U.S. Department of the Interior
National Park Service
Natural Resource Stewardship and Science
Fort Collins, Colorado

The National Park Service, Natural Resource Stewardship and Science office in Fort Collins, Colorado, publishes a range of reports that address natural resource topics. These reports are of interest and applicability to a broad audience in the National Park Service and others in natural resource management, including scientists, conservation and environmental constituencies, and the public.

The Natural Resource Report Series is used to disseminate comprehensive information and analysis about natural resources and related topics concerning lands managed by the National Park Service. The series supports the advancement of science, informed decision-making, and the achievement of the National Park Service mission. The series also provides a forum for presenting more lengthy results that may not be accepted by publications with page limitations.

All manuscripts in the series receive the appropriate level of peer review to ensure that the information is scientifically credible, technically accurate, appropriately written for the intended audience, and designed and published in a professional manner.

This report received formal peer review by subject-matter experts whose background and expertise put them on par technically and scientifically with the authors of the information. The peer review was led according to the Fundamental Science Practices of the U.S. Geological Survey.

Views, statements, findings, conclusions, recommendations, and data in this report do not necessarily reflect views and policies of the National Park Service, U.S. Department of the Interior. Mention of trade names or commercial products does not constitute endorsement or recommendation for use by the U.S. Government.

This report is available in digital format from the Northeast Temperate Network website and the Natural Resource Publications Management website. To receive this report in a format that is optimized to be accessible using screen readers for the visually or cognitively impaired, please email irma@nps.gov.

Executive Summary

The National Park Service (NPS) Vegetation Mapping Inventory (VMI) Program classifies, describes, and maps existing vegetation of national park units for the NPS Natural Resource Inventory and Monitoring (I&M) Program. The NPS VMI Program is managed by the NPS I&M Division and provides baseline vegetation information to the NPS Natural Resource I&M Program. The U.S. Geological Survey Upper Midwest Environmental Sciences Center, NatureServe, NPS Northeast Temperate Network, and NPS Appalachian National Scenic Trail (APPA) have completed vegetation classification and mapping of APPA for the NPS VMI Program.

Mappers, ecologists, and botanists collaborated to affirm vegetation types within the U.S. National Vegetation Classification (USNVC) of APPA and to determine how best to map the vegetation types by using aerial imagery. Analyses of data from 1,618 vegetation plots were used to describe USNVC associations of APPA. Data from 289 verification sites were collected to test the field key to vegetation associations and the application of vegetation associations to a sample set of map polygons. Data from 269 validation sites were collected to assess vegetation mapping prior to submitting the vegetation map for accuracy assessment (AA). Data from 3,265 AA sites were collected, of which 3,204 were used to test accuracy of the vegetation map layer. The collective of these datasets affirmed 280 USNVC associations for the APPA vegetation mapping project.

To map the vegetation and land cover of APPA, 169 map classes were developed. The 169 map classes consist of 150 that represent natural (including ruderal) vegetation types in the USNVC, 11 that represent cultural (agricultural and developed) vegetation types in the USNVC, 5 that represent natural landscapes with catastrophic disturbance or some other modification to natural vegetation preventing accurate classification in the USNVC, and 3 that represent nonvegetated water (non-USNVC). Features were interpreted from viewing 4-band digital aerial imagery using digital onscreen three-dimensional stereoscopic workflow systems in geographic information systems (GIS). (Digital aerial imagery was collected each fall during 2009–11 to capture leaf-phenology change of hardwood trees across the latitudinal range of APPA.) The interpreted data were digitally and spatially referenced, thus making the spatial-database layers usable in GIS. Polygon units were mapped to either a 0.5-hectare (ha) or 0.25-ha minimum mapping unit, depending on vegetation type or scenario; however, polygon units were mapped to 0.1 ha for alpine vegetation.

A geodatabase containing various feature-class layers and tables provide locations and support data to USNVC vegetation types (vegetation map layer), vegetation plots, verification sites, validation sites, AA sites, project boundary extent and zones, and aerial image centers and flight lines. The feature-class layer and related tables of the vegetation map layer provide 30,395 polygons of detailed attribute data covering 110,919.7 ha, with an average polygon size of 3.6 ha; the vegetation map coincides closely with the administrative boundary for APPA.

Summary reports generated from the vegetation map layer of the map classes representing USNVC natural (including ruderal) vegetation types apply to 28,242 polygons (92.9% of polygons) and cover 106,413.0 ha (95.9%) of the map extent for APPA. The map layer indicates APPA to be 92.4% forest and woodland (102,480.8 ha), 1.7% shrubland (1866.3 ha), and 1.8% herbaceous cover (2,065.9 ha).

Map classes representing park-special vegetation (undefined in the USNVC) apply to 58 polygons (0.2% of polygons) and cover 404.3 ha (0.4%) of the map extent. Map classes representing USNVC cultural types apply to 1,777 polygons (5.8% of polygons) and cover 2,516.3 ha (2.3%) of the map extent. Map classes representing nonvegetated water (non-USNVC) apply to 332 polygons (1.1% of polygons) and cover 1,586.2 ha (1.4%) of the map extent.

A thematic AA study was completed of map classes representing USNVC natural (including ruderal) vegetation types. Initial AA results were discussed with NPS staff. Following input from NPS staff on how to handle map classes that fell below accuracy standards, adjustments were made to the vegetation map layer. Final results indicate an overall accuracy of 80.18% (kappa index of 79.94% for chance agreements) based on data from 3,204 of the 3,265 AA sites. Most individual map-class themes exceed the NPS VMI Program standard of 80% with a 90% confidence interval with 95% of map classes for users' accuracy and 93% of map classes for producers' accuracy meeting or exceeding the standard.

The APPA vegetation mapping project delivers many geospatial and vegetation data products, including an indepth project report discussing methods and results, which include descriptions to vegetation associations, field keys to vegetation associations, map classification, and map-class descriptions. The suite of products also includes a database of vegetation plots, verification sites, validation sites, and AA sites; digital images of field sites; field data sheets; digital aerial imagery; hardcopy and digital maps; a contingency table listing AA results; and a geodatabase of vegetation and land cover (map layer), field sites (vegetation plots, verification sites, validation sites, and AA sites), aerial imagery index, project boundary, and metadata. Geospatial data are projected in Universal Transverse Mercator, Zone 18 North, by using North American Datum of 1983. Information on the NPS VMI Program and completed mapping projects are on the Internet at http://science.nature.nps.gov/im/inventory/veg.

Acknowledgments

The success of this vegetation mapping project was dependent on the collaborative efforts of several individuals from various organizations. The dedicated people who worked on this project collectively have a wide array of knowledge, skill, and expertise; essential in moving the Appalachian National Scenic Trail (APPA) vegetation mapping project to its completion. The authors of this report wish to acknowledge those individuals who were vital in making this vegetation mapping project a success.

Funding for the APPA vegetation mapping project was provided by the National Park Service (NPS) Vegetation Mapping Inventory Program with additional funding by the U.S. Geological Survey (USGS). The authors respectfully thank the NPS Vegetation Mapping Inventory Program staff for entrusting them with this project, including coordinators Karl Brown and Tammy Cook for funding the project and giving guidance. The authors also thank the NPS Northeast Temperate Network Natural Resource Inventory and Monitoring (I&M) Program staff for their support of the vegetation mapping project, including Fred Dieffenbach (Environmental Monitoring Coordinator), Brian Mitchell (former Acting Northeast Region I&M Program Manager), John Karish (former NPS Northeast Region I&M Program Manager), and Elizabeth Johnson (former NPS Northeast Region I&M Coordinator). Staff members of the NPS APPA also are thanked by the authors for supporting this project, in particular Jim Von Haden (Integrated Resources Program Manager), Matthew Robinson (GIS Specialist), and Casey Reese (former Natural Resource Manager). Image acquisition for this project was no small task, and the authors recognize the USGS National Geospatial Technical Operations Center and Photo Science, Inc. for acquiring an excellent set of aerial imagery of the APPA corridor.

The authors of this report also acknowledge our colleagues from within their own offices. Of the USGS Upper Midwest Environmental Sciences Center, the authors acknowledge Larry Robinson for managing the collection of digital aerial imagery with contractors, JC Nelson for producing the cost-surface analysis and random-site selection for accuracy assessment (AA), Jenny Hanson for reviewing vegetation classification names and codes against various documents, Jayme Stone for making digital documents of field forms and preparing close-out meeting materials, and Joe Jakusz for managing AA and assisting in geodatabase product development. Of NatureServe, the authors acknowledge Lesley Sneddon for providing the initial project management to classify the vegetation of APPA, for providing expertise and oversight throughout the remainder of the vegetation mapping project, and for providing classification expertise to mappers during map reconnaissance; Rickie White for assisting in the Southern Blue Ridge project area, including vegetation data collection coordination and AA reconciliation; Milo Pyne for providing classification expertise for the Southern Blue Ridge project area, including classification development, map reconnaissance, and AA reconciliation; Carl Nordman for providing classification expertise to the mappers during map reconnaissance; Jim Drake for providing classification expertise during AA reconciliation for the Central Appalachian, Lower New England, and Northern Appalachian project areas; Don Faber-Langendoen for providing guidance on the U.S. National Vegetation Classification; and Mary Russo for getting classification data into and out of the central database of NatureServe with ease and speed.

The authors give special recognition to several individuals from the NatureServe Network Member Programs for their contribution to the APPA vegetation classification. Gary Fleming and Karen Patterson (Virginia Natural Heritage Program) contributed significantly with their development of the vegetation classification in the Southern Blue Ridge project area and the southern portion of the Central Appalachian project area. Other individuals contributing to the APPA vegetation classification include James Vanderhorst (West Virginia Natural Heritage Program); Ephraim Zimmerman, Tony Davis, Jeff Wagner, and Rocky Gleason (Western Pennsylvania Conservancy and Pennsylvania Natural Heritage Program); Greg Edinger (New York Natural Heritage Program); and Andy Cutko and Kristin Puryear (Maine Natural Areas Program).

The authors also thank the numerous field-crew individuals who sampled vegetation plots (including observation sites), validation sites, and AA sites. These field crews collected the invaluable data needed for vegetation classification and map layer assessment. The field teams consisted of ecologists, botanists, field assistants, and interns having a diverse range of expertise and included independent contractors and staff from various Natural Heritage Programs, NatureServe, and the NPS. The following is a list of individuals who contributed in the field-data collection throughout the APPA vegetation mapping project: A. Cutko, A. Feldman, A. Levesque, B. Eichelberger, B. Engstrom, B. Moore, B. Streets, B. Wichmann, C. Bledsoe, C. Davis, C. Eichelberger, C. Elam, C. Fredrick, C. Lea, C. Michaud, C. Nordman, D. Cameron, D. Markey, D. Sperduto, E. Hoy, E. Jones, E. McLane, E. Perkons, E. Sorenson, E. Zimmerman, F. Sechler, G. Cabri, G. Edinger, G. Fleming, G. Podniesinski, J. Albritton, J. Drake, J. Gorman, J. Harrison, J. Jakusz, J. Kulick, J. Myers, J. Ryndock, J. Schlawin, J. Stanley, J. Teague, J. Vanderhorst, J. Wagner, J. Wisgo, K. Anderson, K. Dixon, K. Forti, K. Getman, K. Israel, K. Patterson, K. Puryear, K. Snow, K. Taverna, K. Walz, L. Gastinger, L. Kelly, L. Smart, M. Furedi, M. Hall, M. Peters, M. Pyne, M. Schafale, N. Olmstead, N. Van Alstine, P. Swain, R. Gleason, R. White, S. Gawler, S. Perles, S. Shupp, T. Davis, T. Dowling, T. Evans, and T. Govus. Additional recognition is given to Tom Govus for his significant contribution in collecting field data in the Southern Blue Ridge project area and for organizing the plethora of field photographs collected with these field-data sites across APPA project areas. Additional recognition also is given to Brett Engstrom for his significant contribution in collecting field data in the northern Lower New England and southern Northern Appalachian project areas.

Lastly, the authors give recognition to the individuals who joined the mappers in the field during map reconnaissance and verification to provide vegetation expertise. Appreciation is given to Milo Pyne, Carl Nordman, and Lesley Sneddon (NatureServe); Gary Fleming (Virginia Natural Heritage Program); James Vanderhorst and Brian Streets (West Virginia Natural Heritage Program); Tony Davis and Mary Ann Furedi (Pennsylvania Natural Heritage Program); Andy Cutko (Maine Natural Areas Program); Brett Engstrom (contractor); and Tom Govus (contractor, who also organized the plethora of field photographs collected at vegetation plots.)

Photograph images in this report are either by authors of or by contributors to this report unless otherwise specified.

Introduction and Project Overview

This report describes the Appalachian National Scenic Trail (APPA) vegetation mapping project for the National Park Service (NPS) Vegetation Mapping Inventory (VMI) Program. This "Introduction and Project Overview" section provides a general description of the vegetation mapping project without an indepth review of the methods and results. The report then continues with an indepth description of the methods and results for each main project component to provide the necessary detail to replicate this project. Appendixes are included and referenced in the report to provide further detail. Because of the length of this report, acronyms and abbreviations are reestablished for each main section and appendix.

Throughout this report, APPA also is referred to as the "AT corridor" for the Appalachian Trail corridor and sometimes as the "corridor" after the AT corridor context is established. For clarity purposes, the footpath of APPA always is referred to as the "Appalachian Trail footpath."

Appalachian National Scenic Trail[1]

The APPA is an approximately 3,525-kilometer long footpath between Springer Mountain in northern Georgia and Mount Katahdin in central Maine (Figure 1) and includes a corridor of variable widths averaging 300-meters wide. The APPA is approximately 111,000 hectares (ha) that passes through 14 states and 88 counties. The AT corridor, with its expansive latitudinal and elevation ranges, traverses through a variety of wild, scenic, wooded, pastoral, and culturally significant lands.

More than 99% of lands within APPA are protected under ownership and jurisdiction by various public entities, including APPA, 6 other national park units of the NPS, 8 national forests of the U.S. Forest Service, 2 national wildlife refuges of the U.S. Fish and Wildlife Service, and 60 state-managed lands. With this diversity of land ownership throughout the AT corridor, natural and cultural resource management is administered by APPA through a cooperative partnership with the Appalachian Trail Conservancy, which is a nation-wide nonprofit organization established in 1925 that cooperates with 31 local volunteer clubs. Also known as "The People's Trail," the APPA is a testament of volunteerism in the United States and is supported by volunteers who donate their time and resources to monitor, maintain, and manage the AT corridor. Local club volunteers develop management and landscape protection plans, monitor and manage rare plants and invasive species, build and maintain shelters and bridges, and maintain the Appalachian Trail footpath (Figure 2).

The idea for the Appalachian Trail footpath gained popularity in 1921 when Benton MacKaye published an article detailing his vision of a trail to provide people a retreat from an increasingly industrialized modern life. The design and construction of the Appalachian Trail footpath began with volunteers from various hiking clubs throughout the 1920s and 1930s. In 1925, the Appalachian Trail Conference, now known as the Appalachian Trail Conservancy, formed to organize the localized hiking clubs for the purpose of constructing and managing the Appalachian Trail footpath. The Civilian Conservation Corp in the 1930s helped complete the continuous stretch of the Appalachian

[1]Information within this section was largely compiled from the website for APPA at http://www.nps.gov/appa.

Trail footpath from Mount Oglethorpe in Georgia to Mount Katahdin in Maine, which was opened in 1937. In 1958, because of development in the area, the southern terminus of the footpath was relocated from Mount Oglethorpe to its current location on Springer Mountain in Georgia. In 1968, the U.S. Congress passed the National Trails System Act, establishing the Appalachian Trail footpath as the first National Scenic Trail. The National Trails System Act of 1968 was amended in 1978 to acquire additional lands to protect and preserve the Appalachian Trail footpath. The National Trails System Act highlights the importance of continued volunteers in their roles of planning, development, maintenance, and managing APPA; the Appalachian Trail Conservancy and their volunteer-based club organizations continues in a cooperative role with the NPS in these roles.

Figure 1. The Appalachian National Scenic Trail (shown by the red line in the figure) follows an approximate 3,525-kilometer long footpath between Springer Mountain in northern Georgia and Mount Katahdin in central Maine.[2]

[2]The map display in Figure 1 was made using the Appalachian Trail Interactive Map; the Interactive Map was built cooperatively by the Appalachian Trail Conservancy and National Park Service. The Interactive Map can be accessed on the Internet at https://www.appalachiantrail.org/home/explore-the-trail.

Figure 2. In addition to developing resource plans, managing vegetation, and maintaining structures, local volunteer clubs with the Appalachian Trail Conservancy help maintain the Appalachian Trail footpath.

One of the management priorities of APPA is to protect the natural resources of the AT corridor by "Managing, preserving, and interpreting natural resources in the AT corridor, and increasing awareness of the AT's value as a natural resource, reserve of biodiversity, and barometer of regional environmental health.[3]" The AT corridor supports a diverse natural resource community as it traverses through forests and meadows, over high mountain ridges, and through low valleys between Georgia and Maine. Vegetation is a significant component of the natural resources in APPA (Figure 3). Classification and mapping of vegetation are necessary to facilitate management of the AT corridor by informing resource managers and researchers involved in decision making and monitoring.

National Park Service Vegetation Mapping Inventory Program

The NPS VMI Program classifies, describes, and maps existing vegetation of national park units with a significant natural resource. Managed by the NPS Natural Resource Inventory and Monitoring (I&M) Program Division, the NPS VMI Program provides to the NPS I&M Program baseline vegetation information needed to manage ecosystem integrity for NPS units. Vegetation layers and associated information support a wide variety of resource assessment, park management, and planning needs. The layers and information also provide structure for framing and answering critical scientific questions about vegetation communities and their relation to environmental processes across the landscape.

[3]Quoted from the NPS 2015 Business Plan for APPA.

Figure 3. Vegetation is a significant natural resource of the Appalachian National Scenic Trail; a view of vegetation on Round Bald near Carvers Gap along the North Carolina-Tennessee State line, with the Roan Mountains in the distance.

Program Procedures and Standards

Program scientists developed procedures for classifying and mapping vegetation, and for completing a mapping accuracy assessment (AA) (The Nature Conservancy and Environmental Systems Research Institute 1994a, 1994b; The Nature Conservancy et al. 1994; NatureServe 2004; Lea and Curtis 2010). Ecology and mapping teams collaborated to share knowledge and data and to resolve issues regarding classification and mapping procedures.

Products of the NPS VMI Program meet Federal Geographic Data Committee (FGDC) standards for vegetation classification and metadata, and national standards for spatial accuracy and data transfer. These standards include the following:

- National Vegetation Classification Standard (NVCS; Federal Geographic Data Committee 2008),
- Content Standard for Digital Geospatial Metadata (Federal Geographic Data Committee 1998a),
- United States National Map Accuracy Standards (U.S. Geological Survey 1999), and
- Spatial Data Transfer Standard (Federal Geographic Data Committee 1998b).

Mapping standards include a minimum mapping unit (MMU) of 0.5 ha and a classification accuracy meeting or exceeding 80% (with a 90% confidence level) for map classes representing natural (including ruderal[4]) vegetation types in the U.S. National Vegetation Classification (USNVC).

[4]Ruderal vegetation is defined as "vegetation found on human-disturbed sites, with no apparent recent historical natural analogs and whose current composition and structure is not a function of continuous cultivation by humans and includes a broadly distinctive characteristic species combination, whether tree, shrub, or herb dominated. The vegetation is often composed of invasive species, whether exotic or native, that have expanded in extent and abundance due to the human disturbances" (Faber-Langendoen et al. 2004).

Geospatial products are projected in Universal Transverse Mercator (UTM) by using North American Datum of 1983 (NAD83). The NPS VMI Program provides an array of mapping and vegetation data products. Mapping products include aerial imagery, spatial map layers of vegetation, metadata, a map-classification description or key, and an AA of the vegetation map. Vegetation products include vegetation classification, field key to vegetation types, formal descriptions of vegetation types, and field data in database format. More information on the NPS VMI Program, including completed vegetation mapping projects, is on the Internet at http://science.nature.nps.gov/im/inventory/veg. Information on the NPS Natural Resource I&M Program is available on the Internet at http://science.nature.nps.gov/im/index.cfm.

Classification Standard

The NVCS (Federal Geographic Data Committee 2008) is a methodology to classify existing vegetation and is a framework to organize a vegetation classification within a hierarchical structure. The USNVC is a vegetation classification that follows the NVCS as a standard to define and organize existing vegetation in the United States. The NVCS is static in its methods and hierarchical structure, whereas the USNVC is flexible with its vegetation classification concepts and assignments, yet remains within the static structural hierarchy of the NVCS. The NPS VMI Program uses the USNVC to classify and describe vegetation of national park units to provide a uniform approach in vegetation classification. The use of a national standard aids effective resource stewardship by augmenting compatibility and widespread use of the information throughout the NPS and other federal and state agencies.

The NVCS separates vegetation into two overriding categories: natural vegetation (including ruderal vegetation) and cultural vegetation. Each category is further divided into three main sections: (1) Upper (where physiognomy plays a predominant role), (2) Middle (where floristics and physiognomy play a significant role), and (3) Lower (where floristics plays a predominant role). The hierarchical structures for natural and cultural vegetation types with examples of vegetation types from the USNVC are listed in Tables 1 and 2. Definitions of these various levels are detailed within Section 2 of the NVCS (Federal Geographic Data Committee 2008); however, because of the emphasis given by the NPS VMI Program to vegetation types of the floristic levels (alliance and association) and the group level of the NVCS, the following brief definitions are provided.

- An association-level type is the finest level of the NVCS and is “defined on the basis of a characteristic range of species composition, diagnostic species occurrence, habitat conditions and physiognomy” (Jennings et al. 2006, as quoted in FGDC 2008:14). “Associations reflect topo-edaphic climate, substrates, hydrology, and disturbance regimes” (FGDC 2008:14).
- An alliance-level type is hierarchically one level above the association level and is “defined by a characteristic range of species composition, habitat conditions, physiognomy, and diagnostic species, typically at least one of which is found in the uppermost or dominant stratum of the vegetation” (Jennings et al. 2006, as quoted in FGDC 2008:14). “Alliances reflect regional to subregional climate, substrates, hydrology, moisture/nutrient factors, and disturbance regimes” (FGDC 2008:14).

- A group-level type is hierarchically one level above the alliance level (two levels above association level) yet is also the lowest level of the middle section of the NVCS hierarchy. The group level is defined in Table 2.4 of the NVCS as "combinations of relatively narrow sets of diagnostic plant species (including dominants and codominants), broadly similar composition, and diagnostic growth forms that reflect biogeographic differences in composition and sub-continental to regional differences in mesoclimate, geology, substrates, hydrology, and disturbance regimes" (FGDC 2008:17).

Table 1. Hierarchy structure of the National Vegetation Classification Standard, Version 2 (Federal Geographic Data Committee 2008) for natural vegetation with example assignments from the U.S. National Vegetation Classification (USNVC Database 2016).*

Level	Example (classification code assignment)
Upper: Physiognomy plays a predominant role	
Formation Class	Forest & Woodland (1; C01)
Formation Subclass	Temperate & Boreal Forest & Woodland (1.B; S15)
Formation	Cool Temperate Forest & Woodland (1.B.2; F008)
Middle: Both floristics and physiognomy play a significant role	
Division	Eastern North American Forest & Woodland (1.B.2.Na; D008)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (1.B.2.Na.2; M502)
Group	Appalachian Oak / Chestnut Forest (1.B.2.Na.2.1; G015)
Lower: Floristics plays a predominant role	
Alliance	*Quercus rubra* - *Quercus prinus* Woodland (A0624)
Association	*Quercus rubra* - *Betula lenta* / *Polypodium virginianum* Woodland (CEGL006585)

*The Oak - Birch Talus Slope Woodland Association—a vegetation type recognized by the Appalachian National Scenic Trail vegetation mapping project—is presented in its full hierarchical classification assignments by the U.S. National Vegetation Classification.

Table 2. Hierarchy structure of the National Vegetation Classification Standard, Version 2 (Federal Geographic Data Committee 2008) for cultural vegetation with example assignments from the U.S. National Vegetation Classification (USNVC Database 2016).*

Level	Example (classification code assignment)
Upper: Physiognomy plays a predominant role	
Cultural Class	Agricultural & Developed Vegetation (7; CL01)
Formation Subclass	Woody Agricultural Vegetation (7.A; CSC01)
Cultural Formation	Forest Plantation & Agroforestry (7.A.2; CFO02)
Cultural Subformation	Forest Plantation (7.A.2.1; CSF05)
Middle: Both floristics and physiognomy play a significant role	
Cultural Group [optional]	Temperate & Boreal Plantation (7.A.2.1.2; CGR007)
Cultural Subgroup	Eastern North American Temperate Forest Plantation (7.A.2.1.2.a; CSG005)
Lower: Floristics plays a predominant role	
Cultural Type	Native Northern Pine Plantation (7.A.2.1.2.a.1; CTY009)
Cultural Subtype [optional]	*Pinus strobus* Planted Forest (CST007178)

*The White Pine Plantation Cultural Subtype—a vegetation type recognized by the Appalachian National Scenic Trail vegetation mapping project—is presented in its full hierarchical classification assignments by the U.S. National Vegetation Classification.

Appalachian National Scenic Trail Vegetation Mapping Project

The APPA vegetation mapping project was initiated by the NPS VMI Program to classify and map vegetation types throughout the AT corridor, thereby providing NPS Natural Resource I&M Program, resource managers, and biological researchers with useful baseline vegetation information.

The objective for the APPA vegetation mapping project was to accurately identify and map existing vegetation types within the AT corridor. To accomplish this objective, three main components were necessary: (1) vegetation classification, (2) vegetation mapping, and (3) AA. Each of these main components is discussed in greater detail in this report; however, as with any vegetation mapping project, several intermediate steps are inherent to the process. The remainder of this section provides an overview of events to complete the APPA vegetation mapping project, including the three main components and some of the more prevalent intermediate steps. This overview is presented somewhat in order of sequence; however, some overlap of events intrinsically exists. A timeline outlining the sequence of task events for the APPA vegetation mapping project is listed in Figure 4.

Project Boundary

The project boundary extent for the APPA vegetation mapping project coincides closely with the APPA administrative boundary and covers an area of 110,918 ha. A feature-class layer showing the extent of the project boundary was developed and incorporated into the geodatabase for the APPA vegetation mapping project.

Ecoregions and Project Areas

The AT corridor spans over 11 degrees of latitude and over 15 degrees of longitude as it traverses nearly 1,525 kilometers across the Appalachian Mountain range between northern Georgia and central Maine. The composition of vegetation changes dramatically throughout this range, which necessitates that the vegetation classification, vegetation mapping, and AA be developed by segments of the AT corridor.

The initial vegetation classification effort approached APPA in four segments that closely follow the ecoregion boundaries defined by The Nature Conservancy (2007). Likewise, vegetation mapping and AA efforts approached the AT corridor in four segments; however, these segments were partitioned differently than The Nature Conservancy (TNC) ecoregion boundaries, and are thereby project defined and termed “APPA project areas.” Although the boundary extents of the APPA project areas and TNC ecoregions resemble each other from afar, they do have distinct differences, particularly where the two northern project areas and ecoregions meet. Locations of the four APPA project areas, in reference to TNC ecoregions, are shown in Figure 5. Although the APPA vegetation mapping project proceeded by segments of the AT corridor, the end product is contiguous in presentation across the entire AT corridor.

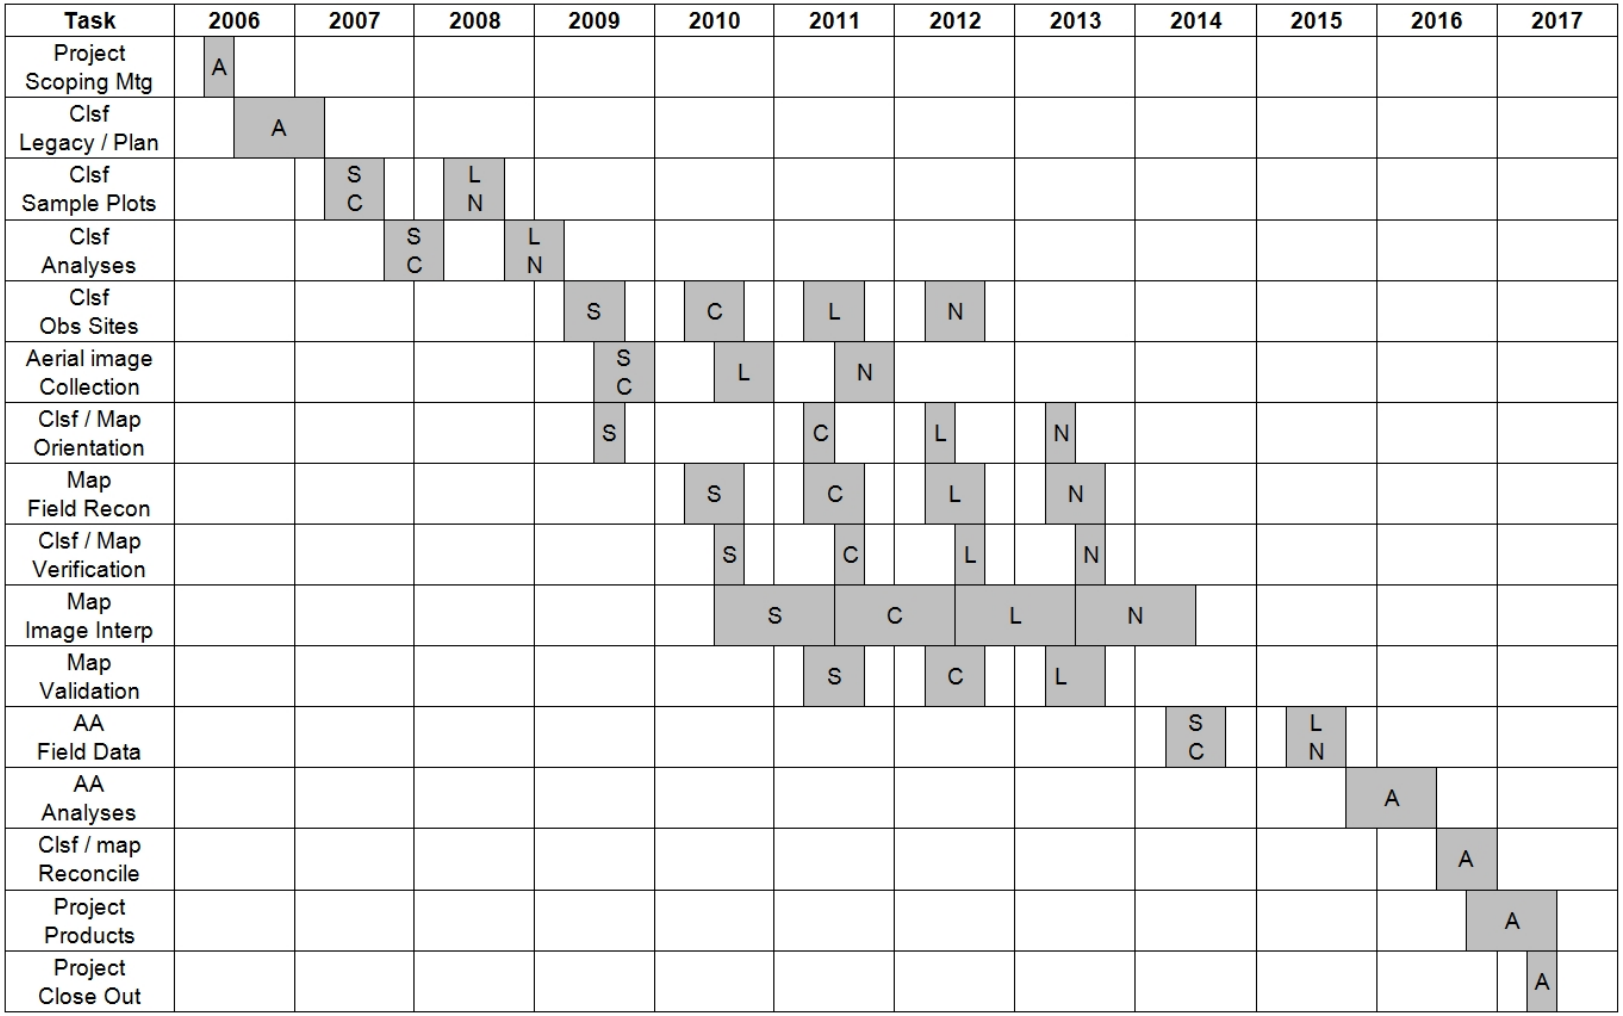

Figure 4. Timeline by year and task event for the Appalachian National Scenic Trail vegetation mapping project. Each cell that represents a year is split into four blocks. From left to right in a cell year, blocks represent January–March, April–June, July–September, and October–December. Shaded blocks are when tasks were completed, coded with the Project Area the task was completed (A, APPA; S, Southern Blue Ridge; C, Central Appalachian; L, Lower New England, and N, Northern Appalachian). Mtg, meeting; Clsf, classification; Obs, observation; Recon, reconnaissance; Interp, interpretation; AA, accuracy assessment.

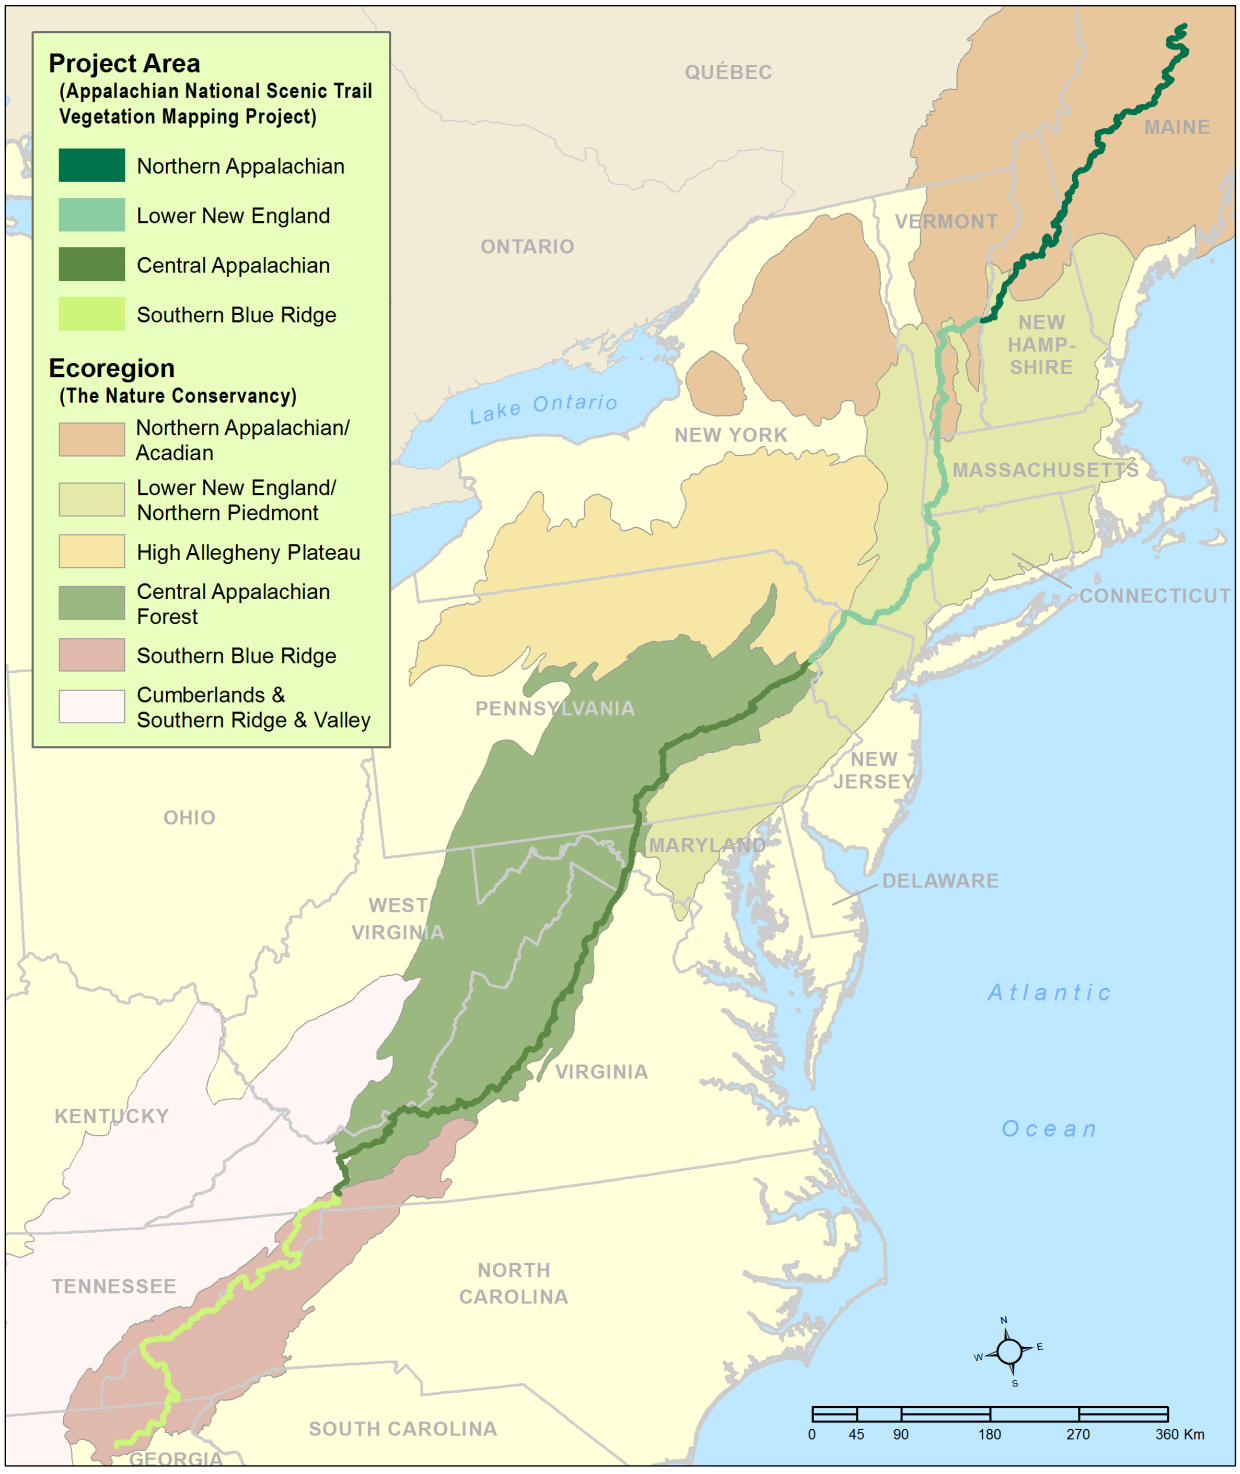

Figure 5. Locations of the four focus project areas defined for the Appalachian National Scenic Trail, in reference to ecoregions defined by The Nature Conservancy (2007).

Ecoregions

To develop the initial vegetation classification, particularly the collection of vegetation plots and subsequent analyses, the AT corridor was partitioned into four focal areas that closely follow four ecoregion boundaries defined by The Nature Conservancy (2007). The AT corridor technically passes through six ecoregions, but two of the ecoregions are minor in the area through which the AT corridor passes. Accordingly, the two "minor" ecoregions are incorporated into the four more "involved" ecoregions. The four ecoregions of TNC are as follows:

- Southern Blue Ridge,
- Central Appalachian Forest,
- Lower New England / Northern Piedmont, and
- Northern Appalachian / Acadian.

The two ecoregions of TNC that have minor amounts of land within the AT corridor are the Cumberlands And Southern Ridge And Valley and the High Allegheny Plateau, which both were assumed into the Central Appalachian Forest ecoregion.

Project Areas

For the mapping and AA efforts, TNC ecoregions were modified into four project defined areas for two reasons. The first reason is that a consensus could not be reached on the division between the Southern Blue Ridge and Central Appalachian Forest ecoregions, and the NPS VMI Program made a final determination. The second reason is that the interlaced transition between the Lower New England / Northern Piedmont and Northern Appalachian / Acadian ecoregions made it difficult for mappers to consistently apply mapping conventions. (See the interlacing between the Lower New England / Northern Piedmont and Northern Appalachian / Acadian ecoregions across Vermont and New Hampshire in Figure 5.)

The four APPA project areas are (1) Southern Blue Ridge (SBR), (2) Central Appalachian (CAP), (3) Lower New England (LNE), and (4) Northern Appalachian (NAP). The four APPA project areas are shown by their locations in Figures 6–9 and are described as follows:

- the SBR project area includes APPA lands between the southern terminus of the AT corridor on Springer Mountain in Georgia and Dickey Gap in Virginia (Corners Creek Road near State Highway 16);
- the CAP project area includes APPA lands between Dickey Gap in Virginia (Corners Creek Road near State Highway 16) and the Delaware River (Pennsylvania-New Jersey State line along Interstate 80);
- the LNE project area includes APPA lands between the Delaware River (Pennsylvania-New Jersey State line along Interstate 80) and the Connecticut River (Vermont-New Hampshire State line between Norwich, Vermont, and Hanover, New Hampshire); and
- the NAP project area includes APPA lands between the Connecticut River (Vermont-New Hampshire State line between Norwich, Vermont, and Hanover, New Hampshire) and the northern terminus of the AT corridor on Baxter Peak of Mount Katahdin in Maine.

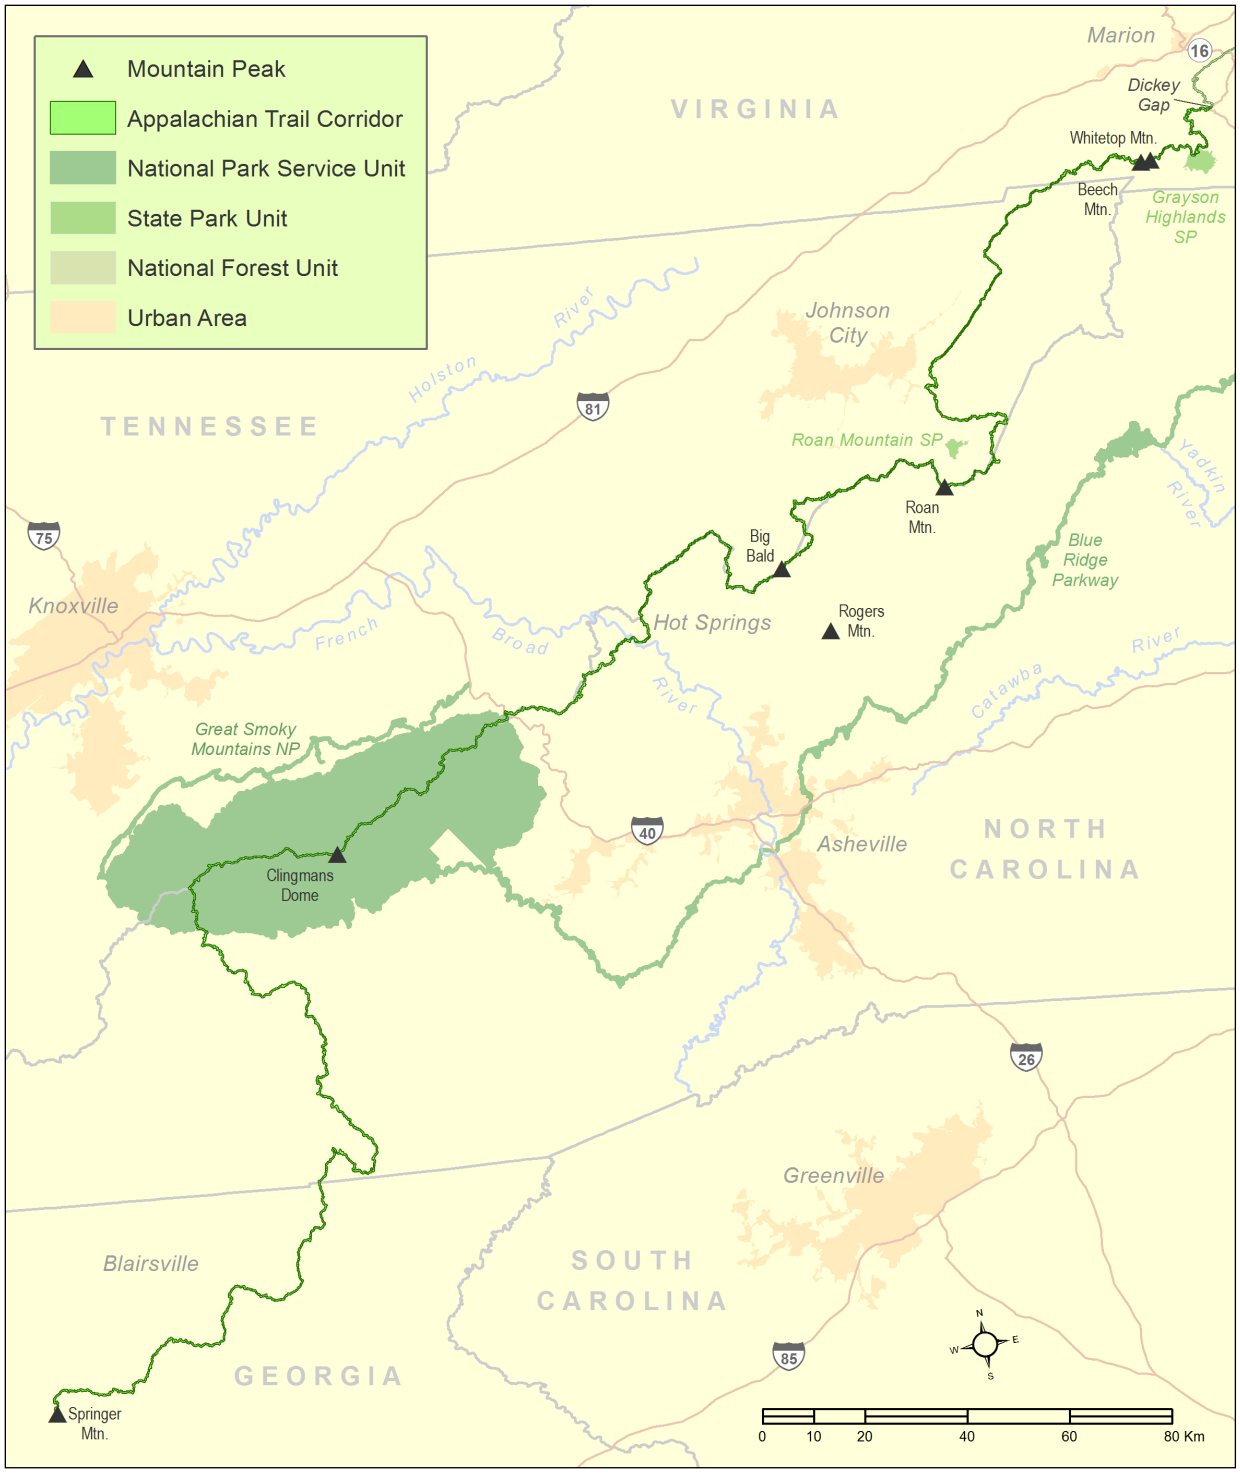

Figure 6. The Southern Blue Ridge project area for the Appalachian National Scenic Trail vegetation mapping project.

Figure 7. The Central Appalachian project area for the Appalachian National Scenic Trail vegetation mapping project.

Figure 8. The Lower New England project area for the Appalachian National Scenic Trail vegetation mapping project.

Figure 9. The Northern Appalachian project area for the Appalachian National Scenic Trail vegetation mapping project.

Because vegetation mapping was completed south to north in sequence by the four APPA project areas, the AA processes to test the vegetation map followed the same sequence. Similarly, the field keys to vegetation associations, which were used extensively for classifying vegetation associations during the AA field efforts and analyses, also followed the APPA project area sequence.

Project Continuity

Although four distinct areas had been set up (whether by TNC ecoregions or APPA project areas) to approach the classification, mapping, and AA components of the APPA vegetation mapping project, the deliverable is a set of products that is contiguous across the AT corridor. Granted, TNC ecoregions and APPA project areas are integrated into this report and the product suite, they are included merely to help readers and users better understand concepts and locations.

Project Scoping Meeting

A scoping meeting to initiate the APPA vegetation mapping project was held at the National Conservation Training Center (U.S. Fish and Wildlife Service) in Shepherdstown, West Virginia, during May 2006. Meeting participants consisted of ecologists, botanists, mapping experts, project coordinators, and resource managers from the NPS, ATC, NatureServe, and 11 state Natural Heritage Programs, which include Georgia, Maine, Maryland, Massachusetts, New Jersey, New York, North Carolina, Pennsylvania, Vermont, Virginia, and West Virginia.

The scoping meeting included addressing the following: (1) identifying supplemental data sources including Natural Heritage Program reports, classifications, existing vegetation maps, and plot and observation site data that had already been gathered; (2) reviewing vegetation mapping standards; (3) reviewing each vegetation association in the preliminary vegetation classification by regional experts to assess the potential existence of associations within the AT corridor; (4) discussing specific challenges associated with mapping APPA; (5) discussing the roles of nongovernment organizations and federal and state agencies; (6) identifying active participants in vegetation field sampling, classification, and mapping; (7) identifying issues with adjacent land owners and access; (8) discussing the mapping boundary; and (9) exploring aerial imagery and options for acquisition of new aerial imagery.

Classification of Vegetation

Classifying the vegetation within APPA began by generating a preliminary classification list, followed by acquiring vegetation data from legacy data, collecting vegetation-plot data, performing analyses of vegetation data, and assigning USNVC associations to analyses results.

The preliminary classification list was prepared as a primer for the project scoping meeting to determine the need for additional vegetation plots. Legacy vegetation data were assessed and used when applicable as a first source of vegetation plots to support classification. Data from additional vegetation-sampling plots were collected during 2007–08 to support vegetation types not supported by the legacy vegetation plots. Additional observation sites were collected (Figure 10) during 2009–12 to support common or ruderal vegetation types that were undersampled. (An observation site is a type of vegetation plot that examines the major vegetative components without completing a botanical inventory.) The collective of legacy plots, sampling plots, and observation sites provided

1,618 vegetation plots for the analyses to classify the vegetation of the entire AT corridor. The plot data were originally entered into the NPS PLOTS Database Version 2.0 (NatureServe 2005) and were eventually converted to the NPS PLOTS version 4.0 (National Park Service 2015) database. The vegetation-plot data were subjected to a series of analyses to classify associations in the USNVC and document those associations with local descriptors. A series of meetings to review the initial classifications by TNC ecoregion were held at various dates and locations. The purpose of these meetings was for NatureServe and local ecologists to comprehensively review the analyses and classification of vegetation plots. Adjustments to the vegetation classification were made following each ecoregion meeting. Field keys to vegetation associations were developed for each APPA project area. The vegetation classification and field keys were then continually refined throughout the remainder of the APPA vegetation mapping project with additional data from map reconnaissance, verification, validation, and AA.

Figure 10. A field ecologist recording vegetation data on an observation-site form in support of vegetation classification for the Appalachian National Scenic Trail vegetation mapping project.

The APPA vegetation mapping project identified 280 natural (including ruderal) associations in the USNVC. Of these 280 associations, 224 were a direct result from the analyses and classification of the vegetation plots. Another 29 of the 280 associations were anticipated to exist within the AT corridor and were confirmed during field reconnaissance for vegetation mapping, and another 24 associations—that were not anticipated—also were recognized during the field reconnaissance efforts. Three additional associations were recognized from the AA field data. Methods and results of vegetation classification are provided in the “Vegetation Classification” section of this report.

Classification Organization

Throughout this project report and the final products related to the APPA vegetation mapping project, the vegetation classification provided is from a 2016 version of the USNVC (USNVC Database 2016), which follows the methodology and organizational hierarchy of the NVCS, version 2 (Federal Geographic Data Committee 2008). The NVCS makes a distinction between natural (including ruderal) and cultural vegetation. Areas with at least 1% vegetation cover are classified and described with the USNVC with one exception—aquatic areas are only included when at least 10% vegetation cover (emergent or submergent) is present. Aquatic areas with less than 10% vegetation cover are categorized as open water; these areas are not described in the USNVC.

The term "vegetation type" is used throughout this report to reference vegetation classification units in general, at any level of the classification hierarchy. For example, the *Pinus strobus* - *Quercus alba* - (*Carya alba*) / *Gaylussacia ursina* Forest Association, the *Pinus strobus* - *Quercus prinus* Appalachian Forest Alliance, and the Appalachian Oak / Chestnut Forest Group are each treated as a vegetation type.

Vegetation Classification Orientation Meetings

A series of classification orientation meetings were held to allow for the classifiers to present the vegetation classification to the mappers. The meetings for each APPA project area were held prior to field reconnaissance efforts to map each area.

The first orientation meeting focused on the SBR project area and was held July 28–30, 2009, at the Blue Ridge Parkway Headquarters in Asheville, North Carolina. This meeting provided an orientation of vegetation classification for the SBR project area and provided a venue for collaborator discussion of the entire APPA vegetation mapping project, which included a review of the vegetation-plot collection and analyses, discussions of the mapping and AA processes and support needs, and an overview of end products. A result from this orientation meeting was the directive from the NPS VMI Program to collect additional observation-site data across all four APPA project areas for 4 years; one project area for each year. The main goal for additional observation sites was to collect vegetation data to support undersampled and ruderal associations in the USNVC. Participants at this meeting were from various entities from within the NPS, U.S. Geological Survey (USGS), and NatureServe organizations. This orientation meeting concluded with a field tour near Hot Springs, North Carolina, where participants visited some representative vegetation types within the SBR project area (Figure 11).

The orientation meetings to discuss the vegetation classifications for the remaining three APPA project areas (CAP, LNE, and NAP) were held at the USGS Upper Midwest Environmental Sciences Center (UMESC) in La Crosse, Wisconsin, with participants from NatureServe, USGS, and occasionally Natural Heritage Programs. For the CAP, LNE, and NAP project-area meetings, classifiers and mappers met on April 21–22, 2011, April 4–5, 2012, and April 1–3, 2013, respectively.

Figure 11. A field visit near Hot Springs, North Carolina, of forest vegetation during the orientation meeting for the Appalachian National Scenic Trail vegetation mapping project.

Mapping of Vegetation

The series of vegetation classification orientation meetings prepared the mappers for field reconnaissance. The purpose for field reconnaissance was to visit the vegetation types in the field, discern the vegetation type appearances in the aerial images, and establish mapping protocols. Field reconnaissance proceeded in the SBR project area during 2010, the CAP project area during 2011, the LNE project area during 2012, and the NAP project area during 2013. The mappers completed three field trips each year and were assisted intermittently by a vegetation ecologist for classification guidance (Figure 12). The first and second trips each year focused on collecting information on each individual association or map class. The third trip focused on the verification process, which tested a draft version of the vegetation field keys and a sampling of preliminary map polygons. The mapping protocols and vegetation field keys were then adjusted based on the verification results.

The mapping proceeded from fall 2010 to spring 2014; one APPA project area was mapped per mapping season following the field reconnaissance effort for a project area. Mappers interpreted vegetation and land cover types by viewing the digital aerial imagery collected for this project. The mappers viewed the aerial imagery stereoscopically by using computer workstations equipped with both three-dimension (3D) and geographic information system (GIS) software (Figure 13). Map conventions based on fieldwork and the vegetation classification helped maintain consistency in mapping. Draft versions of the vegetation map (a spatial database layer) were completed in spring 2014 for the SBR and CAP project areas, and spring 2015 for the LNE and NAP project areas. Each map layer was prepared for AA, some receiving map validation prior to entering AA.

Figure 12. A vegetation ecologist providing classification guidance to mappers during field reconnaissance for the Appalachian National Scenic Trail vegetation mapping project.

Figure 13. Image interpretation of vegetation using computer workstations equipped with three-dimension and geographic information system software.

The vegetation map layer has 169 map classes representing APPA. Of these 169 map classes, 150 represent 261 of the 280 USNVC associations recognized by this vegetation mapping project; 19 associations were determined always less than a MMU. Another 11 map classes represent cultural vegetation types (agricultural and developed) in the USNVC, 3 map classes represent nonvegetation open water (non-USNVC), and 5 map classes represent natural landscapes that have undergone catastrophic disturbance or some other form of modification to natural vegetation preventing accurate vegetation classification and placement in the USNVC. The vegetation map layer provides 30,395 polygons of detailed attribute data covering 110,919.7 ha. Methods and results of vegetation mapping are provided in greater detail in the "Vegetation Mapping" section of this report.

Minimum Mapping Units

The standard MMU of 0.5 ha set by the NPS VMI Program was applied to mapping forest, cultural, and park-special vegetation map classes. For woodland, shrubland, herbaceous, sparse vegetation, and nonvegetated open-water map classes, a MMU of 0.25 ha was applied with the exception of nine map classes representing alpine shrub, herbaceous, and sparse vegetation types; these alpine map classes were mapped to a MMU of 0.125 ha. Other allowances for reduced MMUs were applied to map polygons along the AT corridor boundary. More details on MMU conventions are provided in the "Vegetation Mapping" section of this report.

Map Validation

Map validation was completed on the draft vegetation maps for three of the four APPA project areas (SBR, CAP, and LNE); the map validation was canceled for the NAP project area because the cost-benefit ratio from the previous three project-area map validations was determined insufficient by the NPS VMI Program. The purpose of map validation was to test the initial vegetation map and determine its readiness for the AA process. With the use of a cost-surface analysis that modeled landscape accessibility, one or two site locations were randomly selected for each map class. The NPS coordinated the field-data collection, which proceeded during the field season following each map completion of an APPA project area. A total of 269 validation sites were collected. Because only one or two validation sites were collected for each map class, the small sample size lacked vigor to properly assess the vegetation map to address issues; however, the validation sites did prove useful for improving the field keys to vegetation associations. More details on map validation are provided in the "Vegetation Mapping" section of this report.

Accuracy Assessment Study

An AA was completed on draft versions of the vegetation map layer. A cost-surface analysis was applied to determine areas that would allow field crews to safely access AA sites in a timely and effective manner. The AA sites were randomly selected by map-class theme within areas deemed accessible from the cost-surface analysis. During the 2014 and 2015 field seasons, field crews collected data from 3,265 stratified-random sites to evaluate the accuracy of the vegetation map layer for those map classes representing USNVC associations. The AA field data were compared to the vegetation map data, with the initial results reviewed by the AA and mapping teams (Figure 14), and the map data were reconciled as necessary with agreement by NPS staff. Results from the AA study indicate an overall accuracy of 80.18% (kappa index of 79.94%, which accounts for chance

agreements) based on an analysis of data from 3,204 of the 3,265 AA sites. The results were tabulated into a contingency matrix. Methods and results of the AA are provided in greater detail in the "Accuracy Assessment" section of this report.

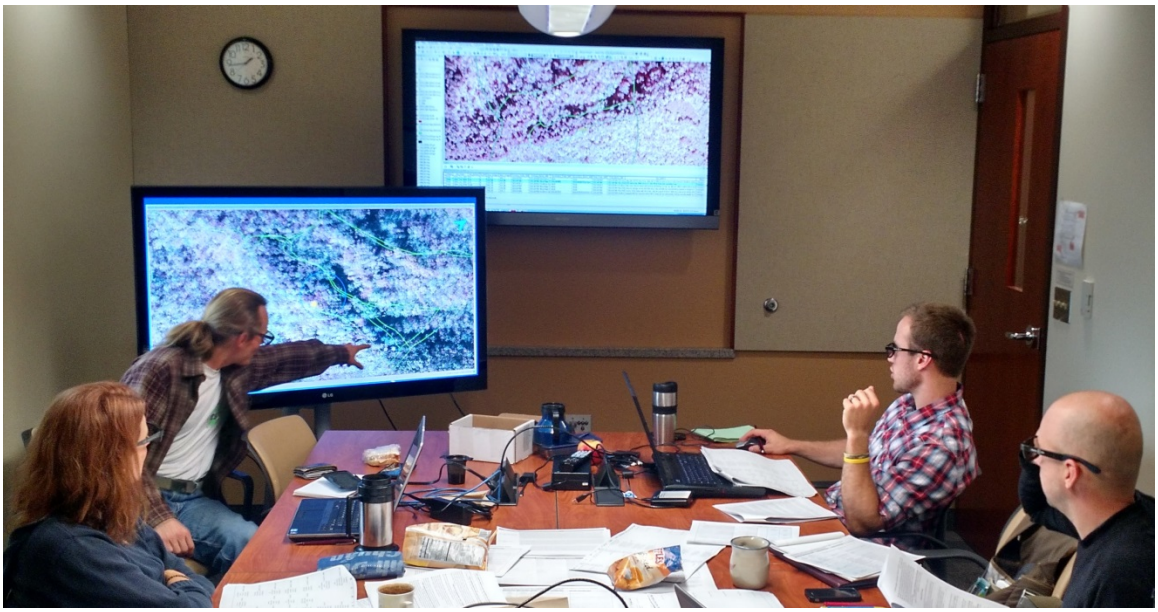

Figure 14. The accuracy assessment analysis team meeting with mappers to review the initial accuracy results of vegetation maps for the Appalachian National Scenic Trail vegetation mapping project.

Product Development and Delivery

The suite of end products developed and compiled for the APPA vegetation mapping project includes a project geodatabase, an orthorectified mosaic for each flight line of aerial imagery collected for the project, metadata documentation for geospatial datasets, a digital map book displaying the project aerial imagery, a vegetation database with the formal field data collected during this project (vegetation plots, verification sites, validation sites, and AA sites), digital images of the formal field-site locations, maps and graphics showing a representation of each feature class within the project geodatabase, and this NPS Natural Resource Report summarizing the APPA vegetation mapping project. The set of products are delivered to NPS staff from the VMI Program, Northeast Temperate Network, and APPA. The VMI Program posts the products to the Integrated Resource Management Applications Portal, providing easy access to these end products by NPS, partners, and the public.

The project geodatabase contains the following five feature classes: (1) polygon features showing the locations of vegetation types and general land-cover features; (2) point features showing the locations of vegetation plots, verification sites, validation sites, and AA sites; (3) point features showing the locations of the digital aerial imagery set obtained for the APPA vegetation mapping project; (4) line features showing the locations of flight lines to the aerial imagery obtained for the APPA vegetation mapping project; and (5) polygon features showing the APPA project boundary extent. Included in the geodatabase are tables that provide more information about the features, including links to classifications and detailed sampling data. Geospatial products were projected in the UTM, Zone 18 North, by using NAD83.

Digital Aerial Imagery

Digital aerial imagery provides baseline data for mapping vegetation types and other land-cover features. Vertical photographs (photographs taken with the aerial camera pointed straight down at the ground) collected with proper overlap for each flight line allows an interpreter to study the photographs in 3D with a stereoscope (Avery 1978) or, as with the APPA vegetation mapping project, to view stereo models of digital aerial images in 3D using computers and specialized GIS software. Because ecologic settings are taken into account when mapping vegetation types, viewing the aerial images in 3D helps recognize those ecologic settings.

Digital 4-band—true-color and color-infrared—aerial imagery was acquired in the months of October during 3 years (2009–11) for the APPA vegetation mapping project using a plane-mounted digital camera. This set of imagery became the primary source for image interpretation and mapping. The aerial imagery was collected at a pixel resolution of 30.48 centimeters (centimeter measurement calculated from a standard 12-inch measurement). The goal of fall-dated imagery, particularly with the color infrared bands, was to capture peak leaf-phenology change of hardwood trees; thus, aiding mappers in viewing distinctions among various hardwood-forest types.

Staff from the UMESC of the USGS coordinated the collection of digital aerial imagery with the following requirements:

- a fall-dated imagery set showing peak leaf-phenology change of trees,
- a date to capture peak leaf-phenology change that was coordinated with APPA staff,
- a suitable pair of images for stereo viewing with 60% forward lap and 30% side lap,
- a collection time that would avoid long shadows and maintain proper color balance,
- a pixel resolution of 30.48 centimeters (equivalent to 12 inches), and
- a minimum of a 100-meter buffer beyond the APPA administrative boundary.

The aerial flight contractor, Photo Science, Inc., used a plane-mounted, high-resolution panchromatic digital mapping camera with electronic forward motion compensation to eliminate image blur. The digital mapping camera uses a camera assembly combining panchromatic and multispectral camera heads to output a full resolution (7,680 by 13,824 pixels) panchromatic scene with coregistered red, green, blue and near-infrared outputs. The final 4-band output image can be displayed as either true color or color-infrared when mapping. The camera system uses a sophisticated inertial measurement unit (IMU) and a sensitive global positioning system (GPS) to track the precise location and position of the camera sensor at the instance of exposure. Image processing software uses these positional data to reference each image frame to the surface of the Earth within 1 meter (Ip et al. 2007).

With the AT corridor being nearly 3,525 kilometers in length, the aerial imagery mission was flown in segments over 3 years to capture peak-leaf phenology, after leaf color change but prior to leaf fall. Priority was given to peak-leaf phenology in the higher elevations to ensure that all forest species were in leaf-on status for viewing on computers to successfully complete fieldwork and mapping (Figure 15).

Baseline information about the digital aerial imagery collected for the APPA vegetation mapping project is listed in Table 3. The aerial imagery missions captured 271 flight lines of aerial imagery and covered the AT corridor with a minimum 100-meter buffer beyond the APPA boundary. The entire SBR and CAP project areas and the southern-most LNE project area were captured in 2009, most of the LNE project area in 2010, and the northern-most LNE project area and the entire NAP project areas in 2011. Each year the acquisition window was determined through coordination among the USGS, Photo Science, and NPS Northeast Temperate Network Natural Resource I&M Program staff to capture imagery as close to peak-leaf color as possible. The flight line locations for the digital aerial imagery collected for the APPA vegetation mapping project are shown in Figure 16.

Figure 15. Viewing aerial imagery on a computer to complete fieldwork for vegetation mapping.

Table 3. Digital aerial imagery sets collected for the Appalachian National Scenic Trail vegetation mapping project.*

Imagery Date	Imagery type	Pixel Resolution	Footprint (pixels)	Footprint (m)	Area (ha)
10-19-2009	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-20-2009	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-21-2009	4 band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-03-2010	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-08-2010	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-09-2010	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-06-2011	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-07-2011	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4
10-08-2011	4-band imagery	30.48 cm (12 in)	7,680 by 13,824	2,340.9 by 4,213.6	986.4

*m, meter; ha, hectare; cm, centimeter; in, inch

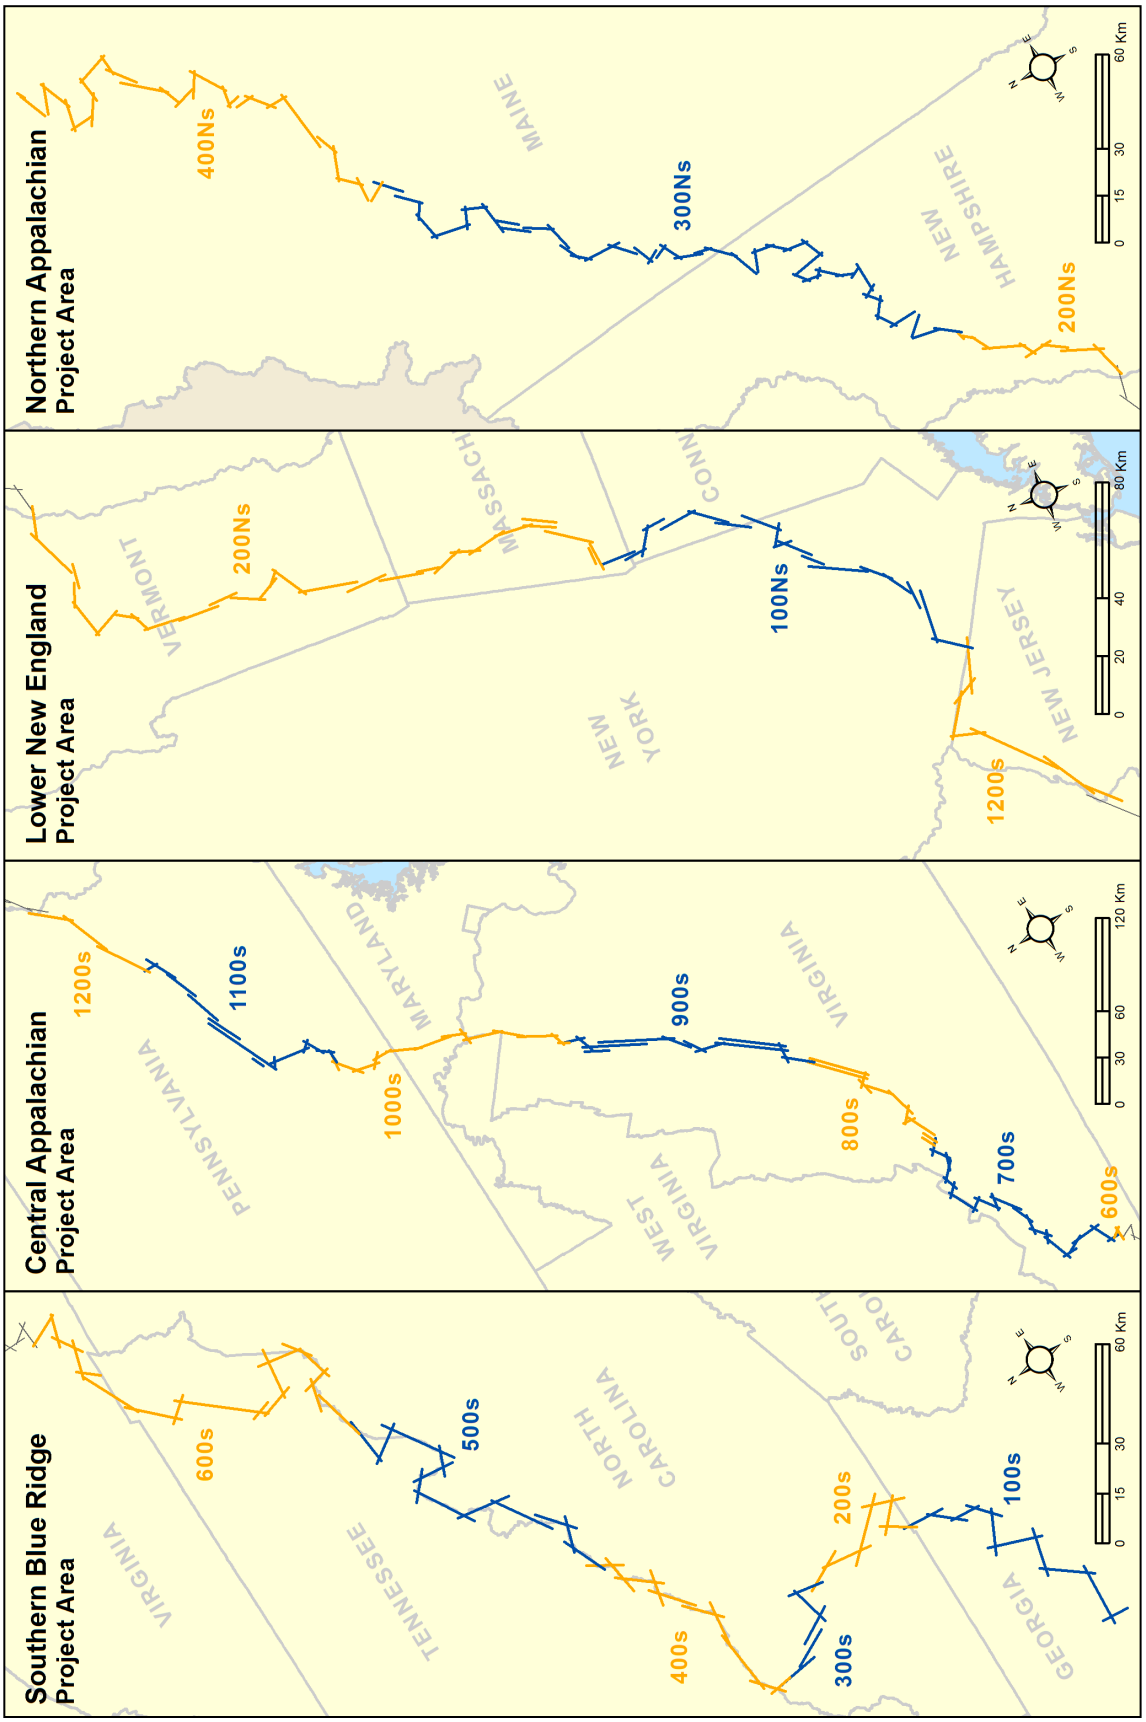

Figure 16. Flight line locations of the digital aerial imagery collected for the Appalachian National Scenic Trail (APPA) vegetation mapping project. Flight lines are shown within the set of four APPA project areas. The four APPA project areas are shown at different scales and directions.

The digital aerial imagery was reviewed to assure that requirements for mapping purposes were met[5]. Upon acceptance, exposures were adjusted for viewing and interpreting purposes. The aerial imagery was then processed for both field and mapping purposes. Processing resulted in the creation of the following two products: (1) a two-dimensional orthorectified mosaic of each flight line for background display in a GIS and (2) stereo models to view and map images in 3D using a GIS and specialized 3D computer hardware and software.

Orthorectified Mosaic

Individual image tiles from the digital aerial imagery collected for the APPA vegetation mapping project were converted to Tagged Image File Format and referenced to the Earth using the camera generated GPS and IMU records. Because the IMU records the rotation values from the camera sensor in three directions (roll, pitch, and yaw) and the GPS records the horizontal and vertical values from the sensor at the moment of exposure, specific software programs can reference each digital aerial image precisely to its ground position. To further increase the fit of the images to the Earth, software programs drape each aerial image over the landscape using digital elevation models.

Once referenced, or orthorectified, the individual digital aerial images were color balanced and "stitched" together to form an orthoimage mosaic for each flight line. Each mosaic was compressed into Joint Photographic Experts Group 2000 to accommodate computer hardware systems and GIS software with manageable file sizes. Each orthoimage mosaic was projected in the UTM, Zone 18 North, by using NAD83. An example of an orthoimage mosaic is shown in Figure 17.

Stereo Models

Digital aerial images were collected with a 60% overlap of each frame along a flight line. This overlapping coverage of the ground on the images is what allows for the creation of a 3D onscreen view in specialized computer software. Before the aerial imagery can be viewed in 3D, a number of processing steps must take place. For the APPA vegetation mapping project, stereo models were produced using IMAGINE Photogrammetry (ERDAS, Inc.). A stereo model is a flight line of imagery, along with a separate georeferencing file, called a block file, which establishes the relation of each aerial image to the adjacent image in order to precisely align the image pair (also known as a stereo pair), and make it viewable in 3D and display in the correct geospatial position. When the stereo model is imported into the software program called "Stereo Analyst for ArcGIS" (ERDAS, Inc.), the imagery can be viewed in 3D and map interpretation performed. Because the block file associated with each stereo model contains georeferencing information, the delineations made on-screen by the interpreter are also georeferenced as they are drawn, creating the vegetation map. More information on the use of stereo models with specialized stereo viewing equipment for mapping is provided in the "Vegetation Mapping" section of this report.

In addition to mosaic orthoimages and stereo models, feature-class layers were produced to show in a GIS the flight line locations and the center locations of individual aerial images. These feature

[5]Since the dates of aerial imagery collection, the APPA administrative boundary has expanded. This boundary expansion resulted in instances of imagery holidays; these instances are few and minor, largely because the flight planning included a minimum of a 100-meter buffer beyond the APPA administrative boundary.

classes are incorporated into the geodatabase product for the APPA vegetation mapping project. Aerial orthoimagery mosaics by flight line also are included as products, along with a nonspatial digital map book of aerial images.

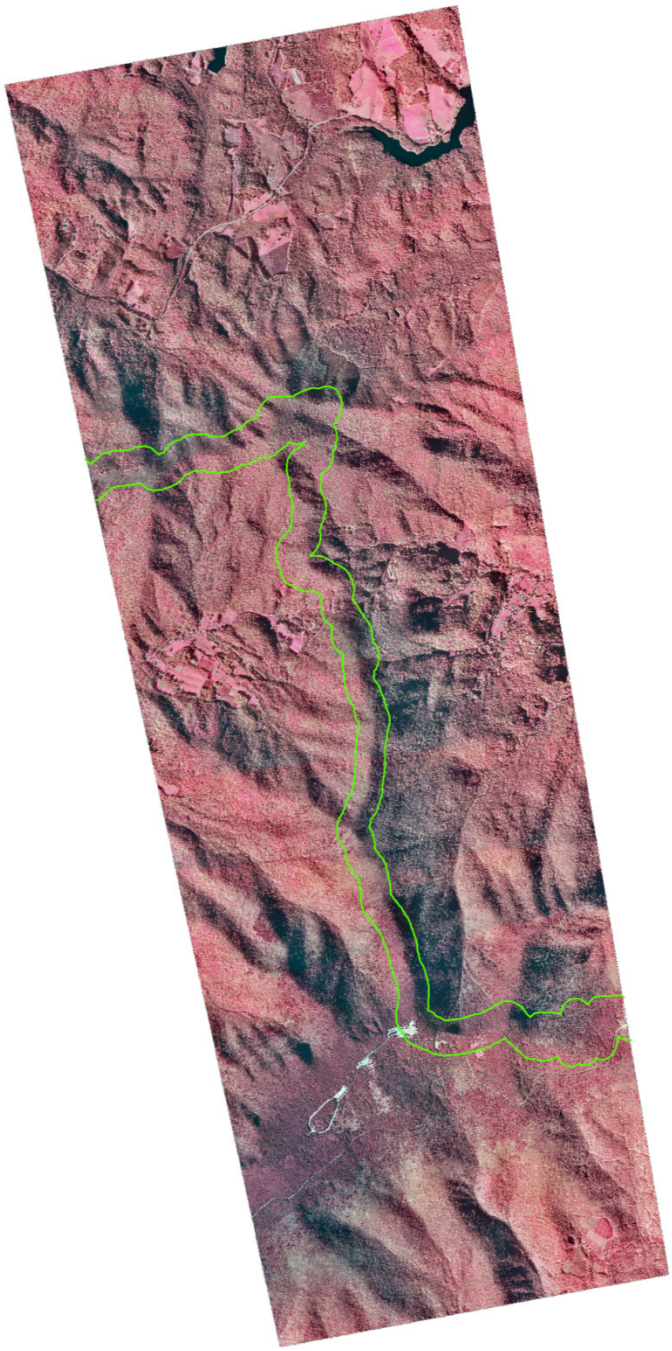

Figure 17. An example of an orthoimage mosaic developed of a flight line of 4-band digital aerial imagery that was acquired for the Appalachian National Scenic Trail (APPA) vegetation mapping project. (This flight line of 4-band digital aerial imagery is shown with the color-infrared bands. The flight line of imagery covers the Roan Mountain area along the North Carolina-Tennessee State line. The APPA project boundary is overlaid in green for reference.)

Vegetation Classification

Classifying the vegetation of the Appalachian National Scenic Trail (APPA, also referred to as the "AT corridor" for the Appalachian Trail corridor) for the APPA vegetation mapping project consisted of generating a preliminary classification list, acquiring vegetation data from legacy data, collecting vegetation-plot data, performing analyses of vegetation data, and assigning U.S. National Vegetation Classification (USNVC) associations to the results of the analyses.

Methods

Preliminary Vegetation Classification

The first step in classifying natural (including ruderal) vegetation of APPA was to prepare a preliminary classification report prior to the May 2006 scoping meeting. This report served as a working list to compare existing datasets and determine the need for additional vegetation plots. This classification was produced by querying the NatureServe Biotics database for all vegetation associations in the USNVC known to occur within the vicinity of the AT corridor. This yielded an initial listing of 349 vegetation associations that represented a broader area than the AT corridor and included some associations that did not exist in APPA lands. An assumption with this initial listing of associations was that the list included some associations not yet accounted for in legacy datasets. This preliminary classification list was presented at the scoping meeting in 2006 to determine what data already existed with the network of Natural Heritage Programs and what data were needed to adequately classify the vegetation of the AT corridor. A plan was organized to build a comprehensive database of existing vegetation information from legacy data to determine the vegetation sampling needs for the APPA vegetation mapping project.

Legacy Vegetation Data

To build the initial vegetation database with legacy data, NatureServe acquired existing vegetation data from sampling plots and observation sites (also known as observation points) that had been collected within or nearby the AT corridor as a part of previous vegetation inventory projects. Data contributions were from the National Park Service (NPS) and the following network of Natural Heritage Programs:

- Carolina Vegetation Survey,
- Connecticut Natural Heritage,
- Maine Natural Areas Program,
- Massachusetts Natural Heritage,
- New Hampshire Natural Heritage Bureau,
- New Jersey Natural Heritage Program,
- New York Natural Heritage Program,
- Pennsylvania Natural Heritage Program,
- Vermont Natural Heritage Program, and
- Virginia Natural Heritage Program.

The assemblage of legacy vegetation data from the Natural Heritage Programs and the NPS resulted in a large dataset of vegetation information existing in various formats. Sampling plots and observation sites of vegetation differ from each other in the amount and kinds of data recorded. A sampling plot is defined as a predetermined area that is dependent on the structure of the vegetation (e.g., 400-square meters within forest vegetation) where the abundance of all plant species within the predetermined area is measured, along with a suite of environmental characteristics, to help define the vegetation association in the USNVC. An observation site is similar to a sampling plot, but abundance of only dominant plant species is measured and limited environmental data are collected.

NatureServe evaluated the vegetation legacy dataset, then categorized each sampling plot or observation site by their suitability for quantitative and qualitative analyses and for classification and mapping purposes (Table 4) using a five-tier system. A tier 1 data category described the legacy data most suitable for quantitative analysis, classification, and mapping purposes, where a tier 5 category described data as being unsuitable for any analysis, classification, or mapping purpose and was omitted from use. Intermediate tiers identified varying suitability of the legacy data for quantitative, qualitative, classification, and mapping purposes. Examples of tier 1 legacy data were sampling plots that supported vegetation classifications for other vegetation mapping projects of five national park units that the AT corridor passes through (Table 5).

Table 4. Criteria and suitability categories by tier ratings to assess legacy data for contribution to the vegetation classification for the Appalachian National Scenic Trail vegetation mapping project.

Tier	Criteria	Suitability
Tier 1	Georeferenced classification plot data, and contains a complete record of species and abundance in all strata.	Suitable for quantitative analysis, vegetation classification, and mapping.
Tier 2	Classification plot data not georeferenced, but contains a complete record of species abundance in all strata.	Suitable for quantitative analysis and vegetation classification, but not mapping.
Tier 3	Georeferenced observation point data, and contains a partial record of species abundance in all strata.	Suitable for qualitative classification and mapping.
Tier 4	Observation point data that is not georeferenced, and contains partial record of species abundance in all strata.	Suitable for qualitative classification.
Tier 5	Observation point data or classification plots that are not georeferenced, and contains substantial data omissions, transcription and entry errors, or data collected in a format incompatible for classification purposes.	Unsuitable for classification or mapping; data omitted.

Table 5. Tabulation of legacy data from national park units that the Appalachian Trail corridor passes and that meet tier 1 data criteria and suitability for contribution to the vegetation classification for the Appalachian National Scenic Trail vegetation mapping project.

National Park	State	Plots
Blue Ridge Parkway	Virginia	6
Delaware Water Gap National Recreation Area	New Jersey, Pennsylvania	16
Great Smoky Mountains National Park	North Carolina, Tennessee	15
Harpers Ferry National Historical Park	Maryland, West Virginia	13
Shenandoah National Park	Virginia	63

Legacy data from 391 vegetation plots (sampling plots and observation sites collectively) were determined suitable for classification and mapping purposes. These 391 legacy data were imported into the PLOTS Database Version 2.0 (NatureServe 2005), resulting in standardized cover values for species records, environmental data, geocoordinates and metadata. Each legacy sampling plot and observation site was accepted as a tangible vegetation plot for the APPA vegetation mapping project and assigned a unique PLOT code (APPA.####); the original legacy plot and site codes were retained for archival purpose. Spatial coordinates providing locations to these vegetation plots of legacy origin were standardized into decimal degrees using the North American Datum of 1983 because the AT corridor crosses several (four) Universal Transverse Mercator (UTM) zones[6]. Some legacy vegetation plots have previously received analyses and classification to USNVC association as part of other vegetation mapping projects with the NPS Vegetation Mapping Inventory (VMI) Program, as listed in Table 6. Other legacy vegetation plots had either been classified to a state-specific classification (non-USNVC) or had received no classification of any kind. These vegetation plots without USNVC association assignment were screened and tentatively assigned, when possible, to an association in the USNVC by using classification crosswalks between state classifications and the USNVC or by assessing best fit of species composition and environmental data to association descriptions in the USNVC.

Supplemental Vegetation Data

In addition to assembling legacy vegetation data, supplemental vegetation data also were assembled from the network of Natural Heritage Programs. These supplemental data consisted of georeferenced ecological community and species element occurrence records from within the AT corridor. Although these records are limited in the type of information needed for full classification analysis, they help verify the existence of certain vegetation associations within the AT corridor that were not represented by the legacy vegetation data. The supplemental data were retrieved from 16 community and species inventories for each state that the AT corridor crosses (Table 6).

Identifying Classification Gaps

After gathering all known data that were determined suitable to classify the vegetation for APPA, the classifications from the legacy vegetation plots were then compared to the preliminary classification list. This comparison revealed the number of vegetation plots giving support to various vegetation associations that exist along the AT corridor. Then the reports detailing community and species inventories were reviewed to identify vegetation associations not represented by vegetation-plot data. The resulting tally of vegetation plots by vegetation association provided a listing of associations requiring vegetation-plot data for analysis to ultimately characterize the vegetation associations for the APPA vegetation mapping project.

[6]Near the close of the APPA vegetation mapping project, all spatial coordinate data were projected to UTM, Zone 18 North, by using the North American Datum of 1983 (NAD83) to comply with NPS VMI Program standards.

Table 6. Supplemental data sources from community and species inventories used to help develop the vegetation classification for the Appalachian National Scenic Trail vegetation mapping project.

Additional Vegetation Plots

To confirm the existence of and to characterize vegetation associations of APPA that were not recognized by legacy vegetation plots, additional vegetation-plot data were necessary. The additional vegetation-plot data were collected either as vegetation-sampling plots or as observation sites.

Additional Vegetation-Sampling Plots

The additional vegetation-sampling plots were collected during 2007–08. Sampling plot locations were determined by state to accommodate the magnitude of scale of the entire AT corridor. Locations of legacy vegetation plots varied widely by state. For example, in Connecticut and Massachusetts, sampling plots were thoroughly distributed throughout the AT corridor and additional

vegetation plots were determined unnecessary. Conversely, in Pennsylvania, vegetation plots and supplemental vegetation data were few and limited for the AT corridor.

Although the selection of additional sampling plots was done by state, the analyses and classification of vegetation plots were completed by The Nature Conservancy (TNC) ecoregions (The Nature Conservancy 2007) to address distinct patterns of vegetation within the four main ecoregions of APPA. Therefore, the details in deciding locations for collecting plot-sample data are given by state within each of the four ecoregions; Southern Blue Ridge, Central Appalachian Forest, Lower New England / Northern Piedmont, and Northern Appalachian / Acadian.

Southern Blue Ridge Ecoregion

The Southern Blue Ridge ecoregion, which includes the AT corridor through Georgia, North Carolina, Tennessee, and southwestern Virginia, provides the most ecologically diverse section of APPA. Numerous endemic plant species and unique plant communities exist in this ecoregion. This diversity would normally complicate the development of a vegetation sampling design. However, the vegetation within the AT corridor of the Southern Blue Ridge ecoregion had been sampled extensively with past vegetation inventory projects and with legacy vegetation plots sampled by the U.S. Forest Service and Carolina Vegetation Inventory. Vegetation-plot data from other vegetation mapping projects of the NPS VMI Program, including the Blue Ridge Parkway (BLRI) and Great Smoky Mountains National Park (GRSM), provided sufficient vegetation plots for the AT corridor in North Carolina and Tennessee. Therefore, North Carolina and Tennessee were considered a lower priority for collecting additional sampling plots, and emphasis was placed on Georgia and Virginia for collecting additional sampling plots.

Central Appalachian Forest Ecoregion

The Central Appalachian Forest ecoregion, which includes the AT corridor from southwestern Virginia northward through West Virginia, Maryland, and Pennsylvania to the Delaware River, is the longest ecoregion segment of APPA. The existence of legacy vegetation plots along the AT corridor were variable within this ecoregion. Vegetation-plot data from other vegetation mapping projects of the NPS VMI Program, including the BLRI, Harpers Ferry National Historic Park (HAFE), and Shenandoah National Park (SHEN), yielded a substantial amount of suitable vegetation-plot data for the AT corridor in Virginia. Conversely, legacy vegetation plots for the AT corridor through Maryland, Pennsylvania, and West Virginia were lacking, and an emphasis was placed on these three states for collecting sampling plots.

Lower New England / Northern Piedmont Ecoregion

The Lower New England ecoregion includes the AT corridor from the Delaware River at the Pennsylvania-New Jersey State line northward through New Jersey, New York, Connecticut, and Massachusetts, and continues through portions of Vermont and into the southwestern one-fourth of New Hampshire. (The AT corridor through the Green Mountains in Vermont is of the Northern Appalachian / Acadian ecoregion.) The Lower New England ecoregion is one of the shortest ecoregion segments of APPA. Most of the legacy vegetation plots along the AT corridor within the Lower New England ecoregion were collected for vegetation community inventories of Connecticut and Massachusetts (Elliman 2003; 2004). Vegetation-plot data from the Delaware Water Gap

National Recreation Area vegetation mapping project (of the NPS VMI Program) provided several suitable vegetation plots for the AT corridor in New Jersey. However, only a few legacy vegetation plots were available along the AT corridor through the rest of New Jersey, New York, and Vermont.

Existing classification concepts were sufficient for the ecoregion; however, substantial geographic gaps were in vegetation-plot data. For this reason, a full-scale, comprehensive vegetation community inventory using a stratified sampling approach was needed for New Jersey and Vermont and part of New York. The stratified sampling approach was based on two major geospatial data sources, including (1) the National Land Cover Database 2001 (NLCD) (Homer et al. 2007) and (2) the ecological land unit raster file developed by TNC (Ferree and Anderson 2008). The NLCD is a 16-class land cover classification developed for classification using satellite imagery nested. The upper level classification of cover types include water, barren, shrubland, herbaceous, wetlands, developed, forested, nonnatural woody (e.g., orchards), and planted herbaceous. The ecological land unit classification for the northeast United States was developed from bedrock geology, elevation, and landform layers; the latter two are derivatives from a 30-meter digital elevation model.

Northern Appalachian / Acadian Ecoregion

The Northern Appalachian / Acadian ecoregion, includes the AT corridor through the Green Mountain portions of Vermont, the northeastern three-fourths of New Hampshire, and Maine. Most of the legacy vegetation plots along the AT corridor in the Northern Appalachian / Acadian ecoregion were concentrated in the White Mountains of New Hampshire at high elevations; the remaining legacy vegetation plots existed in the Bigelow Preserve in Maine. Therefore, a full-scale effort to collect sampling plots of vegetation within the AT corridor was given to nonalpine regions; more emphasis was given to Maine because this State had the fewest legacy vegetation plots available for analysis and classification. The same stratified sampling approach was applied that was used for the Lower New England ecoregion.

Additional Vegetation Observation Sites

In 2009—after completion of the additional vegetation sampling plots—the NPS VMI Program issued a directive to collect additional observation-site data across all four APPA project areas over 4 years; one project area for each year. Vegetation data at observation sites were collected in the Southern Blue Ridge (SBR) project area during 2009, in the Central Appalachian (CAP) project area during 2010, in Lower New England (LNE) project area during 2011, and in the Northern Appalachian (NAP) project area during 2012. (Refer to the "Introduction and Project Overview" section of this report for detailed locations of the four APPA project areas (Figures 6–9) and for an explanation of the differences between the four TNC ecoregions and the four APPA project areas.)

The main goal for additional observation sites was to collect vegetation data to support common or ruderal vegetation types that were undersampled. Another goal for the additional sites was to test early drafts of the field keys to vegetation associations, by APPA project area. Staff from the U.S. Geological Survey (USGS) at the Upper Midwest Environmental Sciences Center (UMESC) located observation sites by viewing the aerial imagery acquired for the APPA vegetation mapping project. The coordinate locations (for use in a geospatial positioning system) to targeted observation sites were provided to field crews for navigating for field data collection.

Field Sampling Methodology

The sampling methodology for the additional vegetation-sampling plots was adapted from field-method standards of the NPS VMI Program (NatureServe 2004). Sampling plots were square or rectangular in shape and either 100 meter squared (10 meters by 10 meters) or 400 meter squared (20 meters by 20 meters) and were intentionally placed to represent the character of an entire stand of vegetation. Within each plot sample, the vegetation was visually separated into strata, and the canopy cover and average height of each stratum was estimated. Within each stratum, all taxa within the plot sample area were identified, and the foliar cover of each taxon was estimated by using the cover classes in Table 7.

Table 7. Codes to cover scales and vegetation strata used during vegetation-sampling plot to develop the vegetation classification for the Appalachian National Scenic Trail vegetation mapping project.

Cover Scales		Vegetation Strata	
T	0–1%	T1	Emergent canopy
P	>1–5%	T2	Main canopy
1	>5–15%	T3	Subcanopy
2	>15–25%	S1	Tall shrubs
3	>25–35%	S2	Short shrubs
4	>35–45%	S3	Dwarf-shrubs
5	>45–55%	H	Herbaceous (field layer, including tree seedlings)
6	>55–65%	A1	Floating-leaved aquatics
7	>65–75%	A2	Submerged-leaved aquatics
8	>75–85%	–	
9	>85–95%	–	
10	>95%	–	

For each plot sample location, field crews recorded environmental information, including slope, aspect, topographic position, hydrologic regime, soil drainage, soil texture, and evidence of disturbance on a vegetation plot sampling form. For an example of a vegetation plot sampling form, see "Appendix A: Vegetation Plot Sampling Form." Any unvegetated area of the plot was characterized by the exposed substrate with categories drawn from a standardized list (e.g., bare soil, woody debris, and open water). Location information, including spatial coordinates, was obtained by using a global positioning system (GPS) and then recorded. Digital photograph images were taken to provide additional information and assist in classifying the plot. Notes were taken of the surrounding vegetation and any other significant environmental information, such as landscape context, stand health, recent disturbance, or evidence of historic disturbance to establish how representative the observed plot was in relation to other plots of the same type. Finally, the field crew gave the plot a provisional classification name. An example of a vegetation plot is shown in Figure 18.

Data Analyses and Vegetation Classification

Analysis and classification of vegetation-plot data that were acquired for the APPA vegetation mapping project, whether from obtaining legacy plots or collecting additional vegetation plots, were done by TNC ecoregion (The Nature Conservancy 2007) because of the large geographic extent and

ecological diversity of the AT corridor[7]. The additional vegetation-plot data that were collected within the AT corridor during the 2007–12 field seasons included 461 sampling plots and 747 observation sites; this is in addition to the 410 legacy plots previously obtained. The vegetation field data from the additional sampling plots and observation sites were entered into PLOTS Database Version 2.0 (NatureServe 2005) for the APPA vegetation mapping project, adding to the vegetation data from the legacy vegetation plots.[8] Species were assigned standardized codes and names based on the PLANTS 3.5 database developed by Natural Resources Conservation Service in cooperation with the Biota of North America Program (U.S. Department of Agriculture, Natural Resources Conservation Service 2006). A collection of 1,618 vegetation plots was then available for the analyses to classify the vegetation of the entire AT corridor.

Figure 18. An example of a vegetation-sampling plot to classify vegetation for the Appalachian National Scenic Trail vegetation mapping project.

Although final preparations of vegetation-plot data for analyses were different among ecoregion, the analyses methodology for classification followed similar protocols. The analyses and classification of vegetation-plot data were done by ecoregion. For the Southern Blue Ridge ecoregion, the analyses and classification were completed by the Virginia Natural Heritage Program. For the Central Appalachian Forest ecoregion, the classification of legacy vegetation plots was complete from other vegetation classification projects (Pennsylvania Natural Heritage Program 2002, 2004; Vanderhorst,

[7]Although the selection of additional sampling plots was done by state, and the selection of additional observation sites was done by each of the four APPA project areas, the analyses and classification of vegetation plots (sampling plots and observation sites) were completed by TNC ecoregion (The Nature Conservancy 2007) to address distinct patterns of vegetation within four unique sections of the AT, including the Southern Blue Ridge, Central Appalachian Forest, Lower New England / Northern Piedmont, and Northern Appalachian / Acadian ecoregions.

[8]Near the completion of the APPA vegetation mapping project, all vegetation-plot data were converted to the NPS PLOTS version 4.0 (National Park Service 2015) database to comply with NPS VMI Program standards.

2000) and database sources[9] and met tier 1 legacy data suitability (Table 4). The analyses and classification of these legacy vegetation-plot data in this ecoregion were completed either by or for the organizations listed in Table 8.

Table 8. Organizations with completed vegetation classification that contributed to classification development of the Appalachian Trail corridor within the Central Appalachian Forest ecoregion for the Appalachian National Scenic Trail vegetation mapping project.

Organization	Project Location	State	Year
National Park Service	Blue Ridge Parkway	Virginia	2003
Virginia Natural Heritage Program	Fauquier, Loudoun and Clarke Counties	Virginia	1994
Virginia Natural Heritage Program	George Washington and Jefferson National Forest	Virginia	1992–94, 1999
Environmental Protection Agency	Cumberland County	Pennsylvania	2001, 2003
National Park Service	Harpers Ferry National Historic Park	Maryland, West Virginia	2004–05
West Virginia Natural Heritage Program	Monroe County	West Virginia	2008
National Park Service	Shenandoah National Park	Virginia	1990, 1999, 2000–01, 2003, 2006

The additional vegetation-plot data that were collected specifically for the Central Appalachian Forest ecoregion were classified to USNVC associations by NatureServe, either quantitatively with standard analyses protocols or qualitatively. Qualitative classification was applied to vegetation plots in Maryland and Pennsylvania because of the lack of complexity with the vegetation within the AT corridor passing through these States. For the Lower New England / Northern Piedmont and Northern Appalachian / Acadian ecoregions, the quantitative analyses and classification were completed by NatureServe. Most of the analyses were on vegetation-plot data that were collected specifically for the APPA vegetation mapping project. Supplemental vegetation-plot data from outside of the AT corridor were used to support the understanding of data within the AT corridor.

Vegetation-plot data were imported to PC–ORD 5.15 software (McCune and Mefford 2006) for multivariate numerical analyses. The analytical process was designed to progressively partition the large dataset of vegetation plots into more workable subsets using (1) cluster analysis to identify groups of similar vegetation-plot concepts, (2) statistical analysis to validate those vegetation-plot groups, and (3) ordination studies to examine compositional gradients between vegetation-plot groups and their correlations with important environmental gradients. Finer-scale subsets of the vegetation-plot data were exported into Microsoft software products (Microsoft Corp.) to calculate summary statistics. The process of these analyses was iterative, as finer groups of vegetation plots were increasingly identified and analyzed, until vegetation classification could be assigned to

[9]Database sources from the Ecological Society of America VEGBANK database (http://vegbank.org/vegbank/index.jsp), including the Virginia Department of Conservation and Recreation Division of Natural Heritage Vegetation Plots database and the West Virginia Division of Natural Resources Plots 2 community ecology plots database.

vegetation plots. For each ecoregion, NatureServe ecologists met with regional ecologists to comprehensively review the analyses and vegetation classification as defined by the cluster analysis. Without a cluster analysis, the vegetation classification would rely solely on expert opinion. A cluster analysis, however, provides an initial ordination of the vegetation data, allowing for a more consistent and repeatable vegetation classification process.

Cluster Analysis

Hierarchical, agglomerative cluster analysis using the Lance-Williams Flexible-Beta linkage method (Lance and Williams 1966; 1967) and the Bray-Curtis dissimilarity measure (Bray and Curtis 1957) was used to identify compositionally similar groups of vegetation-plot data. The Flexible-Beta method is a generalized sorting strategy, the performance of which varies with user-specified emphasis (beta) on different measures of between-group distance. In general, beta settings ranging from the default -0.25 to -0.5 to produced optimal results with vegetation-plot data, performing similarly to minimum-variance clustering (e.g., Ward 1963). The Bray-Curtis coefficient (also known as the Sorensen coefficient) has been used with demonstrable success in a wide range of ecological studies (Beals 1984). Among available measures of ecological "distance," represented as a mathematical dissimilarity between samples, the Bray-Curtis coefficient is a balanced measure that places some emphasis on dominant (i.e., high-cover) species while still giving minor (i.e., low-cover) species considerable weight in the analysis (Gauch 1982).

Cluster analysis of every dataset or subset of vegetation-plot data were run using the Bray-Curtis coefficient and four alternative data treatment protocols, including (1) raw cover-class scores, (2) cover-class scores relativized by site totals (equalizing the total abundances in plot samples and thus equalizing the mathematical weight of samples in the analysis), (3) cover-class scores relativized by species maxima (giving low-cover species more weight in the analysis), and (4) cover-class scores relativized by both site totals and species maxima. A fifth protocol was run using the Relative Euclidian (Chord) distance measure and raw cover-class scores (McCune and Grace 2002), which procedure is conceptually similar to protocol (2), except that squared abundance values are relativized such that the sum of squares for each plot equals 1, and Euclidian distance is used to calculate dissimilarity.

After examining the results from all five protocols, the most ecologically interpretable dendrogram for each dataset of vegetation plots was accepted. Varying the beta setting in Flexible-Beta clustering affects the level at which group of vegetation plots are resolved in a dendrogram and can produce subtle changes in group membership. An initial beta setting of -0.5 was used in all analyses, but was occasionally changed to -0.25 once the optimal data-treatment protocol was identified for a given group. Experience has indicated that all five data-treatments protocols will perform similarly in the analyses for a given dataset and in combination, will identify many groups of vegetation plots that always cluster together regardless of the protocol used. However, an advantage of this method is that the method also will readily identify those vegetation plots or groups of plots whose larger group plot memberships change when different data-treatment protocols are used. Invariably, these vegetation plots represent plot samples or observation sites that are more problematic (e.g., ecotonal, transitional, and heterogeneous) and fit less clearly into classified groups of vegetation plots.

The initial vegetation-plot dataset was progressively fragmented by identifying one or more homogeneous subset of plots at each iteration, removing those subsets and reclustering the remaining plots. More comprehensive cluster, statistical, and ordination analyses were completed on these subsets of vegetation plots. In addition, special subsets of vegetation plots were assembled to more intensively examine relations between vegetation-plot groups that were in different subsets of plots. Groups of individual vegetation plots were fine-tuned during the cluster analyses of each vegetation-plot subset. During analysis, group membership of vegetation plots that proved problematic were ultimately reassigned from their initial groups to other groups after evaluating the statistical interpretability of each affected group with and without the questionable plot and by examining the position of the vegetation plot on the axes of non-metric multidimensional scaling ordinations.

Compositional Summary Statistics

Compositional statistics were calculated to evaluate the adequacy of vegetation-plot groups recognized in cluster analysis and ultimately to assist in classifying and locally describing the community types. Total mean cover and total frequency across all vegetation plots were determined for every taxon. To compute mean cover, cover-class scores were converted to the midpoints of their respective percent ranges. The midpoints were averaged, and the resulting values were back-transformed to cover-class scores. For each taxon in each group of vegetation plots that was under consideration, the following summary statistics were then calculated.

- Frequency—the number of samples in a group of vegetation plots in which a species occurs.
- Mean Cover—back-transformed cover-class value corresponding to mean percent cover calculated from midpoint values of cover-class ranges. All samples assigned to a group of vegetation plots were considered when calculating mean cover, not just samples in which a taxon was present; absences were assigned a cover value of zero.
- Relative Cover—the arithmetic difference between mean cover (for a given group of vegetation plots) and total mean cover (for the entire vegetation-plot dataset) (equals Mean Cover minus Total Mean Cover). Expressed by plus or minus symbols, this value provides a relative approximation of how much more, or less, abundant a particular species is in a vegetation-plot group compared to the overall dataset.
- Constancy—the proportion of vegetation plots in a group in which a species occurs, expressed as a percentage (equals Frequency divided by the number of samples in a group, multiplied by 100).
- Fidelity—the degree to which a species is restricted to a group, expressed as the proportion of total frequency that frequency in a given group of vegetation plots constitutes (equals Frequency divided by Total Frequency, multiplied by100). An accidental or exotic species can have maximal (100) Fidelity to a type if the species occurs in only one sample in the entire dataset. As a result, fidelity alone can perform poorly as a criterion for identifying characteristic species and distinguishing among types.
- Diagnostic Value (DV) (equals Constancy multiplied by Fidelity, divided by 100)—a synthetic value indicating species that are both frequent within and relatively restricted to a group of vegetation plots.

- Diagnostic Value Adjusted by Cover, Scaled (Adj DV [scaled]) (equals DV multiplied by Mean Cover, divided by 9)—by dividing DV by 9, the maximum possible cover value, this statistic synthesizes information about frequency, DV, and mean abundance. A species entirely restricted to a particular group of vegetation plots, occurring in every plot of that group, and attaining maximum mean cover will have an Adj DV (scaled) of 100 for that vegetation type. Empirically, taxa most characteristic of a vegetation type will have a much lower Adj DV (scaled), although the exact range of values in any given vegetation type or vegetation-plot dataset may vary considerably.
- Diagnostic Value Adjusted by Cover, Unscaled (Adj DV [unscaled]) (equals DV multiplied by Relative Cover)—an alternative, unscaled synthetic measure of adjusted DV, using Relative Cover as the modifier of DV. Because cover classes form a logarithmic, rather than linear scale of values, Adj DV (unscaled) is a statistically more legitimate means of incorporating information on cover and has the advantage of not favoring only dominant species and, therefore, can better identify species that are considerably more abundant within a given group of vegetation plots than in the vegetation-plot dataset as a whole. This statistic, however, is sensitive to vegetation types that have few vegetation plots assigned to them and to species with low overall frequency.

Additionally, the following statistics were generated for each group of vegetation plots.

- Mean Species Richness—the average number of species present per vegetation plot (S).
- Homoteneity—the mean constancy of the S most constant species, expressed as a fraction. This value (sensu Curtis 1959) can be considered the constancy of the average species in a community type; higher values for homoteneity indicate greater uniformity in species composition among vegetation plots. Although homoteneity is not independent of size of a vegetation-plot group, often increasing as the number of group members decrease, homoteneity can be used to evaluate if community types have been defined at an appropriate level. Ordinarily, approximately 0.600 or higher would be considered a desirable homoteneity value for association-level groups of vegetation plots in a landscape-level dataset where data were collected consistently by one or a few people. However, because of many data collectors, differences in data collection protocols, the geographic scope and natural diversity of some vegetation types, and the size of groups represented in the vegetation-plot dataset for APPA, 0.500 was set as the lowest acceptable homoteneity for associations, with few exceptions.
- Goodness of fit (Bray-Curtis similarity)—the mean distance between vegetation plots constituting a community type is another useful measure of within-group homogeneity. The similarity coefficient (C) can be calculated as 1 minus Bray-Curtis dissimilarity, or as C equals 2 (MC) divided by MA, plus MB multiplied by 100, where MA equals sum of cover values in plot A, MB equals sum of cover values in plot B, and MC equals sum of cover-class values of species shared by vegetation plots A and B, using the lower mean cover value for each species (Bray and Curtis 1957). Mean within-group similar values greater than 0.45 indicate very homogeneous groups of vegetation plots when applied to large-patch forest

vegetation. However, geographically extensive and variable forest types, and isolated, small-patch vegetation types (e.g., rock outcrops and bogs) often have much lower similar values.

These procedures were executed in Microsoft Access and Excel (Microsoft Corp.) using macros written in Visual Basic. This macro greatly reduced the time required for calculations and made it possible to efficiently evaluate a large number of vegetation-plot groups in the competing dendrograms generated by different cluster analysis protocols.

Also, similar groups of vegetation plots were compared statistically head-to-head by calculating total frequency and total mean cover and then by generating summary statistics solely for the vegetation-plot groups in question. This type of analysis was used to compare similar vegetation types. The analysis also was used to compare problematic or questionable vegetation types with related types by identifying within-plot group differential and diagnostic species. In combination with ordination studies, these comparison studies were especially helpful in evaluating whether certain groups of vegetation plots should be treated as its own association in the USNVC or merely a variant of another association already identified.

Ordination

The ordination method of non-metric multidimensional scaling (NMS; Kruskal 1964) was used to validate the vegetation classification of vegetation plots, detect compositional variation and trends that are obscured in cluster analysis process, and aid in identifying the environmental gradients along which vegetation types are distributed. The NMS is a type of indirect gradient analysis that assigns vegetation plots to coordinates in ordination space in a way that maximizes, to the extent possible, the rank-order (i.e., non-parametric) correlation between intersample distance in ordination space and intersample dissimilarity (i.e., ecological distance; Minchin 1987). The NMS initially assigns spatial coordinates to vegetation plots at random, then calculates stress as the mismatch between the set of ordination distances and the matrix of dissimilarity between vegetation plots. The vegetation-plot coordinates are then moved such that stress is reduced and recalculated, and then the process is repeated iteratively until stress cannot be further reduced. Because NMS does not converge on a single, tractable solution for a given ordination, a sufficient number of iterations are required to reach a point at which decreases in stress are negligible and several starting configurations are necessary to avoid reaching local minima of stress. Additionally, unlike the axes of a detrended correspondence analysis ordination, the dimensions of an NMS ordination do not form a decreasing series of variance in composition explained and, therefore, actual axis numbers are arbitrary. The NMS will extract as many dimensions as are specified, and an appropriate number of dimensions must be determined a priori by examining the rate at which stress declines with an increasing number of dimensions.

The NMS process was implemented in PC–ORD 5.15 software (McCune and Mefford 2006). Each dataset or subset of vegetation plots was examined with cluster analysis and analyzed in an NMS ordination using the same distance measure used for clustering (Figure 19). Smaller subsets of vegetation plots having closely related community types also were ordinated using the Bray-Curtis coefficient. Outliers (average within-group distance greater than 2.5 standard deviations), which frequently distort distribution patterns in ordinations, were removed from each subset. Each ordination was computed using 50 random starting configurations and runs with real data, 400

iterations, and an instability criterion of 0.00001. Following this procedure, two- or three-dimensional (3D) solutions with the lowest stress levels were used for interpretation, and the coefficients of determination (r2) for each axis, representing the percent variation explained in the reduced ordination space compared to the original distance matrix, were calculated. Varimax rotation was used to optimize axis placement in all ordinations.

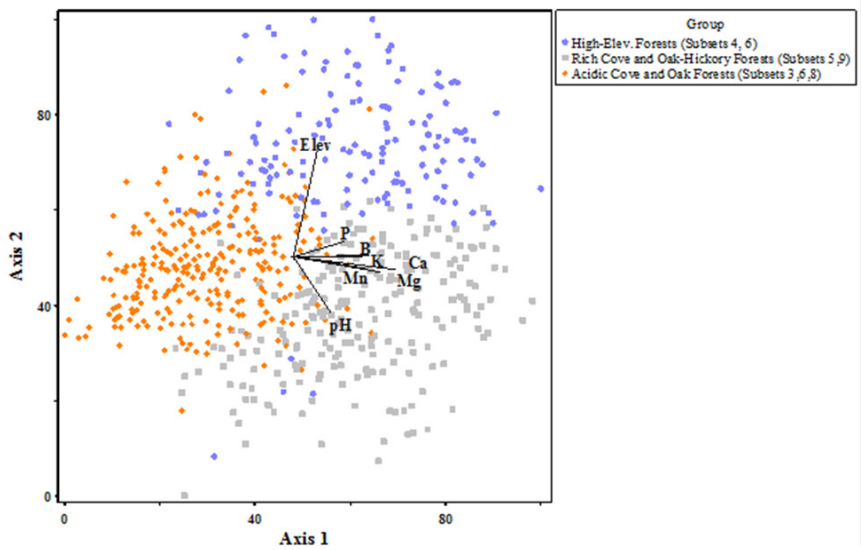

Figure 19. An example of ordination grouping from non-metric multidimensional scaling to analyze vegetation-plot data for the Appalachian National Scenic Trail vegetation mapping project.

The relation between compositional variation and environmental gradients was examined by calculating Pearson correlations between environmental variables and sample coordinates on each axis and by displaying significant correlations ($r > 0.45$) with joint plot overlays. Environmental variables used in ordination analyses were ordinal variables for slope, slope shape, topographic position, and topographic relative moisture index and were continuous variables for arcsine-transformed surface substrate and soil values, Beers transformed aspect, elevation, and natural log-transformed soil chemistry values. Missing or unmeasured environmental values, particularly soil chemistry values, imposed significant constraints on this process. In subsets where large numbers of plots were missing soil data, ordinations were performed using only topographic variables. In cases where smaller numbers of plots in a given subset had missing data, either those plots were deleted before running the ordinations, or missing values were populated with average values for a group of vegetation plots.

Environmental Summary Statistics

Mean values for continuous and ordinal environmental variables were calculated for each classified group of vegetation plots to aid in describing vegetation communities and identifying the differences between those vegetation communities. These calculations were made with raw (untransformed) values, which were averaged across all vegetation plots representing a given group of vegetation plots. Mean aspect was calculated as the average position along an arc defined by the range of aspect values.

Vegetation Community Assignments to USNVC Associations

Once vegetation communities were classified by analyses of the vegetation plots, the vegetation communities were subjectively compared to associations in the USNVC. All classified community types from vegetation-plot analyses were assigned to a conceptually similar USNVC association or used as a basis for a potentially new association to be added into the USNVC. To select nominals for new USNVC associations, or to recommend name changes of existing USNVC associations, high-constancy species (especially those with high mean cover and high DV, if available) were favored to facilitate identification of the vegetation type from the vegetation-plot data. A "constant" species was generally considered to be a species occurring in greater than 67% of vegetation plots. In a few cases, species that were less constant in a vegetation association but had high mean cover and DV were selected as parenthetical nominals. Pertinent new information of a vegetation association discovered during the classification development for the APPA vegetation mapping project was assimilated into the global (regional) descriptions in the USNVC, as appropriate, for those respective associations. Global information was then appended to all local descriptions of associations for APPA to provide a broader context (regional) to the vegetation associations that exist in the AT corridor.

Classification Review Meetings

Meetings were held by TNC ecoregion to comprehensively review the analyses and classification of vegetation plots. NatureServe ecologists met with local ecologists who were familiar with the classification procedure to review the analyses and vegetation classification. Adjustments to the vegetation classification were made accordingly following each ecoregion meeting.

The classification review meeting for the Southern Blue Ridge and Central Appalachian Forest ecoregions was hosted by the Virginia Natural Heritage Program in October 2009. Participants included ecologists from NatureServe and Virginia and West Virginia Natural Heritage Programs. The classification review meeting for the Lower New England / Northern Piedmont and Northern Appalachian / Acadian ecoregions was hosted by the New York Natural Heritage Program in February 2011. Participants included ecologists from NatureServe; an independent contractor; and New York, New Jersey, New Hampshire, and Maine Natural Heritage Programs.

Results and Discussion

Vegetation Classification Results

A listing of 280 USNVC associations that are recognized for the APPA vegetation mapping project is provided in “Appendix B: Vegetation Classification by U.S. National Vegetation Classification.” The 280 associations are a result of the vegetation classification, vegetation mapping, and AA efforts with this vegetation mapping project. Of these 280 associations, 224 were a direct result from the analyses and classification of the vegetation plots; however, several more associations were anticipated to occur within the AT corridor and were included in the early drafts of the field keys to vegetation associations for each APPA project area. Of these anticipated associations, 29 were confirmed during the field reconnaissance for vegetation mapping, and another 24 vegetation associations that were not anticipated were recognized during the field reconnaissance for vegetation mapping; these associations were added to the vegetation classification for APPA. Lastly, another three associations were recognized from the AA field data and were added to the vegetation classification.

Vegetation Descriptions

All USNVC associations identified with the APPA vegetation mapping project are described in "Appendix C: Descriptions of Vegetation Associations." These descriptions list the position of each vegetation association hierarchically placed in the USNVC, a concept summary, information about environmental characteristics, vegetation, important species, classification issues, relation to other classification systems, and distribution. Most fields in the descriptions have separate sections with information on the global characteristics (prefaced by "Global" and referring to its range-wide characteristics) and on the local characteristics (prefaced by "Appalachian National Scenic Trail" and referring to its APPA-specific characteristics).

The global information in the vegetation association descriptions in Appendix C applies to the vegetation association across its entire range; this information has been gathered from scientific literature and other field data and is stored in NatureServe's central database. For the descriptive text fields, global information (listed as "Global") can be thought of as an average or modal expression of a natural stand of the association throughout its range. The local information (listed as "Appalachian National Scenic Trail") is derived from data from the classification phases of the APPA vegetation mapping project, which consisted mostly of plot data from the plots sampled before and during this project; however, some information also is included from AA field data and less formal field observations. The local information is separated by the four project areas established for the APPA vegetation mapping project, including the SBR, CAP, LNE, and NAP project areas.

Toward the close of the vegetation mapping project, conifer forest plantations were moved to the cultural portion of the USNVC; however, descriptions to those forest plantations remain in Appendix C and are identified by their Cultural Subtype code. Vegetation associations without any type of vegetation-plot data—including those associations that were discovered after the collection of vegetation plots—have descriptions included in Appendix C, but any local information is based on general or cursory field observations or notes on abundant species.

Vegetation Field Keys

A field key to vegetation associations of APPA is provided in "Appendix D: Field Key to Vegetation Associations," which can be used with the vegetation descriptions in "Appendix C: Descriptions of Vegetation Associations." The vegetation field key consists mostly of dichotomous options that ultimately lead to a USNVC association. The start of the field key quickly separates into four main field keys, one for each of the four APPA project areas (SBR, CAP, LNE, and NAP). Each of these four field keys focuses on vegetation associations existing to their respective APPA project area, rather than the entire AT corridor extent. Several vegetation associations exist in more than one of the four APPA project areas, especially when associations exist near convergence of those project areas. Some vegetation associations exist in all four APPA project areas and are included in each field key by project area.

The vegetation association descriptions provided in "Appendix C: Descriptions of Vegetation Associations" are recommended to complement the vegetation field key to determine a correct assessment of vegetation classification. As with the descriptions of vegetation associations, cultural plantations are included in the field key to vegetation associations of APPA.

Plant Species List

A listing of plant species that were recorded while collecting field data to support the APPA vegetation mapping project are provided in "Appendix E: List of Plant Species." This listing of plant species is an export of all plant taxa generated from the PLOTS database for the vegetation mapping project and includes plant species that were documented at vegetation plots, validation sites, and AA sites[10]. Although the primary purpose of vegetation plots (sampling plots and observation sites collectively) was to characterize USNVC associations, the primary purpose of validation and AA sites was to assess the vegetation map layer produced for the vegetation mapping project. The list of plant species is not intended to be a comprehensive list of every taxon within the AT corridor; however, more than 2,100 plant species are listed from the field-data collection efforts.

