogeton robbinsii, Potamogeton vaseyi, Stuckenia filiformis, Potamogeton friesii*, and *Potamogeton strictifolius; Vallisneria americana* is often present.
Global Vegetation: The dominants are usually submerged macrophytes or floating-leaved pondweeds. Indicator species include *Elodea canadensis, Potamogeton robbinsii, Potamogeton vaseyi, Stuckenia filiformis, Potamogeton*

friesii, and *Potamogeton strictifolius*. *Vallisneria americana* is often present. *Nymphaea odorata* and *Nuphar* spp. are often present but are not abundant. This vegetation is found in quiet waters at 0.5-2 m depth.

6.B.1.Na. Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation

M111. Eastern North American Cliff & Rock Vegetation

G840. Appalachian Cliff & Rock Vegetation
Group Summary Description:

A2071 Appalachian Acidic Cliff Alliance
Alliance Summary Description: This alliance is made up of sparse, patchy vascular vegetation with variable nonvascular cover occurring on cliff faces of acidic rock types in the southeastern U.S. north to the Central Appalachians. Mosses and lichens are often abundant. Vascular plants are generally confined to crevices and cover is generally less than 10% over all, but can be patchy and reach up to 25% cover in areas. Characteristic plants include species of *Asplenium, Dryopteris*, and other ferns, as well as scattered shrubs such as *Kalmia latifolia, Rhododendron* spp., *Hydrangea arborescens*, and forbs such as *Silene rotundifolia, Mitchella repens, Eurybia divaricata*, and others.

[CEGL004980] *Asplenium montanum - Heuchera villosa* Felsic Cliff Sparse Vegetation
Translated Name: **Mountain Spleenwort - Hairy Alumroot Felsic Cliff Sparse Vegetation**
Common Name: **Appalachian Felsic Cliff**

USNVC Classification

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Appalachian Cliff & Rock Vegetation (G840)
Alliance	Appalachian Acidic Cliff Alliance (A2071)

Element Concept

Global Summary: This community occurs in the Blue Ridge and upper Piedmont of Georgia, North Carolina, South Carolina, Tennessee, and Virginia. It includes vertical rock faces associated with felsic, metamorphic and igneous geologies. This community generally has little vegetative cover, often with 90% of the rock surface unvegetated. Mosses (e.g., *Thuidium* spp., *Fissidens* spp., *Campylium* sp., *Bryoandersonia* sp., *Plagiomnium* sp.) and lichens can have moderate coverage, and vascular plants occur on ledges and rooted in cracks. *Asplenium montanum* and *Heuchera villosa* are characteristic components. Other typical species include *Agrostis perennans, Arisaema triphyllum, Aristolochia macrophylla, Asplenium trichomanes, Eurybia divaricata (= Aster divaricatus), Cystopteris protrusa, Dryopteris marginalis, Hydrangea arborescens, Parthenocissus quinquefolia, Polypodium appalachianum*, and *Rubus canadensis*. These cliffs are typically dry, although small seepages may occur. They are usually shaded by trees rooted on ledges and by the surrounding forest.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: Set of dry, exposed, vertical, short, southern aspect cliffs on the summit of Blood Mountain in Georgia.
Global Environment: This community includes vertical rock faces associated with felsic, metamorphic and igneous geologies. Some occurrences attributed to this type appear to be on subcalcareous substrates. These cliffs are typically dry, although small seepages may occur. They are usually shaded by trees rooted on ledges and by the surrounding forest.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: Very sparse vegetation including *Hypericum buckleii* and *Diervilla sessilifolia* with scattered *Deschampsia flexuosa*. Lichens, including *Umbilicaria mammulata*, are abundant. *Kalmia latifolia, Rhododendron catawbiense*, and *Vaccinium corymbosum* are scattered shrubs.
Global Vegetation: This community has little vegetative cover, often with 90% of the rock surface unvegetated. Mosses (e.g., *Thuidium* spp., *Fissidens* spp., *Campylium* sp., *Bryoandersonia* sp., *Plagiomnium* sp.) and lichens can have moderate coverage, and vascular plants occur on ledges and rooted in cracks. *Asplenium montanum* and *Heuchera villosa* are characteristic components. Other typical species include *Agrostis perennans, Arisaema triphyllum, Aristolochia macrophylla, Asplenium trichomanes, Eurybia divaricata (= Aster divaricatus), Cystopteris protrusa, Dryopteris marginalis, Hydrangea arborescens, Parthenocissus quinquefolia, Polypodium appalachianum*, and *Rubus canadensis*. An example of a shaded rock outcrop from the Chattahoochee National Forest (Georgia) which is assigned here contains low coverages of the woody plants *Hydrangea arborescens, Kalmia latifolia, Vaccinium arboreum*, and *Vaccinium simulatum*, along with the herbs *Campanula divaricata, Dryopteris marginalis, Galax urceolata, Iris cristata, Muhlenbergia tenuiflora, Polygonatum biflorum, Silene stellata*, and *Solidago sphacelata*. An example in Great Smoky Mountains National Park (Tennessee) consisted of *Heuchera villosa, Pilea pumila, Impatiens pallida, Sedum ternatum*, and various moss species but did not contain *Asplenium montanum*.
Global Dynamics: These cliffs are typically dry, although small seepages may occur. They are usually shaded by trees rooted on ledges and by the surrounding forest.

A3991 Appalachian Lichen Boulderfield Alliance

Alliance Summary Description: This alliance consists of large, dry, lichen-dominated boulderfields with little or no vascular vegetation, occurring in the eastern U.S. It occurs on a variety of sedimentary, metasedimentary and metamorphic substrates, including quartzite, sandstone and metabasalt. The dominant taxa vary across the range of the alliance. Some common combinations of lichens include *Lasallia papulosa* and *Lasallia pensylvanica* (either singly or together), *Lasallia papulosa* and *Umbilicaria caroliniana*, and *Umbilicaria mammulata*. Some other examples are dominated by *Umbilicaria muehlenbergii, Lasallia papulosa*, and *Melanelia stygia*. These are some of the most abundant and conspicuous lichens found in examples. Individual occurrences can be as large as an acre. Vascular plants are generally sparse or absent. In moister examples, trees of adjacent forest communities often shade the outcrop community for much of the day.

[CEGL004142] *Lasallia (papulosa, pensylvanica) - Dimelaena oreina - (Melanelia culbersonii)* Nonvascular Vegetation

Translated Name: **(Toadskin Lichen, Pennsylvania Toadskin Lichen) - Golden Moonglow Lichen - Culberson's Black-parmelia**
Nonvascular Vegetation
Common Name: **Central Appalachian Acidic Boulderfield**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Appalachian Cliff & Rock Vegetation (G840)
Alliance	Appalachian Lichen Boulderfield Alliance (A3991)

ELEMENT CONCEPT

Global Summary: This association is widely but locally distributed from the western Piedmont foothills in Maryland and Virginia through the Blue Ridge and Ridge and Valley portions of the Central Appalachians, north at least to the Delaware Water Gap in Pennsylvania and New Jersey. It occurs primarily on fully exposed, minimally weathered quartzite and sandstone boulderfields at elevations from about 300 to 1000 m (1000-3300 feet). On the largest occurrences, vascular plants are generally absent and lichens dominate these habitats. *Lasallia papulosa* and *Lasallia pensylvanica*, either singly or in combination, are generally abundant and conspicuous. *Dimelaena oreina* abundantly covers many dry, exposed rock surfaces that are not covered with *Lasallia* spp. and larger foliose lichens. Although of scattered occurrence, *Melanelia culbersonii* has been found across the full elevation range of

the type and is a good diagnostic species, as it appears to be restricted mostly to siliciclastic rocks (and occasionally coarse-grained, quartz-rich granites that are nearly devoid of dark minerals) in this region. A variety of other foliose, crustose and fruticose lichen species are associated. Smaller, more marginal occurrences have sparse vascular plant cover, primarily stunted trees of *Betula lenta, Sassafras albidum*, and *Quercus prinus*, ericaceous shrubs, and scrambling vines of *Parthenocissus quinquefolia*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This nonvascular vegetation occurs on fully exposed, minimally-weathered quartzite and sandstone boulderfields at elevations from about 300 to 1,000 m (1,000-3,300 feet). It was sampled at four locations in Maryland in the Central Appalachian project area. Sites include gentle, southwest-facing lower and steep, west-facing upper slopes of quartzite talus from the Everton Formation with rapidly drained soils. The unvegetated surface is dominated by large rocks with small amounts of leaf litter, downed wood, small rocks, and bare soil. No evidence of disturbance was reported other than a small presence of exotic plants.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: Quartzite and sandstone boulderfields covered with lichens. Occurs at elevations from about 300 to 1,000 m (1,000-3,300 feet); restricted to Delaware Water Gap National Recreation Site within the Lower New England project area.
Global Environment: This association occurs primarily on fully exposed, minimally weathered quartzite and sandstone boulderfields at low and middle elevations of the Northern Blue Ridge, Ridge and Valley, and adjacent foothills of the upper Piedmont. A few occurrences have also been noted on boulderfields composed of acidic granitic rocks (e.g., on Old Rag Mountain in Shenandoah National Park). The known elevation range is from about 300 to 1000 m (1000-3300 feet). Aspect is variable among sites, but slopes are typically steep to very steep (often >30°). Block size is highly variable, from relatively small and loose stones (<1 m in diameter) to large, stable boulders (>1 m in diameter). Although this association is most extensive on boulder deposits, it may also occur on outcrops associated with the boulderfields, or on very large, exposed cliffs. There is little or no available soil except for occasional small deposits of organic matter in crevices.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Lasallia papulosa* and/or *Lasallia pensylvanica* are abundant and conspicuous along with *Dimelaena oreina* and *Xanthoparmelia* spp. Stunted *Betula lenta* may sometimes be present in very low numbers.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Dominated by *Lasallia papulosa* and/or *Lasallia pensylvanica* either singly or together along with *Dimelaena oreina*; *Melanelia culbersonii* is diagnostic; stunted *Betula lenta* sometimes present in very low numbers.
Global Vegetation: On the largest occurrences, vascular plants are generally absent and lichens dominate. Maximum patch size is about ten acres, but most patches are considerably smaller. *Lasallia papulosa* and *Lasallia pensylvanica*, either singly or in combination, are generally abundant and conspicuous. *Dimelaena oreina* abundantly covers many dry, exposed rock surfaces that are not covered with *Lasallia* spp. and larger foliose lichens. Although of scattered occurrence, *Melanelia culbersonii* has been found across the full elevation range of the type and is a good diagnostic species, as it appears to be restricted mostly to siliciclastic rocks (and occasionally coarse-grained, quartz-rich granites that are nearly devoid of dark minerals) in this region. Other minor umbilicate and foliose species include *Hypogymnia physodes, Physcia subtilis, Umbilicaria muehlenbergii, Xanthoparmelia conspersa*, and *Xanthoparmelia plittii*. Many crustose species occur, including *Aspicilia cinerea, Fuscidea recensa, Lecanora* spp., *Lepraria* spp., *Rhizocarpon obscuratum (= Rhizocarpon reductum)*, and *Sarcogyne clavus*. Flat surfaces and interstices that have thin deposits of organic matter often support a variety of fruticose lichens, including *Cladina rangiferina, Cladonia uncialis (= Cladina uncialis), Cladonia crispata, Cladonia macilenta, Cladonia ochrochlora*, and *Cladonia squamosa*. In the upper elevation range, boreal lichens such as *Melanelia stygia* and *Arctoparmelia centrifuga* are present, but they are not abundant. Along the edges of the boulderfields, scattered individuals of *Parthenocissus quinquefolia, Vaccinium* spp., and other vascular plants may occur in transition zones with forests or woodlands. Smaller, more marginal occurrences frequently have sparse vascular plant cover, primarily stunted trees of *Betula lenta, Sassafras albidum, Quercus prinus, Quercus coccinea, Quercus velutina, Carya glabra*, and *Carya ovalis*. Widely scattered shrubs may include *Kalmia latifolia* and other ericads. Herbs are usually absent, but *Dicentra eximia* is known from some occurrences.
Global Dynamics: The exposed rock surfaces supporting this community are subject to fluctuating, daily extremes of temperature, humidity, and moisture saturation during the growing season, as well as to low temperatures, high winds, and frequent ice during the winter. Boulderfield habitats have resulted from periglacial phenomena and the collapse of resistant strata from weathering and erosion of weaker underlying rocks. Most Central Appalachian

boulderfields are well-weathered and now support woodland or forest vegetation. Relatively few remain fully exposed and support wholly nonvascular communities.

Appalachian National Scenic Trail (Lower New England Project Area):
Global: *Dimelaena oreina*, *Lasallia papulosa*, *Lasallia pensylvanica*, *Melanelia culbersonii*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Melanelia culbersonii* (G2G4); **Invasive/Exotic Plants**: *Rumex acetosella* (Medium/Low)
Global: Vulnerable Plants: *Melanelia culbersonii* (G2G4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (23-May-2011). Although aggregate acreage is not large, there are probably several hundred occurrences of this association in Virginia alone, with many more known from or likely in adjacent states. Habitats are typically remote, extremely steep and difficult to traverse, minimizing potential human threats.

RELATED CONCEPTS

Global Similar Types:

- *Lasallia papulosa - Lasallia pensylvanica* Nonvascular Vegetation (CEGL004385) of quartzite cliffs in the western North Carolina Piedmont.
- *Lasallia papulosa - Stereocaulon glaucescens - Chrysothrix chlorina* Nonvascular Vegetation (CEGL004143) occurs on mafic (metabasaltic) boulderfields of the northern Blue Ridge.
- *Umbilicaria muehlenbergii - Lasallia papulosa - (Melanelia stygia)* Nonvascular Vegetation (CEGL004389) occurs at higher elevations in the same region and has different dominant species.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Plots were sampled in Maryland; however, classification of this association is based primarily on geographically limited lichen inventories in Shenandoah National Park, but it is believed to be widely applicable to similar boulderfields that are characteristic of Central Appalachian siliciclastic ridges.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community is included in the Delaware Water Gap National Recreation Area vegetation classification. While outside the APPA corridor, this community may be identified during APPA accuracy assessment.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Classification of this association is based on geographically limited lichen inventories in Shenandoah National Park, but it is believed to be widely applicable to similar boulderfields that are characteristic of Central Appalachian siliciclastic ridges. In the park inventory, lichens were mass-collected from boulderfield and outcrop habitats on different geologic substrates, and specimens were identified by Richard Harris (New York Botanical Garden), Don Flenniken (author of Macrolichens of West Virginia), and James Lawry (George Mason University). Classification of lichen communities in eastern North America is currently difficult and tentative because inventory and data are generally lacking. The classification of this type versus *Betula lenta - Quercus prinus / Parthenocissus quinquefolia* Woodland (CEGL006565) can be tricky where there is a continuous

gradation of vegetation cover (as at Delaware Water Gap), but generally this is applied where there is less than 25% vascular vegetation and nonvascular species are dominant.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled at Black Rock and Devil's Racecourse in Maryland. It is also known to occur along the AT corridor in Shenandoah National Park in Virginia.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community is included in the Delaware Water Gap National Recreation Area vegetation classification. While outside the APPA corridor, this community may be identified during APPA accuracy assessment.
Global Range: This association is widely but locally distributed from the western Piedmont foothills in Maryland (e.g., Sugarloaf Mountain) and Virginia (e.g., Bull Run Mountain) through the Blue Ridge and Ridge and Valley portions of the Central Appalachians, north at least to the Delaware Water Gap in Pennsylvania and New Jersey. The type is fairly common on the siliciclastic western flank of the Northern Blue Ridge and throughout the Ridge and Valley in west-central and northwestern Virginia. It is also frequent in the Ridge and Valley region of Pennsylvania (T. Smith pers. comm.) but may be restricted to the northeastern tier of counties in West Virginia. The potential range of this association covers a much larger geographic area.