This list includes taxa identified to the genus, species, and subspecies level. Some tree and shrub seedlings and immature herbaceous plants only could be identified to the genus level and, therefore, are listed as such. The plant taxa list provides scientific and common names and is organized alphabetically by scientific name. Taxa names were standardized to the PLANTS Database (U.S. Department of Agriculture, Natural Resource Conservation Service 2016), which is in accordance with the NatureServe Ecology vascular plant taxonomic standard (Kartesz 1999).

Discussion of Vegetation Classification by Ecoregion

Vegetation of APPA is discussed by TNC ecoregion. These vegetation discussions are derived from the analyses of vegetation-plot data to develop the vegetation classification for the APPA vegetation mapping project. For clarification, these discussions reference the vegetation that is within the AT corridor portion of an ecoregion and not of an entire ecoregion area.

Southern Blue Ridge Ecoregion

The vegetation within the AT corridor of the Southern Blue Ridge ecoregion consists mainly of three matrix-type forests, including upland oak, northern hardwood, and cove forests. These three matrix forests often include small-patch shrub and herbaceous vegetation. The most common of the three matrix forests is upland oak and is represented by several USNVC oak-forest associations of the Appalachian Oak / Chestnut Forest and Piedmont-Central Atlantic Coastal Plain Oak Forest Groups (G015 and G165, respectively). These oak forest associations are commonly positioned on middle to upper slopes at elevations up to 1,200 meters. These forest associations are dominated by canopy trees of white oak (*Quercus alba*), chestnut oak (*Q. prinus*), northern red oak (*Q. rubra*), black oak (*Q. velutina*) and hickory species (*Carya* spp.), with the forest understory vegetation composed of heath shrubs where soils are drier and more acidic, such as blueberry species (*Vaccinium* spp.), huckleberry species (*Gaylussacia* spp.), and rhododendron species (*Rhododendron* spp.). When the oak forest associations are positioned in more sheltered, mesic locations with richer soils, the oak-

[10]Plant taxa from vegetation plots, along with other plot sample data, had been entered into the National Park Service PLOTS Database Version 2.0 (NatureServe 2005) and later converted into the PLOTS version 4.0 (National Park Service 2015) database. Plant taxa from validation and accuracy assessment sites, along with other site and environmental data, had been entered into the PLOTS version 4.0 (National Park Service 2015) database according to National Park Service specifications.

canopy composition remains largely the same, but the forest understory vegetation shifts from a dominance by heath shrubs toward a dominance by mesophytic forbs and graminoids.

In elevations from 1,000 to 1,500 meters, the matrix forest transitions from one of oak dominance to northern hardwood dominance. The forest matrix of northern hardwood is represented by various USNVC associations of the Appalachian-Allegheny Northern Hardwood - Conifer Forest Group (G742). Northern hardwood forest associations are not recognized within the AT corridor of Georgia, but they are recognized within the AT corridor on middle to upper slopes at higher elevations of Tennessee and North Carolina. These forest associations are dominated by canopy trees of American beech (*Fagus grandifolia*), sugar maple (*Acer saccharum*), yellow buckeye (*Aesculus flava*), yellow birch (*Betula allegheniensis*), eastern hemlock (*Tsuga canadensis*), and northern red oak, with the forest understory vegetation composed of heath, herb, forb, and fern species, depending on moisture availability.

The matrix forest of low-elevation slopes in sheltered landforms is of forested coves. These sheltered cove forests are typically with northern to eastern exposures and have high moisture availability; sheltered slopes at low elevation support mesophytic hardwood forests. This matrix forest of coves is represented by several USNVC forest associations of the Appalachian-Central Interior Mesic Forest Group (G020). These forest associations are dominated by canopy trees of American basswood (*Tilia americana*), white ash (*Fraxinus americana*), tuliptree (*Liriodendron tulipifera*), yellow buckeye, eastern hemlock, and sweet birch (*Betula lenta*). Forest understory vegetation is variable with a heath-shrub dominance in acidic and nutrient-poor sites and a lush herbaceous-vegetation dominance in richer sites.

In addition to the vegetation components making up the three matrix forests, other vegetation components that are notable integrate with these matrix forests, including spruce-fir forests, shrub and herbaceous balds, vegetated rocky outcrops, dry-pine forests and woodlands, white pine-oak forests, wetland forests, seeps, and ruderal vegetation.

At the highest elevations (above 1,500 meters) on exposed upper slopes and ridges, the matrix forest of northern hardwood transitions to a forest of spruce and fir. Spruce-fir forests are represented by various USNVC associations of the Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest Group (G632). These forest associations are dominated by canopy trees of Fraser fir (*Abies fraseri*) and red spruce (*Picea rubens*). Spruce-fir forest associations are uncommon because of the limited locations of high-elevation environment to support spruce and fir growth and because of decline in Fraser fir as a result of infestation by balsam wooly adelgid (*Adelges piceae*). Spruce-fir forest associations are recognized on Unaka and Roan Mountains along the North Carolina-Tennessee border and on Whitetop Mountain in southern Virginia.

Also at high elevations (above 1,200 meters), shrub and herbaceous balds are uncommon. These balds are represented by several USNVC associations of the Southern Appalachian Grass Bald and Southern Appalachian Shrub Bald Groups (G657 and G658, respectively). These bald associations either are dominated by heath shrubs, such as mountain laurel (*Kalmia latifolia*) and rhododendron species, or by various graminoid and sedge species (Carex spp.). Outcrop and edaphic locations exist

at all elevations and are represented by various USNVC associations of the Central & Southern Appalachian Rocky Outcrop Group (G670); these associations are variable from sparsely-vegetated herbaceous associations at high elevations on extremely exposed sites to an encroachment of shrubs and trees at middle and low elevations.

On convexed, exposed rocky slopes, forests and woodlands of dry-pine trees commonly exist as small-scale patches within the large-scale matrix forest of upland oak. Dry-pine forests and woodlands are represented by various USNVC dry-pine associations of the Virginia Pine - Table Mountain Pine Woodland & Barrens and the Shortleaf Pine - Oak Forest Groups (G162 and G012, respectively). For these dry-pine forest and woodland associations, the dominant pine trees consist of pitch pine (*Pinus rigida*), Virginia pine (*P. virginiana*), and Table Mountain pine (*P. pungens*), and the common oak trees consist of chestnut oak and bear oak (*Quercus ilicifolia*). Carolina hemlock (*Tsuga caroliniana*) formerly dominated some of these forest and woodland patches; however, the spread of hemlock woolly adelgid (*Adelges tsugae*) has decimated hemlock stands. Within the locally common upland-oak forest matrix are USNVC white pine-oak forest associations of the Appalachian Oak / Chestnut Forest Group (G015). These forest associations are dominated by canopy trees of eastern white pine (*Pinus strobus*) with a subcanopy of mixed oaks.

The AT corridor in the Southern Blue Ridge ecoregion crosses few rivers. Riverine and floodplain vegetation is rare, usually as small-patch stands. Riverine and floodplain forests, woodlands, and river scour vegetation are represented by various USNVC associations of the Eastern North American Riverine Wetland Vegetation and the Silver Maple - Sugarberry - Sweetgum Floodplain Forest Groups (G755 and G673, respectively). These associations are dominated by canopy trees of silver maple (*Acer saccharinum*), river birch (Betula nigra), and American sycamore (*Platanus occidentalis*). Other wetland vegetation types in this ecoregion are small-patch seeps existing under the tree canopy of upland forests. Seep vegetation is represented by several USNVC associations of the Central & Southern Appalachian Seep and Central Interior-Appalachian Seepage Swamp Groups (G184 and G044 respectively). Within the mountainous topography, palustrine wetland vegetation is uncommon.

Ruderal vegetation is represented by various USNVC associations of the Southeastern Ruderal Grassland & Shrubland, Eastern North American Ruderal Meadow & Shrubland, and the Eastern North American Native Ruderal Forest Groups (G583, G059, and G030, respectively). These ruderal vegetation associations represent (1) successional old fields composed of a variety of shrub and herbaceous vegetation species; (2) successional forests composed of tuliptree, Virginia pine, and black locust (*Robinia pseudoacacia*); and (3) old home sites composed mostly of black walnut (*Juglans nigra*).

Central Appalachian Forest Ecoregion

The matrix forest of upland oak within the AT corridor of the Central Appalachian Forest ecoregion is overwhelmingly represented by several USNVC oak-forest associations of the Appalachian Oak / Chestnut Forest Group (G015); however, the compositional variation within these associations varies dramatically as the AT corridor proceeds northward from the Southern Blue Ridge ecoregion and into Maryland and Pennsylvania. In the southern portion of the AT corridor within the Central

Appalachian Forest ecoregion, plant species and community diversity is higher than the central and northern portions as a result of greater range of environmental gradients in the southern portion, most notably elevation and geologic substrates. In the southern portion, the oak forest associations of G015 have oak-tree canopy dominance similar to the upland-oak forest matrix of the Southern Blue Ridge ecoregion; that is, a tree canopy dominated by mixed oak species. In the more central and northern portions, the oak forest associations of G015 take on a tree canopy dominance that is more common to the Central Appalachian Forest ecoregion; that is, a tree canopy dominance of chestnut oak with few other oak species. On drier, nutrient-poor and acidic sites, the forest understory vegetation tends to be shrubby and dominated by heath shrubs such as mountain laurel, blueberry species, and huckleberry species. When the oak forest associations are in more sheltered, mesic locations with richer soils, the oak-canopy composition remains largely the same, but the forest understory vegetation shifts from a dominance by heath shrubs toward a dominance by mesophytic forbs and graminoids.

Forests dominated by northern-hardwood trees exist within the AT corridor of the Central Appalachian Forest ecoregion, although less widespread and a more discontinuous pattern than in the Southern Blue Ridge ecoregion. Northern hardwood forests are represented by several USNVC associations of the Appalachian-Allegheny Northern Hardwood - Conifer Forest Group (G742). Northern hardwood forest associations are most common in the Blue Ridge escarpment of Virginia; these forests decline dramatically as the AT corridor enters the Ridge and Valley geography of Maryland and Pennsylvania. Forest associations of G742 are dominated by canopy trees of American beech, sugar maple, yellow buckeye, yellow birch, eastern hemlock, and northern red oak, with the forest understory vegetation composed of heaths, herbs, forbs, and ferns, depending on moisture availability.

Related to northern hardwood forests, forests of mesophytic-hardwood trees are positioned in sheltered landforms of low-elevation slopes in coves. These mesophytic hardwood forests are typically positioned with northern to eastern exposures with high moisture availability and are represented by various USNVC forest associations of the Appalachian-Central Interior Mesic Forest Group (G020). These hardwood forest associations are dominated by canopy trees of American basswood, white ash, tuliptree, yellow buckeye, eastern hemlock, and sweet birch. Forest understory vegetation is variable with a heath-shrub dominance in acidic and nutrient-poor sites and a lush herbaceous-vegetation dominance in richer sites.

Forests and woodlands dominated by dry-pine trees exist as small-scale patches within the large-scale matrix forest of upland oak. Dry-pine forests and woodlands are represented by various USNVC associations of the Virginia Pine - Table Mountain Pine Woodland & Barrens Group (G162). These forest and woodland associations are characterized by short-statured canopy trees, usually positioned on exposed rocky south- and west-facing slopes, ridge spurs, crests, and clifftops. The dominant trees include pitch pine, Virginia pine, and Table Mountain pine, and the common oak trees consist of chestnut oak and bear oak. On mafic and calcium rich glades in the Blue Ridge escarpment of Virginia, small-patch wooded barrens exist that are represented by various USNVC

associations of the Appalachian Mafic Glade Group (G180). These wooded barren associations are dominated by canopy trees of white ash and eastern redcedar (*Juniperus virginiana*).

With a lack of suitable habitat, areas of shrubland, grassland, and sparse vegetation are uncommon. Where shrubland, grassland, and sparse vegetation areas exist, they are represented by various USNVC associations of the North-Central Appalachian Acidic Scrub & Grassland Group (G789) for shrublands and grasslands and the Appalachian Cliff & Rock Vegetation Group (G840) for sparse vegetation areas. These vegetation associations are typically in the Shenandoah National Park (SHEN) of Virginia and in Delaware Water Gap National Recreation Area (DEWA) of Pennsylvania (and New Jersey). Mountain laurel and blueberry species are occasional to shrubland sites on acidic rock outcrop. An array of tolerant forb and low-shrub species that are adapted to the mafic conditions dominate herbaceous vegetation sites on mafic rock.

Palustrine and riverine wetlands are uncommon because of low topographic diversity. Where wetlands are present, palustrine and riverine wetlands are in seeps, springs, basins, depressions, and alluvial terraces. Seep, spring, basin, and depression vegetation are represented by several USNVC associations of the Central Interior-Appalachian Seepage Swamp and Laurentian-Acadian-Appalachian Acidic Swamp Groups (G044 and G045, respectively). These vegetation associations are recognized in the acidic flats of Pennsylvania and are dominated by canopy trees of red maple (*Acer rubrum*), ash species, birch species, and blackgum (*Nyssa sylvatica*). Alluvial terrace forest is represented by various USNVC associations of the Silver Maple - Sugarberry - Sweetgum Floodplain Forest Group (G673). These alluvial associations are dominated by canopy trees of silver maple, with American sycamore uncommon; however, American sycamore are present on the embankments of major rivers where the AT corridor crosses. Alluvial terrace shrub and herbaceous vegetation are represented by various USNVC associations of the Eastern North American Riverine Wetland Vegetation Group (G755) and are dominated by a variety of graminoid and forb species. These shrub and herbaceous vegetation associations exist in small patches along high-dynamic streams and low-dynamic rivers.

Ruderal vegetation is represented by various USNVC associations of the Southeastern Ruderal Grassland & Shrubland, Eastern North American Ruderal Meadow & Shrubland, Eastern Ruderal Wet Meadow & Marsh, Eastern North American Native Ruderal Forest, and Eastern North American Exotic Ruderal Forest Groups (G583, G059, G556, G030, and G032, respectively). These ruderal vegetation associations represent (1) successional old fields composed of a variety of shrub and herbaceous vegetation species; (2) successional forests composed of tuliptree, Virginia pine, and black locust; and (3) old home sites composed mostly of tree of heaven (*Ailanthus altissima*) and other exotics tree species.

Lower New England / Northern Piedmont Ecoregion

Where the AT corridor crosses the Delaware River, a transition exists from the southward vegetation components of the Central Appalachian Forest ecoregion to the northward vegetation components of the Lower New England / Northern Piedmont ecoregion. As with the Southern Blue Ridge and Central Appalachian Forest ecoregions, the matrix oak and oak-hickory forests are largely represented by several USNVC oak-forest associations of the Appalachian Oak / Chestnut Forest

Group (G015) throughout the southern portion of the AT corridor within the Lower New England / Northern Piedmont ecoregion; however, these oak associations of G015 become almost nonexistent as the AT corridor proceeds north of Connecticut, marking the northernmost limit of chestnut oak and black oak. Northern red oak, with its broad ecological amplitude, remains an important component of other forest types throughout the northern portion. The oak-hickory forest component is common and is represented by USNVC associations of the Northeastern Oak - Hickory Forest & Woodland Group. These oak-hickory forest associations are dominated by varying canopy trees of white oak, chestnut oak, northern red oak, black oak, and hickory species. Forest understory vegetation is variable, but typically dominated by blueberry species.

Northward into Massachusetts, the matrix forest becomes northern hardwood where elevations increase and the climate is generally colder and more mesic. The northern hardwood forest component within the AT corridor that is southward in the Lower New England / Northern Piedmont ecoregion is represented by various USNVC associations of the Appalachian-Allegheny Northern Hardwood - Conifer Forest Group (G742). These northern hardwood forest associations are dominated by canopy trees similarly as they are in the southern two ecoregions. The northern hardwood forest component within the AT corridor that is northward in the Lower New England / Northern Piedmont ecoregion is represented by various USNVC forest associations of the Laurentian-Acadian Hardwood Forest Group (G743). These northern hardwood forest associations are dominated by canopy trees in various combinations of sugar maple, red maple, white ash, American beech, yellow birch, sweet birch, American basswood, and northern red oak. Eastern white pine and eastern hemlock become important in this group within coves, low slopes, and more sheltered positions.

At elevations above 700 meters, a broad transitional zone exists where northern hardwood and spruce-fir forests intermix. The northern hardwood forest components that are represented by various USNVC forest associations of the G743 and the Laurentian-Acadian Hemlock - White Pine - Hardwood Forest Group (G741) intermix with the spruce-fir forest components that are represented by various USNVC forest associations of the Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest Group (G744). In this transition zone, spruce-fir-hardwood forest associations of G744 are dominated by canopy trees of red spruce, balsam fir (*Abies balsamea*), paper birch (*Betula papyrifera*), and yellow birch. The landscape above this intermixing transitional zone until tree line is reached produces stands of spruce-fir forest without northern hardwood and is dominated by canopy trees of red spruce and balsam fir.

Other small-patch forests and woodlands are nestled into the larger matrix forests of oak and oak-hickory. Small-patch forests and woodlands on rich-alkaline summits, upper slopes, and glades within the AT corridor throughout New Jersey, New York, Connecticut, and Massachusetts are represented by various USNVC associations of the Northeastern Chinquapin Oak - Red-cedar Alkaline Forest & Woodland Group (G016). These forest and woodland associations are dominated by canopy trees of sugar maple and chinquapin oak and occasionally with eastern redcedar and white ash. Woodlands and shrublands on acidic outcrops of summits and upper slopes within the AT corridor of New York and New Jersey are represented by various USNVC associations of the North-

Central Appalachian Acidic Scrub & Grassland Group (G789). These woodland and shrubland associations are dominated by tree and shrub canopies of pitch pine and bear oak, and sandcherry (*Prunus pumila*) may occasionally exist at grassy openings where herbaceous vegetation consists of little blue stem (*Schizachyrium scoparium*), poverty oat grass (*Danthonia spicata*), and Pennsylvania sedge (*Carex pennsylvanica*).

Wetlands consist of floodplain forests, acidic and alkaline forest swamps, shrub bogs and fens, shrub swamps, herbaceous wet meadows, marshes, and aquatic vegetation. Although wetlands as a whole are common, floodplain forests are not common. Floodplain forests are mostly represented by a USNVC association of the Silver Maple - Green Ash - Sycamore Floodplain Forest Group (G652). This floodplain forest association is dominated by canopy trees of silver maple and box elder (*Acer negundo)* and is recognized at Vernon Valley and Wallkill River in New Jersey. A flatwoods forest type is in this same vicinity and is represented by a USNVC association of the Central Hardwood Flatwoods & Swamp Forest Group (G597). This flatwoods forest association is dominated by canopy trees of pin oak (*Quercus palustris*), green ash (*Fraxinus pennsylvanica*), and red maple.

Particularly in New Jersey and New York, the acidic swamp forests exist within basin floors, low flats, and depressions and are represented by various USNVC associations of the Laurentian-Acadian-Appalachian Acidic Swamp Group (G045). These acidic swamp forest associations are dominated by canopy trees of red maple, ash species, red spruce, balsam fir, and eastern hemlock. Alkaline swamp forests are represented by various USNVC associations of the Laurentian-Acadian-Appalachian Alkaline Swamp Group (G046). These alkaline swamp forest associations are rare and are dominated by canopy trees of black ash (Fraxinus nigra), tamarack (*Larix laricina*), and arborvitae (*Thuja occidentalis*, also known as northern white cedar).

Shrub bog and fen wetlands are represented by USNVC associations of the Eastern North American Sub-boreal Bog & Acidic Fen Group (G745) and are dominated by leatherleaf (*Chamaedaphne calyculata*), highbush blueberry (*Vaccinium corymbosum*), swamp loosestrife (*Decodon verticillatus*), common buttonbush (*Cephalanthus occidentalis*), and shrubby cinquefoil (*Dasiphora fruticosa*). Acidic shrub swamp wetlands are uncommon and are represented by various USNVC associations of the Eastern North American Shrub Swamp (G167). These shrub swamp associations are dominated by speckled alder (*Alnus incana*) and are often codominated by dogwood species (*Cornus* spp.). Wet meadows are common and are represented by various USNVC associations of the Laurentian-Northeastern Wet Meadow (G771). These wet-meadow associations are characterized by dense herbaceous vegetation with a low coverage of shrubs and are dominated by sedges and graminoids, including upright sedge (*Carex stricta*), bluejoint (*Calamagrostis canadensis*), and three-way sedge (*Dulichium arundinaceum*).

Freshwater marshes and aquatic vegetation areas are uncommon, only recognized at a few locations within permanently flooded basins. Graminoid marshes are represented by various USNVC associations of the Eastern North American Freshwater Marsh Group (G125) and are dominated by cattail species (*Typha* spp.) and other graminoid and sedge species. Aquatic vegetation areas exist within the most deeply inundated wetlands and are represented by various USNVC associations of the Eastern North American Freshwater Aquatic Vegetation Group (G114). These aquatic vegetation

associations are typically dominated by aquatic floating species, including yellow pond-lily (*Nuphar advena*) and American white waterlily (Nymphaea odorata).

Ruderal vegetation is represented by various USNVC associations of the Eastern North American Native Ruderal Forest, Eastern North American Ruderal Meadow & Shrubland, and Eastern Ruderal Wet Meadow & Marsh Groups (G030, G059, and G556, respectively). These ruderal vegetation associations represent (1) successional forests composed of white pine, oak species, birch species, and maple species; (2) successional old fields composed of a variety of shrub and herbaceous vegetation species; and (3) herbaceous marshes invaded by common reed (*Phragmites australis*) and reed canarygrass (*Phalaris arundinacea*).

Northern Appalachian / Acadian Ecoregion

The vegetation within the AT corridor of the Northern Appalachian / Acadian ecoregion is considerably more boreal in composition than that of the southern three ecoregions; this is because of the high elevations that exist for the northern latitude of the Northern Appalachian / Acadian ecoregion. The Northern Appalachian / Acadian ecoregion is the only ecoregion where, within the AT corridor, alpine vegetation exists and oak species other than northern red oak are essentially absent.

Mixed forests of white pine, hemlock, and hardwood mixture of trees exist at lower elevations, particularly in more sheltered sites of low slopes, ravines, and coves. The mixtures of white pine, hemlock, and hardwood forests are represented by various USNVC associations of the Laurentian-Acadian Hemlock - White Pine - Hardwood Forest Group (G741). These mixed forest associations are dominated by canopy trees of eastern white pine and eastern hemlock. Within these pine-hemlock-hardwood forests, talus woodlands represented by associations of other USNVC groups exist on steep colluvial slopes. Talus woodlands of rich substrates are dominated by canopy trees of sugar maple, American basswood, and white ash. Talus woodlands of acidic substrates may form nearly monotypic stands of yellow birch.

The matrix forest is northern hardwood and is represented by several USNVC forest associations of the Laurentian-Acadian Hardwood Forest Group (G743). These northern hardwood forest associations reach elevations of about 760 meters and are dominated by canopy trees with various combinations of sugar maple, red maple, white ash, American beech, yellow birch, and American basswood. Above 760 meters and to about 1,220 meters, an extensive transition zone exists between the matrix northern hardwood forest and the spruce-fir matrix forest. The matrix spruce-fir forest in these high elevation zones above 1,220 meters and up to tree-line elevation is represented by various USNVC forest associations of the Northern Appalachian-Acadian Red Spruce - Fir - Hardwood Forest Group (G744). These spruce-fir forest associations are dominated by canopy trees of red spruce and balsam fir. The matrix forest within the 760- to 1,220-meter transitional zone is spruce-fir-northern hardwood forest and also is represented by various USNVC forest association of the G744. These spruce-fir-northern hardwood forest associations are dominated by canopy trees of red spruce, balsam fir, paper birch, and yellow birch.

Between 1,220 and 1,430 meters in elevation, the spruce and fir have a low, stunted growth form (known as krummholz) and are represented by USNVC spruce shrub associations of the Eastern Alpine Tundra Group (G104); these spruce shrub associations are mostly dominated by canopy trees of black spruce (*Picea mariana*). The highly exposed and harsh environments that are at elevations above tree line are home to a mosaic of alpine vegetation consisting of low heaths, herbs, and graminoids. This mosaic of vegetation is represented by several USNVC low-shrub and herbaceous associations of G104. Depending on exposure, wind, water availability, and depth of snow cover, the vegetation composition is variable. Characteristic low shrub and herbaceous species include leatherleaf, black crowberry (*Empetrum nigrum*), pincushion plant (*Diapensia lapponica*), Lapland rosebay (*Rhododendron lapponicum*), bog blueberry (*Vaccinium uliginosum*), tufted bulrush (*Trichophorum caespitosum*), Bigelow's sedge (*Carex bigelowii*), Pickering's reedgrass (*Calamagrostis pickeringii*), and highland rush (*Juncus trifidus*). Within this mosaic of alpine vegetation, small-patch areas of rock, scree, and talus exist with their vegetation restricted to cracks or small shelves where regular moisture is present. Sparse vegetation areas of rock, scree, and talus areas of the alpine zone are represented by various USNVC associations of the Eastern Alpine Cliff, Scree & Rock Vegetation Group (G108). Sparse vegetation areas of rock, scree, and talus areas of lower elevations below tree line are represented by various USNVC associations of the Laurentian-Acadian-Great Lakes Cliff & Rock Vegetation Group (G839), depending on whether the substrate is acidic or alkaline.

Wetlands are mainly associated with ponds, basins, and streams and are a mix of alluvial and non-alluvial vegetation. Non-alluvial vegetation includes forested swamps and also shrub and herbaceous bogs and fens that range from acidic to slightly alkaline. The tree canopy of forest swamps can range from completely deciduous to completely coniferous, with the most common being mixed deciduous and coniferous. Acidic swamps are most common of the non-alluvial wetlands and are represented by various USNVC associations of the Laurentian-Acadian-Appalachian Acidic Swamp Group (G045). These acidic swamp associations are dominated by canopy trees of red maple, eastern hemlock, red spruce, and balsam fir; one instance is recognized of an acidic swamp dominated by canopy trees of black spruce (*Picea mariana*). Alkaline swamps are uncommon (with only a few stands within the AT corridor of Maine) and are represented by various USNVC associations of the Laurentian-Acadian-Appalachian Alkaline Swamp Group (G046). These alkaline swamp associations are dominated by canopy trees of red spruce and balsam fir, but are distinguished by the dominance or codominance by arborvitae (*Thuja occidentalis*, also known as northern white cedar). Small patch shrub-herbaceous seeps are scattered about as wetlands in the understory of matrix upland forest canopies and are represented by various USNVC associations from the North-Central & Northeastern Seep Group (G189).

Non-alluvial vegetation of bogs, fens, and wet herbaceous meadows exists outside of the high elevations. Acidic bogs and fens are uncommon and are represented by various USNVC associations of the Eastern North American Sub-boreal Bog & Acidic Fen Group (G745). These acidic bog and fen associations are characterized by heath shrubs, including leatherleaf and rhodora (*Rhododendron canadense*) and various sedge species; the non-vascular layer is typically well developed with abundant moss species. Acidic shrub swamps are scattered and are represented by various USNVC

associations of the Eastern North American Shrub Swamp Group (G167). These acidic shrub swamp associations are dominated by speckled alder and are often codominated by dogwood species. Alkaline shrub fens are unique and are represented by a pair of USNVC associations of the Eastern North American Sub-boreal Alkaline Fen Group (G185). These alkaline fen associations are dominated by heath shrubs, including sweetgale (*Myrica gale*) and leatherleaf and various sedge species. Wet herbaceous meadows are scattered and are represented by various USNVC association of the Laurentian-Northeastern Wet Meadow Group (G771). These wet meadows are characterized by dense herbaceous vegetation with low-shrub cover and are dominated by sedges and graminoids, including upright sedge, bluejoint, and three-way sedge.

Freshwater marshes and aquatic vegetation areas are uncommon and only recognized at a few locations within permanently flooded basins. Emergent herbaceous and graminoid marshes are represented by various USNVC associations of the Eastern North American Freshwater Marsh Group (G125) and are dominated by pickerelweed (*Pontederia cordata*), broadleaf arrowhead *(Sagittaria latifolia*), green arrow arum (*Peltandra virginica*), or cattail species and other graminoid and sedge species. Aquatic vegetation areas exist within the most deeply inundated wetlands and are represented by various USNVC associations of the Eastern North American Freshwater Aquatic Vegetation Group (G114). These aquatic vegetation associations are typically dominated by aquatic floating species, including yellow pond-lily and American white waterlily.

Areas of alluvial vegetation, which are on rich-minerotrophic floodplains of slightly elevated alluvial terraces of rivers and streams, are uncommon. Alluvial forests are represented by various USNVC associations of the Silver Maple - Green Ash - Sycamore Floodplain Forest and Silver Maple - Green Ash - Black Ash Floodplain Forest Groups (G652 and G653, respectively). These alluvial forest associations are dominated by canopy trees of sugar maple, ash species, and American basswood. On coarse substrates deposited along rivers and streams, areas of alluvial vegetation are represented by various USNVC associations of the Eastern North American Riverine Wetland Vegetation, Northeastern Riverscour Barrens & Prairie, and Laurentian-Acadian Riverscour Vegetation Groups (G755, G754, and G792, respectively). These alluvial vegetation associations are characterized by perennial plants that tolerate inundation and flood scouring, including twisted sedge (*Carex torta*), Indian hemp (*Apocynum cannabinum*), and flatsedge species (*Cyperus* spp.); battered and stunted trees and shrubs are sometime sparsely present, including American sycamore and willow species (*Salix* spp.).

Ruderal vegetation is represented by various USNVC associations of the Eastern North American Native Ruderal Forest, Eastern North American Ruderal Meadow & Shrubland, and Eastern Ruderal Wet Meadow & Marsh Groups (G030, G059, and G556, respectively). These ruderal vegetation associations represent (1) successional forests composed of white pine, northern red oak, birch species, maple species, and quaking aspen (*Populus tremuloides*) and (2) successional old fields and wet meadows composed of a variety of shrub and herbaceous vegetation species.

Vegetation Mapping

Methods

Mapping vegetation of the Appalachian National Scenic Trail (APPA, also referred to as the "AT corridor" for the Appalachian Trail corridor) involved the following six primary steps: (1) preliminary map classification with a vegetation primer for each APPA project area, (2) field reconnaissance for each APPA project area, (3) map classification by each APPA project area, (4) aerial image interpretation and mapping by each APPA project area, (5) compilation of a final classification and map layer covering the entire AT corridor following accuracy assessment (AA), and (6) database development of the map layer. Although these steps proceeded sequentially, they overlap to some degree. Steps 1–4 proceeded sequentially by APPA project area starting in the Southern Blue Ridge (SBR) project area in 2010, moving north to the Central Appalachian (CAP) project area in 2011, then to the Lower New England (LNE) project area in 2012, and ending in the Northern Appalachian (NAP) project area in 2013. (See Figures 6–9 in the "Introduction and Project Overview" section of this report for detailed locations of the four APPA project areas.) Steps 5 and 6 compiled all APPA project areas into a contiguous map classification and map layer.

Preliminary Map Classification

Prior to field reconnaissance of each APPA project area, mappers needed to become familiar with the vegetation types expected to exist in the AT corridor. To accomplish this for APPA, the mappers met with vegetation classifiers and regional experts and reviewed the vegetation classification and field key to vegetation associations for each APPA project area. During these meetings, each vegetation association was discussed, including what defines it, where it was known to exist within the specific APPA project area, what other associations it is likely to be confused with, and any other aspects of the vegetation association that could help define its location or aerial imagery signature on the landscape.

Using this information and personal experience, the mappers formed an initial map classification for each APPA project area. This preliminary map classification promoted continuity from the classifiers to the mappers at the onset of the vegetation mapping process. Additionally, this preliminary step put in the hands of the mappers the foundations of a working map classification to test, update, and refine during field reconnaissance.

Field Reconnaissance

Field reconnaissance efforts were initiated to prepare for mapping vegetation types in APPA. Mappers and classifiers visited the AT corridor by APPA project areas and compared, with the aid of weatherized field computers, the ground conditions to their aerial signatures on the digital 4-band (true-color and color-infrared) imagery that was obtained for the APPA vegetation mapping project. Vegetation classification was determined by the appropriate APPA project area vegetation field key and a classifier. This process was necessary, as Hershey and Befort (1995) explain, because color-infrared photography (or imagery) is not sufficiently consistent between image sets to allow a species to be depicted precisely. Sun angle, light intensity, shadow, exposure, and difference in digital postcapture processing can affect image appearance. Additionally, differences in site history, hydrologic regime, intraspecific variation, elevation, latitude, and seasonality can change the

appearance of a single species across a single image. Hence, ground exploration of the imagery is a critical endeavor. Ultimately, the field reconnaissance efforts in each APPA project area helped correlate the imagery signatures of the vegetation with the vegetation classification on the ground (Figure 20).

Figure 20. Field reconnaissance to correlate aerial-image signatures with ground vegetation for the Appalachian National Scenic Trail vegetation mapping project.

Field reconnaissance also allowed mappers to become familiar with the local ecology of vegetation types in each APPA project area because ecologic concepts may differ. Where mappers discovered limitations to interpreting vegetation types by using digital aerial imagery, environmental models were tested to determine if vegetation types could be consistently separated by environmental elements. In APPA, the history of disturbance (both man-made and natural) that pervades the AT corridor prevented models from being a reliable tool for aerial-imagery interpretation.

The mappers and classifiers proceeded with field reconnaissance in the SBR project area during 2010, the CAP project area during 2011, the LNE project area during 2012, and the NAP project area during 2013. Fieldwork within each APPA project area was done over three 2-week long trips. The first and second trips each year focused on collecting information on each individual association or map class. The third trip focused on the verification process, which tested a draft version of the vegetation field keys and a sampling of preliminary map polygons. The third trip also included additional opportunities for note collection. During each field trip, the mappers and classifiers worked as a team to ensure correct assessment of vegetation types and to promote correct classification during mapping. The team became familiar with the vegetation and local ecology of

each APPA project area as they discussed the structural, floristic, and habitat characteristics of the vegetation present in the field and compared the vegetation types to the appearance of the vegetation in the imagery. Through this process in each of the APPA project areas, the team built an understanding of how to map the vegetation types, established a working map classification with mapping protocols, and helped the classifier to refine the vegetation classification and the field key to vegetation associations. A representative sample of the natural landscape of APPA was reviewed by the mappers during the field reconnaissance that included more than 24 weeks of fieldwork in 4 years. During the field efforts, several different vegetation types were determined, including vegetation types that had not been represented by the vegetation plots. These vegetation types were reviewed for inclusion and were added accordingly to the vegetation and map classifications.

Project orthoimagery mosaic sets of the 4-band digital aerial imagery allowed for easy in-field use. The file sizes were much smaller, and most of the imagery signature was maintained. This imagery was accessed using ArcMap in ArcGIS (Version 10.3, Esri), which also allowed the mapping team to digitally collect notes on vegetation and imagery signatures in the field, such as recording the map-class assignment. Notes to promote proper perspective of species composition, such as comments regarding significant species, also were recorded. An example of species composition is heterogeneous versus monotypic forest stand.

Verification

Between the second and third field reconnaissance efforts for each of the APPA project areas, small areas of the AT corridor with both familiar and novel signatures were mapped for field verification. The 4-band digital aerial imagery collected for the APPA vegetation mapping project was interpreted by the mappers, who applied the mapping conventions established from the earlier field reconnaissance efforts. During the third field reconnaissance effort for each APPA project area, the mappers and classifiers visited sites to verify that the test mapping was correct and that the field key to vegetation associations functioned correctly.

A total of 289 verification sites were assessed within the AT corridor with 82, 54, 90, and 63 assessed in the SBR, CAP, LNE, and NAP project areas, respectively. Specific map verification sites were selected in the field during the third field reconnaissance effort for each of the APPA project areas. Locations of verification sites were chosen in an attempt to cover the suite of vegetation types present along the 3,525-kilometer length of the AT corridor. At each verification site, field data were collected, and the field key to vegetation associations, map classification, and mapping conventions were assessed and adjusted as needed. The mappers and classifiers collected coordinate location information using field computers equipped with a global positioning system (GPS) in conjunction with the digital aerial imagery. The field key to vegetation associations for each APPA project area was then used to determine the vegetation association of the area greater than a minimum mapping unit (MMU). The vegetation association was compared to the map class assigned by the mappers, and an electronic data sheet was completed for each verification site. These data were entered into a feature-class layer with relate tables and incorporated into the geodatabase for the APPA vegetation mapping project. The field data also were imported into a NPS PLOTS version 4.0 (National Park Service 2015) database for the mapping project.

Map Classification

A map class represents a definable feature (e.g., a vegetation type, a non-vegetated feature, and an anthropogenic area) that can be consistently distinguished on aerial imagery or by use of an environmental model, or both. The set of map classes that represents all the mapped features defines the map classification. The map classification and protocols that define the mappable features are based on existing classification systems. For the APPA vegetation mapping project, all map classes, except those representing park-special vegetation and open-water types, were linked to the U.S. National Vegetation Classification (USNVC), as identified by NatureServe. For natural (including ruderal) vegetation, map classes were linked to natural types in the USNVC at the finest level, association. For cultural vegetation, map classes were linked to cultural vegetation types in the USNVC at the lowest applicable level.

After a draft of the map classification was developed for each of the APPA project areas, a "mapping tree" was created to facilitate the mapping process. A mapping tree is a diagram that divides the map classes into logical groups (e.g., Northern Hardwood Forest, Herbaceous Wetland, and Shrub Dominated) and then further divides the groups into subgroups (e.g., Floodplain Forest, Rank Vegetation, and Ruderal), with a final selection of choices between the similar map classes in each subgroup. The choices in a mapping tree are meant to present the mappers with a limited and consistent set of options and to remind the mappers of possible alternative map classes. Although each mapping tree is unique by APPA project area, some map classes are shared among mapping trees. A graphic version of each mapping tree by APPA project area is provided in the final products for the APPA vegetation mapping project.

To develop map-class names, for those map classes representing a single vegetation association in the USNVC, the association's common name was used (e.g., Lower New England-Northern Piedmont White Pine - Hemlock Dry-Mesic Forest). For those map classes representing more than one association in the USNVC, a comparable name (e.g., Chestnut Oak / Heath Forest map class for the collective associations of Central Appalachian-Northern Piedmont Chestnut Oak Forest and Low-Elevation Mixed Oak / Heath Forest) was derived. For those map classes representing cultural vegetation, either the common name at the lowest level mapped in the USNVC (e.g., Herbaceous Agricultural Vegetation, which is a Cultural Subclass) was used, or a generic name (e.g., Developed Area) was derived. For vegetation map classes lacking a direct link to the USNVC, a descriptive name was derived (e.g. Recently Burned Landscape). For those map classes representing non-vegetation features, a generic name (e.g., Open Water Lake) was derived.

Throughout the project, the map classification remained fluid. Each field endeavor, including the AA effort, revealed new information that prompted modifications to the map classes and their definitions. Revisions also were made to the map classification as the vegetation classification matured and the USNVC was revised; as aerial images were interpreted, new problems forced redefinition, expansion, conjunction, or minor adjustment to map-class definitions. As individual map classes changed, these changes were consistently reapplied to areas that had already been mapped in each of the APPA project areas to ensure consistent mapping within each APPA project area and across the entire AT corridor.

A map-class code was derived for each map class for ease of assigning information to map polygons. Each map-class code was made using four alpha characters and was to represent an independent map class; each code was to begin with one of the following first alpha characters to represent the major physiognomic characteristic:

- F—Forest (typically >60% tree cover),
- W—Woodland (>25% tree cover),
- S—Shrubland (>25% shrub cover and <25% tree cover),
- H—Herbaceous Vegetation (>10% herbaceous cover and <25% tree or shrub cover),
- V—Sparse (1-10% vegetation cover),
- C—Cultural (agricultural and developed landscapes),
- X—Park special vegetation, and
- Z—Open water with <10% vegetation cover.

The second character was to represent one of the following two possible scenarios: (1) to denote a ruderal map class with an "X" or (2) to denote the first significant term in the map-class name. The subsequent two characters were to represent other significant terms in the map-class name (e.g., FCWH for Central Appalachian White Pine - Hemlock Forest, SXMW for Ruderal Mixed Wet Shrub Swamp, and XPLM for Palmerton Smelter Ecological Restoration Area).

Aerial Image Interpretation and Mapping

The vegetation of APPA was mapped by U.S. Geological Survey (USGS) Upper Midwest Environmental Sciences Center (UMESC) staff using digital-onscreen three-dimensional (3D) mapping systems running geographic information system (GIS) software. The mapping team performed onscreen interpretation of digital imagery that was spatially referenced in GIS. The appropriate mapping tree by APPA project area was used to further assist the mapping process and enforce consistent application of the map classification. A draft version of the vegetation map—a spatial-database layer—was then prepared for the validation study for the SBR, CAP, and LNE project areas; a validation study was not conducted on the NAP project area. The vegetation map was then adjusted per the validation results prior to AA. The vegetation map was adjusted again according to the results from the analysis of the AA to meet accuracy criteria set by the National Park Service (NPS) Vegetation Mapping Inventory (VMI) Program.

The digital aerial imagery used for the onscreen mapping was obtained over 3 years starting in the fall of 2009 using a plane-mounted digital camera. (Refer to the "Introduction and Project Overview" section in this report for more information on the digital aerial imagery collected for the APPA vegetation mapping project.) The mappers used systems that incorporated passive stereo technology that uses polarized glasses to produce a 3D image on a liquid-crystal-display monitor for a computer. The stereo models were imported into the software program called "Stereo Analyst for ArcGIS" (ERDAS, Inc.) for 3D viewing and editing.

Mapping proceeded from fall 2010 to spring 2014 with one APPA project area mapped per mapping season. A mapper would map a single flight line of aerial imagery and then give this draft work to another mapper for quality assurance/quality control. This mapper would then assess the draft work

for errors in mapping and return the draft for review and modification. Areas of high complexity could be revised more than once. This review process ensured that all portions of the AT corridor were examined at least twice and by different individuals.

ArcGIS software was used as the GIS platform for the onscreen digital mapping. Because the 3D images were viewed directly in the GIS environment, vegetation could be mapped directly in ArcGIS (Figure 21). The polygon vector data were stored using an ArcGIS file geodatabase, which was projected in in Universal Transverse Mercator (UTM), Zone 18 North, by using North American Datum of 1983 (NAD83).

Figure 21. A computer workstation running ArcGIS (Esri) and three-dimensional software for onscreen digital mapping of vegetation for the Appalachian National Scenic Trail vegetation mapping project.

Standard image signature characteristics were applied—including texture, color, pattern, and position in the landscape—to guide placement of polygons during mapping. In addition to image signature characteristics, mappers needed to understand the environmental distribution of the vegetation types by APPA project area across the landscape to help identify those vegetation types and to properly place polygon boundaries. For each polygon, the appropriate map-class code was applied.

Supplemental imagery and datasets were used by the mappers to visualize and understand the landscape. These layers increased the mappers' ability to understand historical landscape change and use, determine wet and dry areas, and better visualize conifers. The supplemental imagery and datasets included digital aerial imagery and field data from the field reconnaissance efforts and vegetation plot and verification site data. Many of these supplemental imagery and datasets were only available at the state- or county-level; therefore, a decision was made to only use this information for mapping if a concept could be applied across an entire APPA project area. For

example, if leaf-off winter imagery in New Hampshire was determined to help split wetland forest types, then a similar leaf-off winter imagery set was needed in Maine to ensure that vegetation was mapped consistently across the entire NAP project area.

The NPS VMI Program's standard MMU of 0.5 hectare (ha) was applied to mapping forest, cultural, and park-special vegetation map classes. For woodland, shrubland, herbaceous, and sparse vegetation map classes, as well as nonvegetated open-water map classes, a MMU of 0.25 ha was applied, with the exception of nine map classes[11] representing alpine shrub, herbaceous, and sparse vegetation associations in the USNVC. The nine map classes were mapped with a MMU of 0.125 ha and were used only in the alpine zone of New Hampshire and Maine. The 0.25-ha MMU was applied to woodland map classes because they were comparatively rare along the AT corridor. The 0.25-ha MMU was applied to non-alpine shrubland, herbaceous, and sparse vegetation map classes because of their frequent interface with each other and general rarity within the AT corridor. The 0.125-ha MMU was specifically applied to the nine alpine map classes in New Hampshire and Maine because of the consistent occurrence of mappable small-patch variation within the very restricted alpine zone. Without this 0.125-ha MMU, most of the mappable variation within the alpine zone would not have been mapped.

For the many polygons that represent vegetation crossing outside the boundary of the APPA vegetation mapping project, mappers allowed those map classes to be mapped less than the MMU if the vegetation that continued over the project boundary was contiguous and covered at least the standard MMU for that map class. In these instances, map classes with a 0.5-ha MMU were mapped down to 0.1 ha and map classes with a 0.25-ha or 0.125-ha MMU were mapped down to 0.05 ha. For example, a 0.18-ha polygon of the Acidic Hardwood Swamp Forest (FAHS) map class would be mapped inside the project boundary if at least 0.32 ha of contiguous connected FAHS was outside the boundary.

Map Validation

Following the initial mapping of the SBR, CAP, and LNE project areas, a map validation was initiated. The intent of the map validation was to determine if the mapping had any gross systematic errors before the vegetation map was submitted into the much more resource- and time-intensive AA process.

For the map validation, one or two site locations were randomly selected for each map class. A cost-surface analysis that modeled landscape accessibility was applied to the site selection. Geographic coordinates to these site locations were then sent to the NPS, which assigned the field assessment to NPS staff or private contractors. At each validation site, a quick assessment of vegetation was made using the appropriate field key to vegetation associations. In the SBR project area, 62 validation sites were assessed during 2011; in the CAP project area, 72 sites were assessed during 2012; and in the

[11]The nine map classes receiving a 0.125-ha MMU are of the following map-class codes: HAWM, HBAM, HMSF, SAHM, SCAB, SCTH, SSSB, SWAR, and VAFB. Refer to one of several map-classification tables within this report for descriptions of map-class codes.

LNE project area, 135 sites were assessed during 2013. Following completion of map validation for the LNE project area, the NPS determined that the cost-benefit ratio for map validation was insufficient to warrant continuing the map validation process for the NAP project area.

Applying the results from the map validation to the APPA vegetation map was deemed impossible because of the very small sample size, issues with inconsistent data collection, and variation in data quality among field crews. Furthermore, the NPS deemed the costs of collecting validation data in the NAP project area overweighed the benefits to the entire vegetation mapping project so no validation data exists for the NAP project area. This provided the project with an inconsistent, sparsely populated dataset that did not cover the entire APPA project boundary.

The most direct value of the map validation process was as an independent review and testing of the field keys to vegetation associations for the three southern APPA project areas. The validation process exposed numerous systematic and structural errors within these vegetation field keys. These errors were fixed, resulting in refined and strengthened vegetation field keys for the AA process. This validation process improved the field keys for the three southern APPA project areas.

Incorporation of Other National Park Unit Map Layers

The AT corridor passes through several NPS park units along its 3,525-kilometer path from Georgia to Maine. Many of these NPS park units had existing vegetation map layers and each map layer was examined for incorporation into the final APPA map layer. The idea was to use the existing park unit map layers as is to (1) save time and resources and (2) ensure that the APPA map layer fit seamlessly with the other park-unit map layers.

Each NPS park-unit map layer was examined individually to determine if inclusion of the map layer into the APPA map layer was appropriate. The following is a list of determinations; individual park units are listed from south to north.

- Great Smoky Mountains National Park (GRSM)—the existing GRSM map layer (unpublished report) was not incorporated into the final APPA map layer because of the age of the GRSM map layer, differences in the vegetation and map classifications between the map layers for GRSM and for the SBR project area for APPA, and systematic disagreements between the existing GRSM map layer and interpretation of signatures on the aerial imagery obtained for the APPA vegetation mapping project.
- Blue Ridge Parkway (BLRI)—the existing BLRI map layer (unpublished report) was not incorporated into the final APPA map layer because of the age of the map, the amount of edge mapping needed to join the BLRI map layer to the APPA map layer, and the small amount of the BLRI map layer that would be inclusive to the APPA map layer.
- Shenandoah National Park (SHEN)—the existing SHEN map layer (Young et al. 2009) was not incorporated into the final APPA map layer because of a highly different mapping methodology. The SHEN map was developed using a GIS based environmental gradient model combined with the MaxEnt software program (Phillips et al. 2006) and 15-meter hyperspectral satellite imagery.

- Harpers Ferry National Historical Park (HAFE) and the Chesapeake & Ohio Canal National Historical Park (CHOH)—at the time of APPA mapping, HAFE and CHOH did not have completed map layers; these map layers could not be assessed for inclusion and were not incorporated into the final APPA map layer.
- Delaware Water Gap National Recreation Area (DEWA)—the existing DEWA map layer (Perles et al. 2007) was incorporated into the final APPA map layer because the mapping methodology, map classification, and vegetation classification matched those used for the APPA map layer. To complete the AT corridor through DEWA, the APPA project boundary was clipped though the DEWA map layer. Slight modifications were made to the DEWA-based map polygons along the edge of the AT corridor to remove polygons that fell below the MMU protocols for the APPA vegetation mapping project. Once the DEWA-based map polygons were added to the APPA map layer, the map and vegetation classifications for the APPA vegetation mapping project were similarly updated to include the data from the DEWA vegetation mapping project.

The DEWA portion of the AT corridor was excluded from the AA process for APPA because an AA analysis of the DEWA map layer was completed during the DEWA vegetation mapping project.

Database Development

Following the AA reconciliation, the map layer would have only map-attribute codes assigned to each polygon. To assign meaningful information to each polygon (e.g., map-class names and links to USNVC types), a feature-class table and other supportive tables were produced and ArcGIS was used to relate the tables of polygon information within a geodatabase. A geodatabase provides access to a variety of interrelated datasets, is expandable, and equips resource managers and researchers with a powerful GIS tool. The geodatabase developed for the APPA vegetation mapping project includes many feature-class layers produced from this project, including the map layer, vegetation plots, verification sites, validation sites, AA sites, aerial image locations, aerial flight line locations, and project boundary extent. Geospatial products for the APPA vegetation mapping project have been projected in UTM, Zone 18 North, by using NAD83.

Results

Map Classes

After reconciling map classes from the AA analysis, 169 map classes represent APPA; 150 of the 169 map classes represent vegetation types in the USNVC. Prior to the AA study, 194 map classes existed to map the AT corridor, of which 175 map classes represented vegetation types in the USNVC. The AA study determined that confusion in mapping existed among some map classes; these map classes were listed with accuracy levels less than 80% (in the 90% confidence interval), as set by the NPS VMI Program. Map classes with low accuracy were examined for consistent sources of error and then NPS staff from APPA and the Northeast Temperate Network Natural Resource Inventory and Monitoring (I&M) Program were consulted to determine if map classes should be merged to reduce error rates. The map classes with low accuracies were merged with the map classes that they were most often confused with during the mapping, unless the lower accuracy was accepted by the NPS staff. Various reasons are recognized for where confusion in mapping existed among the

map classes, including a breakdown of the mapping tree or ecological mapping conventions, inconsistent signatures on the aerial imagery across and among map classes, aerial imagery signatures of vegetation and vegetation on the ground that shift with latitude and elevation, and disagreement in classification between field reconnaissance and AA. Further details regarding the mapping confusion are provided in the "Accuracy Assessment" section of this report and in individual map-class descriptions in "Appendix F: Descriptions of Map Classes." The descriptions in Appendix F also explain the link among map classes and the vegetation types they represent. Ground photograph images showing representations of the map classes are provided where possible.

A total of 150 map classes represent 261 vegetation associations in the USNVC. From this vegetation mapping project, 280 vegetation associations in the USNVC are recognized for APPA; however, 19 associations were not directly mapped within the AT corridor. Because these associations exist below the MMU within the AT corridor and are otherwise integrated into other overarching map classes in no consistent manner, the associations are not represented by any one map class. Of the 150 map classes representing vegetation associations, 92 represent a single association (when it exists above a MMU), 33 represent 2 associations mapped together, 15 represent 3 or 4 associations mapped together, and 10 represent 5 or more associations mapped together.

Nineteen map classes are not specifically tagged to natural vegetation types in the USNVC. Among these 19 map classes, 11 represent cultural vegetation types in the USNVC. Of these 11 map classes, 5 represent developed areas and 6 represent agricultural landscapes, including agroforestry. Five of the remaining eight map classes represent natural landscapes that have undergone catastrophic disturbance or some other form of modification to natural vegetation preventing accurate vegetation classification and placement in the USNVC. The three remaining map classes represent nonvegetated water (non-USNVC).

The map classification for the APPA vegetation mapping project is listed in "Appendix G: Map Classification by Map-Class Category" and "Appendix H: Map Classification by U.S. National Vegetation Classification." Appendix G lists the map classification from a map-class perspective and lists the vegetation types in the USNVC that are assigned to each map class. Appendix H lists the map classification from a vegetation classification perspective and lists how the map classes relate to the USNVC in hierarchical order.

Summary Report of the Map Layer

A summary report is provided in Table 9 of the spatial-data layer (vegetation map) by individual map class at the most detailed level of polygon attribution (map class). The table summarizes frequency of polygons, area, average polygon size, and percent map coverages for each map class.

Table 9. Frequencies of polygons and areas for map classes represented in the vegetation map layer for the Appalachian National Scenic Trail vegetation mapping project.*

Map-Class Category Map-Class Code - Name	MMU (ha)	Poly Freq	Area (ha)	Ave (ha)

Brief Analysis and Discussion

General Overview of the Vegetation Map

Collectively, the spatial-database layer (vegetation map) produced for the APPA vegetation mapping project consists of 30,395 polygons and covers 110,919.7 ha, with an average polygon size of 3.6 ha. The 150 map classes representing natural (including ruderal) vegetation in the USNVC apply to 92.9% of polygons (28,242 polygons; average size of 3.8 ha) and cover 95.9% of the AT corridor (106,413.0 ha). Further broken-down, map classes representing natural vegetation in the USNVC indicate that the AT corridor is 92.4% forest and woodland (102,480.8 ha), 1.7% shrubland (1866.3 ha), and 1.8% herbaceous cover (2,065.9 ha). Map classes representing cultural vegetation in the USNVC apply to 5.8% of polygons (1,777 polygons; average size of 1.4 ha) and cover 2.3% of the AT corridor (2,516.3 ha). Map classes representing park special vegetation apply to 0.2% of polygons (58 polygons; average size of 7.0 ha) and cover 0.4% of the AT corridor (404.3 ha). Map

classes representing nonvegetated open and flowing water (non-USNVC) apply to 1.1% of polygons (332 polygons; average size of 4.8 ha) and cover 1.4% of the AT corridor (1,586.2 ha).

Forest and Woodland

Overall, map classes representing ruderal forest (there are no ruderal woodland) associations account for 24.2% (5,986) of all mapped forest and woodland polygons and 17.1% (17,482.9 ha) of forest and woodland areas within the AT corridor, whereas map classes representing nonruderal forest and woodland associations account for 75.8% (18,743) of the forest and woodland polygons, but 82.9% (84,997.9 ha) of forested areas within the AT corridor. This difference indicates that nonruderal forest and woodland associations are generally in larger, more homogenous and contiguous blocks, and the average area of a ruderal forest block is 2.9 ha compared to 4.5 ha for nonruderal forest and woodland map classes. These nonruderal forest and woodland coverage figures also discount the value of large blocks of contiguous forest composed of numerous different nonruderal map classes.

By area, the 10 most common forest and woodland map classes cover more than 62% of the forested and woodland landscape within the AT corridor (57.5% of the corridor). These 10 map classes represent a diverse mix of mesophytic and northern hardwood, oak, and conifer forests and woodlands, both ruderal and nonruderal, across the AT corridor in every APPA project area. The remaining 38% of forest and woodland landscape within the AT corridor is represented by 76 map classes; many of these map classes are very rare and isolated, but represent a wealth of ecological diversity.

Shrublands

Overall, map classes representing ruderal shrubland associations account for 40.6% (775) of the mapped shrubland polygons and 38.0% (708.9 ha) of shrubland areas within the AT corridor, whereas map classes representing nonruderal shrubland associations account for 59.4% (1,133) of the shrubland polygons and 62.0% (1,157.4 ha) of shrubland areas within the AT corridor. This difference indicates that nonruderal shrubland associations are slightly larger and more homogenous than ruderal shrublands, with an average polygon size of 1.0 ha compared to 0.9 ha for ruderal shrubland map classes.

By area, two shrubland map classes consist of 54.5% of the shrub cover within the AT corridor. The first map class, which is the more common of the two map classes, is the Central & Northern Ruderal Shrubland (SXCN). The SXCN map class defines ruderal shrublands from Virginia to southern New Hampshire and generally exist in small patches at low elevation. The second map class is the Mixed Conifer Krummholz (SMCK). The SMCK map class defines the short-statured conifer forest at the highest elevations in the Green and White Mountains and generally exists in large, contiguous patches.

Herbaceous and Sparse Vegetation

Overall, map classes representing ruderal herbaceous and sparse vegetation associations account for 70.6% (1,605) of the mapped herbaceous and sparse polygons and 81.2% (2,065.9 ha) of herbaceous and sparse areas within the AT corridor, whereas map classes representing nonruderal herbaceous and sparse associations account for only 29.4% (669) of the herbaceous and sparse polygons and

18.8% (478.7 ha) of APPA herbaceous and sparse areas. This difference indicates that nonruderal herbaceous and sparse vegetation associations are rarer and more fragmented than ruderal herbaceous and sparse vegetation association.

By area, two herbaceous and sparse vegetation map classes consist of 57.0% of herbaceous and sparse vegetation cover within the AT corridor. These two map classes are ruderal herbaceous vegetation map classes and are defined by unimproved pasture and hay field, by occasionally maintained roadsides, and by fallow agriculture, all of which are common within the corridor.

Park-Special Vegetation

Five park-special map classes were developed to address vegetation that does not easily or consistently classify in the USNVC. The following is a list of the park-special vegetation map classes.

- Constructed Wetland Ruderal Vegetation Complex (XCMC)
- Palmerton Smelter Ecological Restoration Area (XPLM)
- Recently Burned Landscape (XRBL)
- Potomac River Outcrops (XPRO)
- Beaver Meadow Complex (XBMV)

Overall, map classes representing park-special vegetation account for 0.2% (58) of the mapped polygons and 0.4% (404.3 ha) of area within the AT corridor.

The XCMC and XPLM map classes represent landscapes being actively managed and restored. Both of these map classes contain vegetation that is highly modified from a natural state and that does not conform well to existing ruderal vegetation associations in the USNVC. The applications of these map classes in mapping were limited to specific locations. The application of the XCMC map class was limited to the Liberty Marsh of the Wallkill River National Wildlife Refuge in New York and New Jersey, and the application of the XPLM map class was limited to the U.S. Environmental Protection Agency superfund site that is under restoration near Palmerton, Pennsylvania.

The XRBL map class represents areas where stand-replacing fires happened before the aerial imagery for the APPA vegetation mapping project was collected. In some cases, depending on fire intensity and vegetation regeneration, the map class may have been used for areas where a stand-replacing fire happened a few years prior to aerial imagery acquisition, but the map class was generally applied to areas where stand-replacing fires happened the year aerial imagery was collected. These fires resulted in areas with insufficient vegetation regeneration for classification in the USNVC; therefore, the mappers had no reasonable way to determine what the vegetation was regenerating into. Where vegetation regeneration within a prior stand-replacing fire could be classified to a USNVC association, the applicable map class representing the association was applied.

The XPRO map class represents a very limited and unique area of sparsely vegetated bedrock outcrops in the Potomac River where the AT corridor crosses along the Virginia-Maryland border. For the XPRO map class, no formal vegetation data exist to support classification in the USNVC.

Lacking options for the mappers, a park-special vegetation map class was created as a place holder for this sparse vegetation pending future investigation.

The XBMV map class represents a mosaic of wetland vegetation types within active and recently abandoned beaver ponds. In these wetlands, vegetation associations have not differentiated into distinct mappable units (considering the MMU of 0.25 ha for herbaceous vegetation). Or, although the vegetation has differentiated into distinct associations, none of the associations were greater than a MMU and, therefore, mapping the wetland as dominated by a single vegetation association would be incorrect. The XBMV map class represents vegetation with high heterogeneity, but that heterogeneity is limited to associations in the USNVC that naturally exist in wetlands.

Cultural Vegetation

A final aspect of APPA is the cultural landscape. The cultural landscape covers 2.3% (2,516.3 ha) of the AT corridor spread among 1,777 polygons (1.4-ha average). Eleven map classes represent cultural vegetation in the USNVC. Five of these 11 cultural map classes represent developed landscapes, which account for 1.8% (1,963.7 ha) of the AT corridor and 5.1% (1,543) of the polygons. These map classes represent everything from natural landscapes recently razed for development to parking lots devoid of vegetation. Another four map classes represent agroforestry for timber production, which accounts for 0.2% (174.9 ha) of the AT corridor and 0.4% (123) of the polygons. These map classes represent conifer and hardwood trees specifically planted and actively managed for timber production. Two more map classes represent woody crops for food production, which account for 0.003% (3.1 ha) of the AT corridor and 0.007% (2) of the polygons. These map classes represent fruit orchards and vineyards. And lastly, one map class represents herbaceous crops, which account for 0.3% (374.6 ha) of the AT corridor and 0.4% (108) of the polygons. This map class represents row crops such as corn, wheat, and soybean and other improved and actively managed herbaceous crops.

Open Water

Although open water in APPA is uncommon, open water covers 1.1% (1,586.2 ha) of the AT corridor. More than one-third of the open water is due to two lakes that the AT corridor encircles in Maine, which together cover 540.9 ha. The remainder comes from smaller lakes scattered throughout the AT corridor and the many large rivers that the AT corridor parallels and crosses.

Map Layer Presentation

A sample presentation of the map layer for each APPA project area is shown in Figures 22–25. The linear nature and length of APPA precludes full map presentation in this report. Insets are included in Figures 22–25 to provide examples of the details that exist in the map at a fine scale; however, with this presentation, the color symbology is generalized with map classes grouped into broader categories. These categories are the same as the bolded categories provided in “Appendix G: Map Classification by Map-Class Category” and Table 9.

Detailed map polygons and their classification to the USNVC are provided in the project geodatabase and can be accessed using GIS software.

Accuracy Assessment

Methods

Objective and Overview

The objective of an accuracy assessment (AA) is to measure the probability that a particular location has been assigned the correct vegetation class in the vegetation map layer. The process of an AA is based on field observations, and the process of mapping is based on aerial image interpretation; each process has different perspectives of scale and observation. An AA estimates thematic accuracy by map class in the map layer, giving users the information needed to determine suitability of the map layer for a particular application. At the same time, map layer producers are able to learn more about the nature of accuracy, including error, in the map layer. Thus, the two attributes of an AA are "users' accuracy," which is the probability that the map actually represents what was classified on the ground, and "producers' accuracy," which is the probability that an AA site has been mapped correctly. An error in mapping from the users' perspective is one of commission where a map class was mapped as a vegetation type that did not exist at the assessment site. An error in mapping from the producers' perspective is one of omission where a map class was not mapped as the vegetation type that existed at the assessment site. Both users' and producers' accuracies can be obtained from the same set of data by using different analyses. Errors exist when map classes are not the same as the classes observed in the field. A major assumption of an AA is that the application of the classification system is identical between mapping and field assessment. When the application of classification is not applied consistently with the field assessment, a "false error" could result and, therefore, requiring additional review of field data and classification decision.

Sampling Design

A stratified random sampling approach was used to select AA sites for the Appalachian National Scenic Trail (APPA, also referred to as the "AT corridor" for the Appalachian Trail corridor) vegetation mapping project. First, a cost-surface analysis layer of the AT corridor was developed to determine areas that would allow field crews to safely access AA sites in a timely and effective manner. Second, the AA sites were randomly generated for selection by map-class theme within areas deemed accessible from the cost-surface analysis. For each of the APPA project areas, the AA sampling design approached the APPA vegetation map layer as one contiguous study rather than as four independent studies. The AA sites, however, were selected during 2 years; sites were selected the first year in the Southern Blue Ridge (SBR) and Central Appalachian (CAP) project areas and the second year in the Lower New England (LNE) and Northern Appalachian (NAP) project areas. (See Figures 6–9 in the "Introduction and Project Overview" section of this report for detailed locations of the four APPA project areas.)

Cost-Surface Analysis

A cost-surface analysis was developed to extrapolate the amount of field crew effort needed to traverse the landscape to reach an AA site. Typical drivers of cost included topographic slope, land cover type, man-made improvements, and physical obstacles. A geospatial layer showing the cost-surface analysis of APPA was developed using ArcGIS (Version 10.x, Esri). This cost-surface

analysis modeled a continuum from easily accessible to inaccessible lands throughout the AT corridor.

The first step to develop the cost-surface analysis for APPA involved generating slope from a 10-meter digital elevation model. Topographic slope is the fundamental driver of cost when traversing the AT corridor. Separate functions were used to describe on-trail and off-trail costs; however, functions followed the same premise for slope (e.g., as slope increases, travel becomes exponentially more difficult). The next step to develop the cost-surface analysis involved identifying absolute barriers, including slopes greater than 60%; perennial rivers lacking a bridge; lakes, streams, and private property. Absolute barriers were deemed inaccessible in the cost-surface analysis. Corridors created by public trails or roads were identified and used to connect areas of the AT corridor that would otherwise have been isolated by absolute barriers. The last step to develop the cost-surface analysis involved identifying access points to the AT corridor, including trailheads and public roadways.

Portions of the AT corridor more than 8 kilometers from access points were excluded from the initial AA site selection. Final cumulative costs, which represented the scale of difficulty to reach a particular area from an access point, were derived from the cost-surface analysis. For some rare map classes, the cost-surface values were expanded beyond what was considered accessible to retain a sufficient number of AA sites for statistical analysis.

Site Selection

Locations within the APPA vegetation mapping project boundary, except those areas excluded by the cost-surface analysis, were included in the AA sampling design. Map classes representing natural (including ruderal) vegetation associations in the U.S. National Vegetation Classification (USNVC) were included as the individual themes to randomly select sites.

The number of samples needed for each map class (theme) were determined by using National Park Service (NPS) Vegetation Mapping Inventory (VMI) Program recommendations (Lea and Curtis 2010) as suggested in the following scenarios.

- Scenario A—the class is abundant, covering more than 50 hectares (ha) in total area. The map class receives the maximum sample size of 30.
- Scenario B—the class is relatively abundant, covering at least 8.33 ha but no more than 50 ha in total area. The map class receives a sample size of six-tenths of the observations per hectare of the map class (equal to one observation for every 1.67 ha of map-class area). (This ratio allocates observations at a density rate equal to 30 observations per 50 ha).
- Scenario C—the class is relatively rare, covering less than 8.33 ha in total area. The map class receives five observations; the recommended minimum sample size.

For Scenario C, a map class could receive less than five observations if the area was on private land or if the total area was extremely low.

With APPA lands extending approximately 3,525 kilometers from northern Georgia to central Maine, the AA field data collection was staggered across two field seasons to allow for a logistically plausible AA process. Field data from AA sites in the southern two APPA project areas (SBR and CAP) were collected during the 2014 field season, and field data from AA sites in the northern two APPA project areas (LNE and NAP) were collected during the 2015 field season. The AA site selection process for the southern two project areas (SBR and CAP) began prior to the map completion of the northern-most project area (NAP); therefore, the number of AA sites needed to be prorated to select for those map class coexisting in the southern two project areas and the northern two project areas. For map classes used in either of the southern two project areas and in the LNE project area (but not the NAP project area), the number of AA sites were prorated by using the already completed vegetation map layers for each project area. For map classes used in either of the southern two project areas and into the NAP project area (where mapping was not yet complete), the number of AA sites were prorated for the northern two project areas based on the area the mappers expected to map in the NAP project area, plus the calculated area from the already completed map layer of the LNE project area. These prorated estimates were then applied to the southern two and northern two project areas.

Random selection of AA site locations was buffered from the polygon boundaries in the vegetation map layer to ensure that field classification of the observed area (a circular area approximately the size of the minimum mapping unit [MMU]) for each AA site would overlap with vegetation types represented in adjacent polygons.

The required buffer distance was calculated with the following formula:

$$\text{Buffer Distance} = \sqrt{R^2 + F^2 + M^2}$$

where *R* is the radius distance of the observation area, *F* is the expected (e.g., 90th percentile) global positioning system (GPS) error distance, and *M* is the standard requirement (maximum positional error distance in the map) for positional accuracy. The MMUs that were used to map APPA were 0.5 ha, 0.25 ha, and 0.125 ha[12], depending on the map class; map-class MMUs are described in the "Vegetation Mapping" section of this report. Depending on MMU size, values for *R*, *F*, *M* and the polygon buffer distance vary; these values are given in Table 10. The value of *R* is 40 meters for 0.5 ha, 28 meters for 0.25 ha, and 20 meters for 0.125 ha. The values of *F* and *M* are generalized to 15 meters and 12 meters, respectively. Therefore, a buffer distance of either 44 meters for a 0.5-ha MMU map class or 34 meters for a 0.25-ha MMU map class was applied to the interior side of polygon boundaries. Because of the small size, a buffer distance of 10 meters for a 0.125-ha MMU map class was applied to the interior side of polygon boundaries rather than 28 meters as calculated from the buffer-distance formula.

[12]The 0.125-ha MMU was applied to nine map classes representing alpine shrub, herbaceous, and sparse vegetation associations in the USNVC; these nine map classes were used only in the alpine zone of New Hampshire and Maine.

Table 10. Values for calculating buffer distance from map polygon boundaries for the random selection of accuracy assessment sites.*

MMU (ha)	R (m)	F (m)	M (m)	Buffer (m)
0.500	40	15	12	44
0.250	28	15	12	34
0.125	20	15	12	28**

*MMU, minimum mapping unit; ha, hectare; R, radius; m, meter; F, global positioning system error; M, map positional accuracy.

**The calculated buffer is 28 meters by use of the standard buffer-distance formula; however, 10 meters is applied because of the small MMU size of 0.125 ha.

For some map-class themes that were characteristically shaped as narrow and linear in the mapping, the buffer distance needed to be reduced because the target number of AA sites could not otherwise be attained. The buffer distance was reduced on a case-by-case basis and was reduced incrementally until the target number of sites could be selected for a particular theme; this process promoted the maximum distance in buffer while still attaining the targeted number of sites. Multiple AA sites in a polygon were allowed provided that the site extents did not overlap in area, with a maximum of three sites allowed in any single mapped polygon.

Once the number of AA sites was determined and buffers were applied, random sites with associated geographic coordinates were generated for each map class using the Geospatial Modelling Environment suite of tools (Spatial Ecology LLC). The site coordinates were projected in the Universal Transverse Mercator (UTM), Zone 18 North, by using the North American Datum of 1983 (NAD83). The site coordinates then were provided to the field crews to upload into GPS receivers. Staff from the U.S. Geological Survey (USGS) Upper Midwest Environmental Sciences Center (UMESC) provided the field crews with two different sets of 1:16,000-scale hard-copy maps that display the locations of the AA sites; one map set displayed AA sites on digital raster graphics (DRG [from the USGS National Map]) and the other map set displayed AA sites on true-color aerial imagery (from Esri). The AA site locations shown on the hard-copy maps were color coded, based on the MMU of the map class that was assigned to the polygon, to instruct the field crews on the area to classify for the AA site. When map polygons were shaped as narrow and linear, or were classified with a 0.125-ha MMU map class, the hard-copy maps for the field crews included polygon lines to denote the interpreted boundaries between two map classes. Likewise, track files for use with handheld GPS units were provided to the field crews to show these same boundary lines. An example of an AA field-crew map displaying AA site and map information over a USGS DRG backdrop is shown in Figure 26.

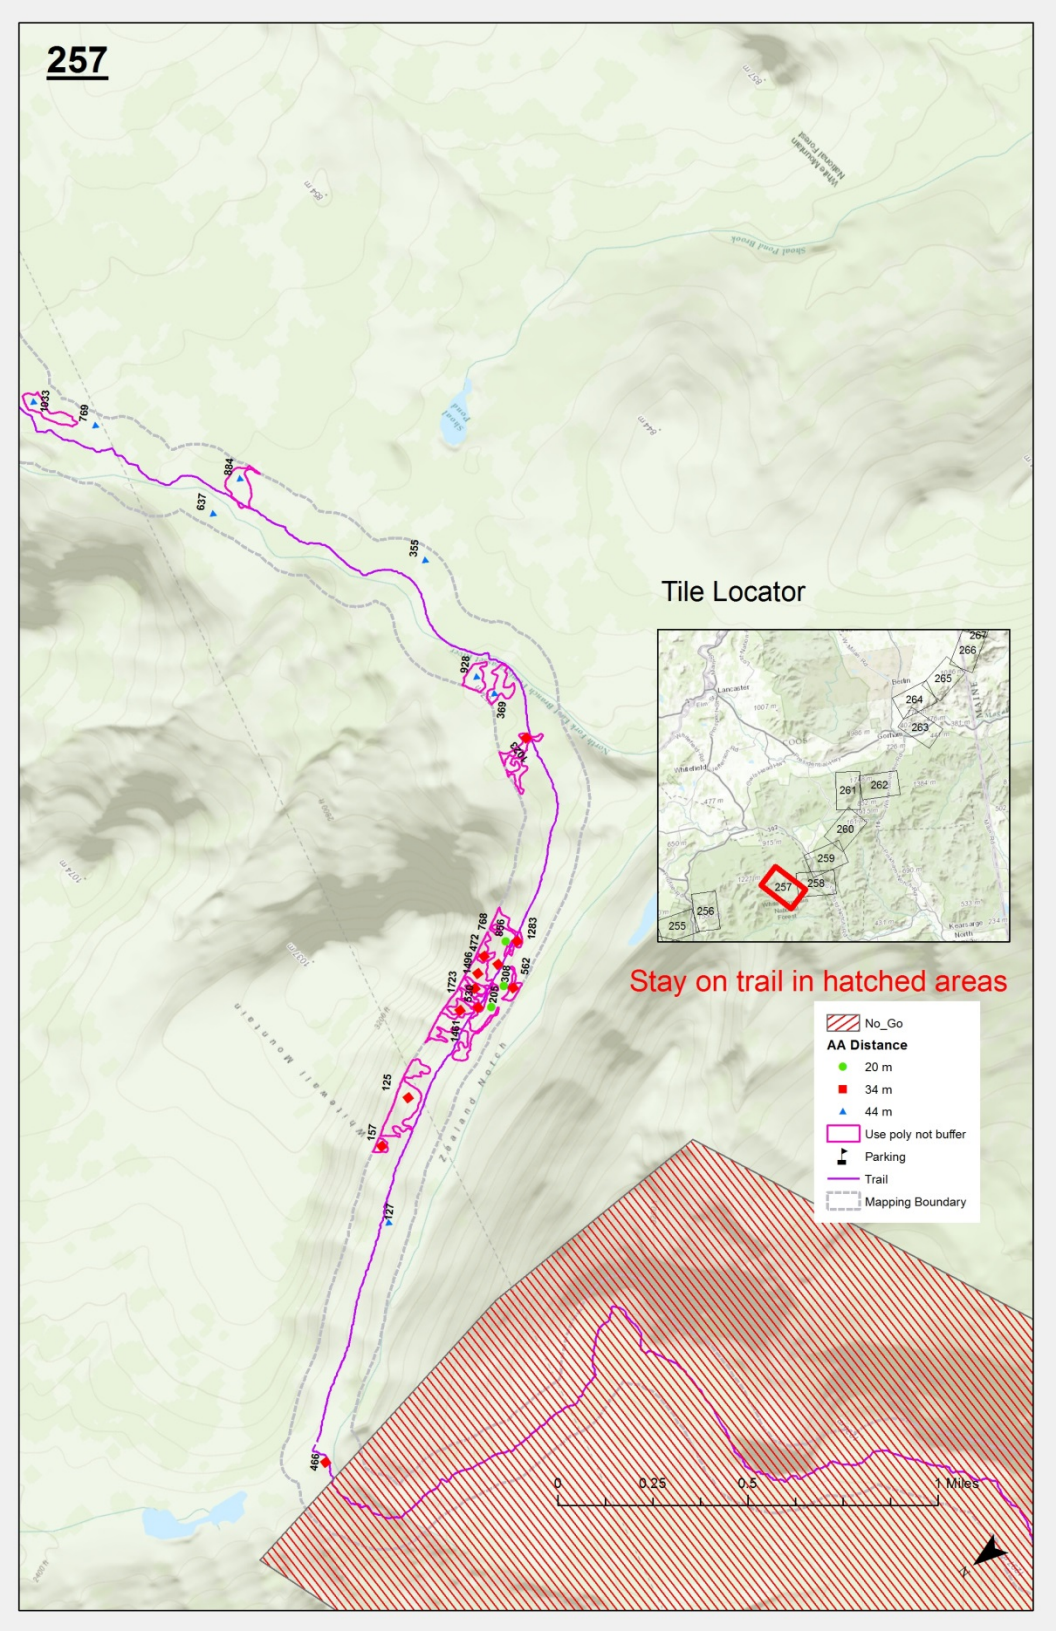

Figure 26. An example of an accuracy assessment map to direct field crews to sites, with site and map information shown over a U.S. Geological Survey digital raster graphic backdrop.

Field Data Collection

Without knowing the map classifications of AA site locations, field observation data were collected by AA field teams (field crews) that consisted of different individuals; each field crew consisted of a lead botanist and field assistant who were trained in AA procedures by ecologists from NatureServe and UMESC. During the two AA field seasons (2014 and 2015), 65 field crews that consisted of 53 individuals completed the AA field data collection. Each field crew navigated to preselected AA sites using GPS and hard-copy maps. The AA sites were distributed geographically to field crews in a method to prevent duplication of effort.

Field crews assessed an area approximately the size of the MMU defined for each AA site. The size of the MMU defined for each AA site is a circle with a 40-meter radius for a MMU of 0.5 ha; a circle with a 28-meter radius for a MMU of 0.25 ha; a circle with a 20-meter radius for a MMU of 0.125 ha; or if the mapped polygon boundaries could not support a circular MMU, an area specified by polygon boundaries that was provided on the hard-copy maps and GPS track files. At each AA site, field crews determined the assessment area size (0.5 ha, 0.25 ha, or 0.125 ha) by looking at the colored symbol shown at each AA site location shown on the hard-copy maps. A blue-triangle AA site indicated a 40-meter analysis radius (0.5-ha analysis area); a red-square AA site indicated 28-meter analysis radius (0.25-ha analysis area); a green-circle AA site indicated a 20-meter analysis radius (0.125-ha analysis area); and any blue, red, or green site with corresponding polygon boundary lines to show the analysis area and boundary location. In these very narrow polygons (as indicated on the DRG and true-color aerial imagery maps with boundary lines), the field crews considered the AA site coordinate location in relation to polygon boundaries and gave more attention to vegetation along the axis of the polygon.

Within the targeted assessment area, the field crew (Figure 27) recorded data on a field form. The data included the GPS coordinate location, dominant and indicator species, environmental data, and pertinent comments. For an example of a field form, see “Appendix I: Accuracy Assessment Form.” A field key to the vegetation associations of APPA (draft versions from 2014 and 2015) guided field crews to the vegetation association that best classifies the AA site. When the association type was uncertain (e.g., a vegetation type that expressed a variation not supported by the vegetation field key or an ecotone between two vegetation types), the crew still made a single “best call” but took extra notes on the circumstance. In numerous instances, an “alternate field call” was recorded, thus providing a second vegetation type to classify a specific site. When two vegetation types were recognized, the crew was instructed to note the vegetation type that contained the most area within the radius of a MMU. For additional field collection details and procedures, see “Appendix J: Accuracy Assessment Field Manual.”

Figure 27. Field classification of an accuracy assessment site for the Appalachian National Scenic Trail vegetation mapping project.

Data Analyses

Field data for 3,265 AA sites were collected and then entered into the NPS PLOTS version 4.0 (National Park Service 2015) database, with subsequent review of data entry. Of the 3,265 AA sites, 34 sites were excluded from the analysis because of unresolvable issues with the field data and another 27 sites were excluded because of a classification change in the U.S. National Vegetation Classification (USNVC) that included moving conifer plantation types from the Natural section to the Cultural section of the USNVC[13] or because no vegetation type was developed to represent a park-special map class[14]. Thus, 3,204 AA sites were used in the analysis of vegetation map layer accuracy. The analysis included the following steps:

[13]In 2015, the USNVC received a significant update and included moving conifer plantation types from the Natural section of the USNVC to the Cutlural section. The AA site selection for the APPA vegetation mapping project was concluded before the 2015 classification update became final. To remain consistent with the original AA study design of including only natural vegetation types, conifer plantation types were excluded in the analysis; however, field data collected of conifer plantation types at AA sites remain in the AA dataset.

[14]The Potomac River Outcrops (XPRO) map class was included in the AA site selection with the assumption that sparse vegetation associations in the USNVC would be identified for the map class prior to the AA field effort. No vegetation associations were developed for the XPRO map class; therefore, the map class was confirmed as a park-special map class and excluded in the anaylsis, which was consistent with the exclusion of other park-special map classes lacking USNVC classification.

- Initial comparative analysis of the field-site and map-polygon data,
- Review of disagreements and correction of false errors as necessary,
- Analysis of individual map classes,
- Final output of results into a contingency (matrix) table, and
- Final output of the analyses and results into a spatial database for use in a geographic information system (GIS).

Initial Comparative Analysis

The AA field-site data and map-polygon data were spatially joined using ArcGIS. Each AA field-site classification call (to a vegetation type) was compared to the corresponding map-polygon classification call (to a map class representing one or more vegetation types). Results from this initial comparison were tabulated either as a "match" (agreement) or a "mismatch" (disagreement). Matches were determined when either the primary or the secondary field-site calls were in agreement with the map-polygon call. Mismatches were determined when the criteria for a match was not met.

Review of Mismatches

Each set of mismatched classification calls were reviewed to ascertain as being a "false error" or a "true error." A false error is defined as a mismatch that was caused by one of the following: (1) spatial accuracy error in the field-site coordinates or map layer, (2) a missing or misapplied field-site classification call, (3) a field-site assessment of an area smaller than a MMU for the map class being assessed (an inclusion), or (4) a significant change in vegetation with time. In contrast, a true error is defined as a mismatch that was caused by the mapping, determined after exploring causes for a false error. This review process involved using ArcGIS to locate and view the AA field site locations and their corresponding polygons on a computer screen by using digital aerial imagery and the software program called "Stereo Analyst for ArcGIS" (ERDAS, Inc.). The field data sheets also were reviewed to gain a fuller sense of the context of the ground data. Anything determined to be a false error was reclassified as a match pending a secondary review during a series of AA reconciliation meetings.

Spatial Accuracy

A spatial error might exist when (1) the GPS device acquired inaccurate field coordinates or (2) a geospatial error existed within the vegetation map layer (called a "map-layer shift"). These spatial errors could displace the newly acquired field coordinate to an adjacent polygon on the map layer. Spatial errors in GPS coordinates were minimized during the random site selection process by selecting AA site coordinates more than 10 meters (for 0.125-ha MMU map classes), 34 meters (for 0.25-ha MMU map classes), and 44 meters (for 0.5-ha MMU map classes) from map polygon edges; however, field-acquired GPS coordinates collected with a poor GPS accuracy could position the coordinates into an adjacent map polygon. Furthermore, during AA site selection, the buffer distance from polygon edges was reduced when the target number of AA sites for a map class could not otherwise be attained and, therefore, increased the likelihood that the field-acquired GPS position was not in the correct map polygon, even with acceptable GPS accuracy.

Questionable Field-Site Classification Call

A field-site classification call might be questioned during the analysis. A likely reason for questioning a field-site call was if the perspective from the ground was limited by impenetrable vegetation or if wet soils prevented the field crew from accessing the entire AA site; i.e., the area of a MMU for the map class being assessed. Another reason for questioning a field-site call was if the AA site was diverse and other vegetation types were omitted or not recognized by the field crew. Questionable field-site calls were reviewed by checking the aerial imagery at the AA site and by inspecting the field data sheets for misapplications. Questionable field-site calls required further, joint analysis by UMESC and NatureServe staff during the series of AA reconciliation meetings.

Inclusion

The actual area assessed in the field might have been below an area of a MMU for the map class being assessed; therefore, the assessed area was termed an inclusion. The AA site in question may have contained vegetation that was merely an inclusion (smaller than a MMU for the map class being assessed) to the entire AA site area. Certain vegetation features are quite distinct from each other when the aerial imagery was viewed three dimensional (3D) (e.g., open woodland or dense forest), which makes for easy determination of site inclusion. An inclusion might also exist when the field assessment was indeed of a proper area (of a MMU for the map class being assessed), but the field-assessed area overlapped into an adjacent map polygon. Determining if the assessed area actually falls within the intended polygon can sometimes be difficult, particularly in the case of smaller map polygons. Along with the questionable field-site classification calls, inclusion errors required further joint analysis by UMESC and NatureServe staff during the series of AA reconciliation meetings.

Vegetation Change With Time

The vegetation map layer represents the ground conditions as presented in the aerial imagery that was acquired for the APPA vegetation mapping project. Sometimes the vegetation landscape changed between the date of imagery and the date of AA field assessment, which was between 4 and 5 years. When this change happens, the assessed area was termed as a change in vegetation with time. Determinations of vegetation change were easily made by a comparison between the aerial imagery and field-site photograph images. Determinations were confirmed during the series of AA reconciliation meetings.

Analysis of Individual Map Classes

A contingency table was generated to present the results of the initial analysis of the AA data to the vegetation map layer. This contingency table provided important information including users' and producers' accuracies of individual map classes and agreements and disagreements of map classes. Individual map-class accuracies that fell below the NPS VMI Program standard were reviewed to determine which map classes were in confusion with each other. If repeated confusion was evident, a decision was made whether to merge the map classes to gain higher accuracy or to leave the map classes separate and accept lower accuracy. A lower accuracy was accepted if the benefits of having that particular class mapped separately outweighed the benefits of a merge with other classes to produce a higher accuracy. These decisions were made with input from UMESC and APPA staff.

To avoid underestimating the role that the NPS, NatureServe, and UMESC staff had in the reconciliation of AA results and the impact that these results had on the final map classification for the APPA vegetation map layer, further understanding of the processes and steps that ultimately produced the final AA results and map classification is needed. The following is an outline of the discussions among APPA, NatureServe, and UMESC staff regarding AA issues, AA results, and eventual merging of map classes.

Review and Reconciliation of Site Specific AA Data

NatureServe and UMESC staff met to review and reconcile site specific AA field data. Because of the large number of AA sites that needed to be reviewed, two meetings took place at the UMESC to review and reconcile the AA site data across all four APPA project areas. The first meeting took place during October 6–8, 2015, to reconcile AA sites in the SBR project area, and the second meeting took place during February 22–26, 2016, to reconcile AA sites in the CAP, LNE, and NAP project areas. Site-specific AA field-site data were reviewed for potential changes to classification assignments and for inclusions or vegetation change with time. Adjustments to the vegetation classification also were addressed. Of the 3,204 analyzed AA sites, 698 were included in the review and reconciliation of AA field data.

Postreconciliation AA Contingency Table

The AA contingency table was updated to reflect adjustments from the review and reconciliation meeting. Individual map classes that fell below the 80% accuracy standard of the NPS VMI Program were studied to determine where confusion was present in the mapping. Detailed proposals were drafted, and the proposals listed the potential merges of map classes that had consistent confusion in mapping. These proposals were sent to NPS staff from APPA and the Northeast Temperate Network Natural Resource Inventory and Monitoring (I&M) Program for their input and decision. Each proposed resolution explained the pros and cons regarding the effect the resolution had on the vegetation map layer. This information helped APPA and Northeast Temperate Network staff to realize the cost-benefit ratio of accepting a map class with lower than standard accuracy to retain map detail or of accepting a merging of map classes to gain higher accuracy yet lose some map detail. These proposals and the associated NPS decisions are outlined in "Appendix H: Accuracy Assessment Reconciliation."

Final AA Contingency Table

The results from the complete analyses, including the reconciliations of AA site data and the consolidation of map classes, were updated into the contingency table. The frequency of agreement and the placement of disagreements are listed in the contingency table. The percentages of users' and producers' accuracies were recalculated for each map class to reflect changes from consolidating map classes.

AA Spatial Database

For use in a GIS, a feature-class layer was produced of the AA site locations, as well as supporting tables; the layer and tables were incorporated into the geodatabase for the APPA vegetation mapping project. The field data for AA also are included in the NPS PLOTS version 4.0 (National Park Service 2015) database for the project.

Results and Discussion

Of the 3,204 sites used in the analysis, the initial comparison determined that only 75.46% of the AA sites matched the corresponding polygons that represented natural (including ruderal) vegetation associations in the USNVC. Through the review process of correcting false errors and of combining some map classes because of low accuracies, the overall accuracy was increased to 80.18 %. A kappa adjustment for chance agreements resulted in an overall accuracy of 79.94%.

The contingency matrix of the AA results for the APPA vegetation mapping project can be accessed from the NPS Integrated Resource Management Applications Portal[15]. The matrix table lists the accuracy of each map class (along with 90% confidence intervals); with the users' accuracy reflecting errors of inclusion (commission errors) and the producers' accuracy reflecting errors of exclusion (omission errors). The width of each confidence interval was affected by the sample size used to derive the point estimate.

The overall accuracy of the map layer for the APPA vegetation mapping project fundamentally met the 80% accuracy requirement established by the NPS VMI Program. The most important factors affecting map accuracy were (1) difficulties by the mappers and field crews in determining the amount of "disturbance" at a site and determining if enough ruderal species were present to indicate whether the site should be mapped or classified to a "ruderal" or to a "natural" type; (2) difficulties by the mappers in overestimating and underestimating the presence of oak and in distinguishing between oak species to determine which oak map class to apply; (3) difficulties by the mappers in determining between upland and wetland hydrology, which was made difficult by the often limited size and patchy distribution of wetlands along the AT corridor; (4) difficulties by the mappers in overestimating and underestimating conifer species in the canopy and distinguishing between different conifer species; (5) difficulties by the mappers and the field crews in splitting low-elevation from high-elevation map classes in the tension zone between the two elevation gradients, even with the use of mapping conventions, modeling, and vegetation descriptions; (6) difficulties for the field crews in assessing a true MMU in field conditions, which were often challenging to access and/or to move about in; and (7) disagreement between mappers and field crews in estimating percent-cover of the strata. In regard to percent-cover estimates, past experience indicates that estimates in the field are generally lower than estimates from an aerial survey; thus, some mismatches resulted from these two different perspectives.

With the analysis complete, some individual map-class accuracies did not meet the 80% requirement (taking into account 90% confidence intervals). In general, errors of commission (users' accuracy) occurred in fewer map classes than did errors of omission (producers' accuracy). The following are map classes for which the mapping project did not meet the required rates of accuracy in terms of either the actual percentage or the confidence intervals.

[15]Go to http://science.nature.nps.gov/im/inventory/veg/project.cfm?ReferenceCode=2177176 to access the AA contingency table from the NPS Integrated Resource Management Applications Portal for the Appalachian National Scenic Trail vegetation mapping project, NPS Vegetation Mapping Inventory Program.

Users' Accuracy (Errors of Commission)

For each map class that has a users' accuracy (errors of commission) below NPS VMI Program standards, the individual errors of commission are reviewed and reported. This section reports on individual map classes with users' accuracy below program standards and the associated map classes with which the errors of commission occur. A low users' accuracy indicates that a map class was mapped too aggressively, which refers to an overapplication of the map class within the AT corridor. At the individual AA site level, the low users' accuracy indicates that the AA site was mapped as the map class being tested, but AA determined that the vegetation at the AA site is represented by a different map class (e.g., the mappers called the polygon the FOTM map class, but the AA recognized a vegetation type at the AA site that is represented by the FSCO map class).

For simplification, the following explanations of map classes with low-users' accuracy provide vegetation classification of AA sites using map classes that represent the classified vegetation associations. Some map classes represent multiple vegetation associations. For the purpose of these explanations, the level of detail by vegetation association is not necessarily needed.

Oak - Tuliptree - Maple Forest (FOTM) Map Class

The users' accuracy for the Oak - Tuliptree - Maple Forest (FOTM) map class was 52%, with a 90% confidence interval of 35–68%. Of the 31 AA sites tested for FOTM, 15 sites contained vegetation types other than FOTM; the following is a list of attributed errors.

- One Lower New England High Slope Chestnut Oak Forest (FSCO) site, two Central Appalachian Oak Forest (FCAO) sites, and six Central & Northern Oak Forest (FCNO) sites were mapped as FOTM because mappers underestimated the coverage of oak (*Quercus* spp.) and overestimated the coverage of tuliptree (*Liriodendron tulipifera*) and sugar maple (*Acer saccharum*).
- One Central Appalachian Hemlock - Chestnut Oak Forest (FCHO) site and one Hemlock - Hardwood - Oak Forest (FHHO) site were mapped as FOTM because mappers underestimated the coverage of oak and eastern hemlock (*Tsuga canadensis*) and overestimated the coverage of tuliptree and sugar maple.
- One Central Appalachian Ruderal Hardwood Forest (FXCH) site and one Ruderal Northern Hardwood Forest (FXNH) site were mapped as FOTM because mappers underestimated the coverage of oak and because the degree of disturbance present was discounted.
- One Northern Appalachian Hardwood Forest (FNAH) site was mapped as FOTM because mappers overestimated the coverage of oak and overestimated the coverage of tuliptree.
- One Acidic Hardwood Swamp Forest (FAHS) site was mapped as FOTM because wetland hydrology was mistaken for upland hydrology and because mappers misidentified the species of hardwood in the canopy.

Hemlock - Hardwood Swamp Forest (FHHS) Map Class

The users' accuracy for the Hemlock - Hardwood Swamp Forest (FHHS) map class was 50%, with a 90% confidence interval of 24–76%. Of the 14 AA sites tested for FHHS, 7 sites contained vegetation types other than FHHS; the following lists the attributed errors.

- One Rich Hardwood Swamp Forest (FRHS) site and six FAHS sites were mapped as FHHS because mappers overestimated the coverage of eastern hemlock and because of senescence and death of eastern hemlock.

Ruderal Central Appalachian Hardwood (FXCH) Map Class

The users' accuracy for the Ruderal Central Appalachian Hardwood (FXCH) map class was 58%, with a 90% confidence interval of 40–76%. Of the 26 AA sites tested for FXCH, 11 sites contained vegetation types other than FXCH; the following is a list of attributed errors.

- One Chestnut Oak - Mixed Oak Forest (FCOM) site, one Central Appalachian Oak - Hickory Forest (FAOH) site, two FSCO sites, and two FCAO sites were mapped as FXCH because the mappers overestimated the coverage of oak and/or hickory (*Carya* spp.) and because the degree of disturbance present was discounted.
- Two Central Appalachian Hardwood Forest & Woodland (FCHW) sites were mapped as FXCH because the degree of disturbance present was discounted.
- One FXNH site was mapped as FXCH because the species of maple (*Acer* spp.) and birch (*Betula* spp.) present at the site were misjudged.
- One Ruderal Tuliptree Forest (FXTT) site was mapped as FXCH because the mappers underestimated the coverage of tuliptree; and
- One Central Appalachian Swamp Forest (FCAS) site was mapped as FXCH because wetland hydrology was mistaken for upland hydrology and because mappers misidentified the species of hardwood in the canopy.

Rich Hardwood Swamp (FRHS) Map Class

The users' accuracy for the Rich Hardwood Swamp (FRHS) map class was 54%, with a 90% confidence interval of 36–71%. Of the 28 AA sites tested for FRHS, 13 sites contained vegetation types other than FRHS; the following is a list of attributed errors.

- Two FXNH sites and three FNAH sites were mapped as FRHS because upland hydrology was mistaken for wetland hydrology.
- One Northeastern Ruderal Oak - Red Maple Forest (FXOM) site was mapped as FRHS because upland hydrology was mistaken for wetland hydrology and because mappers overestimated the coverage of oak.
- One FAHS site was mapped as FRHS because the relative richness of the site was misinterpreted and because the hardwood canopy species were misjudged;
- One FHHS site was mapped as FRHS because the mappers underestimated the coverage of eastern hemlock.

- One Lower New England-Northern Piedmont White Pine - Hemlock Dry-Mesic Forest (FPHD) site, one White Pine - Hemlock - Red Spruce Forest (FPHS) site, one Successional Mixed Spruce - Fir - Hardwood Forest (FXSF) site, and one Low-Elevation Spruce - Fir Forest (FLSF) site were mapped as FRHS because upland hydrology was mistaken for wetland hydrology, because mappers underestimated the coverage of conifer trees, and because conifer tree species were misjudged.
- One Northern White-cedar Swamp Forest (FNWS) site was mapped as FRHS because mappers underestimated the coverage of conifer trees, and because conifer tree species were misjudged.

Mixed Spruce Swamp Forest & Woodland (FMSS) Map Class

The users' accuracy for the Mixed Spruce Swamp Forest & Woodland (FMSS) map class was 56%, with a 90% confidence interval of 34–78%. Of the 18 AA sites tested for FMSS, 8 sites contained vegetation types other than FMSS; the following is a list of attributed errors.

- Four Low-Elevation Spruce - Fir Forest (FLSF) sites were mapped as FMSS because upland hydrology was mistaken for wetland hydrology.
- Three FNWS sites were mapped as FMSS because mappers underestimated the coverage of northern white-cedar (*Thuja occidentalis*) and overestimated the coverage of red spruce (*Picea rubens*).
- One Red Spruce - Red Maple Acidic Swamp Forest (FCMS) site was mapped as FMSS because the mappers underestimated the coverage of red maple (*Acer rubrum*).

Producers' Accuracy (Errors of Omission)

For map classes that have a producers' accuracy (errors of omission) below programmatic standards, each map class and the individual errors of omission are reviewed. A low producers' accuracy indicates that a map class was mapped too conservatively, which refers to an under-application of the map class within the AT corridor. This section reports on the individual map classes with low producers' accuracy and the map classes that the errors of omission occur with. At the individual AA site level, therefore, the AA determined that the vegetation at the AA site was the map class being reviewed, but that the mappers called it a different map class (e.g. the AA recognized a vegetation type at the AA site that is represented by FAMO, but the mappers called the polygon FROH).

For the same reasons given for the explanations of map classes with low users' accuracy, the following explanations of map classes with low-producers' accuracy provide vegetation classification of AA sites by using the map classes that represent the classified vegetation associations.

High-Elevation Red Oak Forest (FROH) Map Class

The producers' accuracy for the High-Elevation Red Oak Forest (FROH) map class was 61%, with a 90% confidence interval of 49–73%. Of the 51 AA sites classified in the field as FROH, 20 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Eight sites assessed in polygons mapped as FAMO were determined to be FROH. Mappers modeled the understory composition as low-elevation based on field experience, mapping conventions, and vegetation descriptions; however, the map class was determined to more closely resemble high-elevation.
- Five sites assessed in polygons mapped as Southern Appalachian Hardwood Forest (FSAH) were determined to be FROH. Mappers underestimated the coverage of northern red oak (*Quercus rubra*) in the canopy.
- Three sites assessed in polygons mapped as FCOM were determined to be FROH. Mappers assessed northern red oak as chestnut oak and the elevation model failed to completely address high-elevation FCOM in the tension zone with FROH.
- One site assessed in polygons mapped as Blue Ridge Hemlock - Northern Hardwood Forest (FBHH) was determined to be FROH. Mappers underestimated the coverage of northern red oak.
- Two sites assessed in polygons mapped as Southern Appalachian Catawba Rosebay Heath Bald (SBCH) and one site assessed in a polygon mapped as Southern Appalachian Heath Bald (SBAH) were determined to be FROH. Mappers underestimated the coverage of northern red oak in these areas.

Mixed Shrub Bald and Thicket (SMBT) Map Class

The producers' accuracy for the Mixed Shrub Bald and Thicket (SMBT) map class was 58%, with a 90% confidence interval of 40–77%. Of the 24 AA sites classified in the field as SMBT, 10 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Two sites assessed in polygons mapped as FROH and one site assessed in a polygon mapped as Appalachian Ruderal Hardwood Forest (FXAH) were determined to be SMBT. Mappers overestimated the tree cover at these sites.
- Four sites assessed in polygons mapped as Ruderal Blackberry - Greenbrier Shrub Thicket (SXBG) were determined to be SMBT. Mappers overemphasized the degree of disturbance and confused shrubs species at these sites.
- Two sites assessed in polygons mapped as SBAH and one site assessed in polygon mapped as SBCH were determined to be SMBT. Mappers assessed the species of Rhododendron incorrectly and the elevation model failed to completely address the tension zone between low- and high-elevation shrublands.

Central Appalachian Oak Forest (FCAO) Map Class

The producers' accuracy for the Central Appalachian Oak Forest (FCAO) map class was 47%, with a 90% confidence interval of 33–60%. Of the 45 AA sites classified in the field as FCAO, 24 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Six sites assessed in polygons mapped as FSCO, three sites assessed in polygons mapped as FCNO, and two sites assessed in polygons mapped as Chestnut Oak Heath (FCOH) were determined to be FCAO. Mappers underestimated the coverage of chestnut oak at these sites.
- Three sites assessed in polygons mapped as FAOH were determined to be FCAO. Mappers overestimated the coverage of hickory at these sites.
- Two sites assessed in polygons mapped as FOTM and two sites assessed in polygons mapped as FCHW were determined to be FCAO. Mappers overestimated the coverage of tuliptree and other non-oak hardwood tree species at these sites.
- One site assessed in a polygon mapped as FROH was determined to be FCAO. Mappers modeled the understory composition as high-elevation based on field experience, mapping conventions, and vegetation descriptions; however, the map class was determined to more closely resemble low-elevation.
- Two sites assessed in polygons mapped as FXCH and one site assessed in a polygon mapped as FXTT were determined to be FCAO. Mappers overestimated the degree of disturbance and underestimated the coverage of northern red oak at these sites.
- One site assessed in a polygon mapped as Central Appalachian White Pine-Hemlock Forest (FCWH) and one site assessed in a polygon mapped as Central Appalachian Hemlock-Hardwoods (FCHH) were determined to be FCAO. Mappers overestimated the coverage of pine and eastern hemlock at these sites.

Central Appalachian Oak - Hickory Forest (FAOH) Map Class

The producers' accuracy for the Central Appalachian Oak - Hickory Forest (FAOH) map class was 53%, with a 90% confidence interval of 38–67%. Of the 38 AA sites classified in the field as FAOH, 18 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Five sites assessed in polygons mapped as FCHW were determined to be FAOH. Mappers underestimated the coverage of oak at these sites.
- Three sites assessed in polygons mapped as FCAO, two sites assessed in polygons mapped as FCOH, one site assessed in a polygon mapped as FCOM, and one site assessed in a polygon mapped as FSCO were determined to be FAOH. Mappers overestimated the coverage of chestnut oak and underestimated the coverage of hickory at these sites.
- Two sites assessed in polygons mapped as FXTT and one site assessed in a polygon mapped as FXCH were determined to be FAOH. Mappers overestimated the degree of disturbance and underestimated the coverage of oak and hickory at these sites.

- One site assessed in a polygon mapped as FROH and one site assessed in a polygon mapped as Central Appalachian Northern Red Oak Forest (FCRO) were determined to be FAOH. Mappers modeled the understory composition as high-elevation based on field experience, mapping conventions, and vegetation descriptions; however, the map class was determined to more closely resemble low-elevation.
- One site assessed in a polygon mapped as Central Appalachian Pine - Oak Xeric Shale Woodland (WPOS) was determined to be FAOH. Mappers overestimated the coverage of yellow pine at the site and misinterpreted the bedrock morphology.

Central Appalachian Ruderal Hardwood Forest (FXCH) Map Class

The producers' accuracy for the Central Appalachian Ruderal Hardwood Forest (FXCH) map class was 33%, with a 90% confidence interval of 21–46%. Of the 45 AA sites classified in the field as FXCH, 30 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Five sites assessed in polygons mapped as FCHW, one site assessed in a polygon mapped as FOTM, and one site assessed in a polygon mapped as FNAH were determined to be FXCH. Mappers underestimated the degree of disturbance at these sites.
- Four sites assessed in polygons mapped as FCAS, two sites assessed in polygons mapped as Silver Maple - Hardwood Floodplain Forest (FMHF), and one site assessed in a polygon mapped as FAHS were determined to be FXCH. Mappers underestimated the degree of disturbance at these sites and assessed the sites as wetlands or floodplains rather than uplands.
- Three sites assessed in polygons mapped as FCNO, one site assessed in a polygon mapped as FSCO, one site assessed in a polygon mapped as FAOH, and one site assessed in a polygon mapped as Sugar Maple - Chinquapin Oak / Sedge Forest (FSMC) were determined to be FXCH. Mappers underestimated the degree of disturbance and overestimated the coverage of oaks at these sites.
- Three sites assessed in polygons mapped as FXOM were determined to be FXCH. Mappers overestimated the coverage of oaks at these disturbed sites.
- Three sites assessed in polygons mapped as FXTT were determined to be FXCH. Mappers overestimated the coverage of tuliptree at these disturbed sites.
- One site assessed in a polygon mapped as Piedmont-Central Appalachian Sycamore - River Birch Floodplain Forest (WCRS) was determined to be FXCH. Mappers underestimated the degree of disturbance at these sites, misinterpreted the species in the canopy, and overestimated canopy cover at this site.
- One site assessed in a polygon mapped as Central Appalachian Hardwood-White Pine (FCHP) was determined to be FXCH. Mappers underestimated the degree of disturbance and overestimated of the coverage of eastern white pine (*Pinus strobus*) in the canopy at this site.
- One site assessed in a polygon mapped as Pin Oak Small River Floodplain Forest (FPOF) was determined to be FXCH. Mappers underestimated the degree of disturbance and overestimated the coverage of pin oak (*Quercus palustris*) at this site.

- One site assessed in a polygon mapped as Ash - Willow Floodplain Forest (FFAW) was determined to be FXCH. Mappers assessed this site as a disturbed floodplain forest rather than a disturbed upland forest.

Ruderal Northern Hardwood Forest (FXNH) Map Class

The producers' accuracy for the Ruderal Northern Hardwood Forest (FXNH) map class was 61%, with a 90% confidence interval of 49–74%. Of the 49 AA sites classified in the field as FXNH, 19 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Three sites assessed in polygons mapped as FXOM were determined to be FXNH. Mappers overestimated the coverage of oaks at these disturbed sites.
- Three sites assessed in polygons mapped as FAHS, two sites assessed in polygons mapped as FRHS, and one site assessed in a polygon mapped as FMHF were determined to be FXNH. Mappers underestimated the degree of disturbance at these sites and assessed these sites as wetlands or floodplains rather than uplands.
- Two sites assessed in polygons mapped as FNAH and one site assessed in a polygon mapped as FOTM were determined to be FXNH. Mappers underestimated the degree of disturbance at these sites.
- Two sites assessed in polygons mapped as Successional Heath Shrubland (SXHE) were determined to be FXNH. Mappers underestimated the tree cover at these disturbed sites.
- One site assessed in a polygon mapped as Northeastern Ruderal Red-cedar Forest (FXER) was determined to be FXNH. Mappers overestimated the coverage of eastern redcedar (*Juniperus virginiana*) at this site.
- One site assessed in a polygon mapped as FCNO was determined to be FXNH. Mappers underestimated the degree of disturbance and overestimated the coverage of oaks at this site.
- One site assessed in a polygon mapped as FXCH was determined to be FXNH. Mappers assessed the hardwood tree species composition incorrectly at this disturbed site.
- One site assessed in a polygon mapped as FXSF was determined to be FXNH. Mappers overestimated the coverage of red spruce at this disturbed site.
- One site assessed in a polygon mapped as Hardwood - Oak Talus Woodland (WHOT) was determined to be FXNH. Mappers underestimated the degree of disturbance at this site, misinterpreted the species in the canopy, and overestimated canopy cover at this site.

Northern Appalachian Hardwood Forest (FNAH) Map Class

The producers' accuracy for the Northern Appalachian Hardwood Forest (FNAH) map class was 58%, with a 90% confidence interval of 46–71%. Of the 48 AA sites classified in the field as FNAH, 20 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Four sites assessed in polygons mapped as FAHS, three sites assessed in polygons mapped as High-gradient Hardwood Floodplain Forest (FFHH), three sites assessed in polygons mapped as FRHS, and one site assessed in a polygon mapped as FMHF were determined to be FNAH. Mappers assessed these sites as wetlands or floodplains rather than uplands.
- Two sites assessed in polygons mapped as FXOM were determined to be FNAH. Mappers overestimated the degree of disturbance and the cover of oaks at these sites.
- Two sites assessed in polygons mapped as FCHH were determined to be FNAH. Mappers overestimated the coverage of eastern hemlock at these sites.
- One site assessed in a polygon mapped as Transitional Northern Hardwood - Red Spruce Forest (FTHS) was determined to be FNAH. Mappers overestimated the coverage of red spruce at this site.
- One site assessed in a polygon mapped as Ruderal Black Locust Forest (FXBL) was determined to be FNAH. Mappers overestimated the degree of disturbance and the coverage of black locust (*Robinia pseudoacacia*) at this site.
- One site assessed in a polygon mapped as FXNH was determined to be FNAH. Mappers overestimated the degree of disturbance at this site.
- One site assessed in a polygon mapped as FHHO was determined to be FNAH. Mappers overestimated the coverage of eastern hemlock and oak at this site.
- One site assessed in a polygon mapped as FFAW was determined to be FNAH. Mappers overestimated the degree of disturbance at this site and assessed this site as a floodplain rather than an upland.

Rich Hardwood Swamp Forest (FRHS) Map Class

The producers' accuracy for the Rich Hardwood Swamp Forest (FRHS) map class was 56%, with a 90% confidence interval of 38–73%. Of the 27 AA sites classified in the field as FRHS, 12 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Three sites assessed in polygons mapped as Hemlock - Spruce - Hardwood Forest (FHSH) and two sites assessed in polygons mapped as FHHO were determined to be FRHS. Mappers overestimated the coverage of eastern hemlock at these sites and assessed these sites as uplands rather than wetlands.
- Three sites assessed in polygons mapped as FAHS and two sites assessed in polygons mapped as FCMS were determined to be FRHS. Mappers assessed the species composition of these wetland forest sites incorrectly.
- One site assessed in a polygon mapped as FXSF was determined to be FRHS. Mappers incorrectly assessed the canopy species, the hydrology, and the degree of disturbance.

- One site assessed in a polygon mapped as FHHS was determined to be FRHS. Mappers overestimated the coverage of eastern hemlock in the canopy.

Low-Elevation Spruce - Fir Forest (FLSF) Map Class

The producers' accuracy for the FLSF map class was 57%, with a 90% confidence interval of 37–77%. Of the 21 AA sites (this map class was insufficiently sampled during AA) classified in the field as FLSF, 9 sites fell within polygons that were mapped as other vegetation types; the following is a list of attributed errors.

- Four sites assessed in polygons mapped as FMSS were determined to be FLSF. Mappers assessed these sites as wetlands rather than uplands.
- Two sites assessed in polygons mapped as FCMS and one site assessed in a polygon mapped as FRHS were determined to be FLSF. Mappers underestimated the coverage of red spruce and assessed these sites as wetlands rather than uplands.
- One site assessed in a polygon mapped as Montane Balsam Fir - Birch Forest (FMFB) was determined to be FLSF. Mappers overestimated the coverage of balsam fir (*Abies balsamea*) at this site.
- One site assessed in a polygon mapped as FPHS was determined to be FLSF. Mappers overestimated the coverage of eastern hemlock and eastern white pine at this site.

ENVIRONMENTAL / SITE INFORMATION

Measured Slope _____ ° _____ %

__ Flat	0 °	0 %
__ Gentle	0-5 °	1-9%
__ Moderate	6-14 °	10-25%
__ Somewhat steep	15-25 °	26-49%
__ Steep	27-45 °	50-100%
__ Very steep	45-69 °	101-275%
__ Abrupt	70-100 °	276-300
__ ovrhng/shltrd	>100 °	>300%

Measured Aspect _____ ° (N=0 °)

__ Flat		__ SE	113-157 °
__ Variable		__ S	158-202 °
__ N	338-22 °	__ SW	203-247 °
__ NE	23-67 °	__ W	248-292 °
__ E	68-112 °	__ NW	293-337 °

Topographic Position
__ Interfluve (Ridge/summit/crest) __ Toeslope
__ High Slope (upper/convex slope) __ Low level (terrace)
__ Midslope __ Channel bed
__ Lowslope (lower/footslope) __ Basin Floor

Cowardin System
__ Upland __ Palustrine
__ Estuarine __ Lacustrine __ Riverine

Landform (check most applicable)

__ Alluvial flat	__ Depression	__ Saddle
__ Alluvial terrace	__ Draw	__ Seep
__ Basin floor	__ Floodplain	__ Stream terrace
__ Bank	__ Gorge	__ Talus
__ Bottomlands	__ Gap	__ Valley floor
__ Cliff	__ Interfluve	
__ Colluvial slope	__ Midslope	
__ Cove	__ Ravine	
	__ Ridge	

Rock types present:

Hydrologic Regime:
__ Not a wetland (Upland: XERIC : DRY - MESIC : MESIC)
__ Intermittently flooded __ Permanently flooded __ Semipermanently flooded __ Temporarily Flooded (e.g. floodplains) __ Tidally Flooded
__ Seasonally Flooded (e.g. seasonal ponds) __ Saturated (e.g. bogs, perennial seeps) __ Unknown __ Irregularly flooded __ Irrglrly exposed

QUALITATIVE ASSESSMENT:

A) Environmental comments:

B) Landscape comments:

Soil Texture:
__ Sand __ Peat __ Silt loam __Muck
__ Sandy loam __ Loam __ Clay loam __Clay

Drainage:
__ Rapidly drained __ Moderately well drained __Somewhat poorly drained
__ Well drained __ Poorly drained __ Very poorly drained

Ground cover [Exclusive of living plants; adds to 100%]

_____% Bedrock	_____% Litter. duff	_____% Other _____
_____% Large rocks (cobbles, boulders >10cm)	_____% Wood (> 1 cm)	
_____% Small rocks (gravel, 0.2-10 cm)	_____% Water	
_____% Loose sand (0.1-2 mm)	_____% Bare soil	

Leaf type:
__Broad-leaved __ Succulent
__Needle-leaved __ Mixed
__Microphyllous
__Graminoid
__Broad-leaved herbaceous
__Pteridophyte
__Extremely xeromorphic

Leaf phenology (dominant stratum)
__ Evergreen
__ Cold-deciduous
__ Drought-deciduous
__ Mixed evergreen-cold-deciduous
__ Mixed evergreen drought deciduous
__ Herb - Annual
__ Herb - Perennial

Physiognomic Class
__ Forest (closed tree canopy)
__ Woodland (open tree canopy)
__ Shrubland
__ Dwarf Shrubland
__ Herbaceous (less than 25% woody layers)
__ Nonvascular
__ Sparse Vegetation

Natural and Anthropogenic Disturbance

_ logging	_ fire	_ Hydrologic
_ erosion	_ trails/roads	_ Agriculture
_ grazing/browsing	_ wind/ice damage	_ Old Growth
_ pine bark beetle	_ exotic plants	_ Fire Suppression
_ dogwood anthr	_ ORV	_ Hemlock/Fir Adelgid

Disturbance and animal use comments:

Appendix B: Vegetation Classification by U.S. National Vegetation Classification

Explanation of Vegetation-Classification Table

Table B–1 lists the vegetation classification for the Appalachian National Scenic Trail vegetation mapping project for the National Park Service Vegetation Mapping Inventory Program. The vegetation classification is a subset from the U.S. National Vegetation Classification (USNVC) with classification names, codes, and hierarchy that reflects USNVC Database (2016). For a listing of the vegetation classification with the map classification assignments, see "Appendix H: Map Classification by U.S. National Vegetation Classification."

Table B–1. Vegetation classification for the Appalachian National Scenic Trail vegetation mapping project, organized hierarchically by the U.S. National Vegetation Classification (USNVC).

USNVC Upper Hierarchical Code and Name USNVC Middle and Lower Hierarchical Code and Name
1. FOREST & WOODLAND CLASS
1.B. Temperate & Boreal Forest & Woodland Subclass

Biology Department
100 Morrissey Blvd.
Boston, MA 02125-3393

This subset of the International Ecological Classification Standard covers associations attributed to the Appalachian National Scenic Trail. This classification has been developed in consultation with many individuals and agencies and incorporates information from a variety of publications and other classifications. Comments and suggestions regarding the contents of this subset should be directed to Mary J. Russo, Central Ecology Data Manager, Durham, NC <mary_russo@natureserve.org> and Lesley Sneddon, National Ecologist, Boston, MA <Lesley_sneddon@natureserve.org>.

NatureServe also has partnered with many International and United States Federal and State organizations, which have also contributed significantly to the development of the International Classification. Partners include the following The Nature Conservancy; Provincial Forest Ecosystem Classification Groups in Canada; Canadian Forest Service; Parks Canada; United States Forest Service; National GAP Analysis Program; United States National Park Service; United States Fish and Wildlife Service; United States Geological Survey; United States Department of Defense; Ecological Society of America; Environmental Protection Agency; Natural Resource Conservation Services; United States Department of Energy; and the Tennessee Valley Authority. Many individual state organizations and people from academic institutions have also contributed to the development of this classification.

1.B.2.Na. Eastern North American Forest & Woodland

M883. Appalachian-Interior-Northeastern Mesic Forest

G742. Appalachian-Allegheny Northern Hardwood - Conifer Forest

Group Summary Description: This forest group occurs in the central and northeastern U.S., ranging from extreme southern Ontario, north-central New York and lower New England west to Lake Erie and south to the higher elevations of the Carolinas, on relatively cool, mesic sites. Northern hardwoods such as *Acer rubrum, Acer saccharum, Betula alleghaniensis, Betula lenta, Fagus grandifolia, Fraxinus americana, Quercus rubra*, and *Tilia americana* are characteristic, either forming a deciduous canopy or mixed with *Tsuga canadensis* (or in some cases *Pinus strobus*). Other common and sometimes dominant trees include *Quercus* spp. (most commonly *Quercus rubra*, but also *Quercus alba, Quercus prinus*), *Aesculus flava, Liriodendron tulipifera*, and *Prunus serotina*. It is of more limited extent and more ecologically constrained in the southern part of its range, in higher elevations of the northern parts of Virginia and West Virginia. This type is one of the matrix forest types in the northern part of the Central Interior and Appalachian Division. In general, this group is dominated by long-lived, mesic species that form multi-layered uneven-aged forests. Canopy dynamics are dominated by single and multiple disturbances, encouraging gap phase regeneration. Larger disturbances include windthrow, insect attack and ice storms. Although stand-replacing wind events are rare, small to medium blowdown events are more common.