Common Name: **Central Appalachian Mafic Boulderfield**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Appalachian Cliff & Rock Vegetation (G840)
Alliance	Appalachian Lichen Boulderfield Alliance (A3991)

ELEMENT CONCEPT

Global Summary: This association is known only from four counties on the northern Virginia Blue Ridge, where it occurs on fully exposed, minimally weathered metabasalt boulderfields at elevations from about 670 to 1160 m (2200-3800 feet). Vascular plants are generally absent and lichens dominate these habitats. *Lasallia papulosa* and *Stereocaulon glaucescens* are generally abundant and conspicuous in variable combinations. Although not abundant, *Chrysothrix chlorina* is scattered on sheltered boulder faces and in grottoes and is a good diagnostic species as it appears to be absent from siliciclastic boulderfields in this region. A variety of other foliose, crustose and fruticose lichen species are associated, including several characteristic arctic-boreal species at higher elevations.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This nonvascular vegetation occurs on fully exposed, minimally-weathered metabasalt boulderfields at elevations from about 670 to 1,160 m (2,200-3,800 feet) in the northern Virginia Blue Ridge.

Global Environment: This association occurs on fully exposed, minimally weathered metabasalt boulderfields at middle and high elevations of the northern Blue Ridge. The known elevation range is from about 670 to 1160 m (2200-3800 feet), with the majority of acreage located above 915 m (3000 feet). Aspect is variable among sites, but slopes are typically steep to very steep (often >30°). Block size is typically <1 m, with the surficial boulders in the field somewhat loose. Although this association is most extensive on boulder deposits, it may also occur on fully exposed outcrops associated with the boulderfields.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Lasallia papulosa* and *Stereocaulon glaucescens* are abundant and conspicuous in variable combinations; *Chrysothrix chlorina* is scattered on sheltered boulder faces.

Global Vegetation: Vascular plants are generally absent and lichens dominate. Maximum patch size is about one acre, and many patches are much smaller. *Lasallia papulosa* and *Stereocaulon glaucescens* are generally abundant and conspicuous in variable combinations. Although not abundant, *Chrysothrix chlorina* is a good diagnostic species as it appears to be absent from siliciclastic and granitic boulderfields in this region; it is scattered on sheltered boulder faces and in grottoes, often with *Psilolechia lucida, Usnea halei*, and *Ramalina intermedia*. Other minor umbilicate and foliose species include *Flavoparmelia baltimorensis, Parmelia sulcata*, and *Umbilicaria muehlenbergii*. Many crustose species occur, including *Aspicilia cinerea, Diploschistes scruposus, Fuscidea recensa, Lepraria* spp., *Porpidia* spp., *Rhizocarpon rubescens*, and *Trapeliopsis granulosa*. Flat surfaces and interstices that have thin deposits of organic matter often support a variety of fruticose lichens, including *Cladina rangiferina, Cladina stellaris, Cladonia crispata, Cladonia furcata, Cladonia pleurota*, and *Cladonia squamosa*. At higher elevations, a number of characteristic arctic-boreal lichens occur, including *Cladonia coccifera, Melanelia stygia, Microcalicium arenarium, Parmelia omphalodes, Porpidia tuberculosa, Rhizocarpon geographicum*, and *Umbilicaria caroliniana*. Along the edges of the boulderfields, scattered individuals or patches of *Polypodium appalachianum, Hylotelephium telephioides*, and other vascular plants may occur in transition zones with forests or woodlands.

Global Dynamics: The exposed rock surfaces supporting this community are subject to fluctuating, daily extremes of temperature, humidity, and moisture saturation during the growing season, as well as to low temperatures, high winds, and frequent ice during the winter. Boulderfield habitats have resulted from periglacial phenomena and the collapse of resistant strata from weathering and erosion of weaker underlying rocks. Most Central Appalachian boulderfields are well-weathered and now support woodland or forest vegetation. In this region, metabasalt underlies much less acreage than quartzite and sandstone and is less resistant to weathering. Consequently, exposed metabasalt boulderfields are quite rare.

CONSERVATION STATUS RANK

Global Rank & Reasons: G1? (7-Dec-2006). As currently defined, this association has an extremely narrow geographic range, with fewer than 20 known discrete patches covering an aggregate area of less than 10 acres. Although well-weathered, forested talus of metabasalt and similar mafic rocks are locally common in the Central Appalachians, fully exposed, minimally weathered boulderfields of these substrates are extremely rare in the region.

RELATED CONCEPTS

Global Similar Types:
- *Lasallia (papulosa, pensylvanica) - Dimelaena oreina - (Melanelia culbersonii)* Nonvascular Vegetation (CEGL004142) occurs on low- to middle-elevation siliciclastic boulderfields of the same region, has a different species composition, and has different relative abundances of shared species.
- *Umbilicaria muehlenbergii - Lasallia papulosa - (Melanelia stygia)* Nonvascular Vegetation (CEGL004389) occurs on high-elevation siliciclastic rocks of the Ridge and Valley and Allegheny Mountains.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Classification of this association is based on geographically limited lichen inventories in Shenandoah National Park.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Classification of this association is based on geographically limited lichen inventories in Shenandoah National Park. In the park inventory, lichens were mass-collected from boulderfield and outcrop habitats on different geologic substrates and specimens were identified by Richard Harris (New York Botanical Garden), Don Flenniken (author of Macrolichens of West Virginia), and James Lawry (George Mason University). Classification of lichen communities in eastern North America is currently difficult and tentative because inventory and data are generally lacking. Because *Stereocaulon glaucescens* and many other species in this association have northern or arctic-boreal ranges, related boulderfield communities are most likely to be found north of Virginia.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This rare mafic nonvascular type occurs in Shenandoah National Park in Virginia.
Global Range: This association is known only from metabasalt districts in four counties on the northern Virginia Blue Ridge. The potential range is larger, but suitable habitat (i.e., mafic substrates at higher elevations) are not known to occur elsewhere in the Central Appalachians.

A4229 Appalachian-Northeastern Acidic Talus Alliance

Alliance Summary Description:

[CEGL006422] *Juniperus virginiana / Corydalis sempervirens* Cliff Sparse Vegetation

Translated Name: **Eastern Red-cedar / Rock Harlequin Cliff Sparse Vegetation**
Common Name: **Eastern Temperate Acidic Cliff**

USNVC Classification

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Appalachian Cliff & Rock Vegetation (G840)
Alliance	Appalachian-Northeastern Acidic Talus Alliance (A4229)

Element Concept

Global Summary: This sparsely vegetated cliff association occurs in the oak - pine - hemlock forest region of the northeastern U.S. The setting is dry vertical exposures of resistant acidic bedrock such as granite, quartzite, sandstone, shale or schist, with little or no soil development. These cliffs are mostly dry but may contain small areas of seepy conditions, with associated floristic variation. The patchy vegetation is restricted to cracks and crevices and can vary from well-vegetated to barren across the cliff face. In most cases, overall cover averages less than 25%. The association presents itself as a mixture of open rock, scrubby trees and shrubs, herbaceous plants, and bryoids. Typical tree species include *Juniperus virginiana, Fraxinus americana, Acer rubrum*, and *Betula papyrifera*; none usually grow very large. Individuals of additional tree species from the surrounding forest may also be present; these include *Tsuga canadensis, Quercus* spp., and *Carya* spp. *Rubus odoratus, Rubus allegheniensis*, and *Rhus copallinum* are representative shrubs. Woody vines include *Vitis aestivalis* and *Parthenocissus quinquefolia*. Herbaceous composition varies; typical species include *Deschampsia flexuosa, Danthonia spicata, Campanula rotundifolia, Aquilegia canadensis, Corydalis sempervirens, Saxifraga virginiensis*, and *Woodsia ilvensis*. *Adlumia fungosa* may be found in these habitats; *Opuntia humifusa* occurs in some of the most southerly occurrences of this association.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This community is found on cliff faces developed on resistant acidic bedrock such as granite, quartzite, sandstone, shale or schist, with little or no soil development. The outcrops are typically vertical to near-vertical. Exposure varies, and moisture regime likewise varies from dry on the exposed faces to moist on more protected or seepy areas.
Global Environment: This community is found on cliff faces developed on resistant acidic bedrock such as granite, quartzite, sandstone, shale or schist, with little or no soil development. The outcrops are typically vertical to near-vertical. Exposure varies, and moisture regime likewise varies from dry on the exposed faces to moist on more protected or seepy areas. These cliffs may contain small areas of seepage vegetation among the generally dry substrate. [For extensive seepage cliffs, see the cliff seep association *Drosera rotundifolia - Viola* spp. Cliff Sparse Vegetation (CEGL006429).]

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The patchy vegetation is restricted to cracks and crevices and can vary from well-vegetated to barren across the cliff face. In most cases, overall cover averages less than 25%. The association presents itself as a mixture of open rock, scrubby trees and shrubs, herbaceous plants, and bryoids. Typical tree species include *Juniperus virginiana, Fraxinus americana, Acer rubrum*, and *Betula papyrifera*; none usually grow very large. Individuals of additional tree species from the

surrounding forest may also be present; these include *Tsuga canadensis, Quercus* spp., and *Carya* spp. *Rubus odoratus, Rubus allegheniensis*, and *Rhus copallinum* are representative shrubs. Woody vines include *Vitis aestivalis* and *Parthenocissus quinquefolia*. Herbaceous composition varies; typical species include *Deschampsia flexuosa, Danthonia spicata, Campanula rotundifolia, Aquilegia canadensis, Corydalis sempervirens, Saxifraga virginiensis*, and *Woodsia ilvensis*. *Opuntia humifusa* occurs in some of the most southerly occurrences of this association.
Global Vegetation: The patchy vegetation is restricted to cracks and crevices and can vary from well-vegetated to barren across the cliff face. In most cases, overall cover averages less than 25%. The association presents itself as a mixture of open rock, scrubby trees and shrubs, herbaceous plants, and bryoids. Typical tree species include *Juniperus virginiana, Fraxinus americana, Acer rubrum*, and *Betula papyrifera*; none usually grow very large. Individuals of additional tree species from the surrounding forest may also be present; these include *Tsuga canadensis, Quercus* spp., and *Carya* spp. *Rubus odoratus, Rubus allegheniensis*, and *Rhus copallinum* are representative shrubs. Woody vines include *Vitis aestivalis* and *Parthenocissus quinquefolia*. Herbaceous composition varies; typical species include *Deschampsia flexuosa, Danthonia spicata, Campanula rotundifolia, Aquilegia canadensis, Corydalis sempervirens, Saxifraga virginiensis*, and *Woodsia ilvensis*. *Opuntia humifusa* occurs in some of the most southerly occurrences of this association.
Global Dynamics: This community consists of drought-tolerant species that take advantage of thin layers of soil that form on narrow ledges or in bedrock crevices (Podniesinski 2005). The successional stages of this type vary with resource availability from bare rock outcrops with no vegetation, to outcrops with lichen cover, to outcrops with lichen and moss cover, to outcrops with grass cover, and eventually to rock outcrops with stunted woodland or forest cover. These stages overlap in time and space, depending on resource availability (Collins and Anderson 1994). Species composition is variable given the limited habitat to support vegetation and the unpredictable nature of plant colonization and establishment. Trees are typically absent from this community, but when present, they are usually stunted and less than 10 m in height (Podniesinski 2005). Tree roots may straddle boulders or run horizontally over rock surfaces as they cannot penetrate the rock surface (Collins and Anderson 1994).

Translated Name: **(Rock Polypody, Appalachian Polypody) / Lichens Nonvascular Vegetation**
Common Name: **Northern Lichen Talus Barrens**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Appalachian Cliff & Rock Vegetation (G840)
Alliance	Appalachian-Northeastern Acidic Talus Alliance (A4229)

ELEMENT CONCEPT

Global Summary: This sparsely vegetated, open talus slope of the northern Appalachian Mountains region is characterized by large boulder talus dominated by lichen cover. Soil is confined to shallow accumulations in rock pockets, and higher plant growth is limited by both lack of nutrients and dry conditions. Little data are available on the dominant lichens, but they can include *Umbilicaria* spp., as well as other common foliose and crustose species. Vascular plants are a variable mix of scattered individuals of *Picea rubens, Betula papyrifera var. cordifolia, Betula papyrifera var. papyrifera, Betula alleghaniensis, Acer spicatum, Sorbus americana* and/or *Sorbus decora, Polypodium virginianum, Polypodium appalachianum, Deschampsia flexuosa*, and *Parthenocissus quinquefolia*. In more southern examples of this community, *Betula populifolia, Tsuga canadensis, Ostrya virginiana, Juniperus virginiana*, and *Quercus rubra* may be present. The community provides denning sites for small mammals and snakes.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: Sites are very steep, lichen-covered talus slopes and boulderfields occurring at mid elevations of 300 to 900 m (984-2,953 feet) with little to no soil accumulation.

Global Environment: This sparsely vegetated, open talus slope of the northern Appalachian Mountains region is characterized by large boulder talus dominated by lichen cover. Soil is confined to shallow accumulations in rock pockets, and higher plant growth is limited by both lack of nutrients and dry conditions.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: *Cladina* spp. and *Cladonia* spp. are characteristic of this community. Scattered and isolated patches of stunted vegetation are possible at low cover (≤10%) and include, but not are limited to, *Picea rubens, Betula papyrifera var. cordifolia*, dwarf ericads such as *Vaccinium* spp., and *Polypodium* spp.

Global Vegetation: Little data are available on the dominant lichens, but they can include *Umbilicaria* spp., as well as other common foliose and crustose species. Vascular plants are a variable mix of scattered individuals of *Picea rubens, Betula papyrifera var. cordifolia, Betula papyrifera var. papyrifera, Betula alleghaniensis, Acer spicatum, Sorbus americana* and/or *Sorbus decora, Polypodium virginianum, Polypodium appalachianum, Deschampsia flexuosa*, and *Parthenocissus quinquefolia*. In more southern examples of this community, *Betula populifolia, Tsuga canadensis, Ostrya virginiana, Juniperus virginiana*, and *Quercus rubra* may be present.

G839. LAURENTIAN-ACADIAN-GREAT LAKES CLIFF & ROCK VEGETATION

Group Summary Description: This structurally and floristically variable group is found in the Great Lakes region of the U.S. and Canada, and northern New England on both alkaline and acidic cliffs. Overall, vegetation varies from sparse nonvascular vegetation to open-treed or shrubby communities. Acidic cliffs include igneous, metamorphic, or sedimentary rock. Woody acidic cliff species may include *Juniperus communis, Amelanchier* spp., stunted individuals of *Betula papyrifera, Picea rubens, Pinus banksiana, Pinus resinosa, Pinus strobus*, and *Quercus rubra*. Shrubs may include *Alnus viridis ssp. crispa (= Alnus crispa), Arctostaphylos uva-ursi, Diervilla lonicera, Juniperus communis, Physocarpus opulifolius*, and *Vaccinium angustifolium*. Common herbs include *Athyrium filix-femina, Campanula rotundifolia, Cystopteris fragilis, Danthonia spicata, Deschampsia caespitosa, Dryopteris carthusiana, Dryopteris fragrans, Dryopteris marginalis, Euthamia graminifolia, Fragaria virginiana, Phegopteris connectilis (= Thelypteris phegopteris), Poa compressa, Polypodium appalachianum, Rubus pubescens*, and *Sibbaldiopsis tridentata (= Potentilla tridentata)*. Cliff faces include acidic igneous or metamorphic rock (gneiss, schist, granite, and quartzite). Soils are largely absent, confined to cracks and crevices. Extensive cliff formations occur on the shores of the Great Lakes and other large waterbodies; inland locations often support extensive talus slopes at their bases as a result of weathering and rockslides.