A3301 *Acer saccharum - Fagus grandifolia - Tilia americana* Forest Alliance

Alliance Summary Description: This forested alliance is dominated by hardwoods, such as *Acer saccharum, Acer rubrum, Fagus grandifolia, Fraxinus americana*, and *Tilia americana*, with common associates of *Betula alleghaniensis, Betula lenta, Liriodendron tulipifera, Prunus serotina*, and *Quercus* spp. (most commonly *Quercus rubra*). The shrub layer is characterized by *Acer pensylvanicum, Amelanchier* spp., *Cornus florida* (most common in the southern part of range), *Hamamelis virginiana, Lindera benzoin, Sambucus racemosa (= Sambucus pubens), Staphylea trifolia*, and *Viburnum* spp. This community is characterized by a fairly diverse herbaceous flora. Typical herbs include *Allium tricoccum, Anemone quinquefolia, Asarum canadense, Caulophyllum thalictroides, Cystopteris bulbifera, Dicentra cucullaria, Sanguinaria canadensis*, among others. Characteristic graminoids include *Brachyelytrum erectum, Carex platyphylla, Carex sprengelii, Elymus hystrix (= Hystrix patula)*, and *Piptatherum racemosum (= Oryzopsis racemosa)*. This alliance occurs in the northeastern U.S., ranging from central New England west to the Lake Erie-Lake Ontario ecoregion in southern Ontario and south to the higher elevations of Virginia and West Virginia. It Stands occur on both glaciated and unglaciated till, on deep, typically circumneutral to somewhat alkaline, mesic soils. This type is one of the matrix forest types in the region.

[CEGL006632] *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest

Translated Name: **Sugar Maple - American Beech - White Ash / Jack-in-the-Pulpit Forest**
Common Name: **Transitional Northern Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Acer saccharum - Fagus grandifolia - Tilia americana* Forest Alliance (A3301)

ELEMENT CONCEPT

Global Summary: This association, known commonly as "northern hardwood forest," is a widespread matrix forest in the Allegheny Plateau of Pennsylvania and New York, the adjacent Lake Ontario and Lake Erie plains and in Lower New England to northern New Jersey. This forest occurs most commonly on moderately acidic (pH 5.5-7), moderate to well-drained tills at elevations generally below 762 m (2500 feet). Slope and rolling topographic settings are common. The closed-canopy forest has sparse to moderate shrub and herb cover and may have local carpets of tree seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. The closed-canopy forest has sparse to moderate shrub and herb cover and may have local carpets of tree seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. The canopy is dominated by *Acer saccharum* mixed with variable amounts of *Fagus grandifolia* and/or *Fraxinus americana* Associated hardwood species include *Acer rubrum, Betula papyrifera*, and *Betula alleghaniensis*, and *Tilia americana*. *Betula lenta* may be present. Conifers are usually present at low abundance. Characteristic species include *Pinus strobus* and *Tsuga canadensis*. Oaks are generally not present, although *Quercus rubra* and *Quercus alba* are sometimes present in low numbers. The shrub layer is often dominated by saplings of canopy tree species Characteristic understory shrubs or small trees include *Acer pensylvanicum, Amelanchier laevis, Ostrya virginiana, Viburnum acerifolium* and, occasionally, *Lindera benzoin*. The patchy herbaceous layer is a mix of ferns, rhizomatous herbs and clubmosses. Characteristic species include *Dryopteris intermedia, Dryopteris carthusiana, Polystichum acrostichoides, Huperzia lucidula, Maianthemum canadense, Clintonia borealis, Trientalis borealis, Oclemena acuminata (= Aster acuminatus)*, and *Uvularia sessilifolia*. Occasional species include *Aralia nudicaulis, Trillium erectum, Trillium grandiflorum, Dryopteris campyloptera, Streptopus lanceolatus (= Streptopus roseus), Cinna latifolia, Thelypteris noveboracensis, Mitchella repens, Solidago macrophylla*, and *Medeola virginiana*. The bryophyte layer may include *Dicranum* spp. and *Leucobryum glaucum*. Sugar maple leaf litter is high in nitrogen relative to lignin and thus decomposes rapidly, increasing the nutrient pool in the soil organic layer. Structure and composition of the forest are maintained primarily by single small tree-fall gaps. Yellow birch is maintained in the system by mineral soils on "tip-up mounds."

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This northern hardwood forest is a widespread matrix forest in central New England and upstate New York. This widespread community was sampled at sites ranging from gentle to somewhat steep slopes and ridges of any aspect. Soils are typically mesic moderately well- to well-drained sandy loam, silt loam, and loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, bare soil and/or downed wood. Evidence of disturbance includes past logging or clearing, beaver activity, windthrow, wind/ice damage, beech bark disease, possible past fire, and the minor presence of exotic plants.

Global Environment: This association, known commonly as "northern hardwood forest," is a widespread matrix forest in central New England. This forest occurs most commonly on acidic (pH 5-6), moderate to well-drained tills at elevations generally below 760 m (2500 feet).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This matrix "Northern Hardwood Forest" is characterized by a combination of *Acer saccharum, Fagus grandifolia*, and/or *Betula alleghaniensis*. Conifers include *Pinus strobus, Tsuga canadensis*, and in the northern portion of the range, *Picea rubens* and/or *Abies balsamea* may be present but not abundant (<25% cover). Tall shrubs include *Acer pensylvanicum, Acer spicatum*, and *Viburnum lantanoides*. The herb layer is patchy and most often a mix of *Dryopteris intermedia* and other ferns, clubmosses (Lycopodiaceae), *Trillium erectum, Maianthemum racemosum, Trientalis borealis, Arisaema triphyllum*, and other herbs. Two variants are recognized along the Appalachian Trail. One variant is dominated by *Fagus grandifolia* (>30% cover); *Acer saccharum, Fagus grandifolia*, and/or *Betula alleghaniensis* also occur in the canopy. *Dennstaedtia punctilobula* and *Dryopteris intermedia* are common ferns. An early-successional variant arises from cutting and is dominated by some combination of young, small-diameter *Acer saccharum, Fraxinus americana, Prunus serotina, Betula alleghaniensis*, and/or *Betula papyrifera*. A shrub layer, when present, is often disturbed containing exotic species. The herb layer is patchy and most often a mix of ferns, clubmosses (Lycopodiaceae), and other herbs. This community also supports MA state-imperiled *Carex aestivalis* and *Solidago macrophylla*.

Global Vegetation: The closed-canopy forest has sparse to moderate shrub and herb cover and may have local carpets of tree seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. On some rocky, higher-elevation sites, dense ferns and other herbs may form a lush understory (the "fern-glade variant"). The canopy is dominated by *Acer saccharum* mixed with variable amounts of *Fagus grandifolia* and/or *Fraxinus*

americana. Associated hardwood species include *Acer rubrum, Betula papyrifera, Betula alleghaniensis*, and *Tilia americana*. *Betula lenta* may be present. Conifers are usually present at low abundance. Characteristic species include *Pinus strobus* and *Tsuga canadensis*. Oaks are generally not present, although *Quercus rubra* and *Quercus alba* are sometimes present in low numbers. The shrub layer is often dominated by saplings of canopy tree species. Characteristic understory shrubs or small trees include *Acer pensylvanicum, Amelanchier laevis, Ostrya virginiana, Viburnum acerifolium* and, occasionally, *Lindera benzoin*. The patchy herbaceous layer is a mix of ferns, rhizomatous herbs and clubmosses. Characteristic species include *Dryopteris intermedia, Dryopteris carthusiana, Polystichum acrostichoides, Huperzia lucidula, Maianthemum canadense, Clintonia borealis, Trientalis borealis, Oclemena acuminata (= Aster acuminatus)*, and *Uvularia sessilifolia*. Occasional species include *Aralia nudicaulis, Trillium erectum, Trillium grandiflorum, Dryopteris campyloptera, Streptopus lanceolatus (= Streptopus roseus), Cinna latifolia, Thelypteris noveboracensis, Mitchella repens, Solidago macrophylla*, and *Medeola virginiana*. The bryophyte layer may include *Dicranum* spp. and *Leucobryum glaucum*. In the southern portion of the range, exotic species, including *Berberis thunbergii* and *Microstegium vimineum*, may be common in the shrub and herb layers.
Global Dynamics: Sugar maple leaf litter is high in nitrogen relative to lignin and thus decomposes rapidly, increasing the nutrient pool in the soil organic layer. Structure and composition of the forest are maintained primarily by single small tree-fall gaps. Yellow birch is maintained in the system by mineral soils on "tip-up mounds."

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Includes high-elevation (968 m) "elfin" stunted, multi-trunked montane northern hardwood forests sampled at Saddle Ball in Massachusetts and at Bromley and Styles Peak, Vermont. At Bromley in Vermont, it is a typical montane northern hardwood forest of northern New England with the canopy wind-pruned at higher elevation (>2,500 feet). *Dryopteris campyloptera* and northern forest herbs such as *Clintonia borealis* and *Oclemena acuminata* dominate the ground cover. Uneven-aged classes and pit-and-mound topography is typical in older stands of this community.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: In Vermont, there is a heavy infestation of beech bark disease reported at Maple Hill in Bennington and Bromley.
Global Classification Comments: This type was formerly included in CEGL006252. It is the Allegheny-Lower New England counterpart to *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006631), from which it was separated to reflect the transitional northern - central hardwoods character of the vegetation.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Massachusetts at Becket Mountain, Cady Brook Natural Heritage Site, Clarksburg State Forest, Mt. Williams-Mt. Fitch Natural Heritage Site, October Mountain State Forest, Saddle Ball, and Tully Mountain, and in Vermont at Bridgewater Heights, Bromley Mountain, Coolidge Range, Harmon Hill, Kent Brook Falls, Kent Pond, Maple Hill, Middle Pinnacle, Mt. Tabor South, Quimby Mountain vicinity, Sherburne Pass, Shrewsbury, Stamford, Stratton Pond vicinity, Styles Peak, Sunderland, Thistle Hill, Wallingford Pond West, and Winhall.
Global Range: This association is a widespread matrix forest in the Allegheny Plateau of New York and Pennsylvania, on the Lake Ontario and Lake Erie plains and in Lower New England, with a more limited distribution to northern New Jersey.

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Acer saccharum - Fagus grandifolia - Tilia americana* Forest Alliance (A3301)

Element Concept

Global Summary: These rich floodplain forests are found on slightly elevated alluvial terraces and active floodplains of larger rivers in the mid-Atlantic states, interior to the Coastal Plain. The setting is a raised river terrace; however, this forest may occur very close to the riverbank if the water channel is well-entrenched. The alluvial soils are slightly acidic to alkaline and less regularly inundated than the soils supporting floodplain forests dominated by silver maple or sycamore. Stands on lower terraces may flood occasionally, but the period of inundation is short. The canopy is closed to somewhat open, and a subcanopy is often present. Shrubs are typically sparse but may range up to about 30% cover. The herb layer is well-developed, fairly diverse, and seasonally variable, with spring ephemerals giving way to taller ferns, graminoids and forbs. Bryoids are very minor. The canopy dominants are usually some combination of *Acer saccharum, Fraxinus americana*, and sometimes *Carya cordiformis*. Canopy associates include *Quercus rubra, Juglans nigra, Prunus serotina, Fraxinus nigra, Liriodendron tulipifera, Ulmus americana, Tilia americana*, and *Fagus grandifolia*. *Carpinus caroliniana* is often present as a small tree, along with *Acer saccharum*. *Lindera benzoin* is the most common shrub; *Asimina triloba* is characteristic in the southern portion of this type's range. Vines such as *Toxicodendron radicans* and *Parthenocissus quinquefolia* are frequent but usually at low cover. The herb layer usually features spring ephemerals, including *Claytonia virginica, Dicentra canadensis*, and *Erythronium americanum*, followed by a mixture of ferns, forbs and graminoids. Characteristic species include *Arisaema triphyllum, Caulophyllum thalictroides, Carex laxiculmis, Deparia acrostichoides, Elymus virginicus, Elymus riparius, Onoclea sensibilis*, and *Podophyllum peltatum*. Exotic species, such as *Microstegium vimineum, Glechoma hederacea*, and *Alliaria petiolata*, may be abundant, especially in disturbed areas. These terrace forests are related to lower floodplain forests, e.g. *Platanus occidentalis - Acer negundo - Juglans nigra / Asimina triloba / Mertensia virginica* Floodplain Forest (CEGL004073), but distinguished by the reduced importance of *Acer saccharinum* and *Platanus occidentalis*; they differ from enriched upland hardwood forests, e.g., *Acer saccharum - Tilia americana / Asimina triloba / Jeffersonia diphylla - Caulophyllum thalictroides* Forest (CEGL008412), in their alluvial soils and flooding regime.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hardwood terrace floodplain forest of the mid-Atlantic states occurs on slightly elevated alluvial terraces and active floodplains of larger rivers from Pennsylvania and New Jersey south. One sampled site is a temporarily flooded floodplain with poorly drained clay soil and another is a saturated alluvial flat with poorly drained clay loam soil. The unvegetated surface consists of leaf litter, with lesser amounts of downed wood and bare soil; one site has a dense cover of bryophytes. Evidence of disturbance includes alterations to hydrology, periodic flooding, erosion, grazing/browsing, and the presence of trails/roads and exotic plants.

Global Environment: These rich floodplain forests are found on slightly elevated alluvial terraces of mid-sized to larger rivers. The setting is a raised river terrace; however, this forest may occur very close to the riverbank if the water channel is well-entrenched. The alluvial soils are slightly acidic to alkaline. Stands on lower terraces may flood occasionally, but the period of inundation is short. Along the Potomac River west of Washington, DC, this community occupies alluvial fill overlying terraces interpreted as the Penholoway and Wicomico. It is often the higher of paired alluvial benches downstream of defending bedrock outcrops on major islands, with *Platanus occidentalis - Acer negundo - Juglans nigra / Asimina triloba / Mertensia virginica* Floodplain Forest (CEGL004073) occupying the lower bench. Soils are generally deep sandy loams, loamy sands or sands and are likely Inceptisols. The mean flooding recurrence interval along the Potomac is 15 to 30 years.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Canopy dominants can include *Acer saccharum, Fraxinus americana*, and sometimes *Carya cordiformis*; other canopy associates include *Quercus rubra, Juglans nigra, Prunus serotina, Fraxinus nigra, Liriodendron tulipifera, Ulmus americana, Tilia americana, Acer negundo*, and *Fagus grandifolia*. *Carpinus caroliniana* is often present as a small tree, along with *Acer saccharum*. *Lindera benzoin* is the most common shrub. *Asimina triloba* is characteristic in the southern portion of this type's range; other characteristic herbaceous species include *Arisaema triphyllum, Caulophyllum thalictroides, Carex laxiculmis, Deparia acrostichoides, Elymus virginicus, Elymus riparius, Onoclea sensibilis*, and *Podophyllum peltatum*. Typical of many floodplain situations, the herb layer of the sampled plots is heavily invaded by the exotic *Microstegium vimineum*, almost to the exclusion of any other herbs.
Global Vegetation: The canopy is closed to somewhat open, and a subcanopy is often present. Shrubs are typically sparse but may range up to about 30% cover. The herb layer is well-developed, fairly diverse, and seasonally variable, with spring ephemerals giving way to taller ferns, graminoids and forbs. Bryoids are very minor. The canopy dominants are usually some combination of *Acer saccharum, Fraxinus americana*, and sometimes *Carya cordiformis*. Canopy associates include *Quercus rubra, Juglans nigra, Prunus serotina, Fraxinus nigra, Liriodendron tulipifera, Ulmus americana, Tilia americana, Celtis occidentalis*, and *Fagus grandifolia*. *Carpinus caroliniana* is often present as a small tree, along with *Acer saccharum* and *Acer negundo*. *Lindera benzoin* is the most common shrub; *Asimina triloba* is characteristic in the southern portion of this type's range. Vines such as *Toxicodendron radicans* and *Parthenocissus quinquefolia* are frequent but usually at low cover. The herb layer usually features spring ephemerals, including *Claytonia virginica, Dicentra canadensis*, and *Erythronium americanum*, followed by a mixture of ferns, forbs and graminoids. Characteristic species include *Arisaema triphyllum, Caulophyllum thalictroides, Carex laxiculmis, Deparia acrostichoides, Elymus virginicus, Elymus riparius, Onoclea sensibilis*, and *Podophyllum peltatum*. *Matteuccia struthiopteris* may form local dominance patches in this type along the Potomac River in Maryland and Virginia. Exotic species, such as *Microstegium vimineum, Glechoma hederacea*, and *Alliaria petiolata*, may be abundant, especially in disturbed areas.

[CEGL006637] *Acer saccharum - Tilia americana / Acer pensylvanicum / Caulophyllum thalictroides* Forest

Translated Name: **Sugar Maple - American Basswood / Striped Maple / Blue Cohosh Forest**
Common Name: **Transitional Northern Sugar Maple - Ash Rich Mesic Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Acer saccharum - Fagus grandifolia - Tilia americana* Forest Alliance (A3301)

ELEMENT CONCEPT

Global Summary: This rich sugar maple - white ash - basswood forest is found from the Allegheny Plateau of Pennsylvania and New York, the Lake Ontario and Lake Erie plains and Lower New England, south to the Central Appalachian region of western Virginia and eastern West Virginia. Stands occur on nutrient-rich, mesic or wet-mesic settings on sloped to rolling terrain. Slope bottoms, where colluvium collects, are a common landscape position. The surface soils are deep sand, loamy sand, or loam and may be underlain by sandy clay loam to clay loam. The sites are somewhat poorly drained to well-drained and can have a water table 0.4-2 m below the surface. Small (<1 ha) seep areas that may occur within these forests have soils that are usually saturated. This forest community has a well-developed tree canopy composed of deciduous species. Shrubs are scattered, but the herbaceous stratum is generally extensive. Bryoids are only a minor component of the ground layer, which is predominantly nitrogen-rich sugar maple leaves. *Acer saccharum* and *Tilia americana* are the dominant trees; *Fraxinus americana* is frequent but not necessarily abundant. *Ostrya virginiana* is very common as a small tree. *Acer rubrum, Fagus grandifolia*, and *Prunus serotina* are typical associates, in small amounts. *Ulmus rubra* and *Juglans cinerea* are occasional, *Magnolia acuminata* infrequent. Shrubs that may be found in this community include *Cornus alternifolia, Hamamelis virginiana*, and *Lonicera canadensis*. The ground flora, including many spring ephemerals, is diverse and consists primarily of nutrient- and light-requiring species. Many of these flower and fruit early in the spring before the tree canopy has fully leafed out. Fern richness is often high. Various sedges are present (particularly the Laxiflorae). These forests are differentiated from less-rich northern hardwood forests, e.g., *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632), primarily by their abundant and diverse herbaceous layer, as well as by the greater prominence of sugar maple, basswood and ash in the canopy and reduced importance of beech.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This rich sugar maple - white ash - basswood forest ranges from Ontario and New England west to Michigan and south to New Jersey and New York. Elevation of sampled plots ranges from 186-796 m (610-2,611 feet). Sites are mesic moderate to somewhat steep mid to upper slopes and coves with mostly western and eastern aspects. Soils are moderately well- to well-drained sandy loam, silt loam and loam. The unvegetated surface is strongly dominated by leaf litter, with only occasional large/small rocks, bare soil and/or downed wood. Evidence of disturbance includes past logging, erosion, and the presence of exotic plants.

Global Environment: In Virginia, stands occur on nutrient-rich, mesic or, sometimes, wet-mesic situations on flat to rolling terrain. The surface soils are deep sand, loamy sand, or loam and underlain by sandy clay loam to clay loam. The sites are somewhat poorly drained to well-drained and can have a water table 0.4-2 m below the surface. The elevation of known examples ranges from 115-830 m (380-2700 feet). Ground cover is deciduous litter, predominantly of nitrogen-rich sugar maple leaves.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This enriched deciduous forest is dominated by *Acer saccharum* and *Fraxinus americana* with *Tilia americana* frequent. *Ostrya virginiana* is very common as a small tree. The shrub layer is sparse and often made up of canopy tree saplings. Strong-enrichment indicator herbs such as *Caulophyllum thalictroides, Adiantum pedatum, Asarum canadense*, and *Panax quinquefolius* are present, often with abundant spring ephemerals. In addition, this community supports CT state-critically imperiled *Uvularia grandiflora*.

Global Vegetation: This forest community has a well-developed tree canopy composed of deciduous species. Shrubs are scattered, but the herbaceous stratum is well-represented. *Acer saccharum* and *Tilia americana* are the dominant trees; *Fraxinus americana* is frequent but not necessarily abundant. *Ostrya virginiana* is very common as a small tree. *Acer rubrum, Fagus grandifolia*, and *Prunus serotina* are typical associates, in small amounts. *Ulmus rubra* and *Juglans cinerea* are occasional, *Magnolia acuminata* infrequent. Shrubs that may be found in this community include *Cornus alternifolia, , Hamamelis virginiana*, and *Lonicera canadensis*. The ground flora, much of which is spring ephemerals, is diverse and consists primarily of nutrient- and light-requiring species. Many of these flower and fruit early in the spring before the tree canopy has fully leafed out; *Dicentra cucullaria, Dicentra canadensis, Hepatica* spp., *Asarum canadense, Caulophyllum thalictroides, Viola canadensis, Viola rotundifolia, Actaea pachypoda, Osmorhiza claytonii, Panax quinquefolius, Sanguinaria canadensis*, and *Erythronium americanum* are typical. Fern richness is often high, with characteristic species including *Adiantum pedatum, Cystopteris bulbifera, Deparia acrostichoides (= Athyrium thelypterioides), Dryopteris goldiana, Dryopteris filix-mas, Dryopteris marginalis, Botrychium virginianum, Athyrium filix-femina, Phegopteris hexagonoptera (= Thelypteris hexagonoptera)*, and, especially in seepy spots, *Matteuccia struthiopteris*. Various sedges are present

(particularly the Laxiflorae group) such as *Carex laxiflora, Carex platyphylla, Carex plantaginea, Carex leptonervia, Carex hitchcockiana, Carex aestivalis, Carex davisii, Carex bebbii*, and others. The herbaceous flora in seeps often contains *Carex scabrata, Ageratina altissima (= Eupatorium rugosum), Impatiens capensis* (sometimes *Impatiens pallida* as well), and *Solidago flexicaulis*. One state-rare plant species, *Cuscuta rostrata*, is associated with this vegetation type.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Uvularia grandiflora* (G5, CT state-critically imperiled); **Invasive/Exotic Plants**: *Berberis thunbergii* (High/Medium), *Epipactis helleborine* (Medium/Low), *Lonicera morrowii* (High/Medium), *Rosa multiflora* (Medium/Low), *Taraxacum officinale*

Global: Vulnerable Plants: *Cuscuta rostrata* (G4, VA state-rare), *Panax quinquefolius* (G3G4, under collection pressure)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (3-Dec-2014). This community has a wide geographic distribution, but is locally distributed within its range due to specific requirements for mesic sites with fertile soils. In gentler topographic regions, many examples of this community have probably been destroyed for agriculture, and most remaining examples elsewhere have been altered by past logging. Consequently much of the remaining acreage is of variable quality.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: *Allium tricoccum, Osmorhiza claytonii, Solidago flexicaulis, Caulophyllum thalictroides, Dicentra canadensis, Arisaema triphyllum*, and *Deparia acrostichoides* are all rich-site indicators at Styles Peak in Bennington, Vermont. The Shrewsbury, Vermont, site has large-diameter (>75 cm) sugar maples that may be remnants of primary forest.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: The attribution of this type to the Ridge and Valley subsection is based on the location of a single stand on the westernmost scarp slope of the Ridge Valley (east slope of Middle Mountain) at the Allegheny Front. The status of this association in Maryland is uncertain. This type was formerly included in CEGL005008. It is separated from *Acer saccharum - Fraxinus americana / Acer spicatum / Caulophyllum thalictroides* Forest (CEGL006636) to better highlight the transitional character of these rich hardwoods in the Allegheny Plateau and adjacent regions, as compared to the rich mesic northern hardwoods in the Laurentian-Acadian region.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (Dalton-Gulf Road Natural Heritage Site, Warren Turnpike Hillocks), Massachusetts (Shaker Campsite Natural Heritage Site), and Vermont (Bridgewater Heights, Coolidge Range, Mt. Tabor South, Prosper NW Hills, Sherburne Pass, Shrewsbury, Thistle Hill, Winhall).
Global Range: This forest association ranges generally from the Allegheny Plateau of Pennsylvania and New York to the Lake Ontario and Lake Erie plains and Lower New England to the Central Appalachian region of western Virginia and eastern West Virginia.

A4126 *Acer saccharum - Tilia americana - Quercus rubra* Rocky Forest Alliance

Alliance Summary Description: Canopy dominants of this semi-rich to rich rocky forest are *Acer saccharum, Fraxinus americana*, and *Tilia americana*. Canopy associates include *Carya ovata, Juglans cinerea, Ostrya virginiana, Quercus rubra*, and, less commonly, *Betula alleghaniensis* or *Thuja occidentalis*. The open shrub layer is characterized by *Acer pensylvanicum, Rubus odoratus, Sambucus racemosa (= Sambucus pubens), Staphylea trifolia*, and, more rarely, *Cornus rugosa*. This community is characterized by a fairly diverse herbaceous flora. Typical herbs include *Adiantum pedatum, Allium tricoccum, Anemone quinquefolia, Aralia racemosa, Asarum*

canadense, Caulophyllum thalictroides, Cystopteris bulbifera, Dicentra cucullaria, Dryopteris goldiana, Sanguinaria canadensis, and others. Characteristic graminoids include *Carex platyphylla, Carex sprengelii, Elymus hystrix (= Hystrix patula)*, and *Piptatherum racemosum (= Oryzopsis racemosa)*. This association can grade into open talus woodland. This alliance occurs from southern New England to the Lake Erie-Lake Ontario ecoregion of southern Ontario south to the Allegheny and central Appalachian Mountains on circumneutral to calcareous talus slopes or shallow rocky soils.

[CEGL006577] *Acer saccharum - Fraxinus americana - Juglans cinerea / Staphylea trifolia / Adlumia fungosa* Forest

Translated Name: **Sugar Maple - White Ash - Butternut / American Bladdernut / Allegheny-vine Forest**
Common Name: **Northern Calcareous Talus Slope Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Acer saccharum - Tilia americana - Quercus rubra* Rocky Forest Alliance (A4126)

Element Concept

Global Summary: This semi-rich to rich forest of southern New England to the central Appalachian Mountains in Pennsylvania occurs on talus slopes or shallow rocky soils overlying calcareous or circumneutral bedrock. Canopy dominants are *Acer saccharum* with *Fraxinus americana*. Canopy associates include *Juglans cinerea, Quercus rubra, Tilia americana, Ostrya virginiana*, and *Betula alleghaniensis*. The open shrub layer is characterized by *Staphylea trifolia, Rubus odoratus*, and *Cornus rugosa*. A characteristic vine is *Adlumia fungosa* in the northern portion of the range. This community is characterized by a fairly diverse herbaceous flora. Typical herbs include *Adiantum pedatum, Allium tricoccum, Anemone quinquefolia, Aralia racemosa, Asarum canadense, Caulophyllum thalictroides, Cystopteris bulbifera, Dicentra cucullaria, Dryopteris goldiana, Sanguinaria canadensis*, and others. Characteristic graminoids include *Carex platyphylla, Carex sprengelii, Elymus hystrix (= Hystrix patula)*, and *Piptatherum racemosum (= Oryzopsis racemosa)*. This association grades into open woodland [see related woodland type *Acer saccharum - Tilia americana - Fraxinus americana / Ostrya virginiana / Geranium robertianum* Woodland (CEGL005058)] and bedrock upslope.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This enriched, dry-mesic to mesic sugar maple - ash forest occurs on talus or shallow, very rocky soils overlying calcareous or circumneutral bedrock. It ranges from Virginia northward with limited occurrences in New England.
Global Environment: Sites include talus slopes or shallow rocky soils weathered from calcareous or circumneutral bedrock. Slopes are steep, usually with north to east aspects. Bedrock outcrops are frequent. Exposed rock (boulder and outcrop) cover can be up to 50%, which reduces both species richness and herbaceous cover.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This canopy is codominated by *Acer saccharum* and *Fraxinus americana* along with many canopy associates including *Tilia americana, Quercus rubra, Ostrya virginiana*, and *Betula alleghaniensis*. The shrub layer is characterized by *Staphylea trifolia*. The herb layer is characterized by *Cystopteris* spp., *Woodsia* spp., *Asarum canadense*, and others. This community tends to have more southern species that drop out at the northern edge of the range.
Global Vegetation: Canopy dominants are *Acer saccharum* with *Fraxinus americana*. Canopy associates are *Juglans cinerea, Quercus rubra, Tilia americana, Ostrya virginiana*, and *Betula alleghaniensis*. The open shrub layer is characterized by *Staphylea trifolia, Rubus odoratus*, and *Cornus rugosa*. A characteristic vine is *Adlumia fungosa* in the northern portion of the range. This community is characterized by a fairly diverse herbaceous flora. Typical herbs include *Adiantum pedatum, Allium tricoccum, Anemone quinquefolia, Aralia racemosa, Asarum canadense, Caulophyllum thalictroides, Cystopteris bulbifera, Dicentra cucullaria, Dryopteris goldiana, Sanguinaria canadensis*, and others. Characteristic graminoids include *Carex platyphylla, Carex sprengelii, Elymus hystrix (= Hystrix patula)*, and *Piptatherum racemosum (= Oryzopsis racemosa)*.
Global Dynamics: Exposed rock (boulder and outcrop) cover can be up to 50%, which reduces both species richness and herbaceous cover. However, due to the relatively rapid weathering of carbonate materials and extremely fertile soils, these habitats are typically well-vegetated with herbaceous plants. High cover of mosses

provides a foothold for many species, while organic mats and soil pockets are also numerous. Invasive exotic weeds do not appear to be particularly troublesome, but windthrow, slumping or landsliding of unstable colluvium, and other erosional disturbances appear to be relatively frequent in the habitats of this type.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community was possibly observed at the New Jersey / New York line by the mapping reconnaissance team in the summer of 2012. Keeping this community in through accuracy assessment.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Prominent distinguishing features of this community are its extremely steep, bouldery/gravelly mesic habitats, the infrequency of *Quercus* spp., the presence of *Juglans cinerea*, and the general abundance of *Staphylea trifolia* and *Adlumia fungosa*. It intergrades with both dry, open forests and other mesophytic forests along environmental continua defined by slope position and interrelated degrees of rock substrate and mineral soil development. As a result, transitional or intermediate stands that are difficult to classify may be encountered.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was possibly observed at the New Jersey / New York line by the mapping reconnaissance team in the summer of 2012.

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Acer saccharum - Tilia americana - Quercus rubra* Rocky Forest Alliance (A4126)

ELEMENT CONCEPT

Global Summary: This association occurs in the Central Appalachians of Pennsylvania, Maryland, northern Virginia, and probably northeastern West Virginia, extending eastward locally in the Piedmont. It is associated with steep, usually stream- or river-fronting slopes covered by rocky colluvium weathered from various calcium-bearing sedimentary, metasedimentary, and igneous bedrock, including the Sykesville metasedimentary melange, hornblende tonalite, metapyroxenite, metabasalt, mica schists, phyllite, calcareous shale, limestone, and dolomite. Substrates vary from stable, large-block boulderfields to fine talus and unstable, loose scree. Surface substrate in 16 plots averaged 15% bedrock cover and 42% cover of boulders and large rocks. North and east aspects prevail among these plots. Colluvial soils are strongly calcareous and frequently restricted to interstices among rocks but may form deeper deposits where microtopography permits. Vegetation is a rich mesophytic forest with the overstory consisting largely of *Tilia americana* (mostly *var. americana* but occasionally *var. heterophylla*), *Fraxinus americana*, and *Acer saccharum*. *Acer nigrum* is also codominant in a few localities. Minor overstory associates include *Carya cordiformis, Ulmus rubra, Celtis occidentalis, Quercus rubra, Liriodendron tulipifera, Quercus prinus*, and *Quercus muehlenbergii*. Because of frequent blowdowns and canopy gaps induced by the continuous, often unstable substrates, stands tend to be somewhat open to very open. *Staphylea trifolia* is constant and abundant in the shrub layer. Other characteristic small trees, shrubs, and vines that may achieve high cover are *Asimina triloba, Ostrya virginiana, Toxicodendron radicans, Parthenocissus quinquefolia*, and *Hydrangea arborescens*. Density of herbs varies seasonally, as well as with rock cover and available microhabitats. Spring ephemerals, especially *Cardamine concatenata* and *Dicentra canadensis*, are fairly common in most stands, while dense colonies of *Impatiens pallida* overwhelmingly dominate the late-season aspect of some stands. Other herbs that occurred in half or more of plot samples are, in descending order of constancy, *Dryopteris marginalis, Eurybia divaricata (= Aster divaricatus), Arisaema triphyllum, Asarum canadense, Polystichum acrostichoides, Solidago flexicaulis, Maianthemum racemosum ssp. racemosum, Hydrophyllum virginianum*, and *Actaea racemosa (= Cimicifuga racemosa)*. Less constant herbs that may be important locally include *Arabis laevigata, Cystopteris bulbifera, Pilea pumila, Polymnia canadensis, Sanguinaria canadensis, Symphyotrichum cordifolium (= Aster cordifolius)*, and *Thalictrum dioicum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This rich boulderfield forest occupies stream- or river-fronting boulder- and talus-strewn slopes weathered from a variety of calcium-bearing sedimentary, metasedimentary and igneous rocks. It was sampled twice in central Pennsylvania in the Central Appalachian project area. One site is a steep, northeast-facing upper slope with rapidly drained, submesic

soil. The other site is a gentle, north-facing lower slope with well-drained sandy loam soil. The unvegetated surface of one site is dominated by large rocks (covered with lichens and mosses) with some leaf litter and downed wood. The other site has an equal mix of leaf litter and bare soil. Evidence of disturbance includes trails, erosion and the presence of exotic plant species.

Global Environment: This community is associated with steep, usually stream- or river-fronting slopes covered by rocky colluvium weathered from various calcium-bearing sedimentary, metasedimentary, and igneous bedrock. Substrates vary from stable, large-block boulderfields to fine talus and unstable, loose scree. Habitats developed on the Sykesville metasedimentary melange, hornblende tonalite, metapyroxenite, and metabasalt tend to have more stable boulder deposits, while habitats formed by weathering of mica schists, phyllite, calcareous shale, limestone, and dolomite tend to have finer and looser debris. The habitats usually include sections of outcrops that are often extensive above the talus deposits. Surface substrate in 16 plots averaged 15% bedrock cover and 42% cover of boulders and large rocks. North and east aspects prevail among these plots. Soils are colluvial and frequently restricted to interstices among rocks but may form deeper deposits where microtopography permits. Samples extracted from plots varied from strongly acidic to circumneutral but had consistently high to very high calcium levels, high magnesium, and moderately low iron and aluminum.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This forest is characterized by a mixed canopy with *Tilia americana, Fraxinus americana*, and *Acer saccharum*. *Acer saccharum* is often dominant in Pennsylvania stands. Minor overstory associates include *Carya cordiformis, Ulmus rubra, Celtis occidentalis, Quercus rubra, Liriodendron tulipifera*, and/or *Quercus prinus*. *Staphylea trifolia* is usually abundant in the shrub layer, and *Sambucus canadensis* and/or *Lindera benzoin* may be common. *Toxicodendron radicans* is a common vine. *Collinsonia canadensis, Impatiens pallida, Dryopteris marginalis, Dryopteris intermedia, Polygonatum biflorum, Eurybia divaricata, Arisaema triphyllum, Maianthemum racemosum*, and *Polystichum acrostichoides* are common herbs. One stand is heavily invaded by exotic species including *Acer platanoides, Lonicera japonica*, and *Microstegium vimineum*.

Global Vegetation: Vegetation of this type is a rich mesophytic forest with the overstory consisting largely of *Tilia americana* (mostly *var. americana* but occasionally *var. heterophylla*), *Fraxinus americana*, and *Acer saccharum*. *Acer nigrum* is also codominant in a few localities. Minor overstory associates include *Carya cordiformis, Ulmus rubra, Celtis occidentalis, Quercus rubra, Liriodendron tulipifera, Quercus prinus*, and *Quercus muehlenbergii*. Because of frequent blowdowns and canopy gaps induced by the continuous, often unstable substrates, stands tend to be somewhat open to very open. *Staphylea trifolia* is constant and abundant in the shrub layer. Other characteristic small trees, shrubs, and vines that may achieve high cover are *Asimina triloba, Ostrya virginiana, Toxicodendron radicans, Parthenocissus quinquefolia*, and *Hydrangea arborescens*. Density of herbs varies seasonally, as well as with rock cover and available microhabitats. Spring ephemerals, especially *Cardamine concatenata* and *Dicentra canadensis*, are fairly common in most stands, while dense colonies of *Impatiens pallida* overwhelmingly dominate the late-season aspect of some stands. Other herbs that occurred in half or more of plot samples are, in descending order of constancy, *Dryopteris marginalis, Eurybia divaricata (= Aster divaricatus), Arisaema triphyllum, Asarum canadense, Polystichum acrostichoides, Solidago flexicaulis, Maianthemum racemosum ssp. racemosum, Hydrophyllum virginianum*, and *Actaea racemosa (= Cimicifuga racemosa)*. Less constant herbs that may be important more locally include *Arabis laevigata, Cystopteris bulbifera, Pilea pumila, Polymnia canadensis, Sanguinaria canadensis, Symphyotrichum cordifolium (= Aster cordifolius)*, and *Thalictrum dioicum*. Many additional species occur at low constancy and cover. Mean species richness of 16 plot samples was 42 taxa per 400 square meters. Despite the very rocky substrate, the exotic weed *Alliaria petiolata* is capable of becoming established or even rampant in this community. This species was present in 94% of plot samples, occasionally achieving 5 to 10% cover. Several other exotics were present at low cover and constancy.

Alliance	*Acer saccharum - Tilia americana - Quercus rubra* Rocky Forest Alliance (A4126)

Element Concept

Global Summary: The global range of this community is poorly known but probably includes high-elevation areas of the Central Appalachians in Virginia, West Virginia, Maryland, and Pennsylvania. In Virginia, this association is almost exclusively associated with cool, rocky, northwest- to northeast-facing slopes at elevations from about 975 m (3000 feet) to more than 1300 m (4300 feet). Habitats occur on various geologic substrates, including sandstone, metabasalt (greenstone), amphibolite, and granitic formations. *Betula alleghaniensis* and *Quercus rubra* are constant, high-cover, usually codominant canopy trees. Minor canopy associates can include *Acer saccharum, Betula lenta, Tsuga canadensis, Tilia americana*, and *Fraxinus americana*. *Acer pensylvanicum* and *Acer spicatum* are the most abundant and characteristic understory trees, although *Ilex montana* may be locally abundant. More-or-less frequent shrubs include *Hamamelis virginiana, Sambucus racemosa (= Sambucus pubens)*, and *Hydrangea arborescens*. *Rhododendron maximum* is a frequent shrub at the four southernmost sites in Virginia but is absent elsewhere. The herb layer varies from moderately sparse to very dense.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This yellow birch - oak forest is found on rocky, northwest- to northeast-facing slopes at elevations from about 975 m to more than 1,300 m (3,000-4,300 feet). It was sampled at seven locations in the Central Appalachian project area. Sites range from gentle to steep mid and upper slopes with northerly aspects. Soils are rapidly to well-drained silt loam, loam and clay loam. The unvegetated surface is dominated by leaf litter or large rocks with some downed wood and occasional exposed bedrock or small rocks. Evidence of disturbance includes wind/ice damage, fire, gypsy moth damage, and the presence of exotic plant species.
Global Environment: In Virginia, this association is almost exclusively associated with cool, rocky, northwest- to northeast-facing slopes at elevations from about 975 m (3000 feet) to more than 1300 m (4300 feet). Habitats occur on various geologic substrates, including sandstone, metabasalt (greenstone), amphibolite, and granitic formations. With one exception, soils collected at plot-sampling sites are very strongly to extremely acidic (mean pH = 4.2), with low base status. Sites are mesic to submesic and are often exposed to severe winter temperatures, wind, and ice. Bedrock and boulders typically cover more than 30% of the ground surface. Surface cover of bryophytes and lichens is usually greater than 10%.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Betula alleghaniensis* and *Quercus rubra* are constant, high-cover, usually codominant canopy trees. *Acer pensylvanicum* and *Acer spicatum* are the most abundant and characteristic understory trees, although *Ilex montana* may be locally abundant. *Hamamelis virginiana, Sambucus racemosa var. racemosa*, and *Kalmia latifolia* are common shrubs. Herbs can include *Arisaema triphyllum, Carex aestivalis, Maianthemum canadense, Oclemena acuminata, Dennstaedtia punctilobula*, and *Deschampsia flexuosa var. flexuosa* and ferns such as *Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula*, and *Dryopteris intermedia*. In addition, this community supports VA-state critically imperiled *Abies balsamea* and VA-state imperiled *Sibbaldiopsis tridentata*.

Global Vegetation: In stands of this association, *Betula alleghaniensis* and *Quercus rubra* are constant, high-cover, usually codominant canopy trees. Minor canopy associates can include *Acer saccharum, Betula lenta, Tsuga canadensis, Tilia americana*, and *Fraxinus americana*. *Acer pensylvanicum* and *Acer spicatum* are the most abundant and characteristic understory trees, although *Ilex montana* may be locally abundant. More-or-less frequent shrubs include *Hamamelis virginiana, Sambucus racemosa (= Sambucus pubens)*, and *Hydrangea arborescens*. *Rhododendron maximum* is a frequent shrub at the four southernmost sites in Virginia but is absent elsewhere. The herb layer varies from moderately sparse to very dense. *Dryopteris intermedia, Oclemena acuminata (= Aster acuminatus), Angelica triquinata, Athyrium filix-femina ssp. asplenioides, Maianthemum canadense, Arisaema triphyllum*, and *Eurybia divaricata (= Aster divaricatus)* are the most constant and/or abundant herbaceous species. A large number of low-cover and/or low-constancy herbs also occur in the type. A few of the most characteristic include *Dryopteris marginalis, Viola blanda, Dennstaedtia punctilobula, Solidago curtisii, Impatiens pallida, Clintonia borealis, Ageratina altissima, Trillium undulatum, Circaea alpina, Carex aestivalis*, and *Carex debilis var. rudgei*. Species richness of plot-sampled stands ranges from 16 to 61 taxa per 400 square meters (mean = 35). One globally rare plant species, *Aconitum reclinatum* and one state-rare plant species, *Poa saltuensis* have been recorded in plots of this community type.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Acer pensylvanicum*, *Acer spicatum*, *Arisaema triphyllum*, *Betula alleghaniensis*, *Dryopteris intermedia*, *Hamamelis virginiana*, *Oclemena acuminata*, *Quercus rubra*, *Sambucus racemosa*

Global: *Acer pensylvanicum*, *Acer spicatum*, *Angelica triquinata*, *Athyrium filix-femina* ssp. *asplenioides*, *Betula alleghaniensis*, *Dryopteris intermedia*, *Hamamelis virginiana*, *Oclemena acuminata*, *Quercus rubra*, *Sambucus racemosa*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Abies balsamea* (G5, VA state-critically imperiled), *Sibbaldiopsis tridentata* (G5, VA state-imperiled); **Invasive/Exotic Plants**: *Alliaria petiolata* (High/Medium)

Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Gymnocarpium appalachianum* (G3), *Poa saltuensis* (G5, VA state-rare), *Scutellaria saxatilis* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (20-Jun-2001). Rank is based on potential range of this community which could include throughout the Central Appalachians.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharum - Betula alleghaniensis - Prunus serotina* Forest (CEGL006045) the prevalent northern hardwoods forest in the Alleghany Plateau and Allegheny Mountain regions.
- *Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides / Eurybia chlorolepis - Dryopteris intermedia* Forest (CEGL007285) the prevalent northern hardwoods forest in the Southern Appalachians.

- *Betula alleghaniensis / Sorbus americana - Acer spicatum / Polypodium appalachianum* Forest (CEGL008504) is a high-elevation boulderfield woodland with low species richness (range from 12 to 24; mean = 18) and a very open canopy dominated by stunted and gnarled *Betula alleghaniensis*, typically with no other species in the canopy.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community type is one of the two major northern hardwood forests of the Central Appalachians. It typically occurs in small to moderate patches on steep, sheltered, bouldery slopes in matrices of montane oak-hickory and northern red oak forests.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: This association is somewhat intermediate between high-elevation *Quercus rubra*-dominated forests and "classic" (beech - birch - maple) northern hardwood forests. It can be readily distinguished from similar associations (CEGL006045 and CEGL007285) by the complete absence of *Fagus grandifolia* and the infrequency of *Acer saccharum* and *Prunus serotina*.

On the Northern Blue Ridge and higher ridges of the Ridge and Valley province, *Betula alleghaniensis - Quercus rubra / Acer spicatum / Dryopteris intermedia - Oclemena acuminata* Forest (CEGL008502) is the main "northern hardwood" forest in Virginia. This community appears to be absent from Allegheny Mountain in Highland County and the Mount Rogers - Whitetop Mountain area of the Southern Blue Ridge, where *Acer saccharum - Betula alleghaniensis - Prunus serotina* Forest (CEGL006045) and *Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides / Eurybia chlorolepis - Dryopteris intermedia* Forest (CEGL007285) are prevalent, respectively.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in high-elevation areas of the Central Appalachians in Virginia, West Virginia, Maryland, and Pennsylvania. It was sampled in Virginia at Apple Orchard Mountain, Big Mountain, Crescent Rock, Garden Mountain, Mount Marshall, and The Pinnacle.
Global Range: The global range of this community is poorly known but probably includes high-elevation areas of the Central Appalachians in Virginia, West Virginia, Maryland, and Pennsylvania. In Virginia, this vegetation type is widely but locally distributed at higher elevations of the Northern Blue Ridge, Ridge and Valley, and Allegheny Mountains. It is rare and local on the Blue Ridge south of Roanoke Gap, and in the Cumberland Mountains of southwestern Virginia.

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Acer saccharum - Tilia americana - Quercus rubra* Rocky Forest Alliance (A4126)

Element Concept

Global Summary: This community type occurs throughout the northern Blue Ridge in Virginia, Maryland, and West Virginia, and more locally in the western Virginia Ridge and Valley region. Sites include steep, boulder and stone slides below cliffs; boulder-filled slope concavities and hollow-heads; and other very rocky, submesic to mesic habitats at middle elevations between 760 and 1030 m (2500-3400 feet). This is an open to closed, mixed hardwood forest, with tall, well-formed trees. Because of somewhat unstable substrates and occasional exposure to severe wind and ice storms, downfalls and crown damage may be frequent in some stands. *Tilia americana* (including both *var. americana* and *var. heterophylla*), *Fraxinus americana*, and *Quercus rubra* are the most abundant, variably dominant or codominant canopy trees. *Carya cordiformis, Robinia pseudoacacia*, and *Carya ovata* are minor but constant canopy associates. Understory layers tend to be open, with *Acer pensylvanicum, Ostrya virginiana, Sambucus racemosa (= Sambucus pubens)*, and *Ribes rotundifolium* the most characteristic species. The usually patchy herb layer varies greatly in richness and density with substrate conditions.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This basic boulderfield forest occurs on steep, boulder and stone slides below cliffs, boulder-filled slope concavities, and other very rocky, submesic to mesic habitats between 760 and 1,030 m (2,500-3,400 feet) elevation. It was sampled at eight locations in the Central Appalachian project area. Sites are somewhat steep mid and upper slopes with mostly western aspects. Soils are rapidly to well-drained loam, silt loam and sandy loam. The unvegetated surface is dominated by either large/small rocks or leaf litter or a mix of both along with some downed wood. Evidence of disturbance includes past logging/clearing, trails, grazing/browsing, wind/ice damage, chestnut blight and hemlock adelgid damage, and the presence of exotic plant species.

Global Environment: Sites include steep, boulder and stone slides below cliffs; boulder-filled slope concavities and hollow-heads; and other very rocky, submesic to mesic habitats at middle elevations. Most plot-sampled stands are situated between 760 and 1030 m (2500-3400 feet) elevation, but stands occasionally occur as low as 450 m (1500 feet). The community is most frequent and characteristic of sites underlain by Catoctin metabasalt (greenstone) but also occurs locally on base-rich granitic rocks of the Blue Ridge basement complex, e.g., layered pyroxene granulite, charnockite, and porphyritic leucocharnockite. Scattered boulderfield habitats for this community in the Ridge and Valley province are derived from calcareous shales and siltstones. Stands occur at lower, middle, and upper slope topographic positions. Mean slope in plots is 23°. Rock cover (bedrock, boulders, and/or stones) is essentially continuous, but surficial exposure of rocks averages 50%, with leaf litter (47%) and decaying wood (3%) comprising the remainder of the substrate. Soils are mostly interstitial, have high organic content (mean = 23%), and are generally difficult to extract. Samples collected from plots are very strongly acidic (mean pH = 4.7) but have moderately high calcium, magnesium, and manganese levels (up to 4628 ppm, 372 ppm, and 269 ppm, respectively).

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Fraxinus americana* and *Tilia americana* codominate the canopy. *Quercus rubra, Carya ovata*, and *Betula lenta* are also common and sometimes codominant. *Ostrya virginiana* and *Acer pensylvanicum* are common in the subcanopy. Shrubs can include *Sambucus racemosa var. racemosa, Prunus virginiana*, and/or *Hamamelis virginiana*. *Parthenocissus quinquefolia* is a constant vine. The herb layer is diverse with *Laportea canadensis, Impatiens pallida, Hydrophyllum virginianum, Dryopteris marginalis, Asarum canadense, Actaea racemosa (= Cimicifuga racemosa), Arisaema triphyllum*, and others.

Global Vegetation: Stand physiognomy is an open to closed, mixed hardwood forest, with tall, well-formed trees. Because of somewhat unstable substrates and occasional exposure to severe wind and ice storms, downfalls and crown damage may be frequent in some stands. *Tilia americana* (including both *var. americana* and *var. heterophylla*), *Fraxinus americana*, and *Quercus rubra* are the most abundant, variably dominant or codominant canopy trees. More locally, *Betula lenta* and *Acer saccharum* are codominants in the mixtures, although the latter is absent from the majority of plot-sampled stands. *Carya cordiformis, Robinia pseudoacacia*, and *Carya ovata* are minor but constant canopy associates. Understory layers tend to be open, with *Acer pensylvanicum, Ostrya virginiana, Sambucus racemosa (= Sambucus pubens)*, and *Ribes rotundifolium* the most characteristic species. The usually patchy herb layer varies greatly in richness and density with substrate conditions. Scrambling vines of *Parthenocissus quinquefolia*, along with the forbs *Impatiens pallida, Laportea canadensis*, and *Ageratina altissima*, constitute much of the herb-layer cover. Additional more-or-less constant herbs include *Actaea racemosa (= Cimicifuga racemosa), Arisaema triphyllum, Asarum canadense, Dryopteris marginalis, Eurybia divaricata (= Aster divaricatus), Galium triflorum, Hydrophyllum virginianum, Osmorhiza claytonii*, and *Polymnia canadensis*, all of which are well-adapted to the interstices and moss mats of very bouldery/rocky habitats. On sites with slightly better development of mineral soils, a larger variety of nutrient-demanding herbs (e.g., *Caulophyllum thalictroides, Trillium grandiflorum, Viola canadensis*) may be present. Species richness of plot-sampled stands ranges from 14 to 59 taxa per 400 square meters (mean = 40).
Global Dynamics: *Juglans cinerea* was formerly a frequent associate of this community but has been nearly eliminated in recent decades by a canker dieback caused by the fungus *Melanconis juglandis*.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Alliaria petiolata* (High/Medium), *Polygonum persicaria*, *Prunus avium* (High/Low)
Global: Vulnerable Plants: *Gymnocarpium appalachianum* (G3), *Panax quinquefolius* (G3G4, under collection pressure)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (1-Oct-2001). Based on current documentation, there are probably fewer than 100 occurrences of this community rangewide. Patch sizes are not large, and the type appears to be associated with a narrow range of ecological conditions, including base-rich substrates and intermediate elevations. The Blue Ridge of Maryland and the Ridge and Valley of Virginia and West Virginia support additional occurrences, but these are unlikely to be numerous due to a general lack of suitable substrates within the critical elevation range.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: *Betula lenta* and *Acer saccharum* are codominants in some canopy mixtures, although the latter is absent from the majority of plot-sampled stands.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Classification of this unit is supported by 20 plots from Alleghany, Amherst, Botetourt, Greene, Madison, Page, Rappahannock, Rockbridge, and Rockingham counties, Virginia (G. Fleming pers. comm.). Boulderfield forests and woodlands have not been thoroughly inventoried in Virginia and elsewhere. The global ranges and ecological relationships of this and other units are not well known and require additional study. In particular, the distribution and status of this association (CEGL008528) in the Ridge and Valley province needs clarification. The distribution of this community type in the northern Blue Ridge appears to be centered above 760 m (2500 feet) elevation, where *Liriodendron tulipifera* begins to reach its upper elevational limits. Above 1000 to 1060 m (3300-3500 feet) (depending on aspect) elevation, this type is replaced by *Betula alleghaniensis / Sorbus americana - Acer spicatum / Polypodium appalachianum* Forest (CEGL008504).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the Northern Blue Ridge in Virginia, Maryland, and West Virginia, and more locally in the western Virginia Ridge and Valley region. It was sampled in Washington County, Maryland, and in Virginia at Angels Rest, Bearfence Mountain, Front Royal, Hightop Mountain, Pass Mountain, Pearis Mountain near the New River, and Saddleback Mountain.
Global Range: This community type occurs in suitable habitats throughout the northern Blue Ridge in Virginia, Maryland, and West Virginia, and more locally in the western Virginia Ridge and Valley region. Stands assigned to this type but somewhat transitional to northern hardwood forest, *Betula alleghaniensis - Quercus rubra / Acer spicatum / Dryopteris intermedia - Oclemena acuminata* Forest (CEGL008502), also occur on the northwest flank of Peters Mountain in Alleghany County, Virginia. Similar forests have been observed in a few other sites of the western Virginia Ridge and Valley region.

A0266 *Betula alleghaniensis - Aesculus flava* Forest Alliance

Alliance Summary Description: This alliance includes montane forests, mainly of the Southern and Central Appalachians, dominated by *Fagus grandifolia, Betula alleghaniensis*, and *Aesculus flava*, occurring in combination or with strong dominance by one of these species. Other species that may form a typically minor canopy component include *Acer saccharum, Betula lenta, Halesia tetraptera var. monticola, Picea rubens, Prunus serotina var. serotina, Quercus rubra*, and *Tilia americana var. heterophylla*. Subcanopy species can include small stems of canopy species as well as *Acer spicatum, Acer pensylvanicum, Amelanchier laevis*, and *Sorbus americana*. Shrub density varies among associations, ranging from very high to entirely lacking. Common species in the shrub and sapling strata include *Acer pensylvanicum, Acer spicatum, Amelanchier arborea var. austromontana, Aristolochia macrophylla, Cornus alternifolia, Crataegus punctata, Hydrangea arborescens, Ilex montana, Ribes cynosbati, Ribes rotundifolium, Ribes glandulosum, Rubus allegheniensis, Rubus canadensis, Vaccinium erythrocarpum*, and *Viburnum lantanoides*. The composition of herbaceous strata varies among associations. Variability in the herbaceous stratum may be related to aspect, elevation, and soil-nutrient status. These forests occur in a cool, humid climate, typically at high elevations (1066-1828 m [3500-6000 feet]) on a variety of sites, from upper concave slopes and steep, periglacial boulderfields and talus slopes, to flat ridgetops and saddles between ridges. Associations will vary with elevation, latitude, and geology and occur as small to large patches surrounded by other forest types, montane grasslands, or shrublands.

[CEGL008558] *Acer rubrum var. rubrum - Betula lenta - Magnolia fraseri / (Rhododendron maximum, Kalmia latifolia)* Ruderal Forest

Translated Name: **Red Maple - Sweet Birch - Mountain Magnolia / (Great Laurel, Mountain Laurel) Ruderal Forest**

Common Name: **Southern Appalachian Ruderal Acidic Mixed Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)

Element Concept

Global Summary: This association includes submesic, potentially fire-exposed or heavily logged, mid and upper slopes in the Southern Appalachians north to the Cumberlands. Canopy dominance may be shared by a number of species, including *Acer rubrum var. rubrum, Carya glabra, Magnolia fraseri, Halesia tetraptera var. monticola, Nyssa sylvatica, Betula alleghaniensis var. alleghaniensis, Betula lenta, Oxydendrum arboreum*, and *Tsuga canadensis*, but the community's most distinctive character is the relative lack of dominance by any one species and the lack of oak species in the canopy. This community may occasionally be dominated by *Betula lenta* and/or *Betula alleghaniensis* with an extremely dense understory of *Rhododendron maximum*; it may intergrade with acidic cove forests farther downslope. The understory shrub layer is composed of a combination of *Kalmia latifolia* and *Rhododendron maximum*, though the cover is not consistently 100%. The proportion of *Kalmia* to *Rhododendron* varies widely through this association, with more xeric sites having a higher concentration of *Kalmia latifolia* than *Rhododendron maximum*. In addition, drier versions of this association tend to contain abundant *Sassafras albidum* in the understory, whereas the more mesic versions have lower densities of *Sassafras albidum*. The herb layer is generally sparse but may sometimes be dominated by a dense cover of ferns such as *Dennstaedtia punctilobula* or *Dryopteris marginalis*.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This maple-birch forest occurs primarily on midslopes and saddles of various aspects and of varying topographic complexity at lower elevations (760-1,400 m [2,500-4,600 feet]). These stands are thought to have originated from episodes of logging and/or fire, but not severe soil disturbance such as cultivation or grading.

Global Environment: This is a submesic forest found on moderate to steep terrain on upper slopes of many different aspects and positions in the Great Smoky Mountains National Park area at 760 to 1440 m (2500-4600 feet) in elevation and extending up the Blue Ridge into southern Virginia at the same altitude. Although tree sizes can be very large, this community is usually a late-successional community that developed in mid-elevation areas that were historically dominated by *Castanea dentata*. As the *Castanea dentata* senesced and logging proceeded in remote

sections of the park, the tree species now seen in the canopy began to be released from the understory to the canopy. This may explain why the community is so variable in its slope position, moisture regime, and elevation. The areas were probably historically fire-exposed sites before the suppression of landscape-scale fires. Soils are usually very deep.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This acidic, successional, mixed hardwood forest canopy is dominated by some combination of *Acer rubrum, Betula lenta, Magnolia fraseri, Nyssa sylvatica, Oxydendrum arboreum*, and/or *Betula alleghaniensis*, but not strongly dominated by *Betula alleghaniensis*. Shrub species are typically primarily evergreen, *Kalmia latifolia* and *Rhododendron maximum* can be very dense. The herb layer is very poorly developed or dominated by acid-loving species, especially ferns.
Global Vegetation: The canopy of this association is typically shared by a wide range of species including *Acer rubrum var. rubrum, Betula alleghaniensis var. alleghaniensis, Betula lenta, Magnolia fraseri, Oxydendrum arboreum, Nyssa sylvatica*, and *Tsuga canadensis*. The understory includes some subcanopy trees such as *Ilex opaca var. opaca* or *Ilex montana*, and shrub species such as *Kalmia latifolia* and *Rhododendron maximum* can be very dense. The proportion of *Kalmia* to *Rhododendron* varies widely through this association, with more xeric sites having a higher concentration of *Kalmia latifolia* than *Rhododendron maximum*. In addition, drier versions of this association tend to contain abundant *Sassafras albidum* in the understory, whereas the more mesic versions have lower densities of *Sassafras albidum*. Although the herb layer is comprised mostly of small shrubs, seedlings, and evergreens, *Trillium undulatum, Goodyera pubescens*, and other acid-loving species can occasionally be found in this association.
Global Dynamics: It is assumed that these communities may have burned in the past. The lack of oak trees in this association is poorly understood. Some examples of this association occur in virgin forest areas, though there are areas where large chestnut stumps are present; these stands may represent a post-chestnut-blight or post-chestnut-blight logging replacement forest. Other stands occur in areas with a previous logging history, and may reflect stands developing after logging.

Shrub/sapling (tall & short)	Broad-leaved evergreen shrub	*Kalmia latifolia*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Acer rubrum*, *Betula lenta*, *Kalmia latifolia*, *Magnolia fraseri*, *Nyssa sylvatica*, *Oxydendrum arboreum*, *Rhododendron maximum*
Global: *Acer rubrum* var. *rubrum*, *Betula alleghaniensis* var. *alleghaniensis*, *Betula lenta*, *Kalmia latifolia*, *Magnolia fraseri*, *Rhododendron maximum*

OTHER NOTEWORTHY SPECIES

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (9-Oct-2001). Ranked as modified due to the heavy effects logging had on most of these stands over the past 100 years. Stands of this type appear to have been modified by a combination of logging, chestnut death, and fire suppression. These are mature stands in the Great Smoky Mountains National Park.

RELATED CONCEPTS

Global Similar Types:

- *Betula alleghaniensis - (Tsuga canadensis) / Rhododendron maximum / (Leucothoe fontanesiana)* Forest (CEGL007861) is a more natural association, with a more reliable species composition, sometimes containing *Tsuga canadensis*.
- *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543)
- *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271) oak-dominated.
- *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest (CEGL007230)
- *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest (CEGL007267) oak-dominated.
- *Quercus prinus - Quercus rubra / Rhododendron maximum / Galax urceolata* Forest (CEGL006286)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This is not terribly common but occurs in areas that were disturbed at some point in the past and have grown back into a mix of a number of hardwood species. Usually there is not one dominant species, but instead a mix of *Acer rubrum, Betula lenta, Magnolia fraseri, Nyssa sylvatica*, and others.
Appalachian Ruderal Hardwood Forest (CEGL007219) and Southern Appalachian Ruderal Acidic Mixed Hardwood Forest (CEGL008558) can both have high cover of *Acer rubrum, Magnolia fraseri*, and *Oxydendrum arboreum*, but this association (CEGL008558) typically does **not** have a large component of *Liriodendron tulipifera* or *Betula alleghaniensis*. The trees in stands of this association are older (greater than 70 years), larger, and more mature than in CEGL007219.

To distinguish between Blue Ridge Hemlock - Northern Hardwood Forest (CEGL007861) and this association (CEGL008558): there is no *Tsuga canadensis* in CEGL008558 and it is usually found on more concave upper slopes and not so much on steep sideslopes, whereas CEGL007861 can be on either.

These stands are thought to have originated from episodes of logging and/or fire, but not severe soil disturbance such as cultivation or site clearing. This community may have originally been dominated by *Castanea dentata* until its decline due to chestnut blight. This released the other hardwood species in the understory, resulting in this composition. In higher elevation examples, this community may be a long-term post-disturbance example of Southern Appalachian Northern Hardwood Forest (Typic Type) (CEGL007285).
Global Classification Comments: None of the communities listed as similar associations are very close to this association in canopy composition, but the understory of all of these associations is similar. Some examples of this community may resemble and even intergrade with acidic cove forest (CEGL007543) but usually occur high up on south- and even some north-facing slopes far from the concave cove areas. This community may begin to pick up species such as *Picea rubens* and *Prunus pensylvanica* at the highest parts of its elevational range in the Southern Appalachians. In the Cumberlands, it definitely can intergrade with acidic coves, and the line between these communities is often hard to draw.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was observed and is mapped within the AT corridor from Max Patch north to Fox Creek (Grayson Highlands area).
Global Range: This association is documented only from the Great Smoky Mountains National Park and Cumberland Gap National Historical Park, but it may occur throughout the mid- to higher elevation exposed slopes of eastern Tennessee and western North Carolina, and possibly also into adjacent parts of Virginia and West Virginia.
Nations: US
States/Provinces: KY, NC, TN, VA?
TNC Ecoregions: 51:C
USFS Ecoregions (1994/95): M221Cc:CCC, M221Ce:CCC, M221Dc:CC?, M221Dd:CCC
Federal Lands: BIA (Eastern Band of Cherokee); NPS (Appalachian Trail [Southern Blue Ridge], Blue Ridge Parkway, Cumberland Gap, Great Smoky Mountains); USFS (Pisgah)

[CEGL004973] *Aesculus flava - Betula alleghaniensis - Acer saccharum / Caulophyllum thalictroides - Actaea podocarpa* Forest

Translated Name: **Yellow Buckeye - Yellow Birch - Sugar Maple / Blue Cohosh - Mountain Bugbane Forest**
Common Name: **Southern Appalachian Northern Hardwood Forest (Rich Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)

ELEMENT CONCEPT

Global Summary: This association includes forests on high but sheltered slopes in the Southern Appalachians, with canopies dominated by species typically known as northern hardwoods (*Aesculus flava, Fagus grandifolia, Betula alleghaniensis, Acer saccharum*), but with a rich herbaceous flora dominated by forbs and more typical of lower elevation "cove" forests. This forest occurs on deep, rocky soils on the upper slopes of coves, and on other protected landforms, at elevations of 1070-1525 m (3500-5000 feet), and can be associated with mafic substrates. Other canopy species can include *Fraxinus americana, Tilia americana var. heterophylla*, and *Quercus rubra*. In the Great Smoky Mountains and in the Nantahala Mountains (Standing Indian), *Halesia tetraptera var. monticola* can be an important canopy component. The shrub stratum is typically open, but small trees such as *Acer spicatum, Acer pensylvanicum*, and *Amelanchier laevis* are frequent. Herbaceous cover can be lush, quite diverse, and is typically dominated and characterized by large forbs such as *Caulophyllum thalictroides, Actaea podocarpa (= Cimicifuga americana), Actaea racemosa (= Cimicifuga racemosa), Collinsonia canadensis, Ageratina altissima var. roanensis, Laportea canadensis, Campanulastrum americanum*, and *Tiarella cordifolia*. Other species typical of northern hardwood forests such as *Dryopteris intermedia* and *Eurybia chlorolepis* are also common. The canopy of these forests always has a component of *Betula alleghaniensis* and/or *Fagus grandifolia*, occurring with *Acer saccharum*, over a lush and diverse herbaceous stratum.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This northern hardwood forest is usually found at elevations greater than 1,100 m (3,600 feet), but can be found as low as 975 m (3,200 feet) in some cases. It was sampled at 14 locations in the park. Sites cover a wide range of landscapes, from gentle to somewhat steep lower to upper slopes and ridgetops with mostly northern aspects. Soils are typically moderately well-drained loams. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes possible past logging, wind/ice damage, and the presence of exotic plant species.
Global Environment: This association includes forests on high but sheltered slopes in the Southern Appalachians. This forest occurs on deep, rocky soils on the upper slopes of coves, and on other protected landforms, at elevations of 1070-1525 m (3500-5000 feet), and can be associated with mafic substrates.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy includes *Betula alleghaniensis, Aesculus flava, Acer saccharum, Fraxinus americana*, and *Tilia americana*, particularly *Tilia americana var. heterophylla*. Shrubs are variable but often comprised of canopy regeneration. The rich mesic herbaceous layer approaches that of a cove forest. Indicator species include *Caulophyllum thalictroides, Actaea*

racemosa, Collinsonia canadensis, Laportea canadensis, and *Campanulastrum americanum*. Additional common and/or abundant herbs include *Carex pensylvanica, Dryopteris intermedia, Prenanthes altissima, Sanguinaria canadensis*, and *Solidago curtisii (= Solidago caesia var. curtisii)*. In addition, the community supports TN state-imperiled *Agastache scrophulariifolia, Ageratina altissima var. roanensis, Allium tricoccum*, and *Polygonatum biflorum var. commutatum*, and VA state-imperiled *Phacelia fimbriata*.

Global Vegetation: The canopy of these forests always has a component of *Betula alleghaniensis* and/or *Fagus grandifolia*, occurring with *Acer saccharum*, over a lush and diverse herbaceous stratum. The canopies of stands are dominated by species typically known as "northern hardwoods" (*Aesculus flava, Fagus grandifolia, Betula alleghaniensis, Acer saccharum*), but with a rich herbaceous flora dominated by forbs and more typical of lower elevation "cove" forests. Other canopy species can include *Tilia americana var. heterophylla, Fraxinus americana*, and *Quercus rubra*. In the Great Smoky Mountains and the Nantahala Mountains, *Halesia tetraptera var. monticola* can be an important canopy component. The shrub stratum is typically open, but small trees such as *Acer spicatum, Acer pensylvanicum*, and *Amelanchier laevis* are frequent. Herbaceous cover can be lush, quite diverse, and is typically dominated and characterized by large forbs such as *Caulophyllum thalictroides, Actaea podocarpa (= Cimicifuga americana), Actaea racemosa (= Cimicifuga racemosa), Collinsonia canadensis, Ageratina altissima var. roanensis, Laportea canadensis, Campanulastrum americanum*, and *Tiarella cordifolia*. Other species typical of northern hardwood forests such as *Dryopteris intermedia* and *Eurybia chlorolepis* are also common.

Stratum	Lifeform	Species
Tree canopy	Broad-leaved deciduous tree	*Acer saccharum*, *Aesculus flava*, *Betula alleghaniensis*, *Fagus grandifolia*
Herb (field)	Flowering forb	*Actaea racemosa*, *Laportea canadensis*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Acer saccharum*, *Betula alleghaniensis*, *Caulophyllum thalictroides*, *Dryopteris intermedia*, *Fraxinus americana*

Global: *Acer saccharum*, *Betula alleghaniensis*, *Deparia acrostichoides*, *Fagus grandifolia*, *Halesia tetraptera* var. *monticola*, *Viola canadensis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Agastache scrophulariifolia* (G4, TN state-critically imperiled), *Ageratina altissima* var. *roanensis* (G5T3T4, TN state-imperiled), *Allium tricoccum* (G5, TN state-critically imperiled), *Phacelia fimbriata* (G4, VA state-imperiled), *Polygonatum biflorum* var. *commutatum* (G5T5, TN state-imperiled); **Invasive/Exotic Plants**: *Stellaria media* (Low)

Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Carex ruthii* (G3), *Coreopsis latifolia* (G3), *Gentiana austromontana* (G3), *Geum geniculatum* (G2), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Solidago glomerata* (G3), *Stachys clingmanii* (G2); **Other Plants**: *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (27-Oct-2003). This community is naturally uncommon due to specific habitat requirements and a restricted geographic range. It only occurs at moderate to high elevations, on protected landforms, in the Southern Blue Ridge. Most documented occurrences are of moderate to high quality, although destructive silvicultural practices could threaten remaining occurrences. The European gypsy moth (*Lymantria dispar*) is predicted to spread within the range of this community by 2005 and poses a threat to this community. There are potential difficulties in assigning plots or occurrences to this association (Southern Appalachian Northern Hardwood Forest [Rich Type] (CEGL004973)) versus Southern Appalachian Cove Forest (Rich Montane Type) (CEGL007695). The current (2003) understanding of the differences would dictate leaving the rank at G3.

RELATED CONCEPTS

Global Similar Types:

- *Aesculus flava - Acer saccharum - (Tilia americana var. heterophylla) / Hydrophyllum canadense - Solidago flexicaulis* Forest (CEGL007695) lacks *Betula alleghaniensis* and occurs at lower elevations.
- *Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides / Eurybia chlorolepis - Dryopteris intermedia* Forest (CEGL007285) occurs on higher, more open slopes with lower soil fertility.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: "Rich" northern hardwoods of the Southern Appalachians. This unit occupies more concave slopes than Southern Appalachian Northern Hardwood Forest (Typic Type) (CEGL007285) at somewhat lower elevations, and is associated with soils that have slightly higher pH, Ca, Mg, and total base saturation. In analysis, a number of plots shifted allegiance between this group and the group representing Southern Appalachian Rich Cove Forest (Montane Calcareous Type) (CEGL007695) of the Rich Cove Forests class depending on the protocols used for cluster analysis. In the field, these two types intergrade in the elevation range 1,100 to 1,300 m (3,600-4,300 feet), and some plots may be difficult to subjectively classify and could be assigned equally well to either type. At the other end of the gradient, this type can merge into Southern Appalachian Northern Hardwood Forest (Typic Type) (CEGL007285) along a topographic cline.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: Other species that have high diagnostic value and constancy in this type, and that might be considered as alternate nominals, are *Fagus grandifolia, Dryopteris intermedia*, and *Actaea podocarpa (= Cimicifuga americana)*.
Global Classification Comments: These forests occur above the elevational limit of some of the typical "cove" canopy species [see *Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava* Forest Alliance (A0235)] such as *Liriodendron tulipifera* and *Carya cordiformis*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Frequent along and near the AT in most high-elevation areas from Mount Rogers south to the Nantahala Mountains. This community was sampled in North Carolina, including Standing Indian Mountain and Yellow Mountain in Nantahala National Forest; in Tennessee, including Great Smoky Mountains National Park (Devil's Tater Patch, Mud Gap) and Cherokee National Forest (Hughes Gap); and at Whitetop Mountain in Virginia.
Global Range: This community is a regional endemic, found only in the high-mountain areas of the Southern Blue Ridge, from Virginia south through western North Carolina, eastern Tennessee, and northeastern Georgia, with outlying examples in the Cumberlands and Southern Ridge and Valley in Virginia (Clinch Mountain and High Knob massif).
Nations: US
States/Provinces: GA, NC, TN, VA:S2, WV

Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)

Element Concept

Global Summary: This association occurs in the Great Smoky Mountains and high mountain areas of southwestern Virginia, and at lower elevations in protected mountain settings in West Virginia. This community is found on steep, mostly north-facing slopes, and on slopes and flats along and above streams. These forests occur on midslope or toeslope positions, protected by higher landforms, where solar exposure is very low. The elevations of samples range from as low as 320 m in West Virginia (1040 feet) to around 1350 m (4400 feet), but the community can probably occur as high as 1524 m (5000 feet) or until *Picea rubens* begins to dominate. Sites are rocky, often with many large boulders and talus. Soils are stony with heavy litter layers and pockets of colluvium. This forest is affected by occasional disturbance by ice, wind and landslides. This mixed forest type has an open to closed canopy dominated by *Betula alleghaniensis* and/or *Tsuga canadensis*, although either of these species may be locally dominant at a small scale. In some stands, *Acer rubrum, Betula lenta, Liriodendron tulipifera* (at lower elevations), *Tilia americana var. heterophylla, Picea rubens*, or *Quercus rubra* can be important in the canopy or occur as minor associates. Other minor canopy and subcanopy species may include *Fagus grandifolia, Prunus serotina*, and *Magnolia acuminata*. The tall-shrub stratum is over 2 m in height, very dense (50-100% coverage) and dominated by *Rhododendron maximum*. Other minor shrubs commonly include *Acer pensylvanicum, Amelanchier laevis, Amelanchier arborea, Clethra acuminata, Hamamelis virginiana* (West Virginia), *Ilex montana*, and *Vaccinium erythrocarpum*. The ground layer is dominated by leaf litter, fallen trees and rocks. Herbaceous cover is sparse to moderate and is composed of scattered plants typical of mid- to high-elevation acidic forests. Composition can be quite variable among stands, but some of the more characteristic species include *Dryopteris intermedia, Oclemena acuminata, Polystichum acrostichoides* (West Virginia), *Viola blanda*, and *Viola rotundifolia*. The bryophyte layer can be well-developed and diverse. This association grades into forests dominated by *Picea rubens* or *Tsuga canadensis* at higher elevations.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This mixed hemlock - northern hardwood forest of the Blue Ridge Mountains is found at elevations of 320 to 1,040 m (1,000-5,000 feet) on steep, mostly north-facing mesic slopes, and on toeslopes and flats along streams. It was sampled once in the Central Appalachian project area. The site occupies a flat cove head known as Pine Swamp located just below the crest of Peters Mountain with mesic clay loam soil. Seepage swales interlace the matrix forest. The unvegetated surface is dominated by leaf litter with some downed wood. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This evergreen-deciduous mixed forest occurs at elevations usually greater than 1,100 m (3,600 feet), but as low as 975 m (3,200 feet) in some cases. Sites range from gentle to somewhat steep mid and upper slopes and summits. Soils are rapidly to well-drained clay loam. The unvegetated surface is dominated by leaf litter with some downed wood or may be a mix of leaf litter, exposed bedrock and large rocks.
Global Environment: This community occurs on steep, mostly north-facing mesic slopes, and on toeslopes and flats along streams. It typically occupies mid- to lower slope and valley-bottom topographic positions that are well-protected by higher landforms. These sites have low solar exposure and may be subject to cold-air inversions. Elevations (of plot-sampled stands) range from 320-750 m (1040-2400 feet) in West Virginia, to 915-1450 m (3000-4800 feet) in the Virginia mountains, and to 1030-1450 m (3400-4800 feet) in the Great Smoky Mountains. Lower elevation stands may intergrade with *Betula lenta*-dominated forest types. Sites are often rocky, with many large

boulders and stones and pockets of colluvium. Soils, weathered from sandstone, acidic shale, or metamorphic igneous rocks, have dense, root-rich duff layers. Samples collected from plots are highly acidic (mean pH = 3.7 to 4.8) with low base status and moderately high organic matter content (mean = 20%). On stream-bottom sites, local areas of seepage are not uncommon, and habitats may be somewhat transitional to a saturated hydrologic regime. Sites occupied by this forest are affected by occasional ice, wind, and landslide disturbances.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This forest has a strong *Betula alleghaniensis* component with variable amounts of *Tsuga canadensis* and *Acer rubrum*. *Liriodendron tulipifera, Prunus serotina*, and *Acer pensylvanicum* may also be present in the canopies of some stands. The shrub layer is made up of dense *Rhododendron maximum* cover along with other shrubs such as *Ilex montana* and *Hamamelis virginiana*. Few herbs are present but may include *Agrostis perennans, Carex debilis var. rudgei, Dennstaedtia punctilobula*, and *Dryopteris intermedia*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy of this mixed forest is codominated by *Tsuga canadensis* and *Betula alleghaniensis*, but in some stands *Tsuga canadensis* may not be present; additional species may include *Acer* spp., *Magnolia acuminata, Oxydendrum arboreum, Picea rubens* and *Prunus serotina*. *Rhododendron maximum* dominates the dense shrub layer which can also include *Hamamelis virginiana, Ilex montana*, and *Rubus flagellaris*. Common herbs are *Agrostis perennans, Carex debilis var. rudgei, Carex digitalis, Dennstaedtia punctilobula*, and *Dryopteris intermedia*.

Global Vegetation: This mixed forest has an open to closed canopy codominated by *Betula alleghaniensis* and/or *Tsuga canadensis*, although either of these species may be solely dominant over small areas. In some stands, *Acer rubrum, Betula lenta, Liriodendron tulipifera* (at lower elevations), *Tilia americana var. heterophylla, Picea rubens*, or *Quercus rubra* can be important in the canopy or occur as minor associates. Other minor canopy and subcanopy species may include *Fagus grandifolia, Prunus serotina*, and *Magnolia acuminata*. The community has a very dense (50-100% cover), evergreen tall-shrub stratum (>2 m tall) dominated by *Rhododendron maximum*. In the Great Smoky Mountains, a dense low-shrub stratum dominated by *Leucothoe fontanesiana* is typical, but this species is absent from Virginia and West Virginia examples of the type. Other minor shrubs commonly include *Acer pensylvanicum, Amelanchier laevis, Hamamelis virginiana* (in West Virginia stands), *Ilex montana*, and *Vaccinium erythrocarpum*. Herbaceous cover is sparse to occasionally moderate and is composed of scattered plants typical of mid- to high-elevation acidic forests. Composition can be quite variable among stands, but some of the more characteristic species include *Dryopteris intermedia, Oclemena acuminata, Polystichum acrostichoides* (in West Virginia stands), *Viola blanda*, and *Viola rotundifolia*. Some additional herbaceous species found in this community include *Arisaema triphyllum, Dennstaedtia punctilobula, Huperzia lucidula*, and *Medeola virginiana*. In Southern Appalachian stands with very dense evergreen shrub layers, species richness can be extraordinarily low (<10 taxa per 1000-square-meter sample), but in stands with somewhat more open shrub layers, richness can exceed 30 taxa per sample. The bryophyte layer can be well-developed and diverse; mosses and liverworts collected from West Virginia plots include *Anomodon attenuatus, Aulacomnium heterostichum, Bryhnia graminicolor, Bryoandersonia illecebra, Campylium chrysophyllum, Hypnum curvifolium, Hypnum imponens, Loeskeobryum brevirostre, Mnium stellare, Plagiothecium denticulatum, Platyhypnidium riparioides, Thuidium delicatulum, Bazzania trilobata, Leucobryum glaucum*, and *Mnium hornum*. The regionally rare plants *Botrychium oneidense* and *Prenanthes roanensis* are minor components of this vegetation type.

Global Dynamics: The *Tsuga canadensis* component of Virginia stands has been devastated by outbreaks of hemlock woolly adelgid over the past several decades, leading to more open canopy conditions, along with increased regeneration and greater importance of *Betula alleghaniensis* in most stands.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (23-May-2011). This community type is naturally uncommon within its range due to specific requirements for protected, mesic sites at high elevations. Most remaining examples of this community have been affected by past logging and are currently threatened with the loss of their *Tsuga canadensis* component due to ongoing or potential infestations by the exotic pest hemlock woolly adelgid (*Adelges tsugae*). This community type has a restricted but locally extensive distribution in the highest mountains of southwestern and west-central Virginia, North Carolina, West Virginia, and Tennessee. This association was originally described from Great Smoky Mountains National Park.

RELATED CONCEPTS

Global Similar Types:
- *Acer rubrum var. rubrum - Betula lenta - Magnolia fraseri / (Rhododendron maximum, Kalmia latifolia)* Ruderal Forest (CEGL008558) is a post-disturbance forest, some stands of which could resemble CEGL007861 without *Tsuga*.
- *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543)
- *Picea rubens - (Betula alleghaniensis, Aesculus flava) / Rhododendron (maximum, catawbiense)* Forest (CEGL004983)
- *Picea rubens - (Betula alleghaniensis, Aesculus flava) / Viburnum lantanoides / Solidago glomerata* Forest (CEGL006256)
- *Picea rubens / Betula alleghaniensis / Bazzania trilobata* Forest (CEGL008501)
- *Tsuga canadensis - (Betula alleghaniensis, Quercus rubra) / Ilex montana / Rhododendron catawbiense* Forest (CEGL008513)
- *Tsuga canadensis - Acer saccharum - Fagus grandifolia / Dryopteris intermedia* Forest (CEGL006639)
- *Tsuga canadensis - Betula alleghaniensis - Acer saccharum / Dryopteris intermedia* Forest (CEGL006638)
- *Tsuga canadensis - Betula alleghaniensis - Prunus serotina / Rhododendron maximum* Forest (CEGL006206)
- *Tsuga canadensis - Halesia tetraptera - Magnolia fraseri / Rhododendron maximum / Dryopteris intermedia* Forest (CEGL007693)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Examples of this community exhibit wide variation in species richness. As defined by the more constant species, however, the composition appears to be "classic" with *Betula alleghaniensis* and *Tsuga canadensis* over *Rhododendron maximum*.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Stands of this community may be hard to distinguish from Southern Appalachian Ruderal Acidic Mixed Hardwood Forest (CEGL008558).

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: As defined by the more constant species, however, composition appears to be "classic" CEGL007861, with *Betula alleghaniensis* with or without *Tsuga* over *Rhododendron maximum*, and in most of the Great Smokies plots, *Leucothoe fontanesiana*. Variation in the cover/density of these ericads may account (at least in part) for the great fluctuation in herbaceous richness in this group.

Global Classification Comments: This association is a high-elevation acidic cove forest and is characterized by species indicative of montane, infertile environments, a dense shrub layer of *Rhododendron maximum*, and a mixed deciduous-evergreen to mostly deciduous canopy. Species richness is typically low, ranging from 4 to 38 species per sample with an average of 19 species per 400-square-meter sample. Analysis of plot samples from the Great Smoky and Virginia mountains, and from Fayette and Raleigh counties, West Virginia, shows the most constant species as *Betula alleghaniensis, Rhododendron maximum, Tsuga canadensis*, and *Dryopteris intermedia*.

Some stands in West Virginia may be better classified as *Tsuga canadensis - Betula alleghaniensis - Prunus serotina / Rhododendron maximum* Forest (CEGL006206), a seemingly more diverse and lower-elevation type. Forests of high-elevation coves at Salt Pond Mountain in Giles County (e.g., War Spur Branch), where *Picea rubens* is codominant with or subordinate to *Tsuga canadensis* and *Betula alleghaniensis*, are tentatively placed here. Some of these stands, however, may be better classified as wetlands and require additional investigation.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is locally distributed throughout higher elevations of the Southern and Central Appalachians and along the AT from Potts Mountain, Virginia, to the Nantahala Mountains. In the Central Appalachian project area, it was sampled along the Virginia/West Virginia stateline at Pine Swamp Branch in Giles County, Virginia.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Present in scattered high-elevation areas along the AT corridor from Potts Mountain, Virginia, to the Nantahala Mountains in Tennessee.

Global Range: This community has been documented in the Great Smoky Mountains of Tennessee; in the Mount Rogers - Whitetop Mountain area of the Virginia Blue Ridge (Grayson, Smyth and Washington counties); on Salt Pond Mountain in the Ridge and Valley of west-central Virginia (Giles County); on Allegheny Mountain in Highland County, Virginia, and adjacent Pocahontas County, West Virginia; and in Fayette County, West Virginia, along and near the New River Gorge, and along Gauley River in West Virginia. This vegetation type may be locally distributed throughout higher elevations of the Southern and Central Appalachians.

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)

Element Concept

Global Summary: This is a broadly defined association meant to cover typical "northern hardwood forests" over 1220 m (4000 feet) elevation of the Southern Blue Ridge and the highest adjacent ridges of the Virginia Ridge and Valley. This deciduous forest association occurs on exposed landforms such as open, north-facing slopes. The canopy is dominated by various mixtures of *Betula alleghaniensis, Fagus grandifolia*, and sometimes *Aesculus flava*. In the northern part of the range, *Acer saccharum* can codominate in the canopy. Other canopy trees may be present but are of minor importance (e.g., *Prunus serotina, Quercus rubra, Halesia tetraptera var. monticola*). Common subcanopy trees include *Acer pensylvanicum, Acer spicatum, Amelanchier laevis*, and *Acer saccharum*. A shrub stratum may be absent to moderately dense. *Viburnum lantanoides* is a typical shrub. Other possible shrub species include, but are not limited to, *Hydrangea arborescens, Ilex montana, Rubus canadensis*, and *Sambucus racemosa var. racemosa (= Sambucus racemosa var. pubens)*. Herbaceous cover can be dominated by sedges or ferns or be composed of a mixture of sedges, ferns, and other forbs. Typical herbaceous species include *Ageratina altissima var. roanensis, Eurybia chlorolepis (= Aster chlorolepis), Arisaema triphyllum, Athyrium filix-femina ssp. asplenioides (= Athyrium asplenioides), Carex pensylvanica, Dryopteris intermedia, Solidago curtisii (= Solidago caesia var. curtisii), Stellaria pubera, Stellaria corei*, and *Streptopus lanceolatus var. roseus (= Streptopus roseus)*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This typic Southern Appalachian northern hardwood forest occurs on exposed landforms such as open, north-facing slopes at high elevations typically over 1,220 m (4,000 feet). It was sampled at three locations in the Central Appalachian project area. Sites are somewhat steep to steep mid and upper slopes. Soils are well-drained. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Evidence of disturbance reported at one site includes logging, wind/ice damage, and chestnut blight.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This northern hardwood forest is usually found at elevations greater than 1,100 m (3,600 feet), but can occur as low as 975 m (3,200 feet) in some cases. It was sampled at 24 locations in the park. Sites cover a wide range of landscapes, from gentle to steep mid to upper slopes and ridgetops with mostly northern aspects, but any aspect is possible. Soils are typically well-drained loams. The unvegetated surface is dominated by leaf litter with some downed wood, but sometimes there will be good amounts of exposed bedrock and large/small rocks. Evidence of disturbance includes past logging, trails, wind/ice damage, feral hog damage, and the presence of exotic plant species.
Global Environment: This deciduous forest association occurs at high elevations (typically over 1220 m [4000 feet]) in the Southern Appalachians, on exposed landforms such as open, north-facing slopes. Virginia examples of the type occur at elevations from 1100-1585 m (3600-5200 feet). Mean elevation of 28 plot-sampled Virginia stands is 1340 m (4400 feet). Habitats include a wide range of slope positions and aspects. Surface cover of bedrock and boulders is typically less than 25%, but occasionally higher. Soil samples collected from plot-sampling sites are consistently extremely acidic (mean pH = 3.8) with low base status.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: Variable canopy includes *Betula alleghaniensis, Fagus grandifolia, Aesculus flava* and *Acer saccharum*. Additional canopy species can include *Fagus grandifolia*. *Acer pensylvanicum, Crataegus punctata, Rubus canadensis*, and *Rubus flagellaris* are dominant shrubs. Indicator species include *Viburnum lantanoides, Ageratina altissima var. roanensis, Eurybia chlorolepis, Athyrium filix-femina ssp. asplenioides, Carex pensylvanica, Carex lucorum var. austrolucorum, Viola blanda var. blanda*, and *Solidago curtisii*. Other common herbs include *Arisaema triphyllum, Dryopteris intermedia*, and *Laportea canadensis*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy tends to be dominated by *Betula alleghaniensis* with smaller amounts of *Fagus grandifolia, Aesculus flava*, and *Acer saccharum*. Additional canopy and subcanopy species include *Acer pensylvanicum, Quercus rubra*, and occasionally *Picea rubens*. Indicator species include *Viburnum lantanoides, Ageratina altissima var. roanensis, Eurybia chlorolepis, Athyrium filix-femina ssp. asplenioides, Carex pensylvanica*, and *Solidago curtisii*. Additional common and/or abundant vegetation includes shrubs *Rhododendron maximum* and *Rubus canadensis*; ferns *Dennstaedtia punctilobula, Dryopteris carthusiana, Dryopteris intermedia*; and forbs *Arisaema triphyllum, Laportea canadensis, Maianthemum canadense, Oclemena acuminata*, and *Stellaria pubera*. In addition, this community supports many state-rare species, including TN state-critically imperiled *Thalictrum coriaceum*, TN state-imperiled *Allium burdickii, Stachys clingmanii* (also considered globally imperiled), *Ageratina altissima var. roanensis, Brachyelytrum septentrionale*, and *Rugelia nudicaulis*, and NC state-imperiled *Dryopteris carthusiana*.

Global Vegetation: Over most of this community's range, the canopy is dominated by various mixtures of *Betula alleghaniensis, Fagus grandifolia* and, less commonly, *Aesculus flava*. In Virginia stands of this type (primarily from the Mount Rogers - Whitetop massif), *Acer saccharum* is generally a codominant canopy tree in mixed stands with *Fagus grandifolia* and *Betula alleghaniensis* and with *Aesculus flava* less important. Other canopy trees, including *Prunus serotina, Quercus rubra*, and *Halesia tetraptera var. monticola*, may be present but are of minor importance. Common subcanopy trees include *Acer pensylvanicum, Acer spicatum, Amelanchier laevis*, and *Acer saccharum*. The shrub stratum may vary from nearly undeveloped to moderately dense. *Viburnum lantanoides* is a typical shrub, except in the northern portion of the range, where it varies from infrequent to locally dominant. Other potential shrub components include, but are not limited to, *Hydrangea arborescens, Ilex montana, Rubus canadensis*, and *Sambucus racemosa (= Sambucus pubens)*. Herbaceous cover is variably dominated by sedges, ferns and forbs. Typical herbaceous species include *Ageratina altissima var. roanensis, Eurybia chlorolepis (= Aster chlorolepis), Arisaema triphyllum, Athyrium filix-femina ssp. asplenioides (= Athyrium asplenioides), Carex pensylvanica, Carex lucorum var. austrolucorum, Dryopteris intermedia, Solidago curtisii (= Solidago lancifolia), Stellaria pubera, Stellaria corei, Streptopus lanceolatus var. roseus (= Streptopus roseus)*, and *Viola blanda var. blanda*.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4), *Carex lucorum* var. *austrolucorum* (G5T3T4); **Other Plants**: *Viola blanda* var. *blanda* (G5T4T5)
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Abies fraseri* (G2, globally imperiled & TN-state critically imperiled), *Ageratina altissima* var. *roanensis* (G5T3T4, TN state-imperiled), *Allium burdickii* (G4G5, TN state-critically imperiled), *Brachyelytrum aristosum* (G5, TN state-imperiled), *Clintonia borealis* (G5, TN state-imperiled), *Dryopteris carthusiana* (G5, NC state-imperiled), *Rugelia nudicaulis* (G3, TN state-imperiled), *Smilax biltmoreana* (G4, TN state-imperiled), *Solidago glomerata* (G3, TN state-imperiled), *Stachys clingmanii* (G2, globally imperiled & TN-state critically imperiled), *Thalictrum coriaceum* (G4, TN state-critically imperiled); **Invasive/Exotic Plants**: *Poa compressa* (High/Low, invasive/exotic), *Viburnum lantana* (invasive/exotic)
Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, All Virginia stands and Subtype 1; Southern Blue Ridge endemic), *Arnoglossum muehlenbergii* (G4, VA state-rare), *Cardamine clematitis* (G3), *Carex lucorum* var. *austrolucorum* (G5T3T4, All Virginia stands and Subtype 2), *Carex manhartii* (G3G4), *Carex misera* (G3), *Erythronium umbilicatum* ssp. *monostolum* (G5T3), *Gentiana austromontana* (G3), *Glyceria nubigena* (G2G3, endemic to Great Smoky Mountains and adjacent areas near the park), *Gymnoderma lineare* (G3), *Hypericum graveolens* (G3), *Hypericum mitchellianum* (G3), *Ilex collina* (G3, Southern Blue Ridge endemic), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Rhododendron vaseyi* (G3, NC/Southern Blue Ridge endemic), *Rugelia nudicaulis* (G3), *Solidago glomerata* (G3), *Stachys clingmanii* (G2); **Other Plants**: *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (14-Dec-1998). This is a broadly defined association meant to cover typical "northern hardwood forests" of the Southern Blue Ridge. If needed, more subassociations may be recognized based on differences related to geology and other environmental variables. Even if broadly defined, this type is limited in distribution to western North Carolina, eastern Tennessee, and southwestern Virginia, and in extent by its requirement for higher elevations (typically over 1220 m [4000 feet]). Most of the area of this community type is on public lands administered by the U.S. Forest Service (Pisgah, Nantahala, Cherokee, and Jefferson national forests) and National Park Service (Great Smoky Mountains National Park and Blue Ridge Parkway). Most sites for this community are relatively secure from most threats. Exotics plants and animals, such as garlic mustard (*Alliaria petiolata*) and the gypsy moth may represent significant threats to this community.

RELATED CONCEPTS

Global Similar Types:
- *Acer saccharum - Betula alleghaniensis - Prunus serotina* Forest (CEGL006045)
- *Aesculus flava - Betula alleghaniensis - Acer saccharum / Caulophyllum thalictroides - Actaea podocarpa* Forest (CEGL004973) has a more diverse canopy and a richer and more diverse herbaceous layer.
- *Betula alleghaniensis - Acer saccharum - Aesculus flava / Acer pensylvanicum / Trillium grandiflorum* Forest (CEGL004417)
- *Betula alleghaniensis - Quercus rubra / Acer spicatum / Dryopteris intermedia - Oclemena acuminata* Forest (CEGL008502)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is the "typic" Southern Appalachian northern hardwood forest. In Virginia stands of this type (primarily from the Mount Rogers - Whitetop massif), *Acer saccharum* is generally a codominant canopy tree in mixed stands with *Fagus grandifolia* and *Betula alleghaniensis*; *Aesculus flava* is less important; and *Viburnum lantanoides* is not very constant in the shrub layer.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This association appears to represent the "Typic" Southern Appalachian northern hardwood forest. There is a disproportionate number of Virginia plots in the group, which perhaps makes the summary statistics diverge a bit from the classic concept and name that was derived from further south. In Virginia stands of this type (primarily from the Mount Rogers - Whitetop massif), *Acer saccharum* is generally a codominant canopy tree in mixed stands with *Fagus grandifolia* and *Betula alleghaniensis*; *Aesculus flava* is less important; and *Viburnum lantanoides* is not very constant in the shrub layer.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: This community tends to be more common than Southern Appalachian Northern Hardwood Forest (Rich Type) (CEGL004973).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is frequent along and near the AT in most high-elevation areas from Mount Rogers south to the Great Smoky Mountains. In the Central Appalachian project area, it was sampled in Virginia at Garden Mountain and Hurricane Mountain.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Frequent along and near the AT in most high-elevation areas from Mount Rogers south to the Great Smoky Mountains. This community was sampled in North Carolina; at Great Smoky Mountains National Park (Devil's Tater Patch, Masa Knob, and Mollies Ridge Shelter) and Pisgah National Forest (Hughes Gap), in Tennessee; and at Garden Mountain, Hurricane Mountain, Mount Rogers, Quebec Branch, and Whitetop Mountain, Virginia.
Global Range: The type is nearly endemic to high elevations of the Southern Blue Ridge in eastern Tennessee, western North Carolina, and southwestern Virginia. In the Virginia Blue Ridge, it is prevalent in the Mount Rogers - Whitetop Mountain area and at high elevations of the Iron Mountains. Local outliers also occur at the highest elevations of Clinch Mountain in the adjacent Ridge and Valley province.

[CEGL004982] *Betula alleghaniensis - Tilia americana var. heterophylla / Acer spicatum / Ribes cynosbati / Dryopteris marginalis* Forest

Translated Name: **Yellow Birch - Appalachian Basswood / Mountain Maple / Eastern Prickly Gooseberry / Marginal Woodfern Forest**

Common Name: **Southern Appalachian Hardwood Rich Boulderfield Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis* - *Aesculus flava* Forest Alliance (A0266)

Element Concept

Global Summary: This association includes boulderfield forests of the Southern Appalachians, with abundant *Betula alleghaniensis*, but in habitats that allow for more diverse canopies, including other species such as *Aesculus flava, Betula lenta*, and *Tilia americana var. heterophylla*. This community occurs in a cool, humid climate, on steep, rocky, northwest- to northeast-facing, middle to upper concave slopes, or in saddles between ridges, at moderate to high elevations (610-1220 m [2000-4000 feet]) of the Blue Ridge and possibly ranging into the Cumberland Mountains and adjacent Ridge and Valley and Appalachian Plateau provinces. It grows on bouldery talus and is often associated with small streams and seepage. *Betula alleghaniensis* in the canopy are often stunted and gnarled, with roots that may have grown to encircle the boulders. The canopy is much more open than the surrounding forest and tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. A woody layer of shrubs and vines is usually well-developed. Rooting opportunities for most herbaceous plants is limited because of the development of this community on periglacial boulderfields of blocky talus, thus herbaceous cover is only sparse to moderate. Typical shrubs and vines which are more abundant in this type than in other associations in this alliance include *Acer spicatum, Aristolochia macrophylla, Hydrangea arborescens, Parthenocissus quinquefolia, Toxicodendron radicans, Vitis* spp., *Ribes cynosbati*, and *Ribes rotundifolium*. *Dryopteris marginalis* is often an abundant herb. This type is conceptually similar to *Betula alleghaniensis / Ribes glandulosum / Polypodium appalachianum* Forest (CEGL006124), which is more restricted to more extreme boulderfield situations at high elevations (1370-1615 m [4500-5300 feet]). The association described here generally occurs at lower elevations in less extreme environmental situations and lacks species characteristic of high elevations. However, it ranges to higher elevations than the typical rich cove forests with which it shares canopy species. Similar *Betula alleghaniensis*-dominated forests occur on glaciated rocky slopes in the upper mid-Atlantic and in the northeastern United States. The *Betula alleghaniensis*-dominated periglacial boulderfields of the southern Appalachian Mountains are distinguished from the northern forests by the occurrence of Southern Appalachian endemic species, better developed shrub layers and slightly less species diversity.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This boulderfield forest typically occurs below 1,220 m (4,000 feet) elevation. The rooting substrate is composed of large rocks and boulders with very little soil development. The sampled site is a steep, north-facing upper slope with well-drained loam soil. This example is an old-growth forest with many canopy gaps, likely due to wind and/or ice damage.
Global Environment: This community occurs in a cool, humid climate, usually found on steep, rocky, northwest- to northeast-facing, middle to upper concave slopes, or in saddles between ridges, at moderate to high elevation (610-1220 m [2000-4000 feet]). These forests grow over bouldery talus and are often associated with small streams and seepage.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is more diverse than other boulderfield forests and typically dominated by *Betula alleghaniensis* with associates including *Betula lenta* and *Tilia americana var. heterophylla*. Common shrubs and subcanopy trees are *Acer spicatum, Acer pensylvanicum, Hydrangea arborescens, Clethra acuminata, Hamamelis virginiana*, and *Ilex montana*. Herbs can be quite abundant and include *Athyrium filix-femina, Dryopteris intermedia, Eupatorium purpureum, Eurybia divaricata, Euonymus obovatus*, and *Ribes* spp. Mosses may cover much (up to 60%) of the rock surfaces. In addition, this community supports GA-state imperiled *Veratrum viride*.
Global Vegetation: This association includes boulderfield forests of the Southern Appalachians, with abundant *Betula alleghaniensis*, but in habitats that allow for more diverse canopies, including other species such as *Aesculus flava, Betula lenta*, and *Tilia americana var. heterophylla*. *Betula alleghaniensis* in the canopy are often stunted and gnarled, with roots that may have grown to encircle the boulders. The canopy is much more open than the surrounding forest and tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. A woody layer of shrubs and vines is usually well-developed. Rooting opportunities for most herbaceous plants is limited because of the development of this community on periglacial boulderfields of blocky talus, thus herbaceous cover is only sparse to moderate. Typical shrubs and vines which are more abundant in this type than in other associations in this alliance include *Acer spicatum, Aristolochia macrophylla, Toxicodendron radicans, Hydrangea arborescens, Parthenocissus quinquefolia, Ribes cynosbati*, and *Ribes rotundifolium*. *Dryopteris marginalis* is often an abundant herb.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Veratrum viride* (G5, GA state-imperiled)
Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Cardamine clematitis* (G3), *Geum geniculatum* (G2), *Micranthes careyana* (G3), *Scutellaria*

saxatilis (G3), *Solidago glomerata* (G3), *Stachys clingmanii* (G2); **Other Plants**: *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (22-Jan-2008). This community is scattered throughout the high mountains but is fairly uncommon. Unlike many other forest types in the Southern Appalachians, this community has not historically been threatened by logging as much as other types because of the stunted nature of the trees and the relative inaccessibility to loggers of these boulderfields. North Carolina, in which most of the examples should be found, estimates to have about 15 occurrences, mostly small ones (M. Schafale pers. comm. 2007).

RELATED CONCEPTS

Global Similar Types:

- *Betula alleghaniensis / Ribes glandulosum / Polypodium appalachianum* Forest (CEGL006124) more affiliated with northern hardwoods.
- *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710) often associated, but on less extremely rocky soils.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Small group of plots crosswalked somewhat tentatively to this association (CEGL004982). Soil data were not available for six plots of this group, so it was not possible to assess whether the greater representation of "rich-site" species (compared to Southern Appalachian Boulderfield Forest (Currant & Rockcap Fern Type) (CEGL006124)) correlates with a fertility gradient.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: *Ribes cynosbati* is much less constant than either *Hydrangea arborescens* or *Euonymus obovatus*. Likewise, *Dryopteris marginalis* is much less constant or abundant than a number of other herbs.
Global Classification Comments: This association includes boulderfield forests of the Southern Appalachians, with abundant *Betula alleghaniensis*, but in habitats that allow for more diverse canopies, including other species such as *Aesculus flava, Betula lenta*, and *Tilia americana var. heterophylla*. This community occurs in a cool, humid climate, on steep, rocky, northwest- to northeast-facing, middle to upper concave slopes, or in saddles between ridges, at moderate to high elevations (610-1220 m [2000-4000 feet]) of the Blue Ridge and possibly ranging into the Cumberland Mountains and adjacent Ridge and Valley and Appalachian Plateau provinces. It grows on bouldery talus and is often associated with small streams and seepage. *Betula alleghaniensis* in the canopy are often stunted and gnarled, with roots that may have grown to encircle the boulders. The canopy is much more open than the surrounding forest and tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. A woody layer of shrubs and vines is usually well-developed. Rooting opportunities for most herbaceous plants is limited because of the development of this community on periglacial boulderfields of blocky talus, thus herbaceous cover is only sparse to moderate. Typical shrubs and vines which are more abundant in this type than in other associations in this alliance include *Acer spicatum, Aristolochia macrophylla, Hydrangea arborescens, Parthenocissus quinquefolia, Toxicodendron radicans, Vitis* spp., *Ribes cynosbati*, and *Ribes rotundifolium*. *Dryopteris marginalis* is often an abundant herb. This type is conceptually similar to *Betula alleghaniensis / Ribes glandulosum / Polypodium appalachianum* Forest (CEGL006124), which is more restricted to more extreme boulderfield situations at high elevations (1370-1615 m [4500-5300 feet]). The association described here generally occurs at lower elevations in less extreme environmental situations and lacks species characteristic of high elevations. However, it ranges to higher elevations than the typical rich cove forests with which it shares canopy species. Similar *Betula alleghaniensis*-dominated forests occur on glaciated rocky slopes in the upper mid-Atlantic and in the northeastern United States. The *Betula alleghaniensis*-dominated periglacial boulderfields of the southern Appalachian Mountains are distinguished from the northern forests by the occurrence of Southern Appalachian endemic species, better developed shrub layers and slightly less species diversity.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Rare and local along the AT in the southernmost part of the study area, from the Great Smoky Mountains south. This community was sampled on Chattahoochee National Forest in Georgia.
Global Range: This community occurs in the southern Appalachian Mountains of the eastern United States.
Nations: US

States/Provinces: GA, KY?, NC, TN, VA?

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)

ELEMENT CONCEPT

Global Summary: This association includes high-elevation boulderfield forests of the Southern Appalachians, strongly dominated by *Betula alleghaniensis*, with few or no other species in the canopy, and with other species indicative of high elevations. This community occurs in a cool, humid climate, on steep, rocky, northwest- to northeast-facing, middle to upper concave slopes, or in saddles between ridges, at elevations of 1370-1615 m (4500-5300 feet). It is known from the high elevations of the Blue Ridge from West Virginia south to eastern Tennessee and western North Carolina. This forest is distinguished by a closed to somewhat open canopy dominated by *Betula alleghaniensis*, occurring over angular rocks (0.25-1 m diameter) covered by thin soil, lichens, mosses or vines. The rocks may be almost totally covered by moss. *Betula alleghaniensis* in the canopy are often stunted and gnarled, with roots that may have grown to encircle the boulders. Tree density is typically less than that of the surrounding forests. Other species that may form a minor canopy component include *Aesculus flava, Prunus pensylvanica, Sorbus americana, Acer spicatum, Picea rubens, Tilia americana var. heterophylla, Sambucus racemosa var. racemosa (= Sambucus racemosa var. pubens)*, or *Quercus rubra*. Tree windthrow is common, leaving patches of exposed mineral soil and gaps in the canopy. The shrub density is typically high but may vary between occurrences. Herbaceous cover is generally sparse because of thin, rocky soil, but herbs and mosses may cover the rocks and boulders. Characteristic species include, in the herb stratum, *Oclemena acuminata (= Aster acuminatus), Eurybia chlorolepis (= Aster chlorolepis), Aconitum reclinatum, Cardamine clematitis, Carex aestivalis, Actaea podocarpa (= Cimicifuga americana), Claytonia caroliniana, Clintonia borealis, Dryopteris campyloptera, Dryopteris marginalis, Huperzia lucidula, Oxalis montana, Polypodium appalachianum, Streptopus amplexifolius*, and in the shrub stratum, *Acer pensylvanicum, Acer spicatum, Amelanchier arborea var. austromontana, Diervilla sessilifolia, Hydrangea arborescens, Ilex montana, Lonicera canadensis, Ribes glandulosum, Ribes rotundifolium, Rubus canadensis, Sambucus racemosa var. racemosa, Vaccinium erythrocarpum*, and *Viburnum lantanoides*. Seepage areas are common, producing wet microhabitats with unique species assemblages (*Chelone lyonii, Chrysosplenium americanum, Circaea alpina, Rudbeckia laciniata, Impatiens pallida*, and *Monarda didyma*). This association is distinguished by being strongly dominated by *Betula alleghaniensis*, with few or no other species in the canopy, and with other species indicative of high elevations (e.g., *Abies fraseri, Dryopteris campyloptera, Ribes glandulosum, Rugelia nudicaulis, Streptopus amplexifolius, Prunus pensylvanica*, and *Sorbus americana*. On less extreme sites, generally at lower elevations in the Blue Ridge and adjacent montane ecoregions, a similar boulderfield forest is *Betula alleghaniensis - Tilia americana var. heterophylla / Acer spicatum / Ribes cynosbati / Dryopteris marginalis*

Forest (CEGL004982). Similar *Betula alleghaniensis*-dominated forests occur on glaciated rocky slopes in the upper mid-Atlantic and in the northeastern United States. The *Betula alleghaniensis*-dominated periglacial boulderfields of the southern Appalachian Mountains are distinguished from the northern forests by the occurrence of Southern Appalachian endemic species, better developed shrub layers and slightly less species diversity.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This boulderfield forest typically occurs below 1,220 m (4,000 feet) elevation. The rooting substrate is composed of large rocks and boulders with very little soil development. The sampled sites are variable, ranging from gentle to steep slopes and ridgetops with mostly northern and eastern aspects. Soils may be well-drained or wet and somewhat poorly drained. The unvegetated surface is dominated by leaf litter but may also include significant amounts of large rocks, some downed wood and bare soil.

Global Environment: This community occurs in rocky habitats with cool, humid microclimates. Typical sites are steep, boulder-strewn slopes; northwest- to northeast-facing, middle to upper concave slopes; or in saddles between ridges. Elevations typically range from 1370-1615 m (4500-5300 feet), but may vary somewhat. Surface substrate is characterized by angular boulders (0.25-1 m diameter) derived from various bedrock types and covered by thin soil, lichens, mosses or vines. The rocks may be almost totally covered by moss. Seepage areas are frequent, producing wet microhabitats with unique species assemblages. Extreme winter temperatures, high winds, and ice storms periodically affect these forests. Mean elevation of plot-sampled Virginia sites is 1450 m (4760 feet) and aspect ranges from northwest to north. Mean surface cover of exposed bedrock and boulders is 42% and mean cover of bryophytes and lichens is 37%. Soil samples collected from these sites are extremely acidic (mean pH = 3.5), with high organic matter content (mean = 40%) and low base saturation (mean = 10%).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is strongly dominated by *Betula alleghaniensis* and includes other mesophytic species such as *Aesculus flava, Fagus grandifolia, Acer pensylvanicum, Acer spicatum, Prunus pensylvanica, Sorbus americana*, and *Quercus rubra*. Common and/or abundant shrubs include *Ribes glandulosum, Rubus canadensis*, and *Viburnum lantanoides*. Herbs can be very dense (up to 90% cover) and include *Polypodium appalachianum, Arisaema triphyllum, Athyrium filix-femina ssp. asplenioides, Dryopteris intermedia, Eurybia chlorolepis*, and *Oclemena acuminata*. Mosses, when present, can cover large surfaces. This community also supports VA-state imperiled *Cuscuta rostrata*.

Global Vegetation: Stands of this association are distinguished by a closed to somewhat open canopy overwhelmingly dominated by *Betula alleghaniensis*. Canopy trees are often stunted and gnarled, with roots that have grown to encircle the boulders. Tree density is typically less than that of the surrounding forests. Minor canopy associates include *Aesculus flava, Prunus pensylvanica, Sorbus americana, Acer spicatum, Picea rubens, Tilia americana var. heterophylla*, and *Quercus rubra*. Tree windthrow is common, creating canopy gaps and patches of exposed mineral soil. Shrub density is typically high but varies between occurrences. Characteristic shrubs are *Acer pensylvanicum, Acer spicatum, Amelanchier arborea var. austromontana, Diervilla sessilifolia, Hydrangea arborescens, Ilex montana, Lonicera canadensis, Ribes glandulosum, Ribes rotundifolium, Rubus canadensis, Sambucus racemosa var. racemosa (= var. pubens), Vaccinium erythrocarpum*, and *Viburnum lantanoides*. Herbaceous cover is generally sparse because of the rocky substrate, but specially adapted herbs and mosses may cover the rocks and boulders. Characteristic herbs over the range of this community include *Oclemena acuminata (= Aster acuminatus), Eurybia chlorolepis (= Aster chlorolepis), Aconitum reclinatum, Cardamine clematitis, Carex aestivalis, Actaea podocarpa (= Cimicifuga americana), Claytonia caroliniana, Clintonia borealis, Dryopteris campyloptera, Dryopteris marginalis, Huperzia lucidula, Oxalis montana, Polypodium appalachianum*, and *Streptopus amplexifolius*. Local seepage areas may support *Chelone lyonii, Chrysosplenium americanum, Circaea alpina, Rudbeckia laciniata, Impatiens pallida*, and *Monarda didyma*. Six plots from North Carolina, Tennessee, and Virginia were classified as this association in the Appalachian Trail classification project (Fleming and Patterson 2009a). In those plots, *Acer spicatum, Ribes glandulosum, Rubus canadensis*, and *Viburnum lantanoides* are the most constant lower woody species, while *Ageratina altissima var. roanensis, Arisaema triphyllum, Carex aestivalis, Dryopteris intermedia, Eurybia chlorolepis, Huperzia lucidula, Oclemena acuminata*, and *Polypodium appalachianum* are the most constant herbs. Mean species richness in these samples is 28 taxa per plot.

Global Dynamics: Windthrow of trees and damage to the canopy caused by lightning strikes and ice storms are common phenomena in boulderfields. The ice-fractured boulderfields that characterize this community in the upper elevations of the Southern Appalachians are believed to be remnants of Pleistocene periglacial activity. During this time, the high elevations (1120-1525 m [4000-5000 feet]) of the Southern Appalachians were covered by treeless snow fields and exposed rock. Frost and ice action resulted in the accumulation of boulders that persist on the upper

slopes (King and Stupka 1950). Farther north, such as in Pennsylvania, boulderfields are on flat surfaces and are the result of glacial deposition (Allard 1984).

Betula alleghaniensis is well-adapted to the environmental dynamics of boulderfields and can perpetuate because it takes advantage of canopy gaps formed during periodic natural disturbances. This species produces a large number of seeds and is able to germinate on logs and rocks in a minimum amount of soil. The roots of trees develop to form false trunks that encircle the rocks. It is possible that over time, due to soil formation and weathering, these forests may succeed to forests dominated by a mixture of northern hardwood species (*Betula alleghaniensis, Fagus grandifolia, Acer saccharum, Aesculus flava*). However, many *Betula alleghaniensis* forests and the boulderfields on which they occur appear fairly stable. Chafin and Jones (1989) found that despite large trees growing on top of boulders, there is no evidence of rock shattering.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Aesculus flava*, *Arisaema triphyllum*, *Betula alleghaniensis*, *Dryopteris intermedia*, *Polypodium appalachianum*, *Quercus rubra*, *Ribes glandulosum*, *Rubus canadensis*, *Viburnum lantanoides*

Global: *Acer spicatum*, *Aesculus flava*, *Amelanchier arborea* var. *austromontana*, *Betula alleghaniensis*, *Circaea alpina*, *Dryopteris campyloptera*, *Dryopteris intermedia*, *Ilex montana*, *Lonicera canadensis*, *Oclemena acuminata*, *Polypodium appalachianum*, *Ribes glandulosum*, *Ribes rotundifolium*, *Rubus canadensis*, *Vaccinium erythrocarpum*, *Viburnum lantanoides*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Cuscuta rostrata* (G4, VA state-imperiled)

Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Aconitum reclinatum* (G3), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Cardamine clematitis* (G3), *Cuscuta rostrata* (G4, VA state-rare), *Geum geniculatum* (G2), *Glyceria nubigena* (G2G3, endemic to Great Smoky Mountains and adjacent areas near the park), *Lilium grayi* (G3, Southern Blue Ridge endemic), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Prosartes maculata* (G3G4), *Rugelia nudicaulis* (G3), *Solidago glomerata* (G3), *Stachys clingmanii* (G2); **Other Plants**: *Chelone lyonii* (G4), *Conioselinum chinense* (G5), *Meehania cordata* (G5), *Stellaria corei* (G4), *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (27-Oct-2003). This community is scattered throughout the high elevations of the Southern Blue Ridge with highly localized outliers also found at the highest elevations of Clinch Mountain in the adjacent Ridge and Valley province. Examples are further confined to boulder strewn substrates which are relatively uncommon. Unlike many other forest types in the Southern Appalachians, this community has been less impacted by logging due to the stunted nature of the trees and the relative inaccessibility of these boulderfield sites. As of 2003, North Carolina has 12 (principal) Element Occurrences, and given their proportion of the total occurrences and their protection status, a rank of G2G3 is probably justified (M. Schafale pers. comm.).

RELATED CONCEPTS

Global Similar Types:

- *Betula alleghaniensis - Tilia americana var. heterophylla / Acer spicatum / Ribes cynosbati / Dryopteris marginalis* Forest (CEGL004982)
- *Betula alleghaniensis / Sorbus americana - Acer spicatum / Polypodium appalachianum* Forest (CEGL008504)
  Both of these associations occur on high-elevation boulderfields and have much species overlap, including many constant and dominant species, but CEGL008504 is geographically restricted to the Central Appalachians, is much less species-rich, and lacks all of the Southern Appalachian species found in CEGL006124.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This small group of plots appears to be representative of this type (CEGL006124).
Global Classification Comments: Unlike many other forest types in the Southern Appalachians, this community has not been threatened by logging because of the stunted nature of the trees and the inaccessibility of boulderfields to loggers.

This association is similar to *Betula alleghaniensis / Sorbus americana - Acer spicatum / Polypodium appalachianum* Forest (CEGL008504) of the Central Appalachians, but appears to occupy more mesic boulderfields and contains a number of Southern Appalachian species (e.g., *Ribes glandulosum, Eurybia chlorolepis, Heuchera villosa, Abies fraseri, Prenanthes roanensis, Vaccinium erythrocarpum, Aesculus flava*, etc.) that are generally absent from CEGL008504.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Uncommon and local along the AT in high-elevation areas from Mount Rogers to the Nantahala Mountains. This community was sampled in Tennessee, at Yellow Mountain (Nantahala National Forest) in North Carolina, and at Pine Mountain and Whitetop Mountain, Virginia.
Global Range: This community type ranges at high elevations of the Blue Ridge from eastern Tennessee and western North Carolina north to southwestern Virginia. In the southern Virginia Blue Ridge, it occurs frequently on steep, north-facing slopes of Mount Rogers, Whitetop, and Pine Mountain. Small, highly localized outliers also occur at the highest elevations of Clinch Mountain in the adjacent Ridge and Valley province.

Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)

Element Concept

Global Summary: This community is known from high elevations of the Northern Blue Ridge, Ridge and Valley, and Allegheny Mountains in Virginia and West Virginia. It occupies steep, boulder-strewn slopes at elevations from 975 m (3200 feet) to over 1250 m (4100 feet). The type is most frequent and extensive on straight or concave, middle to upper slopes with northerly aspects, but is found occasionally on slopes with other aspects. Surface substrate is characterized by a surface cover of angular boulders weathered from granite, metabasalt (greenstone), quartzite, or sandstone. This vegetation type has a partly closed to very open canopy overwhelmingly dominated by *Betula alleghaniensis*. The canopy trees are usually stunted and gnarled, exhibiting the effects of frequent ice and wind damage. Tree density is typically less than that of the surrounding forests. *Sorbus americana* and *Prunus pensylvanica* are minor canopy associates. Small tree and shrub densities are variable; *Sorbus americana* and *Acer spicatum* often have high cover in these layers. *Menziesia pilosa, Sambucus racemosa (= Sambucus pubens), Rubus idaeus ssp. strigosus*, and *Ribes cynosbati* are frequent shrubs. Herbaceous cover is often limited by the rocky substrate.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This high-elevation boulderfield woodland or open forest was sampled once in the park at Shenandoah National Forest in Virginia on a somewhat steep, northwest-facing upper slope with rapidly drained soil. The unvegetated surface is dominated by large rocks with some leaf litter and downed wood. Evidence of disturbance includes wind/ice damage.
Global Environment: This community occupies steep (up to 38°), boulder-strewn slopes at elevations from 975 m to over 1250 m (3200-4100 feet). Mean elevation of plot-sampled Virginia sites is 1119 m (3672 feet). The type is most frequent and extensive on straight or concave, middle to upper slopes with northerly aspects, but is found occasionally on slopes with other aspects. Surface substrate is characterized by surface cover >75% of angular boulders weathered from granite, metabasalt (greenstone), quartzite, and sandstone. Surface cover of bryophytes and lichens on rocks is typically >60%. Mineral soil samples could not be extracted from any of the Virginia plot-sampling sites. Surficial groundwater seepage is very rare in these habitats, although perched, subsurface groundwater may be present in some localities. Extreme winter temperatures, high winds, and ice storms are frequent, and strongly influence the physiognomy of forests on the boulderfields.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The very open canopy is dominated by stunted and gnarled *Betula alleghaniensis* typically with no other species in the canopy. *Sorbus americana, Prunus pensylvanica*, and *Acer spicatum* often have high cover. *Menziesia pilosa, Sambucus racemosa*, and/or *Ribes cynosbati* are frequent shrubs. Herbaceous cover is often limited by the rocky substrate; however, *Polypodium appalachianum* may abundantly cover mossy and lichen-covered rock surfaces.
Global Vegetation: This vegetation type has a partly closed to very open canopy overwhelmingly dominated by *Betula alleghaniensis*. The canopy trees are usually stunted and gnarled, exhibiting the effects of frequent ice and wind damage. Tree density is typically less than that of the surrounding forests. *Sorbus americana* and *Prunus pensylvanica* are minor canopy associates. Small tree and shrub densities are variable; *Sorbus americana* and *Acer spicatum* often have high cover in these layers. *Menziesia pilosa, Sambucus racemosa (= Sambucus pubens)*, and *Ribes cynosbati* are frequent shrubs. Herbaceous cover is often limited by the rocky substrate, but lithophytic species such as *Polypodium appalachianum* may abundantly cover mossy rock surfaces. Additional characteristic herbs include *Oclemena acuminata (= Aster acuminatus), Dryopteris marginalis, Hylotelephium telephioides (= Sedum telephioides), Carex brunnescens ssp. sphaerostachya, Carex aestivalis, Arisaema triphyllum, Dryopteris intermedia, Maianthemum canadense*, and *Polygonatum pubescens*. *Gymnocarpium appalachianum* and *Rubus*

idaeus ssp. strigosus are rare plants associated with this vegetation. Mean species richness of plot-sampled stands is 17 taxa per 400 m2.

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (21-Jun-2001). This is a small-patch community type occupying very restricted habitats within a narrow geographic range. There are less than 20 known occurrences of the type in Virginia.

RELATED CONCEPTS

Global Similar Types:

- *Betula alleghaniensis - Quercus rubra / Acer spicatum / Dryopteris intermedia - Oclemena acuminata* Forest (CEGL008502) a closed-canopy northern hardwood forest of the same region, occurring on more weathered substrates with better soil development.
- *Betula alleghaniensis / Ribes glandulosum / Polypodium appalachianum* Forest (CEGL006124) occupies more mesic boulderfields and has a number of typical Southern Appalachian species such as *Ribes glandulosum, Tilia americana var. heterophylla, Rubus canadensis, Vaccinium erythrocarpum, Eurybia chlorolepis*, and *Cardamine clematitis*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: See Global Comments.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: On the landscape, this association (CEGL008504) grades into fully exposed, lichen-dominated boulderfields at one extreme, and into rocky northern hardwood, red oak, or cove forests at the other. It has not been formally documented from West Virginia but has been observed by Virginia Division of Natural Heritage ecologists at several sites, including Reddish Knob and Panther Knob, Pendleton County, and Black Mountain, Pocahontas County. It is probably widely but locally distributed at high elevations throughout the extreme western Ridge and Valley and Allegheny Mountains of West Virginia.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the Northern Blue Ridge, Ridge and Valley, and Allegheny Mountains in Virginia and West Virginia. It was sampled at The Pinnacle in Shenandoah National Forest, Virginia.
Global Range: This community type is known from high elevations of the Northern Blue Ridge, Ridge and Valley, and Allegheny Mountains in Virginia and West Virginia.

Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Betula alleghaniensis - Aesculus flava* Forest Alliance (A0266)

ELEMENT CONCEPT

Global Summary: This community includes forest vegetation with short-statured canopies dominated by *Fagus grandifolia* and occurring in the high-elevation landscapes of the Southern Appalachians. On drier sites, such as south slopes, the association is expressed as the classic "beech gap "having a dense, graminoid-dominated herbaceous stratum. On more mesic sites, such as north slopes, the community is thought to be more similar to northern hardwood forests, having a more diverse canopy and subcanopy, occurring over a field stratum that is a mixture of coarse forbs, ferns and sedges. This forest association typically occurs on concave slopes, in gaps, flat ridgetops, or upper slopes of all aspects, at elevations of greater than 1370 m (4500 feet). It is found in scattered sites on high elevations of the southern Appalachian Mountains of North Carolina and Tennessee and possibly Georgia. This community is a broad-leaved deciduous forest with a canopy dominated by stunted, sometimes gnarled *Fagus grandifolia*, sometimes with lesser amounts of *Halesia tetraptera var. monticola* or *Aesculus flava* and *Betula alleghaniensis*. The subcanopy, if present, may include small stems of canopy species as well as *Acer spicatum, Acer pensylvanicum, Amelanchier laevis*, and *Sorbus americana*. Typically there is little shrub development (0-10%) with such species as *Crataegus punctata, Ribes* spp., *Viburnum lantanoides, Rubus canadensis, Hydrangea arborescens*, and *Cornus alternifolia*. Herbaceous cover can vary from dense, often approaching 100% coverage by species of *Carex* including *Carex aestivalis, Carex brunnescens, Carex debilis, Carex intumescens*, and *Carex pensylvanica*, to moderately dense (40-60% cover) and dominated by large herbs and patches of ferns, with lesser amounts of sedges. Other herbaceous species in this community are typical of rich Southern Appalachian forests and may include *Ageratina altissima var. roanensis, Anemone quinquefolia, Arisaema triphyllum, Eurybia chlorolepis (= Aster chlorolepis), Athyrium filix-femina ssp. asplenioides, Actaea racemosa (= Cimicifuga racemosa) Dryopteris campyloptera, Epifagus virginiana, Impatiens pallida, Medeola virginiana, Oxalis montana, Laportea canadensis, Luzula acuminata, Phacelia bipinnatifida, Poa alsodes, Prenanthes altissima, Prenanthes roanensis, Stellaria pubera, Thelypteris noveboracensis*, and *Trillium erectum*. This community commonly occurs as small patches surrounded by other forest types, montane grasslands and shrublands.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This beech gap forest is found above 1,370 m (4,500 feet) elevation. Sites range from gentle to steep upper slopes and, more typically, ridgetops on any aspect. Soils are moderately well- to well-drained sandy loam and loam. The unvegetated surface is dominated by leaf litter with small amounts of downed wood and rocks. Evidence of disturbance includes past catastrophic fire, trails, and wind/ice damage.

Global Environment: This community typically occurs on concave slopes, in gaps, flat ridgetops, or upper slopes of all aspects, at elevations of greater than 1370 m (4500 feet) (Russell 1953, Whittaker 1956, Crandall 1958). High rainfall and low temperatures create mesic conditions. Strong winds and ice storms periodically damage these forests, creating canopy gaps and contributing to its stunted appearance. This community commonly occurs as small patches surrounded by other forest types, montane grasslands and shrublands. In North Carolina, Burton series (Typic Haplumbrept) soils support the Southern Appalachian Beech Gap (Schafale and Weakley 1990). The soil is generally greater than 20 cm deep. The pH ranges from 4.5-6.0, which is considerably less acidic than the adjacent Red Spruce-Fraser Fir Forests (Russell 1953). Leaf mold is thinner compared to the spruce-fir ecosystems. Also lacking is the accumulation of peat or excessive depth of litter (Russell 1953).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is entirely dominated (or nearly so) by *Fagus grandifolia*. Common tree species include *Acer* spp., *Aesculus flava, Betula alleghaniensis*, and *Quercus rubra*. Common and/or abundant shrubs include *Amelanchier arborea, Fagus grandifolia*, and *Ilex montana*. Herbs may be dense (up to 90% cover) and include *Ageratina altissima var. roanensis, Angelica triquinata, Arisaema triphyllum, Athyrium filix-femina ssp. asplenioides, Carex pensylvanica, Dennstaedtia punctilobula, Dryopteris intermedia, Laportea canadensis, Luzula* spp., *Poa alsodes*, and *Solidago curtisii*. In addition, this community supports many state-rare species: in TN, state-critically imperiled *Carex appalachica* and state-imperiled *Ageratina altissima var. roanensis*; and in NC, state-critically imperiled *Streptopus lanceolatus var. roseus* and state-imperiled *Eupatorium steelei*.

Global Vegetation: This community is a broad-leaved deciduous forest with a canopy dominated by stunted, sometimes gnarled *Fagus grandifolia* sometimes with lesser amounts of *Halesia tetraptera var. monticola* or *Aesculus flava* and *Betula alleghaniensis*. The subcanopy, if present, may include small stems of canopy species as well as *Acer spicatum, Acer pensylvanicum, Amelanchier laevis*, and *Sorbus americana*. Typically there is little shrub development (0-10%) with such species as *Crataegus punctata, Ribes* spp., *Viburnum lantanoides, Rubus canadensis, Hydrangea arborescens*, and *Cornus alternifolia*. Herbaceous cover can vary from dense, often approaching 100% coverage by species of *Carex* including *Carex aestivalis, Carex brunnescens, Carex debilis, Carex intumescens*, and *Carex pensylvanica* to moderately dense (40-60% cover) and dominated by large herbs and patches of ferns, with lesser amounts of sedges (Whittaker 1956, Crandall 1958, Bratton 1975). Other herbaceous species in this community are typical of rich Southern Appalachian forests and may include *Ageratina altissima var. roanensis, Anemone quinquefolia, Arisaema triphyllum, Eurybia chlorolepis (= Aster chlorolepis), Athyrium filix-femina ssp. asplenioides, Actaea racemosa (= Cimicifuga racemosa), Dryopteris campyloptera, Epifagus virginiana, Impatiens pallida, Medeola virginiana, Oxalis montana, Laportea canadensis, Luzula acuminata, Phacelia bipinnatifida, Poa alsodes, Prenanthes altissima, Prenanthes roanensis, Stellaria pubera, Thelypteris noveboracensis*, and *Trillium erectum* (Whittaker 1956, Crandall 1958, Schafale and Weakley 1990).

Global Dynamics: Extreme exposure to wind and storms contribute to the high number of wind-blown trees and the stunted nature of the canopy. Frequent damage caused by wind and ice create gaps in the canopy. The origin and maintenance of this community has been debated by ecologists. It has been proposed that beech gaps became established during warmer climates of 7000-900 BC, and that they were once more extensive than today (Flint 1957 in Schofield 1960). Russell (1953) concluded that cold and high winds were responsible for the occurrence of these forests. Fuller (1977) suggested that the allelopathic effects of beech litter may be a factor in maintaining this community. Due to the extreme environment, growth and reproduction of *Fagus grandifolia* are relatively slow in this mid to late successional community. Despite their small size, canopy trees may be quite old. Although beech nuts may be produced by the larger trees, reproduction of beech appears to be almost entirely vegetative from root or stump sprouts (Russell 1953). Small canopy gaps within this type are commonly invaded by a dense thicket of *Rubus canadensis*.

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (1-Nov-2002). This community has a very restricted range with scattered occurrences of small acreage. Many occurrences have been, and continue to be, severely damaged by the European wild boar (*Sus scrofa*). Grazing and soil disturbance by this animal reduces understory herb cover to 10-30 percent of undisturbed levels and may affect tree growth and nutrient cycling (Singer et al. 1984). Beech bark disease, a complex made up of the Beech scale insect (*Cryptococcus fagisuga*) and a closely associated fungus (*Nectria coccinea var. faginata*) poses a severe threat to this community. Most all of the beech gap communities in the Great Smoky Mountains had succumbed to the beech bark disease or a combination of the beech bark disease and pollution by 2002 (R. White pers. comm.). Presumably this trend is being seen throughout the Southern Appalachians, resulting in the possible extinction of this community in the next few years. Therefore, this community was assigned a rank of G1.

RELATED CONCEPTS

Global Similar Types:
- *Fagus grandifolia* Ridge and Valley Forest (CEGL007200)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: "Beech Gap" northern hardwood forest dominated by stunted *Fagus grandifolia* and abundant graminoid cover. This community occupies the high end of an elevation gradient among the four northern hardwood types, and more often occurs at higher topographic positions on sites with lower site moisture potential.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: This type is represented by a clear and strong group of plots in the analysis.
Global Classification Comments: This community includes forest vegetation with short-statured canopies dominated by *Fagus grandifolia* and occurring in the high-elevation landscapes of the Southern Appalachians. On drier sites, such as south slopes, the association is expressed as the classic "beech gap "having a dense, graminoid-

dominated herbaceous stratum On more mesic sites, such as north slopes, the community is thought to be more similar to northern hardwood forests, having a more diverse canopy and subcanopy, occurring over a field stratum that is a mixture of coarse forbs, ferns and sedges. This community is thought to be limited to the range of *Picea rubens* and *Abies fraseri* (Whittaker 1956).

A3303 *Quercus rubra - Acer saccharum - Betula lenta* Forest Alliance

Alliance Summary Description: This alliance, found in the Allegheny, Lake Erie-Lake Ontario, and Lower New England regions south to the Central Appalachians, contains mesic forests dominated by *Quercus rubra* with a variety of mesic hardwoods, including *Acer rubrum, Acer saccharum, Betula lenta, Fagus grandifolia, Fraxinus americana, Quercus alba*, and *Tilia americana*. Typical shrubs include *Amelanchier* spp., *Hamamelis virginiana, Lindera benzoin*, and *Viburnum acerifolium*. Herbs include *Polystichum acrostichoides, Medeola virginiana*, and *Geranium maculatum*. These forests typically occur on deep, moist to well-drained loams and silt loams on north and east midslopes and coves.

[CEGL006046] *Acer saccharum - Quercus rubra / Hepatica nobilis var. obtusa* Forest

Translated Name: **Sugar Maple - Northern Red Oak / Round-lobe Liverleaf Forest**
Common Name: **Sugar Maple - Ash - Oak - Hickory Mesic Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Quercus rubra - Acer saccharum - Betula lenta* Forest Alliance (A3303)

ELEMENT CONCEPT

Global Summary: These are forests of well-drained to moist and often on very rocky slopes. *Fraxinus americana* and *Acer saccharum* are common in the tree canopy, with *Quercus rubra, Carya ovata, Carya glabra, Carya ovalis, Quercus velutina, Tilia americana, Betula lenta*, and *Quercus alba* as associates. *Tsuga canadensis* can be occasional. *Ostrya virginiana* and *Carpinus caroliniana* can form a prominent subcanopy. The shrub layer includes *Hamamelis virginiana, Viburnum acerifolium, Viburnum recognitum, Cornus florida, Corylus cornuta*, and *Lindera benzoin*. The herb layer is often quite diverse with *Carex platyphylla, Carex pedunculata, Carex blanda, Carex laxiflora, Actaea rubra, Polygonatum pubescens, Phegopteris hexagonoptera (= Thelypteris hexagonoptera), Viola rotundifolia, Thalictrum dioicum, Hepatica nobilis var. obtusa (= Hepatica americana), Thalictrum thalictroides (= Anemonella thalictroides), Festuca subverticillata, Actaea pachypoda, Viola sororia, Arabis* spp., *Packera obovata (= Senecio obovatus)*, and *Arisaema triphyllum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This sugar maple - oak forest occurs on rocky slopes. Sites are low flats or gentle to steep low and midslopes with mostly eastern, southern and northern aspects. Soils are dry-mesic to mesic rapidly to moderately well-drained silt loam, loam and sandy loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, bare soil, and/or downed wood. Evidence of disturbance includes trails and the presence of exotic plants.
Global Environment: These are forests of well-drained to moist and often on very rocky slopes.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This semi-rich, dry-mesic forest has some combination of *Quercus rubra, Acer saccharum*, and *Fraxinus americana* in the canopy, with *Carya glabra* and *Betula lenta* as canopy and subcanopy associates. *Tsuga canadensis* can be occasional. *Ostrya virginiana* and *Viburnum acerifolium* are characteristic in the understory. *Arisaema triphyllum, Polystichum acrostichoides, Eurybia divaricata*, and *Polygonatum biflorum* are common in a diverse herb layer.
Global Vegetation: *Fraxinus americana* and *Acer saccharum* are common in the tree canopy, with *Quercus rubra, Carya ovata, Carya glabra, Carya ovalis, Quercus velutina, Tilia americana, Betula lenta*, and *Quercus alba* as associates. *Tsuga canadensis* can be occasional. *Ostrya virginiana* and *Carpinus caroliniana* can form a prominent subcanopy. The shrub layer includes *Hamamelis virginiana, Viburnum acerifolium, Viburnum recognitum, Cornus florida, Corylus cornuta*, and *Lindera benzoin*. The herb layer is often quite diverse with *Carex platyphylla, Carex pedunculata, Carex blanda, Carex laxiflora, Actaea rubra, Polygonatum pubescens, Phegopteris hexagonoptera (= Thelypteris hexagonoptera), Viola rotundifolia, Thalictrum dioicum, Hepatica nobilis var. obtusa (= Hepatica americana), Thalictrum thalictroides (= Anemonella thalictroides), Festuca subverticillata, Actaea pachypoda, Viola sororia, Arabis* spp., *Packera obovata (= Senecio obovatus)*, and *Arisaema triphyllum*.

[CEGL006125] *Quercus rubra - Acer saccharum - Liriodendron tulipifera* Forest

Translated Name: **Northern Red Oak - Sugar Maple - Tuliptree Forest**
Common Name: **High Allegheny Rich Red Oak - Sugar Maple Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Quercus rubra - Acer saccharum - Betula lenta* Forest Alliance (A3303)

ELEMENT CONCEPT

Global Summary: This red oak - sugar maple community is found primarily in the Allegheny Plateau and Appalachian Mountains of the United States, as well as on the northern Piedmont north to the Hudson Valley, with possible extensions east and west of those areas. It is typically found in coves, on moist north- and east-facing slopes and on well-drained flats. Soils are slightly acidic and of intermediate fertility. The closed-canopy tree layer is dominated by a mixture of oaks, primarily *Quercus alba* and *Quercus rubra*, with other hardwoods including *Acer saccharum, Acer rubrum*, and *Liriodendron tulipifera*. *Carya ovata, Carya alba (= Carya tomentosa), Nyssa sylvatica*, and *Quercus velutina* are possible associates. *Carya* spp. may share dominance in some stands. Dominance by *Acer rubrum* or *Liriodendron* may indicate a past disturbance history. A wide variety of more mesic associates, such as *Betula alleghaniensis, Betula lenta, Fagus grandifolia, Fraxinus americana*, and *Tilia americana* could occur but are negligible in dominance. In addition to *Acer saccharum* reproduction, some understory species may include *Carpinus caroliniana, Cercis canadensis, Cornus florida*, and *Ostrya virginiana*. Shrub and vine species include *Amelanchier laevis, Amelanchier arborea, Cornus* spp., *Hamamelis virginiana, Lindera benzoin, Viburnum acerifolium, Viburnum recognitum*, and *Vitis riparia*. Ericaceous shrubs, such as *Kalmia latifolia, Vaccinium angustifolium* and *Vaccinium pallidum*, may also be present but are not abundant. The ground layer species are highly variable but include *Caulophyllum thalictroides, Ageratina altissima, Dennstaedtia punctilobula, Podophyllum peltatum, Maianthemum racemosum (= Smilacina racemosa), Medeola virginiana, Thelypteris noveboracensis, Dryopteris marginalis, Dryopteris intermedia, Actaea* spp., and *Uvularia sessilifolia*. Exotic species, including *Rosa multiflora* and *Alliaria petiolata*, may be present in the shrub and herb layers of disturbed stands.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This mesic red oak - sugar maple - tuliptree forest is typically found in coves, on moist north- and east-facing slopes and on well-drained flats, often covered by bouldery colluviums. It was sampled once in the Central Appalachian project area on a gentle north-facing midslope with moderately well-drained silt soil. The unvegetated surface is dominated by leaf litter with some downed wood, large rocks and bare soil. Evidence of disturbance includes past logging.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This red oak - sugar maple forest ranges from Massachusetts to Pennsylvania and the Central Appalachians. Elevations of sampled plots range from 230-309 m (755-1,014 feet). Sites are mesic somewhat steep to steep low and midslopes (rock outcrops) with mostly eastern and western aspects. Soils are poorly to well-drained sandy loam and loam. The unvegetated surface consists of various combinations leaf litter, exposed bedrock, large and small rocks, bare soil, and downed wood. Evidence of disturbance includes possible windthrow and the presence of exotic plants.

Global Environment: Throughout the range, stands are typically found in coves, on moist north- and east-facing slopes, and on well-drained flats. Soils are slightly acidic and of intermediate fertility (Anderson 1982, Reschke 1990, Fike 1999). In the Catoctin Mountains of Maryland, sites occupied by this community are often covered by bouldery colluvium weathered from metabasalt bedrock. Soils collected from these sites are strongly acidic (mean pH = 4.8) but have moderately high calcium and magnesium levels, typical of soils weathered from iron- and aluminum-rich mafic bedrock.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus rubra, Acer saccharum*, and *Liriodendron tulipifera* codominate the canopy. *Betula lenta* and *Acer rubrum* are common in the subcanopy. The sparse shrub layer includes *Hamamelis virginiana* and the short shrubs *Vaccinium pallidum* and *Vaccinium angustifolium*. *Dryopteris intermedia* is a common herb.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This deciduous forest is dominated by *Quercus rubra* and *Acer saccharum* with *Fagus grandifolia, Liriodendron tulipifera*, and/or *Fraxinus americana* common and abundant (usually >20% relative cover). *Hamamelis virginiana* and *Lindera benzoin* are common shrubs. Herbs are variable and often sparse. This community contains MA state-imperiled *Quercus muehlenbergii*.

Global Vegetation: Stands of this red oak - sugar maple forest contain a closed-canopy tree layer. *Acer saccharum, Liriodendron tulipifera, Quercus alba*, and *Quercus rubra* are the leading dominants. *Acer rubrum, Carya ovata, Carya alba (= Carya tomentosa), Nyssa sylvatica*, and *Quercus velutina* are associates on various sites. *Liriodendron tulipifera* dominance may indicate a past disturbance history, and *Carya* spp. may share dominance in some stands. A wide variety of more mesic associates, such as *Betula alleghaniensis, Betula lenta, Fagus grandifolia*, and *Fraxinus americana*, may occur but are negligible in dominance. In addition to *Acer saccharum* reproduction, understory species may include *Carpinus caroliniana, Cercis canadensis*, and *Ostrya virginiana*.

Shrub and vine species include *Amelanchier laevis, Amelanchier arborea, Cornus* spp., *Hamamelis virginiana, Lindera benzoin, Viburnum acerifolium, Viburnum recognitum*, and *Vitis riparia*. Ericaceous shrubs such as *Kalmia latifolia, Vaccinium angustifolium* and *Vaccinium pallidum* may also be present. The ground layer species are highly variable but include *Caulophyllum thalictroides, Dennstaedtia punctilobula, Podophyllum peltatum, Maianthemum racemosum (= Smilacina racemosa), Medeola virginiana, Thelypteris noveboracensis*, and *Uvularia sessilifolia*. At the southern end of the type's range in the Catoctin Mountains of Maryland, *Liriodendron tulipifera* and *Quercus rubra* are the leading overstory dominants, with *Acer saccharum* common in both the overstory and understory. Minor tree associates include *Fraxinus americana, Tilia americana, Quercus alba, Betula lenta, Fagus grandifolia*, and *Acer rubrum*. *Lindera benzoin* and *Hamamelis virginiana* are the most constant and abundant species in a rather open shrub layer. The most constant herbs in eight plot samples are *Arisaema triphyllum, Brachyelytrum erectum, Carex digitalis, Erythronium americanum, Eurybia divaricata (= Aster divaricatus), Galium triflorum, Pilea pumila, Polystichum acrostichoides, Thalictrum thalictroides, Uvularia sessilifolia, Viola pubescens*, and *Viola sororia*. Many other species occur at lower constancies.

Global Dynamics: Catoctin Mountain, Maryland, stands have been degraded by past clearing, cutting and more recent invasion by introduced species, including *Microstegium vimineum* and *Alliaria petiolata*.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Quercus muehlenbergii* (G5, MA state-imperiled); **Invasive/Exotic Plants**: *Berberis thunbergii* (High/Medium), *Epipactis helleborine* (Medium/Low), *Microstegium vimineum* (High/Medium), *Poa compressa* (High/Low), *Rhamnus cathartica* (High/Medium), *Rosa multiflora* (Medium/Low)

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (2-Oct-2006). This community is reported as a matrix or large-patch type in every ecoregion where it occurs. Despite covering large areas, high-quality stands are probably rare because of widespread historical impacts and ongoing susceptibility to exotics weeds.

Related Concepts

Global Similar Types:
- *Fagus grandifolia - Quercus alba - Quercus rubra* Forest (CEGL006377)
- *Quercus alba - Quercus rubra - Carya ovalis / Acer saccharum / Polystichum acrostichoides* Forest (CEGL007233) is a related type to the south and west.
- *Quercus alba - Quercus rubra - Quercus prinus - Acer saccharum / Lindera benzoin* Forest (CEGL002059)
- *Quercus prinus - Quercus (alba, coccinea) / Viburnum acerifolium - (Kalmia latifolia)* Forest (CEGL005023)
- *Quercus rubra - Acer saccharum - Tilia americana var. heterophylla - Aesculus flava - (Cladrastis kentukea)* Forest (CEGL007698)
- *Quercus rubra - Acer saccharum / Ostrya virginiana / Cardamine concatenata* Forest (CEGL008517) related vegetation occurring on calcareous substrates at low elevations in the Ridge and Valley province of Virginia and Maryland.
- *Quercus rubra - Tsuga canadensis - Liriodendron tulipifera / Hamamelis virginiana* Forest (CEGL006566)

Classification

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Occurs from Pennsylvania and north along the Appalachian Trail corridor.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Some examples in New York have *Acer rubrum* instead of *Acer saccharum*, and not all sites have *Lindera benzoin*.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: Dominant presettlement forest in New Jersey and New York.
Global Classification Comments: According to Anderson (1982) in Ohio, where this community is found in the southeastern unglaciated plateau region, it is differentiated from the oak-maple type, *Quercus alba - Quercus rubra - Quercus prinus - Acer saccharum / Lindera benzoin* Forest (CEGL002059), and the Appalachian oak forest type, *Quercus prinus - Quercus (alba, coccinea) / Viburnum acerifolium - (Kalmia latifolia)* Forest (CEGL005023), by the substantial presence (over 20% canopy or basal area) of *Liriodendron tulipifera* and insignificant amounts of *Fagus grandifolia* or other mesic tree species. This type concept may overlap considerably with that of the oak-maple type, *Quercus alba - Quercus rubra - Quercus prinus - Acer saccharum / Lindera benzoin* Forest (CEGL002059). Braun (1950, e.g., p. 140) reports stands similar to this type in the Shawnee Hills and Mammoth Cave area of Kentucky, as well as other Interior Low Plateau sites. In New York, this type is reported primarily from the southeastern part of the State (Reschke 1990). In the mid-Atlantic states, this type is differentiated from *Quercus (alba, rubra, velutina) - Carya* spp. / *Viburnum acerifolium* Forest (CEGL006336) by somewhat more mesic conditions, a higher non-oak canopy component, and the absence of *Quercus prinus*.

Element Distribution

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from southeastern New York and New Jersey to Pennsylvania, Maryland, West Virginia, and southeastern Ohio. It was sampled in Cumberland County, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Massachusetts (Sheffield-Egremont Town Line Natural Heritage Site) and New York (Black Mountain - Harriman State Park, Canada Hill/Curry Pond, Canopus Lake North and Canopus Lake South in Fahnestock State Park, West Mountain - Bear Mountain State Park).
Global Range: This red oak - sugar maple community is found primarily in the Allegheny Plateau and Appalachian Mountain regions of the United States, with possible extensions east and west of those areas, ranging from Massachusetts and New Jersey west to southeastern Ohio.

Alliance	*Quercus rubra - Acer saccharum - Betula lenta* Forest Alliance (A3303)

ELEMENT CONCEPT

Global Summary: This community type is currently known from the Ridge and Valley region of west-central and northwestern Virginia and adjacent Maryland, with a few outliers in the Piedmont of both states. It occupies submesic slopes with various aspects, broad crests, and occasionally high alluvial terraces at low and middle elevations. Elevation ranges from less than 300 to 1146 m (<1000-3760 feet). Middle slope positions are typical, but stands also occur on lower and upper slopes. This forest association occurs in small to large patches. *Acer saccharum, Quercus rubra*, and, to a lesser extent, *Carya* spp. are the dominant trees in closed-canopy stands. *Carya glabra* and *Carya ovata* are the two most frequent hickories, but *Carya cordiformis, Carya alba*, and *Carya ovalis* are also present in some stands. *Fraxinus americana, Liriodendron tulipifera, Quercus alba, Quercus prinus, Quercus velutina, Fagus grandifolia, Quercus muehlenbergii*, and *Tilia americana* each attain importance in a subset of stands. Understory layers contain substantial reproduction of *Acer saccharum* and moderate representation of the other major canopy species. The shrub layer is usually very open, with much of its cover contributed by tree saplings; *Ostrya virginiana* is the most constant and abundant small tree/shrub, while *Cornus florida, Cercis canadensis*, and *Hamamelis virginiana* are more locally important understory species. Herbaceous growth is usually not lush and frequently exhibits patch-dominance by one to a few species.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This rich oak-hickory forest occurs on midslopes at elevations from 300 to 1,146 m (<1,000-3,760 feet) on limestone, dolomite, and calcareous shales. It was sampled at five locations in the Central Appalachian project area. Sites are generally steep slopes with northerly aspects. Soils are well-drained clay loam. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes woolly hemlock adelgid infestation and the presence of exotic plant species.
Global Environment: The community occupies submesic slopes with various aspects, broad crests, and occasionally high alluvial terraces at low and middle elevations. Elevation ranges from less than 300 to 1146 m (<1000-3760 feet). Middle slope positions are typical, but stands also occur on lower and upper slopes. Habitats

only occasionally have substantial surface cover of bedrock or stones; at most sites, leaf litter is the predominant surface substrate. Soil moisture regime is intermediate between that of mesic cove forests and that of subxeric forests and woodlands of rocky, calcareous slopes. Soil samples collected from plots are friable, light to dark brown silt loams or clay loams that are strongly to moderately acidic (mean pH = 5.0) but have moderately high calcium values (mean about 1200 ppm). Parent geologic material of Ridge and Valley sites includes limestone, dolomite, interbedded limestone and sandstone, calcareous shales and calcareous sandstone. Piedmont sites occur on calcareous Triassic siltstones and interbedded metasedimentary and intrusive mafic rocks of the Potomac River valley.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by *Acer saccharum, Quercus rubra*, and, *Carya* spp. in variable combinations. *Fraxinus americana* may be important and *Liriodendron tulipifera* may be common in disturbed stands. The understory layers contain substantial reproduction of *Acer saccharum* and *Acer rubrum*. *Quercus muehlenbergii* can occur as a minor associate in stands on limestone or dolomite. *Ostrya virginiana* is the most constant and abundant small tree/shrub, with *Cornus florida, Cercis canadensis*, and/or *Hamamelis virginiana* also common. Herbs are patchy and can include *Ageratina altissima, Carex* spp., *Eurybia divaricata, Packera obovata, Hepatica nobilis var. obtusa, Carex platyphylla, Symphyotrichum cordifolium, Carex laxiflora var. laxiflora, Asplenium platyneuron, Galium circaezans, Carex digitalis*, and others.

Global Vegetation: This forest association occurs in small to large patches. *Acer saccharum, Quercus rubra*, and, to a lesser extent, *Carya* spp. are the dominant trees in closed-canopy stands. *Carya glabra* and *Carya ovata* are the two most frequent hickories, but *Carya cordiformis, Carya alba*, and *Carya ovalis* are also present in some stands. *Fraxinus americana, Liriodendron tulipifera, Quercus alba, Quercus prinus, Quercus velutina, Fagus grandifolia*, and *Tilia americana* each attain importance in a subset of stands. Understory layers contain substantial reproduction of *Acer saccharum* and moderate representation of the other major canopy species. The shrub layer is usually very open, with much of its cover contributed by tree saplings; *Ostrya virginiana* is the most constant and abundant small tree/shrub, while *Cornus florida, Cercis canadensis*, and *Hamamelis virginiana* are more locally important understory species. Herbaceous growth is usually not lush and frequently exhibits patch-dominance by one to a few species. The most constant and/or abundant herbs in the type's principal Ridge and Valley range are *Ageratina altissima, Amphicarpaea bracteata, Arabis laevigata, Bromus pubescens, Cardamine concatenata, Carex digitalis, Carex platyphylla, Claytonia virginica, Eurybia divaricata (= Aster divaricatus), Festuca subverticillata, Polystichum acrostichoides*, and *Solidago caesia*. Species richness in 42 plot-sampled stands ranges from 17 to 84 taxa per 400 square meters (mean = 50).

Global Dynamics: At some sites, this community type appears to result from the invasion of fire-suppressed oak-hickory stands by *Acer saccharum*.

Global: *Acer saccharum*, *Ageratina altissima*, *Bromus pubescens*, *Carex digitalis*, *Carex hirtifolia*, *Carya ovata*, *Muhlenbergia tenuiflora*, *Polystichum acrostichoides*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Lithospermum latifolium* (G4, VA state-rare)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (2-Oct-2006). This community type is suspected of being widespread in the Central Appalachians and possibly Kentucky and Tennessee, but additional data analysis is needed to sort out relationships between reported types that are similar. The type appears to be fairly common and secure in west-central and northwestern Virginia and adjacent Maryland.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba - Quercus rubra - Carya ovalis / Acer saccharum / Polystichum acrostichoides* Forest (CEGL007233)
- *Quercus rubra - Acer saccharum - Liriodendron tulipifera* Forest (CEGL006125) has a more northern distribution, usually on non-calcareous soils of intermediate fertility.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: In Virginia, this type is strictly in the Ridge and Valley, occurring at low to middle elevations on limestone, dolomite, and calcareous shales. It does not occur on the metamorphic rocks of the Blue Ridge. Due to the fact that the AT largely follows the Blue Ridge, you will not encounter this type except in the Ridge and Valley divergence area between I-81 and Roanoke, and through most of that stretch, it is very uncommon. This type (CEGL008517) and Central Appalachian Montane Oak - Hickory Forest (Basic Type) (CEGL008518) have some compositional similarities but are pretty well separated by geological substrates and elevation in the areas where their ranges overlap.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: This community type has some affinities to *Quercus rubra - Acer saccharum - Liriodendron tulipifera* Forest (CEGL006125) that is centered in the high Allegheny Mountains and lower New England regions to the north, but it is typically associated with more calcareous soils and differs considerably in floristic composition. *Liriodendron tulipifera* is inconstant (52% constancy) in plot-sampled Central Appalachian stands of this association (CEGL008517) and entirely absent from stands above about 975 m (3200 feet). In two Virginia plots, there is evidence (in the form of numerous large, rotting boles) that *Castanea dentata* (American chestnut) was formerly dominant or codominant and that this type has developed as a residual type following chestnut blight. The Middle Mountain (Highland County) stand is especially important because the site evidently escaped logging and contains an essentially complete record of successional change since the demise of *Castanea dentata*.

Similar oak - hickory - sugar maple vegetation is reported by Andreu and Tukman (1995) and Bryant (1981) from Tennessee and Kentucky. In the old-growth forests of the Kentucky Eden Shale Belt, young *Acer saccharum* reproduction was abundant in all stands, while oak and hickory reproduction was scarce, suggesting that a reduction of wildfire frequencies was contributing to successional replacement of oak-hickory forests by *Acer saccharum* (Bryant 1981). The resemblance of these forests to some aspects of the Central Appalachian type is striking, but comparable quantitative data on environmental factors and total floristic composition are needed to sort out ecologically meaningful units from across a considerable geographic range.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs strictly in the Ridge and Valley in the Virginia and Maryland portions of the Central Appalachians. It was sampled in Virginia at Trout Creek West, Route 624 East, Rich Valley, Kimberling Creek, and Catawba Mountain.
Global Range: This community type is currently known from the Ridge and Valley region of west-central and northwestern Virginia and adjacent Maryland, with a few outliers in the Piedmont of both states. The type may be more widespread than documentation indicates. Within the known range, it appears to be widely but somewhat locally distributed on fertile Ridge and Valley substrates and very locally on calcium-enriched substrates of the Piedmont Plateau. Similar vegetation has been observed in the Cumberland Mountains of southwestern Virginia, but its disposition is uncertain.

References: Andreu and Tukman 1995, Bryant 1981, Eyre 1980, Fleming 1999, Fleming and Coulling 2001, Fleming and Coulling 2001*, Fleming and Moorhead 1996, Fleming and Moorhead 2000, Fleming and Patterson 2009a, Fleming and Patterson 2009b, Fleming and Patterson 2011a, Fleming and Taverna 2006, Fleming et al. 2001, Fleming et al. 2004, Fleming et al. 2007b, Harrison 2004, Rawinski et al. 1994

[CEGL006635] *Quercus rubra - Acer saccharum / Viburnum acerifolium - Lindera benzoin* Forest

Translated Name: **Northern Red Oak - Sugar Maple / Mapleleaf Viburnum - Northern Spicebush Forest**
Common Name: **Red Oak - Transitional Northern Hardwood Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Quercus rubra - Acer saccharum - Betula lenta* Forest Alliance (A3303)

ELEMENT CONCEPT

Global Summary: These mesic forests of oak and northern hardwoods, sometimes mixed with hemlock or pine, are distributed across the Allegheny Plateau, Lake Ontario and Lake Erie plains and Lower New England regions of the northeastern United States. They occur on slightly acidic, well-drained loamy and often rocky soils of intermediate fertility, most often positioned on midslopes and coves. Soil depth is often shallow, but some stands occur on deep tills. Most are at low to mid elevations, usually under 520 m (1700 feet), but they may range up to 765 m (2500 feet). The deciduous-to-mixed canopy is mostly closed, and the lower layers are variable in extent. Tall shrubs are well-represented, although scattered, with occasional denser patches. Herbs are sparse and bryoids are nearly absent. Ericads and other dwarf-shrubs are also nearly absent, a characteristic that distinguishes this association from most other red oak forests in the Northeast. Canopy composition is a variable mixture of *Quercus rubra* (usually at least 30% of the canopy), *Fagus grandifolia, Acer saccharum, Acer rubrum*, and in some stands *Pinus strobus* or *Tsuga canadensis*. Conifers generally make up less than 20% of the canopy cover, and even in mixed stands the cover of deciduous trees exceeds that of conifers. Minor canopy associates include *Fraxinus americana, Tilia americana, Betula lenta, Juglans cinerea*, and *Ulmus americana*. *Acer pensylvanicum* is common as a small tree; in the central and southern portions of the distribution, *Cornus florida* and *Prunus serotina* are common small trees as well. *Corylus cornuta, Viburnum acerifolium*, and *Hamamelis virginiana* are typical shrubs, with *Kalmia latifolia* and *Lindera benzoin* occasional in all but the northern portions of the range. Typical species in the herb layer include *Gaultheria procumbens, Maianthemum canadense, Aralia nudicaulis, Trientalis borealis, Uvularia sessilifolia, Medeola virginiana, Brachyelytrum erectum, Dryopteris intermedia, Polystichum acrostichoides, Dennstaedtia punctilobula, Pteridium aquilinum*, and *Thelypteris noveboracensis*. On more nutrient-rich soils, the herb layer may contain *Solidago caesia, Caulophyllum thalictroides, Dryopteris marginalis*, and *Eurybia divaricata (= Aster divaricatus)*. This association is distinguished from other transitional northern hardwood forests by its greater amount of oak, from other oak forests by its greater prominence of northern hardwoods and lack of dwarf-shrub ericads, and from hemlock-hardwoods by the relatively low importance of hemlock.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This red oak - northern hardwood forest occurs on sideslopes at low to mid elevations, usually under 600 m (1,970 feet) but can range up to 750 m (2,460 feet). Sites are generally moderate to steep mid and upper slopes (sideslopes) with mostly northern and eastern aspects. Soils are dry-mesic to mesic, moderately well- to well-drained sandy loam, silt loam and loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, bare soil,

and/or downed wood. Bryophytes are common. Evidence of disturbance includes trails and old roads, possible past clearing, deer browse, wind/ice damage, and the presence of exotic plants.
Global Environment: These forests occur on slightly acidic, well-drained loamy and often rocky soils of intermediate fertility, most often positioned on midslopes and coves. Soil depth is often shallow, but some occur on deep tills. Stands often occur at low to mid elevations, usually under 520 m (1700 feet), but in the southern portion of their distribution they may range up to 760 m (2500 feet).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Canopy composition is a variable mixture of *Quercus rubra* (usually at least 30% of the canopy), *Fagus grandifolia, Acer saccharum, Acer rubrum*, and in some stands *Pinus strobus* or *Tsuga canadensis* (conifers generally make up less than 20% of the canopy cover); *Picea rubens* may occur sporadically at the northern extent, and *Nyssa sylvatica* may occur to the south. *Fraxinus americana* and/or *Betula alleghaniensis* are canopy associates. *Acer pensylvanicum* and *Viburnum acerifolium* are common shrubs. *Aralia nudicaulis, Dennstaedtia punctilobula, Athyrium filix-femina*, and *Polystichum acrostichoides* are common herbs. In addition, this community supports CT state-imperiled *Panax quinquefolius*, MA state-imperiled *Solidago macrophylla*, and VT state-imperiled *Conopholis americana*.
Global Vegetation: The deciduous-to-mixed canopy is mostly closed, and the lower layers are variable in extent. Tall shrubs are well represented, although scattered, with occasional denser patches. Herbs are sparse, and bryoids are nearly absent. Ericads and other dwarf-shrubs are also nearly absent, a characteristic that distinguishes this association from most other red oak forests in the Northeast. Canopy composition is a variable mixture of *Quercus rubra* (usually at least 30% of the canopy), *Fagus grandifolia, Acer saccharum, Acer rubrum*, and, in some stands, *Pinus strobus* or *Tsuga canadensis*. In mixed stands, the cover of deciduous trees exceeds that of conifers. Minor canopy associates include *Fraxinus americana, Tilia americana, Betula lenta, Juglans cinerea*, and *Ulmus americana*. *Acer pensylvanicum* is common as a small tree; in the central and southern portions of the distribution, *Cornus florida* and *Prunus serotina* are common small trees as well. *Corylus cornuta, Viburnum acerifolium*, and *Hamamelis virginiana* are typical shrubs, with *Kalmia latifolia* and *Lindera benzoin* occasional in all but the northern portions of the range. Typical species in the herb layer include *Gaultheria procumbens, Maianthemum canadense, Aralia nudicaulis, Trientalis borealis, Uvularia sessilifolia, Medeola virginiana, Brachyelytrum erectum, Dryopteris intermedia, Polystichum acrostichoides, Dennstaedtia punctilobula, Pteridium aquilinum*, and *Thelypteris noveboracensis*. On more nutrient-rich soils, the herb layer may contain *Solidago caesia, Caulophyllum thalictroides*, and *Eurybia divaricata (= Aster divaricatus)*.

Herb (field)	Flowering forb	*Aralia nudicaulis*, *Trientalis borealis*
Herb (field)	Fern (Spore-bearing forb)	*Dennstaedtia punctilobula*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): *Acer rubrum*, *Acer saccharum*, *Aralia nudicaulis*, *Dryopteris intermedia*, *Fagus grandifolia*, *Maianthemum canadense*, *Polystichum acrostichoides*, *Quercus rubra*
Global: *Acer pensylvanicum*, *Acer rubrum*, *Aralia nudicaulis*, *Cornus florida*, *Corylus cornuta*, *Dennstaedtia punctilobula*, *Hamamelis virginiana*, *Polystichum acrostichoides*, *Prunus serotina*, *Pteridium aquilinum*, *Quercus rubra*, *Trientalis borealis*, *Viburnum acerifolium*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Conopholis americana* (G5, VT state-imperiled), *Panax quinquefolius* (G3G4, CT state-imperiled), *Solidago macrophylla* (G5, MA state-imperiled); **Invasive/Exotic Plants**: *Berberis thunbergii* (High/Medium), *Epipactis helleborine* (Medium/Low), *Galeopsis tetrahit*, *Poa compressa* (High/Low)
Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (2-Dec-2014). This association is well-distributed, but patchy throughout its range.

RELATED CONCEPTS

Global Similar Types:
- *Acer saccharum - Betula alleghaniensis - Quercus rubra / Viburnum acerifolium* Forest (CEGL006943)
- *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632)
- *Acer saccharum - Pinus strobus / Acer pensylvanicum* Forest (CEGL005005)
- *Pinus strobus - Quercus (rubra, velutina) - Fagus grandifolia* Forest (CEGL006293)
- *Quercus rubra - Acer rubrum - Betula* spp. *- Pinus strobus* Ruderal Forest (CEGL006506)
- *Quercus rubra - Acer saccharum - (Betula alleghaniensis)* Forest (CEGL002461)
- *Quercus rubra - Acer saccharum - Fagus grandifolia / Viburnum acerifolium* Forest (CEGL006633)
- *Quercus rubra - Acer saccharum - Tilia americana var. heterophylla - Aesculus flava - (Cladrastis kentukea)* Forest (CEGL007698)
- *Quercus rubra - Quercus alba - (Quercus velutina, Acer rubrum) / Viburnum acerifolium* Forest (CEGL002462)
- *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest (CEGL006088)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community contains small seepage areas along small stream channels that cannot be mapped separately from the matrix forest community.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: *Acer saccharum* is not found reliably in the canopy of some of the Massachusetts sites. *Picea rubens* is common in the canopy and subcanopy of some of the Massachusetts sites. Some New York examples have very few herbs and shrubs, most likely due to deer browse. Pockets of hemlock are present in the understory at Mosley Hill in Windsor County, Vermont.
Global Classification Comments: This type was formerly included in CEGL006173. It was separated from *Quercus rubra - Acer saccharum - Fagus grandifolia / Viburnum acerifolium* Forest (CEGL006633) to more clearly distinguish the Allegheny Plateau and Lower New England characteristics from the Northern Appalachian region stands.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (Hatch Brook), Massachusetts (Beartown State Forest, Greylock South, Mt. Prospect), New Jersey (Unionville West), New York (Fort Defiance Hill, West Mountain - Bear Mountain State Park), and Vermont (Dana Hill, Middle Pinnacle, Moseley Hill, Spring Lake-Shrewsbury).
Global Range: This association occurs in the Allegheny Plateau, Lake Ontario and Lake Erie plains and Lower New England regions and south to New Jersey.
Nations: CA, US

[CEGL006000] *Quercus rubra - Betula alleghaniensis / Osmunda cinnamomea* Forest

Translated Name: **Northern Red Oak - Yellow Birch / Cinnamon Fern Forest**
Common Name: **Upland/Wetland Transitional Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Quercus rubra - Acer saccharum - Betula lenta* Forest Alliance (A3303)

ELEMENT CONCEPT

Global Summary: This lower slope, wetland transitional forest of southern New England to New Jersey generally occurs immediately upslope from seasonally flooded acidic swamps or small drainages. It occurs on somewhat poorly drained mineral soils, with a soil moisture regime of moist to somewhat wet. The tree canopy is nearly closed, with tree height reflecting moisture availability. Dominant species include *Acer rubrum, Betula alleghaniensis, Quercus rubra*, and *Quercus velutina*. Occasionally *Quercus alba, Quercus palustris, Fagus grandifolia*, and *Tsuga canadensis* may occur. The shrub layer includes *Hamamelis virginiana, Vaccinium corymbosum, Clethra alnifolia, Kalmia latifolia*, and *Lindera benzoin*. The herbaceous layer is nearly continuous and dominated by *Osmunda cinnamomea, Thelypteris noveboracensis, Arisaema triphyllum*, and *Uvularia sessilifolia*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This transitional upland / wetland hardwood forest occurs in basin settings. It was sampled at two locations within the Appalachian Trail corridor in the Lower New England project area. One site is a gently sloping saturated channel bed with somewhat poorly drained loam soil. The other site is a large bottomland swamp with hummocks with poorly drained soil. The unvegetated surface is mix of leaf litter, large rocks, downed wood, bare soil, and/or standing water. Evidence of disturbance includes the presence of exotic plants.
Global Environment: This vegetation occurs on lower slopes, generally adjacent to wetlands. Mineral soils are somewhat poorly drained and moist to somewhat wet sandy loams. The substrate is often rocky.

VEGETATION DESCRIPTION

Global Vegetation: The tree canopy is nearly closed, with tree height reflecting moisture availability. Dominant species include *Acer rubrum, Betula alleghaniensis, Quercus rubra*, and *Quercus velutina*. Occasionally *Quercus alba, Quercus palustris, Fagus grandifolia*, and *Tsuga canadensis* may occur. *Liriodendron tulipifera* is a common associate in the southern portion of the range. The shrub layer includes *Hamamelis virginiana, Vaccinium corymbosum, Clethra alnifolia, Kalmia latifolia*, and *Lindera benzoin*. The herbaceous layer is nearly continuous and dominated by *Osmunda cinnamomea, Thelypteris noveboracensis, Arisaema triphyllum*, and *Uvularia sessilifolia*. *Impatiens capensis, Veratrum viride*, and *Symplocarpus foetidus* may also occur where this vegetation grades into a wetland forest.

MOST ABUNDANT SPECIES

Translated Name: **Northern Red Oak - Eastern Hemlock - Tuliptree / American Witch-hazel Forest**
Common Name: **Red Oak - Hemlock - Mixed Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Quercus rubra - Acer saccharum - Betula lenta* Forest Alliance (A3303)

Element Concept

Global Summary: This closed-canopy, dry-mesic deciduous forest occurs on deep, moist to well-drained loams and silt loams on northern and eastern midslopes and coves. The canopy is dominated by a variety of oaks, hickories and conifers, including *Quercus rubra, Acer saccharum, Fagus grandifolia, Quercus alba, Quercus velutina, Betula lenta, Carya alba (= Carya tomentosa), Fraxinus americana*, and *Liriodendron tulipifera*, with notable presence of *Tsuga canadensis* and/or *Pinus strobus*. The subcanopy and shrub layer consists of *Ostrya virginiana, Carpinus caroliniana, Kalmia latifolia, Hamamelis virginiana, Vaccinium pallidum, Amelanchier laevis, Lindera benzoin, Viburnum acerifolium*, and *Viburnum recognitum*. The herbaceous layer is characterized by *Maianthemum racemosum (= Smilacina racemosa), Gaultheria procumbens, Mitchella repens, Chimaphila maculata, Thelypteris noveboracensis, Dennstaedtia punctilobula, Maianthemum canadense*, and *Podophyllum peltatum*.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mixed hemlock - hardwood forest occurs on northern and eastern midslopes and in coves. Sampled sites range from 384-797 m (1,261-2,614 feet) elevation. Sampled sites are a somewhat xeric ravine with clay loam soil and a gently sloping, north-facing flat with well-drained sandy loam soil. The unvegetated surface is a variable mix of leaf litter, exposed bedrock, large rocks, and downed wood. Evidence of disturbance include erosion, grazing/browsing, wind/ice damage, chestnut blight, woolly hemlock adelgid, and the presence of exotic plant species.
Global Environment: This vegetation occurs on deep, moist to well-drained loams and silt loams on northern and eastern midslopes and coves. Soils may be rocky, and slopes may be steep.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Liriodendron tulipifera* forms the canopy along with *Quercus rubra, Tsuga canadensis, Betula lenta, Betula alleghaniensis, Fagus grandifolia*, and/or *Pinus strobus*. *Hamamelis virginiana* is the dominant shrub. *Thelypteris noveboracensis* is the dominant herb in the sparse ground layer.
Global Vegetation: The canopy has a notable presence of *Tsuga canadensis* and/or *Pinus strobus*. Sharing dominance with these conifers is a variety of oaks and hickories including *Quercus rubra, Acer saccharum, Fagus grandifolia, Quercus alba, Quercus velutina, Betula lenta, Carya alba (= Carya tomentosa), Fraxinus americana, Liriodendron tulipifera*. The subcanopy and shrub layer consists of *Ostrya virginiana, Carpinus caroliniana, Kalmia latifolia, Hamamelis virginiana, Amelanchier laevis, Lindera benzoin, Viburnum acerifolium*, and *Viburnum recognitum*. The herbaceous layer is characterized by *Maianthemum racemosum (= Smilacina racemosa), Gaultheria procumbens, Maianthemum canadense*, and *Podophyllum peltatum*.

A3302 *Tsuga canadensis - Betula lenta - Betula alleghaniensis* Forest Alliance

Alliance Summary Description: This mixed conifer-hardwood forested alliance is dominated by *Tsuga canadensis*, alone or in combination with *Pinus strobus*, and a variety of mesic hardwoods such as *Acer rubrum, Acer saccharum*, and *Fagus grandifolia*. Other common and sometimes dominant trees include *Betula alleghaniensis, Betula lenta, Liriodendron tulipifera, Prunus serotina*, and *Quercus* spp. (most commonly *Quercus rubra*). It occurs in the northeastern U.S., ranging from central New England west to the Lake Erie-Lake Ontario ecoregion in Ontario and south to the higher elevations of Virginia and West Virginia. Stands are often found in ravines or low cool sites, on a variety of primarily mesic soils.

[CEGL006019] *Pinus strobus - Tsuga canadensis / Acer pensylvanicum / Polystichum acrostichoides* Forest

Translated Name: **Eastern White Pine - Eastern Hemlock / Striped Maple / Christmas Fern Forest**
Common Name: **Central Appalachian White Pine - Eastern Hemlock Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Tsuga canadensis - Betula lenta - Betula alleghaniensis* Forest Alliance (A3302)

Element Concept

Global Summary: This dry-mesic white pine - hemlock forest of the northern central Appalachian Mountains and High Allegheny Plateau occurs on well-drained, nutrient-poor acidic soils. The vegetation is a closed-canopy conifer forest dominated by *Pinus strobus* and/or *Tsuga canadensis*. Canopy associates include *Fagus grandifolia, Acer rubrum, Betula lenta, Betula alleghaniensis, Quercus rubra*, and *Liriodendron tulipifera*. The sparse shrub layer contains *Acer spicatum, Hamamelis virginiana, Acer pensylvanicum*, and *Viburnum acerifolium*. *Rhododendron maximum* also occurs in this association in northern Pennsylvania. The sparse herb layer includes *Cypripedium acaule, Gaultheria procumbens, Lycopodium* spp., *Maianthemum canadense, Trientalis borealis, Mitchella repens, Medeola virginiana*, and *Polystichum acrostichoides*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This matrix white pine - hemlock forest of the northern part of the Central Appalachians occurs on mid to upper slopes with infertile, sandy soils. It was sampled once in the park in Cumberland County, Pennsylvania, on a somewhat steep, northwest-facing midslope. Soil is well-drained silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Evidence of disturbance includes past logging.
Global Environment: This vegetation type is reported to occur on dry-mesic sites (e.g., middle slopes) with infertile, sandy soils.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is codominated by *Pinus strobus* and *Tsuga canadensis* with scattered *Liriodendron tulipifera*. Canopy associates include *Prunus serotina, Nyssa sylvatica*, and *Quercus prinus*. *Pinus strobus* and *Tsuga canadensis* are common in the subcanopy and shrub layers. *Mitchella repens* and *Dryopteris intermedia* are typical herbs.
Global Vegetation: This is a closed-canopy, largely coniferous forest dominated by *Pinus strobus* and *Tsuga canadensis* in variable proportions. Canopy associates include *Fagus grandifolia, Acer rubrum, Betula lenta, Betula alleghaniensis, Quercus rubra*, and *Liriodendron tulipifera*. The often sparse shrub layer contains *Acer pensylvanicum, Acer spicatum, Hamamelis virginiana*, and *Viburnum acerifolium*. Herb cover is usually limited by deep shade but includes *Cypripedium acaule, Gaultheria procumbens, Lycopodium* spp., *Maianthemum canadense, Mitchella repens, Polystichum acrostichoides*, and *Trientalis borealis*.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area)

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Dryopteris intermedia*, *Mitchella repens*, *Pinus strobus*, *Tsuga canadensis*
Global: *Carex amphibola*, *Fagus grandifolia*, *Lycopodium digitatum*, *Mitchella repens*, *Oxydendrum arboreum*, *Pinus strobus*, *Polystichum acrostichoides*, *Pyrola americana*, *Triphora trianthophora*, *Tsuga canadensis*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Triphora trianthophora* (G3G4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (1-Feb-2008). This is a somewhat geographically restricted type that is apparently uncommon but not rare.

RELATED CONCEPTS

Global Similar Types:

- *Liriodendron tulipifera - Pinus strobus - Tsuga canadensis - Quercus rubra / Polystichum acrostichoides* Forest (CEGL006304)
- *Pinus strobus - Tsuga canadensis / Rhododendron maximum - (Leucothoe fontanesiana)* Forest (CEGL007102)
- *Pinus strobus - Tsuga canadensis* Lower New England-Northern Piedmont Forest (CEGL006328)
- *Tsuga canadensis - Liriodendron tulipifera - Platanus occidentalis / Rhododendron maximum - Xanthorhiza simplicissima* Wet Forest (CEGL007143)

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Classification confidence is high given the amount of *Pinus strobus* and *Tsuga canadensis* in the canopy and subcanopy. Hemlock woolly adelgid-induced hemlock mortality is a primary disturbance within this community.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: The compositional and environmental factors that differentiate these community types need further scrutiny. Additional inventory and data collection is needed for further evaluation of this vegetation type's distribution and characterization.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is restricted to the northern part of the Central Appalachians in Pennsylvania where it was sampled in Cumberland County.
Global Range: The range of this community is restricted to the northern part of the Central Appalachians in Pennsylvania, and possibly the High Allegheny Plateau in Pennsylvania and New York. It is also reported as possibly occurring in ravines along the Susquehanna River in the Pennsylvania Piedmont (Lancaster County) (G. Podniesinski pers. comm.).

Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Tsuga canadensis - Betula lenta - Betula alleghaniensis* Forest Alliance (A3302)

ELEMENT CONCEPT

Global Summary: This dry-mesic coniferous forest of usually sloping (moderately to steeply) sites is dominated by *Pinus strobus* and/or *Tsuga canadensis*. It can occur in somewhat sheltered ravines where *Tsuga canadensis* is nearly monotypic in all layers. Other frequent tree species depend on geography and can include *Betula papyrifera, Quercus rubra*, and *Acer rubrum*, with *Pinus rigida, Prunus serotina, Quercus velutina, Carya alba, Betula lenta, Acer saccharum, Fraxinus americana, Betula alleghaniensis*, and *Betula populifolia* occurring less frequently. Although frequent, deciduous tree species generally occur with low abundance. Canopy cover is typically 80-90%. The subcanopy is often sparse but may extend up to 40% cover. *Acer pensylvanicum* is a common, though rarely abundant, small tree. Shrubs are absent or sparse but when present may include *Hamamelis virginiana, Kalmia latifolia, Rhododendron maximum, Vaccinium angustifolium*, and *Viburnum acerifolium*. The herbaceous layer is generally not well-developed nor diverse and is generally characterized by *Gaultheria procumbens, Medeola virginiana, Polystichum acrostichoides*, and *Thelypteris noveboracensis*. Other herbaceous associates often include *Aralia nudicaulis, Uvularia sessilifolia, Mitchella repens, Trientalis borealis, Monotropa uniflora, Dryopteris intermedia, Dryopteris marginalis, Dryopteris carthusiana, Polypodium virginianum*, and *Maianthemum canadense*. *Deschampsia flexuosa* and other grasses may be present in small openings and gaps. Nonvascular plants tend to be sparse but can include *Leucobryum albidum* and *Polytrichum* and *Dicranum* species. Soils are moderately to extremely well-drained (dry-mesic to mesic) loamy sands and sandy loams, often sandy, stony or bouldery. The major natural disturbance in this forest type is generally single-tree blowdowns.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hemlock - pine forest occurs on sloping sites and in sheltered ravines from Pennsylvania and New Jersey north to Maine. Sites range from gentle to steep mid and upper slopes. Soils are well-drained sandy loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, and/or downed wood. No evidence of disturbance was reported.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association is only known from one location in New Hampshire at 350 m (1,150 feet) in elevation on a moderate high slope on a west aspect. The soil is sandy loam.
Global Environment: This dry-mesic coniferous forest is usually found on sloping (moderately to steeply) sites or in sheltered ravines. Soils are moderately to extremely well-drained (dry-mesic to mesic), loamy sands and sandy loams, often sandy, stony, or bouldery.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Tsuga canadensis* is dominant in the canopy with abundant or codominant *Pinus strobus* (often emergent); *Acer rubrum* and *Quercus rubra* are common associates. *Acer pensylvanicum* is a common, though rarely abundant small tree. *Picea rubens* is

absent to minor. *Kalmia latifolia* is a common shrub. Herbs are very sparse but include *Arisaema triphyllum, Eurybia divaricata*, and *Polygonatum pubescens*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only occurrence of this association is a closed-canopy evergreen forest dominated by *Pinus strobus* with *Tsuga canadensis* having about half the cover of the former. The understory is sparse with only trace amounts of *Polypodium virginianum, Pteridium aquilinum*, and *Vaccinium angustifolium*.

Global Vegetation: This coniferous forest type is dominated by *Pinus strobus* and/or *Tsuga canadensis*. Other frequent tree species depend on geography and can include *Betula papyrifera, Quercus rubra*, and *Acer rubrum*, with *Pinus rigida, Prunus serotina, Quercus velutina, Carya alba, Betula lenta, Acer saccharum, Fraxinus americana, Betula alleghaniensis*, and *Betula populifolia* occurring less frequently. Although frequent, deciduous tree species generally occur with low abundance. Canopy cover is typically 80-90%. The subcanopy is often sparse but may extend up to 40% cover. *Acer pensylvanicum* is a common, though rarely abundant, small tree. Shrubs are absent or sparse but when present may include *Hamamelis virginiana, Kalmia latifolia, Rhododendron maximum, Vaccinium angustifolium*, and *Viburnum acerifolium*. The herbaceous layer is generally not well-developed nor diverse and is generally characterized by *Gaultheria procumbens, Medeola virginiana, Polystichum acrostichoides*, and *Thelypteris noveboracensis*. Other herbaceous associates often include *Aralia nudicaulis, Uvularia sessilifolia, Mitchella repens, Trientalis borealis, Monotropa uniflora, Dryopteris intermedia, Dryopteris marginalis, Dryopteris carthusiana, Polypodium virginianum*, and *Maianthemum canadense*. *Deschampsia flexuosa* and other grasses may be present in small openings and gaps. Nonvascular plants tend to be sparse but can include *Leucobryum albidum* and *Polytrichum* and *Dicranum* species.

Global Dynamics: The major natural disturbance in this forest type is generally single-tree blowdowns. Fire is not a particularly important feature of this forest type.

[CEGL006639] *Tsuga canadensis - Acer saccharum - Fagus grandifolia / Dryopteris intermedia* Forest

Translated Name: **Eastern Hemlock - Sugar Maple - American Beech / Intermediate Woodfern Forest**
Common Name: **Hemlock - Transitional Northern Hardwood Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Tsuga canadensis - Betula lenta - Betula alleghaniensis* Forest Alliance (A3302)

ELEMENT CONCEPT

Global Summary: This association comprises hemlock - northern hardwood forests of the Allegheny Plateau, Lake Ontario and Lake Erie plains, Lower New England, and south to higher elevations of the Central Appalachian region. This forest is associated with cool, dry-mesic to mesic sites and acidic soils, often on rocky, north-facing

slopes. Soils can have a thick, poorly decomposed duff layer over sandy loams. *Tsuga canadensis* is characteristic and usually dominant in the coniferous to mixed canopy. While hemlock generally forms at least 50% of the canopy, in some cases it may be as low as 25% relative dominance. Hardwood codominants include *Acer saccharum* and *Fagus grandifolia* (common), *Betula alleghaniensis* (uncommon), and *Betula lenta*, which may replace *Betula alleghaniensis* in some areas. *Ostrya virginiana* may be present as a small tree. *Quercus* spp. and *Pinus strobus* tend to be absent or, if present, only occur with low abundance. The shrub layer may be dense to fairly open and often includes *Viburnum acerifolium* and *Acer pensylvanicum* in addition to *Tsuga canadensis* regeneration. Herbs may be sparse, particularly in dense shade, but include *Dryopteris intermedia, Medeola virginiana, Oxalis montana, Mitchella repens, Maianthemum canadense, Uvularia sessilifolia, Polystichum acrostichoides, Trientalis borealis, Huperzia lucidula (= Lycopodium lucidulum), Eurybia divaricata (= Aster divaricatus), Oclemena acuminata (= Aster acuminatus), Dennstaedtia punctilobula*, and *Thelypteris noveboracensis*. Nonvascular plants may be well-developed, often characterized by the liverwort *Bazzania trilobata*. Diagnostic characteristics of this forest are the dominance of *Tsuga canadensis*, presence of *Acer saccharum* and *Fagus grandifolia*, low abundance of either *Betula alleghaniensis* or *Betula lenta*, and a lack of abundant *Quercus* spp. or *Pinus strobus*. In Virginia stands, the most abundant trees are *Tsuga canadensis, Betula alleghaniensis, Acer rubrum*, and *Quercus rubra*; *Fagus grandifolia* and *Acer saccharum* are both inconstant and only occasionally important.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This hemlock - northern hardwood forest typically occurs on rocky acidic soils on north-facing slopes. It was sampled at four locations in the Central Appalachian project area. The sites are gentle to moderate lower to upper slopes. Soils are moderately well- to poorly drained clay loam, sandy loam, loam, and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Evidence of disturbance includes past logging, trails, grazing/browsing, hemlock woolly adelgid damage, and the presence of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hemlock - northern hardwood forest occurs on acidic soils, often on rocky, north-facing slopes. It is distributed in large patches from Vermont south through Pennsylvania (Delaware Water Gap). The elevation of sampled plots ranges from 350-543 m (1,148-1,782 feet). Sites are moderate to steep midslopes and ridges with mostly northern aspects. Soils are well-drained sandy loam and loam. The unvegetated surface consists of leaf litter, with lesser amounts of large/small rocks, bare soil and/or downed wood. Evidence of disturbance includes old roads, past logging, windthrow, and the presence of exotic plants.

Global Environment: This forest is associated with cool, dry-mesic to mesic sites and acidic soils, often on rocky, north-facing slopes. Soils can have a thick, poorly decomposed duff layer over sandy loams. In the southern part of the range, stands often occur in deep, sheltered ravines and along high-gradient mountain streams.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Tsuga canadensis* is dominant or codominant with *Betula alleghaniensis* in the canopy. *Liriodendron tulipifera* may be an important overstory associate at the southern end of the range, while to the north, *Fagus grandifolia* and *Acer saccharum* are more common. *Quercus* spp. (*Quercus prinus, Quercus alba, Quercus rubra*) and *Pinus strobus* tend to be absent or, if present, only occur with low abundance. The subcanopy includes *Tsuga canadensis, Acer rubrum*, and *Betula lenta*. *Hamamelis virginiana* is a characteristic shrub. *Rhododendron maximum* is absent in the shrub layer which is typically dominated by sapling *Tsuga canadensis*. *Dryopteris intermedia* is characteristic in the sparse herb layer. Other common herbs include *Thelypteris noveboracensis, Eurybia divaricata, Medeola virginiana*, and *Mitchella repens*.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This hemlock - northern hardwood forest lacks a significant presence of *Quercus* spp. and *Pinus strobus*. It is dominated by *Tsuga canadensis* with *Acer rubrum, Betula papyrifera, Betula lenta, Fagus grandifolia*, and *Fraxinus americana* common. *Acer pensylvanicum* is a characteristic tall shrub. The herb layer is sparse but *Dryopteris intermedia, Mitchella repens, Clintonia borealis, Trientalis borealis*, and *Lycopodium obscurum* are common.

Global Vegetation: *Tsuga canadensis* is dominant and forms at least 50% of the canopy, at least prior to impacts from the exotic insect pest hemlock woolly adelgid (*Adelges tsugae*). *Fagus grandifolia* and *Acer saccharum* are common and sometimes *Betula alleghaniensis* is uncommon or replaced by *Betula lenta*, and at the southern end of the range (in Virginia and Maryland), *Liriodendron tulipifera* may be an important overstory associate. The shrub layer may be dense to fairly open and often includes *Viburnum acerifolium* and *Acer pensylvanicum* in addition to *Tsuga canadensis* regeneration. Herbs may be sparse, particularly in dense shade, but often include *Dryopteris intermedia, Medeola virginiana, Oxalis montana, Mitchella repens, Maianthemum canadense, Trientalis borealis,*

Huperzia lucidula (= Lycopodium lucidulum), Eurybia divaricata (= Aster divaricatus), and *Thelypteris noveboracensis*. Nonvascular plants may be well-developed, often characterized by the liverwort *Bazzania trilobata*. Diagnostic characteristics of this forest are the dominance of *Tsuga canadensis*, presence of *Acer saccharum* and *Fagus grandifolia*, low abundance of either *Betula alleghaniensis* or *Betula lenta* and a lack of abundant *Quercus* spp. or *Pinus strobus*. In Virginia stands, the most abundant trees are *Tsuga canadensis, Betula alleghaniensis, Acer rubrum*, and *Quercus rubra*; *Fagus grandifolia* and *Acer saccharum* are both inconstant and only occasionally important (G. P. Fleming, pers. comm.).
Global Dynamics: Hemlock woolly adelgid (*Adelges tsugae*) is decimating hemlock stands in the eastern United States. *Betula lenta* is a common colonizer following the death of hemlocks.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (3-Dec-2014). This association has a fairly extensive geographic distribution and occurs in large patches in the Allegheny Plateau part of its range. All stands of this community are now highly threatened by the exotic insect pest hemlock woolly adelgid (*Adelges tsugae*), which causes decline and eventual mortality in *Tsuga canadensis*.

RELATED CONCEPTS

Global Similar Types:
- *Betula alleghaniensis - (Tsuga canadensis) / Rhododendron maximum / (Leucothoe fontanesiana)* Forest (CEGL007861)
- *Tsuga canadensis - (Betula alleghaniensis) - Picea rubens / Cornus canadensis* Forest (CEGL006129)
- *Tsuga canadensis - (Betula alleghaniensis, Quercus rubra) / Ilex montana / Rhododendron catawbiense* Forest (CEGL008513)
- *Tsuga canadensis - Betula alleghaniensis - Acer saccharum / Dryopteris intermedia* Forest (CEGL006638) is an equivalent from further north.

- *Tsuga canadensis - Fagus grandifolia - Acer saccharum / (Hamamelis virginiana, Kalmia latifolia)* Forest (CEGL005043)

- *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest (CEGL006088)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: *Quercus* spp. and *Pinus strobus* tend to be absent or, if present, only occur with low abundance. This type is nearly extinct in Virginia due to the almost complete loss of hemlock from adelgid outbreaks.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Sites in Pennsylvania have seasonal seeps occurring beneath the hemlock canopy. They also have *Nyssa sylvatica* and *Kalmia latifolia*.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: In New Jersey stands, hemlock woolly adelgid is killing *Tsuga canadensis* and several snags and downed trees are present. Canopy gaps stimulating *Betula lenta* growth is common in the shrub layer.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type was formerly included in CEGL006109, which was split into CEGL006638 and CEGL006639. It was separated from *Tsuga canadensis - Betula alleghaniensis - Acer saccharum / Dryopteris intermedia* Forest (CEGL006638) to better characterize the Allegheny Plateau - Lower New England and Central Appalachian characteristics. Many stands of this vegetation type in the national forests and Shenandoah National Park have been devastated during the past decade by adelgid-caused tree mortality. In some cases, 100% of the canopy hemlocks have been killed, littering the forest floor with downed wood and stimulating massive increases in understory growth, particularly of *Betula* spp. and *Acer pensylvanicum*. Since there is no practical treatment for the adelgid on a landscape level, one can only hope that natural pathogens will emerge to keep the adelgid in check before all of our examples of this community are severely degraded or lost. This type is nearly extinct in Virginia due to the almost complete loss of hemlock from adelgid outbreaks. Most of Virginia stands are now better classified as northern hardwoods of one type or another.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is distributed in large patches from New Hampshire south through Pennsylvania and restricted to local patches at higher elevations of the Central Appalachians in Maryland, West Virginia, and Virginia. In the Central Appalachian project area, it was sampled in Maryland, Pennsylvania and Virginia (Limberlost).
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (Mt. Prospect), Massachusetts (North Mountain in Cheshire, Sage's Ravine Natural Heritage Site), New Jersey (Wawayanda State Park), and Vermont (Middle Pinnacle).
Global Range: This community is generally distributed in large patches from the Allegheny Plateau, Lake Ontario and Lake Erie plains, Lower New England and south to higher elevations of the Central Appalachian region in Maryland, West Virginia, and Virginia. In Virginia, it is restricted to the northwestern part of the state, where occurrences are rather local but sometimes extensive.

[CEGL006206] *Tsuga canadensis - Betula alleghaniensis - Prunus serotina / Rhododendron maximum* Forest

Translated Name: **Eastern Hemlock - Yellow Birch - Black Cherry / Great Laurel Forest**
Common Name: **Central Appalachian Hemlock - Northern Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Tsuga canadensis - Betula lenta - Betula alleghaniensis* Forest Alliance (A3302)

Element Concept

Global Summary: This hemlock forest of the central Appalachian Mountains and High Allegheny Plateau occurs on acidic, mesic sandy loams and sands of glacial till or sandstone, in rocky ravines, or moderately steep slopes of any aspect, on stream terraces, or occasionally on flats. This is a closed-canopy, late-successional, mixed forest dominated by *Tsuga canadensis* with associated deciduous canopy species, including *Acer saccharum, Prunus serotina, Betula alleghaniensis, Fagus grandifolia*, and (in the southern portion of the type's range) *Liriodendron tulipifera* and/or *Magnolia acuminata*. Other associates include *Acer rubrum, Betula lenta, Carya* spp., *Pinus strobus, Quercus alba, Quercus rubra, Ulmus americana*, and *Ostrya virginiana*. The shrub layer varies in cover and composition. It is often a patchy but may have locally dense cover of *Rhododendron maximum*, or it may consist of some mixture of *Corylus cornuta, Diervilla lonicera, Hamamelis virginiana, Lindera benzoin, Viburnum lantanoides*, and ericaceous species *Kalmia latifolia, Rhododendron maximum*, and *Vaccinium pallidum*. The herbaceous layer typically includes ferns such as *Dryopteris intermedia, Dryopteris carthusiana, Thelypteris noveboracensis*, and *Dennstaedtia punctilobula*. Forb composition is variable and may include *Anemone quinquefolia, Cornus canadensis, Cardamine diphylla, Eurybia divaricata (= Aster divaricatus), Maianthemum canadense, Medeola virginiana, Mitchella repens, Oxalis montana, Trientalis borealis, Trillium grandiflorum, Trillium erectum*, and *Viola* spp. *Rhododendron maximum, Sambucus racemosa (= Sambucus pubens)*, and the abundance of *Prunus serotina* in the canopy differentiate this from other associations of this alliance.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This hemlock - northern hardwood forest occurs on sandy loams and sands of glacial till or sandstone, in rocky ravines, or moderately steep slopes of any aspect, on stream terraces, or occasionally on flats. It was sampled once in the Central Appalachian project area in Franklin County, Pennsylvania, on a low flat with moderately well-drained soil. The unvegetated surface is dominated by leaf litter with some downed wood and bare soil. Evidence of disturbance includes past logging/thinning and hemlock (*Adelges tsugae*) adelgid damage.
Global Environment: This forest occurs on acidic, mesic sandy loams and sands of glacial till or sandstone, in rocky ravines, or moderately steep slopes of any aspect, on stream terraces, or occasionally on flats.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Tsuga canadensis* is dominant or codominant with *Betula alleghaniensis* in the canopy. *Pinus strobus* is minor to absent. *Acer rubrum, Betula lenta, Prunus serotina, Acer saccharum, Fagus grandifolia, Quercus alba*, and/or *Liriodendron tulipifera* are also common in the canopy. *Rhododendron maximum* is characteristic in the shrub layer, and *Hamamelis virginiana* is another common shrub. Herbs are sparse.

Global Vegetation: This is a closed-canopy, late-successional, mixed forest dominated by *Tsuga canadensis* with associated deciduous canopy species including *Acer saccharum, Prunus serotina, Betula alleghaniensis, Fagus grandifolia*, and (in the southern portion of the type's range) *Liriodendron tulipifera* and/or *Magnolia acuminata*. Other associates include *Acer rubrum, Betula lenta, Carya* spp., *Pinus strobus, Quercus alba, Quercus rubra, Ulmus americana*, and *Ostrya virginiana*. The shrub layer varies in cover and composition. It is often a patchy but may have locally dense cover of *Rhododendron maximum*, or it may consist of some mixture of *Corylus cornuta, Diervilla lonicera, Hamamelis virginiana, Lindera benzoin, Viburnum lantanoides*, and ericaceous species *Kalmia latifolia, Rhododendron maximum*, and *Vaccinium pallidum*. The herbaceous layer typically includes ferns such as *Dryopteris intermedia, Dryopteris carthusiana, Thelypteris noveboracensis*, and *Dennstaedtia punctilobula*. Forb composition is variable and may include *Anemone quinquefolia, Cornus canadensis, Cardamine diphylla, Eurybia divaricata (= Aster divaricatus), Maianthemum canadense, Medeola virginiana, Mitchella repens, Oxalis montana, Trientalis borealis, Trillium grandiflorum, Trillium erectum*, and *Viola* spp.

Global Dynamics: Hemlock woolly adelgid is killing hemlocks throughout the range of this association.

[CEGL006088] *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest

Translated Name: **Eastern Hemlock - American Beech - Northern Red Oak Forest**
Common Name: **Hemlock - Beech - Red Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Allegheny Northern Hardwood - Conifer Forest (G742)
Alliance	*Tsuga canadensis - Betula lenta - Betula alleghaniensis* Forest Alliance (A3302)

ELEMENT CONCEPT

Global Summary: This association comprises dry-mesic hemlock-mixed hardwood forests of the northeastern United States. It occurs on dry to dry-mesic, nutrient-poor, well-drained, often stony sandy loams or loamy sands over acidic bedrock. The canopy is a mixture of *Tsuga canadensis*, with *Fagus grandifolia* and/or *Quercus rubra* in variable proportions depending on soil (site) and disturbance characteristics. The overstory can range from mostly coniferous to mostly deciduous; drier sites tend to have more abundant beech or oak, and cooler sites tend to have more abundant hemlock. Associated tree species include *Betula lenta* (sometimes replaced by *Betula papyrifera* at the northern end of this type's range), *Pinus strobus*, and *Acer rubrum*. Shrubs are often sparse but locally abundant and, in addition to saplings of canopy species, include *Hamamelis virginiana, Acer pensylvanicum, Viburnum acerifolium, Kalmia latifolia*, and in the south *Ilex montana*. Though heaths may be present, they are rarely prominent. The herb layer is generally sparse but usually includes several of the following: *Mitchella repens, Lycopodium digitatum (= Diphasiastrum digitatum), Lycopodium obscurum, Lycopodium annotinum, Epifagus virginiana, Gaultheria procumbens, Maianthemum canadense, Trientalis borealis, Medeola virginiana, Aralia nudicaulis, Uvularia sessilifolia, Pteridium aquilinum, Dryopteris intermedia, Monotropa uniflora*, and occasionally *Lycopodium dendroideum, Coptis trifolia*, and *Dennstaedtia punctilobula*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hemlock - hardwood forest occurs on nutrient-poor, well-drained, often stony sandy loams or loamy sands. It is widespread in southern New England. The elevation of sampled plots ranges from 360-544 m (1,181-1,785 feet). Sites range from dry to mesic, gentle to steep lower to upper slopes. Soils are rapidly drained to well-drained loam and sandy loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, bare soil, and/or downed wood. Evidence of disturbance includes the minor presence of exotic plants.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon association is only known from one location in New Hampshire at 300 m (985 feet) in elevation on a moderately sloping summit with a southwest aspect. The soil is sandy loam with abundant litter and duff.
Global Environment: This forest occurs on dry to dry-mesic, nutrient-poor, well-drained, often stony sandy loams or loamy sands. Underlying bedrock is acidic. In Virginia, it occupies extremely acidic (mean pH = 3.8), infertile silt loams on mesic to submesic valley sideslopes and broad, convex ridges at elevations from 1000-1200 m. In New England, it is a common forest type found on dry-mesic acidic soils on various landscape settings.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This community contains a mixture of *Tsuga canadensis* with *Fagus grandifolia* and/or *Quercus rubra* in canopy; canopy and subcanopy associates include *Betula lenta, Pinus strobus, Prunus serotina*, and/or *Acer rubrum*. *Hamamelis virginiana, Acer pensylvanicum, Viburnum acerifolium*, and *Kalmia latifolia* are common shrubs. Herbs are sparse but include *Dryopteris intermedia*. In addition, this community supports VT state-imperiled *Lycopodium complanatum*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only known occurrence of this association is a closed-canopy mixed evergreen-deciduous forest codominated by *Pinus strobus, Quercus rubra*, and *Tsuga canadensis* with a sparse subcanopy of *Acer rubrum*. The understory is sparse as well, with trace cover of *Carex lucorum, Maianthemum canadense*, and *Maianthemum racemosum*.
Global Vegetation: The canopy is a mixture of *Tsuga canadensis* with *Fagus grandifolia* and/or *Quercus rubra* in variable proportions depending on soil (site) and disturbance characteristics; drier sites tend to have more abundant beech or oak and cooler sites tend to have more abundant hemlock. Associated tree species include *Betula lenta* (sometimes replaced by *Betula papyrifera* at the northern end of this type's range), *Pinus strobus*, and *Acer rubrum*. Shrubs are often sparse but locally abundant and, in addition to saplings of canopy species, include *Hamamelis virginiana, Acer pensylvanicum, Viburnum acerifolium, Kalmia latifolia*, and in the south *Ilex montana*. Though heaths may be present, they are rarely prominent. The herb layer is generally sparse but usually includes several of the following: *Mitchella repens, Lycopodium digitatum (= Diphasiastrum digitatum), Lycopodium obscurum, Lycopodium annotinum, Epifagus virginiana, Gaultheria procumbens, Maianthemum canadense, Trientalis borealis, Medeola virginiana, Aralia nudicaulis, Uvularia sessilifolia, Dryopteris intermedia, Monotropa uniflora*, and occasionally *Lycopodium dendroideum, Coptis trifolia*, and *Dennstaedtia punctilobula*.
Global Dynamics: Composition of stands of this forest association vary with soil (site) and disturbance characteristics. At the drier end, *Fagus grandifolia* and/or *Quercus rubra* tend to be more prevalent. Cooler sites, where soils may freeze for longer durations, have especially abundant *Tsuga canadensis*. Disturbance affects composition as *Fagus grandifolia* can regenerate profusely through root-suckering. Stands of this vegetation on Allegheny Mountain in Virginia have low species richness (mean = 15 taxa per 400-square-meter plot samples) and were heavily impacted by logging and subsequent fires during the late 1920s and early 1930s. *Fagus grandifolia* is the most abundant tree in contemporary stands, sometimes forming nearly pure, even-aged forests that originated from root-suckers. *Tsuga canadensis* is present in the understories of most stands, and large *Tsuga* codominates the canopies of a few older stands that escaped fire damage. Small pieces of charred wood and thin charcoal horizons deposited in historical fires were present in the duff layers at most sites examined (Fleming and Moorhead 1996). Insect pests and pathogens, such as the hemlock woolly adelgid (*Adelges tsugae*) and beech bark disease (also called beech scale / *Nectria* complex) are serious threats to the dominant canopy trees in this association. *Betula lenta* is the most common successional invader of stands decimated by hemlock woolly adelgid.

- *Tsuga canadensis - Fagus grandifolia - Quercus (prinus, alba)* Forest (CEGL006474)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: *Pinus strobus* is abundant in the canopy with *Tsuga canadensis* at the Beartown and Dalton Gulf observation point sites in Massachusetts. New York examples often have no herbs and several standing dead eastern hemlock snags from hemlock woolly adelgid damage.

Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: Successional monocultures of *Tsuga canadensis* altered by hemlock woolly adelgid are mapped as this association.
Global Classification Comments: At least in the southern portion of this type's range, the *Tsuga canadensis* component of this community type appears to have been heavily reduced by past disturbances because of this species' commercial timber value and its vulnerability to fire.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (Mt. Prospect), Massachusetts (Beartown State Forest, Dalton Gulf), New York (Bellvale Mountain South), and Vermont (Clarendon Ridge and elsewhere).
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only known from southeast of Balch Hill in New Hampshire.
Global Range: This association is widespread in southern New England and ranges south locally in the northern Piedmont and High Allegheny Mountains to Pennsylvania.

G020. APPALACHIAN-CENTRAL INTERIOR MESIC FOREST

Group Summary Description: This group is composed of tall, productive and diverse forests primarily dominated by a diverse suite of deciduous broad-leaved trees of the unglaciated Appalachians, Piedmont, and Interior Low Plateau regions of the eastern United States. They range from about 125 m (400 feet) elevation to generally 1375 m (4500 feet), and occasionally to 1525 m (5000 feet) in the Southern Appalachians. They are best developed on lower slopes and in sheltered landforms, typically with northern to eastern exposures. Stands are most extensive, diverse and well-developed in the Central and Southern Appalachians, and in the Cumberland and Allegheny Plateaus. Examples in the Interior Low Plateau are somewhat less diverse in comparison, but are still the most diverse and productive forests in this particular region.

The most typical and usually dominant forest tree species include *Liriodendron tulipifera, Prunus serotina, Acer saccharum, Tilia americana* (both var. *americana* and var. *heterophylla*, the latter being especially characteristic), and *Fagus grandifolia*. Other associates can include *Fraxinus americana, Juglans nigra*, and

Magnolia spp. (e.g., *Magnolia acuminata, Magnolia tripetala, Magnolia macrophylla*). Stands are typically dominated by genera other than *Carya* and *Quercus*, although some species of these genera may be present, including *Carya cordiformis, Carya ovalis, Carya ovata, Quercus alba, Quercus muehlenbergii, Quercus pagoda, Quercus rubra*, and *Quercus shumardii*. A diverse herbaceous layer will contain species such as *Adiantum pedatum, Arisaema triphyllum, Galium* spp., *Osmorhiza claytonii, Podophyllum peltatum, Polygonatum biflorum, Trillium* spp., and *Viola* spp.

A2033 *Fagus grandifolia - Liriodendron tulipifera - Carya cordiformis* Forest Alliance

Alliance Summary Description: This basic mesic forest alliance occurs over a wide range, from southern Pennsylvania south along the Appalachians to Alabama and Georgia, as well as in the Cumberland Plateau of Kentucky and Tennessee, and west to the Interior Low Plateau from Illinois, Indiana, and Ohio, and including outliers in the Ozarks of Oklahoma, Missouri, and Arkansas, as well as the adjacent Upper East Gulf Coastal Plain. These are beech-oak, beech-tuliptree-maple, and tuliptree-oak forests, which are mesic but not as rich and diverse as true Appalachian cove forests. Its stands are characterized by a combination of *Acer saccharum, Carya cordiformis, Fagus grandifolia, Liriodendron tulipifera*, and a number of *Quercus* spp., as well as the presence of calciphilic species such as *Quercus muehlenbergii*. *Acer barbatum* or *Acer leucoderme* occur in portions of the range, as does *Magnolia tripetala*. Other canopy associates include *Fraxinus americana, Nyssa sylvatica, Quercus alba, Quercus rubra, Tilia americana*, and *Ulmus rubra*. The tree subcanopy is characterized by *Asimina triloba, Carpinus caroliniana, Cercis canadensis, Cornus florida*, and *Ostrya virginiana*. The herbaceous layer is characterized by calciphilic species, including *Actaea racemosa, Adiantum pedatum, Asarum canadense, Hepatica nobilis*, and *Sanguinaria canadensis*, as well as *Polystichum acrostichoides* and *Podophyllum peltatum*. These forests often occur on concave and sheltered landforms such as north- to east-facing slopes, low slopes, high terraces along streams, and possibly other situations, in generally dissected terrain south of the glacial boundary. The soils are fertile well-drained silt, silt loam, sandy loam, or loam.

[CEGL006296] *Fagus grandifolia - Betula lenta - Liriodendron tulipifera - Acer saccharum* Forest

Translated Name: **American Beech - Sweet Birch - Tuliptree - Sugar Maple Forest**
Common Name: **Beech - Tuliptree - Sugar Maple Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Fagus grandifolia - Liriodendron tulipifera - Carya cordiformis* Forest Alliance (A2033)

Element Concept

Global Summary: This mid- to lower slope deciduous forest of the mid-Atlantic region occurs on deep soils that are not strongly acidic. The tree canopy is characterized by a mixture of *Liriodendron tulipifera, Fagus grandifolia, Acer saccharum, Fraxinus americana, Betula lenta*, and other associated species, including *Acer rubrum, Betula alleghaniensis, Nyssa sylvatica*, and *Carya alba (= Carya tomentosa)*. The subcanopy, where present, is characterized by *Carpinus caroliniana, Cornus florida*, and *Ostrya virginiana*. Common species of the shrub layer include *Hamamelis virginiana* and *Lindera benzoin*. The herbaceous layer is characterized by *Podophyllum peltatum, Sanguinaria canadensis, Botrychium virginianum, Dicentra cucullaria, Dicentra canadensis, Allium tricoccum*, and *Claytonia virginica*. Associated herbs may include *Polystichum acrostichoides, Ageratina altissima var. altissima*, and *Arisaema triphyllum*. Invasive species such as *Berberis thunbergii, Elaeagnus umbellata, Rosa multiflora*, and *Alliaria petiolata* may be present and locally abundant in the shrub and herb layers. This vegetation type often occurs on land where evidence of past agriculture or silviculture is visible.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This tuliptree - beech - maple forest is a mid- to lower-slope forest of the mid-Atlantic region. It is documented in Pennsylvania and New Jersey, and plots have been sampled off the trail at Delaware Water Gap. It occurs on deep soils that are not strongly acidic.

Global Environment: This vegetation occurs on middle to lower slopes on moderately deep soils that are not extremely acidic.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The tree canopy is characterized by a mixture of *Liriodendron tulipifera, Fagus grandifolia, Acer saccharum, Fraxinus americana, Betula lenta*, and other associated species, including *Acer rubrum, Betula alleghaniensis, Nyssa sylvatica*, and *Carya alba (= Carya tomentosa)*. The subcanopy, where present, is characterized by *Carpinus caroliniana, Cornus florida*, and *Ostrya virginiana*. Common species of the shrub layer include *Hamamelis virginiana* and *Lindera benzoin*. The herbaceous layer is characterized by *Podophyllum peltatum, Sanguinaria canadensis, Botrychium virginianum, Dicentra cucullaria, Dicentra canadensis, Allium tricoccum*, and *Claytonia virginica*. Associated herbs may include *Polystichum acrostichoides, Ageratina altissima var. altissima*, and *Arisaema triphyllum*. Invasive species such as *Berberis thunbergii, Elaeagnus umbellata, Rosa multiflora*, and *Alliaria petiolata* may be present and locally abundant in the shrub and herb layers.

Global Vegetation: The tree canopy is characterized by a mixture of *Liriodendron tulipifera, Fagus grandifolia, Acer saccharum, Fraxinus americana, Betula lenta*, and other associated species, including *Acer rubrum, Betula alleghaniensis, Nyssa sylvatica*, and *Carya alba (= Carya tomentosa)*. The subcanopy, where present, is characterized by *Carpinus caroliniana, Cornus florida*, and *Ostrya virginiana*. Translated Name: **Tuliptree - Northern Red Oak - White Ash / Pawpaw / Black Baneberry Forest**
Common Name: **Upper Piedmont-Northern Blue Ridge Basic Mesic Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Fagus grandifolia - Liriodendron tulipifera - Carya cordiformis* Forest Alliance (A2033)

Element Concept

Global Summary: This community is a mesic rich forest occurring in the Piedmont and lower-elevation Appalachians of Virginia and Maryland and possibly extending into adjacent West Virginia, Pennsylvania, and Delaware. These forests are dominated by *Liriodendron tulipifera*, occurring with or codominating with *Quercus rubra* or *Fraxinus americana*. This community type occupies fertile, well-drained soils of mesic lower slopes and ravines, often in areas underlain by metabasalt of the Catoctin Formation but also on a variety of igneous metamorphic and metasedimentary rocks. Occasionally, stands occur on well-weathered boulder "streams" that have been deposited in low-elevation ravine bottoms and slope concavities. Other species possible in the overstory include *Quercus alba, Quercus prinus, Carya ovalis, Carya alba, Carya cordiformis, Ulmus rubra, Nyssa sylvatica, Fagus grandifolia*, and *Juglans nigra*. Subcanopy tree layers contain representatives of the overstory species and *Acer rubrum*. The lowest tree and shrub layers usually contain small to large colonies of *Asimina triloba* and *Lindera benzoin*, along with *Cercis canadensis* and *Cornus florida*. The herb layer is usually lush and dense, except where boulder streams prevail or deer grazing is severe. Patch-dominance of ferns and leafy forbs is characteristic; species achieving local abundance in the type include *Adiantum pedatum, Amphicarpaea bracteata, Arisaema triphyllum, Asarum canadense, Actaea racemosa (= Cimicifuga racemosa), Deparia acrostichoides, Hydrastis canadensis, Phegopteris hexagonoptera, Polystichum acrostichoides*, and *Uvularia perfoliata*. Other constant or characteristic herbaceous species include *Botrychium virginianum, Carex laxiflora var. laxiflora, Circaea lutetiana ssp. canadensis, Collinsonia canadensis, Cypripedium parviflorum var. pubescens, Desmodium nudiflorum, Galearis spectabilis, Galium circaezans, Galium triflorum, Hepatica nobilis var. obtusa, Maianthemum racemosum ssp. racemosum, Phryma leptostachya, Podophyllum peltatum, Sanguinaria canadensis, Sanicula canadensis*, and *Stellaria pubera*. This association is distinguished from more montane rich cove forests by its lower-elevation habitats, shrub layer dominance by *Asimina triloba* (a low-elevation species in the Mid-Atlantic region), and the absence or unimportance of many common species of montane cove forests, e.g., *Acer saccharum, Tilia americana, Caulophyllum thalictroides, Laportea canadensis, Osmorhiza claytonii, Impatiens pallida*, and *Trillium grandiflorum*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This community occurs on lower slopes and/or ravines on deep, well-drained fine-textured silt loam soils in the lower-elevation Appalachians of Virginia and Maryland.
Global Environment: This community type occupies fertile, well-drained soils of mesic lower slopes and ravines. It is most extensive in areas underlain by metabasalt of the Catoctin Formation but also occurs on a variety of igneous metamorphic and metasedimentary rocks. Slopes vary from moderate to steep (range = 7-30°) and are typically straight or concave. The surface substrate usually has less than 10% exposed boulder and stone cover, and more than 90% cover of leaf litter and other humic material. However, a small number of stands occur on well-weathered boulder "streams" that have been deposited in low-elevation ravine bottoms and slope concavities. Soils are deep, dark loams or sandy loams of colluvial origin. Soil samples collected from representative stands were moderately acidic (mean pH is about 5.5 to 5.9), with moderately high Ca and high Mg, Mn, K, Cu, B, and total base saturation.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy of this lower slope and ravine mesic hardwood forest is characterized by a mixture of *Liriodendron tulipifera, Fraxinus americana, Quercus rubra*, and *Carya* spp. The subcanopy is codominated by *Celtis occidentalis, Acer rubrum*, and species from the canopy. Low-elevation shrubs such as *Asimina triloba* and *Cercis canadensis* are characteristic of

most stands. *Hamamelis virginiana* may also be common. The herb layer is patchy to lush and patch-dominated by widespread species such as *Actaea racemosa* and *Uvularia perfoliata*, in addition to *Asarum canadense* and ferns such as *Dryopteris intermedia* and *Polystichum acrostichoides*. It usually lacks montane rich-site herbs.

Global Vegetation: The typical stand structure of this community type consists of a tall, closed overstory, with very open understory tree layers, and a variably dense shrub layer. The overstory of most stands is dominated or codominated by tall, straight *Liriodendron tulipifera* often exceeding 35 m in height. *Fraxinus americana* and *Quercus rubra* are the most frequent overstory associates and often codominate. Less frequent overstory associates that can sometimes codominate in discrete areas include *Quercus alba, Quercus prinus, Carya ovalis, Carya alba, Carya cordiformis, Ulmus rubra, Nyssa sylvatica, Fagus grandifolia*, and *Juglans nigra*. Subcanopy tree layers contain representatives of the overstory species and *Acer rubrum*. The lowest tree and shrub layers usually contain small to large colonies of *Asimina triloba* and *Lindera benzoin*, along with *Cercis canadensis* and *Cornus florida*. More locally important small trees and shrubs include *Carpinus caroliniana* and *Hamamelis virginiana*. High-climbing vines of *Parthenocissus quinquefolia, Toxicodendron radicans*, and *Vitis* spp. are common. The herb layer is usually lush and dense, except where boulder streams prevail or deer grazing is severe. Patch-dominance of ferns and leafy forbs is characteristic; species achieving local abundance in the type include *Adiantum pedatum, Amphicarpaea bracteata, Arisaema triphyllum, Asarum canadense, Actaea racemosa (= Cimicifuga racemosa), Deparia acrostichoides, Hydrastis canadensis, Phegopteris hexagonoptera, Polystichum acrostichoides*, and *Uvularia perfoliata*. The most constant, low-cover herbs in 22 Virginia and Maryland plots of the type are *Botrychium virginianum, Circaea lutetiana ssp. canadensis, Desmodium nudiflorum, Galium circaezans, Galium triflorum, Maianthemum racemosum ssp. racemosum, Phryma leptostachya, Sanguinaria canadensis*, and *Sanicula canadensis*. Additional characteristic herbs include *Carex laxiflora var. laxiflora, Collinsonia canadensis, Cypripedium parviflorum var. pubescens, Galearis spectabilis, Hepatica nobilis var. obtusa, Podophyllum peltatum*, and *Stellaria pubera*.

Global Dynamics: Sites now supporting this community are some of the most productive in the Mid-Atlantic region, and most were cleared or cut over in the past. Dominance of *Liriodendron tulipifera* in stands is no doubt indicative of establishment following abandonment of fields, logging, and natural, large-scale forest disturbances. The ability of *Liriodendron* to opportunistically occupy and outgrow competitors in gaps created by windthrow and other disturbances apparently enables this species to maintain a position in older-aged mixed forests (Orwig and Abrams 1994, Busing 1995). Although many stands representing this community have probably reached an intermediate successional stage (70 to 140 years old) and become more mixed than a typical, early-successional forest dominated by *Liriodendron tulipifera*, their future development is unclear. Most plots contain *Quercus rubra* or *Quercus alba* in the overstory, but recruitment of these oaks is very low. The most numerous potential canopy species now present in the understory are hickories (*Carya alba, Carya cordiformis*, and *Carya ovalis*), *Fraxinus americana*, and *Nyssa sylvatica*. In the absence of longer-lived and more tolerant species such as *Fagus grandifolia* or *Acer saccharum* (usually unimportant or absent in the type), it appears that maturing stands will gradually contain more mixed dominance by *Liriodendron, Carya* spp., *Fraxinus*, and perhaps *Nyssa*, with fewer *Quercus* spp. Most likely because of their moist fertile soils, habitats of this community type are very favorable for shade-tolerant, invasive introduced plants, particularly following small-scale soil disturbances. The most problematic introduced species include *Microstegium vimineum, Rubus phoenicolasius, Lonicera japonica*, and *Alliaria petiolata*. Mortality or partial die-back of *Cornus florida* resulting from the fungal pathogen dogwood anthracnose (*Discula destructiva*) and visible damage to herbaceous plants by grazing white-tailed deer have been noted in many stands of the type.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (24-Jan-2005). While not a naturally rare type, this community has a restricted geographic distribution, mature examples are uncommon, and all stands are vulnerable to logging and degradation by introduced invasive weeds. Many examples are poorly buffered because of upslope land-use change, timber removal, or conversion of upslope forests to managed forest types.

RELATED CONCEPTS

Global Similar Types:

- *Fagus grandifolia - Liriodendron tulipifera - Carya cordiformis / Lindera benzoin / Podophyllum peltatum* Forest (CEGL006055) is associated with fertile ravines of the outer Piedmont and Inner Coastal Plain in Maryland and Virginia. It differs from CEGL006186 in having *Fagus grandifolia* and *Carya cordiformis* as major overstory components, as well as a number of more coastal-ranging species such as *Ilex opaca var. opaca*.
- *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710) occurs at higher elevations in more montane landscapes and contains many species more characteristic of the Appalachians; it lacks several low-elevation species (e.g., *Asimina triloba, Cercis canadensis*) that are characteristic of CEGL006186.
- *Liriodendron tulipifera / (Cercis canadensis) / (Lindera benzoin)* Ruderal Forest (CEGL007220) an earlier-successional type with more monospecific dominance by *Liriodendron tulipifera* and an herb layer frequently dominated by shade-tolerant weeds (e.g., *Alliaria petiolata*, etc.).

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: *Tilia americana* and *Aesculus flava* rare to absent.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: The principal compositional differences between Upper Piedmont-Northern Blue Ridge Basic Mesic Hardwood Forest (CEGL006186) and Southern Appalachian Rich Cove Forest (Typic Type) (CEGL007710), though subtle, are driven by differences in elevation, with CEGL006186 occurring much lower and being essentially a western Piedmont/very low-elevation montane community.
Global Classification Comments: This description is based on analysis of 32 plots from Virginia and Maryland. This association is distinguished from more montane rich cove forests by its lower-elevation habitats, shrub-layer dominance by *Asimina triloba* (a low-elevation species in the Mid-Atlantic region), and the absence or unimportance of many common species of montane cove forests, e.g., *Acer saccharum, Tilia americana, Caulophyllum thalictroides, Laportea canadensis, Osmorhiza claytonii, Impatiens pallida*, and *Trillium grandiflorum*. Several plots from low elevations of Shenandoah National Park are intermediate between this type

and *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710) and could be assigned equally well to either type. For the purposes of vegetation mapping in Shenandoah , these plots were assigned to CEGL007710.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: Two examples were observed in the Central Appalachian project area, one in Clarke County, Virginia, at Ashby Gap and one near the C&O Canal and Harpers Ferry in Washington County, Maryland.
Global Range: This vegetation type is scattered in small to large patches throughout the lower Blue Ridge and northern and western Piedmont of Virginia, and much of the Maryland Piedmont and Blue Ridge. It has also been documented in Pennsylvania and may also occur in eastern West Virginia and the Piedmont portion of Delaware.

A0235 *Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava* Forest Alliance

Alliance Summary Description: This alliance represents the mixed mesophytic forests of the Southern Blue Ridge, Appalachian Plateau, and adjacent ecoregions, with highly variable and diverse canopies, often with no clear canopy dominant. They are locally referred to as "cove forests." Characteristic canopy species include *Acer saccharum, Aesculus flava, Liriodendron tulipifera*, and *Tilia americana var. heterophylla*. Other species that may occur in the canopy include *Acer nigrum, Carya cordiformis, Halesia tetraptera var. monticola, Fraxinus americana*, and *Quercus rubra*. Species composition varies with geology and/or elevation. Shrub strata are open to sparse and can include *Hydrangea arborescens* or *Lindera benzoin*. Herbaceous strata are typically lush and diverse. Species commonly found include *Actaea racemosa (= Cimicifuga racemosa), Asarum canadense, Caulophyllum thalictroides, Hydrophyllum canadense, Hydrophyllum virginianum, Laportea canadensis*, and *Sanguinaria canadensis*. However, the herbaceous layer is usually very diverse and variable. A partial list of other typical species includes *Adiantum pedatum, Ageratina altissima var. roanensis, Arisaema triphyllum, Carex plantaginea, Cystopteris protrusa, Delphinium tricorne, Dicentra canadensis, Dicentra cucullaria, Hepatica nobilis var. acuta, Impatiens capensis, Impatiens pallida, Osmorhiza claytonii, Polystichum acrostichoides, Prosartes lanuginosa, Tiarella cordifolia, Trillium erectum, Trillium grandiflorum*, and *Viola canadensis*. Examples of this alliance mainly occur on sites that are protected, mesic, and at low to moderate elevation (610-1370 m [2000-4500 feet]), primarily broad coves and lower slopes. Forests in this alliance are known from the Southern Blue Ridge of North Carolina, South Carolina, Georgia, Tennessee, Virginia, and the Cumberland Mountains of Kentucky, extending north at least through Virginia on the Northern Blue Ridge, as well as west into the Interior Low Plateau of southern Indiana, southern Ohio, Kentucky, and Tennessee. More information is needed to characterize forests provisionally assigned to this alliance that occur in the Allegheny Plateau of West Virginia and Ohio and in Indiana, as well as in New Jersey and Connecticut.

Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava* Forest Alliance (A0235)

Element Concept

Global Summary: This is a rich mesic, deciduous forest of the High Alleghenies, Western Allegheny Plateau, and Central Appalachians south to the Cumberlands of eastern Kentucky. Stands occur in coves, on slope bases, lower slopes, in middle- to upper-slope coves. Soils are typically deep, fertile, moderately to well-drained and are often derived from calcareous parent materials, with textures including sands, loams, and silt loams. The canopy is dominated by *Acer saccharum* with *Fraxinus americana, Liriodendron tulipifera*, and *Tilia americana* being very characteristic. Associated canopy trees include *Quercus rubra, Ostrya virginiana, Ulmus rubra, Acer rubrum, Betula alleghaniensis, Betula lenta, Fagus grandifolia, Juglans nigra, Carya cordiformis*, and *Prunus serotina*. The shrub layer is of variable composition, characterized by *Cornus alternifolia, Hamamelis virginiana, Asimina triloba, Lonicera canadensis, Rhododendron periclymenoides (= Rhododendron nudiflorum)*, and *Viburnum acerifolium*. *Lindera benzoin* is sparse to absent. The herb layer is diverse and made up of *Adiantum pedatum, Asarum canadense, Actaea racemosa (= Cimicifuga racemosa), Cardamine* spp. (= *Dentaria* spp.), *Hepatica nobilis var. obtusa (= Hepatica americana), Hydrophyllum virginianum, Elymus hystrix (= Hystrix patula), Osmorhiza* spp., *Trillium grandiflorum, Viola* spp., *Dryopteris marginalis, Botrychium virginianum, Anemone quinquefolia, Geranium maculatum, Caulophyllum thalictroides, Sanguinaria canadensis, Claytonia virginica, Allium tricoccum, Cardamine concatenata, Arisaema triphyllum*, and *Laportea canadensis*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This rich cove forest occurs along slope bases, on lower concave slopes, and in middle- to upper-slope coves at elevations from 425 to 1,050 m (1,400-3,450 feet). It was sampled at four locations in the Central Appalachian project area. Sites are somewhat steep mid and upper slopes with northern or western aspects. Soils are well-drained loam. The unvegetated surface is dominated by leaf litter with some downed wood, large rocks and exposed bedrock. Evidence of disturbance includes past logging, wind/ice damage, grazing/browsing, and the presence of exotic plant species.
Global Environment: This community type occupies cool (northwest- to east-facing), mesic, lower to middle slopes, ravines, and coves at elevations from 425 to about 1050 m (1400-3450 feet). Sites may be underlain by a number of bedrock types, including limestone, dolomite, metabasalt (greenstone), granitic rocks, and sandstone. Slopes are typically steep (mean in plots = 23°) and concave in at least one direction. Soils are deep, dark, and fertile, although frequently stony or bouldery. Samples collected from plots range from very strongly acidic to circumneutral (pH range = 4.2-6.8, mean pH = 5.3) but consistently have high calcium levels (mean = 1978 ppm) and moderately high magnesium and manganese levels.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by a mixture of species which can include *Acer saccharum, Fraxinus americana, Betula alleghaniensis, Quercus rubra*, and *Tilia americana*. *Acer pensylvanicum* and *Hamamelis virginiana* are common in the shrub layer. *Lindera benzoin* is sparse to absent. Common herbs include *Actaea racemosa (= Cimicifuga racemosa), Aconitum reclinatum, Viola canadensis var. canadensis, Asarum canadense, Hydrophyllum virginianum, Impatiens pallida, Laportea canadensis, Deparia acrostichoides*, and *Angelica triquinata*. This community also supports VA-state imperiled *Rubus idaeus ssp. strigosus*.
Global Vegetation: The canopy is dominated by *Acer saccharum* with *Fraxinus americana* and *Tilia americana* being very characteristic. Associated canopy trees include *Quercus rubra, Ostrya virginiana, Ulmus rubra, Acer rubrum, Betula alleghaniensis, Betula lenta, Fagus grandifolia, Juglans nigra, Liriodendron tulipifera, Magnolia acuminata, Carya cordiformis*, and *Prunus serotina*. The shrub layer is of variable composition, characterized by *Cornus alternifolia, Hamamelis virginiana, Lindera benzoin, Asimina triloba, Lonicera canadensis, Rhododendron*

periclymenoides, and *Viburnum acerifolium*. The herb layer is diverse and made up of *Adiantum pedatum, Asarum canadense, Actaea racemosa, Cardamine* spp., *Hepatica nobilis var. obtusa, Hydrophyllum virginianum, Elymus hystrix, Osmorhiza* spp., *Trillium grandiflorum, Viola* spp., *Dryopteris marginalis, Botrychium virginianum, Anemone quinquefolia, Geranium maculatum, Caulophyllum thalictroides, Sanguinaria canadensis, Claytonia virginica, Allium tricoccum, Cardamine concatenata, Arisaema triphyllum*, and *Laportea canadensis*. More eastern stands in Kentucky contain *Aesculus flava, Aesculus glabra*, or *Tilia americana var. heterophylla* (Campbell 2001). In 15 plot-sampled Virginia stands, *Acer saccharum* and *Tilia americana* (including both *var. americana* and *var. heterophylla*) are consistently the most important canopy trees in mixed stands with *Fraxinus americana, Carya cordiformis, Quercus rubra*, and *Liriodendron tulipifera* (lower elevations only). Minor canopy associates vary with site conditions and geography. South of the James River, *Aesculus flava* is an occasional canopy tree. On higher and cooler sites, *Betula lenta, Fagus grandifolia*, and *Tsuga canadensis* may be present. *Juglans nigra* and *Ulmus rubra* occur occasionally at lower elevations. Understory layers usually contain a good representation of the canopy species, particularly *Acer saccharum*. The shrub layer is typically sparse to absent and no shrub species attained a constancy >47% or mean cover >5% in plots. The herb layer is lush and often exhibits patch dominance by a small number of species, particularly the spring-flowering forbs *Caulophyllum thalictroides* and *Osmorhiza claytonii*. Other characteristic aestival herbs include *Arisaema triphyllum, Asarum canadense, Dicentra* spp., *Galearis spectabilis, Hydrophyllum virginianum, Maianthemum racemosum, Podophyllum peltatum, Prosartes lanuginosa (= Disporum lanuginosum), Sanguinaria canadensis, Trillium grandiflorum, Uvularia grandiflora*, and *Viola canadensis*. The summer aspect is often dominated by large colonies of *Actaea racemosa, Impatiens pallida*, and/or *Laportea canadensis*.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Acer pensylvanicum*, *Acer saccharum*, *Aconitum reclinatum*, *Angelica triquinata*, *Betula alleghaniensis*, *Fraxinus americana*, *Hydrophyllum virginianum*, *Impatiens pallida*, *Laportea canadensis*, *Quercus rubra*, *Tilia americana*
Global: *Acer saccharum*, *Actaea racemosa*, *Adiantum pedatum*, *Asarum canadense*, *Carya cordiformis*, *Caulophyllum thalictroides*, *Cornus alternifolia*, *Dicentra cucullaria*, *Fraxinus americana*, *Hamamelis virginiana*, *Hydrophyllum virginianum*, *Impatiens pallida*, *Laportea canadensis*, *Lindera benzoin*, *Liriodendron tulipifera*, *Osmorhiza claytonii*, *Sanicula trifoliata*, *Tilia americana*, *Uvularia grandiflora*, *Viola canadensis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Aconitum reclinatum* (G3, regional endemic), *Rubus idaeus* ssp. *strigosus* (G5T5, VA state-imperiled); **Invasive/Exotic Plants**: *Alliaria petiolata* (High/Medium), *Barbarea vulgaris* (Low/Insignificant)
Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Panax quinquefolius* (G3G4, under collection pressure)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (28-Sep-2001). This unit has a fairly wide geographic range, within which it is regularly distributed as a small- to large-patch vegetation type in suitably fertile habitats. Because of excellent site conditions for tree growth, stands are very vulnerable to logging and are further threatened by shade-tolerant exotic weeds.

RELATED CONCEPTS

Global Similar Types:
- *Acer saccharum - Liriodendron tulipifera - Fraxinus americana / Staphylea trifolia* Forest (CEGL006201)
- *Aesculus flava - Acer saccharum - (Tilia americana var. heterophylla) / Hydrophyllum canadense - Solidago flexicaulis* Forest (CEGL007695)
- *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: In extreme southwestern Virginia, this community type is gradational to Southern Appalachian Rich Cove Forest (Montane Calcareous Type) (CEGL007695) of high-elevation coves in the Southern Appalachians. However, this association (CEGL006237) may be distinguished by generally occurring at much lower elevations, having lower species richness, and lacking (or nearly lacking) a number of primarily southern species prominent in CEGL007695, including *Actaea podocarpa, Aesculus flava, Hydrophyllum canadense, Phacelia fimbriata, Phlox stolonifera, Sanicula odorata, Stachys nuttallii (= Stachys cordata)*, and *Trillium sulcatum*. A few occurring frequently in CEGL006237 (especially its high-elevation subtype), including *Aconitum reclinatum, Betula alleghaniensis, Piptatherum racemosum*, and *Sanicula trifoliata*, are absent or uncommon in CEGL007695.

CEGL006237 and CEGL007695 are virtual "sister" associations. The principal difference is that CEGL007695 has *Aesculus flava* as a prominent tree (absent in CEGL006237) and a few distinctly Southern Appalachian herbs. Giles County, Virginia, is getting close to the northern limit *Aesculus flava*, so this area is likely a transition zone where stands could go either way. Classify as CEGL007695 if buckeye is present, or as CEGL006237 if not. All plots and observation points were sampled in the Central Appalachian project area.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Note that the global description lists 14 different tree species in addition to *Acer saccharum*. It is the nature of such mixed cove forests that individual species abundances vary from place to place, even over short spatial scales. So, as a rule of thumb, don't be too concerned about *Acer saccharum* being merely present or minor if the environmental setting and overall floristics of the stand fits the type.
Global Classification Comments: Despite considerable compositional variation, this unit appears to be a widespread and robust vegetation type. Damman and Kershner (1977) describe similar vegetation from gneissic areas of western Connecticut, with key species including *Acer saccharum, Tilia americana, Fraxinus americana, Liriodendron tulipifera, Lindera benzoin, Carpinus caroliniana, Ulmus rubra, Carya cordiformis, Osmorhiza claytonii, Asarum canadense, Caulophyllum thalictroides, Hepatica nobilis var. obtusa (= Hepatica americana), Galearis spectabilis, Viola pubescens*, and *Deparia acrostichoides*. The Sugar Maple - Basswood - Tulip Poplar Community described by Martin (1975) from southeastern Kentucky, and the *Acer saccharum - Liriodendron tulipifera - Fraxinus americana* Community described by Andreu and Tukman (1995) from the Tellico Lake area of eastern Tennessee are similar, but not fully comparable because only woody vegetation was analyzed in these studies.

In extreme southwestern Virginia, this community type is gradational to *Aesculus flava - Acer saccharum - (Fraxinus americana, Tilia americana var. heterophylla) / Hydrophyllum canadense - Solidago flexicaulis* Forest (CEGL007695) of high-elevation coves in the Southern Appalachians. However, CEGL006237 may be distinguished by generally occurring at much lower elevations, having lower species richness, and lacking (or nearly lacking) a number of primarily southern species prominent in CEGL007695, including *Actaea podocarpa, Aesculus flava, Hydrophyllum canadense, Phacelia fimbriata, Phlox stolonifera, Sanicula odorata, Stachys nuttallii (= Stachys cordata)*, and *Trillium sulcatum*. A few occurring frequently in CEGL006237 (especially its high-elevation subtype), including *Aconitum reclinatum, Betula alleghaniensis, Piptatherum racemosum*, and *Sanicula trifoliata*, are absent or uncommon in CEGL007695.