Alkaline cliff vegetation varies from sparse nonvascular vegetation to open-treed or shrubby communities. Nonvascular alkaline cliff plants (lichens, mosses, and liverworts) are common on the exposed cliff face, but vascular plant cover is sparse and patchy, confined to cracks or between boulders at the base of the slope where thin soils accumulate beneath talus. Overhanging trees from the ridgetop may include *Acer saccharum, Thuja occidentalis*, and *Abies balsamea*, and stunted individuals of *Betula papyrifera* may occur on the cliff face. Other woody plants may include *Shepherdia canadensis, Diervilla lonicera, Acer spicatum*, and others. Common herbs may include *Asplenium trichomanes, Geranium robertianum, Maianthemum canadense, Pellaea glabella, Polypodium virginianum, Pteridium aquilinum*, and *Trientalis borealis*. The bedrock may consist of alkaline igneous, metamorphic, or sedimentary rocks. Alkaline rocky cliffs are predominantly dolostone when associated with the Niagaran Escarpment along the northern Lake Michigan and Lake Huron shorelines, perhaps best developed on Drummond Island and adjacent Ontario islands. Alkaline basalts characterize these systems along portions of the Lake Superior shoreline, with a generally distinguishable flora from those on dolostone.

A4007 Laurentian-Acadian-Great Lakes Acidic Cliff Alliance

Alliance Summary Description: This acidic cliff alliance of the Great Lakes and New England portion of the U.S. and adjacent Canada occurs on acidic igneous, metamorphic, or sedimentary rock. Vegetation varies from sparse nonvascular vegetation to open-treed or shrubby communities. Vascular vegetation is sparse and largely confined to crevices. Woody species may include *Juniperus communis, Amelanchier* spp., stunted individuals of *Betula papyrifera, Picea rubens, Pinus banksiana, Pinus resinosa, Pinus strobus*, and *Quercus rubra*. Shrubs may include *Alnus viridis ssp. crispa (= Alnus crispa), Arctostaphylos uva-ursi, Diervilla lonicera, Juniperus communis, Physocarpus opulifolius*, and *Vaccinium angustifolium*. Common herbs include *Athyrium filix-femina, Campanula rotundifolia, Cystopteris fragilis, Danthonia spicata, Deschampsia caespitosa, Dryopteris carthusiana, Dryopteris fragrans, Dryopteris marginalis, Euthamia graminifolia, Fragaria virginiana, Phegopteris connectilis (= Thelypteris phegopteris), Poa compressa, Polypodium appalachianum, Rubus pubescens*, and *Sibbaldiopsis tridentata (= Potentilla tridentata)*.

[CEGL006429] *Drosera rotundifolia - Viola* spp. Cliff Sparse Vegetation

Translated Name: **Roundleaf Sundew - Violet species Cliff Sparse Vegetation**
Common Name: **Northern Appalachian Cliff Seep**

USNVC Classification

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Laurentian-Acadian-Great Lakes Cliff & Rock Vegetation (G839)
Alliance	Laurentian-Acadian-Great Lakes Acidic Cliff Alliance (A4007)

Element Concept

Global Summary: This vegetation develops on cliff faces where seepage or other water maintains wet conditions over a large area. Vascular plants are sparse overall although they may be locally abundant; bryophytes are often abundant. Because mineral composition of the substrate can differ over small distances, nutrient regime (including pH) and species composition can vary across the cliff. Typical species of more acidic areas include *Viola cucullata, Viola macloskeyi ssp. pallens, Oclemena acuminata (= Aster acuminatus), Drosera rotundifolia, Chrysosplenium americanum, Cinna latifolia*, and *Rubus pubescens*. In areas of higher pH, calciphiles such as *Dasiphora fruticosa ssp. floribunda, Saxifraga virginiensis, Cystopteris bulbifera*, and *Packera schweinitziana (= Senecio robbinsii)* can occur. These cliff seeps of the northeastern U.S. have been poorly studied and may encompass more than one association.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association has only been sampled from Pinkham Notch on a steep, seepy slope at 180 m (590 feet) elevation.
Global Environment: Vertical or near-vertical cliff faces kept wet by interstitial water emerging from the rock face or, in some cases, by flow from above. The protected and wet setting creates a cool microclimate.

Vegetation Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by sparse to open herbaceous vegetation. Typical species include *Calamagrostis canadensis, Cystopteris tenuis, Glyceria borealis, Gymnocarpium dryopteris, Oclemena acuminata, Oxalis montana*, and *Phegopteris connectilis*. Shrubs may be present but at sparse cover.
Global Vegetation: Vascular plants are sparse overall although they may be locally abundant; bryophytes are often abundant. Because mineral composition of the substrate can differ over small distances, nutrient regime (including pH) and species composition can vary across the cliff. Typical species of more acidic areas include *Viola cucullata, Viola macloskeyi ssp. pallens, Oclemena acuminata (= Aster acuminatus), Drosera rotundifolia, Chrysosplenium americanum, Cinna latifolia*, and *Rubus pubescens*. In areas of higher pH, calciphiles such as *Dasiphora fruticosa ssp. floribunda, Saxifraga virginiensis, Cystopteris bulbifera*, and *Packera schweinitziana (= Senecio robbinsii)* can occur.

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Laurentian-Acadian-Great Lakes Cliff & Rock Vegetation (G839)
Alliance	Laurentian-Acadian-Great Lakes Acidic Cliff Alliance (A4007)

ELEMENT CONCEPT

Global Summary: This sparsely vegetated cliff association occurs in the spruce-fir forest region of northern New England and New York, and adjacent Canadian provinces. The setting is dry vertical exposures of resistant acidic bedrock such as granite, quartzite, sandstone or schist, with little or no soil development. These cliffs are mostly dry, but may contain small areas of seepy conditions, with associated floristic variation. The patchy vegetation is restricted to cracks and crevices, and can vary from well-vegetated to barren across the cliff face. The association presents itself as a mixture of open rock, scrubby trees and shrubs, herbaceous plants, and bryoids. Typical woody species include *Picea rubens, Abies balsamea, Sorbus decora, Sorbus americana, Betula papyrifera var. papyrifera, Betula papyrifera var. cordifolia, Diervilla lonicera, Ribes triste, Acer rubrum, Acer spicatum*, and *Alnus viridis*. The herbaceous component may feature graminoids such as *Deschampsia flexuosa, Danthonia spicata*, or *Carex brunnescens*; wiry ferns, such as *Polypodium virginianum, Polypodium appalachianum, Cystopteris fragilis, Dryopteris marginalis, Dennstaedtia punctilobula*, and *Woodsia ilvensis*; and herbs, such as *Solidago simplex var. randii, Campanula rotundifolia*, and *Sibbaldiopsis tridentata (= Potentilla tridentata)*. *Paronychia argyrocoma* occurs on some cliffs. Bryoids are not well documented, but the lichen flora often includes *Umbilicaria* spp. This association differs from other northeastern cliff vegetation types by the absence of calciphiles and the characteristically sub-boreal flora, lacking *Quercus* spp. and *Juniperus virginiana*, and with little or no *Tsuga canadensis*. Cliffs intermediate between the acidic versus calcareous substrate and sub-boreal versus temperate setting do occur.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This sparsely vegetation herbaceous association occurs on very steep south-facing cliffs and escarpments at elevation ranging from 650 to 1,200 m (2,130-3,940 feet). The non-vegetated substrate is >90% bedrock.

Global Environment: This sparsely vegetated cliff association occurs in the spruce-fir forest region of northern New England and New York, and adjacent Canadian provinces. The setting is dry vertical exposures of resistant acidic bedrock such as granite, quartzite, sandstone or schist, with little or no soil development. These cliffs are mostly dry, but may contain small areas of seepy conditions, with associated floristic variation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by sparse herbaceous vegetation with no clear dominants. Species have low consistency among sites and may include *Agrostis scabra, Carex brunnescens, Carex debilis, Carex lucorum, Danthonia spicata, Dennstaedtia punctilobula, Doellingeria umbellata, Dryopteris campyloptera, Maianthemum canadense, Oclemena acuminata, Polygonum cilinode, Polypodium virginianum*, and *Solidago simplex ssp. randii var. randii*. Tree saplings of species, including *Abies balsamea, Betula alleghaniensis, Picea rubens*, and *Sorbus americana*, are common.