The exotic weed *Alliaria petiolata* is a rampant invader of some stands of this vegetation on the Northern Blue Ridge.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled at Kelly Knob in Virginia, and at Hawksbill Mountain and Stony Man in Shenandoah National Park. It is common from Giles County, Virginia, north to Pennsylvania.

Global Range: This forest is found in the High Alleghenies, Western Allegheny Plateau, Central Appalachians, and Cumberlands from New York and New Jersey south to West Virginia, Virginia, and eastern Kentucky.
Nations: US
States/Provinces: KY, MD, NJ, NY, OH?, PA, VA:S3, WV?

Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava* Forest Alliance (A0235)

ELEMENT CONCEPT

Global Summary: This association includes forests of protected coves in the southern Appalachian Mountains of eastern Tennessee, western North Carolina, and southwest Virginia. This type extends peripherally into the Cumberland Mountains and Ridge and Valley of southwestern Virginia. These forests are associated with nutrient-rich soils and, often, mafic geologies, and occur on steep, middle to low protected slopes and coves at 610-1400 m (2000-4600 feet) elevation. Examples of this association have deciduous forest canopies dominated by either *Acer saccharum, Aesculus flava, Fraxinus americana, Halesia tetraptera var. monticola*, or *Tilia americana var. heterophylla*, or by various combinations of these species. Other common canopy species can include *Carya cordiformis* and *Quercus rubra*. A shrub stratum is very sparse or absent, and the herbaceous stratum is dense and luxurious, with high species richness. The defining feature of this association is the lush herbaceous flora with many calciphilic species indicative of high pH or circumneutral soils. Characteristic species include *Asarum canadense, Carex plantaginea, Cymophyllus fraserianus, Cystopteris protrusa, Deparia acrostichoides, Diplazium pycnocarpon, Dryopteris goldiana, Hepatica nobilis var. acuta, Hydrophyllum canadense, Osmorhiza claytonii, Prosartes lanuginosa (= Disporum lanuginosum), Solidago flexicaulis*, and *Viola canadensis*. The herbaceous stratum can have local dominance by *Laportea canadensis, Viola canadensis, Dryopteris intermedia, Actaea podocarpa (= Cimicifuga americana), Actaea racemosa (= Cimicifuga racemosa)*, and *Caulophyllum thalictroides*.

This forest lacks dominance by *Betula alleghaniensis* and *Fagus grandifolia*, and has an herbaceous flora indicative of high-base status soils. This association typically has a much more diverse herbaceous stratum than other deciduous cove forests of the Southern Blue Ridge.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This rich yellow buckeye - sugar maple forest of montane protected mid- to low-slope coves occurs at middle elevations (610-1,400 m [2,000-4,600 feet]) in the Southern Blue Ridge and at low to middle elevations (200-915 m [650-3,000 feet]) in the Northern Blue Ridge and adjacent Ridge and Valley. It was sampled at one location in Giles County, Virginia, in the Central Appalachian project area. The site is a moderate midslope cove with mesic sandy loam soil underlain by calcareous red siltstone of the Juniata Formation. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Evidence of disturbance includes the presence of exotic plant species.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This montane cove forest was sampled at 11 locations in this section of the park at elevations ranging from 490 to 1,250 m (1,600-4,100 feet, mean = 3,261 feet). Sites are moderate to very steep mid and upper slopes with northern aspects. Soils are acidic, mesic, moderately well- to well-drained loam, silt loam and sandy loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Very little evidence of disturbance was noted.
Global Environment: In the southern part of its range, this vegetation type occurs on protected, concave landforms, at elevations ranging from 610-1400 m (2000-4600 feet). It is associated with nutrient-rich soils and often with mafic substrates, occurring on steep, middle to lower, protected slopes and in coves. In Virginia, the type is restricted to an elevational range from about 760-1220 m (-2500-4000 feet). Virginia sites supporting this community are on strongly concave, moderately steep (mean = 17°) slopes with north to east aspects. Underlying bedrock includes igneous metamorphic formations in the Blue Ridge, and calcareous shale, calcareous mudstone, and calcareous sandstone in the Ridge and Valley and Cumberland Mountains. Surface cover of bedrock and boulders ranges from 0-35%. Dark, apparently fertile, loamy soils at plot sampling sites are moderately acidic (mean pH = 5.6) but have high levels of calcium, magnesium, manganese, and total base saturation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This is an extremely diverse and rich montane Southern Appalachian cove forest that occupies sheltered landforms at middle elevations. The diverse canopy often contains a mixture of *Acer saccharum, Tilia americana var. heterophylla*, and *Aesculus flava*. *Carya cordiformis* and *Fraxinus americana* are constant but minor canopy associates *Prunus serotina* and *Magnolia acuminata* may also be present. Shrubs are sparse to absent. An exceedingly rich and lush herb layer is dominated by a profusion of spring ephemerals and other nutrient-demanding forbs. Indicator species include *Hydrophyllum canadense, Asplenium rhizophyllum, Asarum canadense, Cystopteris* sp., and *Hepatica nobilis var. acuta*. Other common herbs include *Caulophyllum thalictroides, Deparia acrostichoides, Dryopteris intermedia, Laportea canadensis*, and *Viola blanda var. blanda*. *Alliaria petiolata* is an abundant exotic.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is diverse, often with *Acer saccharum, Tilia americana var. heterophylla, Aesculus flava*, and *Fraxinus americana* all as part of canopy. *Liriodendron tulipifera* and *Prunus serotina* may also be present. Shrubs include *Halesia tetraptera var. monticola* and *Lindera benzoin*. The herbaceous layer is extremely diverse and rich. Common species include *Asplenium rhizophyllum, Asarum canadense, Cystopteris* spp., *Viola canadensis, Caulophyllum thalictroides, Deparia acrostichoides, Prosartes lanuginosa (= Disporum lanuginosum), Dryopteris intermedia, Dryopteris marginalis, Hepatica nobilis var. acuta, Hydrophyllum canadense, Impatiens pallida, Laportea canadensis, Osmorhiza claytonii, Polystichum acrostichoides, Solidago flexicaulis*, and *Sanguinaria canadensis*. This community also supports GA-state imperiled *Stachys latidens* and NC-state imperiled *Trillium simile* (regional endemic) and *Eupatorium steelei*.
Global Vegetation: This association represents forests of medium- to high-elevation protected coves in the southern Appalachian Mountains. Tree canopies are dominated by variable mixtures of *Acer saccharum, Aesculus flava, Fraxinus americana, Halesia tetraptera var. monticola*, and *Tilia americana var. heterophylla*. In the Great Smoky Mountains of North Carolina and Tennessee, relative dominance of canopy species varies from site to site, with some stands strongly dominated by *Halesia tetraptera var. monticola*. Other common canopy species are *Carya cordiformis* and *Quercus rubra*. The shrub layer is very sparse or absent, but the herb layer is dense and luxuriant, with relatively high species richness. A defining feature of this association is the lush herbaceous flora with many calciphilic species indicative of high pH or base-rich soils. Characteristic herbs include *Asarum canadense, Carex plantaginea, Cymophyllus fraserianus, Cystopteris protrusa, Deparia acrostichoides, Diplazium pycnocarpon, Dryopteris goldiana, Hepatica nobilis var. acuta, Hydrophyllum canadense, Osmorhiza claytonii, Prosartes*

lanuginosa (= Disporum lanuginosum), Solidago flexicaulis, and *Viola canadensis*. The herb layer can also have local dominance by *Laportea canadensis, Dryopteris intermedia, Actaea podocarpa (= Cimicifuga americana), Actaea racemosa (= Cimicifuga racemosa), Ageratina altissima*, and *Caulophyllum thalictroides*. This association typically has a much more diverse herbaceous stratum than other deciduous cove forests of the Southern Blue Ridge. Virginia stands of this association entirely lack *Halesia tetraptera var. monticola* and are dominated by *Acer saccharum, Tilia americana var. heterophylla, Fraxinus americana*, and *Aesculus flava*. The most abundant herbs recorded in Virginia plots are *Laportea canadensis, Actaea racemosa, Caulophyllum thalictroides, Impatiens pallida, Trillium sulcatum, Hydrophyllum canadense, Hydrophyllum macrophyllum, Viola canadensis, Dicentra canadensis*, and *Delphinium tricorne*. Many additional herbs occur at low cover. Species richness in plots south of Virginia ranges from 35-94 taxa (mean = 58) per 1000-m2 plot (n = 30 plots). Species richness in 13 400-m2 plots from Virginia ranges from 33-60 taxa (mean = 46).

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (20-Feb-2010). This community is naturally uncommon within its range due to specific habitat requirements. It only occurs in protected, concave topographic positions over high-base status soils in the Southern Blue Ridge, and adjacent parts of the Ridge and Valley and Cumberland Mountains - all regions

with predominantly nutrient-poor (acidic) soils. Although relatively secure and not highly threatened today, most remaining examples of this community have been affected by past logging, thus much of the remaining acreage is not of high quality.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharum - Fraxinus americana - Tilia americana - Liriodendron tulipifera / Actaea racemosa* Forest (CEGL006237) is related but a more northern and western type usually dominated strongly by sugar maple; it also occurs at lower elevations and lacks *Aesculus flava*.
- *Aesculus flava - Betula alleghaniensis - Acer saccharum / Caulophyllum thalictroides - Actaea podocarpa* Forest (CEGL004973) is a higher-elevation, rich northern hardwood forest that always contains a substantial component of *Betula alleghaniensis* and/or *Fagus grandifolia*.
- *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710) is a similar rich cove forest of the same region that occurs at somewhat lower elevations and in less calcareous soils, and has an abundance of *Liriodendron tulipifera* in the overstory.
- *Tilia americana var. heterophylla - Aesculus flava - Acer saccharum / Cystopteris bulbifera - Asarum canadense* Forest (CEGL006472) is a rich, bouldery forest of low-elevation limestone and dolomite valleys, coves and gorges; contains a substantial component of low-elevation species and obligate calciphiles absent from CEGL007695.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Only one plot occurs in the southern Central Appalachians in Giles County, Virginia. This community is characterized by a mixed canopy of *Aesculus flava, Acer saccharum*, and *Tilia americana var. heterophylla*. This is a "montane" type, both in elevation and the overwhelming abundance of *Acer saccharum* and *Aesculus flava*, which may constrain the competitiveness of *Liriodendron* (Fleming and Patterson 2009a).
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This association (CEGL007695) and Central Appalachian Rich Cove Forest (CEGL006237) are virtual "sister" associations. The principal difference is that CEGL007695 has *Aesculus flava* as a prominent tree (absent in CEGL006237) and a few distinctly Southern Appalachian herbs. Giles County, Virginia, is getting close to the northern limit of *Aesculus flava*, so this area is likely a transition zone where stands could go either way. Classify as CEGL007695 if buckeye is present, or as CEGL006237 if not.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Mean pH of this type (5.2) is strongly acidic, while calcium levels are only moderately high. Overall mean soil chemistry is similar to that of Southern Appalachian Rich Cove Forest (Typic Type) (CEGL007710) and does not explain the compositional separation of these units. This association (CEGL007695) is clearly a more "montane" type, and both elevation and the overwhelming abundance of *Acer saccharum* and *Aesculus flava* may constrain the competitiveness of *Liriodendron tulipifera*. This association does not list tuliptree as a component, but it is found within the elevational range of tuliptree.
Global Classification Comments: This association was originally defined for the richest cove forests in the Great Smoky Mountains and may need revision to apply more generally to similar forests in the Southern Blue Ridge. In the Smokies, relative dominance of canopy species varies among examples of this association. Some examples may have canopies strongly dominated by *Halesia tetraptera var. monticola*, while others have major canopy dominance by either *Acer saccharum, Aesculus flava, Tilia americana var. heterophylla*, or *Fraxinus americana*. Deciduous cove forests are perhaps the most complex group of communities to classify in the Southern Blue Ridge, due to a combination of wide environmental range, high species richness, and high biogeographic variability. The recognition of associations based on fertility and elevation is provisional and will likely need further refinement.

In a regional Southern Appalachian classification (1134 plots from Georgia, North Carolina, Tennessee, Virginia) for the Appalachian Trail project (Fleming and Patterson 2009a), 40 plots were classified as this association. Soils collected from these plots are generally strongly or moderately acidic (perhaps influenced by slow organic matter decomposition), but have high calcium and magnesium concentrations consistent with weathering from mafic and other base-rich rocks. The most constant ($\geq$70%) species with mean cover <1% in the 40 analyzed plots are *Acer saccharum, Polystichum acrostichoides, Laportea canadensis, Tilia americana var. heterophylla, Aesculus flava, Caulophyllum thalictroides, Fraxinus americana, Actaea racemosa, Prosartes lanuginosa, Viola canadensis, Osmorhiza claytonii, Dryopteris marginalis, Dryopteris intermedia, Hydrophyllum canadense,*

Impatiens pallida, and *Carya cordiformis*. The most diagnostic species (relative to similar types) are *Hydrophyllum canadense, Caulophyllum thalictroides, Laportea canadensis, Viola canadensis var. canadensis, Astilbe biternata, Tilia americana var. heterophylla, Solidago flexicaulis*, and *Aesculus flava*. In both the Appalachian Trail analysis and a subsequent 1300-plot analysis of all Virginia montane upland forest and woodland vegetation (Fleming and Patterson 2009b), this type was clearly distinct from a group representing *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710), a somewhat lower-elevation rich cove forest with abundant *Liriodendron tulipifera*. The latter is infrequent and rarely attains significant cover in this association (CEGL007695), which can be generally characterized as a "sugar maple-buckeye-basswood" forest.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: These rich forests occur in southwestern Virginia, and more often south into the Southern Blue Ridge. One plot was sampled in the southern Central Appalachians at Angels Rest in Giles County, Virginia.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community occurs in coves throughout the study area but only rarely intersects the trail corridor. It was sampled in Chattahoochee National Forest in Georgia, in Nantahala National Forest at Nantahala Gorge (The Jump Up), Runaway Knob and elsewhere in North Carolina, in Tennessee, and at Lost Mountain, Virginia.
Global Range: This association occurs in the southern Appalachian Mountains of eastern Tennessee, western North Carolina and southwestern Virginia. It likely ranges into the Blue Ridge of Georgia and extends peripherally into Virginia's Cumberland Mountains and Ridge and Valley.

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava* Forest Alliance (A0235)

ELEMENT CONCEPT

Global Summary: This association represents deciduous forests of concave lower slopes and flats at middle elevations (610-1370 m [2000-4500 feet]) in the Southern Blue Ridge and at low to middle elevations (200-915 m [650-3000 feet]) in the Northern Blue Ridge and adjacent Ridge and Valley. The canopy is dominated by some mixture of rich-site mesophytic species such as *Fraxinus americana, Tilia americana var. heterophylla, Aesculus flava*, and *Magnolia acuminata*, occurring with more widely tolerant tree species such as *Liriodendron tulipifera, Acer rubrum, Tsuga canadensis*, and *Betula lenta*. In stands that have been impacted by the last cycle of industrial logging (70-80 years BP), *Liriodendron tulipifera* may dominate. The herbaceous stratum is diverse and often very lush. Typical herbaceous species include *Actaea racemosa (= Cimicifuga racemosa), Caulophyllum thalictroides, Prosartes lanuginosa (= Disporum lanuginosum), Aruncus dioicus, Adiantum pedatum, Collinsonia canadensis, Osmorhiza claytonii*, and *Laportea canadensis*. This association is distinguished by the absence or scarcity of calciphilic species, such as *Diplazium pycnocarpon, Asplenium rhizophyllum, Dryopteris goldiana, Aquilegia canadensis, Solidago flexicaulis, Deparia acrostichoides*, and *Cystopteris protrusa*, by generally occurring at elevations above 610 m (2000 feet) (200 m at the northern end of the range), and by lacking species typical of lower elevation forests.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This low-elevation, lower slope and cove rich tuliptree forest was sampled at 8 locations in the Central Appalachian project area. Sites range from gentle to steep mid and lower slopes and coves associated with sheltered and ravine settings. Soils range from rapidly drained to somewhat poorly drained and include clay loam. The unvegetated surface is typically dominated by leaf litter but may contain substantial to small amounts of exposed bedrock, large and small rocks, downed wood and/or bare soil. Evidence of disturbance includes the presence of exotic plant species.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This cove forest is found at elevations generally below 1,100 m (3,600 feet), the range of plots for this community is from 200 to 1,140 m (650-3,750 feet, mean = 2,415 feet). Sites range from moderate to steep mid and lower slopes on any aspect. Soils are variable but typically acidic but mesic moderately well- to well-drained loam. The unvegetated surface is usually dominated by leaf litter but sometimes there can be significant amounts exposed bedrock, large/small rock, downed wood and/or bare soil. Evidence of disturbance includes trails, past logging, hemlock/fir adelgid damage, and the presence of exotic plant species.

Global Environment: This association is characteristic of concave lower slopes and flats at middle elevations (610-1370 m [2000-4500 feet]) in the Southern Blue Ridge and at low to middle elevations (200-915 m [650-3000 feet]) in the Northern Blue Ridge and adjacent Ridge and Valley. At the northern end of the range in Virginia, maximum elevation decreases from about 760 m (2500 feet) in the Southern Blue Ridge to as low as 200 m (650 feet) at the extreme north end of the Blue Ridge in Clarke and Loudoun counties. In Virginia, stands occupy mesic sites underlain by base-rich substrates, including metabasalt (greenstone), pyroxene-bearing granites, amphibolite, calcareous sandstone, siltstone, shale, limestone, and dolomite. These sites are mostly situated on moderately steep (mean slope = 17°), straight or concave slopes with east to northeast aspects. Soils are deep, dark and fertile, with moderately high mean calcium and magnesium levels.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This low-elevation cove forest is dominated by *Liriodendron tulipifera* in the canopy (at least 50%, but usually close to 100% cover). *Fraxinus americana, Quercus rubra*, and *Tilia americana var. heterophylla* are canopy associates. *Acer saccharum, Acer rubrum, Betula lenta, Carya glabra*, and *Carya ovata* are minor canopy associates *Aesculus flava* is common south of the James River in Virginia. Low-elevation shrubs are absent from most stands but *Lindera benzoin* is common. Montane rich-site herbs such as *Laportea canadensis, Osmorhiza claytonia*, and *Caulophyllum thalictroides* usually among the patch-dominants of a lush and diverse herb layer. Common and/or abundant herbs from sampled plots include *Arisaema triphyllum, Actaea racemosa (= Cimicifuga racemosa), Cardamine angustata, Corydalis flavula, Circaea lutetiana ssp. canadensis, Galearis spectabilis, Polystichum acrostichoides, Sanguinaria*

canadensis, Viola pubescens and *Stellaria pubera*. In addition, this community also supports VA-state imperiled *Trillium cernuum*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy of this cove forest is dominated by *Liriodendron tulipifera*, its coverage highly variable, often 40%, but sometimes close to 100%. Additional tree species may include *Acer* spp., *Aesculus flava, Betula lenta, Carya glabra, Carya cordiformis, Fraxinus americana, Halesia tetraptera var. monticola, Magnolia acuminata, Quercus rubra*, and *Tilia americana var. heterophylla*. Common shrubs include *Lindera benzoin* and *Acer pensylvanicum*. Herb cover is often quite dense (up to 100%); common species include *Adiantum pedatum, Arisaema triphyllum, Botrychium virginianum, Actaea racemosa (= Cimicifuga racemosa), Galearis spectabilis, Galium triflorum, Laportea canadensis, Osmorhiza claytonii, Phegopteris hexagonoptera, Phryma leptostachya, Polygonatum biflorum, Polystichum acrostichoides, Sanicula canadensis, Sanguinaria canadensis, Stellaria pubera*, and *Trillium vaseyi*. In addition, this community also supports several state-rare species: GA-state imperiled *Stachys latidens* and *Triosteum aurantiacum*; NC-state imperiled *Galium lanceolatum* and *Smilax hugeri*; and VA-state imperiled *Trillium cernuum*.

Global Vegetation: In the heart of its Southern Blue Ridge range, canopies of this community are dominated by variable mixtures of nutrient-demanding mesophytic species such as *Fraxinus americana, Tilia americana var. heterophylla*, and *Aesculus flava*, in association with more wide-ranging tree species such as *Liriodendron tulipifera, Acer rubrum, Tsuga canadensis*, and *Betula lenta*. Herb layers are diverse and often very lush. Typical herbaceous species include *Actaea racemosa (= Cimicifuga racemosa), Caulophyllum thalictroides, Aruncus dioicus, Adiantum pedatum, Collinsonia canadensis, Laportea canadensis, Osmorhiza claytonii*, and *Prosartes lanuginosa (= Disporum lanuginosum)*. In the Southern Blue Ridge, this association is distinguished by the scarcity of calciphilic species such as *Diplazium pycnocarpon, Asplenium rhizophyllum, Dryopteris goldiana, Aquilegia canadensis, Solidago flexicaulis, Deparia acrostichoides*, and *Cystopteris protrusa*; by generally occurring at elevations above 610 m (2000 feet); and by lacking species typical of lower elevation forests. Virginia examples are similar but lack *Aesculus flava* in areas north of the James River. *Liriodendron tulipifera, Fraxinus americana, Tilia americana* (both *var. heterophylla* and *var. americana*), and *Quercus rubra* are the most important canopy species. *Acer saccharum, Betula lenta, Carya glabra*, and *Carya cordiformis* are minor canopy associates. *Ulmus rubra* is a constant understory tree that occasionally reaches the overstory. Most occurrences have a patchy to moderately dense shrub layer dominated by *Lindera benzoin* (10-25% mean cover in 51 plots). The herbaceous flora is lush and forb-rich, at least early in the growing season. The most characteristic herbs in Virginia plot samples are *Actaea racemosa, Arisaema triphyllum, Circaea lutetiana ssp. canadensis, Sanguinaria canadensis, Stellaria pubera, Osmorhiza claytonii, Amphicarpaea bracteata, Adiantum pedatum, Asarum canadense, Galearis spectabilis, Ageratina altissima var. altissima, Laportea canadensis*, and *Trillium grandiflorum*. Species richness of 51 Virginia plots ranges from 29 to 98 taxa per 400 square meters (mean = 60).

Global Dynamics: The contemporary abundance of *Liriodendron tulipifera* in this association no doubt reflects the influence of past logging. However, it is likely that *Liriodendron* has always been a component of this vegetation, capable of maintaining a position in these mixed forests because of its rapid growth and superior ability to colonize light gaps caused by downfalls (Fowells 1965, Busing 1995). An abundance of *Acer saccharum* in the understory of some stands of this type also suggests that their composition is a temporary (though long-lasting) seral phase following extensive disturbances which favored *Liriodendron tulipifera*.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area)

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Trillium cernuum* (G5, VA state-imperiled); **Invasive/Exotic Plants**: *Ailanthus altissima* (Medium), *Alliaria petiolata* (High/Medium), *Berberis thunbergii* (High/Medium)
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Galium lanceolatum* (G5, NC state-imperiled), *Smilax hugeri* (G4, NC state-imperiled), *Stachys latidens* (G4G5, GA state-imperiled), *Trillium cernuum* (G5, VA state-imperiled), *Trillium luteum* (G4, NC state-imperiled), *Triosteum aurantiacum* (G5, GA state-imperiled); **Invasive/Exotic Plants**: *Ailanthus altissima* (Medium, invasive/exotic), *Alliaria petiolata* (High/Medium, invasive/exotic), *Berberis thunbergii* (High/Medium, invasive/exotic), *Celastrus orbiculata* (High/Medium, invasive/exotic)
Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Cardamine flagellifera* (G3), *Carex ruthii* (G3), *Euphorbia purpurea* (G3, Southern Blue Ridge endemic), *Panax quinquefolius* (G3G4, under collection pressure), *Stachys clingmanii* (G2), *Trillium rugelii* (G3), *Tsuga caroliniana* (G3); **Other Plants**: *Stellaria pubera* (G5), *Trillium grandiflorum* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (20-Feb-2010). This community is somewhat uncommon due to specialized habitat requirements, but is fairly widespread throughout the Southern Appalachians and southern part of the Central Appalachians. It is secure throughout its range, but susceptible to impacts by logging due to its location in accessible topographic positions.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharum - Fraxinus americana - Tilia americana - Liriodendron tulipifera / Actaea racemosa* Forest (CEGL006237) is the principal rich cove forest of the Central Appalachians, particularly in the Ridge and Valley and Allegheny Mountains; usually codominated by *Acer saccharum*.
- *Aesculus flava - Acer saccharum - (Tilia americana var. heterophylla) / Hydrophyllum canadense - Solidago flexicaulis* Forest (CEGL007695) is a similar rich cove forest of the same region that occurs at somewhat higher elevations and in more calcareous soils, and has an abundance of *Acer saccharum* in the overstory.
- *Betula alleghaniensis - Tilia americana var. heterophylla / Acer spicatum / Ribes cynosbati / Dryopteris marginalis* Forest (CEGL004982) is an obligate boulderfield forest of the Southern Appalachians.
- *Liriodendron tulipifera - Quercus rubra - Fraxinus americana / Asimina triloba / Actaea racemosa* Forest (CEGL006186) occurs at lower elevations and lacks many montane species.
- *Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava - Acer saccharum / (Magnolia tripetala)* Forest (CEGL005222) has a more western distribution.
- *Quercus rubra - Tilia americana var. heterophylla - (Halesia tetraptera var. monticola) / Collinsonia canadensis - Prosartes lanuginosa* Forest (CEGL007878) is strongly dominated by *Quercus rubra*.

- *Tilia americana var. heterophylla - Aesculus flava - Acer saccharum / Cystopteris bulbifera - Asarum canadense* Forest (CEGL006472) is a rich, bouldery forest of low-elevation limestone and dolomite valleys, coves, and gorges; contains a substantial component of low-elevation species and obligate calciphiles absent from CEGL007695.
- *Tilia americana var. heterophylla - Fraxinus americana / Sanguinaria canadensis - (Aquilegia canadensis, Asplenium rhizophyllum)* Forest (CEGL007711)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Although lacking *Aesculus flava* north of the James River in Virginia, this community type is well-represented and seems to have a remarkably consistent composition over nearly the entire length of the Blue Ridge in Virginia. These stands have all recovered from logging in the past, but remain threatened by future timber harvests because of excellent site productivity. Shade-tolerant, invasive exotics, especially *Alliaria petiolata*, pose a serious threat to the integrity of this community's herbaceous flora.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Low-elevation *Liriodendron tulipifera* rich cove forests can be distinguished from successional *Liriodendron tulipifera* forests (i.e., Ruderal Tuliptree Forest (Rich Type) (CEGL007220), Ruderal Tuliptree Forest (Typic Type) (CEGL007221)) by the presence of other rich and mesophytic trees such as *Fraxinus americana, Tilia americana var. heterophylla, Aesculus flava*, and *Magnolia acuminata*. The principal compositional differences between Upper Piedmont-Northern Blue Ridge Basic Mesic Hardwood Forest (CEGL006186) and Southern Appalachian Rich Cove Forest (Typic Type) (CEGL007710), though subtle, are driven by differences in elevation, with CEGL006186 occurring much lower and being essentially a western Piedmont/very low elevation montane community.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: The pH of this type is strongly acidic (near 5.2), while calcium levels are only moderately high. Ordination studies suggest that differences in elevation and relative topographic position are significant. An abundance of *Acer saccharum* in the understory of some stands of this type also suggests that current composition of some stands is a temporary seral phase following extensive disturbances which favored *Liriodendron tulipifera*.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: Approximately one-third of this distribution is north of the range of *Aesculus flava*. Even in the large Southern Appalachian sample used in this regional analysis (48 plots [19 plots in AT corridor]), *Aesculus flava* is not very constant (40%) and attains >10% cover in only four plots. On the other hand, both *Tilia americana* (both vars. included) and especially *Fraxinus americana* are constant.
Global Classification Comments: Deciduous cove forests are perhaps the most complex group of communities to classify in the Southern Blue Ridge, due to a combination of wide environmental range, high species richness, and high biogeographic variability. The recognition of associations based on fertility and elevation is provisional and will likely need further refinement. This association is distinguished by the absence or scarcity of calciphilic species, such as *Diplazium pycnocarpon, Asplenium rhizophyllum, Dryopteris goldiana, Aquilegia canadensis, Solidago flexicaulis, Deparia acrostichoides*, and *Cystopteris protrusa*, by generally occurring at elevations above 610 m (2000 feet), and by lacking species typical of lower elevation forests.

In a regional Southern Appalachian analysis (1134 plots from Georgia, North Carolina, Tennessee, and Virginia) for the Appalachian Trail project, 48 plots were classified as this association (Fleming and Patterson 2009a). Compared to the related *Aesculus flava - Acer saccharum - (Tilia americana var. heterophylla) / Hydrophyllum canadense - Solidago flexicaulis* Forest (CEGL007695), this group has a significantly lower mean elevation (736 m [2415 feet] vs. 994 m [3261 feet] for CEGL007695), and is associated with soils of somewhat lower base status. The most constant (>70%) species with mean cover >1% in the 48 analyzed plots are *Liriodendron tulipifera, Fraxinus americana, Polystichum acrostichoides, Quercus rubra, Acer rubrum, Actaea racemosa, Tilia americana* (both *var. heterophylla* and *var. americana*), and *Amphicarpaea bracteata*. The most diagnostic species (relative to similar types) are *Lindera benzoin, Amphicarpaea bracteata, Liriodendron tulipifera, Actaea racemosa, Polystichum acrostichoides*, and *Galearis spectabilis*.

Although lacking *Aesculus flava* north of the James River, this community type is well-represented and seems to have a remarkably consistent composition over nearly the entire length of the Blue Ridge in Virginia. These stands have all recovered from logging in the past, but remain threatened by future timber harvests because of

excellent site productivity. Shade-tolerant, invasive exotics, especially *Alliaria petiolata*, pose a serious threat to the integrity of this community's herbaceous flora.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was observed along the AT from Reservoir Hollow in Clarke County in northern Virginia south to Quebec in Smyth County in southwestern Virginia. It continues south into the Southern Blue Ridge in southwestern Virginia. It was sampled in Virginia at Brushy Mountain, Jarman Gap, Kimberling Creek, Loft Mountain, Quebec, Reservoir Hollow, and Thompson Wildlife Management Area. There is also an occurrence at Harpers Ferry in Loudoun County, Virginia.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community occurs in coves ranging from northern Georgia to northern Virginia, but only rarely intersects the trail corridor. It was sampled in Georgia, North Carolina (including Birch Springs Shelter in Great Smoky Mountains National Park), Tennessee, and in Virginia near Comers Creek and Hurricane Creek.
Global Range: This association occurs in the southern and central Appalachian Mountains of eastern Tennessee, western North Carolina, northeastern Georgia, and Virginia. It appears to be most frequent on the Blue Ridge proper, with the northernmost occurrence at Harpers Ferry in Loudoun County, Virginia, but ranges into the adjacent Ridge and Valley and extreme northern part of the Cumberland Mountains in Virginia.

[CEGL007878] *Quercus rubra - Tilia americana var. heterophylla - (Halesia tetraptera var. monticola) / Collinsonia canadensis - Prosartes lanuginosa* Forest

Translated Name: **Northern Red Oak - Appalachian Basswood - (Mountain Silverbell) / Richweed - Yellow Fairybells Forest**
Common Name: **Southern Appalachian Red Oak Cove Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava* Forest Alliance (A0235)

ELEMENT CONCEPT

Global Summary: This community is a *Quercus rubra*-dominated rich forest of protected steep, rocky slopes at intermediate elevations (mostly 800-1400 m [2600-4600 feet]) in the Southern Appalachians. Its distribution is not completely known, but appears to be concentrated in the southern part of the Southern Blue Ridge, in southwestern North Carolina, eastern Tennessee, and possibly northern Georgia. This forest has a canopy dominated by *Quercus rubra* (25-50% cover) occurring with lesser amounts of *Tilia americana var. heterophylla, Fraxinus americana, Acer saccharum, Betula lenta*, and *Carya glabra*. *Halesia tetraptera var. monticola* is an important canopy associate over parts of the range, particularly in the Great Smoky Mountains. Other minor canopy and subcanopy trees include *Liriodendron tulipifera, Magnolia acuminata, Acer pensylvanicum, Acer rubrum, Aesculus flava, Carya cordiformis*, and *Prunus serotina*. The shrub stratum is open, made up of saplings from the canopy and subcanopy, with no clear dominant. Herbs are sparse to moderate in coverage, with relatively high species richness. Herbs with the highest coverages are *Collinsonia canadensis, Polystichum acrostichoides, Prosartes lanuginosa, Actaea racemosa, Thelypteris noveboracensis*, and *Impatiens pallida*. Other typical herbs are *Actaea pachypoda, Ageratina altissima var. roanensis, Agrostis* spp., *Arisaema triphyllum, Athyrium filix-femina ssp. asplenioides, Caulophyllum thalictroides, Desmodium nudiflorum, Dioscorea quaternata, Dryopteris marginalis, Galium lanceolatum, Laportea canadensis, Maianthemum racemosum, Phegopteris hexagonoptera, Polygonatum biflorum, Sanguinaria canadensis, Smilax herbacea, Solidago curtisii (= Solidago caesia var. curtisii), Tradescantia subaspera*, and *Viola cucullata*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This *Quercus rubra* cove forest occurs primarily at elevations primarily from 915 to 1,220 m (3,000-4,000 feet) sometimes higher (up to 1,430 m [4,700 feet]). Sites are somewhat steep sheltered slopes or coves with moderately well-drained loam soil. The unvegetated surface is dominated by leaf litter with some downed wood.

Global Environment: This community is found on protected steep, rocky slopes at intermediate elevations in the Southern Appalachians. The known elevational range is 600-1580 m (2000-5200 feet), but most stands occur between 800 and 1400 m (2600-4600 feet). The type is most commonly associated with middle-slope sites that have moderate to high surficial rock cover, including sideslopes and the upper parts of coves. It is also known from more exposed, rocky, convex upper slopes and ridge spurs. The mean aspect of 35 plots samples is 41° (northeast). Soil samples collected from plots are strongly acidic with notably high organic matter content, but have higher magnesium and calcium levels than most other Southern Appalachian soils. Soil chemistry data suggests that mafic bedrock underlies at least some of the sites occupied by this association.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This mesic forest occurs in sheltered coves and has a canopy with *Quercus rubra* ranging from 10-25% cover (a significant component but not dominant) with *Fraxinus americana* and/or *Tilia americana var. heterophylla*; it may also contain *Halesia* spp., *Betula alleghaniensis, Acer saccharum, Aesculus flava, Fagus grandifolia*, and *Carya ovalis*. Shrubs are very sparse. The rich and diverse herbaceous layer may include *Caulophyllum thalictroides, Collinsonia canadensis*, and *Thelypteris noveboracensis*. This community also supports TN-state imperiled *Stachys clingmanii* (also considered globally imperiled) and *Ageratina altissima var. roanensis*.

Global Vegetation: This forest has a canopy dominated by *Quercus rubra* (25-50% cover) occurring with lesser amounts of *Tilia americana var. heterophylla, Fraxinus americana, Acer saccharum, Betula lenta*, and *Carya glabra*. *Halesia tetraptera var. monticola* is an important canopy associate over parts of the range, particularly in the Great Smoky Mountains. Other minor canopy and subcanopy trees include *Liriodendron tulipifera, Magnolia acuminata, Acer pensylvanicum, Acer rubrum, Aesculus flava, Carya cordiformis*, and *Prunus serotina*. The shrub stratum is open, made up of saplings from the canopy and subcanopy, with no clear dominant. Herbs are sparse to moderate in cover, with relatively high species richness. Herbs with the highest covers are *Collinsonia canadensis, Polystichum acrostichoides, Prosartes lanuginosa, Actaea racemosa, Thelypteris noveboracensis*, and *Impatiens pallida*. Other typical herbs are *Actaea pachypoda, Ageratina altissima var. roanensis, Agrostis* spp., *Arisaema*

triphyllum, Athyrium filix-femina ssp. asplenioides, Caulophyllum thalictroides, Desmodium nudiflorum, Dioscorea quaternata, Dryopteris marginalis, Galium lanceolatum, Laportea canadensis, Maianthemum racemosum, Phegopteris hexagonoptera, Polygonatum biflorum, Sanguinaria canadensis, Smilax herbacea, Solidago curtisii (= Solidago caesia var. curtisii), Tradescantia subaspera, and *Viola cucullata*. Many other herbs occur at low cover and constancy. Mean species richness of 35 plots is 67 taxa per 1000 square meters.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Acer saccharum*, *Collinsonia canadensis*, *Halesia tetraptera* var. *monticola*, *Quercus rubra*, *Tilia americana* var. *heterophylla*
Global: *Collinsonia canadensis*, *Prosartes lanuginosa*, *Quercus rubra*, *Tilia americana* var. *heterophylla*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4, TN state-imperiled), *Castanea dentata* (G4, TN state-imperiled), *Stachys clingmanii* (G2, globally imperiled & TN-state critically imperiled)
Global: Vulnerable Plants: *Stachys clingmanii* (G2); **Other Plants**: *Halesia tetraptera* var. *monticola* (G5T5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3? (3-Sep-2002). The conservation status of this community has not yet been fully assessed.

RELATED CONCEPTS

Global Similar Types:

- *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710) is a mesophytic, mixed cove forest with a lusher, richer herb layer and lacking a substantial component of *Quercus rubra*.
- *Quercus alba - Quercus rubra - Quercus prinus / Collinsonia canadensis - Podophyllum peltatum* Forest (CEGL007692) occurs mostly on non-rocky, upper slopes and broad ridgetops and has a substantial component of *Quercus alba*.
- *Quercus rubra - Acer saccharum - Tilia americana var. heterophylla - Aesculus flava - (Cladrastis kentukea)* Forest (CEGL007698)
- *Quercus rubra - Fraxinus americana - Acer saccharum / Actaea racemosa - Caulophyllum thalictroides* Forest (CEGL004256) is a similar Southern Appalachian forest occurring at higher average elevation and only weakly dominated by *Quercus rubra* and with abundant *Acer saccharum, Fraxinus americana*, and *Carya* spp.; also contains some higher-elevation species such as *Betula alleghaniensis, Ageratina altissima var. roanensis*, and *Eurybia chlorolepis*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Moderately high Mg and base saturation in soil samples suggests base-rich substrates.
Global Classification Comments: This association may represent a subset of *Quercus alba - Quercus rubra - Quercus prinus / Collinsonia canadensis - Podophyllum peltatum* Forest (CEGL007692), Appalachian Montane Oak

- Hickory Forest (Rich Type), or may be transitional between it and *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710), Southern Appalachian Cove Forest (Typic Montane Type). More regional information is needed to assess the distinctiveness of this type. It is described from a small number of samples from Great Smoky Mountains National Park. In a regional analysis for the Appalachian Trail project and a follow-up comparative analysis with *Quercus alba - Quercus rubra - Quercus prinus / Collinsonia canadensis - Podophyllum peltatum* Forest (CEGL007692), 35 plots from North Carolina and Tennessee were classified as this type (Fleming and Patterson 2009a). These analyses demonstrated that this type is distinct from CEGL007692 and has a wider distribution on the Southern Blue Ridge than previously documented.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Plots analyzed are concentrated in the southern part of the study area, from the Nantahala Mountains to the Great Smoky Mountains. This community was sampled in Tennessee, including at Big Abrams Gap in Great Smoky Mountains National Park.
Global Range: This community is found in the Southern Blue Ridge of Tennessee, North Carolina, and possibly Georgia.

[CEGL006472] *Tilia americana var. heterophylla - Aesculus flava - Acer saccharum / Cystopteris bulbifera - Asarum canadense* Forest

Translated Name: **Appalachian Basswood - Yellow Buckeye - Sugar Maple / Bulblet Bladderfern - Canadian Wild Ginger Forest**
Common Name: **Southern Appalachian Limestone Rich Cove Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava* Forest Alliance (A0235)

ELEMENT CONCEPT

Global Summary: This association is currently known only from carbonate rock districts in the west-central and southwestern Virginia portions of the Ridge and Valley province, extending into peripheral areas on the flanks of the Southern Blue Ridge and Cumberland Mountains. Occurrences in limestone valleys of West Virginia, Kentucky, and Tennessee seem likely. Sites are restricted to mesic, fertile slopes underlain by limestone or dolomite, small outcrops, and loose talus which is often exposed. Habitats are usually situated on lower to middle slopes subtending streams in low-elevation (<700 m [2200 feet]) montane valleys, coves, and gorges. Slopes are steep to extremely steep (mean = 33°), usually with north to east aspects. Bedrock outcrops are frequent, and significant subsurface lateral seepage may occur seasonally at some sites. Substrate varies from site to site, but generally consists of a mosaic of deep colluvial soil and fine talus or scree that is somewhat to very loose and unstable. Soils collected from plot samples are circumneutral, with very high calcium, magnesium, and total base saturation levels. Stands have a

variable overstory composition, with *Tilia americana var. heterophylla, Aesculus flava, Acer saccharum*, and *Fraxinus americana* consistently important. Other less constant or abundant trees that may be important in some stands include *Ulmus rubra, Carya cordiformis, Liriodendron tulipifera, Quercus muehlenbergii, Quercus rubra, Acer nigrum, Thuja occidentalis*, and *Celtis occidentalis*. On several unusually sheltered, north-facing slopes, *Tsuga canadensis* is a codominant in the canopy mix. The understory and shrub layers of this community tend to be open or sparse, but patches of *Staphylea trifolia* and *Lindera benzoin* are frequent, along with climbing lianas of *Aristolochia macrophylla*. The herb layer is lush and diverse, with an array of patch-dominants that vary both among and within stands. On rockier substrates, *Cystopteris bulbifera* is consistently abundant, often covering up to 50% of an individual plot sample. More-or-less constant herbs that achieve >10% in one or more plots include *Asarum canadense, Solidago flexicaulis, Osmorhiza claytonii, Actaea racemosa, Caulophyllum thalictroides, Laportea canadensis, Impatiens pallida, Polymnia canadensis, Hydrophyllum canadense, Jeffersonia diphylla, Thalictrum dioicum, Viola canadensis, Phacelia bipinnatifida, Dicentra canadensis, Dicentra cucullaria, Trillium grandiflorum, Delphinium tricorne, Stellaria corei*, and *Meehania cordata*. Other characteristic herbs that usually occur at low cover are *Arisaema triphyllum, Sedum ternatum, Cardamine concatenata, Polystichum acrostichoides, Hepatica nobilis var. acuta (= Hepatica acutiloba), Mitella diphylla, Asplenium rhizophyllum, Adiantum pedatum, Uvularia grandiflora, Prosartes lanuginosa, Prosartes maculata, Podophyllum peltatum, Carex albursina, Hybanthus concolor, Trillium sulcatum, Synandra hispidula*, and *Stylophorum diphyllum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This low-elevation (<700 m [2,200 feet]) rich forest occurs on limestone or dolomite talus and boulders in montane valleys, coves, gorges, or steep fertile slopes with many obligate calciphiles. The single sampled site occurs on carbonate rock in the west-central and southwestern Virginia portions of the Ridge and Valley province. It is a mesic ravine with large rocks and dense leaf litter. Evidence of disturbance includes the presence of exotic plant species.

Global Environment: Sites for this community are restricted to mesic, fertile slopes underlain by limestone or dolomite, small outcrops, and loose talus which is often exposed. Habitats are usually situated on lower to middle slopes subtending streams in low-elevation (<700 m [2200 feet]) montane valleys, coves, and gorges. Slopes are steep to extremely steep (mean = 33°), usually with north to east aspects. Bedrock outcrops are frequent, and significant subsurface lateral seepage may occur seasonally at some sites. Substrate varies from site to site, but generally consists of a mosaic of deep colluvial soil and fine talus or scree that is somewhat to very loose and unstable. At sites where fine bouldery colluvium is abundant, there is often a mantle of colluvial soil covering the rocks; in places where large, coarse talus is abundant, soils are primarily interstitial. Overall, exposed rock cover averages about 32% in 16 plot samples. High cover of bryophytes and mesophytic lichens is characteristic on exposed rocks. Soils collected from plot samples indicate very high fertility, with a mean pH of 7.0, 100% mean total base saturation, and very high mean concentrations of calcium (3894 ppm) and magnesium (848 ppm).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy of this low-elevation limestone rich forest is dominated by *Tilia americana var. heterophylla, Acer saccharum, Fraxinus americana*, and/or *Aesculus flava*. Patches of *Staphylea trifolia* and *Lindera benzoin* are frequent in the shrub layer along with climbing lianas of *Aristolochia macrophylla*. Many obligate calciphiles make this association unique. *Cystopteris bulbifera* is consistently abundant in the herb layer; other common herbs include *Caulophyllum thalictroides, Collinsia verna* (VA-state imperiled), and *Trillium sessile*. A total of 43 herbs were recorded from the single sampled plot.

Global Vegetation: Stands have a variable overstory composition, with *Tilia americana var. heterophylla, Aesculus flava, Acer saccharum*, and *Fraxinus americana* consistently important. Other less constant or abundant trees that may be important in some stands include *Ulmus rubra, Carya cordiformis, Liriodendron tulipifera, Quercus muehlenbergii, Quercus rubra, Acer nigrum, Thuja occidentalis*, and *Celtis occidentalis*. On several unusually sheltered, north-facing slopes, *Tsuga canadensis* is a codominant in the canopy mix. The understory and shrub layers of this community tend to be open or sparse, but patches of *Staphylea trifolia* and *Lindera benzoin* are frequent, along with climbing lianas of *Aristolochia macrophylla*. The herb layer is lush and diverse, with an array of patch-dominants that vary both among and within stands. On rockier substrates, *Cystopteris bulbifera* is consistently abundant, often covering up to 50% of an individual plot sample. More-or-less constant herbs that achieve >10% in one or more plots include *Asarum canadense, Solidago flexicaulis, Osmorhiza claytonii, Actaea racemosa, Caulophyllum thalictroides, Laportea canadensis, Impatiens pallida, Polymnia canadensis, Hydrophyllum canadense, Jeffersonia diphylla, Thalictrum dioicum, Viola canadensis, Phacelia bipinnatifida, Dicentra canadensis, Dicentra cucullaria, Trillium grandiflorum, Delphinium tricorne, Stellaria corei*, and

Meehania cordata. Other characteristic herbs that usually occur at low cover are *Arisaema triphyllum, Sedum ternatum, Cardamine concatenata, Polystichum acrostichoides, Hepatica nobilis var. acuta (= Hepatica acutiloba), Mitella diphylla, Asplenium rhizophyllum, Adiantum pedatum, Uvularia grandiflora, Prosartes lanuginosa, Prosartes maculata, Podophyllum peltatum, Carex albursina, Hybanthus concolor, Trillium sulcatum, Synandra hispidula*, and *Stylophorum diphyllum*. Species richness of 24 plot-sampled stands ranges from 21 to 95 taxa per 400 square meters (mean = 58).

Global Dynamics: Distinguishing features of this community are its restriction to areas underlain by carbonate rocks (limestone and dolomite); its affiliation with steep, mesic, often bouldery/gravelly habitats in valleys, gorges, and coves; the infrequency of *Quercus* spp.; and the abundance of *Cystopteris bulbifera* and other obligate calciphiles, along with a generally lush and diverse herb layer with variable patch-dominance by several nutrient-demanding forbs. Although the mean species richness is comparable to that of many other rich cove and slope forests, the herbaceous cover of this type may be locally less dense where very rocky substrates prevail. However, due to the relatively rapid weathering of carbonate minerals and extremely fertile soils, even these microhabitats are typically well-vegetated with herbaceous plants, among which lithophytes such as *Cystopteris bulbifera, Asplenium rhizophyllum, Sedum ternatum*, and *Mitella diphylla* are prominent.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (31-May-2007). The known distribution of this community is restricted to a small portion of the Central Appalachian / Ridge and Valley region. However, within that area the type is frequent and occasionally forms large patches. There are probably more than 100 occurrences within the known range and potentially many more.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharum - Liriodendron tulipifera - Fraxinus americana / Staphylea trifolia* Forest (CEGL006201) of steep, rocky ephemeral creek bottoms on calcareous sandstone and shale in the Cumberland Mountains and Southern Ridge and Valley.
- *Acer saccharum - Tilia americana / Staphylea trifolia / Dryopteris marginalis - (Impatiens pallida)* Forest (CEGL006471) of more northern distribution in the Central Appalachians and Piedmont; an obligate boulderfield community that occupies boulder and talus slopes weathered from a variety of calcium-bearing sedimentary, metasedimentary and igneous rocks.

- *Aesculus flava - Acer saccharum - (Tilia americana var. heterophylla) / Hydrophyllum canadense - Solidago flexicaulis* Forest (CEGL007695) of fertile, sometimes rocky montane coves at higher elevations (610-1400 m [2000-4600 feet]) in the Southern Appalachians.
- *Liriodendron tulipifera - Fraxinus americana - (Aesculus flava) / Actaea racemosa - Laportea canadensis* Forest (CEGL007710) of fertile, sometimes rocky montane coves and slopes, mostly at higher elevations (305-1375 m [1000-4500 feet]) on the Southern and Northern Blue Ridge and immediately adjacent Ridge and Valley.
- *Liriodendron tulipifera - Tilia americana var. heterophylla - Aesculus flava - Acer saccharum / (Magnolia tripetala)* Forest (CEGL005222) is a very similar community of fertile slopes in the western part of the Central Appalachians, the Western Allegheny Plateau, and Cumberland Plateau regions; possibly not as rich, nor restricted to sites underlain by carbonate rocks.
- *Tilia americana var. heterophylla - Fraxinus americana / Sanguinaria canadensis - (Aquilegia canadensis, Asplenium rhizophyllum)* Forest (CEGL007711) of steep, protected, fertile coves and slopes at low elevations (<610 m [2000 feet]) in the Southern Appalachians and adjacent upper Piedmont.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This association encompasses very rich forests of low-elevation coves and river-fronting slopes on limestone and dolomite of the Ridge and Valley province.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Ordination studies demonstrate that it is separated from the more montane cove forests of this analysis at the high end of substrate and soil fertility gradients, where it is correlated with high pH, Ca, Mg, B, base saturation, and boulder cover. It contains a number of low-elevation, calciphilic species that are absent from, or uncommon in, the other rich cove types of the region, e.g., *Cystopteris bulbifera, Staphylea trifolia, Jeffersonia diphylla, Quercus muehlenbergii, Polymnia canadensis*, etc. (Fleming and Patterson 2009a).
Global Classification Comments: Virginia Natural Heritage have now inventoried and sampled many examples of this community in southwest Virginia, and although most sites are rocky, it is not always a "talus" forest but more of a general rich cove forest. Virginia has changed their state name to Southern Appalachian Limestone Rich Cove Forest. The classification was initially supported by analysis of data from eight plots as part of the National Capital Region Parks project. During this project, these plots were examined in a regional (Virginia, Maryland, West Virginia) dataset, along with other plots representing rich talus forest vegetation. The analysis supported this type as distinct from other Central Appalachian rich boulderfields. In a more recent regional analysis for the Appalachian Trail vegetation mapping project (1134 Southern Appalachian plots) (Fleming and Patterson 2009a) and a Virginia statewide analysis of upland montane forests and woodlands (1300 plots) (Fleming and Patterson 2009b), this association was represented by 24 plots from southwestern Virginia. Through extensive field work and these analyses, this type is currently treated as a concept that encompasses a range of substrate conditions, from boulderfields to deep soils.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs near the AT only along the New River at Bluff City, in Giles County, Virginia.
Global Range: The type is currently known only from carbonate rock districts in the west-central and southwestern Virginia portions of the Ridge and Valley province, extending into peripheral areas on the flanks of the Southern Blue Ridge and Cumberland Mountains. Since similar limestone valleys are found in adjacent areas of West Virginia, Kentucky, and Tennessee, occurrences in those states seem likely. Similar vegetation has been observed in southeastern West Virginia (D.P. Walton pers. comm.).

A3304 *Tsuga canadensis - Liriodendron tulipifera* Forest Alliance

Alliance Summary Description: Forests in this alliance are acidic cove forests dominated by *Tsuga canadensis*, occurring with various hardwood species of mesic forests, including *Betula lenta, Fagus grandifolia, Fraxinus americana, Halesia tetraptera, Liriodendron tulipifera, Magnolia acuminata, Quercus rubra*, and *Tilia americana var. heterophylla*, and others. Common shrubs are *Kalmia latifolia, Leucothoe fontanesiana*, and *Rhododendron maximum*. Herbaceous cover is typically sparse and includes acid-loving species such as *Galax urceolata, Goodyera pubescens, Hexastylis* sp., *Polystichum acrostichoides, Thelypteris noveboracensis*, and *Tiarella cordifolia*. They are found primarily in the Southern Blue Ridge, but also ranging into widely scattered areas of the Interior Low Plateau and Cumberlands, where stands containing *Tsuga canadensis* may be notably disjunct from its main range in the north. These forests occur in deep coves, moist flats, and ravines but are occasionally found along larger stream bottoms, typically at elevations below 1068 m (3500 feet).

[CEGL007543] *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest

Translated Name: **Tuliptree - Sweet Birch - Eastern Hemlock / Great Laurel Forest**
Common Name: **Southern Appalachian Acidic Cove Forest (Typic Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

ELEMENT CONCEPT

Global Summary: This association includes hemlock-hardwood forests and acidic cove forests of lower to intermediate elevations in the Southern Blue Ridge, upper Piedmont, Cumberlands, and adjacent areas, ranging from southwestern Virginia and southern West Virginia, south and west to northwestern Georgia. The concept for this association is intended to be broad and cover both mixed stands of evergreen and deciduous hardwoods as well as stands dominated exclusively by deciduous trees in mesic, acidic environments. These communities occur at low to middle elevations (200-1060 m [650-3500 feet]), generally in coves, gorges or sheltered slopes, over acidic soils. The canopy is usually dominated by *Liriodendron tulipifera* or *Betula lenta* mixed with *Tsuga canadensis*, but substantial portions may be comprised mainly of *Tsuga canadensis* and the occasional *Acer rubrum*, while other sites may have little or no *Tsuga* in the canopy. Other deciduous species more typical of "rich" coves may occur as scattered individuals, including *Tilia americana var. heterophylla, Acer saccharum, Fraxinus americana*, and *Fagus grandifolia*. Other canopy/subcanopy species often include *Quercus alba, Quercus rubra, Magnolia fraseri*, and *Pinus strobus*. *Rhododendron maximum* is usually dominant in the shrub stratum, often forming impenetrable thickets. South of Virginia, woody associates may also include *Ilex opaca var. opaca, Calycanthus floridus, Halesia tetraptera var. tetraptera*, and *Leucothoe fontanesiana*. Herbaceous cover is sparse but can be diverse and is composed of acid-loving species. Typical herbs include *Polystichum acrostichoides, Dryopteris intermedia, Dennstaedtia punctilobula, Goodyera pubescens, Mitchella repens, Thelypteris noveboracensis, Galax urceolata, Viola rotundifolia*, and *Tiarella cordifolia*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This acidic cove forest is found at lower elevations (400-1,160 m [1,300-3,800 feet]) along lower slopes, creeks and in ravines. It was sampled at 8 locations in the southern Central Appalachian project area. Sites range from alluvial flats to mostly mid- and lower-slope coves. Soils are mesic silt loam, sandy loam and clay loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. In Virginia, the *Tsuga canadensis* component is being severely affected by hemlock woolly adelgid-related mortality.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This acidic cove forest is found at lower elevations (400-1,160 m [1,300-3,800 feet]) than other cove forests. Sites cover a full range of topography, including alluvial flats as well as moderate to very steep lower to upper slopes. Soils are likewise variable, the most common being moderately well- to well-drained loam, clay loam, sandy loam, and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional large/small rocks and bare soil. Evidence of disturbance includes past logging, erosion, trails, and hemlock/fir adelgid and pine bark beetle damage.

Global Environment: This association is typically found at lower to intermediate elevations (200-1060 m [650-3500 feet]) in the Southern Appalachians and adjacent foothills as well as nearby plateau/gorge systems in West Virginia. Habitats are mesic and located on gentle to steep, lower slopes along creeks in ravines, in coves or gorges, and in concave positions on protected slopes with cool aspects and acidic soils. In situations where midslopes are in protected north-facing positions, this community can range very high up straight or even convex slopes. The type often occurs in linear patches along stream bottoms and in steep ravines in complexes with rich cove communities. Although frequently associated with streams, it is not a wetland. Soils collected from plots are extremely acidic (mean pH = 4.0) and infertile, with high iron and aluminum levels and very low total base saturation. Where present, they are usually well-drained sandy loam, silt loam, loam, clay loam, or clay. The degree of soil development is highly variable. Some stands have relatively deep colluvial or residual soils, while others have a substrate of deeply piled boulders with sparse interstitial, organic soils.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This cove forest has a variable canopy that is codominated by a mixture of *Liriodendron tulipifera, Betula lenta, Tsuga canadensis, Pinus strobus, Acer rubrum, Quercus rubra*, and/or *Quercus alba*. The relative proportion of *Tsuga canadensis* may vary greatly, with some sites having little or none in the canopy. *Rhododendron maximum* is the dominant shrub; *Acer pensylvanicum* and *Hamamelis virginiana* are also common shrubs. *Smilax rotundifolia* is a common vine. Common in the herb layer are *Mitchella repens, Polystichum acrostichoides*, and *Thelypteris noveboracensis*. Characteristic herbs include *Anemone quinquefolia var. quinquefolia, Carex laxiculmis var. laxiculmis, Viola blanda var. blanda*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by species associated with acidic geology, such as *Liriodendron tulipifera, Betula lenta*, and *Tsuga canadensis*, and lacking those of nutrient-rich sites such as *Tilia americana, Fraxinus americana*, or *Aesculus flava*. Other common tree species are *Pinus strobus, Quercus alba, Quercus prinus*, and *Quercus rubra*. The herbaceous layer is usually dominated by ferns, with low to moderately high diversity and lacking species indicative of nutrient-rich soils. *Rhododendron maximum* dominates the sparse to dense shrub layer; other shrubs may include *Acer pensylvanicum, Amelanchier arborea, Hamamelis virginiana, Kalmia latifolia*, and *Pyrularia pubera*. The herbaceous layer is usually dominated by ferns, such as *Dennstaedtia punctilobula, Polystichum acrostichoides*, and *Thelypteris noveboracensis*, with low to moderately high diversity and lacking species indicative of nutrient-rich soils. Typical forbs include *Arisaema triphyllum, Eurybia divaricata, Goodyera pubescens, Medeola virginiana, Mitchella repens, Polygonatum biflorum, Solidago curtisii, Viola hastata*, and *Viola rotundifolia*.

Global Vegetation: This association encompasses hemlock-hardwood forests and acidic cove forests with canopies dominated by mixtures of *Tsuga canadensis, Liriodendron tulipifera, Betula lenta, Quercus rubra*, and *Acer rubrum*. The concept for this association is intended to be broad and cover both mixed stands of evergreen and deciduous hardwoods as well as stands dominated exclusively by deciduous trees. Presumably because of past logging, *Tsuga canadensis* is absent or confined to the understory in some stands, which have mixed canopies of *Liriodendron tulipifera, Betula lenta, Acer rubrum, Magnolia acuminata, Quercus rubra*, and/or *Nyssa sylvatica*. Other deciduous species more typical of fertile coves, including *Tilia americana var. heterophylla, Acer saccharum, Fraxinus americana*, and *Fagus grandifolia*, may occur as scattered individuals. Minor overstory and understory species include *Quercus alba, Quercus prinus, Magnolia fraseri, Magnolia tripetala, Oxydendrum arboreum, Prunus serotina*, and *Pinus strobus*. *Rhododendron maximum* is scattered to dominant in the shrub stratum often forming nearly impenetrable colonies. *Kalmia latifolia* is also a typical, but less abundant, shrub. In the southern

portion of this type's range, *Calycanthus floridus, Halesia tetraptera*, and *Leucothoe fontanesiana* may be common; these are lacking in Virginia and West Virginia occurrences, where *Hamamelis virginiana* and *Acer pensylvanicum* may be minor associates. Herbaceous cover is sparse but can be diverse and is composed of acid-loving species. Frequent low-cover species of this layer include *Arisaema triphyllum, Chimaphila maculata, Dioscorea quaternata, Dryopteris intermedia, Dryopteris marginalis, Eurybia divaricata (= Aster divaricatus), Galax urceolata, Gaultheria procumbens, Goodyera pubescens, Hexastylis* spp., *Luzula echinata, Monotropa uniflora, Medeola virginiana, Mitchella repens, Polypodium virginianum, Polystichum acrostichoides, Thelypteris noveboracensis, Tiarella cordifolia, Viola blanda*, and *Waldsteinia fragarioides*. The spectacular sedge *Cymophyllus fraserianus* is often associated with this forest. Bryophytes identified in West Virginia plots include *Leucobryum glaucum, Thuidium delicatulum, Hypnum imponens, Bazzania trilobata, Dicranum scoparium, Dicranum fulvum, Brotherella recurvans*, and *Polytrichum pallidisetum*.

Global Dynamics: In Virginia, the hemlock component of many stands has been devastated by outbreaks of hemlock woolly adelgid, resulting in extensive damage and mortality to the mature overstory trees.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Rhododendron minus* (G4, TN state-imperiled); **Invasive/Exotic Plants**: *Stellaria media* (Low, invasive/exotic)

Global: Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Betula uber* (G1Q), *Botrychium jenmanii* (G3G4), *Diervilla rivularis* (G3), *Hexastylis contracta* (G3), *Hexastylis naniflora* (G3), *Hexastylis rhombiformis* (G3), *Isotria medeoloides* (G2?), *Malaxis bayardii* (G1G2), *Monotropsis odorata* (G3), *Prenanthes roanensis* (G3), *Scutellaria saxatilis* (G3), *Shortia galacifolia* var. *brevistyla* (G3T2), *Shortia galacifolia* var. *galacifolia* (G3T2T3), *Trillium persistens* (G1G2), *Trillium pusillum* var. 1 (G3T2Q), *Trillium rugelii* (G3), *Vaccinium hirsutum* (G3), *Waldsteinia lobata* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (27-Sep-2004). Within its range, this community type occurs extensively in suitable mesic habitats. Occurrences are subject to compositional modification by outbreaks of hemlock woolly adelgid (*Adelges tsugae*), an exotic insect pest that causes decline and eventual mortality of *Tsuga canadensis*.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: The most constant species (≥64%), in order of descending constancy, are *Rhododendron maximum, Tsuga canadensis, Betula lenta, Acer rubrum, Liriodendron tulipifera, Quercus rubra, Mitchella repens, Polystichum acrostichoides*, and *Hamamelis virginiana*. Variable species richness is probably influenced by somewhat variable soil fertility and the variation in cover/density of evergreen *Rhododendron* shrub colonies. High canopy compositional variation may occur due to dramatic changes currently happening in this community as a result of hemlock losses.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This represents the typical acidic cove forest of the Southern Appalachians. Variable richness is probably influenced by somewhat variable soil fertility and especially variation in cover/density of evergreen *Rhododendron* shrub colonies.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: In Virginia, at least, the *Tsuga* component is being severely affected by adelgid-related mortality. If trends continue, this species may have to be made a parenthetical nominal in the future.
Global Classification Comments: Deciduous trees more typical of "rich" coves, such as *Aesculus flava, Tilia americana var. heterophylla*, and *Acer saccharum*, are present in this forest only as minor components, if at all. Likewise, rich-site herbs, such as *Actaea racemosa (= Cimicifuga racemosa), Caulophyllum thalictroides, Actaea pachypoda*, and *Adiantum pedatum*, are absent or nearly so. This forest is distinguished from "northern hardwood forests" by the lack of or near absence of *Fagus grandifolia, Betula alleghaniensis, Aesculus flava*, and the presence of low-elevation species, such as *Betula lenta* and *Liriodendron tulipifera*, and generally by a more depauperate herb layer. There is much variability in species composition in the 43 plots classified as this association from the Appalachian Trail region (Fleming and Patterson 2009a), but constancy of the nominal species was quite high (≥84%). The most constant species (≥64%), in order of descending constancy, are *Rhododendron maximum, Tsuga canadensis, Betula lenta, Acer rubrum, Liriodendron tulipifera, Quercus rubra, Mitchella repens, Polystichum acrostichoides*, and *Hamamelis virginiana*. Species richness in 400-m2 plots ranges from 11 to 72 species per plot. This variable richness is probably influenced by somewhat variable soil fertility and the variation in cover/density of evergreen *Rhododendron* shrub colonies. An interesting example from the Piedmont/Blue Ridge transition of Georgia (Cedar Creek Canyon, Chattahoochee National Forest) has high coverage of *Rhododendron minus* and other foothills/Piedmont species such as *Liquidambar styraciflua* and *Aesculus sylvatica*.

In the 900- to 1060-m (3000-3500 feet) elevational range, the type becomes transitional to *Betula alleghaniensis - (Tsuga canadensis) / Rhododendron maximum / (Leucothoe fontanesiana)* Forest (CEGL007861),

which lacks lower-elevation species such as *Liriodendron tulipifera* and *Galax urceolata*, and contains many species characteristic of higher elevations and northern latitudes.

Similar vegetation has been observed in coves of the Cumberland Mountains of southwestern Virginia (e.g., Clinch Ranger District: Dark Hollow, Roaring Branch, Pick Breeches and Flannery Ridges,) but comprehensive data are needed to determine whether these stands are part of this forest types or transitional to *Tsuga canadensis - (Fagus grandifolia, Tilia americana var. heterophylla) / Magnolia tripetala* Forest (CEGL008407). The latter unit apparently has an extensive distribution in the Cumberland Plateau of Kentucky and Tennessee, the Southern Ridge and Valley of Tennessee, and the Central Appalachians of West Virginia and southwestern Pennsylvania.

Element Distribution

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from Roanoke, Virginia, in the southern Central Appalachians south to Georgia in the Southern Blue Ridge. It was sampled in Virginia at Bluff City North, Brushy Mountain / Dismal Creek, Iron Spring Branch, Lick Creek, Pearis Mountain West, Pine Swamp Branch, and Vaught Branch.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is frequent in coves along and near the AT throughout the Southern Blue Ridge and Cumberlands and into southwestern Virginia. It was sampled in Chattahoochee National Forest in Georgia, in North Carolina and Tennessee, and at Feathercamp Ridge, Holston Mountain, Lost Mountain, and Whitetop Laurel Creek in Virginia.
Global Range: This community occurs in the Southern Blue Ridge and Cumberlands and peripherally in the upper Piedmont and southern Central Appalachians, ranging from southwestern Virginia and southeastern West Virginia south and west to northwestern Georgia.

Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

Element Concept

Global Summary: This association comprises small-stream floodplain forests of the shale lowlands of Virginia's Ridge and Valley and parts of the Northern Blue Ridge. Sites encompass the bottoms and toeslope terraces of small, high-order, more-or-less high-gradient mountain streams at elevations less than 760 m (2500 feet). *Liriodendron tulipifera* and *Pinus strobus* are the most constant and abundant canopy trees, but *Tsuga canadensis, Quercus alba*, and *Betula lenta* are locally codominant. Many additional species occur as minor canopy or understory trees. *Carpinus caroliniana* and *Cornus florida* are dominant in the shrub layer. It has an extremely diverse though not particularly dense herbaceous stratum, with a mixture of wetland and upland species.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This small-stream floodplain forest occurs in the shale lowlands of Virginia's Ridge and Valley and parts of the Northern Blue Ridge. It was sampled at two locations in the park, both in the Central Appalachian project area. One site is a somewhat steep, north-facing slope with moderately well-drained soil; the other is a flat floodplain along Craig Creek on sandy clay alluvium weathered from shale. The unvegetated surface at the first site is a mix of exposed bedrock, large rocks, litter/duff, downed wood, and bare soil, while the other is dominated by litter/duff with some small rocks, downed wood, and bare soil. The first stand is described as an old-growth forest of ice- and wind-deformed trees. Other evidence of disturbance includes the presence of exotic species.

Global Environment: Sites encompass the bottoms and toeslope terraces of small, high-order, more-or-less high-gradient mountain streams at elevations less than 760 m (2500 feet). Hydrologic regime is probably similar to that reported for Passage and Mill creeks in the Massanutten Mountains, where annual water table fluctuations are dramatic and small-scale fluvial landforms greatly influence species distributions (Hupp 1982, 1986, Olson and Hupp 1986). The lowest terraces of these narrow bottoms are probably flooded briefly once a year, while higher terraces are inundated only during rare, catastrophic floods. Slope ranges from 0-10° and aspect is variable. Microtopography is complex and includes floodplains, terraces, fans at tributary hollow mouths, and various bank features. Coarse woody debris, boulders, and cobbles transported by flood events are usually prominent components of the surface substrate. Soils are highly variable and range from well-drained to poorly drained. Soils collected from plot-sampled stands were strongly acidic (mean pH = 5.2) with moderately low base status.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is typically dominated by *Liriodendron tulipifera* and *Pinus strobus*, with *Tsuga canadensis, Betula lenta*, and *Quercus alba* as associates. Other tree species may include *Acer rubrum, Acer saccharum, Carya ovata, Fraxinus americana, Platanus occidentalis*, and *Quercus velutina*. Common and/or abundant shrubs include *Carpinus caroliniana, Cornus florida*, and *Lindera benzoin*. Common vines include *Smilax rotundifolia, Parthenocissus quinquefolia* and *Toxicodendron radicans*. The diverse herb layer (up to 50 species have been recorded from a single plot) is dominated by *Amphicarpaea bracteata* and *Eurybia divaricata*. *Mitchella repens, Carex digitalis, Dichanthelium dichotomum var. dichotomum, Polystichum acrostichoides*, and *Dioscorea quaternata* are also common herbs.

Global Vegetation: Microtopographic diversity supports a wide range of mesophytic and wetland species, and contributes to notably high species richness (range = 46 to 122 taxa per 400 m2; mean = 73) in plot-sampled stands. *Liriodendron tulipifera* and *Pinus strobus* are the most constant and abundant canopy trees, but *Tsuga canadensis, Quercus alba*, and *Betula lenta* are locally codominant. Many additional species occur as minor canopy or

understory trees, including *Acer rubrum, Carya alba, Carya ovata, Carya cordiformis, Fraxinus americana, Juglans nigra, Magnolia acuminata, Platanus occidentalis, Quercus rubra*, and *Ulmus americana*. *Carpinus caroliniana* and *Cornus florida* are dominant in the shrub layer, frequently extending into the lowest (6-10 m tall) tree layer. Other characteristic shrubs are *Lindera benzoin, Hamamelis virginiana, Ostrya virginiana, Viburnum prunifolium, Viburnum acerifolium*, and *Asimina triloba*. Climbing lianas, including *Parthenocissus quinquefolia, Toxicodendron radicans, Smilax rotundifolia*, and *Vitis* spp., are often common. The herb layer is usually very diverse although not particularly dense or lush. Some of the more constant species in plot-sampled stands include *Amphicarpaea bracteata, Botrychium virginianum, Polystichum acrostichoides, Geranium maculatum, Eurybia divaricata (= Aster divaricatus), Desmodium nudiflorum, Actaea racemosa (= Cimicifuga racemosa), Galium triflorum, Stellaria pubera*, and *Arisaema triphyllum*. Herbs that are associated with more frequently flooded streambanks and other wet microhabitats include *Carex torta, Dichanthelium clandestinum, Glyceria striata, Impatiens capensis, Leersia virginica, Lycopus virginicus, Ranunculus recurvatus, Thalictrum pubescens, Verbesina alternifolia*, and *Viola cucullata*.

Global: Vulnerable Plants: *Anemone quinquefolia* var. *minima* (G5T3), *Tsuga caroliniana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (1-Oct-2001). Although patch sizes are small, there are likely to be several hundred occurrences of this community type in Virginia alone.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharum - Liriodendron tulipifera / Galium concinnum - Carex laxiculmis* Forest (CEGL006473)
- *Liriodendron tulipifera - Pinus strobus - Tsuga canadensis - Quercus rubra / Polystichum acrostichoides* Forest (CEGL006304) is an upland forest of acidic coves.
- *Liriodendron tulipifera - Platanus occidentalis - Betula lenta / Lindera benzoin / Circaea lutetiana ssp. canadensis* Floodplain Forest (CEGL006255) is a richer and more diverse small-stream floodplain forest of base-rich alluvium in the Northern Blue Ridge.
- *Tsuga canadensis - Liriodendron tulipifera - Platanus occidentalis / Rhododendron maximum - Xanthorhiza simplicissima* Wet Forest (CEGL007143) lacks abundant tulip poplar.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This type is a small-stream floodplain forest of metashale and shale landscapes in the Central Appalachians.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: In three studies of national forest landscapes conducted by Virginia Division of Natural Heritage ecologists (Fleming and Moorhead 1996, Rawinski et al. 1996, Fleming and Moorhead 2000), vegetation of small-stream floodplains had the highest species richness of any classified community type, as well as the single plot with the highest richness recorded in the Virginia mountains (Plot PM28, Peters Mountain, Alleghany County, n=122). Twelve plots were classified as this association in the Appalachian Trail classification study (Fleming and Patterson 2009a).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This forest association occurs on the shale lowlands of Virginia's Ridge and Valley and parts of the Northern Blue Ridge. It was sampled in Virginia along Jennings Creek in Botetourt County and along Craig Creek in Craig County.
Global Range: This community is widely but locally distributed in the Blue Ridge and Ridge and Valley regions of northwestern and west-central Virginia. Occurrences in Maryland, Pennsylvania, and West Virginia are likely.
Nations: US
States/Provinces: VA:S3, WV?
TNC Ecoregions: 59:C

[CEGL006304] *Liriodendron tulipifera - Pinus strobus - Tsuga canadensis - Quercus rubra / Polystichum acrostichoides* Forest

Translated Name: **Tuliptree - Eastern White Pine - Eastern Hemlock - Northern Red Oak / Christmas Fern Forest**
Common Name: **Central Appalachian Acidic Cove Forest (White Pine - Hemlock - Mixed Hardwoods Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

ELEMENT CONCEPT

Global Summary: This mixed hardwood - white pine - hemlock cove forest is widely but locally distributed in the southern part of the Central Appalachians in Virginia, West Virginia, and Maryland. It occurs on the lower slopes and bottoms of ravines and coves at lower elevations, generally below 915 m (3000 feet). Sites may be underlain by bedrock or colluvial and alluvial deposits of various sedimentary and metasedimentary rocks, granitic rocks, or metabasalt. Habitats are generally mesic with acidic soils of moderate or intermediate fertility. The overstory is codominated by variable mixtures of *Liriodendron tulipifera, Pinus strobus, Tsuga canadensis, Quercus rubra*, and *Quercus alba*. This forest generally has a moderate to strong evergreen component, but *Pinus strobus* varies from

widely scattered to codominant, and *Tsuga canadensis* has been greatly reduced by recent outbreaks of the hemlock woolly adelgid and may be restricted to the understory. Less frequent overstory associates include *Acer rubrum, Betula lenta, Carya* spp., *Fagus grandifolia, Fraxinus americana, Nyssa sylvatica*, and *Quercus prinus*. Characteristic understory species include *Acer pensylvanicum, Amelanchier arborea, Cercis canadensis, Cornus florida, Ostrya virginiana, Oxydendrum arboreum, Viburnum acerifolium, Rubus* spp., *Corylus americana, Hamamelis virginiana, Hydrangea arborescens*, and *Lindera benzoin*. The herb layer is usually patchy to moderately dense. Frequent patch-dominants include *Amphicarpaea bracteata, Dennstaedtia punctilobula, Eurybia divaricata*, and *Polystichum acrostichoides*. Other constant but low-cover herbs include *Botrychium virginianum, Desmodium nudiflorum, Dioscorea quaternata, Galium triflorum, Maianthemum racemosum ssp. racemosum, Mitchella repens*, and *Stellaria pubera*. Many additional herbs occur at low constancy.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This acidic cove forest occurs on the lower slopes and bottoms of ravines and coves at lower elevations, generally below 915 m (3,000 feet). It was sampled once in the park at 331 m elevation on a somewhat steep, broad south-facing lower slope on shale with well-drained soil. The unvegetated surface is dominated by leaf litter with some downed wood, small rocks and bare soil. Evidence of disturbance includes the presence of exotic plant species, logging, and damage from pine bark beetle and hemlock woolly adelgid.

Global Environment: This community occurs at lower elevations, generally below 915 m (3000 feet), on the lower slopes and bottoms of ravines and coves, extending to upper slopes, ridgetops, and rolling plateaus on parts of the Cumberland Plateau. Sites may be underlain by bedrock or colluvial and alluvial deposits of various metasedimentary rocks, granitic rocks, or metabasalt. Habitats are generally mesic with acidic soils of moderate or intermediate fertility. Soils are mostly well-drained, dry to moist sandy loam, sandy clay loam, silt loam, loam, and silty clay.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Tsuga canadensis* and *Pinus strobus* codominate the canopy. Canopy associates include *Quercus rubra, Quercus prinus*, and/or *Quercus alba*. *Liriodendron tulipifera* is often present. *Acer rubrum, Acer pensylvanicum, Amelanchier arborea, Cercis canadensis*, and/or *Cornus florida* are common tall shrubs and small trees. *Rhododendron maximum* is absent.

Global Vegetation: The overstory is codominated by variable mixtures of *Liriodendron tulipifera, Pinus strobus, Tsuga canadensis, Quercus rubra, Quercus velutina*, and *Quercus alba*. This forest generally has a moderate to strong evergreen component, but *Pinus strobus* varies from absent to widely scattered to codominant, and *Tsuga canadensis* has been greatly reduced in many areas by recent outbreaks of the hemlock woolly adelgid and may be restricted to the understory. Less frequent overstory associates include *Acer rubrum, Betula lenta, Carya alba, Carya glabra, Fagus grandifolia, Fraxinus americana, Nyssa sylvatica*, and *Quercus prinus*. The subcanopy is of variable cover and may include *Acer pensylvanicum, Acer rubrum, Amelanchier arborea, Cercis canadensis, Cornus florida, Ostrya virginiana, Oxydendrum arboreum, Nyssa sylvatica, Pinus strobus*, and *Tsuga canadensis*. The shrub layer is typically patchy or open and characterized by *Viburnum acerifolium, Rubus* spp., *Corylus americana, Hamamelis virginiana, Hydrangea arborescens, Ilex opaca*, and *Lindera benzoin*. The herb layer is usually patchy to moderately dense. Frequent patch-dominants include *Amphicarpaea bracteata, Dennstaedtia punctilobula, Eurybia divaricata*, and *Polystichum acrostichoides*. Other constant but low-cover herbs include *Botrychium virginianum, Desmodium nudiflorum, Dioscorea quaternata, Galium triflorum, Maianthemum racemosum ssp. racemosum, Medeola virginiana, Mitchella repens, Stellaria pubera, Viola hastata*, and *Dryopteris intermedia*. Many additional herbs occur at low constancy. Species richness of 34 Virginia and West Virginia plot samples ranges from 21 to 98 taxa per 400 square meters (mean = 57), with the WV plots decidedly less species-rich (WV mean=28.5 spp.; VA mean = 64 spp.).

Global Dynamics: Compositional variation in Central Appalachian mesic cove forests is strongly correlated with variation in soil chemistry, particularly calcium, magnesium, and total base saturation levels. Analyses of extensive regional plot data indicate that this community type occupies an intermediate position on the soil fertility gradient, on sites with acidic, moderately infertile to moderately fertile substrates.

Global: *Pinus strobus*, *Tsuga canadensis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Rubus phoenicolasius* (Medium)
Global: Vulnerable Plants: *Panax quinquefolius* (G3G4, under collection pressure)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (25-Jan-2008). This community appears to be widely but locally distributed over a large part of the Central Appalachians in Virginia, West Virginia, and Maryland. The type frequently forms large patches in suitable mesic habitats, but mature, high-quality stands are uncommon due to extensive past logging and more recent biotic disturbances (e.g., hemlock woolly adelgid).

RELATED CONCEPTS

Global Similar Types:

- *Liriodendron tulipifera - Pinus strobus - (Tsuga canadensis) / Carpinus caroliniana / Amphicarpaea bracteata* Forest (CEGL008405) very similar but currently defined as a montane alluvial forest of small-stream floodplains.
- *Pinus strobus - Quercus alba - Quercus prinus / Vaccinium stamineum* Forest (CEGL008539) occurs on drier sites, primarily in the central Appalachian Ridge and Valley province and the Piedmont.
- *Pinus strobus - Tsuga canadensis / Acer pensylvanicum / Polystichum acrostichoides* Forest (CEGL006019) evergreen forest restricted to the northern part of the Central Appalachians.
- *Tsuga canadensis - Quercus prinus - Liriodendron tulipifera / Kalmia latifolia - (Rhododendron catawbiense)* Forest (CEGL008512) occurs in the same region but occupies extremely infertile coves, mostly on acidic granite, sandstone, and quartzite.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: *Rhododendron maximum* is absent from this community. This type has a strong *Pinus strobus* component and significantly higher herb richness due to its association with subacidic soils. High canopy compositional variation may occur due to dramatic changes currently happening in this community as a result of hemlock losses. For example, *Pinus strobus* is now the sole evergreen codominant or dominant in many stands. Even in stands unaffected by adelgid, the proportions of hemlock and white pine are highly variable.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: This association is represented by 35 Virginia plots, all of which have been analyzed in a statewide classification (>1300 plots) of montane upland forests and woodlands (Fleming and Patterson 2009b). Ten plots from the southern part of the Central Appalachians were classified as this association in the Appalachian Trail classification project (Fleming and Patterson 2009a).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is distributed in the southern part of the Central Appalachians from near Roanoke, Virginia, north to Maryland. It was sampled at Middle Creek, in Botetourt County, Virginia.
Global Range: This community occurs in the southern portion of the Central Appalachians of Maryland, West Virginia, and Virginia, extending to the adjacent Cumberland Plateau in West Virginia. It is rare in the western Piedmont foothills of Virginia, adjacent to the Blue Ridge.

Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

ELEMENT CONCEPT

Global Summary: This community occurs on creek and river margins and on lower or protected slopes. This association occurs in the Southern Blue Ridge and extends into adjacent ecoregions, such as the Cumberlands of Kentucky and Tennessee. This forest vegetation has a canopy dominated by *Pinus strobus*, sometimes codominating with *Tsuga canadensis*, occurring over a shrub stratum dominated by *Rhododendron maximum*. This is an evergreen forest, but deciduous trees may form a minor part of the canopy. Other minor canopy species may include *Liriodendron tulipifera, Betula lenta, Magnolia fraseri* (within its range), *Acer rubrum*, and *Tilia americana var. heterophylla*. Other shrub species may include *Kalmia latifolia, Leucothoe fontanesiana, Lindera benzoin*, and *Ilex opaca var. opaca*. Herbaceous cover is typically sparse. The Kentucky examples lack *Leucothoe fontanesiana* and have *Magnolia macrophylla* rather than *Magnolia fraseri*. Large stems of *Smilax rotundifolia* may be present in stands of this vegetation.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This acidic white pine - hemlock forest is largely restricted to lower slopes, coves, gorges, and stream and river margins below 915 m (3,000 feet). It was sampled at four locations in the park on sites that range from flat to gently sloping coves and lower slopes with mesic, moderately well- to well-drained clay loam, loam, sandy loam, and silt loam soils. Leaf litter with

some downed wood and occasional small rocks and bare soil cover the ground surface where vegetation is absent. Evidence of disturbance includes past logging, pine bark beetle damage, and wind/ice damage.
Global Environment: This community occurs on creek and river margins and on lower or protected slopes, at elevations below 915 m (3000 feet) in the southern Appalachian Mountains, including the Cumberland Mountains of Kentucky and Tennessee.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The moderately dense (60-70% cover) canopy and subcanopy are dominated almost exclusively by evergreen conifers *Pinus strobus* and *Tsuga canadensis*. Additional tree species may include *Acer rubrum, Halesia tetraptera var. monticola, Ilex opaca, Liriodendron tulipifera, Quercus alba*, and *Quercus prinus*. The shrub layers are dominated by *Rhododendron maximum*. Other common shrubs can include *Gaylussacia ursina, Halesia tetraptera var. monticola*, and *Kalmia latifolia*. *Tsuga canadensis* is also common in the shrub layer. Herbs are generally sparse to absent but when present include *Dennstaedtia punctilobula, Medeola virginiana, Thelypteris noveboracensis*, and *Viola* spp.
Global Vegetation: This forest vegetation has a canopy dominated by *Pinus strobus*, sometimes codominating with *Tsuga canadensis*, occurring over a shrub stratum dominated by *Rhododendron maximum*. This is an evergreen forest, with evergreen species dominating in all strata, but deciduous trees may form a minor part of the canopy. Other minor canopy or subcanopy species may include *Liriodendron tulipifera, Betula lenta, Magnolia fraseri* (within its range), *Acer rubrum, Quercus alba, Oxydendrum arboreum*, and *Tilia americana var. heterophylla*. Other shrub species may include *Kalmia latifolia, Leucothoe fontanesiana, Lindera benzoin, Hamamelis virginiana*, and *Ilex opaca var. opaca*. Herbaceous cover is typically sparse. Typical herbs include *Thelypteris noveboracensis, Chimaphila maculata, Mitchella repens, Polystichum acrostichoides, Medeola virginiana, Galax urceolata*, and *Tiarella cordifolia*. Kentucky Cumberland examples lack *Leucothoe fontanesiana* and have *Magnolia macrophylla* rather than *Magnolia fraseri*. Large stems of *Smilax rotundifolia* may be present in stands of this vegetation.

RELATED CONCEPTS

Global Similar Types:
- *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543) is a mixed to deciduous acidic cove forest of the Southern Appalachians.
- *Pinus strobus - Tsuga canadensis / Acer pensylvanicum / Polystichum acrostichoides* Forest (CEGL006019)
- *Tsuga canadensis - (Fagus grandifolia, Tilia americana var. heterophylla) / Magnolia tripetala* Forest (CEGL008407) is an evergreen to mixed acidic cove forest of the Cumberland Mountains, Cumberland Plateau, and Southern Ridge and Valley.
- *Tsuga canadensis - Liriodendron tulipifera - Platanus occidentalis / Rhododendron maximum - Xanthorhiza simplicissima* Wet Forest (CEGL007143) occurs on broad, regularly inundated floodplains.

- *Tsuga canadensis / Rhododendron maximum - (Clethra acuminata, Leucothoe fontanesiana)* Forest (CEGL007136) is dominated by *Tsuga canadensis*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: The most constant species (≥64%) in 11 plots classified as this association in the Appalachian Trail analysis (Fleming and Patterson 2009a), in order of descending constancy, are *Tsuga canadensis, Pinus strobus, Rhododendron maximum, Acer rubrum, Oxydendrum arboreum, Quercus alba, Liriodendron tulipifera, Ilex opaca var. opaca, Kalmia latifolia*, and *Gaylussacia ursina*. Species richness ranges from 18 to 29 species in 1000-m2 plots. All plots are from the Great Smoky Mountains or Chattahoochee National Forest.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: Characterized by strong evergreen dominance in all layers. Environmental differences with Southern Appalachian Acidic Cove Forest (Typic Type) (CEGL007543) are obscure.
Global Classification Comments: This association is distinguished by a strong evergreen dominance in all strata and the importance of *Pinus strobus* in the canopy. Forests (included here) in the Cumberlands of Kentucky lack *Leucothoe fontanesiana* and have *Magnolia macrophylla* rather than *Magnolia fraseri*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Very local in southernmost part of the Southern Appalachians; it rarely intersects the AT corridor. All plots are from Chattahoochee National Forest in Georgia.
Global Range: This community occurs in the Southern Blue Ridge, but extends into adjacent Cumberland Plateau or Ridge and Valley.

Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

ELEMENT CONCEPT

Global Summary: This community occurs along streams and on protected slopes in the mountains of North Carolina, Tennessee, South Carolina, Georgia, West Virginia, and Kentucky. It can also occur on xeric ridges and sideslopes, or sites which have been subjected to extreme crown fires or other catastrophic disturbance that has removed the canopy. It is a broad-leaved, evergreen shrubland, dominated by *Rhododendron maximum* which forms a continuous, dense shrub canopy up to 5 m tall. *Kalmia latifolia, Rhododendron minus*, and *Rhododendron catawbiense* may also occur as components of the shrub stratum. Shrub vegetation beneath the upper shrub canopy may be open to dense depending on the stand's age and topographic setting. The ground layer is dominated by leaf litter or bare soil, although scattered herbs and woody seedlings do occur. Seedlings and saplings of *Rhododendron maximum, Acer rubrum, Betula lenta, Betula alleghaniensis*, and *Tsuga canadensis* are common and typical herbs include *Dryopteris intermedia, Heuchera villosa, Viola* spp., *Thelypteris noveboracensis, Listera smallii*, and *Galax urceolata*. This shrubland is typical along streams and on mesic, unexposed, often north-facing slopes at elevations of approximately 300-1100 m (1000-3000 feet), but can also occur on steep slopes and ridges where natural disturbances have removed the canopy. Soils supporting this community are typically acidic. Occurrences at edges of streams may flood during rainy seasons. This community can occur as the result of disturbance and will succeed to forest with an ericaceous understory without some form of disturbance. This community may have scattered woody species that are greater than 5 m tall but with generally less than 10% total cover.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: These montane shrublands are generally found in areas where tree canopy has died out or been blown down. The single sampled stand is located on a very steep, northwest-facing summit with well-drained peat soil. The unvegetated surface is made up almost entirely of leaf litter with some wood. Evidence of disturbance includes wind/ice damage.
Global Environment: This community occurs along streams and on mesic, unexposed, often north-facing slopes at elevations of approximately 300-1100 m (1000-3000 feet). Soils supporting this community are typically acidic. Occurrences at edges of streams may flood during rainy seasons. It can occur at higher elevations on steep slopes and ridges where extreme crown fires or other catastrophic disturbance have removed the canopy.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The continuous cover (100%) of tall shrubs is dominated almost exclusively by *Rhododendron maximum*. Additional shrubs do include *Kalmia latifolia, Vaccinium simulatum*, and the short shrub *Gaylussacia ursina*. In addition, there may be scattered emergent (5-10 m) trees of *Acer rubrum, Quercus coccinea, Quercus prinus*, and *Quercus rubra*. No herbs are present under the dense canopy.
Global Vegetation: This evergreen, sclerophyllous shrubland is dominated by *Rhododendron maximum* which forms a continuous, dense shrub canopy up to 5 m tall. *Kalmia latifolia, Rhododendron minus*, and *Rhododendron catawbiense* may also occur as components of the shrub stratum. Shrub vegetation beneath the upper shrub canopy may be open to dense depending on the stand's age and topographic setting. Species such as *Tsuga canadensis, Pinus strobus, Acer rubrum, Betula lenta*, and *Liriodendron tulipifera* in the tree canopy stratum make up less than 10% cover. The ground layer is dominated by leaf litter or bare soil although scattered herbs and woody seedlings do occur. Seedlings and saplings of *Rhododendron maximum, Acer rubrum, Betula lenta, Betula alleghaniensis*, and *Tsuga canadensis* are common, and typical herbs include *Dryopteris intermedia, Heuchera villosa, Viola* spp., *Thelypteris noveboracensis, Listera smallii*, and *Galax urceolata*.
Global Dynamics: *Rhododendron maximum* sprouts vigorously after disturbance, and this community often results from logging, fire, chestnut blight, or cessation of grazing. Stems greater than 4 cm in diameter survive hot fires, and fire generally stimulates basal sprouting, although intense annual fires may suppress reestablishment (Core 1966). Drastic overstory removal, heavy shading, and disease have been found to decrease the density of or kill *Rhododendron* (Hodgdon and Pike 1961).

This shrubland will become established by invading disturbed or cleared lands if there is adequate moisture and lack of direct sunlight. This community can also result from secondary succession when a forest's canopy is removed (by logging, disease, etc.) and the *Rhododendron* understory closes, forming a dense shrubland. The

reestablishment of woody competitors is inhibited by the shade of the dense shrub canopy as well as by phytotoxins in the litter and soil (Gant 1978). *Rhododendron maximum* Shrubland may persist for over 60 years on a site (Plocher and Carvell 1987) but will succeed to a forested community as trees that become established in thicket openings mature.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This community was sampled in Nantahala Gorge at The Jump Up (Nantahala National Forest) in North Carolina.
Global Classification Comments: This *Rhododendron maximum* shrubland frequently occurs adjacent to wet herbaceous cliff vegetation, riparian shrublands, or within forests dominated by *Tsuga canadensis, Quercus rubra, Liriodendron tulipifera, Pinus strobus, Quercus prinus, Picea rubens*, or *Abies fraseri*. Similar ericaceous shrublands occur at higher elevations, over 1100 meters (3500 feet), in the southern Appalachian Mountains. These high-elevation "heath balds" are distinguished from *Rhododendron maximum* Upland Shrubland by the dominance of *Rhododendron catawbiense* or by the occurrence of ericaceous shrubs typical of high-elevation environments such as *Leiophyllum buxifolium, Menziesia pilosa*, and *Photinia melanocarpa (= Aronia melanocarpa)*. Disjunct populations of *Rhododendron maximum* are found in Maine and New Hampshire, but these populations may represent a different community (Hodgdon and Pike 1961). Similar vegetation has been observed at 1400 m (4600 feet) elevation on Beartown Mountain (Tazewell County, Virginia), where historical logging and subsequent fires burned *Picea / Rhododendron* forests, consuming the organic soil and exposing bare rock. Today this site has large areas of dense *Rhododendron maximum* on ridgecrests and upper slopes, with an occasional spruce tree growing above the shrubs and some shrub-sized spruce regeneration intermixed. These areas are currently treated as a disturbance stage of *Picea rubens - (Betula alleghaniensis, Aesculus flava) / Rhododendron (maximum, catawbiense)* Forest (CEGL004983).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled in Nantahala Gorge at The Jump Up (Nantahala National Forest) in North Carolina.
Global Range: This community occurs in the Southern Blue Ridge, but may be possible throughout the range of *Rhododendron maximum*.

[CEGL007693] *Tsuga canadensis - Halesia tetraptera - Magnolia fraseri / Rhododendron maximum / Dryopteris intermedia* Forest

Translated Name: **Eastern Hemlock - Mountain Silverbell - Mountain Magnolia / Great Laurel / Intermediate Woodfern Forest**
Common Name: **Southern Appalachian Acidic Cove Forest (Silverbell Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

ELEMENT CONCEPT

Global Summary: This association includes forests dominated by *Tsuga canadensis* and *Halesia tetraptera var. monticola*, occurring in restricted montane areas of western North Carolina and eastern Tennessee. This forest is found on protected, lower slopes and coves at elevations of 854 to 1403 m (2800-4600 feet). The most important canopy trees are *Tsuga canadensis* and *Halesia tetraptera var. monticola*, although *Magnolia fraseri* or *Fagus grandifolia* can have high canopy coverage in some examples. Some occurrences have dense, tall-shrub strata dominated by *Rhododendron maximum*, while other occurrences have a more open shrub stratum with greater herbaceous cover, often dominated by *Dryopteris intermedia*. Other subcanopy/shrub species may include *Acer pensylvanicum, Acer saccharum, Acer rubrum, Amelanchier laevis, Betula alleghaniensis, Betula lenta*, and *Prunus pensylvanica*. Other common herbaceous species include *Mitchella repens, Medeola virginiana, Polystichum acrostichoides, Solidago curtisii (= Solidago caesia var. curtisii), Viola blanda*, and *Viola hastata*. *Rubus canadensis* is also common. This community is distinguished from *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543) by not having *Liriodendron tulipifera* as an important component and by generally occurring at higher elevations (over 915 m [3000 feet]). This community is distinguished from *Betula alleghaniensis - (Tsuga canadensis) / Rhododendron maximum / (Leucothoe fontanesiana)* Forest (CEGL007861) by occurring on more protected sites and having more diverse tree and herb strata.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This acidic cove forest is found at higher elevations (850-1,400 m [2,800-4,600 feet]). Sites are somewhat steep to steep mid and upper slopes with mesic, well-drained sandy loam and silt loam soils. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes hemlock death due to hemlock woolly adelgid.
Global Environment: This association includes forests dominated by *Tsuga canadensis* and *Halesia tetraptera var. monticola*, occurring in restricted montane areas of western North Carolina and eastern Tennessee. This forest is found on protected, lower slopes and coves at elevations of 854 to 1403 m (2800-4600 feet).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The most important canopy trees are *Tsuga canadensis* and *Halesia tetraptera var. monticola*, although *Magnolia fraseri* or *Fagus grandifolia* can have high canopy coverage in some examples. *Acer saccharum, Acer rubrum, Liriodendron tulipifera, Tilia americana var. heterophylla*, and *Oxydendrum arboreum* may also be present. Some occurrences have the tall-shrub stratum dominated by *Rhododendron maximum*, while others are more open and often with understories dominated by *Dryopteris intermedia*. Common herbs include *Eurybia divaricata, Arisaema triphyllum, Athyrium filix-femina*

ssp. asplenioides, Dennstaedtia punctilobula, Laportea canadensis, Polygonatum biflorum, Polystichum acrostichoides, Solidago curtisii, Tiarella cordifolia, and *Viola rotundifolia*.
Global Vegetation: The most important canopy trees are *Tsuga canadensis* and *Halesia tetraptera var. monticola*, although *Magnolia fraseri* or *Fagus grandifolia* can have high canopy coverage in some examples. Some occurrences have dense, tall-shrub strata dominated by *Rhododendron maximum*, while other occurrences have a more open shrub stratum with greater herbaceous cover, often dominated by *Dryopteris intermedia*. Other subcanopy/shrub species may include *Acer pensylvanicum, Acer saccharum, Acer rubrum, Amelanchier laevis, Betula alleghaniensis, Betula lenta*, and *Prunus pensylvanica*. Other common herbaceous species include *Mitchella repens, Medeola virginiana, Polystichum acrostichoides, Solidago curtisii (= Solidago caesia var. curtisii), Viola blanda*, and *Viola hastata*. *Rubus canadensis* is also common.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Acer saccharum*, *Dennstaedtia punctilobula*, *Dryopteris intermedia*, *Halesia tetraptera* var. *monticola*, *Tsuga canadensis*
Global: *Acer saccharum*, *Dryopteris intermedia*, *Halesia tetraptera* var. *monticola*, *Mitchella repens*, *Tsuga canadensis*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Rugelia nudicaulis* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (29-Sep-2004). This community is uncommon and geographically restricted to the Great Smoky Mountains, Tennessee, and to Joyce Kilmer Wilderness in western North Carolina. Occurrences are subject to compositional modification by outbreaks of hemlock woolly adelgid (*Adelges tsugae*), an exotic insect pest that causes decline and eventual mortality of *Tsuga canadensis*.

RELATED CONCEPTS

Global Similar Types:

[CEGL006923] *Tsuga canadensis - Quercus prinus - Betula lenta* Forest

Translated Name: **Eastern Hemlock - Chestnut Oak - Sweet Birch Forest**
Common Name: **Central Appalachian Hemlock - Chestnut Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Interior-Northeastern Mesic Forest (M883)
Group	Appalachian-Central Interior Mesic Forest (G020)
Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

ELEMENT CONCEPT

Global Summary: This association is a hemlock - mixed oak forest which often occurs on steep northeastern to northwestern exposures. It ranges from the New Jersey Highlands south to the Blue Ridge, Ridge and Valley, Cumberlands, and Piedmont provinces of Maryland and West Virginia. Occurrences in West Virginia are known from the Bluestone River Gorge and are likely elsewhere. Stands occur at elevations from 150 m to about 750 m (500-2500 feet) on moderately to very steep, sheltered slopes. Northerly aspects and middle slope positions prevail among documented examples. Some sites are "boulderfields" with up to 60% cover by large rocks. Geologic substrate is variable. Soils are usually very stony to extremely stony sandy loams, consistently oligotrophic, with very low pH and base status. Stands of this association are typically floristically depauperate and generally dominated by variable combinations of *Quercus prinus* and *Tsuga canadensis*. *Betula lenta* and, less commonly, *Quercus velutina, Quercus coccinea*, and *Quercus rubra* are major overstory associates, each attaining codominance in a subset of stands. *Quercus alba, Acer rubrum, Liriodendron tulipifera, Pinus strobus, Sassafras albidum*, and *Fagus grandifolia* are minor overstory associates. Small trees and shrubs can be absent or sparse due to dense shading by hemlock, with *Hamamelis virginiana* most consistently providing moderate cover. Less frequently, *Kalmia latifolia, Rhododendron maximum*, and *Viburnum acerifolium* are shrub components. At some New Jersey sites, a single dense stratum or multiple open strata of ericaceous species can develop, including *Rhododendron maximum, Kalmia latifolia, Gaylussacia baccata*, and *Vaccinium pallidum*. The herb layer of this community is typically very sparse or absent; typical scattered species include *Maianthemum canadense, Dennstaedtia punctilobula, Chimaphila maculata, Deschampsia flexuosa, Carex swanii*, and *Aralia nudicaulis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This hemlock - chestnut oak forest occurs on moderately steep sheltered slopes with northeastern to northwestern exposures at lower elevations from 150 m to about 750 m (500-2,500 feet). It was sampled once in the Central Appalachian project area

on a low flat with moderately well-drained sandy loam soil. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes heavy hemlock woolly adelgid damage resulting in canopy thinning.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This hemlock - mixed oak forest occurs on moderately steep sheltered slopes with northern exposures at lower elevations, globally ranging from 170-880 m (550-2,900 feet), from the New Jersey Highlands south to the Central Appalachians. Sites are dry gentle to steep mid and upper slopes, ridges and rock outcrops with mostly northern aspects. Soils are well-drained silt loam, loam and sandy loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, bare soil, and/or downed wood. Evidence of disturbance includes hemlock mortality and a minor presence of exotic plants.

Global Environment: Stands occur at elevations from 150 m to about 750 m (500-2500 feet) on moderately to very steep, sheltered slopes. Northern to northwestern aspects and middle slope positions prevail among documented examples. Some sites are "boulderfields" with up to 60% cover by large rocks; some appear above or below cliff bands. Geologic substrate is variable but includes shales and sandstone. Soils are usually very stony to extremely stony sandy loams, consistently oligotrophic, with very low pH and base status. Soils in eight West Virginia plots in the environs of Bluestone National Scenic River are described as dry to somewhat moist, well-drained, stone-free to very stony sandy loam, silt loam, sandy silt loam, and sandy clay loam; they tested extremely to medium acidic (mean pH = 4.4) with relatively high levels of organic matter, estimated N release, S, Al, B, and Fe and relatively low levels of Ca, Cu, K, Mg, Mn, P, and Zn compared to average values in the area.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus prinus, Quercus rubra*, and/or *Quercus alba* are codominant with *Tsuga canadensis* in the canopy. *Pinus strobus* and/or *Liriodendron tulipifera* may be common in some stands. *Betula lenta, Acer rubrum, Sassafras albidum*, and/or *Tsuga canadensis* are common in the subcanopy. *Hamamelis virginiana* is dominant in the shrub layer. *Rhododendron maximum, Kalmia latifolia*, and/or *Vaccinium pallidum* may be present. The herbaceous layer is sparse due to *Tsuga canadensis* cover and a thick hemlock needle layer.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Quercus prinus* is codominant with *Tsuga canadensis*, and *Quercus rubra* is an overstory associate. *Betula lenta, Acer rubrum*, and *Tsuga canadensis* are common in the subcanopy. *Rhododendron maximum* (rare in the north) and/or *Kalmia latifolia* are common tall shrubs; *Vaccinium pallidum* is a common short shrub. Herbs are sparse.

Global Vegetation: This association is a hemlock - mixed oak forest dominated by *Tsuga canadensis* in association with species of *Quercus* and other deciduous trees indicative of relatively dry, infertile soils. Stands are typically floristically depauperate and generally dominated by variable combinations of *Quercus prinus* and *Tsuga canadensis*. *Betula lenta* and, less commonly, *Quercus velutina, Quercus coccinea, Quercus alba*, and *Quercus rubra* are major overstory associates, each attaining codominance in a subset of stands. *Acer rubrum, Liriodendron tulipifera, Pinus strobus, Sassafras albidum*, and *Fagus grandifolia* are very minor overstory associates. *Oxydendrum arboreum* and *Acer saccharum*, along with overstory species, may be present in the subcanopy. Small trees and shrubs are often absent or sparse due to dense shading by hemlock, with *Hamamelis virginiana* most consistently providing moderate cover. Less frequently, *Kalmia latifolia, Rhododendron maximum, Vaccinium pallidum, Amelanchier arborea*, and *Viburnum acerifolium* are shrub components. At some New Jersey sites, a single dense stratum or multiple open strata of ericaceous species can develop, including *Rhododendron maximum, Kalmia latifolia, Gaylussacia baccata*, and *Vaccinium pallidum*. The herb layer of this community is typically very sparse or absent with scattered individuals of a few species; typical species vary somewhat with geography and include *Maianthemum canadense, Dennstaedtia punctilobula, Dioscorea quaternata, Chimaphila maculata, Deschampsia flexuosa, Dryopteris marginalis, Chimaphila maculata, Carex swanii, Eurybia divaricata, Goodyera pubescens, Gaultheria procumbens, Mitchella repens, Monotropa hypopithys, Monotropa uniflora, Parthenocissus quinquefolia*, and *Aralia nudicaulis*. In nine West Virginia plots, vascular plant richness ranged from 16 to 43 (mean = 26.5) species per 400-square-meter plot.

Global Dynamics: Extensive hemlock mortality caused by hemlock woolly adelgid (*Adelges tsugae*) is changing the composition of many of these forests. Most Maryland stands are now in a degraded condition, and some have suffered virtually complete hemlock mortality. In Bluestone National Scenic River (WV), many hemlocks appear stressed, but large scale mortality was not observed during the 2003-2006 vegetation surveys.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Quercus prinus*, *Tsuga canadensis*
Appalachian National Scenic Trail (Lower New England Project Area): *Acer rubrum*, *Betula lenta*, *Quercus prinus*, *Quercus rubra*, *Tsuga canadensis*
Global: *Chimaphila maculata*, *Quercus prinus*, *Tsuga canadensis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Invasive/Exotic Plants: *Rhamnus cathartica* (High/Medium)
Global: Other Plants: *Kalmia latifolia* (G5), *Maianthemum canadense* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (4-Oct-2006). While this association does not appear to be intrinsically rare, it occurs in small patches in very specific habitats, and its viability is critically threatened by the spread of hemlock woolly adelgid.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community has *Quercus* spp. codominant in the canopy with *Tsuga canadensis* and no *Betula alleghaniensis*. In contrast, Hemlock - Northern Hardwood Forest (CEGL006109) is a hemlock - northern hardwoods community where *Quercus* spp. and *Pinus strobus* are minor to absent. *Liriodendron tulipifera* can occur in both communities, but tends to be more abundant in southern examples of CEGL006109 and is minor in this type (CEGL006923).
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: *Tsuga canadensis* is declining in this community. Hemlock snags and coarse woody debris are common in these stands.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Because of devastation by hemlock woolly adelgid, understory hemlock is often all that's left in this community in Virginia. The original description was based on A. Windisch's (1993) Picatinny Arsenal Hemlock-Mixed Oak-(Heath) Cool Sub-Mesic forest description (TcQf). An expanded circumscription is based on analysis of data from 20 Maryland and Virginia plots, data from Delaware Water Gap, and 9 West Virginia

plots. Analysis of more than 1300 montane Virginia plots indicated that the two Virginia plots originally assigned to this type in the National Capital Region analysis are cove plots that are better classified as *Tsuga canadensis - Quercus prinus - Liriodendron tulipifera / Kalmia latifolia - (Rhododendron catawbiense)* Forest (CEGL008512) (Fleming and Patterson 2009b).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from the New Jersey Highlands south to the Blue Ridge, Ridge and Valley, and Piedmont provinces of Pennsylvania and Maryland, and the Cumberlands in West Virginia. It was sampled in Cumberland County, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in New Jersey and New York at Nuclear Lake, Canada Hill/Curry Pond, Canopus Lake South and Sunken Mine Road North in Fahnestock State Park.
Global Range: This association ranges from the New Jersey Highlands south to the Blue Ridge, Ridge and Valley, and Piedmont provinces of Pennsylvania and Maryland, and the Cumberlands in West Virginia.

Alliance	*Tsuga canadensis - Liriodendron tulipifera* Forest Alliance (A3304)

ELEMENT CONCEPT

Global Summary: This community type occurs somewhat locally throughout the Northern Blue Ridge and Ridge and Valley regions of west-central and northwestern Virginia and may extend into West Virginia. Sites are located between 275 and 760 m (900-2500 feet) elevation. Stands often occupy elongated, linear patches in mesic ravines with incising first-, second-, and third-order streams. Underlying bedrock includes several sandstone and shale formations, as well as igneous and metamorphic formations of the Blue Ridge. Vegetation is a hemlock-hardwood

or mixed hardwood forest that usually, but not always, has a dense evergreen shrub layer. *Tsuga canadensis, Quercus prinus, Liriodendron tulipifera, Acer rubrum, Betula lenta, Quercus rubra*, and *Nyssa sylvatica* are the most characteristic and abundant trees. *Fagus grandifolia, Magnolia acuminata, Pinus strobus*, and *Quercus alba* are minor and localized overstory associates. Understory tree layers are mostly composed of younger trees of the canopy species. *Kalmia latifolia, Hamamelis virginiana*, and *Acer pensylvanicum* are the most constant and abundant species of the shrub layer; less frequently *Menziesia pilosa, Rhododendron catawbiense*, and rarely *Rhododendron maximum* may form large colonies. The herb layer is typically sparse, but some stands have substantial cover by the clonal ferns *Dennstaedtia punctilobula* and/or *Thelypteris noveboracensis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This mixed hemlock-hardwood acidic cove forest is found along the AT only at Shenandoah National Park. Sites are located between 275 and 760 m (900-2,500 feet) elevation. Stands often occupy elongated, linear patches in mesic ravines with incising first-, second-, and third-order streams.

Global Environment: Sites are located between 275 and 760 m (900-2500 feet) elevation. Stands often occupy elongated, linear patches in mesic ravines with incising first-, second-, and third-order streams. Underlying bedrock includes several sandstone and shale formations, as well as igneous and metamorphic formations of the Blue Ridge. Microtopography of habitats is diverse and includes both stream bottoms and adjacent lower to middle slopes, usually with northerly aspects. Mean slope at plot-sampling sites is 22°, and average surface cover of boulders and stones is 14%. Occasional, brief flooding may occur along the larger streams in this unit. Mapped soils are mostly very stony, sometimes sandy colluvial loams. Along streams, substrates often consist of bouldery and rocky terraces with interstitial colluvial / alluvial soils. Soils collected from plots are very strongly to extremely acidic (mean pH = 4.0) and infertile, with high iron and aluminum levels and very low total base saturation.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Tsuga canadensis, Quercus prinus, Liriodendron tulipifera, Acer rubrum, Betula lenta, Quercus rubra*, and *Nyssa sylvatica* are the most characteristic and abundant trees. *Fagus grandifolia, Magnolia acuminata, Pinus strobus*, and *Quercus alba* are minor and localized overstory associates. Understory tree layers are mostly composed of younger trees of the canopy species. *Kalmia latifolia, Hamamelis virginiana*, and *Acer pensylvanicum* are abundant shrubs. Less frequently *Menziesia pilosa, Rhododendron catawbiense*, and rarely *Rhododendron maximum* may form large colonies. There is typically a sparse herb layer, but some stands have substantial cover by the clonal ferns *Dennstaedtia punctilobula* and/or *Thelypteris noveboracensis*.

Global Vegetation: Vegetation is a hemlock-hardwood or mixed hardwood forest that usually, but not always, has a dense evergreen shrub layer. *Tsuga canadensis, Quercus prinus, Liriodendron tulipifera, Acer rubrum, Betula lenta, Quercus rubra*, and *Nyssa sylvatica* are the most characteristic and abundant trees. *Fagus grandifolia, Magnolia acuminata, Pinus strobus*, and *Quercus alba* are minor and localized overstory associates. Understory tree layers are mostly composed of younger trees of the canopy species. In the southern part of the range, *Oxydendrum arboreum* is a common understory tree. Evergreen shrubs are variably important in this type. *Kalmia latifolia* is a constant species but dominates only in a subset of stands. The evergreen rhododendrons *Rhododendron catawbiense* and/or *Rhododendron maximum* occur in 40% of plot samples but never co-occur, and one or the other species is abundant in only 15% of the plots; *Rhododendron catawbiense* is the more frequent species, occurring in about a third of the plots. *Hamamelis virginiana* and *Acer pensylvanicum* are the only other constant shrubs; *Menziesia pilosa* is inconstant but occasionally abundant. The herb layer is typically sparse, with few if any species attaining as much as 1% cover in a 400-square-meter plot, although some stands may have substantial cover by the clonal ferns *Dennstaedtia punctilobula* and/or *Thelypteris noveboracensis*. The most frequent herbs are *Eurybia divaricata, Mitchella repens, Dioscorea quaternata, Goodyera pubescens, Medeola virginiana, Aralia nudicaulis*, and *Gaultheria procumbens*. Significant bryophyte cover is often present on moist rock surfaces and rotting wood. Species richness of 22 plot-sampled stands ranges from 21 to 58 taxa per 400 square meters (mean = 36).

Global Dynamics: In many occurrences of this community type in western Virginia, the *Tsuga canadensis* component has been reduced by heavy timbering or mortality from the introduced insect pest, hemlock woolly adelgid (*Adelges tsugae*).

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area)

Stratum	Lifeform	Species
Tree (canopy & subcanopy)	Needle-leaved tree	*Tsuga canadensis*
Tree (canopy & subcanopy)	Broad-leaved deciduous tree	*Liriodendron tulipifera*, *Quercus prinus*
Shrub/sapling (tall & short)	Broad-leaved evergreen shrub	*Rhododendron catawbiense*
Herb (field)	Fern (Spore-bearing forb)	*Dennstaedtia punctilobula*, *Thelypteris noveboracensis*

Global

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Tsuga canadensis*
Tree canopy	Broad-leaved deciduous tree	*Liriodendron tulipifera*, *Quercus prinus*
Shrub/sapling (tall & short)	Broad-leaved evergreen shrub	*Kalmia latifolia*
Herb (field)	Fern (Spore-bearing forb)	*Dennstaedtia punctilobula*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Kalmia latifolia*, *Liriodendron tulipifera*, *Quercus prinus*, *Tsuga canadensis*
Global: *Galax urceolata*, *Goodyera pubescens*, *Hexastylis virginica*, *Magnolia acuminata*, *Oxydendrum arboreum*, *Rhododendron catawbiense*, *Tsuga canadensis*

OTHER NOTEWORTHY SPECIES

Global: Other Plants: *Thelypteris noveboracensis* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (25-Jun-2001). This vegetation type is locally distributed but fairly common in west-central and northwestern Virginia, sometimes covering large areas.

RELATED CONCEPTS

Global Similar Types:

- *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543) is a very similar type with a geographic distribution in the Southern Appalachians; the ranges of this and CEGL008512 meet, and compositional boundaries become ambiguous, in west-central and southwestern Virginia.
- *Liriodendron tulipifera - Pinus strobus - Tsuga canadensis - Quercus rubra / Polystichum acrostichoides* Forest (CEGL006304) occurs in the same region but occupies coves with somewhat higher soil fertility and has higher overall species richness.
- *Tsuga canadensis - Fagus grandifolia - Acer saccharum / (Hamamelis virginiana, Kalmia latifolia)* Forest (CEGL005043) is centered on the Western Allegheny Plateau, beyond ranges of *Rhododendron catawbiense, Galax urceolata, Oxydendrum arboreum*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Hemlock has been almost entirely extirpated from the canopy of this type in Virginia by hemlock woolly adelgid, although significant hemlock cover remains in the understory of many stands.
Global Classification Comments: The distribution of this unit generally corresponds to a geographic area in which *Rhododendron maximum* is spotty to absent, or both *Rhododendron maximum* and *Rhododendron catawbiense* are absent. Throughout much of southwestern and west-central Virginia, as well as in the Southern Appalachians of North Carolina and Tennessee, habitats favorable for the development of acidic cove forests generally support extensive populations of *Rhododendron maximum*. Over most of this region, *Rhododendron catawbiense* is restricted to more xeric and/or exposed sites, and does not appear to be competitive with *Rhododendron maximum* in mesic habitats (A.S. Weakley pers. comm. 2001). On the Northern Blue Ridge and certain sites of the Ridge and Valley, where *Rhododendron maximum* is inexplicably rare, it is possible that the absence of *Rhododendron maximum* enables *Rhododendron catawbiense* to occupy more mesic cove sites. *Rhododendron catawbiense* reaches its northern limits in Highland and Rockingham counties; north of these counties, many acidic coves lack both of the evergreen rhododendrons.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: Observed by the UMESC mapping team in Shenandoah National Park.
Global Range: This community occurs somewhat locally throughout the Northern Blue Ridge and Ridge and Valley regions of west-central and northwestern Virginia. It is rare in ravines of western Piedmont, metasedimentary foothills. There is good potential for occurrences in adjacent states, particularly West Virginia.

M502. Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland

G015. APPALACHIAN OAK / CHESTNUT FOREST

Group Summary Description: This dry acidic Appalachian oak forest group includes mostly closed-canopy deciduous (oak) forests and mixed (oak-pine) forests with a variable mixture of dry-site oak and pine species. It is characterized by the occurrence of *Quercus prinus* and/or other oaks, typically *Quercus alba, Quercus coccinea*, or *Quercus velutina*,, often with sprouts of *Castanea dentata*. *Pinus strobus* or *Pinus virginiana* may be an important associate in some areas. Widespread hardwood associates include *Quercus rubra, Betula lenta, Carya glabra, Nyssa sylvatica*, and *Sassafras albidum*. Additional associated trees in parts of the group's range include *Halesia tetraptera var. monticola, Liriodendron tulipifera, Magnolia acuminata*, and *Oxydendrum arboreum*. Subcanopy, shrub, and herb layers vary, but in many cases a moderately well- to well-developed heath layer is present. Ericaceous shrubs are often common and include *Kalmia latifolia, Gaylussacia baccata, Gaylussacia frondosa, Gaylussacia ursina, Vaccinium pallidum, Vaccinium angustifolium, Vaccinium stamineum, Vaccinium arboreum, Vaccinium simulatum, Menziesia pilosa, Rhododendron calendulaceum*, and *Rhododendron prinophyllum*. This group is centered on the ranges of *Castanea dentata* and *Quercus prinus*, ranging from central New England south through the Central Appalachian and Western Allegheny regions to the Cumberland Plateau and Southern Appalachians. The substrate is typically dry, acidic, and infertile. Elevation ranges from sea level (in the northern part of the range) to about 1500 m (in the Southern Appalachians).