Global Vegetation: The patchy vegetation is restricted to cracks and crevices, and can vary from well-vegetated to barren across the cliff face. The association presents itself as a mixture of open rock, scrubby trees and shrubs, herbaceous plants, and bryoids. Typical woody species include *Picea rubens, Abies balsamea, Sorbus decora, Sorbus americana, Betula papyrifera var. papyrifera, Betula papyrifera var. cordifolia, Diervilla lonicera, Ribes triste, Acer rubrum, Acer spicatum*, and *Alnus viridis*. A4006 Laurentian-Acadian-Great Lakes Alkaline Cliff Alliance

Alliance Summary Description: Overall, vegetation varies from sparse nonvascular vegetation to open-treed or shrubby communities. Nonvascular plants (lichens, mosses, and liverworts) are common on the exposed cliff face, but vascular plant cover is sparse and patchy, confined to cracks or between boulders at the base of the slope where thin soils accumulate beneath talus. Overhanging trees from the ridgetop may include *Acer saccharum, Thuja occidentalis*, and *Abies balsamea*, and stunted individuals of *Betula papyrifera* may occur on the cliff face. Other woody plants may include *Shepherdia canadensis, Diervilla lonicera, Acer spicatum*, and others. Common herbs may include *Asplenium trichomanes, Geranium robertianum, Maianthemum canadense, Pellaea glabella, Polypodium virginianum, Pteridium aquilinum*, and *Trientalis borealis*. This alliance is found in the Great Lakes region of the U.S. and Canada east to northern New England where exposed bedrock dominates the cliff face. The bedrock may consist of alkaline igneous, metamorphic, or sedimentary rocks. Alkaline rocky cliffs are predominantly dolostone when associated with the Niagaran Escarpment along the northern Lake Michigan and Lake Huron shorelines, perhaps best developed on Drummond Island and adjacent Ontario islands. Alkaline basalts characterize these systems along portions of the Lake Superior shoreline, with a generally distinguishable flora from those on dolostone.

[CEGL006526] *Carex scirpoidea* Alkaline Cliff Sparse Vegetation

Translated Name: **Northern Single-spike Sedge Alkaline Cliff Sparse Vegetation**
Common Name: **Near-Boreal Alkaline Cliff**

USNVC CLASSIFICATION

Division	Eastern North American Temperate & Boreal Cliff, Scree & Rock Vegetation (6.B.1.Na)
Macrogroup	Eastern North American Cliff & Rock Vegetation (M111)
Group	Laurentian-Acadian-Great Lakes Cliff & Rock Vegetation (G839)
Alliance	Laurentian-Acadian-Great Lakes Alkaline Cliff Alliance (A4006)

ELEMENT CONCEPT

Global Summary: This sparsely vegetated cliff association occurs in sub-boreal settings of northern New England, New York, and adjacent Canadian provinces, where weathering of calcium-bearing rock creates calcareous conditions. It is usually found above 305 m (1000 feet) elevation. The vertical cliffs may be composed of alkaline bedrock such as limestone, but this vegetation can also be found on cliffs where the matrix rock is acidic (e.g., schists or even granite), either where local inclusions weather to more nutrient-rich conditions or where fractures conduct more nutrient-rich seepage waters. These cliffs are mostly dry, but may contain small areas of seepy conditions, with associated floristic variation. The patchy vegetation is restricted to cracks and crevices, and can vary from well-vegetated to barren across the cliff face. It is a mixture of scrubby trees and shrubs, herbaceous plants, and bryoids. Characteristic woody plants include *Thuja occidentalis, Alnus viridis, Picea rubens, Acer spicatum, Betula papyrifera, Betula alleghaniensis, Ribes triste, Rubus odoratus, Sambucus racemosa (= Sambucus pubens)*, and *Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda)*. Herbs include some assortment of *Carex scirpoidea, Carex eburnea, Carex brunnescens, Trichophorum caespitosum (= Scirpus cespitosus), Aralia racemosa, Primula mistassinica, Primula laurentiana, Lobelia kalmii, Arabis lyrata, Saxifraga virginiensis, Saxifraga paniculata (= Saxifraga aizoon), Saxifraga oppositifolia, Saxifraga aizoides, Draba breweri var. cana (= Draba lanceolata), Pinguicula vulgaris*, and *Rhodiola rosea (= Sedum rosea)*. Characteristic ferns include *Cryptogramma stelleri, Asplenium trichomanes, Asplenium trichomanes-ramosum, Dryopteris fragrans, Cystopteris bulbifera, Cystopteris fragilis, Gymnocarpium dryopteris, Woodsia ilvensis*, and *Woodsia glabella*. *Dryopteris fragrans* and *Woodsia ilvensis* are more constant than the other vascular species. The bryoid flora can be diverse but is little documented outside of New Hampshire. Noted in the New Hampshire study were the calciphiles *Distichium capillaceum, Gymnostomum aeruginosum*, and *Tortella tortuosa*, and the circumneutral indicators *Amphidium mougeotii* (the most frequent of the indicators), *Diplophyllum apiculatum, Mnium thomsonii, Myurella sibirica*, and *Polytrichastrum alpinum (= Pogonatum alpinum)*. This association is differentiated from other northeastern cliff associations by the combination of a sub-boreal setting (as evidenced by the woody plants within and surrounding this vegetation: *Picea rubens, Alnus viridis, Acer spicatum*, etc.) and the presence of calciphiles such as *Dryopteris fragrans, Dasiphora fruticosa ssp. floribunda*, and *Campanula rotundifolia*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: The only known occurrence of this association is found on a steep abrupt slope in a midslope position at 850 m (2,790 feet) elevation. The substrate is rapidly drained and consists mostly of bedrock.

Global Environment: This sparsely vegetated cliff association occurs in sub-boreal settings of northern New England and New York, and adjacent Canadian provinces, where weathering of calcium-bearing rock creates calcareous conditions. It is usually found above 305 m (1000 feet) elevation. The vertical cliffs may be composed of alkaline bedrock such as limestone, but this vegetation can also be found on cliffs where the matrix rock is acidic (e.g., schists or even granite), either where local inclusions weather to more nutrient-rich conditions or where fractures conduct more nutrient-rich seepage waters. These cliffs are mostly dry, but may contain small areas of seepy conditions, with associated floristic variation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only known occurrence of this association consists of an open canopy of *Thuja occidentalis*. Canopy cover does not exceed 20%. The shrub layer consists of scattered tree saplings, including *Acer pensylvanicum, Acer pensylvanicum, Betula papyrifera var. cordifolia, Prunus pensylvanica, Sorbus americana*, and *Sorbus decora*. The herbaceous layer is open with no clear dominants. Species include *Carex communis, Carex peckii, Cystopteris tenuis, Eurybia macrophylla, Euthamia graminifolia, Maianthemum canadense, Oclemena acuminata, Solidago canadensis*, and *Solidago rugosa*.

Global Vegetation: The patchy vegetation is restricted to cracks and crevices, and can vary from well-vegetated to barren across the cliff face. It is a mixture of scrubby trees and shrubs, herbaceous plants, and bryoids. Characteristic woody plants include *Thuja occidentalis, Alnus viridis, Picea rubens, Acer spicatum, Betula papyrifera, Ribes triste, Rubus odoratus, Sambucus racemosa (= Sambucus pubens)*, and *Dasiphora fruticosa ssp. floribunda (= Pentaphylloides floribunda)*. Herbs include some assortment of *Carex scirpoidea, Carex eburnea, Carex brunnescens, Trichophorum caespitosum (= Scirpus cespitosus), Aralia racemosa, Primula mistassinica, Primula laurentiana, Lobelia kalmii, Arabis lyrata, Saxifraga virginiensis, Saxifraga paniculata (= Saxifraga aizoon), Saxifraga oppositifolia, Saxifraga aizoides, Draba breweri var. cana (= Draba lanceolata), Pinguicula vulgaris*, and *Rhodiola rosea (= Sedum rosea)*. Characteristic ferns include *Cryptogramma stelleri, Asplenium trichomanes-ramosum, Dryopteris fragrans, Cystopteris bulbifera, Cystopteris fragilis, Gymnocarpium dryopteris, Woodsia ilvensis*, and *Woodsia glabella*. The bryoid flora can be diverse but is little documented.

Translated Name: **Norway Spruce Forest Plantation**
Common Name: **Norway Spruce Plantation**

USNVC CLASSIFICATION

Division	Forest Plantation (7.A.2.1.)
Macrogroup	Temperate & Boreal Plantation (CGR007)
Group	Eastern North American Temperate Forest Plantation (CSG005)
Alliance	Exotic Northern Conifer Plantation Cultural Type (CTY014)

ELEMENT CONCEPT

Global Summary: These plantation forests are dominated by the exotic species *Picea abies*, which makes up 70-100% of the canopy. The understory is typically sparse with little, if any, spruce regeneration. Hardwood regeneration and herbaceous species composition tend to reflect the pre-plantation forest types. In the Southeast this occurs as experimental plantations.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: No data are available.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: Spruce plantations are found on gentle to moderate slopes and summits. Soils include mesic somewhat poorly drained silt loam and dry-mesic well-drained sandy loam and loam. The unvegetated surface consists of leaf litter, with small amounts of exposed bedrock, large rocks and/or downed wood. Evidence of disturbance includes managed tree plantings and the presence of exotic plants.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is currently known from one location on a flat at the base of a low slope. Soils are mesic and somewhat poorly drained.
Global Environment: This community represents vegetation that has been planted in its current location by humans.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: Spruce plantations are dominated by *Picea abies* and/or any combination of spruce species. A successional understory may be present with *Prunus serotina, Acer rubrum, Rubus* spp., *Dennstaedtia punctilobula*, and others.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is dominated by *Picea abies* and at one site, *Picea glauca*. A successional understory may be present with *Prunus serotina, Acer pensylvanicum, Rubus* spp., *Dennstaedtia punctilobula, Dryopteris intermedia*, and others.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only known location for this association is characterized by an open mixed evergreen/deciduous canopy dominated by *Picea abies* and *Fraxinus pennsylvanica*. The understory is a dense mix of regenerating trees. The herbaceous layer is dominated by *Solidago canadensis* along with other various herbaceous species.

Global Vegetation: These plantation forests are dominated by the exotic species *Picea abies*, which makes up 70-100% of the canopy. The understory is typically sparse with little, if any, spruce regeneration. Hardwood regeneration and herbaceous species composition tend to reflect the pre-plantation forest types.

Appalachian National Scenic Trail (Northern Appalachian Project Area): Invasive/Exotic Plants: *Picea abies* (exotic/invasive)
Global: Invasive/Exotic Plants: *Picea abies*

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (cultural) (8-Aug-2000). This community represents vegetation which has been planted in its current location by humans and/or is treated with annual tillage, a modified conservation tillage, or other intensive management or manipulation. It is not a conservation priority and does not receive a conservation rank.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Found in south-central PA in the area around Michaux State Forest. Clearly something planted by the PA forestry commission.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: One site in Shrewsbury (Rutland County, VT) was once an apple orchard; the stand is currently a "botanical desert" with only *Thelypteris noveboracensis*.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: The only observation point representing this association is not a confident attribution as the spruce trees do not appear to be planted.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: No data are available.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Massachusetts at Beartown State Forest, Bald Top, and Mount Williams Reservoir.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only known from one location on the Kennebec River in Maine.
Global Range: These plantations are known from the northeastern United States extending south to North Carolina and west to Ohio.

[CST006313] *Pinus* spp. Forest Plantation

Translated Name: **Pine species Forest Plantation**
Common Name: **Mixed Pine Conifer Plantation**

USNVC CLASSIFICATION

Division	Forest Plantation (7.A.2.1.)
Macrogroup	Temperate & Boreal Plantation (CGR007)
Group	Eastern North American Temperate Forest Plantation (CSG005)
Alliance	Exotic Northern Conifer Plantation Cultural Type (CTY014)

ELEMENT CONCEPT

Global Summary: These plantations consist of mature *Pinus strobus* or *Pinus sylvestris*, with other conifers sometimes present in smaller amounts, planted in post-agricultural fields and pastures. Associated canopy conifers include *Pinus resinosa, Picea abies, Picea pungens*, or *Larix decidua*. The understory varies widely in its degree of development and may be virtually absent. Northern hardwoods dominate the sapling and seedling layers in some areas; *Juniperus virginiana* is common in others. Cover is proportional to the degree of canopy break-up or opening that has occurred. Common hardwoods include *Prunus serotina, Acer rubrum*, and *Fraxinus americana*. A tall-shrub layer may be present; common species (aside from smaller individuals of the hardwood saplings) include *Crataegus* spp., *Hamamelis virginiana*, and *Lindera benzoin*. Common short shrubs include *Viburnum recognitum, Vaccinium pallidum, Rubus hispidus*, and *Rubus flagellaris*. The species composition and abundance of the herbaceous layer vary widely due to variation in canopy tree species composition, stand stocking, and soil drainage. Herbaceous species include *Ageratina altissima (= Eupatorium rugosum), Dryopteris intermedia, Dryopteris carthusiana, Oxalis stricta, Potentilla simplex, Mitchella repens, Galium aparine, Galium asprellum, Brachyelytrum*

erectum, Veronica officinalis, Polystichum acrostichoides, Maianthemum canadense, Trientalis borealis, Lycopodium clavatum, and *Lycopodium digitatum (= Diphasiastrum digitatum)*. Graminoid and forb species associated with disturbed areas, such as *Agrostis stolonifera, Dichanthelium clandestinum (= Panicum clandestinum), Dennstaedtia punctilobula*, and *Hypericum perforatum*, are often dominant in these communities. Vines such as *Toxicodendron radicans, Smilax glauca, Smilax rotundifolia, Vitis* spp., and *Parthenocissus quinquefolia* may be present, but not abundant, in these plantations. Disturbance from silvicultural treatments and landscape fragmentation leaves these communities prone to invasion by exotic species, including *Lonicera tatarica, Berberis vulgaris, Rosa multiflora, Celastrus orbiculata, Microstegium vimineum*, and *Alliaria petiolata*, which are locally abundant.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This mixed conifer plantation was sampled once in Cumberland County, Pennsylvania, on a flat, dry summit with sandy loam soil. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes managed tree plantings and the presence of exotic plant species.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: These plantations of mixed pines or pine mixed with other non-native conifers have been planted in post-agricultural fields and pastures. They are common throughout the Northeast.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: These mature plantations are planted in post-agricultural fields and pastures. The trees are typically even-aged and regularly-spaced. Soils are usually moderately well-drained to well-drained and vary from sandy to loamy.
Global Environment: These mature plantations are planted in post-agricultural fields and pastures. The trees are typically even-aged and regularly-spaced. Soils are usually moderately well-drained to well-drained and vary from sandy to loamy.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: These successional or planted forests are dominated by a mixture of pines (and/or other planted conifers) in canopy, mainly *Picea abies* and *Pinus strobus*. Dominant shrubs include *Gaylussacia baccata, Pinus strobus*, and *Vaccinium pallidum*. Herbs are nearly absent due to the dense canopy.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Multiple *Pinus* species can make up the canopy; other conifers are sometimes present in smaller amounts. In uncommon instances, *Tsuga canadensis* may be the sole dominant.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: These plantations consist of mature *Pinus strobus* or *Pinus sylvestris*, with other conifers sometimes present in smaller amounts, planted in post-agricultural fields and pastures. Associated canopy conifers include *Pinus resinosa, Picea abies, Picea pungens*, or *Larix decidua*. The understory varies widely in its degree of development and may be virtually absent. Northern hardwoods dominate the sapling and seedling layers in some areas; *Juniperus virginiana* is common in others. Cover is proportional to the degree of canopy break-up or opening that has occurred. Common hardwoods include *Prunus serotina, Acer rubrum*, and *Fraxinus americana*. A tall-shrub layer may be present; common species (aside from smaller individuals of the hardwood saplings) include *Crataegus* spp., *Hamamelis virginiana*, and *Lindera benzoin*. Common short shrubs include *Viburnum recognitum, Vaccinium pallidum, Rubus hispidus*, and *Rubus flagellaris*. [CST007178] *Pinus strobus* Forest Plantation

Translated Name: **Eastern White Pine Forest Plantation**
Common Name: **Eastern White Pine Plantation**

USNVC CLASSIFICATION

Division	Forest Plantation (7.A.2.1.)
Macrogroup	Temperate & Boreal Plantation (CGR007)
Group	Eastern North American Temperate Forest Plantation (CSG005)
Alliance	Native Northern Pine Plantation Cultural Type (CTY009)