A4128 *Pinus strobus - Quercus alba* Allegheny Forest & Woodland Alliance

Alliance Summary Description: This alliance contains pine-dominated and mixed pine-oak forests and woodlands found in the Allegheny Plateau, Lake Ontario plain and lower New England of the United States. Stands typically occur on mostly dry-mesic sites within glaciated and unglaciated landscapes and are dominated by *Pinus strobus*, often mixed with hardwood species such as *Quercus alba, Quercus rubra, Quercus velutina*, and *Acer rubrum*. Rarely, *Pinus resinosa* or *Pinus rigida* may co-occur.

[CEGL006293] *Pinus strobus - Quercus (rubra, velutina) - Fagus grandifolia* Forest

Translated Name: **Eastern White Pine - (Northern Red Oak, Black Oak) - American Beech Forest**
Common Name: **Northeastern White Pine - Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Pinus strobus - Quercus alba* Allegheny Forest & Woodland Alliance (A4128)

ELEMENT CONCEPT

Global Summary: This mixed white pine - oak forest of the northeastern U.S. occurs on dry-mesic to mesic, acidic, nutrient-poor, sandy loam to sandy soils. In the northern glaciated portion of the range, the forest occurs on outwash plains or moraines, as well as along mid and lower slopes and within protected ravines, and on protected ridges or upper slopes of shale, sandstone or other sedimentary rock, occasionally underlain by metamorphic or igneous rock. Along the unglaciated plateau, this community occurs on rolling topography underlain by sandstone. It occurs at elevations below 915 m (3000 feet) throughout the range. The tree canopy is dominated by a mixture of *Pinus strobus* and oaks, including *Quercus velutina, Quercus rubra, Quercus alba, Quercus prinus* (usually in minor amounts), and *Quercus coccinea,* primarily only in the southern portions of the range. Oak species drop out at the northern extreme of the type's range, leaving only *Quercus rubra*. *Fagus grandifolia* is characteristic over much of the range of this type but is absent in some areas. Other less frequent canopy associates may include *Acer rubrum, Betula lenta, Carya alba, Pinus rigida, Populus tremuloides, Fraxinus americana, Ulmus americana, Tsuga canadensis*, and at the northern range limit may include *Betula papyrifera* and *Populus grandidentata*. The variable subcanopy may include *Hamamelis virginiana* or *Prunus serotina*; other species such as *Carpinus caroliniana, Cornus florida*, and *Nyssa sylvatica* may be present in the central and southern portions of the range. It has a sparse to well-developed, generally ericaceous shrub layer. The herb layer ranges from sparse to moderately dense cover. In disturbed settings, *Rhamnus cathartica* may be an abundant shrub. The bryophyte layer is not well-documented. This association is differentiated from mixed oak-pine forests to the south by *Fagus grandifolia* and the absence of southern-ranging species *Liriodendron tulipifera, Galax urceolata, Trillium catesbaei, Halesia tetraptera*, and

others. The absence of *Ilex glabra* and the unimportance of *Quercus alba* differentiate this type from a closely related association of northeastern coastal areas, *Pinus strobus - Quercus alba / Ilex glabra* Forest (CEGL006382). Earlier successional versions in New England have less dominance by *Pinus* spp. (usually) and more by *Betula* spp. and *Acer rubrum*; these are separated as *Quercus rubra - Acer rubrum - Betula* spp. - *Pinus strobus* Ruderal Forest (CEGL006506).

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This wide-ranging pine-oak forest occurs on a variety of slopes, exposures, and settings. It was sampled once in the Central Appalachian project area on a west-facing lower slope of a ravine with well-drained sandy loam soil. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes trails, wind/ice damage, standing dead trees (creating canopy gaps), and nearby campsite clearings.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: This white pine - oak forest ranges throughout the Northeast from West Virginia north to Maine at elevations below 915 m (3,000 feet). Sites range from gentle to very steep mid and upper slopes and ridges with mostly western and southern aspects. Soils are typically dry to dry-mesic, rapidly to well-drained sandy loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, and/or downed wood. Evidence of disturbance includes the presence of exotic plants.
Global Environment: This mixed white pine - oak forest occurs on dry-mesic to mesic, acidic, nutrient-poor, sandy loam to sandy soils along mid and lower slopes, and along the unglaciated plateau on rolling topography underlain by sandstone. In the northern glaciated portion of the range, the forest occurs on outwash plains or moraines, as well as along mid and lower slopes and within protected ravines, and on protected ridges of shale, sandstone, or other sedimentary rock, occasionally underlain by metamorphic or igneous rock. Along the unglaciated plateau, this community occurs on rolling topography underlain by sandstone. It occurs at elevations below 915 m (3000 feet) throughout the range.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus velutina, Quercus rubra, Quercus alba*, and *Quercus prinus* share the canopy with *Pinus strobus*. *Acer rubrum, Tsuga canadensis, Sassafras albidum, Nyssa sylvatica, Pinus rigida*, and *Betula lenta* are common in the canopy and subcanopy. *Fagus grandifolia* is characteristic but not always present. Heaths are the dominant shrubs and include *Kalmia latifolia, Vaccinium pallidum*, and *Gaultheria procumbens*. *Hamamelis virginiana* is another important shrub. Herbs are very sparse, but *Gaultheria procumbens* may be common.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Quercus rubra, Quercus prinus, Quercus alba, Quercus velutina*, and/or *Quercus coccinea* share canopy dominance with *Pinus strobus* (sometimes emergent); *Fagus grandifolia* and *Tsuga canadensis* can be common and abundant. *Betula lenta* and *Acer rubrum* are characteristic subcanopy species. *Kalmia latifolia* is a common tall shrub, and a dwarf-shrub heath layer that can be extensive includes *Vaccinium angustifolium* and *Gaylussacia baccata*. Common herbs include *Aralia nudicaulis, Pteridium aquilinum*, and *Gaultheria procumbens*. In addition, this community supports MA state-imperiled *Pinus resinosa*.
Global Vegetation: The tree canopy is dominated by a mixture of *Pinus strobus* and oaks, including *Quercus velutina, Quercus rubra, Quercus alba, Quercus prinus* (usually in minor amounts), and *Quercus coccinea*, primarily only in the southern portions of the range. Oak species drop out at the northern extreme of the type's range, leaving only *Quercus rubra*. *Fagus grandifolia* is characteristic but not always present. Other less frequent canopy associates may include *Acer rubrum, Betula lenta, Carya alba, Populus tremuloides, Fraxinus americana, Ulmus americana, Tsuga canadensis*, and at the northern range limit may include *Betula papyrifera* and *Populus grandidentata*. The variable subcanopy may include *Hamamelis virginiana* or *Prunus serotina*; other species such as *Carpinus caroliniana, Cornus florida*, and *Nyssa sylvatica* may be present in the central and southern portions of the range. The sparse to well-developed, generally ericaceous shrub layer includes *Gaylussacia* spp. (usually *Gaylussacia baccata*), *Kalmia latifolia, Vaccinium* spp. (typically *Vaccinium pallidum* and/or *Vaccinium angustifolium*), and sometimes *Kalmia angustifolia*, as well as *Rubus* spp., *Corylus americana, Rhododendron periclymenoides, Gaultheria procumbens, Sassafras albidum*, and *Viburnum prunifolium*. The herb layer ranges from sparse to moderately dense cover, with species including *Aralia nudicaulis, Ageratina altissima, Amphicarpaea bracteata, Brachyelytrum erectum, Carex communis, Carex woodii, Carex pensylvanica, Carex lucorum, Carex debilis, Chimaphila maculata, Desmodium nudiflorum, Galium latifolium, Gaultheria procumbens, Goodyera pubescens, Hieracium venosum, Houstonia purpurea, Maianthemum racemosum, Maianthemum canadense, Medeola virginiana, Melampyrum lineare, Mitchella repens, Monotropa uniflora, Poa cuspidata,*

Polygonatum biflorum, Polystichum acrostichoides, Pteridium aquilinum, Trientalis borealis, and/or *Viola hastata*. In disturbed settings, the exotic *Rhamnus cathartica* may be an abundant shrub. The bryophyte layer is not well-documented but supports *Leucobryum glaucum* and *Polytrichum commune* in occurrences in the northern portion of the range (Acadia National Park).

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Pinus strobus*, *Quercus rubra*, *Quercus velutina*

Appalachian National Scenic Trail (Lower New England Project Area): *Acer rubrum*, *Betula lenta*, *Gaultheria procumbens*, *Gaylussacia baccata*, *Kalmia latifolia*, *Pinus strobus*, *Quercus rubra*, *Trientalis borealis*, *Vaccinium angustifolium*

Global: *Fagus grandifolia*, *Pinus strobus*, *Quercus rubra*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Pinus resinosa* (G5, MA state-imperiled); **Invasive/Exotic Plants**: *Berberis thunbergii* (High/Medium), *Larix decidua*

Global: Invasive/Exotic Plants: *Berberis thunbergii* (High/Medium), *Larix decidua*

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (31-Jan-2007). This vegetation occurs as large patches of the matrix forest type and ranges across most northeastern states. Pristine or old-growth examples are few, but in general this forest type has recovered to mid- to late-successional stages following large-scale clearing by European settlers.

RELATED CONCEPTS

Global Similar Types:

- *Pinus strobus - (Pinus resinosa) - Quercus rubra* Forest (CEGL002480)
- *Pinus strobus - Quercus alba - Quercus prinus / Vaccinium stamineum* Forest (CEGL008539)
- *Pinus strobus - Quercus alba / Ilex glabra* Forest (CEGL006382)
- *Quercus (alba, rubra, velutina) - Carya* spp. / *Viburnum acerifolium* Forest (CEGL006336) has less pine, more hickory, and little or no beech, but can intergrade to this type.

- *Quercus rubra - Acer rubrum - Betula* spp. - *Pinus strobus* Ruderal Forest (CEGL006506)
- *Quercus rubra - Acer saccharum - Fagus grandifolia / Viburnum acerifolium* Forest (CEGL006633)
- *Quercus rubra - Acer saccharum / Viburnum acerifolium - Lindera benzoin* Forest (CEGL006635)
- *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest (CEGL006088)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: In the Massachusetts, Connecticut and New Jersey examples, the well-developed heath shrub layer is diagnostic of this community. *Acer saccharum* and occasional *Tsuga canadensis* may be more common in the understory in later-successional examples of this community in the northern part of the range. In New York, this community looks similar to Lower New England High Slope Chestnut Oak Forest (CEGL006282) but the presence of *Pinus strobus* makes it Northeastern White Pine - Oak Forest (CEGL006293).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: Shallow, acidic soils are a driving force in these forests.
Global Classification Comments: In the northern part of this type's range, it can be similar to *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest (CEGL006088), which is distinguished by having *Tsuga canadensis* as the principal canopy conifer. However, examples of both types may have *Pinus strobus* and *Tsuga canadensis* present. In the southern part of this type's range, drier expressions overlap conceptually with *Pinus strobus - Quercus alba - Quercus prinus / Vaccinium stamineum* Forest (CEGL008539) to the south, and the overlap between those two needs clarification.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs from New England south and west to Pennsylvania and West Virginia. In the Central Appalachian project area, it was sampled in Adams County in southern Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (Sharon Mountain, Silver Hill in Sharon), Massachusetts (Beartown State Forest, Mt. Bushnell), New Jersey (Culvers Gap North, Culvers Gap South, north of Sunrise Mountain), and New York (West Mountain - Bear Mountain State Park).
Global Range: This community occurs in New England south and west to New Jersey and West Virginia. Total acreage for all subsections is approximately 230,000 square km.

A2080 *Pinus strobus - Quercus prinus* Appalachian Forest Alliance

Alliance Summary Description: This alliance includes dry pine-oak forests dominated by *Pinus strobus* occurring either with *Quercus coccinea* and/or *Quercus prinus* in drier associations, or with *Quercus alba, Quercus rubra*, and/or *Quercus velutina* in dry-mesic to mesic ones. Typical species in the subcanopy of the drier associations include *Acer rubrum var. rubrum, Cornus florida, Nyssa sylvatica*, and *Oxydendrum arboreum*. *Pinus strobus* is a consistent constituent of the canopy and usually occurs as supercanopy trees, as well. In these more mesic associations, *Quercus alba, Quercus rubra*, and *Quercus velutina* are also important canopy trees along with minor amounts of *Acer rubrum, Carya alba, Liriodendron tulipifera, Quercus prinus*, and *Tsuga canadensis*. These forests often have dense ericaceous shrub strata with species such as *Gaylussacia* spp., Kalmia latifolia, Rhododendron maximum, and *Vaccinium* spp. Herbaceous strata have low species richness and are composed of species typical of dry montane forests, such as *Chamaelirium luteum, Chimaphila maculata, Epigaea repens, Galax urceolata, Goodyera pubescens, Smilax glauca, Smilax rotundifolia*, and *Viola hastata*. These forests occur on dry to upper slopes and ridgetops, as well as dry-mesic to mesic midslopes at low elevations (below 915 m [3000 feet]) in the Blue Ridge escarpment region. In the Ridge and Valley of Virginia, these forests are known from north-facing slopes over shale substrates and on lower to middle-elevation knobs and side ridges.

[CEGL007519] *Pinus strobus - Quercus (coccinea, prinus) / (Gaylussacia ursina, Vaccinium stamineum)* Forest

Translated Name: **Eastern White Pine - (Scarlet Oak, Chestnut Oak) / (Bear Huckleberry, Deerberry) Forest**
Common Name: **Appalachian White Pine - Subxeric Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Pinus strobus - Quercus prinus* Appalachian Forest Alliance (A2080)

ELEMENT CONCEPT

Global Summary: This community occurs on exposed upper slopes and ridgetops at elevations below 915 m (3000 feet) in the southern Appalachian Mountains. This association represents mixed forests with *Pinus strobus, Quercus prinus*, and *Quercus coccinea*, occurring singly or in combination, each contributing 25-75% of the total canopy coverage. Open subcanopies are composed of *Oxydendrum arboreum, Acer rubrum var. rubrum, Nyssa sylvatica*, and *Cornus florida*. The shrub stratum is dominated by deciduous heath species, typically *Gaylussacia ursina* or *Vaccinium stamineum*. Other species in the shrub/sapling stratum may include *Vaccinium pallidum, Leucothoe recurva, Kalmia latifolia, Castanea dentata*, or *Acer rubrum var. rubrum*. On rocky sites, *Deschampsia flexuosa* may be common.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This white pine - oak forest was sampled at five locations in the Southern Blue Ridge project area. Sites range from moderate to steep, lower to upper slopes and ridgetops on any aspect. Elevations range from 670 to 1,050 m. Soil moisture is variable, ranging from xeric to dry-mesic, rapidly drained to moderately well-drained. Soil textures include loam, sandy loam, clay loam and clay. The unvegetated surface is dominated by leaf litter with some downed wood and occasional exposed bedrock and large/small rocks. Evidence of disturbance includes fire (as recently as 2008), hemlock/fir adelgid damage, and pine bark beetle damage.
Global Environment: This community occurs on exposed upper slopes and ridgetops at elevations below 915 m (3000 feet) in the southern Appalachian Mountains. The presence of *Pinus strobus* in these forests may be a product of disturbance and subsequent fire suppression. It may have increased its abundance since about 1900.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This natural mixed-age forest has a canopy that is a mixture of *Pinus strobus* (cover may be as little as 25%), *Quercus alba, Quercus coccinea, Quercus prinus, Quercus rubra*, and *Quercus velutina*. Other common tree species include *Acer rubrum, Quercus prinus, Nyssa sylvatica*, and *Oxydendrum arboreum*. The dominant shrubs include *Gaylussacia ursina, Kalmia latifolia, Vaccinium pallidum*, and *Rhododendron maximum*. Herbs are very sparse to absent.
Global Vegetation: Stands of this forest association typically contain *Pinus strobus* (contributing 25-75% of the canopy coverage) and *Quercus prinus* and/or *Quercus coccinea* (occurring singly or in combination) as 25-75% of the canopy coverage. Open subcanopies are composed of *Oxydendrum arboreum, Acer rubrum var. rubrum, Nyssa sylvatica*, and *Cornus florida*. The shrub stratum is dominated by deciduous heath species, typically *Gaylussacia ursina* or *Vaccinium stamineum*. Other species in the shrub/sapling stratum may include *Vaccinium pallidum, Leucothoe recurva, Kalmia latifolia, Castanea dentata*, or *Acer rubrum var. rubrum*. On rocky sites, *Deschampsia flexuosa* may be common.

Translated Name: **Eastern White Pine - White Oak - (Mockernut Hickory) / Bear Huckleberry Forest**
Common Name: **Appalachian White Pine - Mesic Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Pinus strobus - Quercus prinus* Appalachian Forest Alliance (A2080)

ELEMENT CONCEPT

Global Summary: This association covers mesic pine-oak-hickory in the Cumberlands and Southern Ridge and Valley, Southern Blue Ridge Escarpment and in the Piedmont transition, found below 885 m (2900 feet) elevation, on protected ridges, mid- to upper slopes, and in disturbed bottoms. Canopies are dominated by variable mixtures of *Pinus strobus, Quercus alba, Quercus velutina, Carya alba*, and *Acer rubrum*. Other canopy species may include *Liriodendron tulipifera, Tsuga canadensis, Quercus rubra, Quercus falcata, Quercus prinus*, and *Magnolia fraseri*. Subcanopy and saplings include canopy species and *Cornus florida, Halesia tetraptera, Oxydendrum arboreum*, and *Nyssa sylvatica*. Shrub layers are moderate to dense, with *Gaylussacia ursina* and *Kalmia latifolia* most commonly dominating. Other shrubs include *Rhododendron minus, Rhododendron maximum, Symplocos tinctoria, Arundinaria*

gigantea, Castanea dentata, Sassafras albidum, Amelanchier arborea, Pyrularia pubera, and *Hydrangea radiata*. The herb stratum is sparse, although ferns (*Thelypteris noveboracensis, Dennstaedtia punctilobula* and *Polystichum acrostichoides*) may occasionally dominate. Common herbs include *Chimaphila maculata, Viola hastata, Goodyera pubescens, Maianthemum racemosum, Polygonatum biflorum, Monotropa uniflora, Trillium catesbaei, Desmodium nudiflorum, Eupatorium purpureum, Galium circaezans, Galium latifolium, Galax urceolata, Hexastylis shuttleworthii, Medeola virginiana, Mitchella repens*, and *Houstonia purpurea*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This white pine - oak forest is found below 1,220 m (4,000 feet) elevation and occurs on moderate to steep, mid to lower slopes, sometimes occurring on lower, broad ridgetops (occasionally reaching 1,370 m [4,500 feet]). Soils may be moderately well-drained clay loam. One sampled stand was probably logged in the 1940-50s.
Global Environment: Stands of this association are found below 885 m (2900 feet) elevation, on protected ridges, mid- to upper slopes, and in disturbed bottoms in the Cumberlands and Southern Ridge and Valley, Southern Blue Ridge Escarpment and in the Piedmont transition region. The presence of *Pinus strobus* in these forests may be a product of disturbance and subsequent fire suppression. It may have increased its abundance since about 1900.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This natural uneven-aged mixed forest typically has from 25-50% *Pinus strobus*; it can also include any or all of the following: *Carya alba, Carya glabra, Liriodendron tulipifera, Quercus alba, Quercus prinus*, and *Quercus velutina*. Common shrubs include *Amelanchier laevis, Castanea dentata, Gaylussacia ursina*, and *Kalmia latifolia*. Herbs are sparse but may include *Galax urceolata, Goodyera pubescens*, and *Lysimachia quadrifolia*.
Global Vegetation: Canopies are dominated by variable mixtures of *Pinus strobus, Quercus alba, Carya alba*, and *Acer rubrum*. Other canopy species may include *Liriodendron tulipifera, Tsuga canadensis, Quercus rubra, Quercus prinus*, and *Magnolia fraseri*. Subcanopy and saplings include canopy species and *Cornus florida, Halesia tetraptera, Oxydendrum arboreum*, and *Nyssa sylvatica*. Shrub layers are moderate to dense, with *Gaylussacia ursina* and *Kalmia latifolia* most commonly dominating. Other shrubs include *Rhododendron minus, Rhododendron maximum, Symplocos tinctoria, Arundinaria gigantea, Castanea dentata, Sassafras albidum, Amelanchier arborea, Pyrularia pubera*, and *Hydrangea radiata*. The herb stratum is sparse, although ferns (*Thelypteris noveboracensis, Dennstaedtia punctilobula*, and *Polystichum acrostichoides*) may occasionally dominate. CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (23-Oct-2003). This community is geographically restricted and uncommon within its range. Grank changed to G3G4 from G2G3 on the recommendation of Gary Kauffman, USDA Forest Service.

RELATED CONCEPTS

Global Similar Types:
- *Pinus strobus - Quercus alba - Quercus prinus / Vaccinium stamineum* Forest (CEGL008539)
- *Quercus alba - Quercus falcata / Vaccinium (arboreum, hirsutum, pallidum)* Forest (CEGL008567)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Small group of white pine - oak forests with much higher species richness than Appalachian White Pine - Subxeric Oak Forest (CEGL007519). Compared to CEGL007519, average topographic position among this group is lower and mean aspect is northwest (versus southwest), suggesting at least somewhat more mesic site conditions. *Quercus alba* is the principal oak associate.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: Two of the plots were pre-classified (by others) as *Pinus strobus / Kalmia latifolia - (Vaccinium stamineum, Gaylussacia ursina)* Forest (CEGL007100), a "pure" *Pinus strobus* type known from the escarpment region of the Southern Blue Ridge.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is widely scattered near the AT in Georgia, North Carolina, and Tennessee. It rarely intersects the trail corridor. It was sampled at Nantahala Gorge in Nantahala National Forest, North Carolina, and in Chattahoochee National Forest, Georgia.
Global Range: This community is known from the Cumberlands and Southern Ridge and Valley, Southern Blue Ridge Escarpment and in the Piedmont transition region.
Nations: US
States/Provinces: GA, KY?, NC, SC, TN

Common Name: **Central Appalachian-Piedmont White Pine - Subxeric Oak Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Pinus strobus* - *Quercus prinus* Appalachian Forest Alliance (A2080)

Element Concept

Global Summary: The known range of this community includes the Central Appalachian region of Virginia, Maryland, and West Virginia, and the northern and central Piedmont of Virginia. The type is particularly abundant and widespread on low shale mountains and hills in west-central Virginia and adjacent West Virginia. Sites are underlain primarily by shale and similar sedimentary rocks (siltstone, metasiltstone, phyllite) or, less commonly, sandstone in the mountains and by a variety of acidic metamorphic and igneous rocks in the Piedmont. Stands occupy middle and upper slopes, ridge crests, dry ravines, and bluffs, mostly below 760 m (2500 feet) elevation in the mountains and above 75 m (240 feet) in the Piedmont. Aspect is variable, and site moisture is typically assessed as subxeric or submesic. Vegetation is a mixed forest, with canopies varying from closed to somewhat open, codominated by *Pinus strobus* (25-75% canopy cover) and various oaks, particularly *Quercus alba, Quercus coccinea, Quercus velutina, Quercus rubra*, and *Quercus prinus*. Minor canopy associates include *Acer rubrum, Carya alba, Carya glabra, Fagus grandifolia* (mostly Piedmont), *Liriodendron tulipifera, Nyssa sylvatica, Pinus virginiana, Quercus falcata* (mostly Piedmont), *Quercus velutina*, and *Tsuga canadensis*. Understory trees include *Acer rubrum, Oxydendrum arboreum*, and *Nyssa sylvatica*, which may be abundant, along with *Cornus florida*. The shrub layer is predominantly ericaceous and varies from sparse and patchy to occasionally dense, with *Vaccinium stamineum, Vaccinium pallidum, Gaylussacia baccata*, and *Kalmia latifolia* being characteristic. Other frequent but lower-cover shrub-layer species include *Amelanchier arborea, Viburnum acerifolium, Smilax rotundifolia, Smilax glauca, Sassafras albidum*, and *Diospyros virginiana*. The herb layer is characterized by species tolerant of dry, acidic soils; it is usually sparse but occasionally contains dense graminoid patches of *Danthonia spicata, Deschampsia flexuosa*, or *Carex pensylvanica*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This white pine - subxeric oak / heath forest is found on sites that are underlain primarily by shale and similar sedimentary rocks (siltstone) mostly below 760 m (2,500 feet) elevation. It occurs on mid and upper slopes, ridge crests, dry ravines, and bluffs. This community was sampled at four locations in the Central Appalachian project area. The sites are somewhat steep mid and upper northeast- and west-facing slopes and ridges with dry, well-drained silt loam soil. The unvegetated surface is dominated by leaf litter with some downed wood. Coppicing of oaks is common and indicative of past logging in some stands.

Global Environment: Sites are underlain primarily by shale and similar sedimentary rocks (siltstone, metasiltstone, phyllite) or, less commonly, sandstone in the mountains and by a variety of acidic metamorphic and igneous rocks in the Piedmont. Stands occupy middle and upper slopes, ridge crests, dry ravines, and bluffs, mostly below 760 m (2500 feet) elevation in the mountains and above 75 m (240 feet) in the Piedmont. At least in West Virginia, it occurs in large patches in all slope positions on southwesterly aspects and becomes restricted to smaller patches on ridge spurs and convex upper slopes on cooler aspects. Aspect is variable, and site moisture is typically assessed as subxeric or submesic. Soils are extremely acidic (mean pH = 4.2) with very low base cation levels. Chemical analysis of soils from 16 sites near the Bluestone River in West Virginia showed soils with relatively high levels of organic matter, estimated N release, S, Al, and Fe, and relatively low levels of B, Ca, Cu, K, Mg, Mn, Na, P, and Zn compared to average values in the area.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus prinus, Quercus alba, Quercus rubra*, and/or *Quercus coccinea* are codominant with *Pinus strobus* in the canopy. *Acer rubrum, Amelanchier arborea, Cornus florida, Kalmia latifolia*, and *Viburnum acerifolium* are common in the tall-shrub layer as are oaks from the canopy. *Vaccinium pallidum* and *Vaccinium stamineum* are characteristic short shrubs. Scattered herbs include *Chimaphila maculata, Galax urceolata*, and *Polygonatum biflorum*. This community also supports VA-state critically imperiled and regional endemic *Heuchera caroliniana*.

Global Vegetation: Vegetation is a mixed forest, with canopies varying from closed to somewhat open, codominated by *Pinus strobus* (25-75% canopy cover) and various oaks, particularly *Quercus alba, Quercus coccinea, Quercus velutina, Quercus rubra*, and *Quercus prinus*. Minor canopy associates include *Acer rubrum, Carya alba, Carya glabra, Fagus grandifolia* (mostly Piedmont), *Liriodendron tulipifera, Nyssa sylvatica, Pinus virginiana, Quercus falcata* (mostly Piedmont), *Quercus velutina*, and *Tsuga canadensis*. In addition, *Acer rubrum, Oxydendrum arboreum*, and *Nyssa sylvatica* are abundant understory trees, along with *Cornus florida*. The shrub layer is predominantly ericaceous and varies from sparse and patchy to occasionally dense. *Vaccinium stamineum, Vaccinium pallidum, Gaylussacia baccata*, and *Kalmia latifolia* are characteristic ericads. Other frequent but lower-cover shrub-layer species include *Amelanchier arborea, Viburnum acerifolium, Smilax rotundifolia, Smilax glauca, Sassafras albidum*, and *Diospyros virginiana*. The herb layer is typically sparse and characterized by species tolerant of dry, acidic soils. It consists mostly of woody seedlings and scattered individuals of *Chimaphila maculata, Polygonatum biflorum, Mitchella repens, Cypripedium acaule, Dioscorea quaternata, Conopholis americana, Houstonia longifolia, Antennaria plantaginifolia, Zizia trifoliata, Gaultheria procumbens, Cunila origanoides, Potentilla simplex*, and *Viola x palmata*. Occasional stands, especially on shale substrates, contain dense graminoid patches of *Danthonia spicata, Deschampsia flexuosa*, or *Carex pensylvanica*. Species richness of plot-sampled stands ranged from 16 to 65 taxa per 400 square meters (mean = 36) in the VA and MD plots and from 20 to 53 (mean = 33.5) species per 200 square meters in the WV plots.

Global Dynamics: The successional status of this community is somewhat unclear. At some sites, it appears that *Pinus strobus* has increased greatly following logging disturbances or fire exclusion, and that the white pine-hardwood forest is characteristic of secondary succession in disturbed oak forests. However, Rhoades (1995) describes a mature mixed oak forest (primarily *Quercus prinus* and *Quercus coccinea*) that underwent rapid change toward an oak-maple-white pine composition over a 20-year period. In 1971, *Pinus strobus* was present only as small seedlings, but by 1994 it had assumed dominance of the sapling class. This suggests that in some situations, particularly in the absence of fire, this forest may be a late-successional or climax community type. In a study along the Bluestone River in West Virginia, some stands of this association have some shade-tolerant, mesophytic trees such as *Acer saccharum var. saccharum, Tsuga canadensis*, and *Fagus grandifolia* in the understory, which may indicate successional trends; in other stands, however, there is evidence of abundant oak regeneration.

Global: *Carya alba*, *Chimaphila maculata*, *Diospyros virginiana*, *Pinus strobus*, *Pinus virginiana*, *Quercus alba*, *Quercus coccinea*, *Quercus falcata*, *Quercus stellata*, *Vaccinium stamineum*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Heuchera caroliniana* (G3, globally vulnerable & VA state-critically imperiled)
Global: Vulnerable Plants: *Heuchera caroliniana* (G3), *Monarda fistulosa* ssp. *brevis* (G5T1T2), *Tsuga caroliniana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (21-Sep-2001). Although currently known from a relatively small geographic range, this community type locally covers extensive areas in the Ridge and Valley portion of the Central Appalachians.

RELATED CONCEPTS

Global Similar Types:

- *Liriodendron tulipifera - Pinus strobus - Tsuga canadensis - Quercus rubra / Polystichum acrostichoides* Forest (CEGL006304) of more mesic habitats (e.g., acidic coves) in Maryland, Virginia, and West Virginia.
- *Pinus strobus - Quercus (coccinea, prinus) / (Gaylussacia ursina, Vaccinium stamineum)* Forest (CEGL007519) of the Southern Appalachians.
- *Pinus strobus - Quercus (rubra, velutina) - Fagus grandifolia* Forest (CEGL006293)
- *Pinus strobus - Quercus alba - (Carya alba) / Gaylussacia ursina* Forest (CEGL007517) of the Southern Appalachians.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Although it occupies a variety of substrates, it is most abundant north of the AT study area on Devonian and Silurian shales of the Ridge and Valley region in west-central Virginia and east-central West Virginia (Fleming and Patterson 2009a).
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: In Virginia, many stands of oak/heath are succeeding to *Pinus strobus - Quercus alba - Quercus prinus / Vaccinium stamineum* Forest (CEGL008539) because of fire exclusion. The circumscription of this type is based on analysis of 16 plot samples from the Virginia Piedmont and Blue Ridge, and Maryland Ridge and Valley, with an additional 16 plots from the environs of the Bluestone River, West Virginia. Additional data, particularly from Central Appalachian regions where white pine is prevalent, would assist in making the classification more robust and identifying potential regional patterns of variation. Central Appalachian white pine - hardwood forests are distinguished from similar vegetation of the Southern Appalachians, e.g., *Pinus strobus - Quercus alba - (Carya alba) / Gaylussacia ursina* Forest (CEGL007517) and *Pinus strobus - Quercus (coccinea, prinus) / (Gaylussacia ursina, Vaccinium stamineum)* Forest (CEGL007519) by the absence of Southern Appalachian species such as *Gaylussacia ursina, Leucothoe recurva, Rhododendron minus, Arundinaria gigantea*, and *Hydrangea radiata*. Six plots from the southern part of the Central Appalachians were classified as this association in the Appalachian Trail classification project (Fleming and Patterson 2009a).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is scattered along and near the AT in the Ridge and Valley section of Virginia from near Roanoke to Bland County. It was sampled at Craig Creek, Dragons Tooth, Lickskillet Hollow, and Peters Mountain in Virginia.
Global Range: The known range of this community includes the Central Appalachian region of Virginia, Maryland, and West Virginia, and the northern and central Piedmont of Virginia. The type is particularly abundant and widespread on low shale mountains and hills in the west-central Virginia (Alleghany, Bath, and Craig counties) and adjacent West Virginia (Pendleton and Pocahontas counties).

[CEGL006454] *Quercus (rubra, velutina, alba) - Betula lenta - (Pinus strobus)* Forest

Translated Name: **(Northern Red Oak, Black Oak, White Oak) - Sweet Birch - (Eastern White Pine) Forest**
Common Name: **Mid-Atlantic Mid-Successional Oak - Pine Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Pinus strobus* - *Quercus prinus* Appalachian Forest Alliance (A2080)

ELEMENT CONCEPT

Global Summary: This association covers mid-successional forests developing after heavy cutting or other disturbance in the mid-Atlantic states, where dry-mesic oak species and earlier successional trees predominate, typically with a supercanopy of *Pinus strobus*. It is usually found on dry-mesic sites that are flat to gently rolling. Characteristic structure is large *Pinus strobus* over a layer of young, small-diameter hardwoods, such as *Acer rubrum, Betula lenta*, and mesic oaks, including *Quercus rubra* and *Quercus palustris*. *Juniperus virginiana* and *Tsuga canadensis* may be common in the canopy or subcanopy. Other common associates include *Prunus serotina, Fagus grandifolia, Fraxinus americana, Populus grandidentata, Acer saccharum, Carya cordiformis, Betula alleghaniensis*, and occasional dry oak species such as *Quercus alba* or *Quercus velutina*. The subcanopy may contain *Carpinus caroliniana* and/or *Ostrya virginiana*. The tall-shrub layer is sparse to moderately dense, consisting of *Lindera benzoin, Ilex verticillata, Viburnum prunifolium, Viburnum recognitum*, and saplings of canopy tree species. Common short shrubs are *Berberis thunbergii, Viburnum acerifolium, Rubus occidentalis, Rubus flagellaris*, and *Rubus allegheniensis*. Ericaceous shrubs may be scattered in this type, however, they generally do not cover greater than 25% of the forest floor. The herbaceous layer is sparse to moderately dense; characteristic herbs include *Maianthemum canadense, Dennstaedtia punctilobula, Lycopodium digitatum, Chimaphila maculata, Galium circaezans, Galium mollugo, Mitchella repens, Polystichum acrostichoides, Dryopteris intermedia, Ageratina altissima var. altissima, Podophyllum peltatum*, and *Oxalis stricta*. *Alliaria petiolata* is a common invasive plant in these forests. Vines are usually sparse, with *Parthenocissus quinquefolia* and *Toxicodendron radicans* typically present at low cover.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mid-successional forest develops after heavy cutting or other disturbance in southern New England and New York south through Delaware Water Gap. It was not observed, but is possible within the Lower New England project area.
Global Environment: This forest occurs on dry-mesic sites that are flat to gently rolling. It typically develops after heavy cutting or other disturbance in the mid-Atlantic states, where dry-mesic oak species and earlier successional trees predominate, typically with a supercanopy of *Pinus strobus*.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: No data available.
Global Vegetation: Characteristic structure is large *Pinus strobus* over a layer of young, small-diameter hardwoods, such as *Acer rubrum, Betula lenta*, and mesic oaks, including *Quercus rubra* and *Quercus palustris*. *Juniperus virginiana* and *Tsuga canadensis* may be common in the canopy or subcanopy. Other common associates include *Prunus serotina, Fagus grandifolia, Fraxinus americana, Populus grandidentata, Acer saccharum, Carya cordiformis, Betula alleghaniensis*, and occasional dry oak species such as *Quercus alba* or *Quercus velutina*. The canopy is typically 20 to 30 m in height with canopy cover usually greater than 70%. The subcanopy usually contains similar species as the canopy, as well as *Carpinus caroliniana* and *Ostrya virginiana*. The tall-shrub layer is sparse to moderately dense, consisting of *Lindera benzoin, Ilex verticillata, Viburnum prunifolium, Viburnum recognitum*, and saplings of canopy tree species. Common short shrubs are *Berberis thunbergii, Viburnum acerifolium, Rubus occidentalis, Rubus flagellaris*, and *Rubus allegheniensis*. Ericaceous shrubs, such as *Kalmia latifolia, Gaylussacia baccata, Vaccinium angustifolium, Vaccinium pallidum*, and *Vaccinium stamineum*, may be scattered in this type, however, they generally do not cover greater than 25% of the forest floor. The herbaceous layer is usually sparse to moderately dense; characteristic herbs include *Maianthemum canadense, Dennstaedtia punctilobula, Lycopodium digitatum, Chimaphila maculata, Galium circaezans, Galium mollugo, Mitchella repens, Polystichum acrostichoides, Dryopteris intermedia, Ageratina altissima var. altissima, Podophyllum peltatum*, and *Oxalis stricta*. *Alliaria petiolata* is a common invasive plant in these forests, Vines are usually sparse, with *Parthenocissus quinquefolia* and *Toxicodendron radicans* typically present at low cover.
Global Dynamics: Varying land-use histories are likely responsible for the species composition and structure of these stands. These are mid-successional forests developing after heavy cutting or other disturbances.

MOST ABUNDANT SPECIES

Global

Stratum	Lifeform	Species
Tree (canopy & subcanopy)	Needle-leaved tree	*Pinus strobus*
Tree canopy	Broad-leaved deciduous tree	*Acer rubrum*, *Betula lenta*
Tree subcanopy	Broad-leaved deciduous tree	*Fagus grandifolia*
Tall shrub/sapling	Broad-leaved deciduous shrub	*Ilex verticillata*, *Lindera benzoin*
Short shrub/sapling	Broad-leaved deciduous shrub	*Rubus occidentalis*
Herb (field)	Fern (Spore-bearing forb)	*Dennstaedtia punctilobula*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Lower New England Project Area):
Global: *Acer rubrum*, *Betula lenta*, *Dennstaedtia punctilobula*, *Fagus grandifolia*, *Lindera benzoin*, *Pinus strobus*

OTHER NOTEWORTHY SPECIES

Global: Other Plants: *Polystichum acrostichoides* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (23-Jun-2006).

RELATED CONCEPTS

Global Similar Types:
- *Quercus rubra - Acer rubrum - Betula* spp. - *Pinus strobus* Ruderal Forest (CEGL006506) is somewhat more northern, with *Betula papyrifera* more typical than *Betula lenta, Quercus rubra* as the only oak species, and *Picea rubens* an occasional minor associate.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community was not observed, but is possible within AT Lower New England project area in the vicinity of Delaware Water Gap and is in a map class with Northeastern White Pine - Oak Forest (CEGL006293).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Mid-successional forests like this are variable and have not been thoroughly sampled and analyzed.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community is possible within the Lower New England project area in the vicinity of Delaware Water Gap.
Global Range: This association occurs in southern New England south to Pennsylvania and possibly further west and south.
Nations: US
States/Provinces: CT?, MA, NJ, NY?, PA
TNC Ecoregions: 59:P, 60:C, 61:C
USFS Ecoregions (1994/95): 212Fc:CCC, 221Bd:CCC
Federal Lands: NPS (Appalachian Trail [Lower New England], Delaware Water Gap)

A0248 *Quercus prinus - Quercus coccinea* Forest Alliance

Alliance Summary Description: This alliance includes dry oak forests strongly dominated by *Quercus prinus* or *Quercus prinus* with admixtures of *Quercus coccinea, Quercus velutina*, or, to the north, *Quercus rubra*. Other canopy/subcanopy associates include *Acer rubrum, Amelanchier arborea, Carya pallida, Magnolia fraseri, Nyssa sylvatica, Oxydendrum arboreum, Pinus rigida, Pinus strobus, Quercus alba, Quercus rubra, Sassafras albidum*, and *Vaccinium arboreum*. An ericaceous shrub layer is variable in cover, with species such as *Gaylussacia baccata, Gaylussacia ursina, Kalmia latifolia, Leucothoe recurva, Rhododendron maximum, Vaccinium angustifolium, Vaccinium pallidum*, and *Vaccinium stamineum*. In the upper Piedmont, *Kalmia latifolia, Vaccinium arboreum*, and *Vaccinium pallidum* are common. In the montane distribution of this alliance, forests of this alliance have replaced forests formerly dominated or codominated by *Castanea dentata*, and chestnut sprouts are common in the understory. Other shrub species found in forests of this alliance include *Diospyros virginiana, Sassafras albidum*, and *Styrax grandifolius*. Herbaceous cover is typically sparse in these dry, rocky forests, and species vary with geographic location. Common species may include *Chimaphila umbellata, Danthonia spicata, Epigaea repens, Galax urceolata, Gaultheria procumbens*, and *Solidago odora*, and others. The alliance is broad-ranging, from the Southern and Central Appalachians, Ridge and Valley, Cumberland Plateau, Piedmont, Interior Low Plateau, north into the Western Allegheny Plateau, Southern New England / Northern Piedmont, to the Chaplain / St. Lawrence valleys and scattered locations of the Northern Appalachians. These forests occur on convex upper slopes, ridgetops, and south-facing slopes, over thin, rocky, infertile soils in the Appalachians, typically below 1066 m (3500 feet) elevation where windthrow and ice damage are common natural disturbances. In the Piedmont, these forests occur on low mountains and hills, on rocky, well-drained, acidic soils, sometimes associated with outcrops of quartzite or other resistant rock.

[CEGL006271] *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest

Translated Name: **(Chestnut Oak, Scarlet Oak) / Mountain Laurel / (Beetleweed, Eastern Teaberry) Forest**
Common Name: **Chestnut Oak Forest (Subxeric Ridge Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus* - *Quercus coccinea* Forest Alliance (A0248)

ELEMENT CONCEPT

Global Summary: This community includes subxeric ridgetop and exposed slope forests in the Southern Appalachians, ranging south and east into the upper Piedmont, north into the Central Appalachians, and north and west into the Ridge and Valley. This community occurs over shallow soils, primarily on south- to west-facing slopes and ridgetops where solar exposure is high. Soils are rocky, infertile, dry, acidic sandy loams typically derived from sandstone. The community includes forests with canopies strongly dominated by *Quercus prinus* and/or *Quercus coccinea*, with lesser amounts of *Quercus velutina, Quercus rubra, Quercus falcata, Oxydendrum arboreum, Nyssa sylvatica, Pinus virginiana*, and *Acer rubrum*, occurring over a typically dense shrub stratum dominated by ericaceous species. The shrub layer may vary between evergreen and deciduous dominance. Typical shrub species include *Kalmia latifolia, Rhododendron maximum, Vaccinium stamineum, Vaccinium pallidum, Gaylussacia ursina, Gaylussacia baccata*, and (in the more southern portions of the range) *Leucothoe recurva*. In addition, *Castanea dentata* may occur abundantly as root sprouts. The herb layer is typically sparse and includes subshrubs such as *Epigaea repens* and *Gaultheria procumbens*. Other common species include *Chamaelirium luteum, Chimaphila maculata, Galax urceolata, Magnolia fraseri, Sassafras albidum, Symplocos tinctoria, Smilax rotundifolia*, and *Smilax glauca*. This community is distinguished by its overall floristic composition, with a high abundance of acid-loving ericaceous species, which are indicative of this community's extremely infertile, acidic soils.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This dry, acidic chestnut oak / heath forest occurs on upper convex slopes and dry ridges with rocky, infertile, dry, acidic sandy loam soil. It was sampled at 14 locations within the AT corridor in the southern part of the Central Appalachians. Sites range from gentle to somewhat steep low to upper slopes and ridges with mostly northern or southern aspects. Soils are xeric to dry-mesic well-drained loam, sandy loam, clay loam, and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional large and/or small rocks. Evidence of disturbance includes past fire, past logging, trails, and wind/ice damage.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This acidic chestnut oak forest is found below 1,220 m (4,000 feet) elevation and occurs on upper slopes and exposed ridgetops and sometimes on lower, broad ridgetops (occasionally reaching 1,370 m [4,500 feet]) with a range of aspects. Soils range from xeric to dry-mesic and from rapidly drained to moderately well-drained. Soil textures include clay loam, loam, sandy loam, and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional large/small rocks and bare soil. Evidence of disturbance includes past logging, trails, pine bark beetle damage, and hemlock/fir adelgid damage.

Global Environment: This community occurs on upper slopes, ridges and spurs, usually convex, primarily on south- to west-facing slopes and ridgetops where solar exposure is high. This community includes subxeric ridgetop forests in the Southern Blue Ridge, ranging south and east into the upper Piedmont and north into the Central Appalachians, and west into the Ridge and Valley. Soils are rocky, infertile, dry to very dry, acidic sandy loams to clay loams often derived from sandstone. These forests occur on moderate to very steep slopes or on flat to gently sloping interfluves. Sites supporting this association are typically below 1067 m elevation (3500 feet), but range up to 1280 m (4200 feet). The average elevation of 55 plots classified as this association in the Appalachian Trail project (Fleming and Patterson 2009a) is 845 m (2771 feet), ranging from 262 m (860 feet) to 1305 m (4281 feet).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus prinus* dominates the canopy. *Quercus coccinea, Acer rubrum*, and *Nyssa sylvatica* are common associates. *Kalmia latifolia* dominates the shrub layer. Other common shrubs include *Castanea dentata* and *Vaccinium pallidum*. This community includes Southern Appalachian species such as *Galax urceolata, Oxydendrum arboreum*, and *Leucothoe recurva*. Additional species common in the herb layer include *Gaultheria procumbens, Epigaea repens*, and *Uvularia puberula*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The forest canopy is dominated largely by dry to subxeric oak species, primarily *Quercus prinus* or *Quercus coccinea* (sometimes *Quercus alba*) usually but not always occurring over a nearly completely closed shrub layer of *Kalmia latifolia*. Additional common tree species include *Acer rubrum, Nyssa sylvatica, Oxydendrum arboreum, Quercus rubra*, and *Quercus velutina*. Common shrubs in addition to *Kalmia latifolia* are *Castanea dentata, Leucothoe recurva, Rhododendron calendulaceum, Rhododendron maximum, Sassafras albidum, Vaccinium pallidum*, and *Vaccinium stamineum*. Herbs are sparse but diverse; common taxa include *Epigaea repens, Galax urceolata, Gaultheria procumbens*, and *Uvularia puberula*. This community also supports TN-state imperiled *Stachys clingmanii* (also considered globally imperiled) and *Buckleya distichophylla*. In a southern variant of this association restricted to the Great Smoky Mountains and Nantahala Mountains, *Gaylussacia ursina* (strongly dominant), *Quercus rubra,*

Pyrularia pubera, Tsuga canadensis, and *Magnolia fraseri* are much more important in a southern variant of this association restricted to the Great Smoky Mountains and Nantahala Mountains.

Global Vegetation: Stands of this association are forests with canopies strongly dominated by *Quercus prinus* and *Quercus coccinea* alone or in mixture. *Quercus velutina* is an important associate in some stands. Other trees, usually in lesser amounts, include *Quercus rubra, Quercus alba, Quercus falcata, Oxydendrum arboreum, Nyssa sylvatica, Pinus virginiana, Pinus rigida, Betula lenta*, and *Acer rubrum*. In addition, *Carya alba, Carya glabra, Magnolia acuminata*, and *Magnolia fraseri* are present in some areas. The canopy trees grow over a typically dense shrub stratum dominated by ericaceous species, which may display either evergreen or deciduous dominance. Typical shrub species include *Kalmia latifolia, Vaccinium stamineum, Vaccinium pallidum, Gaylussacia ursina*, and *Gaylussacia baccata*. Some areas may feature *Rhododendron maximum, Rhododendron calendulaceum, Rhododendron catawbiense*, and *Leucothoe recurva*. In addition, *Castanea dentata* may occur abundantly as root sprouts. The herb layer is typically sparse and includes subshrubs such as *Epigaea repens* and *Gaultheria procumbens*. Other common species include *Carex digitalis var. digitalis, Chamaelirium luteum, Chimaphila maculata, Coreopsis major, Galax urceolata, Danthonia spicata, Dichanthelium dichotomum var. dichotomum, Dioscorea quaternata, Hieracium venosum, Houstonia longifolia, Lysimachia quadrifolia, Solidago caesia, Symplocos tinctoria*, and *Potentilla simplex*. Mosses include *Dicranum fulvum, Dicranum scoparium, Thuidium delicatulum*, and *Leucobryum glaucum*. Macrolichens include *Flavoparmelia baltimorensis, Cladonia furcata, Lasallia papulosa*, and *Umbilicaria mammulata*. This community is distinguished by its overall floristic composition, with a high abundance of acid-loving ericaceous species, which are indicative of this community's extremely infertile, acid soils. In the Great Smoky Mountains *Acer rubrum* is often dominant or codominant in these forests, presumably on former American chestnut (*Castanea dentata*) sites. In the Blue Ridge-Piedmont transition, below 853 m (2800 feet) elevation, where this community is often associated with *Pinus rigida* forests and woodlands, *Quercus falcata* may be a component of the canopy, and the shrub stratum is strongly dominated by *Vaccinium pallidum*.

Global Dynamics: There is abundant evidence of past fires in this community, and the vegetation may be fire-adapted, although information on natural fire regimes is lacking. Most sites have a history of logging.

Other Noteworthy Species

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Buckleya distichophylla* (G3, globally imperiled), *Castanea dentata* (G4, TN state-imperiled), *Stachys clingmanii* (G2, globally imperiled & TN-state critically imperiled)
Global: Vulnerable Plants: *Buckleya distichophylla* (G3), *Canoparmelia amabilis* (G1), *Hexastylis contracta* (G3), *Monotropsis odorata* (G3), *Robinia hispida* var. *rosea* (G4T3?), *Stachys clingmanii* (G2), *Thermopsis fraxinifolia* (G3?), *Thermopsis mollis* (G3G4), *Tsuga caroliniana* (G3), *Vaccinium hirsutum* (G3); **Other Plants**: *Smilax biltmoreana* (G4)

Conservation Status Rank

Global Rank & Reasons: G5 (31-Dec-1997).

Related Concepts

Global Similar Types:
- *Acer rubrum var. rubrum - Betula lenta - Magnolia fraseri / (Rhododendron maximum, Kalmia latifolia)* Ruderal Forest (CEGL008558) is an acidic mixed hardwood forest of the Southern Blue Ridge, resulting after severe fire, logging, or loss of chestnut; a modified type originally defined from the Great Smoky Mountains.
- *Pinus virginiana - Pinus (rigida, echinata) - (Quercus prinus) / Vaccinium pallidum* Forest (CEGL007119)
- *Quercus alba - Quercus (coccinea, velutina, prinus) / Gaylussacia baccata* Forest (CEGL008521)
- *Quercus prinus - (Quercus coccinea) / Carya pallida / Vaccinium arboreum - Vaccinium pallidum* Forest (CEGL008431) defined for the southern Cumberland Plateau and western fringe of the Southern Blue Ridge, with more diverse shrubs.
- *Quercus prinus - (Quercus coccinea, Quercus rubra) / Kalmia latifolia / Vaccinium pallidum* Forest (CEGL006299) is the Central Appalachian analogue of CEGL006271; compositionally similar but generally lacking Southern Appalachian species such as *Galax, Oxydendrum*, and *Leucothoe recurva*.
- *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest (CEGL007267)
- *Quercus prinus - Carya* spp. - *Quercus velutina / Vaccinium arboreum / Iris verna var. smalliana* Forest (CEGL007261) is defined for the lower Piedmont of Alabama and has Coastal Plain affinities.
- *Quercus prinus - Quercus (alba, coccinea) / Viburnum acerifolium - (Kalmia latifolia)* Forest (CEGL005023) is a broadly defined type for the Appalachian Plateau and Interior Low Plateau.
- *Quercus prinus - Quercus (rubra, velutina) / Vaccinium (angustifolium, pallidum*) Forest (CEGL006282) is defined for the Northern Piedmont, Central Appalachians; occurs on granite monadnocks.
- *Quercus prinus - Quercus alba / Oxydendrum arboreum / Vitis rotundifolia* Forest (CEGL006281)
- *Quercus prinus - Quercus rubra / Rhododendron maximum / Galax urceolata* Forest (CEGL006286) is more mesic and has a higher component of *Rhododendron maximum* and relatively little *Kalmia latifolia*.

Classification

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: The most constant species, in order of descending constancy are *Acer rubrum, Kalmia latifolia, Quercus prinus, Quercus coccinea, Nyssa sylvatica, Vaccinium pallidum, Oxydendrum arboreum, Galax urceolata, Smilax rotundifolia, Castanea dentata, Sassafras albidum*, and *Smilax glauca*.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: For the purpose of mapping this association, the northern limit was set in Roanoke, Virginia, extending south into the Southern Blue Ridge. Central Appalachian-Northern Piedmont Chestnut Oak Forest (CEGL006299) was mapped from north of Roanoke through to Cumberland County, Pennsylvania. Unambiguous Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271) is confined to south of the New River. Unambiguous CEGL006299 occurs from Roanoke north.

Between the New River and Roanoke is a transition zone in which many stands could be assigned equally well to either type.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: A southern variant is restricted to Great Smoky Mountains and Nantahala Mountains. Many of the common species in the typic CEGL006271, such as *Quercus coccinea, Nyssa, Vaccinium pallidum, Gaylussacia baccata*, and *Leucothoe recurva*, are absent or inconstant. Additionally, a suite of other species, including *Gaylussacia ursina* (strongly dominant), *Quercus rubra, Pyrularia pubera, Tsuga canadensis*, and *Magnolia fraseri*, are much more important.

Global Classification Comments: Like the other matrix oak/heath forests in Virginia, this type can occur on a wide variety of topographic positions, as long as soil conditions are favorable. A similar association defined for the southern Cumberland Plateau, *Quercus prinus - (Quercus coccinea) / Carya pallida / Vaccinium arboreum - Vaccinium pallidum* Forest (CEGL008431), occurs over sandstone or other geologies not as acidic as the Blue Ridge type and lacks species indicative of the Blue Ridge association, such as *Kalmia latifolia, Gaylussacia ursina, Gaylussacia baccata*, and *Gaultheria procumbens*.

In the Great Smoky Mountains, *Acer rubrum* is often dominant or codominant in these forests, presumably on former American chestnut (*Castanea dentata*) sites. In the Blue Ridge-Piedmont transition, below 853 m (2800 feet) elevation, where this community is often associated with *Pinus rigida* forests and woodlands, *Quercus falcata* may be a component of the canopy, and the shrub stratum is strongly dominated by *Vaccinium pallidum*. A similar association defined for the southern Cumberland Plateau, *Quercus prinus - (Quercus coccinea) / Carya pallida / Vaccinium arboreum - Vaccinium pallidum* Forest (CEGL008431), occurs over sandstone or other geologies not as acid as the Blue Ridge type and lacks species indicative of the Blue Ridge association, such as *Kalmia latifolia, Gaylussacia ursina, Gaylussacia baccata*, and *Gaultheria procumbens*.

In 55 plots classified as this association (homoteneity = 0.60) in the Appalachian Trail analysis (Fleming and Patterson 2009a), the most constant species, in order of descending constancy are *Acer rubrum, Kalmia latifolia, Quercus prinus, Quercus coccinea, Nyssa sylvatica, Vaccinium pallidum, Oxydendrum arboreum, Galax urceolata, Smilax rotundifolia, Castanea dentata, Sassafras albidum*, and *Smilax glauca*. Species richness ranges from 13-52 species and averages 30 species per 400-m2 plot sample. In this same analysis, a group of 11 plots from the Great Smoky and Nantahala mountains segregated as a distinct group in cluster analysis. While the composition of this group fits within the broad concept of this association (CEGL006271), this "southern variant" is distinguished by the dominance of *Gaylussacia ursina* and the greater importance of *Quercus rubra, Pyrularia pubera, Tsuga canadensis*, and *Magnolia fraseri* than in the "typic" expression of CEGL006271. Further, species that are common in the "typic" expression of CEGL006271, *Quercus coccinea, Nyssa sylvatica, Vaccinium pallidum, Gaylussacia baccata*, and *Leucothoe recurva*, are absent or inconstant in the "southern variant." Based on available plot data, environmental and geographic distinctions could not be made between the two groups, but further study may be warranted.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This forest of the Southern Appalachians ranges north to the New River in Virginia. It was sampled in the southern Central Appalachians of Virginia at Brushy Mountain, Garden Mountain, Glade Mountain, Kelly Knob, Lick Creek, Pearis Mountain West, Peters Mountain, Pine Swamp Branch, and Vaught Branch.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is common in and near the AT corridor at low to middle elevations throughout the Southern Blue Ridge. It was sampled in Chattahoochee National Forest and elsewhere in Georgia, in North Carolina and Tennessee (including Mt. Buckley), and in Virginia at Bobby's Ridge, Feathercamp Ridge, Holston Mountain, Hurricane Mountain, and Straight Mountain.

Global Range: The center of distribution for this community is the Southern Blue Ridge of southwestern Virginia, western North Carolina, eastern Tennessee, northeastern Georgia, and northwestern South Carolina. It ranges south and east into the upper Piedmont and north into the Central Appalachians. This type is common in the Southern Ridge and Valley and Cumberland Mountains of southwestern Virginia and presumably Kentucky.

[CEGL006299] *Quercus prinus - (Quercus coccinea, Quercus rubra) / Kalmia latifolia / Vaccinium pallidum* Forest

Translated Name: **Chestnut Oak - (Scarlet Oak, Northern Red Oak) / Mountain Laurel / Blue Ridge Blueberry Forest**
Common Name: **Central Appalachian-Northern Piedmont Chestnut Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus - Quercus coccinea* Forest Alliance (A0248)

ELEMENT CONCEPT

Global Summary: This chestnut oak forest occurs at relatively low elevations (mostly <900 m) in the Central Appalachians and adjacent areas (e.g., northern Piedmont), in association with dry, acidic, infertile soils on middle and upper slopes. The canopy, which may be rather short, is strongly dominated by *Quercus prinus*. The most characteristic canopy associates are *Quercus coccinea*, which varies from sparse to codominant, and *Quercus rubra*. Minor associates frequently include *Quercus velutina, Quercus alba, Nyssa sylvatica, Sassafras albidum*, and/or *Robinia pseudoacacia*. Root sprouts of *Castanea dentata* are present in some areas. *Acer rubrum* and *Nyssa sylvatica* are often abundant in the understory tree layers. Tall shrubs include *Kalmia latifolia* (usually dominant),

Viburnum acerifolium, and *Rhododendron periclymenoides*. The short-shrub layer is well-developed and includes *Vaccinium pallidum, Vaccinium stamineum*, and *Gaylussacia baccata*, any one of which can exhibit patch-dominance. The herb layer generally has sparse cover but sometimes includes scattered individuals of *Aureolaria laevigata, Chimaphila maculata, Comandra umbellata, Cypripedium acaule, Danthonia spicata, Epigaea repens, Gaultheria procumbens, Hieracium venosum, Lysimachia quadrifolia, Medeola virginiana, Monotropa uniflora, Pteridium aquilinum*, and/or *Uvularia puberula*. Strong dominance of *Quercus prinus* in the canopy, strong dominance of *Kalmia latifolia* in the tall-shrub layer, and *Vaccinium pallidum* present and often abundant as a short shrub are diagnostics for this type.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This dry chestnut oak forest occurs on acidic, infertile soils at low elevations (mostly <900 m [2,950 feet]), on mid and upper dry, rocky slopes and crests. This community was sampled throughout the Central Appalachians. Sites range from gentle to steep mid and upper slopes and summits with mostly westerly aspects. Soils are very dry, rapidly to moderately well-drained sandy loam, loam, and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and may include significant amounts of exposed bedrock and large/small rocks. Bryophytes and lichens are often present. Evidence of disturbance includes past logging, trails, grazing/browsing, gypsy moth infestation, and the minor presence of exotic plant species. Two variants of this community were sampled. One variant is found on warmer, more open and exposed sites, especially those with a more discernable history of heavy cutting and fire within the last 100 years. A second variant occurs on sheltered slopes, often with northerly aspects.
Global Environment: This association is found on acidic, infertile soils on low-elevation (mostly <900 m), middle and upper slopes (occasionally on lower slopes). Sites are often exposed, or at least on convex slopes, and moisture potential is typically subxeric to xeric. Sandy loam soils, often stony, are typical. Some exposed bedrock is often present. Many sites have a history of occasional or frequent fires.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus prinus* dominates the canopy with *Kalmia latifolia* dominant in the tall-shrub layer. *Acer rubrum, Nyssa sylvatica*, and *Sassafras albidum* are common in the subcanopy. A well-developed ericaceous short-shrub layer is characteristic which includes *Vaccinium pallidum, Vaccinium stamineum*, and *Gaylussacia baccata*, any one of which can exhibit patch-dominance. *Dennstaedtia punctilobula, Gaultheria procumbens*, and *Epigaea repens* are common in the herb layer. There are two variants of this community found in the park. *Quercus prinus* is dominant in the canopy in both. In one variant, *Quercus coccinea* is the principal associate in the canopy, with *Betula lenta* and *Hamamelis virginiana* important in the subcanopy and shrub layers. *Quercus rubra* is the primary associate in the other variant with *Gaylussacia baccata* and *Rhododendron periclymenoides* occurring in the shrub layer. This community also supports regionally rare and VA-state critically imperiled *Heuchera caroliniana*.
Global Vegetation: The canopy is strongly dominated by *Quercus prinus* or, less frequently, by combinations of *Quercus prinus* and other oaks. The most frequent canopy associates are *Quercus coccinea*, which varies from sparse to codominant, and *Quercus rubra*. Minor associates frequently include *Quercus velutina, Quercus alba, Nyssa sylvatica, Betula lenta*, and *Sassafras albidum*. *Acer rubrum* and *Nyssa sylvatica* are usually abundant in the understory tree layers. Tall shrubs *Kalmia latifolia* (usually dominant), *Viburnum acerifolium*, and *Rhododendron periclymenoides* are often associated, sometimes at low cover. The short-shrub layer is well-developed and includes *Vaccinium pallidum, Vaccinium stamineum*, and *Gaylussacia baccata*, any one of which can exhibit patch-dominance. Occasional stands lack *Kalmia latifolia* and have an entirely deciduous, ericaceous shrub layer. The herb layer generally has sparse cover but sometimes includes *Aureolaria laevigata, Chimaphila maculata, Comandra umbellata, Cypripedium acaule, Danthonia spicata, Epigaea repens, Gaultheria procumbens, Hieracium venosum, Lysimachia quadrifolia, Medeola virginiana, Monotropa uniflora, Pteridium aquilinum*, and *Uvularia puberula*. Strong dominance of *Quercus prinus* in the canopy, strong dominance of *Kalmia latifolia* in the tall-shrub layer, and *Vaccinium pallidum* present and often abundant as a short shrub are diagnostics for this type.
Global Dynamics: Windthrow, fire, and ice storms are common natural disturbances in these habitats. Evidence of past fires is present at many sites, and periodic fire appears to be an important ecological factor in oak regeneration. Development of *Acer rubrum*-dominated understories in these forests is widely considered to be the result of drastic reductions of fire frequencies or exclusion of fire altogether. *Castanea dentata* was formerly an important canopy species in these forests prior to chestnut blight.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area)

Stratum	Lifeform	Species
Tree canopy	Broad-leaved deciduous tree	*Quercus coccinea*, *Quercus prinus*, *Quercus rubra*

Tall shrub/sapling	Broad-leaved evergreen shrub	*Kalmia latifolia*
Short shrub/sapling	Broad-leaved deciduous shrub	*Vaccinium pallidum*, *Vaccinium stamineum*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Epigaea repens*, *Gaultheria procumbens*, *Gaylussacia baccata*, *Kalmia latifolia*, *Nyssa sylvatica*, *Quercus prinus*, *Sassafras albidum*, *Vaccinium pallidum*
Global: *Kalmia latifolia*, *Quercus prinus*, *Vaccinium pallidum*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Castanea dentata* (G4, MD state-vulnerable), *Heuchera caroliniana* (G3, globally vulnerable & VA state-critically imperiled);
Invasive/Exotic Plants: *Calystegia sepium*, *Microstegium vimineum* (High/Medium)
Global: Vulnerable Plants: *Carex polymorpha* (G3), *Heuchera caroliniana* (G3), *Monotropsis odorata* (G3), *Tsuga caroliniana* (G3); **Other Plants**: *Gaylussacia baccata* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (29-Jan-2004). Extensive examples occur in Virginia, Maryland, and West Virginia.

RELATED CONCEPTS

Global Similar Types:

- *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271) of the Southern Appalachians.
- *Quercus alba - Quercus (coccinea, velutina, prinus) / Gaylussacia baccata* Forest (CEGL008521) primarily of the Piedmont.
- *Quercus prinus - Quercus (rubra, velutina) / Vaccinium (angustifolium, pallidum*) Forest (CEGL006282) northern; at high elevations at the southern edge of its range.
- *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057) occurs on submesic sites.
- *Quercus prinus - Quercus rubra / Vaccinium pallidum - (Rhododendron periclymenoides)* Forest (CEGL008523) occurs on subxeric sites.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This association is the Central Appalachian analogue of Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271). It is compositionally similar but generally lacks Southern Appalachian species such as *Galax urceolata, Oxydendrum arboreum*, and *Leucothoe recurva*. At the southern end of its range, there is a transition zone, and many stands could be assigned equally well to either type. It can be distinguished from Central Appalachian Dry-Mesic Chestnut Oak - Northern Red Oak Forest (CEGL006057) by its dense ericaceous short-shrub layer and canopy dominated just by *Quercus prinus*. The canopy in CEGL006057 is codominated by *Quercus prinus* and *Quercus rubra*.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: For the purpose of mapping this association and to distinguish it from other similar chestnut oak associations to the south, i.e., Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271) and to the north, i.e., Lower New England High Slope Chestnut Oak Forest (CEGL006282), the southern limit for mapping was set just north of Roanoke, Virginia, and extending

north through the Central Appalachians to Cumberland, County, Pennsylvania. Unambiguous Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271) is confined to south of the New River. Unambiguous Central Appalachian-Northern Piedmont Chestnut Oak Forest (CEGL006299) occurs from Roanoke north. Between the New River and Roanoke is a transition zone in which many stands could be assigned equally well to either type. Lower New England High Slope Chestnut Oak Forest (CEGL006282) is mapped from north of Cumberland, County, Pennsylvania, into Lower New England.

Global Classification Comments: This community can be readily identified by its dry, infertile sites and quite species-poor vegetation overwhelmingly dominated by *Quercus prinus* and *Kalmia latifolia* (each averaging 25 to 50% cover in more than 80 Virginia and Maryland plot samples), with *Acer rubrum* and *Nyssa sylvatica* abundant in the subcanopy. Two variants of the type have been detected in quantitative analyses: (1) a variant with *Quercus rubra* as the principal associate of *Quercus prinus*, with *Betula lenta* and *Hamamelis virginiana* often important in the subcanopy and shrub layers, typically occurring on sheltered slopes, often with northerly aspects; and (2) a variant with *Quercus coccinea* as the principal associate of *Quercus prinus*, occurring with *Gaylussacia baccata* and *Rhododendron periclymenoides*, typically on warmer, more open and exposed sites, especially those with a more discernible history of heavy cutting and fire within the last 100 years. However, these variants and their habitats are fully intergradational and have few other floristic attributes that could be considered reliably "diagnostic." This association is the Central Appalachian analogue of *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271). It is compositionally similar but generally lacks Southern Appalachian species such as *Galax urceolata, Oxydendrum arboreum*, and *Leucothoe recurva*. At the southern end of its range, there is a transition zone and many stands could be assigned equally well to either type.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges throughout the Central Appalachians, from north Roanoke, Virginia, to Cumberland County, Pennsylvania. It was sampled in Maryland, Pennsylvania (including Lehigh Furnace Gap) and Virginia (including Brushy Mountain/Dismal Creek, Catawba Mountain, James River Face Wilderness, Loft Mountain, McAfee Knob, and Sawmill Run Overlook in Shenandoah National Park).
Global Range: This association is currently described from the Central Appalachians and northern part of the Piedmont in Pennsylvania, Virginia, Maryland, and West Virginia. In northern Virginia, the District of Columbia, and Maryland, it occasionally occurs at the extreme western edge of the Coastal Plain on steep ravine slopes of the fall zone. It also occurs at the northern periphery of the Southern Blue Ridge near Roanoke, Virginia.

Element Concept

Global Summary: This dry to xeric oak-heath forest of central and southern New England ranges south to the northern Piedmont and central Appalachian Mountains. It occurs on upper slopes and ridgetops with thin, nutrient-poor, acidic soils. Windthrow, fire and ice damage are common natural disturbances. The canopy is closed to partially open and is dominated by *Quercus prinus*, which can be codominant with *Quercus rubra*. *Quercus alba, Quercus velutina*, and *Acer rubrum* are common associates, with other less frequent trees including *Betula lenta, Quercus coccinea, Amelanchier arborea, Pinus rigida*, and *Pinus strobus*. *Sassafras albidum, Cornus florida*, and *Nyssa sylvatica* can be minor associates at the southern and western portions of the range. The low-shrub layer is well-developed and comprised chiefly of ericaceous species, including *Vaccinium angustifolium, Vaccinium pallidum, Vaccinium stamineum, Gaylussacia baccata*, or *Kalmia angustifolia*. A tall-shrub layer is often lacking but when present may include *Castanea dentata, Kalmia latifolia, Viburnum acerifolium, Hamamelis virginiana, Quercus ilicifolia*, and *Viburnum prunifolium*. *Ilex montana, Rhododendron prinophyllum*, and *Menziesia pilosa* are minor shrub associates at the southern end of the range. The herbaceous layer is of sparse to moderate cover, depending on shrub cover, and may include *Carex pensylvanica, Deschampsia flexuosa, Danthonia spicata, Ageratina altissima var. altissima, Antennaria plantaginifolia, Aralia nudicaulis, Aureolaria laevigata, Gaultheria procumbens, Chimaphila maculata, Carex rosea, Carex swanii, Carex pensylvanica, Corydalis sempervirens, Comandra umbellata, Cypripedium acaule, Dryopteris marginalis, Epigaea repens, Goodyera pubescens, Hieracium venosum, Lycopodium clavatum, Medeola virginiana, Melampyrum lineare, Monotropa uniflora, Potentilla canadensis, Pteridium aquilinum*, and *Uvularia sessilifolia*.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This oak / heath forest occurs on xeric upper slopes and ridgetops and steep sideslopes with shallow, acidic, rocky, infertile soils. It was sampled at 18 locations in the central and northern Pennsylvania in the Central Appalachian project area. Sites range from gentle to somewhat steep upper slopes and flat summits with mostly westerly aspects. Soils are dry to dry-mesic, rapidly to well-drained sandy loam and loam. The unvegetated surface consists of leaf litter with some downed wood and large rocks, often with some cover of bryophytes/lichens. No evidence of disturbance was reported.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This oak / heath forest occurs on xeric upper slopes and ridgetops and steep sideslopes with shallow, acidic, rocky, infertile soils. It is a widespread chestnut oak forest of Lower New England. The sites are variable ranging from gentle to steep mid and upper slopes and ridgetops. Soils are dry-mesic to dry to somewhat xeric and are typically well-drained or moderately well-drained sandy loam, silt loam and loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks (sometimes significant amounts) and downed wood. Evidence of disturbance includes trails and trampling, deer browse, wind/ice damage, chestnut blight, and the minor presence of exotic plants.

Global Environment: This forest generally occurs on xeric upper slopes and ridgetops and steep sideslopes with shallow, acidic, rocky, infertile soils. Windthrow, fire, and ice storms are common natural disturbances in these habitats.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus prinus* is dominant with *Quercus rubra, Quercus velutina, Nyssa sylvatica, Acer rubrum*, and/or *Betula lenta* codominant in the canopy. *Pinus strobus* and/or *Pinus rigida* may be present (<10% cover). Subcanopy dominants include *Sassafras albidum* and *Cornus florida*. *Vaccinium pallidum, Vaccinium angustifolium, Gaylussacia baccata*, and *Kalmia angustifolia* are common short shrubs. *Kalmia latifolia* and/or *Hamamelis virginiana* may be present, but neither dominant, and are always mixed with other tall shrubs. The herbaceous layer is poorly developed and depauperate and typically includes *Gaultheria procumbens*.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Quercus prinus* typically dominates the canopy, but occasionally *Quercus rubra* or *Quercus velutina* can codominate. *Quercus velutina, Quercus alba*, and/or *Quercus coccinea* may also be common. Subcanopy dominants include *Acer rubrum, Sassafras albidum*, and *Betula lenta*. *Kalmia latifolia* and *Hamamelis virginiana* are common tall shrubs. *Vaccinium pallidum, Vaccinium angustifolium*, and/or *Gaylussacia baccata* form a dense understory. The herbaceous layer is poorly developed and depauperate but includes *Danthonia spicata, Carex pensylvanica*, and *Aralia nudicaulis*. In addition, this community supports NJ state-critically imperiled *Pinus resinosa* and state-imperiled *Sorbus americana* and *Symphyotrichum prenanthoides*.

Global Vegetation: The canopy is closed to partially open and dominated by *Quercus prinus*, which can be codominant with *Quercus rubra*. *Quercus alba, Quercus velutina*, and *Acer rubrum* are common associates, with other less frequent trees including *Betula lenta, Quercus coccinea, Amelanchier arborea, Pinus rigida*, and *Pinus strobus*. *Sassafras albidum, Cornus florida*, and *Nyssa sylvatica* can be minor associates at the southern and western portions of the range. The low-shrub layer is well-developed and comprised chiefly of ericaceous species, including *Vaccinium angustifolium, Vaccinium pallidum, Vaccinium stamineum, Gaylussacia baccata*, or *Kalmia angustifolia*. A tall-shrub layer is often lacking but when present may include *Castanea dentata, Kalmia latifolia, Viburnum acerifolium, Hamamelis virginiana, Quercus ilicifolia*, and *Viburnum prunifolium*. *Ilex montana, Rhododendron prinophyllum*, and *Menziesia pilosa* are minor shrub associates at the southern end of the range. The herbaceous layer is of sparse to moderate cover, depending on shrub cover, and may include *Carex pensylvanica, Deschampsia flexuosa, Danthonia spicata, Ageratina altissima var. altissima, Antennaria plantaginifolia, Aralia nudicaulis, Aureolaria laevigata, Gaultheria procumbens, Chimaphila maculata, Carex rosea, Carex swanii, Carex pensylvanica, Corydalis sempervirens, Comandra umbellata, Cypripedium acaule, Dryopteris marginalis, Epigaea repens, Goodyera pubescens, Hieracium venosum, Lycopodium clavatum, Medeola virginiana, Melampyrum lineare, Monotropa uniflora, Potentilla canadensis, Pteridium aquilinum*, and *Uvularia sessilifolia*.

Global Dynamics: Periodic fire is likely an important ecological factor in oak regeneration.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (31-Jan-2007). This is a very widely distributed oak / ericad forest that covers large areas.

RELATED CONCEPTS

Global Similar Types:
- *Quercus (alba, rubra, velutina) - Carya* spp. / *Viburnum acerifolium* Forest (CEGL006336) is similar to the more mesic end of the range of variation found in this type at Valley Forge National Historical Park.
- *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271) of Southern Appalachians.
- *Quercus prinus - (Quercus coccinea, Quercus rubra) / Kalmia latifolia / Vaccinium pallidum* Forest (CEGL006299)
- *Quercus prinus - Quercus (alba, coccinea) / Viburnum acerifolium - (Kalmia latifolia)* Forest (CEGL005023) of Western Alleghenies, Interior Low Plateau, etc.
- *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057)
- *Quercus prinus - Quercus rubra / Vaccinium pallidum - (Rhododendron periclymenoides)* Forest (CEGL008523)
- *Quercus prinus - Quercus* spp. / *Vaccinium arboreum - (Kalmia latifolia, Styrax grandifolius)* Forest (CEGL007700)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is distinguished by the presence of northern species, such as *Pinus strobus* and *Vaccinium angustifolium*; its lack of Southern Appalachian species; and an abundant ericaceous shrub component.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: For the purpose of mapping this association and to distinguish it from other similar dry chestnut oak associations to the south (i.e., Central Appalachian-Northern Piedmont Chestnut Oak Forest (CEGL006299) and Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271)), the southern limit for mapping in the Central Appalachians was set just north of

Cumberland County, Pennsylvania, to the northern limit at Delaware Water Gap in Pennsylvania. It extends north along the AT throughout the Lower New England project area.

Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community extends north along the AT through New Jersey, New York, Connecticut and Massachusetts in the Lower New England project area. In Connecticut, at Buck Hill in the Housatonic Valley, this community extends from 300 m up to the summit; Southern New England-Northern Piedmont Red Maple Seepage Swamp Forest (CEGL006406) occurs in midslope positions and successional forests dominate the lower slopes. New York examples have a heath layer that ranges in cover from dense to sparse and dominated by *Vaccinium* spp., *Gaylussacia baccata*, or scattered *Kalmia latifolia*

Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.

Global Classification Comments: This community type is closely related to other oak / heath. It is distinguished by the presence of northern species, such as *Pinus strobus* and *Vaccinium angustifolium*, and its general lack of southern Appalachian species, such as *Gaylussacia ursina, Leucothoe recurva*, and *Galax urceolata*. In comparison to *Quercus prinus - Quercus (alba, coccinea) / Viburnum acerifolium - (Kalmia latifolia)* Forest (CEGL005023), it lacks *Oxydendrum arboreum, Pinus echinata*, and *Pinus virginiana*. It occupies poorer sites and has a more abundant ericaceous shrub component than *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057). The Chestnut Oak / Low-Elevation Subtype of Virginia intergrades with the more southern *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271) throughout west-central Virginia. A well-developed Piedmont example of the Chestnut Oak / Low-Elevation Subtype is described by Allard and Leonard (1943). The Chestnut Oak - Northern Red Oak / High-Elevation Subtype of Virginia is similar to *Quercus prinus - Quercus rubra / Vaccinium pallidum - (Rhododendron periclymenoides)* Forest (CEGL008523) of high-elevation granitic terrain on the northern Blue Ridge, but lacks *Quercus velutina, Rhododendron periclymenoides*, and the suite of low-cover herbaceous species characteristic of mineral soil microhabitats in that unit. The recognition of global subtypes equivalent to two distinct state community types is well supported by quantitative analysis of compositional and environmental data. Further study may support the elevation of these subtypes to full association-level status in the USNVC.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled in central and northern Pennsylvania and extends north along the AT through Delaware Water Gap and into Lower New England.

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (Housatonic Valley - Buck Hill, Sharon Mountain), Massachusetts (Sage's Ravine Natural Heritage Site, Upper Sherman Brook Natural Heritage Site), New Jersey (Culvers Gap South, High Point 1, High Point South, Sunrise Mountain Northeast, Sunrise Mountain West), and New York (Harriman State Park, Bellvale Mountain North, Canada Hill/Curry Pond, Canopus Lake North/Fahnestock State Park, Depot Hill, Doodletown, Fort Defiance Hill).

Global Range: This community ranges from southern Maine through the Central Appalachians to higher elevations in Virginia and West Virginia, and north more locally in the Piedmont (an estimated 215,000 square km based on approximate acreage of subsections of occurrence).

Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus* - *Quercus coccinea* Forest Alliance (A0248)

Element Concept

Global Summary: The documented range of this community is confined to the northern Virginia Blue Ridge, scattered locations in the Ridge and Valley province of west-central and southwestern Virginia, and in the gorges of the New and Gauley rivers of southern West Virginia. In addition, there are a few local outliers on sheltered, north-facing bluffs along the James River in the western Piedmont. In the main part of this association's range, stands are associated with strongly convex, upper slopes and spur crests at elevations from 325 m to over 975 m (1050-3200 feet). North or northwest aspects are common, but the type has been documented from other aspects as well, generally with high solar exposure. The vegetation is a species-poor, open to closed-canopy forest of stunted (often <20 m tall, sometimes <10 m tall), gnarled trees over a dense, evergreen tall-shrub layer. *Quercus prinus* is the usual canopy dominant, with occasional associates of *Betula lenta, Tsuga canadensis, Quercus velutina, Quercus*

coccinea, Quercus alba, Nyssa sylvatica, Acer rubrum, Pinus virginiana, and/or *Pinus strobus*. The shrub layer is dominated by *Rhododendron catawbiense, Kalmia latifolia*, and/or *Rhododendron maximum* (the latter primarily in West Virginia occurrences). Additional shrubs which are present at low cover include *Hamamelis virginiana, Ilex montana*, and *Amelanchier arborea*. Deciduous ericads such as *Gaylussacia baccata* and *Vaccinium pallidum* may be present but rarely contribute more than 10% cover. Herbs and subshrubs are exceedingly sparse in the densely shaded, forest-floor environment; most likely to be encountered are the evergreen species *Gaultheria procumbens, Epigaea repens, Galax urceolata, Goodyera pubescens, Mitchella repens*, and *Chimaphila maculata*, sometimes present at low cover.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This chestnut oak / heath forest occurs on north- or northwest-facing convex, upper slopes, clifftops, and spur crests at elevations from 305 to 1,097 m (1,000-3,600 feet). It was sampled at five locations in the Central Appalachians and Cumberlands and Southern Ridge and Valley. Sites vary from gently sloping to steep north-facing slopes, ridges and saddles. Soils are well-drained and include silt loam and sandy loam. The unvegetated surface is dominated by leaf litter with some downed wood and large/small rocks. Disturbance includes *Cornus florida* damage from anthracnose and exposure to wind and storms.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This chestnut oak/heath forest occurs on north- or northwest-facing convex, upper slopes, cliff tops, and spur crests at elevations from 305 to over 975 m (1,000-3,200 feet) Sites may be gently sloping to somewhat steep. Soils range from somewhat poorly drained to well-drained and include silt loam and sandy loam. The unvegetated surface is dominated by leaf litter with some downed wood and large/small rocks. No evidence of disturbance was reported.

Global Environment: This type is generally associated with strongly convex, upper slopes, cliff tops, and spur crests at elevations from 325 m to over 975 m (1050-3200 feet). Plot-sampled stands have various aspects, with north or northwest aspects most common. Slopes are mostly steep, generally >20° but sometimes as low as 10°. Piedmont occurrences of this vegetation type differ somewhat from the main part of the range: they are confined to steep, sheltered bluffs subtending the James River at <200 m (650 feet) elevation. Site moisture potential appears to be in the subxeric to submesic range, with soils in plots described as well- to rapidly-drained, dry sandy loam and silty clay. Surface cover of rocks varies from low to high, and soils have thick, poorly decomposed duff layers. Soils are extremely acidic (mean pH = 4.1) and infertile, with low levels of most nutrients (Ca, Cu, K, Mg, Mn, P, Zn).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The often stunted canopy is dominated by *Quercus prinus* with occasional *Quercus rubra, Acer rubrum, Quercus coccinea, Tsuga canadensis*, and/or *Nyssa sylvatica*; scattered *Pinus pungens* are possible. *Rhododendron catawbiense* is the dominant shrub; *Kalmia latifolia, Hamamelis virginiana*, and *Amelanchier arborea* are mixed into the shrub layer. The short-shrub layer is dominated by *Vaccinium pallidum* and *Gaylussacia baccata*. Herbs are sparse but include *Galax urceolata*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This is an exceptionally species-poor, open- to closed-canopy forest of often stunted (<10 m tall), gnarled trees over a dense, evergreen tall-shrub layer. The canopy is dominated by *Quercus prinus*. Additional tree species include *Acer rubrum* and other *Quercus* spp. The shrub layer can be dense or not and dominated by heaths *Gaylussacia baccata, Kalmia latifolia, Rhododendron catawbiense*, and *Vaccinium pallidum*. The herb layer is generally sparse; *Galax urceolata* is a common species.

Global Vegetation: The vegetation is an exceptionally species-poor, open to closed-canopy forest of somewhat stunted (<20 m tall) to very stunted (<10 m tall), gnarled deciduous or mixed evergreen-deciduous trees over a dense, evergreen tall-shrub layer. *Quercus prinus* is the canopy dominant, with occasional associates of *Tsuga canadensis, Betula lenta, Nyssa sylvatica, Acer rubrum, Quercus velutina, Quercus coccinea, Quercus alba, Quercus rubra, Betula alleghaniensis, Pinus virginiana*, and/or *Pinus strobus*. *Acer rubrum* and *Oxydendrum arboreum* may be abundant subcanopy trees. *Rhododendron catawbiense* and *Kalmia latifolia*, each with mean cover of 25-50% in plots, dominate the shrub layer; *Rhododendron maximum* may be locally important in West Virginia occurrences. Additional shrubs present at low cover include *Acer pensylvanicum, Gaylussacia baccata, Hamamelis virginiana, Ilex montana, Ilex opaca, Amelanchier arborea, Smilax rotundifolia, Vaccinium pallidum*, and *Viburnum acerifolium*. Although not documented in plots, *Pieris floribunda* is reported to be a characteristic shrub of this community in the Thunder Ridge - Apple Orchard Mountain area of Virginia's Bedford and Botetourt counties (Rawinski et al. 1996). Herbs and subshrubs are exceedingly sparse in the densely shaded forest floor environment, but the evergreen species *Gaultheria procumbens, Epigaea repens, Galax urceolata, Goodyera pubescens, Mitchella repens*, and *Chimaphila maculata* are sometimes present at low cover. Occasional herbs

include *Aralia nudicaulis, Conopholis americana, Cypripedium acaule, Dryopteris intermedia, Hexastylis virginica*, and *Polypodium virginianum*. The bryophyte layer may have significant cover by *Leucobryum glaucum*; other bryophytes identified in plots include *Hypnum imponens, Thuidium delicatulum, Dicranum scoparium, Bazzania trilobata*, and *Polytrichum juniperinum*. Lichens collected from this community include *Cladonia caroliniana, Cladonia uncialis, Flavoparmelia baltimorensis*, and *Umbilicaria mammulata*. Vascular plant species richness (per 400 square meters) of Virginia plot-sampled stands ranges from 9 to 16 taxa (mean = 12); in the nine WV sampled plots it ranges from 13 to 33 taxa (mean = 22.4).

Most Abundant Species

Appalachian National Scenic Trail (Central Appalachian Project Area)

Stratum	Lifeform	Species
Tree canopy	Broad-leaved deciduous tree	*Quercus prinus*
Tree subcanopy	Broad-leaved deciduous tree	*Acer rubrum*
Shrub/sapling (tall & short)	Broad-leaved deciduous tree	*Amelanchier arborea*
Shrub/sapling (tall & short)	Broad-leaved evergreen shrub	*Rhododendron catawbiense*

Appalachian National Scenic Trail (Southern Blue Ridge Project Area)

Stratum	Lifeform	Species

Other Noteworthy Species

Global: Vulnerable Plants: *Tsuga caroliniana* (G3)

Conservation Status Rank

Global Rank & Reasons: G4 (20-May-2011). Although this is a somewhat geographically restricted, mostly small-patch vegetation type, many stands occur in public lands on generally inaccessible steep slopes, ridge, and spurs. Threats to this association are neither serious nor wide-ranging, and include occasional clearing for utility corridors with essentially slight impact. Hemlock woolly adelgid may impact some occurrences with high hemlock cover, but in general, this would not cause conversion to a different vegetation type. The dry, acidic soils of this vegetation provide some natural protection against invasive plant species.

Related Concepts

Global Similar Types:
- *Fagus grandifolia - Quercus alba / Kalmia latifolia - (Rhododendron catawbiense) / Galax urceolata* Forest (CEGL004539)
- *Quercus prinus - Quercus rubra / Rhododendron maximum / Galax urceolata* Forest (CEGL006286) is a more mesophytic forest of protected slopes, with substantial *Quercus rubra* and a *Rhododendron maximum* understory.
- *Tsuga caroliniana / Kalmia latifolia - Rhododendron catawbiense* Forest (CEGL007139)

Classification

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is scattered in the southern Central Appalachians in Virginia and extends north through central Virginia to the northern range limit of *Rhododendron catawbiense*. The northernmost stands documented in Virginia are in

Augusta, Nelson, Amherst, and Rockbridge counties; the absolute northern limit of *Rhododendron catawbiense* is Albemarle and Rockingham counties.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Originally defined from the Northern Blue Ridge of Virginia, this type has recently been extended south to the Southern Blue Ridge and Ridge and Valley of southwestern Virginia. It occurs less than 1.5 km north of the North Carolina stateline on the Blue Ridge Parkway. The type is a localized *Quercus prinus*-dominated forest of dry, rocky, somewhat protected to exposed north- or west-facing upper slopes, ridge crests, and blufftops. The understory is characterized by a dense *Rhododendron catawbiense* shrub layer.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: Compared to Chestnut Oak Forest (Mesic Slope Heath Type) (CEGL006286), this type occupies distinctly drier, rockier sites; has a group of more xerophytic indicator species; and contains few Southern Appalachian endemics.
Global Classification Comments: The geographic distribution of this community and the extent to which it recurs throughout the Northern Blue Ridge and Ridge and Valley are somewhat uncertain and need further investigation. Although documented by plot data only on the Blue Ridge of Virginia and at New River Gorge and the Gauley River in West Virginia, similar vegetation is reported to be frequent on xeric, rocky upper slopes and summits throughout the west-central and southwestern Virginia Ridge and Valley region (T.F. Wieboldt pers. comm.). These putative Ridge and Valley occurrences sometimes contain mixtures of *Rhododendron catawbiense* and *Rhododendron maximum*, as do the Gauley River occurrences. For the most part, however, this community appears to reach optimal development in geographic areas (i.e., the Northern Blue Ridge) and drier habitats where *Rhododendron maximum* is spotty or absent. *Tsuga canadensis* is prominent in this association at New River Gorge and the Gauley River, another contrast to Virginia stands. This association (CEGL008524) is not likely to be found in the Southern Blue Ridge, where *Rhododendron catawbiense* is more restricted to high elevations and exposed habitats, above the elevational limits of *Quercus prinus* (Newell 1997, A.S. Weakley pers. comm.). Although stands of this type can be rather difficult to plot-sample, the collection of additional quantitative data from well-developed occurrences would be desirable. This community type is similar to and sometimes co-occurs with *Tsuga caroliniana / Kalmia latifolia - Rhododendron catawbiense* Forest (CEGL007139) on the Northern Blue Ridge. The degree to which periodic fires have influenced the structure and composition of this community type needs investigation.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: The community occurs from the northern part of the Southern Blue Ridge north into Nelson, Amherst, and Rockbridge counties in Virginia. It was sampled in Virginia at Angels Rest, Brushy Mountain, James River Face Wilderness, and Lick Creek.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is frequent in the Central Appalachians and peripheral in the northern Virginia Blue Ridge and scattered locations in the Ridge and Valley. It was sampled at Comers Creek in Smyth County in southwestern Virginia.
Global Range: The documented range of this community includes the southern part of the Central Appalachians and adjacent areas of the Southern Blue Ridge, Southern Ridge and Valley, and Cumberland Mountains in Virginia and West Virginia. In addition, there are a few local outliers on sheltered, north-facing bluffs along the James River in the western Virginia Piedmont.

A0250 *Quercus prinus - Quercus rubra* Forest Alliance

Alliance Summary Description: This alliance includes dry-mesic oak forests codominated by *Quercus prinus* and *Quercus rubra* at moderate elevations in the Central and Southern Appalachians. Many forests in this alliance occur in areas previously dominated by *Castanea dentata*, and chestnut sprouts are common in the understory. The canopy of forests in this alliance tend to be dominated by *Quercus rubra* and/or *Quercus prinus*, although other mesic hardwood species can codominate or be present in the canopy and subcanopy. Typical tree associates include *Acer rubrum, Carya glabra, Carya ovalis, Carya ovata, Liriodendron tulipifera, Quercus coccinea, Quercus velutina*, and *Sassafras albidum*. Typical understory trees include *Acer pensylvanicum, Cornus florida*, or *Oxydendrum arboreum*. Shrub layers are often dense and dominated by ericaceous species, including *Gaylussacia* spp., *Kalmia latifolia, Rhododendron maximum* (especially on northerly aspects), *Rhododendron minus*, and *Vaccinium* spp. Other shrubs may include *Hamamelis virginiana*. Herbaceous coverage tends to be inversely proportional to the shrub coverage. Typical herbaceous species include *Chimaphila maculata, Galax urceolata, Gaultheria procumbens, Houstonia purpurea, Lysimachia quadrifolia, Maianthemum racemosum ssp. racemosum, Polystichum acrostichoides, Thelypteris noveboracensis*, and *Uvularia* spp.

[CEGL007267] *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest

Translated Name: **Chestnut Oak - (Northern Red Oak) - Hickory species / Sourwood - Flowering Dogwood Forest**
Common Name: **Appalachian Montane Oak - Hickory Forest (Chestnut Oak Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus - Quercus rubra* Forest Alliance (A0250)

ELEMENT CONCEPT

Global Summary: This community is known from low to intermediate elevations of the Southern Blue Ridge escarpment, the Great Smoky Mountains, Piedmont transition areas, into the Southern Ridge and Valley, and in the Cumberlands in southern West Virginia. It occurs on relatively exposed landforms below 1000 m (3280 feet) elevation (220-1000 m [700-3280 feet]), on nearly level to steep, convex, middle to upper slopes, ridges, and plateaus, with mostly northwestern to southeastern aspects. These are forests characterized by canopies dominated by *Quercus* and *Carya* species that do not have a well-developed heath shrub layer. *Acer rubrum* and *Liriodendron tulipifera* may have significant coverage, apparently related to logging history. The predominant oaks and hickories in the canopy are *Quercus prinus, Carya glabra, Carya alba, Carya ovata, Quercus coccinea, Quercus velutina, Quercus alba*, and *Quercus rubra*. Additional canopy and subcanopy species can include *Nyssa sylvatica, Magnolia fraseri, Halesia tetraptera var. monticola, Fagus grandifolia, Ilex opaca*, and *Oxydendrum arboreum*. In addition, *Cornus florida* is characteristic and may be dominant in the subcanopy and tall-shrub layers; other tall-shrub species include *Magnolia fraseri, Hamamelis virginiana*, and *Sassafras albidum*. *Kalmia latifolia* or *Rhododendron maximum* may be present but only at very low cover. The short-shrub stratum is sparse (up to 20% cover), with no clear dominant. Some typical shrub species include *Vaccinium pallidum, Viburnum acerifolium*, and (in the central and southern portions of the type's range) *Gaylussacia ursina, Hydrangea arborescens*, and *Hydrangea radiata*. Common vines are *Smilax rotundifolia, Smilax glauca, Parthenocissus quinquefolia, Toxicodendron radicans, Vitis aestivalis, Vitis rotundifolia*, and *Vitis vulpina*. Herb cover is sparse to moderate; diversity and species composition vary among occurrences. Some of the more typical herb species include *Eurybia divaricata, Dioscorea quaternata,*

Maianthemum racemosum, Polystichum acrostichoides, Solidago caesia, Uvularia perfoliata, and *Uvularia puberula*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This montane oak-hickory forest was sampled on moderate to somewhat steep upper slopes and ridgetops on northern aspects at elevations from 762 to 1,029 m. Soils are moderately well- to well-drained loam, sandy loam and clay loam. The unvegetated surface is dominated by leaf litter with small amounts of rock and downed wood.

Global Environment: This community is known from plateaus, ridges, and gorge slopes at low to intermediate elevations, on relatively exposed landforms from 220 to 1000 m (700-3250 feet) elevation. Slopes are moderately steep to steep where it occurs on convex, middle to upper slopes, grading to gentle on ridges and plateaus; aspects are mostly northern to southwestern. Unvegetated ground cover is dominated by litter and rock. In Virginia, the type occurs on sites underlain by colluvial and alluvial fan material, sandstone, quartzite, and rocks of the Northern Blue Ridge granitic complex. Farther south, soils are weathered from sandstones and, less commonly, shales and are strongly acidic, relatively nutrient-poor and sandy to loamy in texture. Soils in West Virginia plots are well- to rapidly-drained, dry to somewhat moist sandy loam, sandy clay loam, sandy silt loam, silt loam, and clay loam, and test slightly to extremely acidic (mean pH = 4.59). Soil chemistry data from 25 plot samples from throughout the range indicate that mean conditions are extremely acidic, with low levels of calcium, magnesium, and total base saturation, along with moderately high iron and aluminum (Fleming and Patterson 2009a).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: *Quercus prinus* is typically dominant or occasionally codominant with *Quercus rubra*. Canopy associates include *Acer rubrum, Carya glabra, Carya ovalis, Quercus alba*, and *Quercus coccinea*. *Cornus florida* is common in the subcanopy. Shrubs may include *Acer rubrum, Hydrangea arborescens, Ilex montana, Pyrularia pubera, Rubus allegheniensis, Sassafras albidum, Symplocos tinctoria*, and *Vaccinium hirsutum* (regional endemic). Herbs are sparse.

Global Vegetation: These are forests dominated by species of *Quercus* and *Carya* and without a well-developed heath shrub layer. *Acer rubrum* and *Liriodendron tulipifera* may have significant coverage, apparently related to logging history. The predominant oaks and hickories in the canopy are *Quercus prinus, Carya glabra, Carya alba, Carya ovata, Quercus coccinea, Quercus velutina, Quercus alba*, and *Quercus rubra*. Additional canopy and subcanopy species can include *Nyssa sylvatica, Magnolia fraseri, Halesia tetraptera var. monticola, Fagus grandifolia, Ilex opaca*, and *Oxydendrum arboreum*. In addition, *Cornus florida* is characteristic and may be dominant in the subcanopy and tall-shrub layers; other tall-shrub species include *Magnolia fraseri, Hamamelis virginiana*, and *Sassafras albidum*. *Kalmia latifolia* or *Rhododendron maximum* may be present but only at very low cover. The short-shrub stratum is sparse (up to 20% cover), with no clear dominant. Some typical shrub species include *Vaccinium pallidum, Viburnum acerifolium*, and (in the central and southern portions of the type's range) *Gaylussacia ursina, Hydrangea arborescens*, and *Hydrangea radiata*. Common vines are *Smilax rotundifolia, Smilax glauca, Parthenocissus quinquefolia, Toxicodendron radicans, Vitis aestivalis, Vitis rotundifolia*, and *Vitis vulpina*. Herb cover is sparse to moderate; diversity and species composition vary among occurrences. Some of the more typical species include *Ageratina altissima, Eurybia divaricata (= Aster divaricatus), Carex communis var. communis, Carex digitalis var. digitalis, Chimaphila maculata, Desmodium nudiflorum, Dichanthelium* spp. (e.g., *Dichanthelium boscii, Dichanthelium commutatum, Dichanthelium dichotomum*), *Dioscorea quaternata, Galium circaezans, Galium latifolium, Goodyera pubescens, Maianthemum racemosum ssp. racemosum, Medeola virginiana, Houstonia purpurea, Lysimachia quadrifolia, Maianthemum racemosum ssp. racemosum, Polystichum acrostichoides, Prenanthes* spp., *Solidago caesia, Thalictrum thalictroides, Thelypteris noveboracensis, Uvularia perfoliata, Uvularia puberula, Uvularia sessilifolia*, and *Viola* spp. (e.g., *Viola blanda, Viola hastata, Viola x palmata, Viola tripartita*). Common mosses from West Virginia plots include *Thuidium delicatulum, Leucobryum glaucum, Hypnum imponens, Polytrichum ohioense, Leucobryum albidum*, and *Dicranum fulvum*.

Global Dynamics: Evidence of past fires is abundant in this type, but its natural fire regime is not known. Most stands have been logged, and in West Virginia, many areas likely formerly covered by this forest type have been strip-mined. Evidence of disturbance recorded in Virginia plots includes fire scars on older trees, charcoal in duff, much rotting *Castanea dentata* wood, damage to *Cornus florida* from dogwood anthracnose (*Discula destructiva*), and minor wind/ice damage to tree crowns. Large areas of this community type were impacted by logging and/or the loss of codominant *Castanea dentata*. Based on the abundance of *Castanea* wood debris and live sprouts, as well as the presence of numerous intact logs in older stands, *Castanea dentata* may have reached near optimal importance on sites of this community type prior to the arrival of the blight. At Peters Mountain in Allegheny County, Virginia, the current canopy dominants in these areas typically range from about 35-69 cm (14-27 inches) dbh, with

maximum ages of 90 to 140 years. Some patches of old-growth forest remain at Peters Mountain, especially on the steeper dip slopes and landslide benches (Fleming and Moorhead 2000).

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Vaccinium hirsutum* (G3, GA state-imperiled)

Global: Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Carex lucorum* var. *austrolucorum* (G5T3T4), *Isotria medeoloides* (G2?), *Monotropsis odorata* (G3), *Solidago glomerata* (G3), *Tsuga caroliniana* (G3), *Vaccinium hirsutum* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (15-Aug-1997).

RELATED CONCEPTS

Global Similar Types:

- *Acer rubrum var. rubrum - Betula lenta - Magnolia fraseri / (Rhododendron maximum, Kalmia latifolia)* Ruderal Forest (CEGL008558)
- *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271) is similar but features a well-developed ericaceous shrub layer.
- *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest (CEGL007230) occurs at higher elevations and has a stronger white oak component.
- *Quercus prinus - Carya ovata - Quercus rubra / Acer saccharum* Forest (CEGL007268) is similar but characterized by *Acer saccharum* as an important subcanopy (or canopy) tree.
- *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057)
- *Quercus prinus - Quercus rubra / Rhododendron maximum / Galax urceolata* Forest (CEGL006286)
- *Quercus rubra - Quercus prinus - Magnolia (acuminata, fraseri) / Acer pensylvanicum* Forest (CEGL004817)

CLASSIFICATION

Status: Standard

Classification Confidence: 2 - Moderate

Global Classification Comments: This forest lacks the dense ericaceous shrub layer typical of other *Quercus prinus*-dominated forests in the Blue Ridge escarpment region and commonly has diverse herbaceous composition. It is distinguished from similar forests in the Ridge and Valley by lacking *Acer saccharum* and from Piedmont forests by the lack of *Quercus falcata* and *Quercus stellata*, and by the presence of species more typical of the Southern Appalachians (*Magnolia fraseri, Halesia tetraptera*, and *Castanea dentata*). This association was

originally defined from the Chattooga Basin Project (S. Simon pers. comm.) and later refined with information from the Great Smoky Mountains. The North Carolina Piedmont examples of this association are only montane transition areas, such as the Sauratown Mountains and Hanging Rock. In West Virginia, this association is floristically intermediate between *Quercus prinus - Carya ovata - Quercus rubra / Acer saccharum* Forest (CEGL007268) and the more xeric *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271), and some stands are difficult to distinguish. It lacks the abundance of *Acer saccharum* of the former and the abundance of ericaceous shrubs of the latter and has higher abundance of *Liriodendron tulipifera* than either.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled in Georgia and North Carolina.
Global Range: This community occurs in the Southern Blue Ridge, the Great Smoky Mountains, and Piedmont transition areas of western North Carolina, eastern Tennessee, northwestern South Carolina, and northeastern Georgia, extending north into the Cumberlands in southern West Virginia and the border area between Virginia, Kentucky, and Tennessee. It also extends north in the Virginia Ridge and Valley and Blue Ridge to Allegheny, Botetourt, and Bedford counties.

Translated Name: **Chestnut Oak - Northern Red Oak / American Witch-hazel Forest**
Common Name: **Central Appalachian Dry-Mesic Chestnut Oak - Northern Red Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus* - *Quercus rubra* Forest Alliance (A0250)

ELEMENT CONCEPT

Global Summary: This closed-canopy, dry-mesic oak forest of the central Appalachian Mountains is a montane forest of somewhat protected rocky slopes. The canopy is codominated by *Quercus prinus* and *Quercus rubra*. Associated canopy species include *Liriodendron tulipifera, Acer rubrum, Carya glabra, Carya ovalis, Carya alba, Acer saccharum, Tilia americana, Fagus grandifolia*, and *Betula lenta*. The tall-shrub layer is most often characterized by *Hamamelis virginiana* and *Acer pensylvanicum*. The lower shrub layer is patchy and contains a mixture of scrambling vines, ericads, and non-ericaceous species. The herbaceous layer is usually sparse but may include *Dryopteris marginalis, Dioscorea quaternata, Eurybia divaricata (= Aster divaricatus), Ageratina*

altissima, Polygonatum biflorum, Solidago caesia, Festuca subverticillata, Thelypteris noveboracensis, Sanicula trifoliata, Prenanthes altissima, Polystichum acrostichoides, Desmodium nudiflorum, Galium latifolium, Houstonia purpurea, and *Maianthemum racemosum*. This association is more or less intermediate in site conditions and composition between oak / heath forests of exposed, xeric, infertile sites and richer cove or montane oak-hickory forests of sheltered, fertile sites.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This widespread mixed chestnut oak - red oak forest occupies sheltered rocky slopes, weathered boulderfields, and rocky ridges from <300 m to about 1,100 m (1,000-3,600 feet) elevation. It was sampled at 22 locations along the AT in the Central Appalachian project area. Sites range from moderate to steep slopes and summits. Soils are dry to dry-mesic, mostly well-drained sandy loam, loam, silt loam and clay loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks (often significant amounts) and occasional exposed bedrock and bare ground. Evidence of disturbance includes past logging, trails, tree gaps, gypsy moth damage, hemlock woolly adelgid, and the presence of exotic plant species.

Global Environment: Sites occupied by this dry-mesic oak forest are mostly protected rocky mountain slopes. In the Central Appalachians of Virginia, West Virginia, and Maryland, the type occurs at low and middle elevations, from <300 m (1000 feet) to about 1100 m (3600 feet), reaching optimal development at 610-915 m (2000-3000 feet). Habitats are underlain by a variety of bedrock types, including metabasalt (greenstone), pyroxene-rich granitic rocks, Antietam and Tuscarora quartzites, metasiltstone and phyllite, shale, and sedimentary material (interbedded sandstone, siltstone, and shale). Among plot-sampled Mid-Atlantic stands, lower to middle slope topographic positions predominate, along with steep (mean = 27°), usually concave slopes, and relatively high surface cover of outcrops, boulders, and stones. Slope aspect is variable, but the majority of aspects range from north to southeast. Soil samples collected from plots were strongly to very strongly acidic (mean pH = 4.8) but had moderately high levels of calcium (mean = 1019 ppm), reflecting the frequent occurrence of this community on moderately base-rich substrates.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus prinus* and *Quercus rubra* dominate the canopy along with up to 25% *Carya glabra, Carya ovalis*, and/or *Carya alba*. Other canopy and subcanopy associates include *Liriodendron tulipifera, Acer rubrum, Sassafras albidum*, and/or *Betula lenta*. *Cornus florida* is a common small tree. *Hamamelis virginiana* is characteristic in the shrub layer. *Toxicodendron radicans* and *Parthenocissus quinquefolia* are common vines. Short ericads are absent or sparse. Dry-mesophytic herbs include a diversity of *Carex* spp., *Asplenium platyneuron, Dioscorea quaternata, Dryopteris marginalis, Eurybia divaricata, Maianthemum racemosum ssp. racemosum*, and *Solidago caesia*. This community lacks Southern Appalachian species.

Global Vegetation: The vegetation is usually a closed-canopy forest codominated by *Quercus prinus* and *Quercus rubra* in variable proportions. Over the full geographic range, overstory associates are reported to include *Liriodendron tulipifera, Fraxinus americana, Tilia americana, Betula lenta, Acer rubrum, Magnolia acuminata, Nyssa sylvatica, Robinia pseudoacacia, Carya glabra, Carya ovalis*, and *Carya alba*. Less frequent, and more local, overstory and understory trees include *Acer saccharum, Amelanchier arborea, Asimina triloba, Fagus grandifolia, Ostrya virginiana*, and *Tsuga canadensis*. A tall-shrub layer is occasionally absent but usually characterized by *Hamamelis virginiana* and, less frequently, by *Cornus florida* and *Acer pensylvanicum*, the latter more common at higher elevations. The lower shrub layer contains scrambling or climbing vines of *Parthenocissus quinquefolia, Vitis aestivalis*, and *Toxicodendron radicans*, along with *Viburnum acerifolium, Hydrangea arborescens, Vaccinium pallidum*, and *Vaccinium stamineum*. In general, ericaceous species are patchy to sparse in this community. The herbaceous layer is usually sparse but may include *Dryopteris marginalis, Dioscorea quaternata, Eurybia divaricata (= Aster divaricatus), Ageratina altissima, Polygonatum biflorum, Solidago caesia, Festuca subverticillata, Thelypteris noveboracensis, Sanicula trifoliata, Prenanthes altissima, Polystichum acrostichoides, Desmodium nudiflorum, Galium latifolium, Houstonia purpurea*, and *Maianthemum racemosum*. Although not one of the more constant herbs, *Aralia nudicaulis* may occasionally dominate the herb layer of this community in large, clonal patches. This association is more-or-less intermediate in site conditions and composition between oak/heath forests of exposed, xeric, infertile sites and richer cove or montane oak-hickory forests of sheltered, fertile sites.

Global Dynamics: Wind and ice damage to tree crowns, damage to *Cornus florida* from dogwood anthracnose (*Discula destructiva*), and a few small fire scars were disturbances noted in plots. Although *Castanea dentata* logs and wood were not abundant in plots, frequent sprouts indicate that *Castanea dentata* was at least an associate tree in this type prior to the arrival of chestnut blight. The northwest slopes of Peters Mountain in Alleghany County,

Virginia, contains old-growth examples of the type with large, widely spaced canopy trees in the 43- to 72-cm (17-28 inches) dbh range. Representative old-age trees include a 59-cm (23 inches) dbh *Quercus prinus* >220 years old; a 63-cm (25 inches) dbh *Quercus prinus* about179 years old; a 67-cm (26 inches) dbh *Quercus prinus* 265 years old; and a 71-cm (28 inches) dbh *Quercus rubra* >247 years old (Fleming and Moorhead 2000).

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: These are Central Appalachian *Quercus prinus - Quercus rubra* forests that occur on sheltered rocky slopes and weathered boulderfields. This type has been repeatedly circumscribed in regional analyses of Central Appalachian data (e.g., George Washington/Jefferson National Forests, Shenandoah National Park, National Capital Region parks) and is robust. This community lacks Southern Appalachian species. A distinctive feature of this community is the little to no cover of ericads.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Wind and ice damage to tree crowns, damage to *Cornus florida* from dogwood anthracnose (*Discula destructiva*), and a few small fire scars were disturbances noted in plots. Although *Castanea dentata* logs and wood are not abundant in plots, frequent sprouts indicate that *Castanea dentata* was at least an associate tree in this type prior to the arrival of

chestnut blight. Geography drives the differences between Central Appalachian Dry-Mesic Chestnut Oak - Northern Red Oak Forest (CEGL006057) and Southern Appalachian Montane Northern Red Oak - Chestnut Oak Forest (CEGL004817). Soils supporting CEGL006057 have significantly higher base status (particularly Ca, Mg) than those of CEGL004817, reflecting the location of many on base-rich granitic and metabasalt substrates. Along the AT, the area of overlap between these types is roughly in Giles County, Virginia. CEGL006057 lacks Southern Appalachian species, while one or both of the magnolias, *Magnolia acuminata* and *Magnolia fraseri* and *Rhododendron maximum* are present in CEGL004817.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs throughout the Central Appalachians (from I-77 in Virginia north to Lehigh County in Pennsylvania). It was sampled in Maryland (Weverton), Pennsylvania (northern and central, Peter's Mountain, Sherman Creek), and Virginia (Angels Rest, Brushy Mountain/Dismal Creek, Dragons Tooth, Front Royal, and James River Face Wilderness).
Global Range: This association occurs throughout the central Appalachian region of Virginia, West Virginia, Maryland, Pennsylvania, and possibly farther north. In Virginia, it is a large-patch community type in both the Northern Blue Ridge and Ridge and Valley provinces. Small-patch outliers of this type occur in rocky, sheltered ravines of the northern Virginia and Maryland Piedmont.

Translated Name: **Chestnut Oak - Northern Red Oak / Great Laurel / Beetleweed Forest**
Common Name: **Chestnut Oak Forest (Mesic Slope Heath Type)**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus* - *Quercus rubra* Forest Alliance (A0250)

Element Concept

Global Summary: This forest is known from protected, usually steep slopes in the Southern Blue Ridge and ranges into adjacent areas of the upper Piedmont to the east and the Cumberlands and Southern Ridge and Valley to the west. In the southern portion of its range (Southern Blue Ridge), it usually occurs on north-facing slopes, while in the northern part of its range (the Cumberlands in West Virginia), most sites have southerly to westerly aspects. This is typically a midslope to lower slope type, but it can be found on upper slopes in a more sheltered position. This forest is found at elevations between 760 and 1220 m (2500-4000 feet) in the Southern Blue Ridge and at somewhat lower elevations (200-600 m) in the Cumberland Plateau. Canopies in these forests are dominated by *Quercus prinus*, usually with lesser amounts of *Quercus rubra* and/or *Acer rubrum*, and always occurring over a dense, very tall shrub stratum (2-6 m) of *Rhododendron maximum*. In some examples, this community may also be codominated or dominated by *Quercus velutina, Quercus alba*, or *Betula lenta*. Additional trees with lower constancy and cover in the canopy and subcanopy include *Tsuga canadensis, Oxydendrum arboreum, Fagus grandifolia*, and *Nyssa sylvatica*. On some sites, *Tsuga canadensis* may have dense understory regeneration. In some areas of the Southern Blue Ridge, *Rhododendron minus* may dominate the shrub layer. Other common shrubs can include *Gaylussacia ursina* (in the Southern Blue Ridge), *Kalmia latifolia, Smilax rotundifolia, Ilex opaca var. opaca*, and/or *Hamamelis virginiana*. Herbs are sparse. The ground cover is dominated by leaf litter, but *Galax urceolata* is found in most occurrences except at the northern limit of this type's range in West Virginia. Other herb species that can be typical include *Chimaphila maculata, Goodyera pubescens, Polystichum acrostichoides, Maianthemum racemosum, Solidago caesia, Mitchella repens, Eurybia divaricata, Dryopteris marginalis*, and *Dioscorea quaternata*. Some examples may have sparse (woodland-like) canopies and occur in association with rock outcroppings. Vascular plant species richness in seven 400-square-meter West Virginia plots ranges from 12 to 49 taxa (mean = 30.1).

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This mesic chestnut oak - northern red oak forest was sampled at two locations in the park; one in Giles County, Virginia, in the Central Appalachians and one in Smyth County, Virginia, in the Cumberlands and Southern Ridge and Valley. The sites are somewhat steep to steep upper slopes and ridges with north aspects at 1,000 m (3,280 feet) elevation. Soils are well-drained loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. No evidence of disturbance was reported.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This chestnut oak forest is found at elevations below 1,164 m on somewhat steep to steep mid and upper slopes with northern aspects. Soils are mesic, well-drained sandy loam and loam. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes wind/ice damage.

Global Environment: This forest is known from protected, usually steep slopes in the Southern Blue Ridge and ranges into adjacent areas of the upper Piedmont to the east and the Cumberlands and Southern Ridge and Valley to the west. In the southern portion of its range (Southern Blue Ridge), it usually occurs on north-facing slopes, while in the northern part of its range (the Cumberlands in WV), most sites have southerly to westerly aspects. This is typically a midslope to lower slope type, but it can be found on upper slopes in a more sheltered position. This forest is found at elevations between 760 and 1220 m (2500-4000 feet) in the Southern Blue Ridge and at somewhat lower elevations (200-600 m) in the Cumberland Plateau. Soils in WV plots are described as well- to rapidly-drained, dry to somewhat moist sandy loam and sandy clay loam that test very strongly to extremely acidic (mean pH = 4.20). Soils of some sites may be classified as folists, characterized by deep organic horizons (duff) over bouldery colluvium.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This forest is dominated by a mix of *Quercus prinus* and *Quercus rubra*; *Acer rubrum, Betula lenta, Magnolia fraseri*, and *Oxydendrum arboreum* occur in the subcanopy. There is very heavy cover (approaching 100% in most cases) of *Rhododendron maximum* in the shrub layer. Herbs are sparse due to the dense shrub layer.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by a mix of *Quercus prinus* and *Quercus rubra*; additional trees may include *Acer rubrum, Acer pensylvanicum, Betula lenta, Magnolia fraseri*, and *Oxydendrum arboreum*. The shrub layer has very thick cover (approaching 100% in most cases) of *Rhododendron maximum*. Herbs are sparse but may include *Clintonia umbellulata* and *Galax urceolata*.

Global Vegetation: Canopies in these forests are dominated by *Quercus prinus*, usually with lesser amounts of *Quercus rubra* and/or *Acer rubrum*, and always occurring over a dense, very tall shrub stratum (2-6 m) of *Rhododendron maximum*. In some examples, this community may also be codominated or dominated by *Quercus velutina, Quercus alba*, or *Betula lenta*. Additional trees with lower constancy and cover in the canopy and subcanopy include *Tsuga canadensis, Oxydendrum arboreum, Fagus grandifolia*, and *Nyssa sylvatica*. On some sites, *Tsuga canadensis* may have dense understory regeneration. In some areas of the Southern Blue Ridge, *Rhododendron minus* may dominate the shrub layer. Other common shrubs can include *Gaylussacia ursina* (in the Southern Blue Ridge), *Kalmia latifolia, Smilax rotundifolia, Ilex opaca var. opaca*, and/or *Hamamelis virginiana*. Herbs are sparse. The ground cover is dominated by leaf litter, but *Galax urceolata* is found in most occurrences except at the northern limit of this type's range in West Virginia. Other herb species that can be typical include *Chimaphila maculata, Goodyera pubescens, Polystichum acrostichoides, Maianthemum racemosum, Solidago caesia, Mitchella repens, Eurybia divaricata, Dryopteris marginalis*, and *Dioscorea quaternata*. Some examples may have sparse (woodland-like) canopies and occur in association with rock outcroppings. Vascular plant species richness in seven 400-square-meter WV plots ranges from 12 to 49 taxa (mean = 30.1).

In the Great Smoky Mountains, this community is found consistently as a transitional band of vegetation, downslope from drier *Quercus prinus* ridgetop forests, *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271), and grading into acidic cove forests, *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543), on the steep ravines below. At Cumberland Gap National Historical Park and the Gauley River National Recreation Area, it can grade into mixed mesophytic forests (CEGL005222) as well.

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (22-Feb-2010). This community is uncommon, but not rare, throughout most of its range. As currently defined, it is a regional endemic, found only in the Southern Blue Ridge and adjacent regions of the upper Piedmont and Cumberlands and Southern Ridge and Valley. This community is often overlooked or not distinguished separately in inventories; thus, it is more common than the number of documented occurrences suggests.

RELATED CONCEPTS

Global Similar Types:

- *Acer rubrum var. rubrum - Betula lenta - Magnolia fraseri / (Rhododendron maximum, Kalmia latifolia)* Ruderal Forest (CEGL008558)
- *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543)
- *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271)
- *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest (CEGL007267)
- *Quercus prinus / Rhododendron catawbiense - Kalmia latifolia* Forest (CEGL008524) is mostly of the Central Appalachians and only peripherally in the northern portion of the Southern Blue Ridge; occupies drier sites and is characterized by a dense *Rhododendron catawbiense* shrub layer.
- *Quercus rubra / (Kalmia latifolia, Rhododendron catawbiense, Rhododendron maximum) / Galax urceolata* Forest (CEGL007299)

CLASSIFICATION

Status: Standard

Classification Confidence: 2 - Moderate

Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This is a mesophytic oak / heath forest with substantial *Quercus rubra* and a *Rhododendron maximum* understory. At most of the Virginia sampling sites, this type appears to occupy a transitional zone between acidic cove forests, i.e., Southern Appalachian Acidic Cove Forest (Typic Type) (CEGL007543), and more xeric oak / heath forests, Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271). In comparison to Central Appalachian Chestnut Oak / Catawba Rosebay Forest (CEGL008524), Chestnut Oak Forest (Mesic Slope Heath Type) (CEGL006286) is associated with distinctly more mesophytic sites, has a strong group of differential indicator species, and contains many more Southern Appalachian endemics.

Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This community is included in the Central Appalachian project area classification for the AT because of the mapping boundaries set for the project. It is more of a Southern Blue Ridge community. It is a rather rare type in Virginia and all occurrences are south of the New River.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: A mesophytic oak/heath forest with substantial *Quercus rubra* and a *Rhododendron maximum* understory. At most of the Virginia sampling sites, this type appears to occupy a transitional zone between acidic cove forests, Southern Appalachian Acidic Cove Forest (Typic Type) (CEGL007543), below and more xeric oak/heath forests, Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271), above.

Global Classification Comments: This association is more protected and more mesic than *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271). It occurs at lower elevations and on more protected topographic positions than *Quercus rubra / (Kalmia latifolia, Rhododendron catawbiense, Rhododendron maximum) / Galax urceolata* Forest (CEGL007299). It is much less diverse than *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest (CEGL007267), lacking the diverse herbaceous and woody components found in that association. Stands similar to this association but with significant cover by *Tsuga canadensis* in the canopy layers are classified as *Liriodendron tulipifera - Betula lenta - Tsuga canadensis / Rhododendron maximum* Forest (CEGL007543).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is an outlier in the southernmost extent of the Central Appalachians; it is uncommon along the AT. It ranges from south of the New River in Virginia through the Cumberlands and Southern Ridge and Valley and into the Southern Blue Ridge. It was sampled in Virginia at Brushy Mountain and Pearis Mountain West.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is uncommon throughout the region and along the trail. It was sampled in North Carolina and at Brushy Mountain in Virginia.

Global Range: This community occurs in the Southern Blue Ridge of northeastern Georgia, northwestern South Carolina, north through eastern Tennessee, western North Carolina, and southwestern Virginia. It extends into the Cumberlands and Southern Ridge and Valley of Kentucky, Virginia and West Virginia. Its range also extends into the upper Piedmont of North Carolina.

ELEMENT CONCEPT

Global Summary: This community is documented primarily from the northern Blue Ridge and its eastern foothills, from Amherst County in west-central Virginia to the Catoctin Mountains of northern Maryland, and extending into northeastern West Virginia. It is likely to be more widespread, but certain topographic and/or soil conditions on the northern Blue Ridge may favor its development and abundance there. This community occupies sites intermediate between the xeric, oligotrophic sites of chestnut oak/heath forests and the somewhat sheltered, submesic, subacidic sites of other montane mixed oak and oak-hickory forests. It occurs on chiefly convex, moderately steep middle to upper slopes, ridge crests, and boulderfields with southeastern to northwestern exposures. Soils are subxeric or xeric and strongly infertile. Many sites have high cover of boulders, cobbles, gravel, or mineral soil. Underlying bedrock includes massive quartzite of the Chilhowee group, various members of the northern Blue Ridge gneissic granitic complex, and less frequently metabasalt of the Catoctin Formation. This type spans a very broad range of elevations, from <300 m to nearly 1100 m (<1000-3600 feet). *Quercus prinus* and *Quercus rubra* generally codominate the overstory, but either species may dominate discrete areas within stands. Minor canopy associates include *Quercus*

velutina, Quercus alba, Betula lenta, Carya spp., *Robinia pseudoacacia*, and *Pinus strobus*. *Acer rubrum* cover may equal or exceed that of the diagnostic oak species in stands with recent harvesting. The shrub layer is dominated by patchy *Vaccinium pallidum, Vaccinium stamineum, Rhododendron periclymenoides*, and *Kalmia latifolia*. *Acer pensylvanicum* and *Smilax rotundifolia* may be present in minor amounts. A suite of low-cover, xerophytic herbs is characteristic, including *Houstonia longifolia, Campanula divaricata, Potentilla canadensis, Lysimachia quadrifolia, Carex pensylvanica, Aureolaria laevigata*, and *Hieracium paniculatum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This dry chestnut oak - northern red oak forest occurs on exposed, convex higher-elevation (610-914 m [2,000-3,000 feet]), moderately steep, middle to upper slopes, ridge crests, and boulderfields with southeastern to northwestern exposures. It was sampled at six locations in the Central Appalachians. The sites are mid and upper slopes and summits with southeastern or northwestern aspects. Soils are well-drained clay loam, sandy loam and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional exposed bedrock, large/small rocks and/or bare soil. Evidence of disturbance includes past logging/clearing, trails and ditches, grazing/browsing, and the presence of exotic plant species.

Global Environment: This community type occurs on chiefly convex, moderately steep middle to upper slopes, ridge crests, and boulderfields with southeastern to northwestern exposures. Soils are subxeric or xeric and strongly infertile. Many sites have high cover of boulders, cobbles, gravel, or mineral soil. Underlying bedrock includes massive quartzite of the Chilhowee group, various members of the northern Blue Ridge gneissic granitic complex, and less frequently metabasalt of the Catoctin Formation. This type spans a very broad range of elevations, from <300 m to nearly 1100 m (<1000-3600 feet). Although *Quercus prinus* generally occurs at elevations below 915 m (3000 feet) in the northern Blue Ridge of Virginia (Harrison et al. 1989, Stephenson and Adams 1989), it often extends upslope on more xeric sites (e.g., Whittaker 1956). Virtually all stands have experienced a history of logging and the loss of *Castanea dentata* as an overstory dominant.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This dry-mesic oak forest is codominated by *Quercus prinus* and *Quercus rubra*. The subcanopy includes *Carya glabra, Acer rubrum, Prunus serotina, Nyssa sylvatica*, and/or *Sassafras albidum*. *Acer rubrum* cover may equal or exceed that of the diagnostic oak species in stands with recent harvesting. Common shrubs include *Vaccinium stamineum, Vaccinium pallidum, Viburnum acerifolium*, and sometimes patchy *Kalmia latifolia* and/or *Rhododendron periclymenoides*. Herbs on rocky soils include *Aralia nudicaulis, Houstonia longifolia*, and *Campanula divaricata*; *Dennstaedtia punctilobula* is more common on deeper soils.

Global Vegetation: *Quercus prinus* and *Quercus rubra* generally codominate the overstory, but either species may dominate discrete areas within stands. *Acer rubrum* cover may equal or exceed that of the diagnostic oak species in stands with recent harvesting. Minor canopy associates include *Quercus velutina, Betula lenta, Carya* spp., *Robinia pseudoacacia, Quercus alba*, and *Pinus strobus*. *Acer rubrum* is the most constant and abundant species of the subcanopy, which also contains *Sassafras albidum, Prunus serotina, Nyssa sylvatica*, and *Acer pensylvanicum* (mostly at higher elevations). Patchy dominance by *Vaccinium pallidum, Vaccinium stamineum, Rhododendron periclymenoides*, and *Kalmia latifolia* characterizes the shrub layer. *Acer pensylvanicum* and *Smilax rotundifolia* may be present in minor amounts. A number of low-cover, xerophytic herbs are characteristic where soil development and rock cover permit, including *Houstonia longifolia, Campanula divaricata, Potentilla canadensis, Lysimachia quadrifolia, Carex pensylvanica, Aureolaria laevigata*, and *Hieracium paniculatum*. *Medeola virginiana* and *Monotropa uniflora* may also be present. *Aralia nudicaulis* is occasionally a patch-dominant on dry, bouldery sites. On other sites with better soil development, *Dennstaedtia punctilobula* nearly dominates the herb stratum. Mean species richness of 28 plots is 40 taxa per 400 square meters, much higher than that of other oak/heath types in the Central Appalachians region.

Global Dynamics: *Castanea dentata* abounds in the shrub layer of some stands, which undoubtedly reflects the former importance of this species in the canopy. Both *Acer rubrum* and *Robinia pseudoacacia* may have increased following logging; the presence of the latter suggests disturbance in recent decades, and the persistence of the former may indicate contemporary fire exclusion.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Ailanthus altissima* (Medium), *Lonicera japonica* (High/Medium)
Global: Vulnerable Plants: *Tsuga caroliniana* (G3); **Other Plants**: *Kalmia latifolia* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (2-Oct-2006). The type occupies a fairly narrow geographic range on the northern Blue Ridge but is locally common within the range. Many occurrences are protected on national park lands. In West Virginia, it is documented from Camp Dawson in Preston County, and from Harpers Ferry National Historic Park. Sites with similar exposure and parent material occur on local peaks of Shenandoah National Park, the Peaks of Otter region, and the northern terminus of the Southern Blue Ridge near Roanoke, at the southern limit of the distribution of charnockitic bedrock.

RELATED CONCEPTS

Global Similar Types:
- *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest (CEGL007230) is a broadly defined association from the Southern Blue Ridge.
- *Quercus prinus - (Quercus coccinea, Quercus rubra) / Kalmia latifolia / Vaccinium pallidum* Forest (CEGL006299)
- *Quercus prinus - Quercus (rubra, velutina) / Vaccinium (angustifolium, pallidum*) Forest (CEGL006282) ranges from Maine to Virginia.
- *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057) is common in the Central Appalachians, possibly ranging north to New Jersey.
- *Quercus rubra - Quercus prinus - Carya ovalis / (Cercis canadensis) / Solidago caesia* Forest (CEGL008514)
- *Tsuga canadensis - Fagus grandifolia - Quercus (prinus, alba)* Forest (CEGL006474)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This association represents mixed oak / sparse heath vegetation on very rocky, somewhat sheltered sites. Plots span the full length of the Northern Blue Ridge, from just north of Roanoke to Harpers Ferry; often in the elevational range of 610 to 1,070 m (2,000-3,500 feet). It is likely to occur along the AT on the Maryland Blue Ridge. This type has never been documented on sedimentary rocks of the Ridge and Valley, and appears to be wholly associated with metamorphic rocks (metasedimentary, granitic, and metabasaltic) of the Blue Ridge and its major foothills in the western Piedmont.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Analysis of 28 plots from Virginia, Maryland, and West Virginia provided the basis for this type's current circumscription. This community type bears some similarity to a number of units in the

USNVC. *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest (CEGL007230) is a broadly defined association from the Southern Blue Ridge. It differs from the present community type in the presence of several Southern Appalachian endemics (*Gaylussacia ursina, Halesia tetraptera, Magnolia fraseri*) whose range does not extend to the Northern Blue Ridge and by the general absence (except for *Lysimachia quadrifolia*) of the xerophytic herbs characteristic of this type. *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057) is common in the Central Appalachians, possibly ranging north to New Jersey. This association represents mixed oak / sparse heath vegetation on very rocky, somewhat sheltered sites. *Acer pensylvanicum, Hamamelis virginiana*, and *Carya* spp., which are characteristic of CEGL006057, are relatively unimportant in stands of the present type. *Quercus prinus - Quercus (rubra, velutina) / Vaccinium (angustifolium, pallidum)* Forest (CEGL006282), which ranges from Maine to Virginia, is characterized by a low, speciose ericaceous layer and lacks the herbaceous species diagnostic of this community type.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is found from the Northern Blue Ridge to just north of Roanoke to Harpers Ferry to the Catoctin Mountains of northern Maryland, extending into northeastern West Virginia. It was sampled in Potomac Wayside and Hogwallow Flats (Shenandoah National Park) in Virginia and at Loudoun Heights and Harpers Ferry in West Virginia.
Global Range: This community is documented only from the northern Blue Ridge and its eastern foothills, from Amherst County in west-central Virginia to the Catoctin Mountains of northern Maryland, and Preston, Mineral, and Randolph counties in West Virginia. Within this range, it is widely distributed and frequently a large-patch type. It is likely to be more widespread, but certain topographic and/or soil conditions on the northern Blue Ridge may favor its development there. The absence of either broad southern Appalachian endemics or species with more northern affinities distinguishes this type from more southern and northern vegetation types.

Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus - Quercus rubra* Forest Alliance (A0250)

ELEMENT CONCEPT

Global Summary: This mixed northern red oak - chestnut oak forest is known from the northern part of the Southern Appalachians and extreme southern part of the Central Appalachians in southwestern Virginia and adjacent parts of West Virginia and Tennessee. It occurs on submesic slopes at various topographic positions and aspects from 600 to 1200 m (2000-4000 feet) elevation. Geologic substrate includes various sedimentary rocks, quartzite, granitic rocks, biotite gneiss, and feldspathic metagraywacke. Soils are deep, extremely acidic, and infertile. Vegetation is a mixed oak forest with a well-developed canopy 30 m or more tall in mature stands. *Quercus rubra* and *Quercus prinus* are the most characteristic canopy dominants, usually occurring in mixed stands with minor associates of *Magnolia acuminata, Magnolia fraseri, Quercus alba, Betula lenta, Acer rubrum, Carya* spp., *Fagus grandifolia, Tsuga canadensis*, and *Liriodendron tulipifera*. *Acer pensylvanicum* is the leading small tree/shrub dominant, with frequent associates of *Oxydendrum arboreum, Pinus strobus, Amelanchier arborea, Amelanchier laevis, Castanea dentata* (sprouts), *Hamamelis virginiana, Rhododendron maximum, Ilex montana, Viburnum acerifolium*, and *Vaccinium pallidum*. The herb layer is typically patchy to sparse, with *Medeola virginiana, Galax urceolata, Convallaria majuscula, Thelypteris noveboracensis*, and *Dennstaedtia punctilobula* occasionally attaining 5% cover in a plot; at higher elevations, the ferns may dominate strongly and cover more substantial areas. Other relatively constant but low-cover herbs include *Dioscorea quaternata, Eurybia divaricata, Solidago curtisii, Polygonatum biflorum, Polystichum acrostichoides, Conopholis americana, Clintonia umbellulata, Viola hastata, Uvularia puberula, Chamaelirium luteum, Zizia trifoliata*, and *Carex appalachica*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This Southern Appalachian mixed oak montane forest ranges in elevation from 600 to 1,200 m (2,000-4,000 feet). It was sampled at six locations in the Central Appalachian project area. Sites range from gentle to steep, lower to upper slopes and ridgetops with mostly western and northern aspects. Soils are mesic to dry-mesic moderately well- to well-drained clay loam, loam, sandy loam, and clay loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional (sometimes significant) large/small rocks and bare soil. Evidence of disturbance includes possible past logging, trails, and some hemlock woolly adelgid damage.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This mixed oak forest is distributed extensively between about 610 and 1,220 m (2,000-4,000 feet) elevation on the southern Virginia Blue Ridge and somewhat less extensively in the drier Ridge and Valley region to the west. It occurs on submesic to near mesic slopes with deep, acidic soils. Sites range from gentle to steep lower to upper slopes and ridgetops with mostly western and northern aspects. Soils are mesic to dry-mesic moderately well- to well-drained clay loam, loam, sandy loam, and clay loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasion (sometimes significant) large/small rocks and bare soil. Evidence of disturbance includes possible past logging, trails, and some hemlock woolly adelgid damage.

Global Environment: This community type occurs on submesic slopes at elevations from 600 to 1200 m (2000-4000 feet) in the northern part of the Southern Appalachians. It occurs on various topographic positions from lower to upper slopes and crests, in deep, infertile soils. Parent material at known sites includes Ordovician siltstones and shale, Devonian shale and sandstone, quartzite, conglomerate sandstone and shale, interbedded quartzite and dolomite, charnockite, layered pyroxene granulite, biotite gneiss, and feldspathic metagraywacke. Among 26 plot-sampling sites, slope profiles are usually convex in at least one direction while surface substrate averaged 8% boulders and small stones, 4% decaying wood, 1% mineral soil, and 87% leaf litter and duff. Aspect was variable among the plots, but eastern aspects are rare. Soil samples collected from plots are extremely acidic (mean pH = 4.2), with low calcium and magnesium, and high iron and aluminum levels.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus rubra* is typically dominant or codominant with *Quercus prinus* in the canopy with a subcanopy dominated by *Acer rubrum* with *Magnolia fraseri* or *Magnolia acuminata* present. *Acer pensylvanicum, Acer rubrum, Oxydendrum arboreum*, and *Amelanchier arborea* are common in the understory. Common and/or abundant shrubs include *Castanea dentata, Hamamelis virginiana, Rhododendron maximum, Vaccinium* spp., and *Viburnum acerifolium*. Herbs are sparse but diverse; common species include *Dioscorea quaternata, Eurybia divaricata, Goodyera pubescens, Medeola virginiana, Polygonatum biflorum, Polystichum acrostichoides, Solidago curtisii*, and *Uvularia puberula*. Southern Appalachian species such as *Oxydendrum arboreum, Rhododendron calendulaceum, Rhododendron maximum* (scattered), *Galax urceolata, Convallaria majuscula*, and *Viola hastata* are conspicuous. In addition, this community supports VA-state critically imperiled *Heuchera caroliniana*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: In this community, *Quercus rubra* is typically dominant or codominant with *Quercus prinus* in the canopy with a subcanopy of *Magnolia fraseri* or *Magnolia acuminata*. *Acer pensylvanicum* is dominant in the short-tree layer. Other common tree species include *Acer rubrum, Oxydendrum arboreum*, and *Tsuga canadensis*. Common and/or abundant shrubs include *Amelanchier arborea, Castanea dentata, Hamamelis virginiana, Rhododendron maximum, Vaccinium* spp., and *Viburnum acerifolium*. Herbs are sparse but diverse; common species include *Dioscorea quaternata, Eurybia divaricata, Goodyera pubescens, Medeola virginiana, Polygonatum biflorum, Polystichum acrostichoides, Solidago curtisii*, and *Uvularia puberula*. This community also supports VA-state critically imperiled *Heuchera caroliniana*.
Global Vegetation: Mature stands have a well-developed canopy of trees 30 m or more tall. *Quercus rubra* is the leading overstory dominant, with only slightly higher density and basal area than *Quercus prinus*. Most stands are mixed, although either species can dominate small areas. One or both of the magnolias, *Magnolia acuminata* or *Magnolia fraseri*, are usually important in the overstory or understory. Minor canopy associates vary and can include *Quercus alba, Betula lenta, Acer rubrum, Carya* spp., *Fagus grandifolia, Tsuga canadensis*, and *Liriodendron tulipifera*. Most of the preceding species may be present in the understory, along with *Acer pensylvanicum, Oxydendrum arboreum, Pinus strobus, Amelanchier arborea* and *Amelanchier laevis*, and sprouts of *Castanea dentata*. The most consistently important small tree / shrub is *Acer pensylvanicum*, attaining densities >500 stems/ha in some stands. Other shrubs that are less constant but sometimes important include *Hamamelis virginiana, Rhododendron maximum, Ilex montana, Viburnum acerifolium*, and *Vaccinium pallidum*. The herb layer is often patchy to sparse, with *Medeola virginiana, Galax urceolata, Convallaria majuscula, Thelypteris noveboracensis*, and *Dennstaedtia punctilobula* occasionally attaining 5% cover in a plot. In the higher part of the elevational range, however, the latter two ferns may greatly dominate the herb layer and cover more substantial areas. Other relatively constant but low-cover herbs include *Dioscorea quaternata, Eurybia divaricata, Solidago curtisii, Polygonatum biflorum, Polystichum acrostichoides, Conopholis americana, Clintonia umbellulata, Viola hastata, Uvularia puberula, Chamaelirium luteum, Zizia trifoliata*, and *Carex appalachica*.
Global Dynamics: The frequency of *Castanea dentata* sprouts in this community type suggests that it was formerly an important tree in the overstory mix. Extensive logging during the late 19th and early 20th centuries, along with removal of *Castanea* by chestnut blight, no doubt favored the oaks in regenerated stands. Many mature, contemporary stands of this vegetation type are now exhibiting classic symptoms of oak decline, with very poor recruitment of the dominant oaks, along with abundant invasion of stand understories by shade-tolerant mesophytic trees. The latter vary from site to site but include *Acer rubrum, Fagus grandifolia, Tsuga canadensis, Pinus strobus*, and rarely, *Acer saccharum var. saccharum*. Exclusion of low-intensity fires and logging disturbances have contributed to these changes, which will likely continue barring the re-introduction of fire. A recently burned stand on Clinch Mountain in southwest Virginia exhibited atypically high cover by herbaceous species, suggesting that fires also benefit herbs by burning off litter/humus and increasing illumination though the elimination of shrubs.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Heuchera caroliniana* (G3, globally vulnerable & VA state-critically imperiled); **Invasive/Exotic Plants**: *Rosa multiflora* (Medium/Low)
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Castanea dentata* (G4, TN state-imperiled), *Heuchera caroliniana* (G3, VA state-critically imperiled); **Invasive/Exotic Plants**: *Rosa multiflora* (Medium/Low, invasive/exotic)
Global: Vulnerable Plants: *Gentiana austromontana* (G3), *Heuchera caroliniana* (G3), *Prenanthes roanensis* (G3), *Tsuga caroliniana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (24-Feb-2010). Although this association is known from a fairly limited geographic area, data suggest that over much of that area, it is an extensive and secure type.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba - Quercus (rubra, prinus) / Rhododendron calendulaceum - (Gaylussacia ursina)* Forest (CEGL007230) occurs on somewhat drier sites and has a stronger white oak component.
- *Quercus prinus - (Quercus rubra) - Carya* spp. / *Oxydendrum arboreum - Cornus florida* Forest (CEGL007267) occurs on drier sites at generally lower elevations, and has a stronger component of low-elevation species.
- *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057) has a more northerly range in the Central Appalachians, lacks Southern Appalachian species, and occupies sheltered rocky slopes and weathered boulderfields.
- *Quercus rubra - Acer rubrum / Pyrularia pubera / Thelypteris noveboracensis* Forest (CEGL006192) occurs in the southern part of the Southern Appalachians and generally lacks *Quercus prinus*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Southern Appalachian Montane Northern Red Oak - Chestnut Oak Forest (CEGL004817) and Central Appalachian Dry-Mesic Chestnut Oak - Northern Red Oak Forest (CEGL006057) are related, but floristically quite different types. Geography drives the differences, and there is an area at the northern end of the range for CEGL004817 and the southern end of the range for CEGL6057 in which the Southern Appalachian species drop out and stands may be difficult to place. Along the AT, that area is roughly in Giles County, Virginia. Unequivocal CEGL006057 ranges south along the AT to Craig County, then becomes transitional to CEGL004817 in Giles County. South of the New River, this vegetation class is represented by CEGL004817.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: *Quercus rubra* is the leading canopy dominant, with *Quercus prinus* a close second; most stands are mixed but either oak can dominate small areas. One or both of the magnolias, *Magnolia acuminata* and/or *Magnolia fraseri*, are often important in the overstory or understory. A variety of other trees, including *Quercus alba, Tsuga canadensis, Liriodendron, Fagus grandifolia*, and *Carya* spp. can sometimes be important in the overstory or understory. *Acer pensylvanicum* is consistently the most important small tree/shrub, attaining densities of >500 stems/ha in some stands. *Oxydendrum arboreum* is less constant but often common. Heaths are not prevalent, but sometimes patchy. Herbs are patchy to sparse; *Medeola virginiana, Convallaria majuscula, Galax urceolata*, and *Thelypteris noveboracensis* occasionally attain 5% cover in a plot.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: Similar to Central Appalachian Dry-Mesic Chestnut Oak - Northern Red Oak Forest (CEGL006057), which is more common in the Central Appalachians.

Global Classification Comments: Classification of this type is supported by analysis of an 1100-plot Southern Appalachian dataset compiled for the Appalachian Trail vegetation mapping project (Fleming and Patterson 2009a). This community is represented by 27 plots and was intensively compared with similar types using cluster analysis, statistical analysis, and NMS ordinations, and found to be distinctive, both compositionally and environmentally. Additional data were collected in southwest Virginia after the Appalachian Trail analysis. The 33 Virginia plots of this type were also included in a statewide analysis of montane oak and oak-hickory vegetation in Virginia, and again formed a distinctive group (Fleming and Patterson 2009b).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from the northern part of the Southern Appalachians to the extreme southern part of the Central Appalachians in southwestern Virginia (Giles County and south from the New River). In the Central Appalachian project area of the AT, it was sampled at Angels Rest, Brushy Mountain, Locust Mountain, and Quebec Branch in Virginia.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is widespread in southwestern Virginia, with an additional 3 plots from Tennessee and North Carolina and one plot from southeastern West Virginia. It was sampled in North Carolina, Tennessee, and at Bobby's Ridge, Comers Creek, Hurricane Creek, Hurricane Mountain, Lost Mountain, and Straight Mountain in Virginia.
Global Range: This association is known from the northern part of the Southern Appalachians and extreme southern part of the Central Appalachians in southwestern Virginia and adjacent parts of West Virginia and Tennessee. The full range south and west of Virginia is not known and needs additional investigation. The type should be sought in northern North Carolina, as it is a major type in Virginia within a few miles of the border. Within the known range, it is a large-patch type that covers extensive areas on the Southern Blue Ridge. It is more localized in the Ridge and Valley and Cumberland Mountains, where it favors the higher ridges.

[CEGL003890] *Vitis aestivalis* Vine-Scrub

Translated Name: **Summer Grape Vine-Scrub**
Common Name: **Montane Grape Opening**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus prinus* - *Quercus rubra* Forest Alliance (A0250)

ELEMENT CONCEPT

Global Summary: This community is strongly dominated by the vine *Vitis aestivalis*. In Great Smoky Mountains National Park, examples occur on steep to very steep, northerly, middle to upper slopes at intermediate elevations between 610 and 1070 m (2000-3500 feet). All areas sampled showed evidence of disturbance by wind, ice, or logging. *Vitis aestivalis* vines, extremely thick in patches and covering nearly every tree as well as the ground, have 50-100% coverage. Trees in the canopy and subcanopy have 0-50% coverage and vary from site to site. The shrub layer is sparse. The herb layer is sparse to moderate, decreasing with vine coverage. Herbaceous composition varies from site to site. Beneath the vine canopy, coarse woody debris and tip-up mounds are typical. The dynamics of this community are poorly understood. It apparently originates from disturbance, such as an ice or wind storm, and can persist for decades. Examples can range in size from less than one to ten hectares.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This native vineland originates from disturbance, such as logging or an ice or wind storm, and can persist for decades. This community can range in size from less than one to ten hectares.
Global Environment: In the Great Smoky Mountains National Park, this community occurs on steep to very steep, northerly, middle to upper slopes at intermediate elevations between 610 and 1070 m (2000-3500 feet) (MacKenzie 1993).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This community is represented by grapevine-dominated patches located in forests (so-called "grapeholes"), usually with greater than 25% coverage in various strata of the native *Vitis aestivalis*, and with a patchy canopy of trees.
Global Vegetation: This community is strongly dominated by the vine *Vitis aestivalis*. These vines, extremely thick in patches and covering nearly every tree as well as the ground, have 50-100% coverage. Trees in the canopy and subcanopy have 0-50% coverage and vary from site to site, but typical species include *Acer rubrum, Acer saccharum, Halesia tetraptera var. monticola*, and *Liriodendron tulipifera*. The shrub layer is sparse. The herb layer is sparse to moderate, decreasing with vine coverage. Herbaceous composition varies from site to site but is typical of mesic forests in the area. Some of the more common species from the sampled areas in Great Smoky Mountains National Park are *Ageratina altissima var. altissima, Amphicarpaea bracteata, Arisaema triphyllum ssp. triphyllum, Polystichum acrostichoides, Sanguinaria canadensis*, and *Viola* spp. Beneath the vine canopy, coarse woody debris and tip-up mounds are typical.
Global Dynamics: The dynamics of this community are poorly understood. It apparently originates from disturbance, such as an ice or wind storm; and can persist for decades. This community can range in size from less than a hectare to ten hectares. All areas sampled showed evidence of disturbance by wind, ice, or logging.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (9-Sep-2015). This is an uncommon community. It is of limited extent within its range and its occurrence could be limited by specific disturbance regimes.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This vineland is expected to occur in the AT corridor in the Southern Appalachians.
Global Classification Comments: This community is important for wildlife, especially bears. In the Great Smoky Mountains, forests previously occupying sites that support this community are mesic forest types, such as cove forests or mesic forest dominated by chestnut oak and red oak. Forests on steep, mesic sites may be more susceptible to treefall and gap formation.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This vineland is expected to occur in the AT corridor in the Southern Appalachians.
Global Range: This community is known from the Great Smoky Mountains of North Carolina and Tennessee and the Cumberland Mountains of Tennessee and Kentucky.

A3116 *Quercus rubra - Quercus alba* Montane Forest Alliance

Alliance Summary Description: This alliance includes *Quercus rubra*-dominated forest vegetation of high elevations (over 1070 m [3500 feet]), as well as more restricted vegetation of montane landscapes dominated by *Quercus alba*, in the Central and Southern Appalachians. A closed to very open canopy has trees that are often gnarled and stunted, especially on ridge crests. *Quercus rubra* is often the only canopy tree, but other species may have minor importance, including *Acer rubrum, Betula alleghaniensis, Betula lenta, Crataegus flabellata*, and *Crataegus punctata*. *Quercus alba* is a significant component of forests at high elevations in Virginia's Ridge and Valley and at the lower elevations of associations in the Southern Blue Ridge. Forests in this alliance have variable physiognomies, ranging from open herb-dominated understories to understories dominated by dense ericaceous shrubs. If a subcanopy is present, typical species include canopy species plus *Acer pensylvanicum, Amelanchier arborea, Halesia tetraptera, Hamamelis virginiana*, and *Ilex montana*. The shrub stratum is dominated by *Kalmia latifolia*, occurring as patches or with continuous cover (>25%). In some parts of this forest's range, *Gaylussacia ursina* is dominant in the often dense low-shrub stratum. In forests with little or no shrub cover, herbaceous cover is dense and diverse, composed of sedges, ferns, and tall herbs, with dominance varying within and among occurrences. Where shrub cover is dense, the herbaceous stratum is not diverse and is typically very sparse with scattered forbs. Forests typically occur over well-drained, loamy soils underlain by Precambrian gneisses, schists, and granites. Soils supporting these forests tend to have relatively high base status. Forests occur on most of the major mountain ranges of the Southern Appalachians at elevations of 1070-1525 m (3500-5000 feet) on broad

ridges, mid to upper slope positions, and on steep rocky slopes at the heads of coves. Forests are also known from the central (on granitic crests) and Northern Blue Ridge (on middle to upper convex slopes) and in the northern Ridge and Valley. Damage by ice storms is probably the most common form of natural disturbance in these montane forests.

[CEGL008506] *Quercus rubra - (Quercus alba) / Ilex montana / Dennstaedtia punctilobula - Lysimachia quadrifolia* Forest

Translated Name: **Northern Red Oak - (White Oak) / Mountain Holly / Eastern Hay-scented Fern - Whorled Yellow Loosestrife Forest**

Common Name: **Central Appalachian Northern Red Oak Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra* - *Quercus alba* Montane Forest Alliance (A3116)

Element Concept

Global Summary: This community type is known primarily from both the Northern Blue Ridge and Ridge and Valley provinces in the southern part of the Central Appalachians. Stands are restricted to elevations above 915 m (3000 feet). Prevailing aspect varies, but most examples are located on gentle to only moderately steep ridge crests and upper slopes. Soils are frequently bouldery and moderately to strongly infertile, with low base status. *Quercus rubra* is the principal dominant species in the overstory, with *Quercus alba* as a frequent but usually low-cover associate, often in a subcanopy layer. Canopy trees often exhibit stunted growth and sparse cover; the stature of these so-called "red oak orchards" reflects the harsh conditions of frequent wind and destructive ice storms. The abundance of *Castanea dentata* in the understory suggests its former importance in stands of this type. In localized stands, *Quercus velutina* or *Tsuga canadensis* share overstory dominance with *Quercus rubra*. The shrub layer is generally sparse to patchy, although a less common variant contains a dense ericaceous shrub layer. Composition of the herb layer varies considerably and usually features patch-dominance by one or more ferns and graminoids.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This high-elevation northern red oak forest occurs on gentle to moderately steep ridge crests and upper slopes and is restricted to elevations above 915 m (3,000 feet). It was sampled at seven locations in the Central Appalachians in northern Virginia. Sites range from gentle to somewhat steep upper slopes and summits with westerly, northerly and southerly aspects. Soils are well-drained silt loam and loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Evidence of disturbance includes wind/ice damage, grazing/browsing, gypsy moth damage, chestnut blight, fire, and the presence of exotic plant species.

Global Environment: Stands are primarily restricted to elevations above 915 m (3000 feet). Prevailing aspect varies, but most examples are located on gentle to only moderately steep ridge crests and upper slopes. Soils are frequently bouldery and moderately to strongly infertile, with low base status. In the Blue Ridge, stands are underlain by mafic and felsic parent material, including metabasalt, layered pyroxene granulite, charnockite, and charnockite gneiss. The Ridge and Valley stands occur on a complex of clastic sedimentary and metasedimentary formations. Most stands likely experience frequent high winds and ice damage. The composition and structure of nearly all examples of this community type in Virginia have been altered by logging in the late 19th and early 20th centuries and by the loss of *Castanea dentata* as an important component in the 1930s.

Vegetation Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus rubra* dominates the canopy with up to 75% cover. Canopy and subcanopy associates include *Acer rubrum, Betula lenta, Prunus serotina, Tsuga canadensis*, and/or *Quercus velutina*. The sparse to patchy shrub layer includes *Acer pensylvanicum, Ilex montana, Kalmia latifolia, Rubus allegheniensis var. allegheniensis, Ribes rotundifolium, Castanea dentata*, and/or *Hamamelis virginiana*. *Deschampsia flexuosa, Dennstaedtia punctilobula, Carex pensylvanica*, and *Lysimachia quadrifolia* are characteristic in the herb layer. This community lacks species from the Southern Appalachians.

Global Vegetation: *Quercus rubra* is the principal dominant species in the overstory, with *Quercus alba* as a frequent but usually low-cover associate, often in a subcanopy layer. Many stands have a stunted, somewhat open canopy. The abundance of *Castanea dentata* in the understory suggests its former importance in stands of this type. Tree associates in the canopy and subcanopy can include *Acer rubrum, Betula alleghaniensis, Betula lenta, Prunus serotina, Tsuga canadensis, Quercus velutina*, and *Quercus prinus*, which is mostly restricted to elevations lower than those at which this type prevails. The shrub layer is generally sparse to patchy; *Acer pensylvanicum, Ilex montana, Kalmia latifolia, Castanea dentata*, and *Hamamelis virginiana* are the most frequent species. Other tall shrubs occurring with lower cover and/or frequency include *Ribes rotundifolium, Rubus allegheniensis, Rhododendron prinophyllum, Corylus cornuta var. cornuta*, and *Prunus virginiana*. *Vaccinium pallidum* and *Vaccinium stamineum* are infrequent low shrubs, but sometimes comprise 10% or more of the herb layer. An uncommon variant of this community type, usually occupying sharply convex landforms with soils shallow to bedrock, contains a dense shrub layer composed largely of *Kalmia latifolia*. Herbaceous composition varies considerably and usually features patch-dominance by one or more of the following: *Dennstaedtia punctilobula, Carex pensylvanica, Lysimachia quadrifolia*, and *Deschampsia flexuosa*. *Calamagrostis porteri* is a patch-dominant grass in a very small percentage of stands. Other characteristic herbs of this community are *Ageratina altissima, Agrostis perennans, Amianthium muscitoxicum, Aralia nudicaulis, Asclepias exaltata, Dioscorea quaternata, Eurybia divaricata (= Aster divaricatus), Hieracium paniculatum, Maianthemum canadense, Pedicularis canadensis, Potentilla canadensis, Prenanthes altissima, Prenanthes trifoliolata, Smilax herbacea, Solidago arguta var. arguta*, and *Solidago curtisii*. Many additional herbs occur at low cover and constancy. Species richness of plot-sampled stands ranges from 13 to 62 taxa per 400 square meters (mean = 40).

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Poa compressa* (High/Low), *Rumex acetosella* (Medium/Low), *Taraxacum officinale*
Global: Vulnerable Plants: *Aconitum reclinatum* (G3), *Gentiana austromontana* (G3), *Poa saltuensis* (G5, VA state-rare)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (24-Feb-2010). This type appears to be limited to a small geographic area of approximately 16 counties and approximately 20,000 square kilometers in northwestern Virginia and adjacent West Virginia. Within that region, it is restricted to the highest ridges, where habitats are patchy. If this type is found to be more widespread in West Virginia, Maryland, and/or Pennsylvania, a revision of the global rank may be warranted.

RELATED CONCEPTS

Global Similar Types:

- *Quercus rubra - Carya ovata - Fraxinus americana / Actaea racemosa - Hydrophyllum virginianum* Forest (CEGL008518) higher diversity, more fertile soils, and a significant component of *Carya*.
- *Quercus rubra / (Vaccinium simulatum, Rhododendron calendulaceum) / (Dennstaedtia punctilobula, Thelypteris noveboracensis)* Forest (CEGL007300) is the Southern Appalachian analogue, with a similar environmental setting and composition, but containing a component of distinctly Southern Appalachian species such as *Galax urceolata, Rhododendron calendulaceum, Vaccinium erythrocarpum, Vaccinium simulatum*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Along the AT, this community is known only from higher elevation areas of the Northern Blue Ridge north of Roanoke, such as the Peaks of Otter and Apple Orchard Mountain / Thunder Ridge. It is very similar to Southern Appalachian High-Elevation Red Oak Forest (Deciduous Shrub Type) (CEGL007300) but lacks all of the Southern Appalachian species.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: The Salt Pond Mountain - Potts Mountain area above Mountain Lake (across the valley from Peters Mountain) in Virginia has typical Southern Appalachian High-Elevation Red Oak Forest (Deciduous Shrub Type) (CEGL007300). Shortly north of there, all of the characteristic Southern Appalachian plants such as *Vaccinium erythrocarpum* and *Rhododendron calendulaceum* drop out, and *Quercus rubra* stands further north in Virginia change to Central Appalachian Northern Red Oak Forest (CEGL008506).
Global Classification Comments: The most constant (≥60%) woody species in 53 samples classified as this association, in order of descending constancy, are *Quercus rubra, Acer pensylvanicum, Ilex montana, Prunus serotina var. serotina, Betula lenta, Quercus alba, Kalmia latifolia, Castanea dentata*, and *Hamamelis virginiana*. The most constant herbaceous species are *Dennstaedtia punctilobula, Lysimachia quadrifolia, Dioscorea quaternata, Carex pensylvanica, Prenanthes altissima*, and *Solidago curtisii*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is known from near Roanoke north to Shenandoah National Park in Virginia. Plots in the AT corridor exist from Shenandoah National Park's Hightop Mountain, Hogback Mountain, Marys Rock, Pollack Knob, and Thunder Hill.
Global Range: This type appears to be limited to a small geographic area of approximately 16 counties and approximately 20,000 square kilometers in northwestern Virginia and adjacent West Virginia. Within that region, it is restricted to the highest ridges, where habitats are patchy. If this type is found to be more widespread in West Virginia, Maryland, and/or Pennsylvania, a revision of the global rank may be warranted.

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra* - *Quercus alba* Montane Forest Alliance (A3116)

Element Concept

Global Summary: This community occurs on most of the major mountain ranges of the Southern Appalachians at elevations of 1070-1646 m (3500-5400 feet) on ridges and mid to upper slopes, commonly with southern and southeastern exposures. Outliers occur in the southern part of the Central Appalachians, on the highest ridges of the Ridge and Valley and Blue Ridge in southwest Virginia. This montane community includes forest vegetation with *Quercus rubra* making up at least 75% of the tree canopy and with greater than 20% shrub cover, which may be continuous to patchy. More than 50% of the total shrub cover is evergreen, although deciduous shrubs may be present. Typical shrub dominants include *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron maximum*. The herbaceous stratum is not diverse and is typically very sparse with scattered forbs and woody seedlings, including *Galax urceolata, Solidago curtisii (= Solidago caesia var. curtisii), Epigaea repens, Dennstaedtia punctilobula, Conopholis americana, Thelypteris noveboracensis, Clintonia umbellulata, Eurybia divaricata (= Aster divaricatus)*, and *Dioscorea villosa*. On exposed sites this community commonly contains acidic rock outcrop communities and montane shrublands as inclusions, and may grade into forests dominated by *Tsuga caroliniana, Pinus rigida, Pinus pungens*, and *Quercus prinus*. At higher elevations, this forest often occurs adjacent to, or grades into, forests dominated by *Picea rubens, Abies fraseri*, or northern hardwood species (*Aesculus flava, Betula alleghaniensis, Fagus grandifolia,*).

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This high-elevation Southern Appalachian northern red oak forest occurs from 1,070-1,525 m (3,500-5,000 feet) elevation on broad ridges and mid to upper slopes with variable exposures. Outliers occur in the southern part of the Central Appalachians, on the highest ridges of the Ridge and Valley and Blue Ridge in southwest Virginia.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation red oak forest occurs higher than 1,065 m (3,500 feet) in the Southern Blue Ridge and occurs on upper gentle to steep slopes, ridges and summits. Soils are moderately well- to well-drained silt loam and loam. The unvegetated surface is dominated by leaf litter with some rocks and downed wood. Evidence of disturbance includes wind/ice damage, and the presence of exotic plant species.

Global Environment: This community occurs on most of the major mountain ranges of the Southern Appalachians at elevations of 1070-1646 m (3500-5400 feet) on ridges and mid- to upper-slope positions, commonly with south and southeast exposures. Outliers occur in the southern part of the Central Appalachians, on the highest ridges of the Ridge and Valley and Blue Ridge in southwest Virginia. DeLapp (1978) found that this community type occurs on most slope aspects but was most commonly found on southeast and south exposures. Of the 13 plot samples from the Appalachian Trail classification project, 60% were on crests and interfluves; the remaining samples had variable slope exposures (Fleming and Patterson 2009a). This community occurs over well-drained soils underlain by Precambrian gneisses, schists and granites. These soils are classified as Typic, Umbric, or Lithic Dystrochrepts, and Typic Haplumbrepts (Golden 1974). Soils supporting this forest with a mainly evergreen shrub understory are slightly more acidic than *Quercus rubra*-dominated forests with deciduous shrub understories (DeLapp 1978).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus rubra* dominates the tree canopy with greater than 75% cover, and *Acer rubrum* dominates the subcanopy. The shrub layer, which may be continuous to patchy, is dominated by evergreen shrubs including *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron maximum*. The herb layer is sparse, but *Galax urceolata* is usually present.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is largely dominated by *Quercus rubra* (usually greater than 75%); additional common and/or abundant trees may include *Acer rubrum, Nyssa sylvatica, Prunus serotina, Quercus alba*, and *Tsuga canadensis*. The dense shrub layer is dominated by ericaceous species *Kalmia latifolia, Rhododendron calendulaceum, Rhododendron maximum*, and *Vaccinium corymbosum*. The herb layer is generally sparse, but *Galax urceolata* is ubiquitous. In addition, this community supports NC-state imperiled *Lonicera canadensis*, GA-state critically imperiled *Sibbaldiopsis tridentata* and *Sorbus americana*, and GA-state-imperiled *Prunus pensylvanica*.
Global Vegetation: Stands of this montane community of the Southern Appalachians are dominated by *Quercus rubra* which makes up at least 75% of the tree canopy. Stands typically have greater than 20% shrub cover, which may be continuous to patchy. More than 50% of the total shrub cover is evergreen, although deciduous shrubs may be present. Typical shrub dominants include *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron maximum*. The herbaceous stratum is not diverse and is typically very sparse with scattered forbs and woody seedlings, including *Galax urceolata, Solidago curtisii (= Solidago caesia var. curtisii), Epigaea repens, Dennstaedtia punctilobula, Conopholis americana, Thelypteris noveboracensis, Clintonia umbellulata, Eurybia divaricata (= Aster divaricatus)*, and *Dioscorea villosa*. Many species in this community are endemic to the Southern Blue Ridge or have the bulk of their worldwide range in that region. Some of these endemic species include *Abies fraseri, Aesculus flava, Ageratina altissima var. roanensis, Euphorbia purpurea, Leucothoe recurva, Prenanthes roanensis, Rhododendron catawbiense, Rhododendron vaseyi, Silene ovata*, and *Solidago curtisii*.
Global Dynamics: The canopy is probably rarely removed completely by natural disturbance; however, small canopy gaps are caused by individual tree death. Occurrences of this community on exposed slopes and south- and west-facing ridges are subject to lightning-caused fires and damage by ice and wind. Damage by icestorms is probably the most common form of natural disturbance. *Quercus rubra* reproduction and survival are optimal in canopy gaps with little regeneration under the forest canopy, hence these forests will eventually succeed to forests with mixed canopy composition of *Quercus rubra, Betula alleghaniensis, Acer rubrum*, and *Fagus grandifolia*. Many *Quercus rubra*-dominated stands of today were, prior to the chestnut blight in the 1930s, dominated or codominated by *Castanea dentata* with scattered *Quercus rubra* and *Acer rubrum* in the canopy (Golden 1974). The fungus *Endothia parasitica* eliminated *Castanea dentata* in the upper canopy, subsequently releasing the subcanopy *Quercus rubra*, which eventually resulted in a nearly pure upper canopy of large *Quercus rubra*.

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (4-Jan-2000). This community is uncommon but not rare. It is secure within its range.

RELATED CONCEPTS

Global Similar Types:
- *Quercus alba / Kalmia latifolia* Forest (CEGL007295)
- *Quercus prinus - Quercus rubra / Rhododendron maximum / Galax urceolata* Forest (CEGL006286)
- *Quercus rubra / (Vaccinium simulatum, Rhododendron calendulaceum) / (Dennstaedtia punctilobula, Thelypteris noveboracensis)* Forest (CEGL007300) has greater than 20% shrub cover but with more than 50% of the shrub cover composed of deciduous species.
- *Quercus rubra / Carex pensylvanica - Ageratina altissima var. roanensis* Forest (CEGL007298) has less than 20% shrub cover and a herb stratum dominated by ferns, tall forbs, and sedges.
- *Quercus rubra / Rhododendron catawbiense - Rhododendron arborescens* Woodland (CEGL004503) occurs at higher elevations, in more extreme environments, sometimes adjacent to CEGL007299.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Soils collected from plots of this group in the Southern Appalachians have extraordinarily low manganese values. Red oak forests with dense *Rhododendron catawbiense* shrub layers that occur in the Apple Orchard Mountain - Thunder Hill region of the Northern Blue Ridge in Virginia are placed here, even though considerably disjunct from the stands south of Virginia. However, this type has been poorly inventoried in southwest Virginia and likely occurs somewhere on the Southern Blue Ridge or higher ridges of the Ridge and Valley.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: No plots were sampled in the Central Appalachian project area; however, this community is known to occur there (G. Fleming pers. comm.).
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Soils collected from plots of this group have extraordinarily low Mn values. This type has been poorly inventoried in southwest Virginia and likely occurs somewhere on the Southern Blue Ridge or higher ridges of the Ridge and Valley.

Global Classification Comments: This community includes forest vegetation with *Quercus rubra* making up at least 75% of the tree canopy and with greater than 20% shrub cover. More than 50% of the total shrub cover is evergreen, although deciduous shrubs may be present. Typical evergreen shrub species in this community include *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron maximum*. The most constant species (>60%) in 13 plots classified as this association from North Carolina, Tennessee and Virginia, in order of descending constancy, are *Quercus rubra, Kalmia latifolia, Rhododendron maximum, Acer rubrum, Ilex montana, Galax urceolata, Castanea dentata, Tsuga canadensis, Rhododendron calendulaceum*, and *Prunus serotina var. serotina* (Fleming and Patterson 2009a).

Two varieties of *Quercus rubra* occur within the range of this community, *Quercus rubra var. ambigua* and *Quercus rubra var. rubra* (Kartesz 1999). Although the two varieties are known to occur together (Rohrer 1983), *Quercus rubra var. ambigua* occurs mostly at elevations greater than 1000 m (3300 feet), while *Quercus rubra var. rubra* occurs at elevations less than 1000 m (3300 feet) (Weakley 1997). The two varieties are based upon morphological differences in the leaves and acorns (Fernald 1950, Coker and Totten 1945); however, studies of foliar flavonoid composition in different *Quercus rubra* populations suggest that varietal distinction may not be warranted (McDougal and Parks 1984). Even though most studies of *Quercus rubra*-dominated vegetation do not distinguish *Quercus rubra* at the varietal level, it is likely, given the elevation range of this community, that the dominant species in this forest is *Quercus rubra var. ambigua*.

Similar *Quercus rubra*-dominated forests occur in the southern Appalachian Mountains. Forests with less than 75% *Quercus rubra* in the canopy are classified in other forest alliances. In Georgia this type occurs on the north side of Rabun Bald, where it grades into *Quercus rubra / Rhododendron catawbiense - Rhododendron arborescens* Woodland (CEGL004503) in more extreme areas.

Element Distribution

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is common in the Southern Appalachians, with outliers occurring in the southern part of the Central Appalachians, on the highest ridges of the Ridge and Valley and Blue Ridge in southwestern Virginia.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: All occurrences along the AT are from the Great Smoky Mountains and south. This community was sampled in Georgia, including Chattahoochee National Forest, and in North Carolina on Nantahala National Forest at Albert Mountain, Big Spring Gap, Little Lodgepole Mountain, Standing Indian Mountain, Wayah Bald, Wine Spring Bald, and Yellow Mountain.
Global Range: This community occurs on most of the major mountain ranges of the Southern Appalachians in North Carolina, Tennessee, Georgia, and Virginia. This community could possibly range into South Carolina.

Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra* - *Quercus alba* Montane Forest Alliance (A3116)

Element Concept

Global Summary: This community includes forest vegetation with *Quercus rubra* making up at least 75% of the tree canopy and with greater than 20% shrub cover, which may be continuous to patchy. More than 50% of the total shrub cover is deciduous, although evergreen shrubs may be present. Typical shrub dominants include *Rhododendron calendulaceum, Vaccinium simulatum, Vaccinium erythrocarpum, Ilex montana, Gaylussacia ursina, Rubus canadensis, Corylus cornuta*, and *Lyonia ligustrina*. The herbaceous stratum is diverse and is predominantly a mix of sedges, ferns, and tall herbs, including *Ageratina altissima var. roanensis, Athyrium filix-femina ssp. asplenioides, Clintonia umbellulata, Collinsonia canadensis, Conopholis americana, Dennstaedtia punctilobula, Dioscorea villosa, Eurybia divaricata (= Aster divaricatus), Laportea canadensis, Lysimachia quadrifolia, Medeola virginiana, Monarda fistulosa, Oclemena acuminata (= Aster acuminatus), Potentilla canadensis, Prenanthes roanensis, Silene stellata, Solidago curtisii (= Solidago caesia var. curtisii),* and *Thelypteris noveboracensis*. Herbaceous dominance varies within and between occurrences. This community occurs on most of the major mountain ranges of the Southern Appalachians at elevations of 1070-1525 m (3500-5000 feet) on broad ridges and mid to upper slope positions, commonly with southeastern and southern exposures. At higher elevations this forest often occurs adjacent to or grades into forests dominated by *Picea rubens, Abies fraseri*, or northern hardwood species such as *Aesculus flava, Betula alleghaniensis,* and *Fagus grandifolia*. In some areas, this community is found adjacent to montane shrublands and grasslands. At low elevations, on dry sites, this community may grade into forests dominated by a mixture of *Quercus* species.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This high-elevation northern red oak community occurs from 1,070-1,525 m (3,500-5,000 feet) elevation on broad ridges and mid to upper slopes with mostly northern and western aspects but any are possible. Soils are mesic to dry-mesic, moderately well- to well-drained loam, sandy loam, clay loam, and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional (sometimes significant) large rocks. Evidence of disturbance includes past logging and chestnut blight damage.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation red oak community is found at elevations above 1,065 m (3,500 feet). It occurs on upper slopes, ridges and summits with primarily northern and western aspects. Soils are mesic to dry-mesic, moderately well- to well-drained loam, sandy loam, clay loam, and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional (sometimes significant) large rocks. Evidence of disturbance includes past logging and chestnut blight damage.

Global Environment: This community occurs at elevations of 1070-1525 m (3500-5000 feet) on broad ridges and mid- to upper-slope positions. DeLapp (1978) found that this community occurs on most slope aspects but was most commonly found on southeast and south exposures. Of the 43 plot samples from the Appalachian Trail classification project, about half are on crests and interfluves; the remaining samples have variable slope exposures (Fleming and

Patterson 2009a). This community occurs over well-drained soils underlain by Precambrian gneisses, schists and granites. These soils are classified as Typic, Umbric, or Lithic Dystrochrepts, and Typic Haplumbrepts (Golden 1974). Soils supporting this forest with a mainly deciduous shrub understory are slightly less acidic than *Quercus rubra*-dominated forests with evergreen shrub understories (DeLapp 1978).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is largely dominated by *Quercus rubra* (usually greater than 75% but as low as 50%), lacks *Carya* species, but sometimes has substantial amounts of *Quercus prinus*. Additional common tree species include *Acer pensylvanicum, Acer rubrum, Betula lenta, Magnolia acuminata*, and *Quercus alba*. The shrub layer is mainly deciduous (although evergreen species may be present) and includes *Amelanchier laevis, Castanea dentata, Ilex montana, Rhododendron calendulaceum, Vaccinium erythrocarpum*, and *Vaccinium simulatum*. The herb layer is generally sparse but diverse; *Clintonia umbellulata, Conopholis americana, Dennstaedtia punctilobula, Dioscorea quaternata, Medeola virginiana, Prenanthes altissima, Solidago curtisii, Thelypteris noveboracensis*, and *Uvularia puberula* are common.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is largely dominated by *Quercus rubra* (usually greater than 75% but as low as 50%), and lacks *Carya* species, but sometimes has substantial amounts of *Quercus prinus*. Additional common tree species include *Acer pensylvanicum, Acer rubrum, Betula lenta, Magnolia acuminata*, and *Quercus alba*. The shrub layer is mainly deciduous (although evergreen species may be present) and includes *Amelanchier laevis, Castanea dentata, Ilex montana, Rhododendron calendulaceum, Vaccinium erythrocarpum*, and *Vaccinium simulatum*. The herb layer is generally sparse but diverse; *Clintonia umbellulata, Conopholis americana, Dennstaedtia punctilobula, Dioscorea quaternata, Medeola virginiana, Prenanthes altissima, Solidago curtisii, Thelypteris noveboracensis*, and *Uvularia puberula* are common. This community also supports TN-state imperiled *Stachys clingmanii* (also considered globally imperiled), *Dichanthelium latifolium, Polygonatum biflorum var. commutatum*, and *Stenanthium gramineum var. micranthum*.

Global Vegetation: This forest is dominated by *Quercus rubra* with other species making up less than 25% of the canopy cover. Other canopy and subcanopy trees may include *Acer pensylvanicum, Acer rubrum, Amelanchier laevis, Betula alleghaniensis, Betula lenta, Castanea dentata* (root sprouts), *Fagus grandifolia, Halesia tetraptera, Hamamelis virginiana, Ilex montana, Magnolia acuminata*, and, on more exposed sites, *Quercus prinus*. At higher elevations, this community may contain *Picea rubens*. The shrub layer may be continuous to patchy but has at least 20% cover and more than 50% of the total shrub cover is deciduous, although evergreen shrubs may be present. Typical shrub dominants include *Rhododendron calendulaceum, Vaccinium simulatum, Vaccinium erythrocarpum, Hamamelis virginiana, Ilex montana, Gaylussacia ursina, Rubus canadensis, Corylus cornuta*, and *Lyonia ligustrina*. In Virginia examples, *Vaccinium erythrocarpum* often occurs as a very low, clonal shrub, only a few inches tall. Other shrubs occur with lower frequency and may include *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron maximum*. *Rubus allegheniensis* occurs in disturbed openings and in seeps. The herbaceous stratum is diverse and is predominantly a mix of sedges, ferns and tall herbs. Herbaceous dominance varies within and among occurrences. Typical herbaceous species include *Ageratina altissima var. roanensis, Athyrium filix-femina ssp. asplenioides, Clintonia umbellulata, Collinsonia canadensis, Conopholis americana, Dennstaedtia punctilobula, Dichanthelium latifolium, Dioscorea quaternata, Eurybia divaricata (= Aster divaricatus), Houstonia purpurea, Laportea canadensis, Lysimachia quadrifolia, Medeola virginiana, Monarda fistulosa, Oclemena acuminata (= Aster acuminatus), Potentilla canadensis, Prenanthes roanensis, Smilax herbacea, Silene stellata, Solidago curtisii (= Solidago caesia var. curtisii)*, and *Thelypteris noveboracensis*. Many species in this community are endemic to the Southern Blue Ridge or have the bulk of their worldwide range in that region. Some of these endemics include *Abies fraseri, Aesculus flava, Ageratina altissima var. roanensis, Carex roanensis, Clethra acuminata, Euphorbia purpurea, Leucothoe recurva, Prenanthes roanensis, Rhododendron catawbiense, Rhododendron vaseyi, Silene ovata, Solidago curtisii*, and *Vaccinium erythrocarpum*.

Global Dynamics: The canopy is probably rarely removed completely by natural disturbance however, small canopy gaps are caused by individual tree death. Occurrences of this community on exposed slopes and south- and west-facing ridges are subject to lightning-caused fires and damage by ice and wind. Damage by icestorms is probably the most common form of natural disturbance.

Quercus rubra reproduction and survival are optimal in canopy gaps with little regeneration under the forest canopy, hence these forests will eventually succeed to forests with mixed canopy composition of *Quercus rubra, Betula alleghaniensis, Acer rubrum*, and *Fagus grandifolia*. Many *Quercus rubra*-dominated stands of today were, prior to the chestnut blight in the 1930s, dominated or codominated by *Castanea dentata* with scattered *Quercus rubra* and *Acer rubrum* in the canopy (Golden 1974). The fungus *Endothia parasitica* eliminated *Castanea dentata*

in the upper canopy, subsequently releasing the subcanopy *Quercus rubra*, which eventually resulted in a nearly pure upper canopy of large *Quercus rubra*.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Castanea dentata* (G4, TN state-imperiled), *Dichanthelium latifolium* (G5, NC state-imperiled), *Polygonatum biflorum* var. *commutatum* (G5T5, TN state-imperiled), *Stachys clingmanii* (G2, globally imperiled & TN-state critically imperiled), *Stenanthium gramineum* var. *micranthum* (G4G5TNR, NC state-imperiled)
Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Calystegia catesbeiana* (G3), *Carex roanensis* (G2G3, Southern Blue Ridge endemic), *Chelone cuthbertii* (G3, Southern Blue Ridge endemic), *Coreopsis latifolia* (G3), *Delphinium exaltatum* (G3), *Euphorbia purpurea* (G3, Southern Blue Ridge endemic), *Gentiana austromontana* (G3), *Helianthus glaucophyllus* (G3G4), *Hypericum mitchellianum* (G3), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Rhododendron vaseyi* (G3, NC/Southern Blue Ridge endemic), *Robinia viscosa* var. *hartwegii* (G3T2), *Silene ovata* (G3, Southern Blue Ridge endemic), *Stachys clingmanii* (G2), *Trillium simile* (G3), *Vaccinium*

hirsutum (G3); **Other Plants**: *Aesculus flava* (G5, Southern Blue Ridge endemic), *Botrychium lanceolatum* var. *angustisegmentum* (G5T4), *Calamagrostis porteri* (G4), *Clematis occidentalis* (G5), *Clethra acuminata* (G4, Southern Blue Ridge endemic), *Helianthemum bicknellii* (G5), *Helianthemum propinquum* (G4), *Leucothoe recurva* (G4G5, Southern Blue Ridge endemic), *Lonicera dioica* (G5), *Prunus virginiana* (G5), *Pyrola americana* (G5), *Rhododendron catawbiense* (G5, Southern Blue Ridge endemic), *Rhododendron prinophyllum* (G5), *Solidago curtisii* (G4G5, Southern Blue Ridge endemic), *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (31-Dec-1997). This community is uncommon but not rare. It is secure within its range.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba / Kalmia latifolia* Forest (CEGL007295)
- *Quercus rubra - (Quercus alba) / Ilex montana / Dennstaedtia punctilobula - Lysimachia quadrifolia* Forest (CEGL008506) is a Central Appalachian high-elevation red oak forest.
- *Quercus rubra - Acer rubrum / Pyrularia pubera / Thelypteris noveboracensis* Forest (CEGL006192)
- *Quercus rubra / (Kalmia latifolia, Rhododendron catawbiense, Rhododendron maximum) / Galax urceolata* Forest (CEGL007299) has greater than 20% shrub cover but with more than 50% of the shrub cover composed of evergreen species.
- *Quercus rubra / Carex pensylvanica - Ageratina altissima var. roanensis* Forest (CEGL007298) has less than 20% shrub cover and an herb stratum dominated by ferns, tall forbs, and sedges.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: These are high-elevation red oak forests with a deciduous shrub layer and abundant fern cover. Virginia examples in the southern part of the mapping area are compositionally similar to those further south, but often have relatively high cover of very low, clonal *Vaccinium erythrocarpum*, a few inches tall. Whether this is due to excessive deer browse or some other factor is hard to assess.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: The Salt Pond Mountain - Potts Mountain area above Mountain Lake (across the valley from Peters Mountain) in Virginia has typical Southern Appalachian High-Elevation Red Oak Forest (Deciduous Shrub Type) (CEGL007300). Shortly north of there, all of the characteristic Southern Appalachian plants such as *Vaccinium erythrocarpum* and *Rhododendron calendulaceum* drop out, and *Quercus rubra* stands further north in Virginia become Central Appalachian Northern Red Oak Forest (CEGL008506).
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: High-elevation red oak forests with a deciduous shrub layer and abundant fern cover. Virginia examples in the northern part of the study area are compositionally similar to those further south, but often have relatively high cover of very low, clonal *Vaccinium erythrocarpum* a few inches tall. Whether this is due to excessive deer browse or some other factor is very hard to assess.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: This community has less diverse canopies than cove forests.
Global Classification Comments: This community includes forest vegetation with *Quercus rubra* making up at least 75% of the tree canopy and with greater than 20% shrub cover. More than 50% of the total shrub cover is deciduous, although evergreen shrubs may be present. Typical deciduous shrub species in this community include *Rhododendron calendulaceum, Vaccinium simulatum, Vaccinium erythrocarpum, Ilex montana, Gaylussacia ursina, Rubus canadensis, Corylus cornuta*, and *Lyonia ligustrina*. The most constant species (≥70%) in 43 plot samples classified as this association from North Carolina, Tennessee, and Virginia, in descending order of constancy, are *Quercus rubra, Acer rubrum, Castanea dentata, Acer pensylvanicum, Rhododendron calendulaceum, Thelypteris noveboracensis, Dioscorea quaternata, Medeola virginiana, Ilex montana*, and *Dennstaedtia punctilobula* (Fleming and Patterson 2009a).

Two varieties of *Quercus rubra* occur within the range of this community, *Quercus rubra var. ambigua* and *Quercus rubra var. rubra* (Kartesz 1999). Although the two varieties are known to occur together (Rohrer 1983), *Quercus rubra var. ambigua* occurs mostly at elevations greater than 1000 m (3300 feet), while *Quercus rubra var. rubra* occurs at elevations less than 1000 m (3300 feet) (Weakley 1997). The two varieties are based upon

morphological differences in the leaves and acorns (Fernald 1950, Coker and Totten 1945); however, studies of foliar flavonoid composition in different *Quercus rubra* populations suggest that varietal distinction may not be warranted (McDougal and Parks 1984). Even though most studies of *Quercus rubra*-dominated vegetation do not distinguish *Quercus rubra* at the varietal level, it is likely, given the elevational range of this community, that the dominant species in this forest is *Quercus rubra var. ambigua*.

Similar vegetation may occur in the Cumberland Mountains (Black Mountain, Cumberland Mountain, Kentucky); for more information, see Braun (1950) and Black Mountain paper (Braun 1940). Kentucky occurrences lack *Gaylussacia ursina, Corylus cornuta, Prenanthes roanensis*, and occur at 1067 to 1160 m (3500-3800 feet) elevation (M. Evans pers. comm.).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from the Southern Blue Ridge north into southwestern Virginia. The northernmost known stand on the AT is on Kelly Knob in Craig County, Virginia, west of Roanoke. It is abundant on Salt Pond Mountain and Potts Mountain above Mountain Lake in Giles County. It was sampled in Virginia at Angels Rest, Garden Mountain, Glade Mountain, Kelly Knob, Locust Mountain, Lone Pine Peak, Pearis Mountain West, Pine Swamp Branch, and Potts Mountain.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: Locally common along the AT in most high-elevation parts of the Southern Blue Ridge, this community was sampled at 32 locations in the park in North Carolina, Tennessee and Virginia. Sites include, in North Carolina, Great Smoky Mountains National Park (Doe Knob, Greer Knob), Nantahala National Forest (Little Lodgepole Mountain, Standing Indian Mountain, Wayah Bald, Wine Spring Bald, and Yellow Mountain); in Tennessee, Great Smoky Mountains National Park; and in Virginia at Bobby's Ridge and Hurricane Mountain.
Global Range: This community occurs on most of the major mountain ranges of the Southern Appalachians in North Carolina, Tennessee, Georgia, and Virginia. It may possibly range into Kentucky's Cumberland Mountains and into West Virginia.

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra* - *Quercus alba* Montane Forest Alliance (A3116)

Element Concept

Global Summary: This community occurs on most of the major mountain ranges of the Southern Appalachians in North Carolina and Tennessee, at elevations over 1400 m (4500 feet) on broad ridges, and on steep rocky slopes at the heads of coves, often with northern or southeastern aspects. It includes forest vegetation with a closed to very open canopy, where *Quercus rubra* makes up at least 75% of the tree canopy and with less than 20% shrub cover. Canopy trees may be gnarled and stunted, especially on ridge crests. Other canopy species may include *Acer rubrum, Crataegus punctata, Crataegus flabellata, Betula alleghaniensis, Betula lenta*, and, at high elevations, *Picea rubens*. An open subcanopy contains canopy species plus *Hamamelis virginiana, Amelanchier arborea, Acer pensylvanicum, Halesia tetraptera*, and *Ilex montana*. Herbaceous cover is dense and diverse, composed of sedges, ferns, and tall herbs, with dominance varying within and between occurrences. Typical herbaceous dominants include *Carex pensylvanica, Ageratina altissima var. roanensis, Thelypteris noveboracensis, Dennstaedtia punctilobula, Eurybia chlorolepis (= Aster chlorolepis), Oclemena acuminata (= Aster acuminatus)*, and *Laportea canadensis*. This forest often occurs adjacent to or grades into forests dominated by *Picea rubens, Abies fraseri*, or northern hardwood species (*Betula alleghaniensis, Fagus grandifolia, Aesculus flava)*. In some areas, this community is found adjacent to montane shrublands and grasslands. This community is often referred to as a "Subalpine Oak Orchard Forest."

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation northern red oak forest occurs above 1,065 m (3,500 feet) in North Carolina and 945 m (3,100 feet) in Virginia. It is found on moderate to steep upper slopes, ridges and summits with mostly western aspects. Soils are mesic to dry-mesic, moderately well- to well-drained loam and silt loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional large/small rocks. Evidence of disturbance includes past logging and hemlock woolly adelgid damage. Stands can be stunted, reduced in height by harsh weather.
Global Environment: This community occurs at elevations over 1400 m (4500 feet) on broad ridges and on steep rocky slopes at the heads of coves, often with north or southeast aspects. Occurrences of this community on exposed slopes and south- and west-facing ridges are subject to lightning-caused fires and damage by ice and wind. Damage by ice storms is probably the most common form of natural disturbance. This community occurs over well-drained, loamy soils underlain by Precambrian gneisses, schists, and granites. These soils are classified as Typic, Umbric, or Lithic Dystrochrepts, and Typic Haplumbrepts (Golden 1974). Soils supporting this community tend to have relatively high base status.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is largely dominated by *Quercus rubra* (usually greater than 75%) and lacks *Carya* species. Additional common and/or abundant trees may include *Acer rubrum, Acer saccharum, Betula alleghaniensis, Fraxinus americana*, and *Prunus serotina*. Shrubs are generally sparse and insignificant. Herbs include *Carex pensylvanica, Danthonia compressa, Dennstaedtia punctilobula, Eupatorium purpureum, Eurybia chlorolepis, Laportea canadensis, Lysimachia quadrifolia, Oclemena acuminata, Solidago curtisii*, and *Thelypteris noveboracensis*. In addition, this community supports TN-state critically imperiled *Angelica atropurpurea* and TN-state imperiled *Ageratina altissima var. roanensis* and *Eupatorium steelei*.
Global Vegetation: This community includes forest vegetation, with a closed to very open canopy, where *Quercus rubra* makes up at least 75% of the tree canopy and with less than 20% shrub cover. Canopy trees may be gnarled and stunted, especially on ridge crests. Other canopy species may include *Acer rubrum, Crataegus punctata,*

Crataegus flabellata, Betula alleghaniensis, Betula lenta, and, at high elevations, *Picea rubens*. An open subcanopy contains canopy species plus *Hamamelis virginiana, Amelanchier arborea, Acer pensylvanicum, Halesia tetraptera*, and *Ilex montana*. Herbaceous cover is dense and diverse, composed of sedges, ferns, and tall herbs, with dominance varying within and among occurrences. Typical herbaceous dominants include *Carex pensylvanica, Ageratina altissima var. roanensis, Thelypteris noveboracensis, Dennstaedtia punctilobula, Eurybia chlorolepis (= Aster chlorolepis), Oclemena acuminata (= Aster acuminatus)*, and *Laportea canadensis*. Many species in this community are endemic to the Southern Blue Ridge or have the bulk of their worldwide range in that region. Some of these endemics include *Abies fraseri, Aesculus flava, Ageratina altissima var. roanensis, Carex roanensis, Clethra acuminata, Euphorbia purpurea, Leucothoe recurva, Prenanthes roanensis, Rhododendron catawbiense, Rhododendron vaseyi, Silene ovata, Solidago curtisii (= Solidago lancifolia)*, and *Vaccinium erythrocarpum*.
Global Dynamics: The canopy is probably rarely removed completely by natural disturbance; however, small canopy gaps are caused by individual tree death. Occurrences of this community on exposed slopes and south- and west-facing ridges are subject to lightning-caused fires and damage by ice and wind. Damage by ice storms is probably the most common form of natural disturbance.

Quercus rubra reproduction and survival is optimal in canopy gaps with little regeneration under the forest canopy, hence these forests will eventually succeed to forests with mixed canopy composition of *Quercus rubra, Betula alleghaniensis, Acer rubrum*, and *Fagus grandifolia*. Many *Quercus rubra*-dominated stands of today were, prior to the chestnut blight in the 1930s, dominated or codominated by *Castanea dentata* with scattered *Quercus rubra* and *Acer rubrum* in the canopy (Golden 1974). The fungus *Endothia parasitica* eliminated *Castanea dentata* in the upper canopy, subsequently releasing the subcanopy *Quercus rubra*, which eventually resulted in a nearly pure upper canopy of large *Quercus rubra*.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4, TN state-imperiled), *Angelica atropurpurea* (G5, TN state-critically imperiled), *Eupatorium steelei* (G4, NC state-imperiled); **Invasive/Exotic Plants**: *Convallaria majalis*
Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Calystegia catesbeiana* (G3), *Carex roanensis* (G2G3, Southern Blue Ridge endemic), *Coreopsis latifolia* (G3), *Euphorbia purpurea* (G3, Southern Blue Ridge endemic), *Gentiana austromontana* (G3), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Rhododendron vaseyi* (G3, NC/Southern Blue Ridge endemic), *Silene ovata* (G3, Southern Blue Ridge endemic); **Other Plants**: *Aesculus flava* (G5, Southern Blue Ridge endemic), *Botrychium lanceolatum* var. *angustisegmentum* (G5T4), *Calamagrostis porteri* (G4), *Clematis occidentalis* (G5), *Clethra acuminata* (G4, Southern Blue Ridge endemic), *Helianthemum bicknellii* (G5), *Helianthemum propinquum* (G4), *Leucothoe recurva* (G4G5, Southern Blue Ridge endemic), *Lonicera dioica* (G5), *Prunus virginiana* (G5), *Pyrola americana* (G5), *Rhododendron catawbiense* (G5, Southern

Blue Ridge endemic), *Rhododendron prinophyllum* (G5), *Solidago curtisii* (G4G5, Southern Blue Ridge endemic), *Streptopus lanceolatus var. roseus* (G5T4), *Vaccinium erythrocarpum* (G5, Southern Blue Ridge endemic)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (30-Apr-1998). This community is relatively secure within its range, but has a naturally restricted habitat. Red oak decline is affecting occurrences of this community; fire may be needed for stand establishment.

RELATED CONCEPTS

Global Similar Types:

- *Crataegus punctata - Crataegus flabellata* Ruderal Forest (CEGL004184)
- *Quercus rubra / (Kalmia latifolia, Rhododendron catawbiense, Rhododendron maximum) / Galax urceolata* Forest (CEGL007299) has greater than 20% shrub cover but with more than 50% of the shrub cover composed of evergreen species.
- *Quercus rubra / (Vaccinium simulatum, Rhododendron calendulaceum) / (Dennstaedtia punctilobula, Thelypteris noveboracensis)* Forest (CEGL007300) has greater than 20% shrub cover but with more than 50% of the shrub cover composed of deciduous species.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Some examples may have a *Crataegus* (hawthorn) understory [see Southern & Central Appalachian Ruderal Hawthorn Forest (CEGL004184) for *Crataegus*-dominated stands].
Global Classification Comments: This community includes forest vegetation with *Quercus rubra* making up at least 75% of the tree canopy and with less than 20% shrub cover. Herbaceous stratum dominance varies within and among occurrences but is composed of sedges, ferns and tall herbs. Typical herbaceous dominants include *Carex pensylvanica, Ageratina altissima var. roanensis, Thelypteris noveboracensis, Dennstaedtia punctilobula, Eurybia chlorolepis, Oclemena acuminata*, and *Laportea canadensis*. In three plots classified as this association in the Appalachian Trail classification project, herbs present in all samples are *Angelica triquinata, Carex pensylvanica, Clintonia umbellulata, Smilax herbacea, Solidago curtisii*, and *Thelypteris noveboracensis*. Woody species with 100% constancy are *Acer rubrum, Acer pensylvanicum, Ilex montana, Prunus serotina var. serotina*, and *Quercus rubra* (Fleming and Patterson 2009a).

Two varieties of *Quercus rubra* occur within the range of this community, *Quercus rubra var. ambigua* and *Quercus rubra var. rubra* (Kartesz 1999). Although the two varieties are known to occur together (Rohrer 1983), *Quercus rubra var. ambigua* occurs mostly at elevations greater than 1000 m (3300 feet), while *Quercus rubra var. rubra* occurs at elevations less than 1000 m (3300 feet) (Weakley 1997). The two varieties are based upon morphological differences in the leaves and acorns (Fernald 1950, Coker and Totten 1945); however, studies of foliar flavonoid composition in different *Quercus rubra* populations suggest that varietal distinction may not be warranted (McDougal and Parks 1984). Even though most studies of *Quercus rubra*-dominated vegetation do not distinguish *Quercus rubra* at the varietal level, it is likely, given the elevational range of this community, that the dominant species in this forest is *Quercus rubra var. ambigua*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was documented in North Carolina and Hughes Gap in Pisgah National Forest in Tennessee.
Global Range: This community occurs on most of the major mountain ranges of the Southern Appalachians in North Carolina and Tennessee.

A0624 *Quercus rubra - Quercus prinus* Woodland Alliance

Alliance Summary Description: This alliance includes woodland communities occurring on acidic, talus slopes or rocky slopes of higher elevations (e.g., from 300-800 m [1000-2620 feet] in New England and to 1370 m [4500 feet] in West Virginia). *Quercus rubra* is sometimes dominant but usually occurs in association with *Acer rubrum, Betula lenta, Quercus alba, Quercus prinus*, and others. Canopies are often stunted. The shrub layer may include, in the northern part of the range, *Acer spicatum, Hamamelis virginiana, Kalmia latifolia, Rhus typhina*, and *Sambucus racemosa var. racemosa (= Sambucus racemosa ssp. pubens)*, while in the southern part of the range, *Gaylussacia ursina, Leucothoe recurva, Menziesia pilosa, Rhododendron arborescens, Rhododendron calendulaceum, Rhododendron catawbiense, Rhododendron maximum, Vaccinium simulatum*, and *Viburnum nudum var. cassinoides* are more typical. Herbs include *Aralia nudicaulis, Carex pensylvanica, Corydalis sempervirens, Deschampsia flexuosa, Maianthemum canadense, Oclemena acuminata (= Aster acuminatus), Polypodium virginianum*, and *Pteridium aquilinum var. latiusculum*. This vegetation is known from the Appalachian Mountains, from New York and New England, south to the Blue Ridge of North Carolina. Soils are shallow and acidic.

[CEGL006565] *Betula lenta - Quercus prinus / Parthenocissus quinquefolia* Woodland

Translated Name: **Sweet Birch - Chestnut Oak / Virginia Creeper Woodland**
Common Name: **Sweet Birch - Chestnut Oak Talus Woodland**

Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra* - *Quercus prinus* Woodland Alliance (A0624)

ELEMENT CONCEPT

Global Summary: This talus or rocky slope woodland community occurs in the central Appalachian Mountains and extends west to the Western Allegheny Plateau in Pennsylvania. The substrate is generally quartzite or sandstone talus. Sites are usually steeply sloping, but the type also sometimes occurs on gentler benches and ridge crests. Soils, where present, are shallow, organic, acidic and infertile. The canopy is of variable cover but generally open with gnarled, widely spaced trees. Characteristic trees are birches, primarily *Betula lenta* but less frequently including *Betula papyrifera, Betula populifolia*, or *Betula alleghaniensis*, as well as *Nyssa sylvatica*. Other tree associates may include *Tsuga canadensis, Acer rubrum, Carya glabra, Quercus prinus, Quercus alba, Quercus rubra, Quercus velutina*, or *Quercus coccinea*. Typical shrubs include *Acer spicatum, Acer pensylvanicum, Amelanchier arborea, Castanea dentata, Kalmia latifolia, Hamamelis virginiana, Menziesia pilosa, Ribes rotundifolium, Vaccinium angustifolium, Vitis* spp., *Toxicodendron radicans, Smilax rotundifolia*, and *Parthenocissus quinquefolia*. Ferns characterize the herb layer and may include *Dryopteris marginalis, Polypodium virginianum, Woodsia obtusa*, or *Asplenium platyneuron*. The forbs *Aralia nudicaulis, Heuchera* spp., and *Scutellaria saxatilis* are also well-adapted to the bouldery habitats. Lichens, especially the rock-tripes *Lasallia papulosa* and *Umbilicaria mammulata* and the foliose species *Flavoparmelia baltimorensis*, characterize the nonvascular layer.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This dry, acidic boulderfield or sandstone talus slope woodland occurs on substrates of fractured rock from 100 to 1,025 m (300-3,360 feet) elevation. It was sampled at nine locations in the Central Appalachian project area. Sites are generally somewhat steep to steep upper slopes with mostly northwestern or variable slopes depending on location. Soils are dry to xeric, rapidly drained sand and sandy loam, where there is soil development. The unvegetated surface consists of large blocky quartzite outcrops many with near-vertical faces, interrupted by sections of large colluvium which collect at bases of the outcrops. Leaf litter, downed wood, and bare soil are also common. Bryophytes may cover up to 30% of the rock surface. Evidence of disturbance includes past fire, past logging, erosion in the form of debris slides, trails, and gypsy moth damage.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This dry, acidic boulderfield or sandstone talus slope woodland occurs on substrates of fractured rock from 336-462 m (1,104-1,515 feet) elevation along the Pennsylvania-New Jersey-New York borders. It can have low vegetation cover and high rock cover. It was sampled at Culvers Gap South and High Point South in New Jersey and Bellvale Mountain North in New York in the Lower New England project area. The sites are dry, steep to somewhat steep, mid and upper slopes or rock outcrops with rapidly drained sandy loam soil. The unvegetated surface consists of large rocks (often lichen-covered) and leaf litter, with small amounts of exposed bedrock and downed wood.

Global Environment: Sites include the edges of very large, unvegetated (except for lichens), scarcely weathered block fields, as well as a variety of more weathered boulderfields and slopes covered by coarse to fine, bouldery colluvium. Much of the bouldery rubble is weathered from resistant quartzite or sandstone caprock. The elevation range of plot-sampled stands in Virginia is 100 to 1025 m (300-3360 feet). Slope position and aspect are variable, while associated landforms include landslide scarps, slide masses, concave hollow heads, and incised hollow bottoms. Mean cover of exposed boulders at Virginia sampling sites is 72%. In this very rocky environment, soil is limited to local, interstitial, root-rich duff deposits, or to "pads" of moss and underlying, thin, organic / sandy material that have developed on wide, flat boulder surfaces. Interstitial air spaces between boulders may be prevalent for 1.0 m or more below the surface. Soils are largely organic and usually extremely acidic and infertile. There is often some heterogeneity of boulder depth and weathering, as well as of microclimate and soil moisture, within boulderfields. In general, sites are somewhat xeric and show little evidence of subsurface drainage. However, this regime is ameliorated by higher elevations and north aspects, which probably slow evaporation and increase the moisture-holding capacity of the bouldery substrate.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: Physiognomy varies from nearly closed forest to very sparse woodland; gnarled and usually stunted *Betula lenta, Quercus prinus*, and/or *Quercus rubra* are characteristic of the open woodland canopy. Other common tree species may include *Prunus serotina, Pinus strobus, Sassafras albidum* and/or *Acer rubrum*. *Hamamelis virginiana* is a common tall shrub, and *Vaccinium pallidum* a common short shrub. *Parthenocissus quinquefolia* is a characteristic vine and *Aralia nudicaulis* is a common herb. *Polypodium virginianum* covers rocks and loose colluvium along with dense lichen cover. In addition, this community supports VA-state critically imperiled *Cornus canadensis* and VA-state imperiled *Betula papyrifera var. cordifolia*.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: Gnarled specimens of *Betula lenta, Quercus prinus*, and/or *Quercus rubra* are characteristic canopy species. *Hamamelis virginiana, Sorbus americana*, and/or *Kalmia latifolia* are common tall shrubs, and *Vaccinium pallidum* is a common dwarf-shrub. *Parthenocissus quinquefolia* is a characteristic vine, *Polypodium virginianum* a characteristic fern. High lichen cover is typical. In addition, this community supports NJ state-imperiled *Sorbus americana*.

Global Vegetation: Physiognomy varies from nearly closed forest to open woodland with widely spaced trees. The canopy is dominated by more-or-less gnarled specimens of *Betula lenta* and *Quercus prinus* generally <20 m tall. *Betula lenta* is usually the sole dominant of less weathered, steeper, more unstable boulderfield habitats, while a greater variety of trees is often codominant with *Betula lenta* on more weathered and stable habitats. Other overstory associates that may be important on some sites are *Quercus rubra, Nyssa sylvatica, Betula populifolia, Betula papyrifera var. cordifolia, Carya glabra, Tsuga canadensis*, and *Betula alleghaniensis*. The presence of well-preserved, fallen boles indicates that *Castanea dentata* was important on some boulderfields prior to the arrival of chestnut blight (Fleming and Moorhead 2000). *Acer rubrum* and *Nyssa sylvatica* are scattered canopy associates and frequent understory species. The typically open shrub layer contains *Acer pensylvanicum, Acer spicatum, Amelanchier arborea, Castanea dentata* sprouts, *Hamamelis virginiana, Ilex montana, Kalmia latifolia, Menziesia pilosa* (at the southern end of the range), and *Ribes rotundifolium*. The ground layer consists almost entirely of low-

statured shrubs, particularly *Menziesia pilosa* and *Vaccinium angustifolium*, and/or scattered to abundant vines of *Parthenocissus quinquefolia, Vitis* spp., *Toxicodendron radicans*, and *Smilax rotundifolia*. True herbs are very sparse and restricted to mossy pockets or flat boulders; typical species are *Dryopteris marginalis, Polypodium appalachianum, Deschampsia flexuosa*, and *Danthonia spicata*. In the southern portion of the range, *Heuchera* spp. and *Scutellaria saxatilis* are characteristic herbs. Bryophyte cover ranges up to 65% in some microhabitats. The rock-tripes *Lasallia papulosa* and *Umbilicaria mammulata*, and the foliose species *Flavoparmelia baltimorensis*, are generally the most conspicuous lichens. The combination of surficial boulder cover and nutrient-poor substrate results in a notably low mean species richness (n = 24 taxa per 400 square meters) in Virginia and Maryland plot samples of this type.

Global Dynamics: This boulderfield woodland represents a long-term sere in the geomorphic and vegetational progression from exposed, lichen-dominated block fields to fully forested mountain slopes with well-developed mineral soils. In addition to edaphic stresses, trees of these habitats are subject to frequent damage from wind and ice storms. This community often occurs in patch-mosaics with open, lichen-covered boulderfields that lack vascular plants. Boundaries between the boulderfield woodlands and adjacent forests are often obscure, with composition gradually changing along with substrate conditions and soil depth. This type frequently intergrades with several communities of the Mixed Oak / Heath Forests group, especially *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057) of somewhat sheltered, often very rocky slopes. In Virginia, this association reaches optimal development on sideslopes of linear sandstone and quartzite strike ridges in the Ridge and Valley, and on the western, metasedimentary flank of the northern Blue Ridge. Landsliding and debris avalanches, which generate and regenerate boulderfield environments, are dominant erosional processes in these landscapes (Hack and Goodlett 1960).

Appalachian National Scenic Trail (Lower New England Project Area): Vulnerable Plants: *Sorbus americana* (G5, NJ state-imperiled)

Global: Vulnerable Plants: *Betula papyrifera* var. *cordifolia* (G5T5, VA state-rare), *Gymnocarpium appalachianum* (G3), *Heuchera americana* var. *hispida* (G5T3?), *Scutellaria saxatilis* (G3); **Other Plants**: *Hamamelis virginiana* (G5)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (23-May-2011). Although this community type occurs in small patches over a limited geographic range, there are probably more than 200 sites (if not many hundreds of sites) in Virginia and West Virginia alone. Moreover, stands occupy rugged habitats that are not prone to anthropogenic disturbances.

RELATED CONCEPTS

Global Similar Types:

- *Betula alleghaniensis - Quercus rubra / Polypodium virginianum* Woodland (CEGL006584)
- *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057) of somewhat sheltered, often very rocky slopes.
- *Quercus rubra - Betula lenta / Polypodium virginianum* Woodland (CEGL006585)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Often occurs adjacent to Central Appalachian-Northern Piedmont Chestnut Oak Forest (CEGL006299) in the Central Appalachians.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: It occurs locally in quartzite areas along the length of the Northern Blue Ridge in Virginia (south to near Roanoke) and forms very large patches on many of the linear Ridge and Valley sandstone strike ridges between the New River and Roanoke. However, the AT is generally located on crests and in areas where you would be unlikely to encounter this type. South of Shenandoah National Park, there are plots near the AT in the James River Face Wilderness (Rockbridge County, Virginia).
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Examples of this community in New Jersey and New York are very rocky with large talus blocks with high bryophyte/lichen cover. Many have dense young *Betula lenta* in the subcanopy.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This vegetation type is broadly defined and exhibits considerable geographic and elevational variation. It is also poorly represented by plot data, and additional sampling is needed, particularly of lower elevation and south-slope stands. Even with limited data, potential variants of the type in Virginia were proposed by Fleming and Moorhead (2000). A variant of sheltered north slopes in which *Tsuga canadensis* is codominant with *Betula lenta* and/or *Quercus* spp. has been reported from Virginia by Hupp (1983) and from Pennsylvania by Fike (1999), but may be referable to bouldery variants of *Tsuga canadensis - Quercus prinus - Betula lenta* Forest (CEGL006923). Many Virginia populations of the state-rare, northern tree *Betula papyrifera var. cordifolia* are associated with this community type.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is found throughout the Central Appalachians from the Blue Ridge and Ridge and Valley sections of Pennsylvania, Virginia, West Virginia, and Maryland, extending northeast to the Pennsylvania-New Jersey border. It was sampled in Shenandoah National Park in Virginia, in Washington County, Maryland, and in Cumberland and Franklin counties, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Culvers Gap South and High Point South in New Jersey and at Bellvale Mountain North, New York.
Global Range: This community occurs locally throughout the Blue Ridge and Ridge and Valley sections of Pennsylvania, Virginia, West Virginia, and Maryland, extending northeast to the Pennsylvania-New Jersey border and New York.

Common Name: **Central Appalachian Xeric Shale Woodland (Chestnut Oak / Mixed Herbs Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra* - *Quercus prinus* Woodland Alliance (A0624)

ELEMENT CONCEPT

Global Summary: The known range of this vegetation type includes the extreme northern end of the Southern Blue Ridge, the western flank of the Northern Blue Ridge, and the Ridge and Valley region of Virginia and Maryland. The likely global range encompasses the entire Central Appalachian extent of these provinces in Virginia, West Virginia, Maryland, and Pennsylvania. Stands are generally confined to low elevations, up to about 840 m (2760 feet), but exceptionally to 1100 m (3600 feet). Habitats are mostly steep, south- to west-facing, middle to upper slopes with abundant shale outcrops, loose stones, and exposed mineral soils. However, substrates appear to be relatively stable and lack the ongoing erosional processes of shale barrens, which these habitats often border on the landscape. Slope shape is typically convex in at least one direction. Site moisture potential is very low. This community is an open to very open woodland dominated by *Quercus prinus*. Overstory trees are often stunted and gnarled. *Quercus rubra* and *Carya glabra* are constant, usually minor canopy associates that attain codominance with *Quercus prinus* locally. *Pinus virginiana* is an important canopy associate in some situations, but is entirely absent from other stands of the type. Understory tree layers are sparse, consisting mostly of younger reproduction of the canopy species. *Quercus ilicifolia, Vaccinium stamineum*, and *Vaccinium pallidum* are the chief species of a patchy shrub layer, which may also include *Rosa carolina, Amelanchier arborea*, and *Viburnum rafinesquianum*. *Quercus ilicifolia* usually forms open colonies in this community type, rather than the dense thickets characteristic in pyrophytic pine-oak/heath vegetation. The herb layer is typically quite patchy and sparse but contains a surprising diversity of xerophytic graminoids and forbs.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This Central Appalachian xeric shale woodland occurs on steep south- to west-facing, mid to upper slopes with abundant outcrops at low elevations, up to about 840 m (2,760 feet) in the shale barrens of the Central Appalachians. It was sampled once in the park at 491 m on a steep southwest-facing midslope with rapidly drained soil. The unvegetated

surface contains exposed bedrock, small rocks and leaf litter. Disturbances include past fires, trails and a nearby road.

Global Environment: With the exception of one site underlain by Tuscarora quartzite, plot-sampling locations are underlain by Devonian and Ordovician shales or Cambrian metashale, metasiltstone, and phyllite of the Hampton and Harper's Formations. Stands are generally confined to low elevations, up to about 840 m (2760 feet), but exceptionally reach 1100 m (3600 feet). Habitats are mostly steep (mean in plots = 23°), south to west-facing, middle to upper slopes with abundant outcrops, loose stones, and exposed mineral soils. However, substrates appear to be relatively stable and lack the ongoing erosional processes of shale barrens, which these habitats often border on the landscape. Slope shape is typically convex in at least one direction. Site moisture potential is very low. Soils are shallow, extremely acidic (mean pH = 4.4), with low calcium and magnesium levels, and high levels of iron and aluminum.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This woodland is codominated by *Quercus prinus* and *Pinus virginiana*. *Pinus strobus* is common in the canopy. *Smilax glauca* and *Smilax rotundifolia* are characteristic vines. *Quercus ilicifolia* is characteristic in the shrub layer. Other common shrubs include *Diospyros virginiana, Rhus copallinum, Vaccinium pallidum*, and *Vaccinium stamineum*. A patchy to moderately dense herbaceous understory is dominated by *Carex pensylvanica, Coreopsis verticillata, Danthonia spicata, Solidago bicolor*, and *Schizachyrium scoparium*.

Global Vegetation: This community is an open to very open woodland dominated by *Quercus prinus*. Overstory trees are often stunted and gnarled. *Quercus rubra* and *Carya glabra* are constant, usually minor canopy associates that attain codominance with *Quercus prinus* locally. *Pinus virginiana* is an important canopy associate in some situations, but is entirely absent from other stands of the type. Understory tree layers are sparse, consisting mostly of younger reproduction of the canopy species. *Quercus ilicifolia, Vaccinium stamineum*, and *Vaccinium pallidum* are the chief species of a patchy shrub layer, which may also include *Rosa carolina, Amelanchier arborea*, and *Viburnum rafinesquianum*. *Quercus ilicifolia* usually forms open colonies in this community type, rather than the dense thickets characteristic in pyrophytic pine-oak/heath vegetation. The herb layer is typically quite patchy and sparse, but contains a surprising diversity of xerophytic graminoids and forbs. The most characteristic herbs are *Danthonia spicata, Carex pensylvanica, Solidago bicolor, Houstonia longifolia, Hieracium greenii, Symphyotrichum undulatum (= Aster undulatus), Potentilla canadensis, Penstemon canescens*, and *Polygonatum biflorum*. Species that are less constant but locally important include *Paronychia montana, Parthenium integrifolium, Silene caroliniana ssp. pensylvanica, Aureolaria laevigata, Coreopsis major, Campanula divaricata, Solidago erecta, Cunila origanoides, Antennaria virginica, Phlox latifolia, Helianthus laevigatus*, and *Liatris pilosa (= Liatris graminifolia)*. Scattered individuals of shale barren endemics such as *Packera antennariifolia (= Senecio antennariifolius)* and *Clematis albicoma* occasionally occur in this community, particularly where stands border well-developed shale barrens, but are not characteristic. Species richness of plot-sampled stands ranges from 16 to 64 taxa per 400 square meters (mean = 33).

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Buckleya distichophylla* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3? (24-Feb-2010). The known range of this shale woodland includes the extreme northern end of the Southern Blue Ridge, the western flank of the Northern Blue Ridge, and the Ridge and Valley region of Virginia and Maryland. This community is probably more widespread than documented, although still fairly range-limited, and forms large patches in some shale landscapes. It is of likely occurrence in West Virginia and Pennsylvania.

RELATED CONCEPTS

Global Similar Types:

- *Pinus rigida - Quercus prinus / Gaylussacia baccata / Carex pensylvanica* Woodland (CEGL004821)
- *Pinus virginiana - Quercus prinus / Quercus ilicifolia / (Hieracium greenii, Viola pedata)* Woodland (CEGL008525) is a *Pinus virginiana*-dominated shale woodland with very sparse understory and herb layers, and dense colonies of *Cladonia* spp. on the soil surface; one of the most barren of shale communities.
- *Pinus virginiana / Vaccinium pallidum / Schizachyrium scoparium - Carex pensylvanica* Woodland (CEGL003624) is a *Pinus virginiana*-dominated shale woodland of the Southern Appalachians.
- *Quercus prinus - Pinus virginiana - (Pinus pungens) / Schizachyrium scoparium - Dichanthelium depauperatum* Woodland (CEGL008540) is a more diverse mixed woodland associated with sandstone, siltstone, and other non-shale outcrops.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is associated with shale landscapes from Craig County, Virginia, through Maryland and possibly into Pennsylvania. It is rare along the AT north of Roanoke due to the lack of shale substrates over most of its length.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: This community type is floristically similar to *Pinus virginiana - Quercus prinus / Quercus ilicifolia / (Hieracium greenii, Viola pedata)* Woodland (CEGL008525) but differs in the dominance of hardwoods (versus *Pinus virginiana*) and in its much greater herbaceous diversity and overall species richness (n = 33 versus 15 per 400 square meters). Edaphic stresses are probably the most important ecological factor maintaining this woodland, but many stands have undoubtedly been influenced by periodic fires as well, which may account for some of the compositional differences with CEGL008525. Although soil samples collected from plots of both community types were similar in pH and base status, we suspect that differences in soil fertility, texture, and/or stability may also distinguish these types. More intensive study of the environmental differences between the two units is warranted. In a regional analysis (1134 plots from Georgia, North Carolina, Tennessee, Virginia) for the Southern Appalachian portion of the Appalachian Trail, a small group of nine plots was classified as this association (Fleming and Patterson 2009a). This association is represented by a total of 18 plots (12 Virginia, 6 Maryland).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is found in the shale barrens of the Central Appalachians (along and near the AT in Craig, Bedford, and Rockbridge counties, Virginia); it is endemic to the Ridge and Valley region, and absent along the AT north of Roanoke due to the lack of shale substrates over most of its length. The only AT site sampled is at Trout Creek in Craig County, Virginia.
Global Range: The known range of this community includes the extreme northern end of the Southern Blue Ridge, the western flank of the Northern Blue Ridge, and the Ridge and Valley region of Virginia and Maryland. The likely global range encompasses the entire Central Appalachians extent of these provinces in Virginia, West Virginia, Maryland, and Pennsylvania.

Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra* - *Quercus prinus* Woodland Alliance (A0624)

ELEMENT CONCEPT

Global Summary: This association consists of variably structured vegetation occurring on harsh, steep, unstable shale talus and cliffs from New Jersey to Vermont. Physiognomy ranges from woodland to shrubland to herbaceous, with areas of very sparse vegetation. Heat, drought and lack of soil development prevent the establishment of many species and limit the community to crevice-rooting herbaceous plants and widely scattered small trees and shrubs. Vegetation cover is variable and patchy. Typical tree species include *Quercus prinus, Pinus strobus*, and *Juniperus virginiana*. Shrubs include scattered *Vaccinium pallidum, Rhus typhina, Rhus glabra, Gaylussacia baccata*, and *Amelanchier arborea*. The herbaceous layer ranges from absent to nearly 30% cover in patches, and consists of drought-tolerant graminoids such as *Deschampsia flexuosa, Carex pensylvanica*, and *Danthonia spicata*, as well as drought-tolerant forbs such as *Comandra umbellata, Solidago arguta, Baptisia tinctoria*, and *Tephrosia virginiana*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This bouldery woodland occurs on unstable shale talus with shallow, very well-drained loamy soils. It was sampled once in New York in the Lower New England project area. The site is a steep southeast-facing lower slope at 183 m (600 feet) elevation. Large slabs of lichen-covered bedrock and boulders are exposed at the surface. Soil is very shallow and is developed mainly in cracks between boulders or in exposed bedrock. The unvegetated surface consists of leaf litter, with small amounts of exposed bedrock and large/small rocks.
Global Environment: Unstable shale talus with shallow, very well-drained soils occurring on harsh, steep, unstable slopes and cliffs from New Jersey to Vermont.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is dominated by *Carya glabra* and *Fraxinus americana* along with *Carya ovata, Juniperus virginiana*, and *Quercus prinus*. *Acer pensylvanicum* dominates the understory. Herbs include *Anthoxanthum odoratum* (exotic), *Carex albursina*, and *Carex swanii*.
Global Vegetation: *Quercus prinus, Pinus strobus*, and *Juniperus virginiana* form the canopy. Shrubs include scattered *Vaccinium pallidum, Rhus typhina, Rhus glabra, Gaylussacia baccata*, and *Amelanchier arborea*. The herbaceous layer ranges from absent to nearly 30% cover in patches, and consists of drought-tolerant graminoids such as *Deschampsia flexuosa, Carex pensylvanica*, and *Danthonia spicata*, as well as drought-tolerant forbs such as *Comandra umbellata, Solidago arguta, Baptisia tinctoria*, and *Tephrosia virginiana*.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (23-May-2011). Approximately 80 occurrences occupying 12 square km (2910 acres) are estimated rangewide. This vegetation has a somewhat limited range in four states. Although the steep slopes and unstable substrate supporting this vegetation do not attract developers, some degradation is likely to be caused by any development occurring on ridgetops. In addition, large cliffs overtopping scree slopes in general are attractive to rock climbers who can cause trampling of this fragile vegetation.

Alliance	*Quercus rubra - Quercus prinus* Woodland Alliance (A0624)

Element Concept

Global Summary: This dry, acidic oak woodland occurs on rocky upper slopes and summits from New England south to the highest peaks in West Virginia. Typical settings are low- to mid-elevation summits and south-facing, upper slopes. Elevations of known occurrences range from near sea level to about 610 m (0-2000 feet) in New England, and to 1370 m (4500 feet) in West Virginia. Soils are shallow, well-drained, acidic, nutrient-poor gravels and coarse sands, often with prominent exposed bedrock. Canopy cover is variable, ranging from open and patchy to closed depending on site conditions. It overtops a dwarf-shrub layer that is frequently extensive and a sparse tall-shrub layer. Herb cover is patchy and variable. Bryoid cover is minor, scattered patches on the rocky substrate. The canopy is dominated by scattered, often stunted *Quercus rubra* with minor associates depending on geography and often including *Quercus velutina, Quercus prinus, Betula populifolia, Betula papyrifera, Betula lenta*, and *Acer rubrum* or *Quercus coccinea* in more coastal regions. *Quercus rubra* tends to be the only oak at the northern end of the range. *Pinus strobus, Pinus rigida*, or other conifers may be present, but only in minor amounts. The dwarf-shrub layer is strongly dominated by heaths, especially *Vaccinium angustifolium, Vaccinium pallidum, Vaccinium myrtilloides*, and *Gaylussacia baccata* with *Gaylussacia frondosa, Comptonia peregrina*, and *Kalmia angustifolia* also common. Tall shrubs may include *Quercus ilicifolia, Hamamelis virginiana, Amelanchier* spp., and *Prunus pensylvanica*. The herbaceous layer is composed of *Deschampsia flexuosa, Danthonia spicata, Carex lucorum, Pteridium aquilinum, Comandra umbellata, Melampyrum lineare, Polygala paucifolia, Epigaea repens, Gaultheria procumbens*, and *Aralia nudicaulis*. The bryophyte layer includes *Polytrichum commune, Leucobryum glaucum*, and others.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This oak / heath woodland or forest occurs on rocky upper slopes and low- to mid-elevation summits, and ranges from the Central Appalachians north through the Northern Appalachians. Elevations range from 375-567 m (1,235-1,860 feet) in New England. Sites are steep to somewhat steep upper slopes and summits (rock outcrops) with mostly northern and southern aspects. Soils are dry rapidly drained to well-drained sandy loam and loam. The unvegetated surface consists of leaf litter, with variable amounts of exposed bedrock, large/small rocks and downed wood. Evidence of disturbance includes the presence of exotic plants.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This red oak woodland occurs on rocky upper slopes and summits from New England south to the highest peaks in West Virginia. Typical settings are low- to mid-elevation summits and south-facing, upper slopes. Elevations of known occurrences range from near sea level to about 610 m (0-2,000 feet) in New England, and to 1370 m (4,500 feet) in West Virginia. Soils are shallow, well-drained, acidic, nutrient-poor gravels and coarse sands, often with prominent exposed bedrock.

Global Environment: This red oak woodland occurs on rocky upper slopes and summits from New England south to the highest peaks in West Virginia. Typical settings are low- to mid-elevation summits and south-facing, upper slopes. Elevations of known occurrences range from near sea level to about 610 m (0-2000 feet) in New England, and to 1370 m (4500 feet) in West Virginia. Soils are shallow, well-drained, acidic, nutrient-poor gravels and coarse sands, often with prominent exposed bedrock.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Quercus rubra* is dominant or codominant with *Quercus prinus, Quercus velutina*, and/or *Acer rubrum*; *Pinus* spp. and *Betula* spp. may be present. *Castanea dentata, Amelanchier laevis*, and *Sassafras albidum* are characteristic understory species. Canopies are often composed of stunted individuals. *Quercus ilicifolia, Vaccinium angustifolium, Vaccinium*

pallidum, and/or *Gaylussacia baccata* dominate the shrub layer. *Deschampsia flexuosa, Danthonia spicata, Cypripedium acaule, Aralia nudicaulis*, and *Pteridium aquilinum* are characteristic in the herb layer.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The open and patchy canopy overtops a sparse tall-shrub layer, and the dwarf-shrub layer is frequently extensive. Herb cover is patchy and variable. Bryoid cover is minor, scattered patches on the rocky substrate. The canopy is dominated by scattered, often stunted *Quercus rubra* with minor associates depending on geography and often including *Quercus velutina, Quercus prinus, Betula populifolia, Betula papyrifera, Betula lenta*, and *Acer rubrum* with *Quercus coccinea* in more coastal regions. *Pinus strobus, Pinus rigida*, or other conifers may be present, but only in minor amounts. Bryoid cover is minor, scattered patches on the rocky substrate. The canopy is dominated by scattered, often stunted *Quercus rubra* with minor associates depending on geography and often including *Quercus velutina, Quercus prinus, Betula populifolia, Betula papyrifera, Betula lenta*, and *Acer rubrum* with *Quercus coccinea* in more coastal regions. *Pinus strobus, Pinus rigida*, or other conifers may be present, but only in minor amounts. The dwarf-shrub layer is strongly dominated by heaths, especially *Vaccinium angustifolium, Vaccinium pallidum, Vaccinium myrtilloides*, and *Gaylussacia baccata* with *Gaylussacia frondosa, Comptonia peregrina*, and *Kalmia angustifolia* also common. Tall shrubs may include *Quercus ilicifolia, Hamamelis virginiana, Amelanchier* spp., and *Prunus pensylvanica*. The herbaceous layer is composed of *Deschampsia flexuosa, Danthonia spicata, Carex lucorum, Pteridium aquilinum, Comandra umbellata, Melampyrum lineare, Polygala paucifolia, Epigaea repens, Gaultheria procumbens*, and *Aralia nudicaulis*. The bryophyte layer includes *Polytrichum commune, Leucobryum glaucum*, and others.
Global Dynamics: Droughty soils and increased light on the forest floor due to relatively open canopy allow drier species to predominate. Fire may be necessary to maintain *Quercus rubra* over time at more dry-mesic sites.

Global: Invasive/Exotic Plants: *Poa compressa* (High/Low), *Rumex acetosella* (Medium/Low)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (20-May-2011). There are nearly 300 estimated occurrences of this vegetation rangewide, occupying over 3000 square km. However, threats to this association are many. Continued residential and commercial development, road construction, and lack of land-use planning will continue to decrease the amount of this vegetation if left unchecked. As a large-patch to matrix-forming vegetation type, one of the largest threats is fragmentation. In addition, repeated gypsy moth infestations can damage, if not destroy, this vegetation. Invasive species, however, are not generally a threat.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: Not all examples in New York and New Jersey are woodlands; some are more forested. Most sites are very rocky with talus boulders.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: This association was documented from one observation point with no environmental or floristic data collected. This association is also not known from areas this far north, therefore, it cannot be confirmed to exist on the trail in this ecoregion.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Massachusetts at East Mountain State Forest, in New York at Bellvale Mountain North, Black Mountain - Harriman State Park, Canopus Lake North/Fahnestock State Park, and Minnewaska Region Plots, and in Vermont at Clarendon Ridge.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association has only been documented from Black Brook Notch in Maine, but due to a lack of data its occurrence cannot be confirmed.
Global Range: This red oak woodland occurs on low- to mid-elevation summits and south-facing, steep upper slopes from New England south to Pennsylvania and New Jersey.

Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus rubra - Quercus prinus* Woodland Alliance (A0624)

ELEMENT CONCEPT

Global Summary: This acidic, large-boulder talus slope woodland occurs in Lower New England and the Allegheny Plateau south to the northern Piedmont. The substrate is large boulders, with vascular plants confined to coarse-textured soils in crevices. Sites are at low to mid elevations, from near sea level to about 520 m (1700 feet). Soils are thin, patchy, and nutrient-poor. The hardwood canopy is very patchy, with open talus interspersed with wooded areas. Canopy closure overall is usually less than 50%. Shrubs are patchy and may form thickets in openings. The herb layer is sparse overall, although dense patches may occur where some soil is available; bryophytes are likewise sparse. The ground cover is exposed talus, moss-covered boulders, and deciduous litter. The tree canopy is dominated by a variable mixture of oak and birch species, including *Quercus rubra* and *Betula lenta*. White oaks such as *Quercus alba* and *Quercus prinus* may occur. The understory is composed of scattered and clumped tall shrubs and small trees, including *Acer spicatum, Acer pensylvanicum, Rubus* spp., *Viburnum acerifolium*, and *Ribes* spp. Ericaceous shrubs are not generally prevalent, but when present may include *Vaccinium angustifolium, Gaylussacia baccata*, or *Kalmia angustifolia*. Vines are particularly characteristic, and include *Parthenocissus quinquefolia, Parthenocissus vitacea, Toxicodendron radicans, Toxicodendron rydbergii, Celastrus scandens*, and *Polygonum cilinode*. Scattered ferns and herbs are *Dryopteris marginalis, Polypodium virginianum, Pteridium aquilinum, Maianthemum racemosum, Eurybia macrophylla (= Aster macrophyllus), Deschampsia flexuosa, Carex pensylvanica, Carex lucorum, Corydalis sempervirens, Solidago bicolor, Solidago caesia*, and *Aralia nudicaulis*. Bryophytes include *Polytrichum commune, Leucobryum glaucum, Umbilicaria* spp., and *Cladina* spp. This association is characterized by the patchy deciduous canopy, with *Betula* spp. common and *Ostrya virginiana* sparse or absent, and by the lack of rich-site indicator herbs.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This northern hardwood - oak talus slope woodland occurs on thin soils at low to mid elevations, from near sea level to about 520 m (0-1,700 feet). The ground cover is exposed talus, moss- and lichen-covered boulders, and deciduous litter. It was sampled once in the Central Appalachian project area in northern Pennsylvania on a moderate, northwest-facing lower slope of a ravine with rapidly drained soil. The unvegetated surface consists of a mix of exposed bedrock, leaf litter and downed wood. Evidence of disturbance includes numerous hemlock snags from hemlock woolly adelgid-induced mortality.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This acidic large-boulder talus slope woodland occurs in the Northern Appalachians, Lower New England, and south to the northern Piedmont at low to mid elevations, from near sea level to about 520 m (0-1,700 feet). The sampled site is a very stony, steep north-facing midslope with somewhat poorly drained sandy loam soil. The unvegetated surface is codominated by leaf litter and large rocks, with lesser amounts of small rocks and downed wood. No evidence of disturbance was reported.

Global Environment: This acidic, large-boulder talus slope woodland occurs in the Lower New England, and Allegheny Plateau, south to the northern Piedmont. The substrate is large boulders, with vascular plants confined to coarse-textured soils in crevices. Sites are at low to mid elevations, from near sea level to about 520 m (0-1700 feet). Soils are thin, patchy, and nutrient-poor.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Betula alleghaniensis* and *Quercus rubra* are codominant in the canopy. *Betula lenta* is also common. Scattered *Kalmia latifolia* may be present over an herb layer dominated by *Polypodium virginianum* and *Dryopteris marginalis*. Other shrubs include *Acer pensylvanicum, Hamamelis virginiana*, and saplings from the canopy. *Tsuga canadensis* snags may be abundant in some stands where *Tsuga canadensis* was codominant until adelgid defoliation.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Quercus rubra* and *Betula alleghaniensis* are codominant in the canopy. *Kalmia latifolia* is the dominant tall shrub. Herbs are sparse but include *Dryopteris marginalis* and *Polypodium virginianum*.

Global Vegetation: The hardwood canopy is very patchy, with open talus interspersed with wooded areas. Canopy closure overall is usually less than 50%. Shrubs are patchy and may form thickets in openings. The herb layer is sparse overall, although dense patches may occur where some soil is available; bryophytes are likewise sparse. The ground cover is exposed talus, moss-covered boulders, and deciduous litter. The tree canopy is dominated by a variable mixture of oak and birch species, including *Quercus rubra* and *Betula lenta*. White oaks such as *Quercus alba* and *Quercus prinus* may occur. The understory is composed of scattered and clumped tall shrubs and small trees, including *Acer spicatum, Acer pensylvanicum, Rubus* spp., *Viburnum acerifolium*, and *Ribes* spp. Ericaceous shrubs are not generally prevalent, but when present may include *Vaccinium angustifolium, Gaylussacia baccata*, or *Kalmia angustifolia*. Vines are particularly characteristic, and include *Parthenocissus quinquefolia, Parthenocissus vitacea, Toxicodendron radicans, Toxicodendron rydbergii, Celastrus scandens*, and *Polygonum cilinode*. Scattered ferns and herbs are *Dryopteris marginalis, Polypodium virginianum, Pteridium aquilinum, Maianthemum racemosum, Eurybia macrophylla (= Aster macrophyllus), Deschampsia flexuosa, Carex pensylvanica, Carex lucorum, Corydalis sempervirens, Solidago bicolor, Solidago caesia*, and *Aralia nudicaulis*. Bryophytes include *Polytrichum commune, Leucobryum glaucum, Umbilicaria* spp., and *Cladina* spp.

Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type was formerly included in CEGL006320. A similar type, *Betula alleghaniensis - Quercus rubra / Polypodium virginianum* Woodland (CEGL006584), occurs in the Northern Appalachian (Laurentian-Acadian) region.

This type possibly could occur in southern Ontario, but *Betula lenta* is a rare species in Canada, and a minor component of the forest stand it occurs in. According to Zoladeski and Hayes (2013), "In Ontario, Cherry Birch [*Betula lenta*] is thought to have always been a minor component of forests at its historical and extant locations; nonetheless, its population has declined by 72%, from 50 trees observed in 1967 to 14 trees in 2005. Presently, there are only two sites [near St. Catharines], in proximity to each other, together harbouring probably not more than 18 individuals... In Ontario, the forest where Cherry Birch was observed in 2010 is composed of Red Oak (*Quercus rubra*), Sugar Maple (*Acer saccharum*), Black Cherry (*Prunus serotina*) and Eastern Hop-hornbeam (*Ostrya virginiana*)."

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is found in the High Allegheny Plateau in northern Pennsylvania and in New York in the Lower New England project area. It was sampled in Northampton County, Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Nuclear Lake in New York.
Global Range: This woodland occurs in Lower New England and the Allegheny Plateau, south to the northern Piedmont.

A2048 *Quercus velutina - Quercus alba* Eastern Forest Alliance

Alliance Summary Description: Forests in this alliance represent dry oak forests characterized by dominance or codominance by some combination of *Quercus alba, Quercus coccinea*, and/or *Quercus velutina*. *Quercus velutina* is characteristic and constant. Stands are generally closed-canopy and characterized by some combination of *Quercus alba, Quercus coccinea, Quercus rubra*, and/or *Quercus velutina*. In addition, *Carya alba, Carya glabra, Carya ovata, Pinus echinata, Pinus virginiana, Quercus prinus*, and *Quercus stellata* are common associates. Other common associates can include *Acer rubrum var. rubrum, Quercus falcata, Quercus macrocarpa* (within its range), and *Sassafras albidum*. Typical understory trees include *Betula lenta, Oxydendrum arboreum*, and *Sassafras albidum*. *Ilex opaca* is an associate in portions of the Piedmont. The shrub layer is usually strongly dominated by ericaceous species, including *Gaylussacia baccata, Kalmia latifolia, Rhododendron calendulaceum, Rhododendron periclymenoides, Vaccinium angustifolium, Vaccinium pallidum*, and occasionally including *Hamamelis virginiana* and *Viburnum acerifolium*. The herbaceous composition varies considerably over the wide range of this alliance. Some common herbs include *Antennaria plantaginifolia, Carex blanda, Carex pensylvanica, Conopholis americana, Cypripedium acaule, Danthonia spicata, Desmodium nudiflorum, Dioscorea villosa, Gaultheria procumbens, Hieracium venosum, Maianthemum racemosum, Medeola virginiana, Polygonatum biflorum, Prenanthes altissima, Schizachyrium scoparium, Solidago odora*, and *Thelypteris noveboracensis*. These forests occupy dry, nutrient-poor sites on sandy or rocky soil, upper slopes, and ridgetops; the alliance also includes red maple - oak or red maple - pine forests that developed over serpentine bedrock but have sufficient duff development that serpentine chemistry is not evident in the vegetation. This alliance is wide-ranging, with a center of distribution in the Central Appalachians, south to the Southern Blue Ridge; to Cumberland, Western Allegheny, and High Allegheny plateaus; west and north to the Great Lakes; and east through Lower New England / Northern Piedmont, and the Piedmont.

[CEGL006018] *Quercus (velutina, alba) / Vaccinium pallidum / Pteridium aquilinum* High Allegheny Plateau, Western Allegheny Plateau Forest

Translated Name: **(Black Oak, White Oak) / Blue Ridge Blueberry / Western Brackenfern High Allegheny Plateau, Western Allegheny Plateau Forest**
Common Name: **Allegheny Plateau Oak Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus velutina* - *Quercus alba* Eastern Forest Alliance (A2048)

ELEMENT CONCEPT

Global Summary: This closed-canopy, dry deciduous forest of portions of the High Allegheny Plateau, Western Allegheny Plateau, portions of the central Appalachian Mountains, and southern New England, occurs on sandy or rocky soil on dry upper slopes and terraces of sandstone, shale, granite, gneiss, and other acidic parent materials. The tree canopy is dominated by a mixture of *Quercus velutina, Quercus alba, Quercus rubra, Quercus coccinea, Acer rubrum*, and *Quercus prinus*. Associates include *Carya glabra, Carya ovata, Nyssa sylvatica, Sassafras albidum, Betula lenta*, and *Prunus serotina*. *Castanea dentata* was formerly common in this forest. The understory is characterized by *Nyssa sylvatica*, and in the southwestern portion of the range by *Oxydendrum arboreum*. The low-shrub layer is characterized by ericaceous shrubs such as *Vaccinium pallidum, Vaccinium angustifolium, Vaccinium stamineum, Gaylussacia baccata, Kalmia latifolia*, and *Rhododendron periclymenoides*, as well as *Viburnum acerifolium*. Typical species of the herbaceous layer include *Pteridium aquilinum, Carex pensylvanica, Oryzopsis asperifolia, Gaultheria procumbens, Hieracium venosum, Cypripedium acaule, Krigia biflora, Polygala paucifolia, Trientalis borealis*, and *Waldsteinia fragarioides*. Disturbance such as windthrow and logging favor *Quercus velutina* and *Betula lenta*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This mixed oak / heath forest occurs on sandy or rocky soil on dry upper slopes and terraces of sandstone or shale.
Global Environment: This closed-canopy, dry deciduous forest of unglaciated portions of the High Allegheny Plateau, Western Allegheny Plateau, portions of the central Appalachian Mountains, and southern New England, occurs on sandy or rocky soil on dry upper slopes and terraces of sandstone or shale.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The tree canopy is dominated by a mixture of *Quercus velutina, Quercus alba*, and *Quercus rubra*. The low-shrub layer is characterized by ericaceous shrubs such as *Vaccinium pallidum, Vaccinium angustifolium, Gaylussacia baccata*, and *Kalmia latifolia*. The herbaceous layer may include *Cypripedium acaule, Carex pensylvanica, Hieracium venosum, Pteridium aquilinum*, and *Trientalis borealis*.