ELEMENT CONCEPT

Global Summary: This eastern white pine plantation type is found throughout the northeastern and midwestern United States and adjacent Canada. Stands contain plantations of *Pinus strobus* that are maintained for the extraction of forest products. Some have been planted as reclamation projects (e.g., following strip-mining). At maturity, the tree canopy is usually dense and contains a monospecific layer of *Pinus strobus*. *Pinus resinosa* or *Pinus virginiana* is occasionally present in small amounts. In older stands or gaps, regenerating trees may include *Fagus grandifolia, Acer saccharum, Acer rubrum*, and *Prunus serotina*; *Robinia pseudoacacia* and *Betula lenta* are occasionally present. *Acer pensylvanicum* and *Ostrya virginiana* are common small trees. The shrub layer is typically sparse and mostly consists of smaller individuals of the tree species. The field layer varies from sparse to absent; it may be locally well-developed in small openings, with variable composition. In some stands, mosses may be abundant. Susceptibility to a variety of pests or diseases, including white pine blister rust (*Cronartium ribicola*) and southern pine beetle (*Dendroctonus frontalis*), has had some impact on its commercial use.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: White pine plantations were sampled once in Cumberland County, Pennsylvania, in the Central Appalachian project area. The site is a dry moderate, northwest-facing upper slope at about 600 m elevation. The unvegetated surface is dominated by leaf litter. Evidence of disturbance includes managed tree plantings and the presence of exotic plant species.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: This old white pine plantation is now a naturalized white pine forest. The site is a mesic alluvial flat with well-drained soil. The unvegetated surface consists of leaf litter, with a small amount of downed wood. Evidence of disturbance includes managed tree plantings and the presence of exotic plant species.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: Stands contain plantations of *Pinus strobus* that are maintained for the extraction of forest products. The type does well on a variety of soils. Some have been planted on strip-mine reclamation sites.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: White pine plantations were sampled infrequently along the Appalachian Trial. The one site sampled in the Southern Blue Ridge occurs in Georgia on a somewhat steep, southwest-facing slope with dry-mesic, well-drained loam soil. Leaf litter, downed wood, and large rocks are common. Evidence of disturbance includes past logging, managed tree plantings, dogwood anthracnose, and fire suppression.
Global Environment: Stands contain plantations of *Pinus strobus* that are maintained for the extraction of forest products. The type does well on a variety of soils. Some have been planted on strip-mine reclamation sites.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The very dense (80-90% cover) canopy is dominated by even-aged (clearly planted) *Pinus strobus*, which also dominates the subcanopy and shrub layers. Shrub layers are relatively sparse due to the dense canopy but may include *Gaylussacia baccata, Kalmia latifolia, Vaccinium angustifolium*, and *Vaccinium pallidum*. An herbaceous layer is nearly absent.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This community is comprised of planted and successional, even-aged *Pinus strobus*, usually with a sparse understory. Shrubs are nearly absent. *Arisaema triphyllum, Dryopteris intermedia*, and *Mitchella repens* are present herbs.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The tree canopy at maturity is usually dense and contains a monospecific layer of *Pinus strobus*. *Pinus resinosa* or *Pinus virginiana* is occasionally present in small amounts. In older stands or gaps, regenerating trees may include *Fagus grandifolia, Acer saccharum, Acer rubrum*, and *Prunus serotina*; *Robinia pseudoacacia* and *Betula lenta* are occasionally present. *Acer pensylvanicum* and *Ostrya virginiana* are common small trees. The shrub layer is typically sparse and mostly consists of smaller individuals of the tree species. The field layer varies from sparse to absent; it may be locally well-developed in small openings, with variable composition. In some stands, mosses may be abundant.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The dense evergreen canopy of these planted, even-aged forests is dominated exclusively by *Pinus strobus*. The subcanopy is made up of *Acer rubrum, Liriodendron tulipifera, Oxydendrum arboreum, Pinus strobus*, and *Quercus velutina*. The sparse shrub layers include saplings of subcanopy species along with *Kalmia latifolia, Sassafras albidum, Symplocos tinctoria, Vaccinium stamineum*, and *Vaccinium hirsutum*. Herbs are very sparse and include *Galax urceolata*.
Global Vegetation: The tree canopy at maturity is usually dense and contains a monospecific layer of *Pinus strobus*. *Pinus resinosa* or *Pinus virginiana* is occasionally present in small amounts. In older stands or gaps, regenerating trees may include *Fagus grandifolia, Acer saccharum, Acer rubrum*, and *Prunus serotina*; *Robinia pseudoacacia* and *Betula lenta* are occasionally present. *Acer pensylvanicum* and *Ostrya virginiana* are common small trees. The shrub layer is typically sparse and mostly consists of smaller individuals of the tree species. The field layer varies from sparse to absent; it may be locally well-developed in small openings, with variable composition. In some stands, mosses may be abundant.
Global Dynamics: *Pinus strobus* is susceptible to a variety of pests and diseases, including white pine blister rust (*Cronartium ribicola*) and southern pine beetle (*Dendroctonus frontalis*), which have had some impact on its commercial use. Blister rust was a problem on young plantations but is not much of a problem in larger trees in the east (P. Manion pers. comm. 2001).

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area)

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Pinus strobus*

Appalachian National Scenic Trail (Lower New England Project Area)

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Pinus strobus*

Appalachian National Scenic Trail (Northern Appalachian Project Area)

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Pinus strobus*

Appalachian National Scenic Trail (Southern Blue Ridge Project Area)

Stratum	Lifeform	Species
Tree (canopy & subcanopy)	Needle-leaved tree	*Pinus strobus*

Global

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Pinus strobus*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Pinus strobus*
Appalachian National Scenic Trail (Lower New England Project Area): *Pinus strobus*
Appalachian National Scenic Trail (Northern Appalachian Project Area): *Pinus strobus*
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Kalmia latifolia*, *Pinus strobus*, *Vaccinium hirsutum*
Global: *Pinus strobus*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Invasive/Exotic Plants: *Berberis thunbergii* (High/Medium)
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Vaccinium hirsutum* (G3)
Global: Vulnerable Plants: *Rhus aromatica* var. *arenaria* (G5T3Q)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (cultural) (8-Aug-2000). This community represents vegetation which has been planted in its current location by humans and/or is treated with annual tillage, a modified conservation tillage, or other intensive management or manipulation. It is not a conservation priority and does not receive a conservation rank.

RELATED CONCEPTS

Global Similar Types:
- *Pinus* spp. Forest Plantation (CST006313)
- *Pinus strobus* Ruderal Forest (CEGL007944)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This association is a plantation and is thus not of high conservation concern.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Because this is an easily identifiable ruderal community, it was only sampled a few times in the park.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community represents vegetation which has been planted in its current location by humans and/or is treated with annual tillage, a modified conservation tillage, or other intensive management or manipulation. It is not a conservation priority.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: Because this is an easily identifiable ruderal community, it was only sampled a few times in the park.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: This community is known to occur along the trail, but no plots or observation points were collected.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This community was sampled in Chattahoochee National Forest, Georgia, but occurs throughout the Southern Blue Ridge section of the Appalachian Trail.
Global Classification Comments: There was a lot of planting of eastern white pine from the 1930s into the 1950s, but there has been very little planting since then (P. Manion pers. comm. 2001). On the Daniel Boone National Forest of Kentucky, *Pinus strobus* plantings are of limited extent and are related to wildlife plantings. In the southern part of this type's range, there has been some damage from southern pine beetle (*Dendroctonus frontalis*). These plantations have been observed in the Peters Mountain area (James River Ranger District) and various other sites in the George Washington and Jefferson national forests.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled in Cumberland County, Pennsylvania, in the Central Appalachian project area. It is probably more common along the trail.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This community is known to occur along the trail, but no plots or observation points were collected.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled in Chattahoochee National Forest, Georgia, but occurs throughout the Southern Blue Ridge section of the Appalachian Trail.
Global Range: This white pine plantation is found throughout the northeastern and midwestern United States and adjacent Canada.
Nations: CA, US