Global Vegetation: The tree canopy is dominated by a mixture of *Quercus velutina, Quercus alba, Quercus rubra, Quercus coccinea, Acer rubrum*, and *Quercus prinus*. Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus velutina* - *Quercus alba* Eastern Forest Alliance (A2048)

ELEMENT CONCEPT

Global Summary: This community is a matrix forest of dry, nutrient-poor uplands of the Mid-Atlantic Piedmont Plateau, occurring locally in similar low-elevation landscapes of the Northern Blue Ridge and Ridge and Valley, Cumberland Plateau and Mid-Atlantic Coastal Plain provinces. The type is well-documented across Virginia, and to a lesser extent in Tennessee and Maryland, but probably also occurs at similar sites in West Virginia and Pennsylvania. Stands are located between 30 and 700 m (100-2300 feet) elevation on rolling to sublevel sites of Piedmont and Inner Coastal Plain uplands, mountain valleys and lower mountain slope benches. In the mountains, many documented occurrences are located on ancient alluvial fan deposits, which are especially extensive along the western foot of the Blue Ridge. The vegetation is a closed to very open oak forest with mixed and variable canopy dominance by *Quercus alba, Quercus velutina, Quercus coccinea*, and *Quercus prinus*. Various *Pinus* spp., including *Pinus virginiana, Pinus echinata, Pinus strobus*, and *Pinus rigida*, are frequent overstory associates, particularly following fire or logging disturbances. *Quercus falcata, Quercus stellata, Carya glabra*, and *Carya alba* are infrequent canopy trees. *Nyssa sylvatica, Amelanchier arborea* and, in the southern part of the range, *Oxydendrum arboreum* attain exceptional abundance and stature in these forests, dominating the subcanopy layers and occasionally reaching the overstory. *Acer rubrum* and *Sassafras albidum* are other common understory trees. In typical stands, the shrub layer is dominated by deciduous ericaceous species, herbaceous species are sparse, and species-richness is moderate to very low.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This low-elevation oak / heath forest ranges from central Pennsylvania south to the Piedmont and valley floors of the Ridge and Valley of Virginia, mostly at <460 m (<1,500 feet) elevation, rarely extending as high as 760 m (2,500 feet) on mountain ridges. It is a matrix forest of the dry, nutrient-poor uplands of the Mid-Atlantic Piedmont Plateau. It was sampled three times in Pennsylvania; once on a flat with somewhat poorly drained clay soil, and twice on moderate east- and northwest-facing midslopes with well-drained sandy loam soils. It was also sampled once on a gentle southwest-facing ridge in Virginia on silt loam sols. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes grazing/browsing, gypsy moth damage, and the presence of exotic plant species.

Global Environment: Stands are located between 30 and 700 m (100-2300 feet) elevation on rolling to sublevel sites of Piedmont and Inner Coastal Plain uplands, mountain valleys and lower mountain slope benches. The type is generally distributed in nutrient-poor soils of the Piedmont uplands. In the mountains, many documented occurrences are located on ancient alluvial fan deposits, which are especially extensive along the western foot of the Blue Ridge from Page County south to Rockbridge County, Virginia. Similar but smaller fans are common where incising streams drain "piedmont" landforms at the foot of Ridge and Valley strike ridges (Harbor 1996). Slopes of plot-sampled stands range from 1-13° (mean = 6°), with aspects essentially flat to westerly. Soils of these sites are deep, very oligotrophic, gravelly loams with low pH and base status. Exposed rocks of any kind (outcrops, boulders, or stones) are usually sparse to absent. Most sites appear to have a history of fires.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus alba* is characteristic in the canopy along with mixed oaks including *Quercus prinus, Quercus coccinea*, and/or *Quercus velutina*. Various *Pinus* spp., including *Pinus virginiana, Pinus echinata, Pinus strobus*, and/or *Pinus rigida*, are frequent overstory associates (but <30% in canopy - this is an oak forest, not a mixed oak-pine forest). *Acer rubrum* and *Nyssa sylvatica* are common in the subcanopy. *Rhododendron periclymenoides, Photinia melanocarpa, Gaylussacia baccata*, and *Vaccinium corymbosum* are common shrubs. *Rubus hispidus* is a common dwarf-shrub. Herbs are sparse to absent.

Global Vegetation: The vegetation is a closed to very open oak forest with mixed and variable canopy dominance by *Quercus alba, Quercus coccinea*, and *Quercus prinus*. Various *Pinus* spp., including *Pinus virginiana, Pinus*

echinata, Pinus strobus, and *Pinus rigida*, are frequent overstory associates, particularly following fire or logging disturbances. *Quercus falcata, Quercus stellata, Carya glabra*, and *Carya alba* are infrequent canopy trees. *Nyssa sylvatica, Amelanchier arborea* and, in the southern part of the range, *Oxydendrum arboreum* attain exceptional abundance and stature in these forests, dominating the subcanopy layers and occasionally reaching the overstory. *Acer rubrum* and *Sassafras albidum* are other common understory trees. The shrub layer is typically dominated by deciduous ericaceous species, with *Gaylussacia baccata, Vaccinium pallidum*, and/or *Vaccinium stamineum* consistently forming dense colonies. Less abundant or constant shrubs and vines include *Castanea pumila, Quercus ilicifolia, Kalmia latifolia, Rhododendron periclymenoides, Lyonia ligustrina, Vaccinium stamineum, Smilax glauca, Smilax rotundifolia*, and *Cornus florida*. Despite high shrub densities, a number of low-cover herbs and subshrubs occur in the type, including *Chimaphila maculata, Isotria verticillata, Uvularia puberula, Epigaea repens, Pteridium aquilinum var. latiusculum, Cypripedium acaule, Gentiana villosa, Comandra umbellata, Angelica venenosa*, and *Iris verna*. Mean species richness of 54 Virginia, Maryland, and District of Columbia plot samples is 25 taxa per 400 square meters.

Global Dynamics: Drought-prone habitats and an abundance of inflammable shrubs make this vegetation type susceptible to periodic fires. Mesophytic, fire-intolerant species such as *Fagus grandifolia, Acer rubrum*, and *Ilex opaca* are rapidly invading the understories of many Piedmont stands from which fire has been excluded for many decades.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (24-Jan-2005). This community is a matrix-forming vegetation type in the Virginia and Maryland Piedmont and is probably more widespread at low elevations of the central Appalachian Mountains than documentation indicates.

RELATED CONCEPTS

Global Similar Types:

- *Quercus (prinus, coccinea) / Kalmia latifolia / (Galax urceolata, Gaultheria procumbens)* Forest (CEGL006271) of southern Appalachians.
- *Quercus alba - (Liriodendron tulipifera, Liquidambar styraciflua) / Calycanthus floridus / Athyrium filix-femina* Forest (CEGL008428)
- *Quercus alba - Quercus falcata - (Carya pallida) / Gaylussacia frondosa* Forest (CEGL006269) of the Mid-Atlantic Coastal Plain.

- *Quercus alba - Quercus falcata / Vaccinium (arboreum, hirsutum, pallidum)* Forest (CEGL008567) described from southeastern Tennessee, with similar understory and associated species but with prominent *Quercus falcata*.
- *Quercus prinus - (Quercus coccinea) / Carya pallida / Vaccinium arboreum - Vaccinium pallidum* Forest (CEGL008431)
- *Quercus prinus - (Quercus coccinea, Quercus rubra) / Kalmia latifolia / Vaccinium pallidum* Forest (CEGL006299) of the Central Appalachians and northern Piedmont.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This is a low-elevation mixed dry oak / heath forest characterized by *Quercus alba* and generally lacking *Carya* spp.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This is a low-elevation oak / heath type that is common in the Piedmont and valley floors of the Ridge and Valley, mostly at <460 m (<1,500 feet) elevation, rarely extending as high as 760 m (2,500 feet) on mountain ridges. There are plots along/near the AT in lower-elevation stretches west of and north of Roanoke, but along most of the trail in Virginia, it is absent or occurs in very small patches. On the Northern Blue Ridge, Central Appalachian Dry Chestnut Oak - Northern Red Oak / Heath Forest (CEGL008523) is a similar, higher-elevation forest.
Global Classification Comments: This unit is distinct among Virginia's oak/heath forests in its occurrence on low-elevation, rolling to sub-level, usually non-rocky terrain of the Piedmont and mountains. *Quercus alba*, normally a minor tree in montane oak/heath forests, is characteristic and usually codominant, while the prevalence of deciduous ericads and the presence of the low-elevation oaks *Quercus falcata* and *Quercus stellata* further distinguish the type. *Quercus prinus* and *Kalmia latifolia*, although present and occasionally abundant, are not as important in this unit as in related Central Appalachian oak/heath vegetation types, particularly *Quercus prinus - (Quercus coccinea, Quercus rubra) / Kalmia latifolia / Vaccinium pallidum* Forest (CEGL006299). The latter is generally associated with relatively steep, often rocky terrain of the Central Appalachians and dissected topography in the Piedmont. Originally, the concept of this type (CEGL008521) was restricted to "Piedmont"-like landscapes in the mountains. However, additional quantitative data analysis of a statewide (Virginia) set of 180 oak/heath plots led to a broader conceptual interpretation that includes both montane and Piedmont stands. The type is represented by 54 plots from Virginia, and 20 from Maryland and the District of Columbia. Attempts to split this unit based on the presence or absence of *Quercus prinus* have proven unworkable because significant environmental or floristic differences between the putative groups are lacking.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This forest was sampled in Cumberland County, Pennsylvania, and at Trout Creek East in Virginia.
Global Range: In parts of the Mid-Atlantic Piedmont, this is a common forest of dry, nutrient-poor uplands. It occurs less frequently in similar low-elevation landscapes of the Central Appalachians (Northern Blue Ridge and Ridge and Valley provinces), and the Cumberland Plateau in Tennessee. It reaches the eastern edge of its range in Maryland, the District of Columbia, and northern Virginia, where it extends slightly into the Coastal Plain along the fall zone. It also occurs in Pennsylvania and possibly West Virginia.

Group	Appalachian Oak / Chestnut Forest (G015)
Alliance	*Quercus velutina - Quercus alba* Eastern Forest Alliance (A2048)

Element Concept

Global Summary: This mixed oak association includes dry, deciduous forests of low elevations (below 915 m [3000 feet]) in the Southern Blue Ridge, associated with sandy, dry soils derived from granitic gneiss and other related acidic substrates. This association is known as a matrix forest type in the area of Brevard, North Carolina, where it occurs on open slopes and broad ridges, in a landscape of a low, rolling plateau. It may extend south into South Carolina. These forests have canopies dominated by *Quercus alba, Quercus coccinea, Quercus falcata, Quercus velutina*, and sometimes *Quercus prinus*, although other species can be present, including *Pinus echinata, Pinus virginiana*, and *Pinus rigida*. This forest is characterized by having associated species more typical of lower, non-montane areas, such as *Quercus falcata, Schizachyrium scoparium, Silphium compositum, Baptisia tinctoria*, and *Piptochaetium avenaceum*, and by the absence of species more typical in mesic, montane oak forests, including *Medeola virginiana, Maianthemum racemosum, Thelypteris noveboracensis, Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula*, and *Dryopteris intermedia)*. The shrub stratum can be quite open, with *Rhododendron calendulaceum* typical. *Kalmia latifolia* and *Vaccinium pallidum* are usually present in moderate abundance. *Solidago odora var. odora* and *Pteridium aquilinum var. latiusculum* are typical herb components.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This dry mixed oak-hickory forest is restricted to low elevations (below about 670 m [2,200 feet]) on sandy soils.
Global Environment: This association includes dry, deciduous forests of low elevations (below 915 m [3000 feet]) in the Southern Blue Ridge, associated with sandy, dry soils derived from granitic gneiss and other related acidic geologies. This association is known as a matrix forest type in the area of Brevard, North Carolina, where it occurs on open slopes and broad ridges, in a landscape of a low, rolling plateau.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This forest usually contains *Quercus falcata* in the canopy, along with *Quercus alba, Quercus coccinea, Quercus velutina*, and sometimes *Quercus prinus* at low cover, although other species can be present, including various *Carya* spp., as well as *Pinus echinata* and *Pinus virginiana*. In some cases, *Quercus falcata* may be an indicator, but may not be present or detectible in all stands. In some examples *Carya* spp. may have greater cover than *Quercus* spp.
Global Vegetation: These forests have canopies dominated by *Quercus alba* with other oak species including *Quercus coccinea, Quercus falcata, Quercus velutina*, and sometimes *Quercus prinus*. Other species can be present, including *Pinus echinata, Pinus virginiana*, and *Pinus rigida*. The subcanopy may contain *Oxydendrum arboreum*. This forest is characterized by having associated species more typical of lower, non-montane areas, such as *Quercus falcata, Schizachyrium scoparium, Silphium compositum, Baptisia tinctoria, Piptochaetium avenaceum*, and by the

absence of species more typical in mesic, montane oak forests (*Medeola virginiana, Maianthemum racemosum, Thelypteris noveboracensis, Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula, Dryopteris intermedia*). The shrub stratum can be quite open, with *Rhododendron calendulaceum* typical. *Kalmia latifolia* and *Vaccinium pallidum* are usually present in moderate abundance. *Solidago odora var. odora* and *Pteridium aquilinum var. latiusculum* are typical herb components.

G016. NORTHEASTERN CHINQUAPIN OAK - RED-CEDAR ALKALINE FOREST & WOODLAND

Group Summary Description: This group encompasses relatively dry calcareous forests and woodlands of temperate eastern North America, in which *Quercus muehlenbergii* is associated with a variety of hardwoods and/or *Juniperus virginiana*. Examples can occur on a variety of topographic and landscape positions, including ridgetops and upper and midslopes. It also includes relatively dry, rich woodlands of traprock habitats in the Northeast. Droughts and fires are factors determining the relative mixture of deciduous hardwood versus evergreen trees. In the Southern Ridge and Valley region, the Central Basin of Tennessee and other related areas, these forests may cover large areas; elsewhere, they occur as relatively small inclusions within a forest matrix of other oak and pine species.

A3107 *Juniperus virginiana - Fraxinus americana - Carya* spp. Woodland Alliance

Alliance Summary Description: This alliance comprises woodlands of the northeastern U.S., possibly reaching southeastern Canada, characterized by *Carya glabra, Fraxinus americana, Juniperus virginiana, Ostrya virginiana*, and *Quercus rubra*. They are known locally as traprock ridges, rocky ridge balds, rocky summits, or barrens. Physiognomy is generally patchy and open to very open canopy, with abundant forbs and grasses.

[CEGL006037] *Juniperus virginiana - Fraxinus americana / Carex pensylvanica - Cheilanthes lanosa* Open Woodland

Translated Name: **Eastern Red-cedar - White Ash / Pennsylvania Sedge - Hairy Lipfern Open Woodland**
Common Name: **Central Appalachian Circumneutral Barrens**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Northeastern Chinquapin Oak - Red-cedar Alkaline Forest & Woodland (G016)
Alliance	*Juniperus virginiana - Fraxinus americana - Carya* spp. Woodland Alliance (A3107)

ELEMENT CONCEPT

Global Summary: This barrens community occurs on steep slopes with exposed outcrops of calcareous sedimentary, metasedimentary, and metamorphic rocks of the Central Appalachians. In the Ridge and Valley province, underlying bedrock includes calcareous shales of the Jennings, Hampshire, Martinsburg, and Brallier formations, and less commonly calcareous Silurian sandstones. Blue Ridge sites are underlain by Catoctin Formation metabasalt, amphibolite, and Harpers Formation metasiltstone and phyllite. Habitats are on steep, southeast - to southwest-facing slopes at elevations from 170 to 580 m (550-1900 feet). On sites underlain by shale, soils are thin but generally better developed than other shale-barren associations. Mafic-rock sites typically have high cover (about 50%) of exposed bedrock outcrops with some areas of shallow soil development. Sandstone sites generally consist of steep, continuous pavements with thin veneers and pockets of soil. Soils from all substrates have high calcium levels; those weathered from metabasalt and amphibolite also have high magnesium and manganese levels. A patchy overstory of stunted trees may ameliorate to some degree the otherwise xeric conditions imposed by exposure and slope. Canopy closure is usually less than 30%, occasionally higher, and tends to be patchy, with herbaceous openings. Shrubs are sparse at most known locations. The herbaceous layer forms 25-90% ground cover. The canopy is codominated by *Juniperus virginiana* and *Fraxinus americana*, with other associates including *Carya glabra, Quercus prinus, Quercus stellata, Celtis tenuifolia, Amelanchier arborea, Quercus rubra*, and *Pinus virginiana*. *Rhus aromatica* is a characteristic shrub. The herbaceous layer is very diverse. *Carex pensylvanica* is

constant and dominant. *Danthonia spicata* is frequent but sparse. Other characteristic species include *Cheilanthes lanosa, Woodsia obtusa, Phacelia dubia, Deschampsia flexuosa, Solidago arguta var. harrisii (= Solidago harrisii), Schizachyrium scoparium, Phlox subulata, Silene antirrhina, Elymus hystrix (= Hystrix patula), Tradescantia virginiana, Helianthus divaricatus, Polygonum scandens var. cristatum, Polygonatum biflorum, Triodanis perfoliata, Pycnanthemum incanum, Allium cernuum*, and *Arenaria serpyllifolia*. This association is distinguished from other shale-barren types by its open physiognomy, occurrence on circumneutral to calcareous rock at low to moderate elevations, and the frequency of several characteristic herbs including *Cheilanthes lanosa, Phacelia dubia, Tradescantia virginiana*, and *Triodanis perfoliata*. In addition, *Fraxinus americana* and *Celtis tenuifolia* occur at a higher frequency in this association than in other shale-barren types.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This circumneutral barrens community is found on steep, southeast - to southwest-facing slopes with exposed basic metamorphic and other calcium-bearing outcrops at low elevations from 170 to 580 m (550-1,900 feet). It was sampled at two locations in Shenandoah National Park in Virginia on somewhat steep to steep, southwest-facing mid and upper slopes with rapidly drained clay loam and loam soils. The unvegetated surface is dominated by exposed bedrock with some leaf litter, downed wood, large/small rocks and bare soil. Evidence of disturbance includes deer grazing/browsing and the presence of exotic plant species.

Global Environment: This barrens community occurs on steep slopes with exposed outcrops of calcareous sedimentary, metasedimentary, and metamorphic rocks of the Central Appalachians. In the Ridge and Valley province, underlying bedrock includes calcareous shales of the Jennings, Hampshire, Martinsburg, and Brallier formations, and less commonly calcareous Silurian sandstones. Blue Ridge sites are underlain by Catoctin Formation metabasalt, amphibolite, and Harpers Formation metasiltstone and phyllite. Habitats are on steep, southeast - to southwest-facing slopes at elevations from 170 to 580 m (550-1900 feet). On sites underlain by shale, soils are thin but generally better developed than other shale barren associations. Mafic-rock sites typically have high cover (about 50%) of exposed bedrock outcrops with some areas of shallow soil development. Sandstone sites generally consist of steep, continuous pavements with thin veneers and pockets of soil. Soils from all substrates have high calcium levels; those weathered from metabasalt and amphibolite also have high magnesium and manganese levels.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This patchy herbaceous and scrub vegetation has an open canopy that is dominated by *Fraxinus americana*, sometimes codominant with *Juniperus virginiana*. *Rhus aromatica* and/or *Cheilanthes lanosa* are usually present. *Carex pensylvanica* is constant and dominant; *Danthonia spicata* is frequent but sparse. Other herbs can include *Sporobolus vaginiflorus, Polygonum tenue, Talinum teretifolium, Symphyotrichum oblongifolium, Dichanthelium linearifolium*, and/or *Euphorbia corollata*. This community also supports VA-state imperiled *Oligoneuron rigidum var. rigidum*.

Global Vegetation: This community type is characterized by a mixed physiognomy of scattered, stunted trees and herbaceous openings. The patchy canopy may ameliorate to some degree the otherwise xeric conditions imposed by exposure and slope. Canopy closure is usually less than 30%, occasionally higher. Shrubs are sparse at most known locations. The herbaceous layer forms 25-90% ground cover, except where broken by rock outcrops. The canopy is codominated by *Juniperus virginiana* and *Fraxinus americana*, with other associates including *Carya glabra, Quercus prinus, Quercus stellata, Celtis tenuifolia, Amelanchier arborea, Quercus rubra*, and *Pinus virginiana*. *Rhus aromatica* is a characteristic shrub. The herbaceous layer is very diverse. *Carex pensylvanica* is constant and dominant. *Danthonia spicata* is frequent but sparse. Other characteristic species include *Cheilanthes lanosa, Woodsia obtusa, Phacelia dubia, Deschampsia flexuosa, Solidago arguta var. harrisii (= Solidago harrisii), Schizachyrium scoparium, Phlox subulata, Silene antirrhina, Elymus hystrix (= Hystrix patula), Tradescantia virginiana, Helianthus divaricatus, Polygonum scandens var. cristatum, Polygonatum biflorum, Triodanis perfoliata, Pycnanthemum incanum, Allium cernuum*, and *Arenaria serpyllifolia*. Although they are very similar, expressions of this community type on shale and metabasalt exhibit some compositional differences. Shale occurrences contain a greater number of low-cover forbs and exclusively contain several shale endemics and other species common on shale barrens, including *Blephilia ciliata, Clematis albicoma, Deschampsia flexuosa, Draba ramosissima, Eriogonum allenii, Melica nitens, Minuartia michauxii, Oenothera argillicola, Packera antennariifolia*, and *Trifolium virginicum*. Occurrences on mafic outcrops tend to have stratified graminoid dominance, with *Schizachyrium scoparium* forming a taller layer over *Carex pensylvanica*. Species documented only on metabasalt and amphibolite, including *Cyperus lupulinus, Isanthus brachiatus, Muhlenbergia capillaris var. capillaris, Polygonum tenue, Oligoneuron rigidum var. rigidum (= Solidago rigida ssp. rigida), Sporobolus*

clandestinus, and *Talinum teretifolium*, are probably associated with high-magnesium soils weathered from this substrate. *Quercus stellata* is common on the few known sandstone sites. However, despite these differences, stands on all substrates share almost all of the type's characteristic species as well as a remarkable number of other specialized xerophytic species, including *Asclepias verticillata, Symphyotrichum oblongifolium (= Aster oblongifolius), Bouteloua curtipendula, Lithospermum canescens, Paronychia montana, Selaginella rupestris, Taenidia montana*, and *Triosteum perfoliatum*.

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (23-Nov-1998). This small-patch community likely totals less than 1000 acres rangewide in fewer than 60 occurrences. It is restricted to two subsections in the central Appalachians. Although the community is relatively isolated by its steep slope and unstable substrate, it is threatened by invasive exotics such as *Bromus sterilis, Bromus tectorum, Bromus japonicus, Centaurea biebersteinii, Lonicera japonica, Verbascum thapsus, Alliaria petiolata*, and *Ailanthus altissima*.

RELATED CONCEPTS

Global Similar Types:

- *Fraxinus americana - Carya glabra / Muhlenbergia sobolifera - Helianthus divaricatus - Solidago ulmifolia* Woodland (CEGL003683) often co-occurring woodland that is more closed and dominated by deciduous trees.
- *Fraxinus americana / Physocarpus opulifolius / Carex pensylvanica - Allium cernuum - (Phacelia dubia)* Wooded Grassland (CEGL008529) mafic barren occurring at higher elevations on the Northern Blue Ridge; lacks *Juniperus virginiana* and many other low-elevation species.
- *Pinus virginiana - Juniperus virginiana - Quercus rubra / Solidago arguta var. harrisii - Opuntia humifusa* Woodland (CEGL006288) typical shale barren community developed on unstable shale slopes undercut by streams; lacks calciphilic species.
- *Pinus virginiana - Juniperus virginiana / Schizachyrium scoparium - Eriogonum allenii* Wooded Grassland (CEGL008530) grass-dominated shale barren of stabilized crests and upper slopes; much less diverse and lacking calciphilic species.

- *Pinus virginiana - Quercus prinus / Packera antennariifolia - Phlox subulata* Woodland (CEGL006562) typical shale barren community developed on unstable shale slopes undercut by streams, in the heart of shale endemism (west-central VA and adjacent WV); lacks calciphilic species.
- *Quercus prinus - Carya glabra / Cheilanthes lanosa - Carex pensylvanica - Camassia scilloides* Woodland (CEGL007070)

ELEMENT CONCEPT

Global Summary: This traprock ridge open woodland is known from mountainous sites in New England, New Jersey, and Pennsylvania, and may occur in southeastern New York. The vegetation occurs primarily on exposed outcrops of basaltic rock in the Connecticut Valley of New England and the Piedmont physiographic province in New Jersey. While most sites are on igneous rock, along the Kittatinny Ridge in Pennsylvania and New Jersey, it occurs on conglomerates of the Shawangunk Formation. Sites supporting this community are upper slopes of basalt, diorite, or conglomerate ridges from 365-1050 m elevation, characteristically south- or west-facing and range in slope from 5-30°. Most sites have minimal soil development. Tree cover is sparse, ranging from 5-30% cover (average 20%) with *Juniperus virginiana* being the most constant canopy tree. Other woody species sometimes present include *Fraxinus americana, Quercus rubra, Quercus prinus, Ostrya virginiana*, and *Carya glabra*. The actual canopy composition reflects, to some extent, the surrounding forest. The scattered shrub layer often includes

Rosa carolina, Quercus prinus, Quercus ilicifolia, Rhus typhina (= Rhus hirta), Vaccinium pallidum, Vaccinium angustifolium, Viburnum rafinesquianum, and *Prunus virginiana*. The herbaceous layer usually covers 12-50% of the ground and is dominated by *Schizachyrium scoparium, Deschampsia flexuosa*, and *Danthonia spicata*, with their relative abundance varying from site to site. Numerous other herbaceous species occur in this community type, including *Carex pensylvanica, Anthoxanthum odoratum, Hypericum gentianoides, Antennaria plantaginifolia, Corydalis sempervirens, Solidago nemoralis, Poa compressa, Maianthemum racemosum, Uvularia perfoliata, Aquilegia canadensis, Asclepias verticillata, Polygonum scandens, Krigia virginica*, and *Houstonia longifolia*. No species is restricted to this community, but the assemblage listed above is very characteristic.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This red-cedar - white ash woodland occurs primarily on exposed outcrops and is known from mountainous sites in New England, New Jersey, and Pennsylvania. Sites are moderate to steep east-, south- and southeast-facing upper slopes and ridgetops. Soils are dry, rapidly drained sandy loam and silt loam. The unvegetated surface consists of leaf litter or large rocks, with lesser amounts of exposed bedrock, small rocks, bare soil and downed wood. Evidence of disturbance includes the presence of exotic plants.

Global Environment: This sparse woodland occurs primarily on exposed outcrops of basaltic rock in the Connecticut Valley of New England and the Piedmont physiographic province in New Jersey and adjacent Pennsylvania. While most sites are on igneous rock, along the Kittatinny Ridge in Pennsylvania and New Jersey, it occurs on conglomerates of the Shawangunk Formation. Sites supporting this community are upper slopes of basalt, diorite, or conglomerate ridges from 365-1050 m elevation. The ridges are characteristically south- or west-facing and range in slope from 5-30°. Most sites have minimal soil development.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Carya glabra, Carya ovata, Fraxinus americana*, and/or *Prunus serotina* are dominant in the canopy with *Juniperus virginiana*. *Quercus ilicifolia* and *Vaccinium pallidum* dominate the shrub layer. *Schizachyrium scoparium, Deschampsia flexuosa*, and/or *Danthonia spicata* are common and dominant grasses, and *Dryopteris marginalis* is a common fern.

Global Vegetation: This community occurs as exposed, mainly herbaceous openings on ridgetops of resistant mafic rock. Occurrences are generally less than 0.1 ha in size. Tree cover is sparse, ranging from 5-30% cover (average 20%) with *Juniperus virginiana* being the most constant canopy tree. Other woody species sometimes present include *Fraxinus americana, Quercus rubra, Quercus prinus, Ostrya virginiana*, and *Carya glabra*. The actual canopy composition reflects, to some extent, the surrounding forest. The scattered shrub layer often includes *Rosa carolina, Quercus prinus, Quercus ilicifolia, Rhus typhina (= Rhus hirta), Vaccinium pallidum, Vaccinium angustifolium, Viburnum rafinesquianum*, and *Prunus virginiana*. The herbaceous layer usually covers 12-50% of the ground and is dominated by *Schizachyrium scoparium, Deschampsia flexuosa*, and *Danthonia spicata*, with their relative abundance varying from site to site. Numerous other herbaceous species occur in this community type, including *Carex pensylvanica, Anthoxanthum odoratum, Hypericum gentianoides, Antennaria plantaginifolia, Corydalis sempervirens, Solidago nemoralis, Poa compressa, Maianthemum racemosum, Uvularia perfoliata, Aquilegia canadensis, Asclepias verticillata, Polygonum scandens, Krigia virginica*, and *Houstonia longifolia*. No species is restricted to this community, but the assemblage listed above is very characteristic. Several uncommon species are associated with this community, including *Houstonia longifolia, Selaginella rupestris, Arabis missouriensis, Polygonum tenue, Scutellaria parvula var. missouriensis (= Scutellaria parvula var. leonardii), Muhlenbergia capillaris, Pycnanthemum torrei*, and *Pycnanthemum clinopodioides*.

Global Dynamics: The role of fire in maintaining these sites is unclear, but several authors suspect that the open structure reflects a history of burning in addition to an edaphic restriction.

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (20-May-2011). There are probably 30-60 occurrences of this community rangewide. At least 19 occurrences have been documented from Connecticut, Massachusetts, Pennsylvania and New Jersey, with outliers in New Hampshire and southeastern New York. This community is restricted to exposed outcrops of basaltic rock in the Connecticut River valley of New England and the Piedmont and High Allegheny Plateau physiographic province of New Jersey and adjacent Pennsylvania. Most occurrences are small; total acreage is probably less than 500 acres rangewide.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community is restricted to exposed outcrops of basaltic rock in the Connecticut River valley of New England and the Piedmont and High Allegheny Plateau physiographic province of New Jersey and adjacent Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: Standing dead red-cedar trees from heat stress occur in the New Jersey Culvers Gap stand.
Global Classification Comments: In general, this community is similar to a number of other sparse woodland ridgetop communities. New Jersey occurrences are floristically related to ridgetop sparse woodlands in Virginia (e.g., greenstone glades) but appear to share more species with the northern occurrences with which they have been grouped here. However, further research may indicate that the New Jersey occurrences represent a unique vegetation assemblage. In Massachusetts, this community typically occurs as herbaceous (and probably successional) patches within a hickory-hop hornbeam forest. New York contains some examples of this community which they classify under the name "red cedar rocky summit community."

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Delaware Water Gap in Pennsylvania and New Jersey, at Culvers Gap North in New Jersey, and at Fort Defiance Hill in New York.
Global Range: This community has been described from mountainous sites in New England states: Fall Mountain in New Hampshire; Bare Mountain, East Mountain, Mount Tom and Mount Norwottuck in Massachusetts; Onion Mountain, Sugarloaf, Sleeping Giant and West Mountain in Connecticut. It has also been documented at sites in the

Watchung Mountains in New Jersey, Kittatinny Ridge in New Jersey and Pennsylvania, and in southeastern New York.

A2047 *Quercus muehlenbergii - Acer saccharum - Tilia americana* Forest Alliance

Alliance Summary Description: This alliance includes a variety of dry and dry-mesic forests characterized by *Quercus muehlenbergii* and *Acer saccharum*, with associates including *Carya ovalis, Carya ovata, Fraxinus americana, Juglans nigra, Quercus alba*, and *Tilia americana*. Common subcanopy trees include *Cercis canadensis, Cornus florida*, and *Ostrya virginiana*. The shrub layer is often sparse and may contain *Cornus alternifolia, Hamamelis virginiana, Staphylea trifolia, Viburnum prunifolium, Viburnum rafinesquianum*, and *Zanthoxylum americanum*. The herbaceous layer may contain *Arabis laevigata, Asclepias quadrifolia, Clematis occidentalis (= Clematis verticillaris), Packera obovata (= Senecio obovatus), Phryma leptostachya, Saxifraga virginiensis*, and *Triosteum aurantiacum*. This vegetation occurs on upper slopes and summits on limestone, dolomite, or marble substrates. The alliance ranges from Ontario, Canada, into the eastern United States from the Great Lakes and Northern Appalachians south along the Allegheny Plateau and Appalachian Mountains, east to the Piedmont, and west to the North Central Tillplain and Interior Low Plateau.

Alliance	*Quercus muehlenbergii - Acer saccharum - Tilia americana* Forest Alliance (A2047)

ELEMENT CONCEPT

Global Summary: This dry calcareous forest occurs on upper slopes and wooded summits on limestone, dolomite or marble bedrock in the northeastern United States. The somewhat open canopy is characterized by a diversity of tree species, including *Acer saccharum, Quercus muehlenbergii, Tilia americana, Fraxinus americana*, and occasionally *Liriodendron tulipifera, Quercus alba, Quercus prinus, Juglans cinerea, Juglans nigra, Carya cordiformis, Ulmus rubra, Carya ovata*, or *Carya ovalis*. *Ostrya virginiana, Betula lenta, Carya alba (= Carya tomentosa), Celtis occidentalis*, and/or *Cornus florida* often form a subcanopy. Shrubs can include *Hamamelis virginiana, Carpinus caroliniana, Staphylea trifolia, Cornus alternifolia, Viburnum acerifolium, Ribes americanum*, and occasionally *Zanthoxylum americanum* or *Viburnum rafinesquianum*. Vines may include *Dioscorea villosa, Menispermum canadense, Parthenocissus quinquefolia*, and *Toxicodendron radicans*. The herb layer is extraordinarily diverse with *Packera obovata (= Senecio obovatus), Carex eburnea, Carex platyphylla, Polygala*

senega, Aquilegia canadensis, Aureolaria flava, Piptatherum racemosum (= Oryzopsis racemosa), Anemone virginiana, Hepatica nobilis var. obtusa (= Hepatica americana), Symphyotrichum patens (= Aster patens), Symphyotrichum undulatum (= Aster undulatus), Triosteum aurantiacum, Thalictrum dioicum, Clematis occidentalis, Asclepias quadrifolia, Arabis canadensis, Geranium maculatum, Penstemon hirsutus, Trillium grandiflorum, Osmorhiza claytonii, Actaea pachypoda, Agastache nepetoides, Allium tricoccum, Arabis lyrata, Arisaema triphyllum, Asclepias exaltata, Collinsonia canadensis, Dichanthelium boscii, Carex laxiflora, Trichophorum planifolium (= Scirpus verecundus), and many others. Bedrock outcrops and boulders are common. Southern species tend to drop out at the northern extent of this type.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This sugar maple - chinkapin oak forest is a semi-rich, dry to dry-mesic forest occurring on calcareous soils. It occurs on upper slopes and wooded summits on limestone, dolomite or marble bedrock from New Jersey north to Vermont. Sites range from gentle to steep mid and upper sideslopes and rock outcrops with mostly eastern and southern aspects. Soils range from moderately well-drained to rapidly drained and include sandy loam, clay loam and loam. The unvegetated surface consists of leaf litter, with small amounts of exposed bedrock, large rocks, bare soil, and/or downed wood. Evidence of disturbance includes trails, stone walls, deer browse, and the presence of exotic plants.
Global Environment: Dry calcareous forest occurring on upper slopes and wooded summits on limestone or marble bedrock. Bedrock outcrops and boulders are common.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is codominated by some combination of *Quercus muehlenbergii* (MA state-imperiled), *Acer saccharum*, and/or *Fraxinus americana*, typically with *Ostrya virginiana* in the subcanopy. *Rubus occidentalis* is a common shrub. The herb layer is diverse with forbs, ferns, and graminoids, including *Amphicarpaea bracteata, Carex ebenea, Eurybia divaricata, Packera obovata*, and *Solidago flexicaulis*. A total of 12 exotic taxa were reported from the five sample plots. In addition, this community supports CT state-imperiled *Asplenium ruta-muraria* and MA state-imperiled *Asclepias verticillata*.
Global Vegetation: The somewhat open canopy is characterized by a diversity of tree species, including *Acer saccharum, Quercus muehlenbergii, Tilia americana, Fraxinus americana*, and occasionally *Liriodendron tulipifera, Quercus alba, Quercus prinus, Juglans cinerea, Juglans nigra, Carya cordiformis, Ulmus rubra, Carya ovata*, or *Carya ovalis*. *Ostrya virginiana, Betula lenta, Carya alba (= Carya tomentosa), Celtis occidentalis*, and/or *Cornus florida* often form a subcanopy. Shrubs can include *Hamamelis virginiana, Carpinus caroliniana, Staphylea trifolia, Cornus alternifolia, Viburnum acerifolium, Ribes americanum*, and occasionally *Zanthoxylum americanum* or *Viburnum rafinesquianum*. Vines may include *Dioscorea villosa, Menispermum canadense, Parthenocissus quinquefolia*, and *Toxicodendron radicans*. The herb layer is extraordinarily diverse with *Packera obovata (= Senecio obovatus), Carex eburnea, Carex platyphylla, Polygala senega, Aquilegia canadensis, Aureolaria flava, Piptatherum racemosum (= Oryzopsis racemosa), Anemone virginiana, Hepatica nobilis var. obtusa (= Hepatica americana), Symphyotrichum patens (= Aster patens), Symphyotrichum undulatum (= Aster undulatus), Triosteum aurantiacum, Thalictrum dioicum, Clematis occidentalis, Asclepias quadrifolia, Arabis canadensis, Geranium maculatum, Penstemon hirsutus, Trillium grandiflorum, Osmorhiza claytonii, Actaea pachypoda, Agastache nepetoides, Allium tricoccum, Arabis lyrata, Arisaema triphyllum, Asclepias exaltata, Collinsonia canadensis, Dichanthelium boscii, Carex laxiflora, Trichophorum planifolium (= Scirpus verecundus)*, and many others.

ELEMENT CONCEPT

Global Summary: This calciphilic maple-oak forest is found in the Central Appalachians and adjacent regions of the eastern United States, ranging south and west to the Interior Low Plateau of Tennessee and the Cumberlands of Alabama. Stands occur in thin soils over calcareous substrates, sometimes in association with limestone glades. These are typically closed-canopy, rich, dry to dry-mesic forests; in some stands the canopy may vary from closed to somewhat open, particularly in Pennsylvania at the northern edge of the range. In the Mid-Atlantic region, stands occupying the driest sites are commonly open and somewhat intermediate in physiognomy between forest and woodland. The stands are primarily composed of *Acer saccharum* or occasionally *Acer nigrum, Quercus muehlenbergii, Fraxinus americana*, and *Ostrya virginiana*. Associates include *Quercus alba, Tilia americana, Acer nigrum, Ulmus rubra, Celtis occidentalis, Carya ovalis*, and *Carya ovata*. *Quercus prinus* may also be present in some examples. A variable subcanopy and shrub layer contains *Cornus florida, Cercis canadensis, Hamamelis virginiana, Rosa carolina, Rhus aromatica, Viburnum prunifolium, Viburnum rafinesquianum, Viburnum rufidulum*, and *Zanthoxylum americanum*. The sparse to well-developed herb layer may contain *Danthonia spicata, Elymus hystrix, Bouteloua curtipendula, Ageratina altissima (= Eupatorium rugosum), Antennaria plantaginifolia, Aquilegia canadensis, Arabis laevigata, Asclepias quadrifolia, Clematis occidentalis* (to the north), *Houstonia longifolia (= Houstonia tenuifolia), Polygonum scandens, Sanicula canadensis, Saxifraga virginiensis*, and *Packera obovata (= Senecio obovatus)*. Some other herbs recorded in Virginia examples include *Agrimonia rostellata, Anemone virginiana var. virginiana, Symphyotrichum patens var. patens (= Aster patens var. patens), Bromus pubescens, Dichanthelium boscii, Erigeron pulchellus var. pulchellus, Galium circaezans, Sanicula canadensis, Scutellaria elliptica*, and *Solidago ulmifolia var. ulmifolia*. Some stands attributed to this type are mesic forests of steep slopes in the Southern Ridge and Valley which are dominated by *Acer saccharum* and some combination of *Quercus alba* and/or *Quercus muehlenbergii* with *Liriodendron tulipifera, Carya* spp., and *Aesculus flava* in either the canopy or subcanopy. The same, or related forests, are reported from limestones of the lower Cumberland Plateau escarpment of Tennessee and possibly Alabama.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This sugar maple - chinkapin oak forest occurs on middle slopes or summits of limestone ridges and sideslopes with dry, rocky soils at 550 m elevation. It was sampled on a rocky, upper slope of a calcareous ridge in Giles County, Virginia, in the Central Appalachian project area on a middle slope. Soils are dry-mesic over calcareous substrates with high levels of magnesium and calcium. The unvegetated surface is dominated by leaf litter with some downed wood, large rocks and bare soil. Evidence of disturbance includes past logging and the presence of exotic plant species.
Global Environment: This association is typically found on upper sideslopes or summits of limestone, dolomite, or marble ridges with dry soils. Along the New River in West Virginia, it is found in small patches on lower to middle gorge slopes eroded from calcareous geologic formations. These are alkaline forests associated with calcareous

soils, often surrounding, or in association with, limestone or dolomite glades. The soils are well-drained, dry, and shallow with outcrops or boulders often present. In the Ridge and Valley and Central Appalachians of Virginia (Fleming 1999), stands of this type are evidently confined to substrates weathered from limestone and dolomite, most frequently occupying submesic to subxeric, southeast- to west-facing slopes at relatively low elevations (mean = 569 m [1867 feet]). These habitats usually appear to be quite dry, rocky, and at least somewhat exposed. The stands are most often situated on middle slopes but range into both lower and upper slope topographic positions. The slope shape is typically convex in at least one direction. Soils are yellow-brown to reddish-brown clay loams and silty clay loams; soil reaction ranges from strongly acidic (pH 5.3) to mildly alkaline (pH 7.4), with mean calcium (Ca) levels of 2474 ppm. In soils weathered from dolomite, magnesium (Mg) levels may exceed 1000 ppm (Fleming 1999). Soil chemistry analyzed from the one WV plot at New River Gorge had high pH (6.8) and high levels of total cation-exchange capacity, calcium (4180 ppm), potassium (121 ppm), and magnesium (424 ppm) compared to most other soils nearby.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The variable mixed overstory of this dry, species-rich, calcareous forest is composed of *Quercus alba, Quercus rubra*, and *Quercus muehlenbergii*, while *Acer saccharum* overwhelmingly dominates the understory, accounting for almost half the total density of stems (>2.5 cm dbh) in the plot. *Fraxinus americana* is also common. *Cercis canadensis* is characteristic in the subcanopy. The shrub layer is rather sparse, while the herb layer is low and fairly dense, featuring patch-dominance by *Packera obovata, Erigeron pulchellus, Hepatica nobilis var. acuta*, and *Thalictrum dioicum*. *Ageratina altissima var. altissima, Agrimonia rostellata, Muhlenbergia sobolifera*, and *Solidago ulmifolia* are also present at low cover. The stand is fairly typical of dry calcareous forests on carbonate substrates of the Virginia Ridge and Valley province.

Global Vegetation: The tall, closed-canopy stands are primarily composed of *Acer saccharum, Quercus muehlenbergii, Fraxinus americana*, and *Ostrya virginiana*. Associates include *Quercus alba, Tilia americana, Acer nigrum, Ulmus rubra, Aesculus flava, Celtis occidentalis, Carya ovalis, Carya cordiformis*, and *Carya ovata*. *Quercus prinus* may also be present in some examples. Throughout the Central Appalachians, stands occupying the driest sites are commonly open and somewhat intermediate in physiognomy between forest and woodland. A variable subcanopy and shrub layer contains *Cornus florida, Cercis canadensis, Carpinus caroliniana, Lindera benzoin, Hamamelis virginiana, Rosa carolina, Rhus aromatica, Viburnum prunifolium, Viburnum rafinesquianum, Viburnum rufidulum*, and *Zanthoxylum americanum*. The sparse to well-developed herb layer is usually species-rich and may contain *Danthonia spicata, Elymus hystrix, Bouteloua curtipendula, Ageratina altissima (= Eupatorium rugosum), Antennaria plantaginifolia, Aquilegia canadensis, Arabis laevigata, Asclepias quadrifolia, Clematis occidentalis* (to the north), *Houstonia longifolia (= Houstonia tenuifolia), Polygonum scandens, Sanicula canadensis, Saxifraga virginiensis*, and *Packera obovata (= Senecio obovatus)*. Some other herbs recorded in Virginia examples include *Agrimonia rostellata, Anemone virginiana var. virginiana, Symphyotrichum patens var. patens (= Aster patens var. patens), Bromus pubescens, Dichanthelium boscii, Erigeron pulchellus var. pulchellus, Galium circaezans, Sanicula canadensis, Scutellaria elliptica*, and *Solidago ulmifolia var. ulmifolia*. Some additional taxa that are relatively constant in the broad type are *Asplenium platyneuron, Botrychium virginianum, Carex blanda, Actaea racemosa (= Cimicifuga racemosa), Galium triflorum, Hybanthus concolor, Maianthemum racemosum, Polygonatum biflorum, Polymnia canadensis, Ranunculus recurvatus*, and *Sanguinaria canadensis*. In addition, *Muhlenbergia sobolifera* may dominate the herbaceous stratum of some stands.

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Poa compressa* (High/Low)
Global: Vulnerable Plants: *Arabis patens* (G3), *Berberis canadensis* (G3), *Carex purpurifera* (G4?, VA state-rare), *Delphinium exaltatum* (G3), *Desmodium cuspidatum* (G5, VA state-rare), *Lithospermum latifolium* (G4, VA state-rare), *Melica nitens* (G5, VA state-rare), *Monarda fistulosa* ssp. *brevis* (G5T1T2, (= ssp. brevis) (unpubl.))

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (19-Oct-2000). This forest is widely but somewhat locally distributed throughout its range in suitable calcareous habitats. It often occurs in relatively small, sometimes linear, patches except where carbonate substrates are more continuously exposed, for example on low hills and knobs (Fleming 1999). It also occurs in large patches on dry limestone knobs in the southwestern Virginia Ridge and Valley. There is very little requisite habitat for this vegetation in the George Washington and Jefferson national forests of Virginia; hence the type can be considered rare there. The largest occurrences on these national forests are probably in the Clinch Ranger District.

RELATED CONCEPTS

Global Similar Types:
- *Acer saccharum - Carya ovata - Juglans nigra / Symphoricarpos orbiculatus / Galium circaezans* Forest (CEGL004741) related forest of the Tennessee Nashville Basin.
- *Acer saccharum - Quercus muehlenbergii / Carex platyphylla* Forest (CEGL006162) a northern variant in southern New England, northern New Jersey, and eastern New York.
- *Acer saccharum - Quercus muehlenbergii* Forest (CEGL005010) more northwesterly.
- *Fraxinus americana - Carya ovata / Frangula caroliniana / Helianthus hirsutus* Woodland (CEGL008458)
- *Quercus alba - Quercus rubra - Carya ovalis / Acer saccharum / Polystichum acrostichoides* Forest (CEGL007233) a more mesic forest found to the south and west.
- *Quercus muehlenbergii - Carya* spp. / *Ostrya virginiana* Upper East Gulf Coastal Plain Forest (CEGL003903)
- *Quercus muehlenbergii - Quercus (alba, rubra) - Carya cordiformis / Viburnum prunifolium* Forest (CEGL004793) clearly related.
- *Quercus muehlenbergii - Quercus (shumardii, stellata) / Cercis canadensis / Viburnum rufidulum* Forest (CEGL007699) more oak-dominated.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This is a dry calcareous forest of limestone and dolomitic (and rarely other sedimentary) substrates. It is rare along the AT. *Quercus muehlenbergii* is the most diagnostic tree. The herbaceous flora is patchy but species-rich, prominently featuring dry-site species such as *Packera obovata, Erigeron pulchellus, Muhlenbergia sobolifera*, and *Solidago ulmifolia*.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: The range of this type, which was initially described from "the High Alleghenies," has gradually extended south to at least the Interior Low Plateau. It may require subdivision. (This

type was formerly attributed questionably to the Upper East Gulf Coastal Plain.) Some stands attributed to this type are mesic forests of steep slopes in the Southern Ridge and Valley which are dominated by *Acer saccharum* and some combination of *Quercus alba* and/or *Quercus muehlenbergii* with *Liriodendron tulipifera, Carya* spp., and *Aesculus flava* in either the canopy or subcanopy (Andreu and Tukman 1995). The same, or related forests, are reported from limestones of the lower Cumberland Plateau escarpment of Tennessee and possibly Alabama (Bowen et al. 1995). There has been discussion of the merits of subdividing this type, in effect re-splitting former *Acer saccharum - Quercus (alba, muehlenbergii) / Aesculus flava* Forest (CEGL006136) (or an equivalent) out of it again.

In a regional analysis of 1134 plots (Georgia, North Carolina, Tennessee, Virginia) for the Southern Appalachian portion of the Appalachian Trail (Fleming and Patterson 2009a), only 14 plots from southwestern Virginia were classified as this type. In a 1300-plot analysis of all Virginia montane upland forest and woodland data (Fleming and Patterson 2009b), 23 plots from across western Virginia are classified as this type. The species that have the highest diagnostic values for the latter group (compared to other calcareous forests) are *Muhlenbergia sobolifera, Erigeron pulchellus var. pulchellus, Bromus pubescens, Solidago ulmifolia var. ulmifolia, Brachyelytrum erectum, Ulmus rubra, Packera obovata, Viburnum prunifolium, Parthenocissus quinquefolia, Quercus rubra, Ostrya virginiana, Thalictrum dioicum, Fraxinus americana*, and *Quercus muehlenbergii*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is extremely uncommon along the AT because of its confinement to limestone. It is limited to valleys of the Ridge and Valley divergence area between I-81 and Roanoke, Virginia. It was sampled at Bluff City South in Virginia.
Global Range: This maple - oak forest is found in the Central Appalachians and adjacent regions of the eastern United States, including the Ridge and Valley and Western Allegheny Plateau regions, ranging from Pennsylvania southward to the Interior Low Plateau of Tennessee and the Ridge and Valley of Virginia.

G650. NORTHEASTERN OAK - HICKORY FOREST & WOODLAND

Group Summary Description: This group is found throughout the northeastern United States, south to Georgia. It is distinguished from other forested groups within the region by a dry-mesic to dry edaphic condition that is transitional between dry barrens and mesic hardwood forests. Forest cover can range from a dense to moderately open canopy of deciduous broadleaf trees (conifers never exceed 25%), and there is commonly a dense shrub layer. In most examples, this vegetation is overwhelmingly deciduous, and characterized by *Quercus alba, Quercus falcata, Quercus prinus, Quercus rubra, Quercus velutina, Fagus grandifolia, Carya glabra, Carya ovata, Carya cordiformis, Carya alba, Fraxinus americana*, and in the southern part of the range, *Liriodendron tulipifera*. One alliance of this group encompasses coastal plain oak-hickory forests of ancient inland dune ridges that are the

remnants of former river terraces; these forests are dry, oak-dominated, and characterized by *Carya pallida*. Pines such as *Pinus rigida, Pinus echinata, Pinus virginiana* can contribute significant canopy cover in these settings.

A2053 *Quercus alba - Carya* spp. - *Fraxinus americana* Forest Alliance

Alliance Summary Description: Associations of this alliance include dry, relatively "rich" forests and open woodlands of the northeastern United States and southern Canada dominated by *Quercus* species and include *Carya* species as a prominent (rarely codominant) feature. *Fraxinus americana*, although sometimes a sporadic member, is generally characteristic of these forests. Associated canopy species include *Quercus alba, Quercus rubra, Quercus velutina, Carya ovalis, Carya glabra*, as well as other oaks and hickories. This vegetation mainly occurs on dry upper slopes or ridgetops; one association is on a bedrock floodplain terrace. Soils are usually fertile, but often very rocky, on well-drained loams or sandy loams, predominantly on southern or eastern exposures. *Ostrya virginiana* is a common understory tree. The shrub layer is usually interrupted to absent. When present, it includes *Viburnum rafinesquianum* and *Cercis canadensis* (at the southern edge of the range). Although ericaceous species may be present and occasionally locally abundant, they are not characteristic. The herbaceous layer is characterized by forbs and may be quite diverse. Common graminoid species include *Carex pensylvanica, Carex lucorum* (at the northern range limit), *Muhlenbergia sobolifera, Elymus hystrix*, and *Danthonia spicata*. Other forbs found in these communities include *Asplenium platyneuron, Solidago caesia, Amphicarpaea bracteata, Woodsia obtusa, Selaginella rupestris, Galium circaezans*, and *Arabis laevigata*. The relatively open canopy, sparse shrub layer, and dense herbaceous layer impart a parklike appearance to many of these forests.

[CEGL003683] *Fraxinus americana - Carya glabra / Muhlenbergia sobolifera - Helianthus divaricatus - Solidago ulmifolia* Woodland

Translated Name: **White Ash - Pignut Hickory / Rock Muhly - Woodland Sunflower - Elmleaf Goldenrod Woodland**

Common Name: **Central Appalachian Basic Woodland**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Northeastern Oak - Hickory Forest & Woodland (G650)
Alliance	*Quercus alba - Carya* spp. - *Fraxinus americana* Forest Alliance (A2053)

Element Concept

Global Summary: This association is a woodland dominated by *Fraxinus americana* and *Carya glabra*, occurring in dry, rocky, fertile soils derived from mafic igneous and metamorphic rocks and, less frequently, granitic rocks and calcareous sedimentary and metasedimentary formations. Stands are found from 60 to 1000 m (240-3300 feet) in elevation in the Blue Ridge and upper Piedmont of Virginia, Maryland, and West Virginia. Less constant and important canopy species include *Carya ovalis, Quercus prinus, Quercus rubra var. rubra, Juniperus virginiana*, and *Pinus virginiana*. Subcanopy species include *Celtis tenuifolia, Celtis occidentalis, Cercis canadensis var. canadensis, Ostrya virginiana*, and *Ulmus rubra*. The shrub stratum includes *Rhus aromatica var. aromatica, Ptelea trifoliata, Viburnum rafinesquianum (= var. rafinesquianum), Rhus typhina, Toxicodendron radicans*, and *Vaccinium pallidum*. Typical species of the herb stratum include *Muhlenbergia sobolifera, Helianthus divaricatus, Pycnanthemum incanum, Elymus hystrix, Carex pensylvanica, Polygonum tenue, Woodsia ilvensis, Woodsia obtusa, Phacelia dubia, Symphyotrichum oblongifolium (= Aster oblongifolius), Solidago arguta var. harrisii (= Solidago harrisii), Selaginella rupestris, Cheilanthes lanosa, Danthonia spicata, Cardamine parviflora var. arenicola, Draba ramosissima, Sedum glaucophyllum*, and others.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This Central Appalachian basic woodland occurs on steep rocky slopes from 60 to 1,000 m (240-3,300 feet) elevation with metabasalt outcrops in the Blue Ridge and upper Piedmont. It was sampled at four locations in the park. Sites are moderate to steep mid and upper slopes with mostly southern aspects. Soils are rapidly to well-drained loamy sand and silt loam. The unvegetated surface is dominated by leaf litter with a mix of exposed bedrock, large and small rocks, downed wood and bare soil. Evidence of disturbance includes past fire, deer trails and browse, and the presence of exotic plant species.

Global Environment: Stands occupy dry, rocky, thin-soiled slopes over mafic igneous and metamorphic rocks (metabasalt, diabase, actinolite schist, layered pyroxene granulite) of the Blue Ridge and upper Piedmont, and less frequently on pyroxene- or hornblende-bearing granites of the Blue Ridge, and calcareous sedimentary and metasedimentary rocks (sandstone, siltstone, metasiltstone, phyllite) of the Blue Ridge and Ridge and Valley provinces. Elevations of 38 plot samples and other observed stands range from 60 to 1012 m (240-3300 feet), with a mean of about 550 m (1800 feet). Habitats are usually situated on steep (up to 37°) middle slopes, often on or around large bedrock exposures. Mean surface cover of outcrops and loose rocks is about 40%. Aspect is variable, but the majority of sites have south to southwest aspects. Somewhat unusual and more mesic sites for this community occur on very steep, east- to northeast-facing, almost cliff-like exposures of pyroxene-bearing granites of the Virginia central Blue Ridge, with 50-70% of surface substrate of exposed bedrock and loose stones. Soils are mostly very stony clay loams that are strongly acidic (mean pH = 5.1) but have relatively high calcium (ca. 1800 ppm) and magnesium (ca. 400 ppm) levels.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Carya glabra* and *Fraxinus americana* are codominant in the open woodland canopy. *Quercus prinus* and *Quercus rubra* are also common. *Celtis occidentalis* is common in the subcanopy. Herbs include *Asplenium platyneuron, Bidens bipinnata, Carex pensylvanica, Danthonia spicata, Carex muehlenbergii, Muhlenbergia sobolifera, Paronychia canadensis, Phytolacca americana, Pycnanthemum incanum, Verbascum thapsus*, and *Solidago ulmifolia*.

Global Vegetation: Vegetation consists of open to very open woodlands with stunted canopies of 6- to 15-m tall trees. *Fraxinus americana* is the characteristic, consistently dominant or codominant canopy species, usually contributing at least 25% cover. *Carya glabra* and, less frequently, *Carya ovata* and *Carya ovalis* are common codominant overstory associates. *Quercus prinus, Quercus rubra, Juniperus virginiana, Pinus virginiana*, and *Juglans nigra* are minor canopy trees. Understory and shrub layers vary in density, with *Ulmus rubra, Celtis occidentalis, Ostrya virginiana, Cercis canadensis*, and *Rosa carolina* the most typical species. The herb layer varies from moderately open to dense and contains a diversity of xerophytic grasses and forbs. Dominant herbs are *Muhlenbergia sobolifera, Helianthus divaricatus, Solidago ulmifolia, Carex pensylvanica, Elymus hystrix*, and *Phacelia dubia*. Unusual stands that occur on concave slopes at two Virginia sites have herb layers dominated by *Chasmanthium latifolium*. Less abundant but relatively constant (50%) herbs include *Acalypha virginica, Ambrosia artemisiifolia, Antennaria plantaginifolia, Arabis laevigata, Danthonia spicata, Dichanthelium boscii, Dichanthelium linearifolium, Eupatorium sessilifolium, Geum virginianum, Heuchera americana, Lespedeza frutescens (= Lespedeza intermedia), Polygonum scandens var. cristatum, Pycnanthemum incanum, Saxifraga virginiensis*, and *Woodsia obtusa*. Less frequent but locally abundant or important herbaceous species include *Schizachyrium scoparium, Senna marilandica, Symphyotrichum laeve var. concinnum (= Aster laevis var. concinnum), Symphyotrichum oblongifolium*, and *Tradescantia ohiensis*; the last species is prominent at, but confined to, the southernmost sites for this community in Giles and Grayson counties. *Solidago juncea, Carex muehlenbergii var. enervis, Lespedeza virginica*, and *Dichanthelium depauperatum* are important species of a variant of this community type occurring on metasedimentary rocks in Maryland, near Harpers Ferry, West Virginia.

An unusual variant of the type, occurring on east- to northeast-facing cliff-like exposures of pyroxene-bearing granites, is somewhat more mesic in character. *Fraxinus americana* is the sole canopy dominant of this variant, with minor associates of *Quercus prinus, Tilia americana, Ulmus rubra*, and *Carya ovata*. The shrub layer contains young reproduction of the canopy species, as well as *Celtis occidentalis, Ostrya virginiana, Rosa carolina*, and *Crataegus pruinosa*. Scrambling vines of *Parthenocissus quinquefolia, Vitis aestivalis*, and *Toxicodendron radicans* are abundant. The herb layer is moderately dense to dense (>60% cover) despite the abundant rock cover. The lithophytes *Dryopteris marginalis, Sedum glaucophyllum, Carex communis*, and *Saxifraga virginiensis* contribute the greatest herbaceous cover. Species richness of plot-sampled stands ranges from 46 to 103 taxa per 400 square meters (mean = 66).

Global Dynamics: This community is associated with outcrops and thin-soil areas over mafic rocks and, less frequently, granitic, sedimentary, and metasedimentary rocks with high base status. Stands are mostly edaphically maintained but may occasionally be impacted by fires. The exotic herb *Commelina communis* and the shrub *Symphoricarpos orbiculatus*, introduced from farther west, are problematic invasives at some sites. *Symphoricarpos orbiculatus* is particularly aggressive and is capable of covering large areas with dense colonies in a matter of years, once established.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Ailanthus altissima* (Medium), *Alliaria petiolata* (High/Medium), *Artemisia vulgaris*, *Bromus sterilis* (Medium/Low), *Commelina communis*, *Humulus japonicus* (Medium/Low), *Hypericum perforatum* (High/Medium), *Lonicera japonica* (High/Medium), *Lonicera morrowii* (High/Medium), *Microstegium vimineum* (High/Medium), *Nepeta cataria*, *Poa compressa* (High/Low), *Polygonum perfoliatum* (Medium), *Rubus phoenicolasius* (Medium), *Verbascum thapsus* (Medium)
Global: Vulnerable Plants: *Cuscuta coryli* (G5?, VA state-rare), *Potentilla arguta* (G5, VA state-rare), *Pycnanthemum clinopodioides* (G1G2), *Sporobolus compositus* (G5, VA state-rare), *Taenidia montana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (24-Feb-2010). This community is naturally rare, geographically restricted, and confined to special edaphic habitats, primarily over mafic rocks in the Blue Ridge and upper Piedmont of Virginia and Maryland, but also on Blue Ridge granite and calcareous sedimentary and metasedimentary rocks in the Ridge and Valley. There are few threats to occurrences of this community. Where trails transect or approach these communities, they receive minor trampling damage and introduction of alien species.

RELATED CONCEPTS

Global Similar Types:

- *Carya (glabra, alba) - Fraxinus americana - (Juniperus virginiana var. virginiana)* Woodland (CEGL003752) is a closely related woodland of the Southern Blue Ridge; the southernmost stands of CEGL003683 in Virginia are transitional to this.
- *Carya glabra - Fraxinus americana / Acer leucoderme / Piptochaetium avenaceum* Woodland (CEGL008489)
- *Fraxinus americana / Physocarpus opulifolius / Carex pensylvanica - Allium cernuum - (Phacelia dubia)* Wooded Grassland (CEGL008529) is more open, wooded herbaceous vegetation of middle elevations on the Northern Blue Ridge.
- *Juniperus virginiana - Fraxinus americana / Carex pensylvanica - Cheilanthes lanosa* Open Woodland (CEGL006037)
- *Juniperus virginiana var. virginiana - Celtis tenuifolia - Cercis canadensis / Sporobolus clandestinus - Danthonia sericea* Woodland (CEGL008499)
- *Quercus alba - Carya glabra - Fraxinus americana / Muhlenbergia sobolifera - Elymus hystrix* Forest (CEGL006216) is an oak-hickory forest occurring on montmorillonite clays of the Piedmont and Blue Ridge foothills.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community also occurs near the AT corridor in Virginia near Narrows in Giles County, at Striped Rock in Grayson County, and at Bald Knob in Franklin County.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: The AT passes through a polygon of this type (CEGL003683) in Harpers Ferry.
Global Classification Comments: As currently circumscribed, this community type does not include related (and often spatially associated) wooded herbaceous vegetation occurring on massive, exposed outcrops, e.g., *Fraxinus americana / Physocarpus opulifolius / Carex pensylvanica - Allium cernuum - (Phacelia dubia)* Wooded Grassland (CEGL008529). In an 1134-plot regional analysis for the Southern Appalachian portion of the Appalachian Trail, only four southwestern Virginia plots were classified as this type (Fleming and Patterson 2009a), but proved distinct from several other Southern Appalachian woodlands. In a subsequent 1300-plot analysis of all Virginia upland forests and woodlands (Fleming and Patterson 2009b), plots from the southernmost parts of this association did not separate from more northern plots in quantitative analyses. See comments on similar associations.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the Blue Ridge and upper Piedmont of Virginia, Maryland, and West Virginia. It was sampled in Maryland (including Maryland Heights) and in Virginia.
Global Range: This community is mostly restricted to areas underlain by mafic metamorphic rocks (metabasalt, actinolite schist, layered pyroxene granulite) in the Blue Ridge and adjacent Piedmont foothills of northern Virginia and Maryland. However, scattered outliers have been documented on diabase of the northern Piedmont Triassic Basin; on calcareous sedimentary and metasedimentary substrates (sandstone, shale, metasiltstone, and phyllite) of the Blue Ridge and Ridge and Valley provinces; and on granitic terrain of the Blue Ridge. This vegetation type is rare in the George Washington National Forest, where the only known examples are located at the northern end of the Pedlar Ranger District. Excellent Blue Ridge and Piedmont examples of the type are protected in Shenandoah National Park and The Nature Conservancy's Wildcat Mountain Natural Area, respectively.

Group	Northeastern Oak - Hickory Forest & Woodland (G650)
Alliance	*Quercus alba* - *Carya* spp. - *Fraxinus americana* Forest Alliance (A2053)

ELEMENT CONCEPT

Global Summary: This oak-hickory forest occurs on well-drained loamy sand of midslopes in the northeastern United States. This vegetation is ecologically transitional between dry-rich oak-hickory forests of relatively high diversity and dry, acidic oak species-poor forests. *Quercus rubra, Quercus alba*, and *Quercus velutina* are prominent in the canopy. *Quercus prinus* and *Quercus coccinea* are canopy associates in the southern portion of the range. Typical hickory species include *Carya glabra, Carya ovata, Carya alba (= Carya tomentosa)*, and *Carya ovalis*. Other canopy associates may include *Acer rubrum, Sassafras albidum*, and *Amelanchier arborea*. At the northern range limit of this type, *Pinus strobus* and *Betula lenta* also occur as minor associates. *Cornus florida* is a characteristic understory tree in portions of the range. The shrub layer is characterized by *Viburnum acerifolium*, with other frequent associates including *Hamamelis virginiana, Vaccinium corymbosum, Corylus cornuta*, and *Corylus americana*. A short-shrub layer may be common, but is generally not abundant, and is characterized by *Vaccinium pallidum* and *Gaylussacia baccata*, with *Vaccinium angustifolium* occurring more frequently to the north. The herbaceous layer is characterized by *Carex pensylvanica, Carex rosea, Maianthemum racemosum (= Smilacina racemosa), Aralia nudicaulis, Hieracium venosum, Solidago bicolor, Desmodium glutinosum, Desmodium paniculatum, Melampyrum lineare, Chimaphila maculata, Eurybia divaricata (= Aster divaricatus), Danthonia spicata, Aureolaria* spp., *Pteridium aquilinum, Dennstaedtia punctilobula*, and *Helianthemum canadense*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This acidic, dry oak-hickory forest of the Northeast occurs on well-drained loamy sand of midslopes. It was sampled at five locations in the Central Appalachian project area. Sites range from gentle to moderate mid and lower slopes of any aspect. Soils are dry, well-drained sandy loam and clay loam. The unvegetated surface is dominated by leaf litter with small amounts of downed wood and occasional large/small rocks or bare soil. Evidence of disturbance includes the presence of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This is an acidic, dry oak-hickory forest of the Northeast (from Maine to Maryland) that occurs on well-drained loamy sand of midslopes. Sampled sites range from 190-463 m (623-1,519 feet) elevation and from gentle to somewhat steep slopes and summits with all aspects. Soils are dry to dry-mesic, moderately well- to well-drained sandy loam, silt loam and loam. The unvegetated surface consists of leaf litter, with lesser amounts of exposed bedrock, large/small rocks, bare soil, and/or downed wood. Evidence of disturbance includes clearing and alterations to hydrology (ditching) at one site, and the presence of exotic plants.

Global Environment: This forest type occurs on well-drained loamy sand of midslopes and other dry-mesic sites.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus rubra, Quercus alba*, and *Quercus velutina* are prominent in the canopy. *Quercus prinus* and *Quercus coccinea* are canopy associates in the southern portion of the range. Typical hickory species include *Carya glabra, Carya ovata, Carya alba*, and *Carya ovalis*. *Nyssa sylvatica* may be common. *Cornus florida* is a characteristic understory tree. The shrub layer is characterized by *Viburnum acerifolium*; *Rubus allegheniensis* and *Hamamelis virginiana* may also be present. A patchy low-shrub layer of *Vaccinium angustifolium, Vaccinium pallidum*, and/or *Gaylussacia baccata* is typical. A patchy herb layer may include *Aralia nudicaulis, Dennstaedtia punctilobula*, and *Dryopteris marginalis*.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Quercus rubra, Quercus alba*, and *Quercus velutina* are prominent in the canopy; *Quercus prinus* and *Quercus coccinea* are canopy associates in the southern portion of the range. Typical hickory species include *Carya glabra, Carya ovata, Carya alba*, and *Carya ovalis*. *Acer saccharum, Betula lenta*, and *Nyssa sylvatica* may be common. *Carpinus caroliniana, Ostrya virginiana*, and *Cornus florida* are common understory trees. The shrub layer is characterized by *Viburnum acerifolium*. *Kalmia latifolia* is common in some stands. A dwarf-shrub layer may be common but generally not abundant with *Vaccinium angustifolium, Vaccinium pallidum*, and/or *Gaylussacia baccata* and a patchy herb layer with *Solidago caesia, Eurybia divaricata, Aralia nudicaulis*, and *Dryopteris marginalis*. In addition, this community supports NJ state-critically imperiled *Diplazium pycnocarpon*.

Global Vegetation: This vegetation is ecologically transitional between dry-rich oak-hickory forests of relatively high diversity and dry, acidic oak-species-poor forests. *Quercus rubra, Quercus alba*, and *Quercus velutina* are prominent in the canopy. Typical hickory species include *Carya glabra, Carya ovata, Carya alba (= Carya tomentosa)*, and *Carya ovalis*. Other canopy associates may include *Acer rubrum, Quercus prinus, Sassafras albidum*, and *Amelanchier arborea*. *Pinus strobus, Tsuga canadensis*, and *Betula lenta* may also occur as minor associates. *Cornus florida* is a characteristic understory tree in portions of the range. The shrub layer is typically rather sparse and characterized by *Viburnum acerifolium*, with other frequent associates including *Hamamelis virginiana, Vaccinium corymbosum, Kalmia latifolia, Corylus cornuta*, and *Corylus americana*. A short-shrub layer may be common but generally not abundant, characterized by *Vaccinium pallidum* and *Gaylussacia baccata*, with *Vaccinium angustifolium* occurring more frequently to the north. The herbaceous layer is characterized by *Carex pensylvanica, Maianthemum racemosum (= Smilacina racemosa), Dryopteris marginalis, Aralia nudicaulis, Hieracium venosum, Solidago bicolor, Desmodium glutinosum, Desmodium paniculatum, Melampyrum lineare, Chimaphila maculata, Eurybia divaricata (= Aster divaricatus), Danthonia spicata, Deschampsia flexuosa, Dennstaedtia punctilobula, Aureolaria* spp., *Pteridium aquilinum, Dennstaedtia punctilobula*, and *Helianthemum canadense*. The invasive species *Microstegium vimineum* and *Berberis thunbergii* may also be present in this forest type.

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G4G5 (24-Jan-2005). This type is not naturally rare and has a wide geographic distribution. Mature stands, however, are uncommon and most stands are subject to logging disturbances or even complete destruction if located in rapidly developing suburban areas.

RELATED CONCEPTS

Global Similar Types:

- *Acer saccharum - Betula alleghaniensis - Quercus rubra / Viburnum acerifolium* Forest (CEGL006943)
- *Pinus strobus - Quercus (rubra, velutina) - Fagus grandifolia* Forest (CEGL006293) can intergrade with this type in New England but is characterized by *Fagus grandifolia* (more or less absent in CEGL006336), a greater amount of *Pinus strobus* in the canopy (usually >20%), and little or no *Carya*.
- *Quercus alba - Quercus rubra - Carya alba / Cornus florida* Acidic Forest (CEGL002067) also contains *Actaea racemosa* and can occur on cherty limestone, and *Quercus velutina* is not characteristic.
- *Quercus alba - Quercus rubra - Carya alba / Vaccinium stamineum / Desmodium nudiflorum* Piedmont Forest (CEGL008475) southern analogue of CEGL006336; is more diverse and occupies soils with slightly higher base status. *Quercus velutina* is not as characteristic of this type. A number of southern herbs such as *Aristolochia serpentaria* are not found in CEGL006336; northern species such as *Corylus cornuta, Vaccinium angustifolium*, and *Aralia nudicaulis* are not found in CEGL008475.
- *Quercus coccinea - Quercus velutina / Sassafras albidum / Vaccinium pallidum* Forest (CEGL006375) lacks *Viburnum acerifolium* and *Cornus florida* and in general is less diverse and occurring on relatively more nutrient-poor soils.
- *Quercus prinus - Quercus (rubra, velutina) / Vaccinium (angustifolium, pallidum*) Forest (CEGL006282)
- *Quercus velutina - Quercus alba - Carya (glabra, ovata)* Forest (CEGL002076) also contains *Quercus ellipsoidalis* or *Quercus macrocarpa* and is of shorter stature and more open canopy.
- *Quercus velutina / Carex pensylvanica* Forest (CEGL002078) is drier and more infertile, and lacks *Viburnum acerifolium, Hamamelis virginiana* and other shrubs.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: A wide range of heath shrub cover was observed in this association throughout the Lower New England project area. While *Carya* spp. are present in most examples of this association, the stand on the north end of Sharon Mountain in Connecticut lacks hickories. *Cornus florida* is characteristic whether there are heath shrubs or not. *Hamamelis virginiana* is also common. Lower New England High Slope Chestnut Oak Forest (CEGL006282) is more depauperate.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: The stand on Mt. Prospect in Connecticut has an unusual abundance of *Tsuga canadensis* in the subcanopy.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community ranges from Maryland to Maine. It was sampled in Cumberland and Perry counties, Pennsylvania, in the Central Appalachian project area. It does not occur in Virginia.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (including at Housatonic Valley - Buck Hill, Mt. Prospect, Sharon Mountain - North End), New Jersey (Culvers Gap North, High Point South, Unionville East), New York (Corbin Hill, Nuclear Lake, Bellvale Mountain South), and at Delaware Water Gap in Pennsylvania.
Global Range: This association occurs from Maine to Maryland.

Alliance	*Quercus alba* - *Carya* spp. - *Fraxinus americana* Forest Alliance (A2053)

ELEMENT CONCEPT

Global Summary: This community is associated with substrates weathered from shale, sandstone, and other sedimentary and metasedimentary rocks in the Central Appalachian region. It appears to be widespread at low elevations of the Ridge and Valley province in Virginia and more local on the western flank of the Northern Blue Ridge, the northern edge of the Southern Blue Ridge, and extending into the Ridge and Valley of West Virginia and Maryland. It is rare on monadnocks of the extreme western Piedmont in southwestern Virginia. Extensive sites for this community in the Ridge and Valley occur on low shale knobs and ridges, or at the base of higher sandstone ridges, where local shale strata have been exposed by stream incision. On the Blue Ridge, stands are confined to a belt of metasedimentary rocks that overlie the plutonic basement complex on the western side of the anticlinorium. Habitats encompass dry, mostly southeast- to west-facing slopes, hollows, broad sub-level ridge crests, and occasionally dry valley bottoms at low elevations (mostly <610 m [2000 feet]). Slope shape is generally convex in at least one direction. The characteristic vegetation of this type is an open oak-hickory or oak-hickory-pine forest dominated by oaks (particularly *Quercus prinus* and *Quercus alba*), with high cover of *Carya* spp., especially *Carya glabra*. *Quercus velutina, Quercus rubra, Carya alba, Pinus virginiana*, and *Pinus strobus* are also important, sometimes codominant trees. Stands in which *Quercus alba* greatly dominates are also common. Total canopy cover is usually in the range of 60-80%, and dominant canopy trees typically do not much exceed, and in some situations

do not reach, 20 m in height. Minor canopy associates include *Carya ovalis, Pinus echinata, Quercus coccinea*, and *Quercus stellata*. Young representatives of most canopy species are common in the understory, along with *Cornus florida* and *Amelanchier arborea*. Generally, there is only a moderate to sparse representation of ericaceous (heath family) shrubs in this community type. However, on gentle ridge crests, where litter and humus tend to accumulate, *Vaccinium pallidum* may dominate the shrub layer in low colonies. On the more extensive steep, convex slopes, where litter accumulations are thin and patchy, ericads are sparse and herbaceous richness tends to be moderately high, although total herb cover can be quite sparse.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This low-elevation (mostly <762 m [2,500 feet]) dry but diverse oak-hickory forest occurs on southeast - to west-facing slopes, hollows, broad sub-level ridge crests, and occasionally dry valley bottoms, with substrates weathered from shale, sandstone, and other sedimentary rocks. It was sampled at 11 locations in the park. Sites include gentle to steep slopes and summits with mostly southerly aspects. Soils are dry to dry-mesic, rapidly to well-drained silt loam, loam and clay loam. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Evidence of disturbance includes grazing/browsing, oak decline, and the presence of exotic plant species.
Global Environment: This community is associated with submesic to subxeric sites on shale, siltstone, metasiltstone, phyllite, sandstone, and deep alluvial fan material washed from these substrates. Extensive sites in the Ridge and Valley occur on low shale knobs and ridges, or at the base of higher sandstone ridges, where local shale strata have been exposed by stream incision. On the Blue Ridge, stands are confined to a belt of metasedimentary rocks that overlie the plutonic basement complex on the western side of the anticlinorium. Habitats encompass dry and dry-mesic, mostly southeast- to west-facing slopes, hollows, broad sublevel ridge crests, and occasionally dry valley bottoms at low elevations (mostly <610 m [2000 feet]). Slope shape is generally convex in at least one direction. The prevalent soils are loams of the Weikert-Berks-Rough complex. Although ranging from strongly to extremely acidic, soil samples collected from plots have slightly higher mean pH, calcium, and magnesium levels, and much lower iron and aluminum than those of more xerophytic oak/heath types. Occasional sites on the Martinsburg shale formation may be moderately calcareous. On steep slopes, the surface cover of mineral soil may be significant (up to 57% in plots) due to erosional processes.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus prinus, Quercus alba*, and/or *Quercus velutina* are codominant in the canopy along with high cover of *Carya glabra* and/or *Carya alba*. *Prunus serotina, Fraxinus americana, Acer rubrum*, and *Sassafras albidum* are common. Common shrubs include *Amelanchier arborea, Rosa carolina var. carolina, Vaccinium stamineum*, and *Vaccinium pallidum*. Common herbs include *Carex pensylvanica, Chimaphila maculata, Dichanthelium boscii, Danthonia spicata, Houstonia longifolia, Polygonatum biflorum, Potentilla canadensis*, and *Symphyotrichum undulatum*. *Smilax rotundifolia* is a common vine. In addition, this community supports VA-state critically imperiled *Heuchera caroliniana* and *Pycnanthemum clinopodioides* (also considered globally imperiled).
Global Vegetation: The characteristic vegetation of this type is an open oak-hickory or oak-hickory-pine forest dominated by oaks (particularly *Quercus prinus* and *Quercus alba*), with high cover of *Carya* spp., especially *Carya glabra*. *Quercus velutina, Quercus rubra, Carya alba, Pinus virginiana*, and *Pinus strobus* are also important, sometimes codominant trees. Stands in which *Quercus alba* greatly dominates are also common. Total canopy cover is usually in the range or 60-80%, and dominant canopy trees typically do not much exceed, and in some situations do not reach, 20 m in height. Minor canopy associates include *Carya ovalis, Pinus echinata, Quercus coccinea*, and *Quercus stellata*. Young representatives of most canopy species are common in the understory, along with *Acer rubrum, Cornus florida*, and *Amelanchier arborea*. At the richer end of the soil spectrum, nutrient-demanding species such as *Cercis canadensis, Acer saccharum, Ostrya virginiana, Fraxinus americana*, and *Ulmus rubra* may be present in the understory but rarely have more than 5% cover in a 400-square-meter plot. Generally, there is only a moderate to sparse representation of ericaceous (heath family) shrubs in this community. However, on gentle ridge crests, where litter and humus tend to accumulate, *Vaccinium pallidum* may dominate the shrub layer in low colonies. Frequent, non-ericaceous low shrubs include *Viburnum acerifolium* and *Rosa carolina*. On the more extensive steep, convex slopes, where litter accumulations are thin and patchy, ericads are sparse and herbaceous richness tends to be moderately high, although total herbaceous cover can be quite sparse. The most constant and characteristic graminoids are *Carex pensylvanica, Danthonia spicata, Dichanthelium boscii*, and *Deschampsia flexuosa*. Characteristic forbs are *Antennaria plantaginifolia, Chimaphila maculata, Desmodium rotundifolium, Galium circaezans, Houstonia longifolia, Maianthemum racemosum ssp. racemosum, Polygonatum biflorum, Potentilla canadensis, Scutellaria elliptica, Symphyotrichum undulatum, Vicia caroliniana*, and several *Lespedeza*

spp. Species richness of 35 plot-sampled stands used in the NCR Parks analysis ranges from 27 to 73 taxa per 400 square meters (mean = 46). Species richness of 49 Virginia plots ranges from 29 to 105 taxa per 400 square meters (mean = 63).

Global Dynamics: Increment cores taken from old trees in the Peters Mountain area of Alleghany County (James River Ranger District) (e.g., a 44-cm (17-inch) dbh *Quercus alba* about 225 years old, a 49-cm (19-inch) dbh *Quercus alba* about 155 years old, and a 46-cm (18-inch) dbh coppice sprout of *Quercus prinus* about 175 years old) indicate slow growth rates in stands of this type (Fleming and Moorhead 2000). Data collected from throughout the Peters Mountain study area also indicate that *Castanea dentata* was much less important in pre-blight forests on shale compared to those on the area's sandstone ridges (Fleming and Moorhead 2000). Periodic drought stress and frequent low-intensity fires are natural disturbances that regenerate the oak component of this community. Due to the contemporary reduction or exclusion of fire from most sites, stands of this association exhibit poor oak recruitment and have become susceptible to invasion by *Acer rubrum, Pinus strobus*, and other shade-tolerant mesophytic trees.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Heuchera caroliniana* (G3, globally vulnerable & VA state-critically imperiled), *Pycnanthemum clinopodioides* (G1G2, globally imperiled & VA state-critically imperiled); **Invasive/Exotic Plants**: *Alliaria petiolata* (High/Medium), *Elaeagnus umbellata* var. *parvifolia*, *Lonicera japonica* (High/Medium), *Lonicera maackii* (High), *Rosa multiflora* (Medium/Low), *Taraxacum officinale*

Global: Vulnerable Plants: *Berberis canadensis* (G3), *Clematis coactilis* (G3), *Heuchera caroliniana* (G3), *Onosmodium virginianum* (G4, VA state-rare), *Pycnanthemum clinopodioides* (G1G2)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (2-Oct-2006). Although currently known from a relatively small geographic range, this community type covers extensive areas at low elevations in the Central Appalachians of Virginia and Maryland. It is very likely that this vegetation is more widely distributed in the Central Appalachians.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba - Quercus rubra - Carya alba / Vaccinium stamineum / Desmodium nudiflorum* Piedmont Forest (CEGL008475) analogue of CEGL008515 occurring in the southeastern Piedmont from southern Maryland to Georgia.
- *Quercus alba - Quercus rubra - Carya ovalis / Acer saccharum / Polystichum acrostichoides* Forest (CEGL007233)

- *Quercus prinus - Quercus rubra - Carya ovalis / Carex pensylvanica - (Calamagrostis porteri)* Forest (CEGL008516) restricted to more fertile phyllite/metasiltstone ridges at higher elevations of the same region.
- *Quercus rubra - Carya (glabra, ovata) / Ostrya virginiana / Carex lucorum* Forest (CEGL006301) occurs at high elevations in the Ridge and Valley and lacks *Quercus prinus* and other lower-elevation species.
- *Quercus rubra - Quercus prinus - Carya ovalis / (Cercis canadensis) / Solidago caesia* Forest (CEGL008514) more diverse oak-hickory forest of the Piedmont and lower Blue Ridge occurring on mafic and granitic substrates.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This type is a Central Appalachian oak-hickory forest that occurs extensively on low-elevation sedimentary and metasedimentary substrates, especially shale and siltstone. It is an extensive (locally matrix-forming) type in the Ridge and Valley province but also occurs on the Northern Blue Ridge. Plots that fell into the AT study area represent the southern end of the range, but are generally characteristic. The type has been repeatedly circumscribed in regional analyses of Central Appalachian data (e.g., George Washington/Jefferson National Forests, Shenandoah National Park, National Capital Region parks) and is robust. This community may be distinguished from Low-Elevation Mixed Oak / Heath Forest (CEGL008521) by the higher cover of *Carya*. It can be distinguished from Central Appalachian Montane Oak - Hickory Forest (Acidic Type) (CEGL008516) by elevation. CEGL008516 is a high-elevation, dry but diverse oak-hickory forest ranging from 550-1270 m (1,800-4,160 feet).
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: The southernmost known stand is a little north of I-81, in the extreme southwestern end of Bland County, Virginia, near Lick Creek. It is not common until you get to Craig County and the ridges west of Roanoke. The most constant species in the Virginia plots are *Amelanchier arborea, Quercus alba, Acer rubrum, Cornus florida, Quercus prinus, Vaccinium stamineum, Vaccinium pallidum, Chimaphila maculata, Quercus velutina*, and *Carya glabra*.
Global Classification Comments: The global range and status of this community type need further investigation. It may occur on a wider variety of substrates, and cover a much larger geographic area, than current documentation indicates. Twenty-one plots from the southern part of the Central Appalachians were classified as this association in the Appalachian Trail classification project (Fleming and Patterson 2009a). In a recent analysis of more than 1300 Virginia montane upland forest and woodland plots (Fleming and Patterson 2009b), this association was represented by 49 plots. The most constant species in these 49 plots are *Amelanchier arborea, Quercus alba, Acer rubrum, Cornus florida, Quercus prinus, Vaccinium stamineum, Vaccinium pallidum, Chimaphila maculata, Quercus velutina*, and *Carya glabra*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This low-elevation oak-hickory forest was sampled along the AT from Bland County in the Cumberlands and Southern Ridge and Valley in southwestern Virginia north through the Central Appalachians to Shenandoah National Park, but it ranges off the trail north into Maryland. It was sampled in Virginia at Bluff City North, Brushy Mountain/Dismal Creek, Catawba Mountain, Jennings Creek, McAfee Knob, Trout Creek East, and Turk Gap.
Global Range: This community type is associated with substrates weathered from shale, sandstone, and similar sedimentary and metasedimentary rocks (e.g., siltstone, metasiltstone, phyllite) in the Central Appalachians. It appears to be widespread at low elevations of the Ridge and Valley province in Maryland and Virginia, and more local on the western flank of the Northern Blue Ridge and the northern edge of the Southern Blue Ridge. It is rare on monadnocks of the extreme western Piedmont in southwestern Virginia. Within its known distribution, this is a matrix community type in localities of optimal habitat.

ELEMENT CONCEPT

Global Summary: This community is currently known from the southern part of the Central Appalachians, on the northern Virginia Blue Ridge and higher ridges of the Ridge and Valley in western Virginia and adjacent West Virginia. Occurrences in western Maryland and central and western Pennsylvania should be sought. This association usually occupies middle to upper slopes and narrow ridge crests underlain by various sedimentary and metamorphic rocks, including sandstone, quartzite, siltstone, metasiltstone, phyllite, acidic shale, and rarely amphibolite. Among 53 Virginia plot samples, elevation ranges from 550-1270 m (2000-4160 feet), but the type is most common between 760 and 1100 m (2500-3600 feet). The moisture potential of plot-sampling sites was assessed as submesic or subxeric. Slopes vary from steep to sublevel, with aspects ranging from northeast to west. This association has an open, mixed canopy dominated by several oaks and hickories. Trees tend to be slightly stunted (often <20 m tall) on the drier and more exposed sites. *Quercus rubra, Quercus prinus*, and *Carya ovalis* are the most abundant canopy species, but *Quercus alba* is a constant minor associate that becomes more abundant and replaces *Quercus prinus* at the highest elevations. *Carya ovata, Carya glabra, Fraxinus americana*, and *Quercus velutina* are minor overstory associates. The subcanopy tends to be strongly dominated by *Carya ovalis*. Lower understory layers tend to be open or sparse with scattered *Ostrya virginiana, Crataegus macrosperma, Amelanchier arborea, Acer pensylvanicum*, and tree saplings. *Vaccinium stamineum, Vaccinium pallidum, Rosa carolina*, and *Spiraea betulifolia var. corymbosa* commonly form a patchy low-shrub layer. The herb layer is open but moderately diverse with drought-tolerant graminoids and forbs.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This high-elevation dry but diverse oak-hickory forest occurs on mid to upper slopes and narrow ridge crests at 625-1270 m (2,000-4,160 feet) elevation that are underlain by various sedimentary and metamorphic rocks, including sandstone, quartzite, siltstone, metasiltstone, phyllite, and acidic shale. It was sampled at six locations in the Central Appalachian project area. Sites are gentle to steep mid and upper slopes and ridges with mostly southern and eastern aspects. Soils are

well-drained silt loam and loam. The unvegetated surface may be dominated by leaf litter, often with some exposed bedrock, large and small rocks, downed wood, and/or bare soil. Evidence of disturbance includes past fire, trails, wind/ice damage, grazing/browsing, and the presence of exotic plant species.

Global Environment: Occurrences are strongly associated with middle- to higher-elevation upper slopes and ridge crests underlain by various sedimentary and metamorphic rocks, including sandstone, quartzite, siltstone, metasiltstone, phyllite, acidic shale, and rarely amphibolite. Among 54 Virginia plot samples, elevation ranges from 550-1270 m (1800-4160 feet), but the type is most common between 760 and 1100 m (2500-3600 feet). The type usually occupies middle to upper slopes and narrow ridge crests. The moisture potential of plot-sampling sites was assessed as submesic or subxeric. Slopes tend to be convex and vary from steep to sublevel (mean = 16°), with aspects ranging from northeast to west. Surface cover of outcrops and boulders averages about 5%, and loose channery is abundant at sites underlain by siltstone, metasiltstone, and shale. Substantial areas of exposed mineral soil are often present. Soil samples collected from plots are strongly to extremely acidic, with moderately low base cation levels, except manganese.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The open canopy and subcanopy are made up of combinations of *Quercus rubra, Quercus prinus, Quercus alba, Carya glabra, Carya ovata*, and/or *Carya ovalis*. *Prunus serotina, Sassafras albidum*, and Acer rubrum are also common in some stands. *Acer pensylvanicum* and *Vaccinium* spp. (mostly *Vaccinium pallidum* and *Vaccinium stamineum*) dominate the patchy shrub layer. Other common shrubs may include *Castanea dentata, Rosa carolina var. carolina, Rubus flagellaris*, and *Rubus occidentalis*. *Galium latifolium, Amphicarpaea bracteata, Dioscorea quaternata, Stellaria pubera*, and *Polygonatum biflorum* characterize the patchy herb layer. Additional common herbs include *Solidago arguta, Carex pensylvanica, Calamagrostis porteri, Dichanthelium boscii, Festuca subverticillata, Deschampsia flexuosa, Carex digitalis, Geranium maculatum, Helianthus divaricatus, Maianthemum racemosum ssp. racemosum, Polygonum scandens var. cristatum, Silene stellata, Symphyotrichum cordifolium*, and *Uvularia perfoliata*. This community also supports VA-state critically imperiled *Heuchera caroliniana*.

Global Vegetation: This association has an open, mixed canopy dominated by several oaks and hickories. Trees tend to be slightly stunted (often <20 m tall) on the drier and more exposed sites. *Quercus rubra, Quercus prinus*, and *Carya ovalis* are the most abundant canopy species, but *Quercus alba* is a constant minor associate that becomes more abundant and replaces *Quercus prinus* at the highest elevations. *Carya ovata, Carya glabra, Fraxinus americana*, and *Quercus velutina* are minor overstory associates. The subcanopy tends to be strongly dominated by *Carya ovalis*. Lower understory layers tend to be open or sparse with scattered *Ostrya virginiana, Crataegus macrosperma, Amelanchier arborea, Acer pensylvanicum*, and tree saplings. *Vaccinium stamineum, Vaccinium pallidum, Rosa carolina*, and *Spiraea betulifolia var. corymbosa* commonly form a patchy low-shrub layer. The herb layer is open but moderately diverse with drought-tolerant graminoids and forbs. Many stands have strong patch-dominance by sedges and grasses, among which the most important species are *Carex pensylvanica, Calamagrostis porteri, Dichanthelium boscii, Festuca subverticillata*, and *Deschampsia flexuosa*. Among the most abundant forbs are *Ageratina altissima var. altissima, Solidago ulmifolia, Solidago arguta var. arguta, Houstonia longifolia, Uvularia perfoliata, Amphicarpaea bracteata, Paronychia canadensis*, and *Galium latifolium*. Forbs tend to be patchy or scattered but may dominate on straight or concave slopes. Additional herbs occurring more-or-less frequently include *Symphyotrichum undulatum (= Aster undulatus), Eurybia macrophylla (= Aster macrophyllus), Agrostis perennans, Helianthus divaricatus, Heuchera americana, Scrophularia lanceolata, Doellingeria infirma (= Aster infirmus), Eupatorium sessilifolium, Asclepias quadrifolia, Penstemon canescens, Arabis laevigata, Cunila origanoides, Carex virescens, Silene stellata, Carex laxiflora, Pycnanthemum incanum, Potentilla canadensis, Polygonum scandens var. cristatum, Vicia caroliniana, Carex cephalophora, Galium circaezans, Bromus pubescens*, and *Danthonia spicata*. Many other herbs occur at low constancy and cover. Species richness of 53 plot-sampled stands ranges from 30 to 103 taxa per 400 square meters (mean = 62).

Global Dynamics: Fire (at least historically), windthrow, ice storms, herbivory by white-tailed deer, and periodic drought stress are natural disturbances that probably influence this community type. The frequent structure exhibited by this association (open understory and dense graminoid herb layer) could possibly be an artifact of frequent historical fires and/or livestock grazing, but such disturbances ceased a considerable time ago on most sites. Oak recruitment is generally poor on most sites, but hickory recruitment is abundant. On the more mesic sites (concave slopes, etc.), the understory often contains *Acer rubrum* and other shade-tolerant mesophytic trees, which have probably invaded following a period of fire exclusion.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Heuchera caroliniana* (G3, globally vulnerable & VA state-critically imperiled); **Invasive/Exotic Plants**: *Alliaria petiolata* (High/Medium), *Barbarea vulgaris* (Low/Insignificant), *Hieracium caespitosum* (Medium/Insignificant), *Lapsana communis*, *Ligustrum obtusifolium* (Medium/Low), *Poa compressa* (High/Low), *Rosa multiflora* (Medium/Low), *Rumex obtusifolius*, *Taraxacum officinale*, *Veronica arvensis*
Global: Vulnerable Plants: *Elymus trachycaulus* (G5, VA state-rare), *Heuchera caroliniana* (G3), *Phlox buckleyi* (G2)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (23-Feb-2010). Although currently known from a relatively small geographic range, this community type covers substantial areas at low to middle elevations of both the Northern Blue Ridge and Ridge and Valley provinces.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba - Carya glabra - Fraxinus americana / Muhlenbergia sobolifera - Elymus hystrix* Forest (CEGL006216) is a drier oak-hickory forest associated with mafic hardpan soils of the Piedmont.
- *Quercus alba - Quercus prinus - Carya glabra / Cornus florida / Vaccinium pallidum* Forest (CEGL008515) occurs at lower elevations in the Central Appalachians.
- *Quercus rubra - Carya (glabra, ovata) / Ostrya virginiana / Carex lucorum* Forest (CEGL006301)
- *Quercus rubra - Carya ovata - Fraxinus americana / Actaea racemosa - Hydrophyllum virginianum* Forest (CEGL008518) occurs in the same region, at similar elevations, and on similar topographic positions, but occurs on rich sites over calcareous and mafic rocks; composition is more mesophytic, with a lush herb layer of leafy, colonial, nutrient-demanding forbs.
- *Quercus rubra - Quercus prinus - Carya ovalis / (Cercis canadensis) / Solidago caesia* Forest (CEGL008514) occurs at lower elevations on mafic and granitic substrates of the western Piedmont and lower Blue Ridge.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This type can occur on any acidic sedimentary or metasedimentary rock, not just metasiltstone and phyllite. Central Appalachian Montane Oak - Hickory Forest (Acidic Type) (CEGL008516) is a dry but very diverse oak-hickory type, while Appalachian Montane Oak - Hickory Forest (Typic Acidic Type) (CEGL007230) is a much more acidic and less floristically diverse type.

Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This community occurs from the New River in Virginia north, although it is known from a few scattered locations south of the New River but not within the AT corridor.
Global Classification Comments: Although it has a similar canopy, this association differs significantly from *Quercus rubra - Quercus prinus - Carya ovalis / (Cercis canadensis) / Solidago caesia* Forest (CEGL008514) in its understory and herbaceous composition. It occupies drier, steeper sites and lacks (or nearly so) many characteristic low-elevation and mesophytic species of CEGL008514, e.g., *Liriodendron tulipifera, Quercus alba, Cercis canadensis, Asimina triloba, Actaea racemosa (= Cimicifuga racemosa), Solidago caesia, Desmodium glutinosum*, etc. Conversely, this type contains a number of montane and xerophytic species that are absent or unimportant in CEGL008514. This type occurs in the same region, at similar elevations, and on similar topographic positions as *Quercus rubra - Carya ovata - Fraxinus americana / Actaea racemosa - Hydrophyllum virginianum* Forest (CEGL008518). The latter, however, is associated with richer, more mesic, deeper-soiled sites over calcareous and mafic rocks. Its herb layer contrasts sharply with the dry, graminoid-dominated herb layer of this association (CEGL008516) in being dominated by large, leafy, nutrient-demanding forbs.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the southern part of the Central Appalachians, on the northern Virginia Blue Ridge, and higher ridges of the Ridge and Valley in western Virginia and adjacent West Virginia. It was sampled in Virginia at Crimora Lake Overlook, Doyles River Overlook, Ivy Creek Overlook, Big Run Overlook, Potts Mountain, and James River Face Wilderness. Four plots are from Shenandoah National Park.
Global Range: This community is currently known from the southern part of the Central Appalachians, on the northern Virginia Blue Ridge and higher ridges of the Ridge and Valley in western Virginia and adjacent West Virginia. A few small occurrences have been documented on the northern edges of both the Southern Blue Ridge and Cumberlands and Southern Ridge and Valley ecoregions. Occurrences in western Maryland and central and western Pennsylvania should be sought. Within the known range, this unit can be a large-patch community type in localities of optimal habitat.

ELEMENT CONCEPT

Global Summary: This association is a dry, rich oak-hickory forest of the northeastern United States, occurring from Maine and Vermont to Pennsylvania and northern New Jersey. It is dominated by a mixture of hickories and oaks over a hop-hornbeam subcanopy with or without a parklike sedge lawn. The vegetation occurs on low-elevation ridgetops, upper slopes, south- or west-facing sideslopes, and is supported by well-drained loams or sandy loams, often derived from alkaline bedrock. The tree canopy, which ranges from nearly closed forest to partially open woodland, is dominated by a mixture of *Carya glabra, Carya ovata, Carya ovalis, Quercus rubra, Quercus alba, Quercus velutina*, with occasional *Ostrya virginiana* and *Acer rubrum*. Minor associates include *Acer saccharum, Pinus strobus*, and *Fraxinus americana*. A subcanopy of *Ostrya virginiana* is conspicuous in most areas. Additional species in the subcanopy or tall-shrub layer that occur in lower abundance can include *Hamamelis virginiana, Cornus florida, Amelanchier arborea, Acer pensylvanicum*, and *Viburnum acerifolium*. Low shrubs can include *Vaccinium angustifolium, Vaccinium pallidum, Rubus idaeus*, or *Viburnum rafinesquianum*. The herb layer can range from a sedge lawn of *Carex lucorum*, with some *Carex pensylvanica, Carex woodii, Carex appalachica*, or *Carex rosea*, to a more patchy herbaceous layer with sedges in addition to scattered *Elymus hystrix, Bromus pubescens, Ageratina altissima, Festuca subverticillata, Uvularia perfoliata, Aralia nudicaulis, Maianthemum racemosum (= Smilacina racemosa), Desmodium glutinosum, Desmodium paniculatum, Prenanthes alba, Solidago bicolor, Hepatica nobilis var. obtusa (= Hepatica americana), Carex* (Laxiflorae group), *Deschampsia flexuosa, Packera paupercula (= Senecio pauperculus), Packera obovata (= Senecio obovatus), Symphyotrichum undulatum (= Aster undulatus), Symphyotrichum patens (= Aster patens), Polystichum acrostichoides*, and *Dichanthelium* spp. Spring ephemerals such as *Erythronium americanum* and *Claytonia virginica* also occur in some portions of the range.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This rich oak-hickory forest occurs on low-elevation ridgetops, upper slopes, and south- or west-facing sideslopes. It extends from Maine and Vermont to Pennsylvania and northern New Jersey. Sites are gentle to steep slopes and ridgetops with mostly eastern and southern aspects. The soils are dry-mesic to dry generally well-drained sandy loam and silt loam. The unvegetated surface consists of leaf litter, with lesser amounts of large rocks (sometimes significant amounts), small rocks, bare soil and/or downed wood. Evidence of disturbance includes wind/ice damage and the presence of exotic plants.

Global Environment: This community occupies upper slopes and sideslopes at low elevations, generally with southeastern to western exposures. The low relief of southern New England limits this vegetation to small occurrences, most of which are <4 ha (10 acres). Soils are well-drained loams or sandy loams and often circumneutral. Soils are often stony, but exposed bedrock, boulders, cobbles, and mineral soil are sparse.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The tree canopy, which ranges from nearly closed forest to partially open woodland, is dominated by a mixture of *Carya glabra, Carya ovata, Carya alba, Quercus rubra, Quercus alba*, and/or *Quercus prinus* often with *Acer saccharum* and *Fraxinus americana* over a subcanopy of *Ostrya virginiana*. Tall shrubs include *Viburnum acerifolium* and *Amelanchier arborea*; *Vaccinium pallidum* is a common dwarf-shrub. The grassy herbaceous layer is dominated by *Carex pensylvanica, Danthonia spicata*, and/or *Carex lucorum* (sedge lawn may or may not be present) along with *Solidago caesia, Solidago bicolor*, and *Deschampsia flexuosa*.

Global Vegetation: This forest has a closed to open canopy dominated by a mixture of *Carya glabra, Carya ovata, Carya ovalis, Quercus rubra, Quercus alba, Quercus velutina*, with occasional *Ostrya virginiana, Quercus prinus, Carya alba*, and *Acer rubrum*. Minor associates include *Acer saccharum, Pinus strobus*, and *Fraxinus americana*. A subcanopy of *Ostrya virginiana* is conspicuous in most areas. Additional species in the subcanopy or tall-shrub layers that occur in lower abundance include *Hamamelis virginiana, Cornus florida, Amelanchier arborea, Acer pensylvanicum*, and *Viburnum acerifolium*. Low shrubs can include *Vaccinium angustifolium, Vaccinium pallidum, Gaylussacia baccata, Rubus allegheniensis, Rubus idaeus, Viburnum dentatum*, or *Viburnum rafinesquianum*. *Vaccinium stamineum* may be present in the most southerly (NJ/PA) occurrences of this association. The herb layer can range from a sedge lawn of *Carex lucorum*, with some *Carex pensylvanica, Carex woodii, Carex appalachica*, or *Carex rosea*, to a more patchy herbaceous layer with sedges in addition to scattered *Elymus hystrix, Bromus pubescens, Danthonia spicata, Anthoxanthum odoratum, Ageratina altissima, Festuca subverticillata, Uvularia perfoliata, Aralia nudicaulis, Maianthemum racemosum (= Smilacina racemosa), Desmodium glutinosum, Desmodium paniculatum, Prenanthes alba, Solidago bicolor, Solidago juncea, Hepatica nobilis var. obtusa (= Hepatica americana), Carex* spp. (Laxiflorae group), *Deschampsia flexuosa, Packera paupercula (= Senecio*

pauperculus), Packera obovata (= Senecio obovatus), Symphyotrichum undulatum (= Aster undulatus), Symphyotrichum patens (= Aster patens), Veronica officinalis, Polystichum acrostichoides, and *Dichanthelium* spp. Spring ephemerals such as *Erythronium americanum* and *Claytonia virginica* also occur in some portions of the range.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): *Amelanchier arborea*, *Carex pensylvanica*, *Carya glabra*, *Carya ovata*, *Maianthemum canadense*, *Viburnum acerifolium*
Global: *Amelanchier arborea*, *Carex lucorum*, *Carex pensylvanica*, *Carex rosea*, *Carya glabra*, *Carya ovalis*, *Carya ovata*, *Deschampsia flexuosa*, *Elymus hystrix*, *Maianthemum racemosum*, *Potentilla canadensis*, *Potentilla simplex*, *Quercus alba*, *Quercus prinus*, *Quercus rubra*, *Quercus velutina*, *Solidago bicolor*, *Solidago juncea*, *Uvularia perfoliata*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Lower New England Project Area): Invasive/Exotic Plants: *Alliaria petiolata* (High/Medium), *Berberis thunbergii* (High/Medium), *Berberis vulgaris* (Medium/Low), *Calystegia sepium*, *Convolvulus arvensis* (Medium/Low), *Microstegium vimineum* (High/Medium), *Rosa multiflora* (Medium/Low)
Global: Vulnerable Plants: *Crataegus spathulata* (G5, VA state-rare)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (20-May-2011). This association is a large-patch to matrix-forming forest association of the northeastern U.S. There are likely to be over 1000 occurrences of this vegetation, with approximately half of those having good ecological integrity. The association is ranked G4 rather than G5 because it has declined up to 30% over the long term, and continues to be threatened by residential and commercial development, invasive species, and repeated gypsy moth infestations. The impact of climate change is not currently known.

RELATED CONCEPTS

Global Similar Types:
- *Quercus alba - Quercus prinus - Carya glabra / Cornus florida / Vaccinium pallidum* Forest (CEGL008515) occurs in similar, low-elevation settings in VA, WV, and MD but much more oak than hickory.
- *Quercus prinus - Quercus rubra - Carya ovalis / Carex pensylvanica - (Calamagrostis porteri)* Forest (CEGL008516) is a "southern analogue" occurring on middle- to higher-elevation upper slopes and ridge crests in the Central Appalachians; has a similar structure and composition but the floristics are somewhat different.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community grades from a forest with extensive sedge lawn to an open glade with patchy sedge cover. In New Hampshire, *Carex pensylvanica* is more of a rich-site indicator than *Carex lucorum*. In Connecticut, *Carex deweyana* and *Festuca subverticillata* are enrichment indicators. Some of the New Jersey examples lack *Ostrya virginiana*.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: As discussed at the classification meeting, some of the northeastern state ecologists would like former *Carya (glabra, ovata) - Fraxinus*

americana - *Quercus* spp. Forest (CEGL006236) split back out of this association (CEGL006301). The global description for CEGL006301 has since been broadened to better represent the merging of the two associations.
Global Classification Comments: Former *Carya (glabra, ovata) - Fraxinus americana - Quercus* spp. Forest (CEGL006236) was lumped into this community in 2009 allowing for oak-hickory without sedge lawn stands to be included in this type (CEGL006301).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut (Mt. Prospect, Sharon Mountain - North End), New Jersey (Culvers Gap North, Sunrise Mountain Southeast, Unionville West), New York (Harriman State Park), and at Delaware Water Gap in Pennsylvania.
Global Range: The principal distribution of this community type is centered in Lower New England, ranging from southern New Hampshire to New Jersey and northern Pennsylvania.

ELEMENT CONCEPT

Global Summary: This community is known from the southern part of the Central Appalachians, extending into the extreme northern portions of the Southern Blue Ridge, Southern Ridge and Valley, and Cumberland Mountains. It

occurs throughout western Virginia and adjacent eastern West Virginia, forming extensive patches on the Northern Blue Ridge and, somewhat more locally, on the higher ridges of the Ridge and Valley province. Favorable sites are upper slopes and ridge crests with deep, base-rich soils weathered from mafic and calcareous parent material, including metabasalt (greenstone), amphibolite, pyroxene-bearing granulite, charnockite, and actinolite schist. It also occurs on sites underlain by calcareous sandstone, siltstone, metasiltone, phyllite, and felsic granites with mafic clasts. Occurrences span a range of intermediate elevations, from 680-1265 m (2250-4150 feet), with a mean elevation of approximately 1000 m (3280 feet). Slopes are mostly gentle to moderate, averaging about 15°. Aspect varies considerably, but a majority of stands are located on sites with southwestern to northwestern or flat exposures. Soils are mostly dark, friable loams and silt loams with variable chemistry, but typically high in calcium, magnesium, and/or manganese. The characteristic expression of this community is that of an oak or oak-hickory forest with an herb layer that resembles that of a rich cove forest. *Quercus rubra* is the most constant member of the overstory but usually shares dominance with *Carya ovalis, Carya ovata, Fraxinus americana* or, less frequently, other mesophytic hardwoods such as *Tilia americana* (both *var. americana* and *var. heterophylla*), *Quercus alba, Carya cordiformis, Prunus serotina*, and *Betula lenta*. Both *Liriodendron tulipifera* and *Quercus prinus*, which are ubiquitous in much of the Central Appalachians, are uncommon to rare in this community type. The subcanopy tends to be strongly dominated by *Carya* spp. and *Fraxinus americana*, with *Acer saccharum, Acer rubrum, Acer pensylvanicum*, and *Ostrya virginiana* also important in some stands. The shrub layer is typically sparse. Most stands have a lush and generally diverse herb layer, with total cover often exceeding 80% and strong patch-dominance by leafy, colonial forbs such as *Actaea racemosa (= Cimicifuga racemosa), Ageratina altissima var. altissima, Hydrophyllum virginianum, Collinsonia canadensis, Caulophyllum thalictroides, Laportea canadensis, Impatiens pallida, Thalictrum coriaceum*, and *Asclepias exaltata*. At higher elevations, where the type is transitional to northern red oak forests, *Dennstaedtia punctilobula* often dominates the herb layer in large clones.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This basic Central Appalachian montane oak-hickory forest occurs at elevations from 297 to 1183 m in the Northern Blue Ridge and Ridge and Valley on convex upper slopes, saddles and broad ridge crests with deep, base-rich soils weathered from mafic and calcareous parent material. It was sampled at 21 locations in Central Appalachians. Sites range from gentle to somewhat steep mid and upper slopes and ridges with variable aspects. Soils are dry to mesic well-drained loam, clay loam, silt loam, sandy loam, and loamy sand. The unvegetated surface is dominated by leaf litter with some downed wood, large rocks and/or bare soil. Evidence of disturbance includes trails, heavy deer browsing, wind/ice damage, gypsy moth damage, and the presence of exotic plant species.

Global Environment: This association typically occupies convex upper slopes, saddles and broad ridge crests with deep, base-rich soils weathered from mafic and calcareous parent material. On the Blue Ridge, these include metabasalt (greenstone), amphibolite, pyroxene-bearing granulite, charnockite, actinolite schist, and calcareous metasiltstone or phyllite. In the Ridge and Valley province, the most common substrates are calcareous sandstone (of several formations) and calcareous siltstone of the Juniata Formation. The type also occurs less frequently on Blue Ridge sites underlain by felsic granite with mafic clasts. Occurrences span a range of intermediate elevations, from 680-1265 m (2250-4150 feet), but are most common above 820 m (2700 feet); mean elevation of 77 plot samples is approximately 1000 m (3280 feet). Slopes are mostly gentle to moderate, averaging about 15°. Aspect varies considerably, but a majority of stands are located on sites with southwestern to northwestern or flat exposures. Overall site moisture potential probably ranges from moderately high to high, and thus sites can generally be considered submesic to mesic. Surface substrate usually consists primarily of leaf litter, with few surface rocks present, although small areas on sharp convexities or in debris-collecting concavities may be notably rocky. Soils are dark, moist, friable loams and silt loams or, less frequently, clay loams. Samples collected from plots are moderately to strongly acidic, with varying base status (calcium concentrations range from 140-4064 ppm) but more uniformly high manganese levels (mean = 159 ppm, max = 511 ppm).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Quercus rubra* shares dominance with *Quercus alba, Carya ovalis, Carya ovata*, and/or *Fraxinus americana* (which may surpass *Carya* spp. coverage in the canopy at higher elevations). The subcanopy is strongly dominated by *Carya* spp., *Fraxinus americana*, and *Prunus serotina*. *Ostrya virginiana* may be present, but not dominant. The shrubs layer is typically very sparse but can include *Acer pensylvanicum, Hamamelis virginiana, Hydrangea* spp., and/or *Magnolia* spp. The lush and diverse herb layer resembles that of a rich cove forest and includes *Actaea racemosa, Ageratina altissima, Asclepias exaltata, Actaea racemosa, Circaea lutetiana ssp. canadensis, Collinsonia canadensis, Dioscorea quaternata, Festuca subverticillata, Dennstaedtia punctilobula, Hydrophyllum virginianum, Monarda clinopodia,*

Sanguinaria canadensis, Stellaria pubera, Thalictrum coriaceum, Uvularia perfoliata, and/or *Viola* spp., along with many others. This community also supports VA-state critically imperiled *Heuchera caroliniana*, WV-state critically imperiled *Bromus pubescens*, VA-state imperiled *Rubus idaeus ssp. strigosus*, and WV-state imperiled *Bromus pubescens*.

Global Vegetation: The characteristic expression of this community is that of an oak or oak-hickory forest with an herb layer that resembles that of a rich cove forest. *Quercus rubra* is the most constant member of the overstory but usually shares dominance with *Carya ovalis, Carya ovata, Fraxinus americana* or, less frequently, other mesophytic hardwoods such as *Tilia americana* (both *var. americana* and *var. heterophylla*), *Quercus alba, Carya cordiformis, Prunus serotina*, and *Betula lenta*. Both *Liriodendron tulipifera* and *Quercus prinus*, which are ubiquitous in much of the Central Appalachians, are uncommon to rare in this community type. The subcanopy tends to be strongly dominated by *Carya* spp. and *Fraxinus americana*, with *Acer saccharum, Acer rubrum, Acer pensylvanicum*, and *Ostrya virginiana* also important in some stands. The shrub layer is typically sparse. Most stands have a lush and generally diverse herb layer, with total cover often exceeding 80% and strong patch-dominance by leafy, colonial forbs, especially *Actaea racemosa (= Cimicifuga racemosa), Ageratina altissima var. altissima, Hydrophyllum virginianum, Collinsonia canadensis, Caulophyllum thalictroides, Laportea canadensis, Impatiens pallida, Thalictrum coriaceum*, and *Asclepias exaltata*. Dominance patterns in the ground layer vary considerably both within and among stands, and at least 22 herbaceous species are known to attain at least 10% cover in one or more stands of this type. Other characteristic herbs that usually occur at lower cover include *Solidago curtisii, Dioscorea quaternata, Amphicarpaea bracteata, Geranium maculatum, Uvularia perfoliata, Monarda clinopodia, Circaea lutetiana ssp. canadensis, Arisaema triphyllum, Eupatorium purpureum var. purpureum, Stellaria pubera, Festuca subverticillata, Sanguinaria canadensis, Silene stellata, Osmorhiza claytonii, Prenanthes altissima, Trillium grandiflorum, Scrophularia lanceolata, Osmunda claytoniana, Helianthus decapetalus, Stachys nuttallii (= Stachys subcordata), Thelypteris noveboracensis*, and *Viola pubescens*. A noteworthy variant of the type features overwhelming herb-layer dominance by *Osmunda claytoniana* on sites with slightly concave microtopography that may sustain higher soil moisture. Another distinctive variant occurs at higher elevations (>1128m [3700 feet]) on granitic terrain of the Northern Blue Ridge and occasionally elsewhere, where this type is somewhat transitional to high-elevation forests strongly dominated by *Quercus rubra* and acidophilic shrubs and herbs. This variant consistently features an open, stunted canopy of gnarled *Quercus rubra* and *Carya ovata* over a fern-rich herb layer dominated by *Dennstaedtia punctilobula*, with the more characteristic nutrient-demanding forbs still present but occurring at lower cover. Mean species richness of 77 plot samples was 57 taxa per 400 square meters.

Global Dynamics: All stands have likely experienced a long history of disturbance, including the loss of *Castanea dentata* as an overstory constituent in the early 20th century, logging, occasional low-intensity fires, and wind and ice storms. Many occurrences also experienced moderate to severe defoliation by gypsy moth (*Lymantria dispar*) during the last several decades. Severe wind and ice storms are common disturbances at higher elevations and more exposed locations, resulting in stunted and gnarled tree stature. Several stands of this type, particularly those in northern Shenandoah National Park, experienced severe oak mortality following sustained defoliation by gypsy moth and coincident drought in the late 1980s and early 1990s; these have regenerated in even-aged stands of *Fraxinus americana* or combinations of *Fraxinus americana* and *Carya* spp. Like most eastern oak forests, stands of this community type tend to have poor or marginal oak recruitment, and many have been invaded by shade-tolerant mesophytes such as *Acer saccharum, Acer rubrum*, and *Tilia americana* following decades of fire exclusion. However, such mesophytic trees are absent from the understories of some stands where younger tree recruitment is overwhelmingly composed of *Carya* spp. Because of the deep, fertile soils occupied by this community, invasive exotics (especially *Alliaria petiolata*) have become well-established at some sites.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Bromus pubescens* (G5, WV state-critically imperiled), *Heuchera caroliniana* (G3, globally vulnerable & VA state-critically imperiled), *Rubus idaeus* ssp. *strigosus* (G5T5, VA state-imperiled); **Invasive/Exotic Plants**: *Ailanthus altissima* (Medium), *Alliaria petiolata* (High/Medium), *Arctium minus* (Medium/Insignificant), *Calystegia sepium*, *Chenopodium album*, *Galinsoga quadriradiata*, *Hieracium caespitosum* (Medium/Insignificant), *Poa compressa* (High/Low), *Ranunculus bulbosus*, *Rosa multiflora* (Medium/Low), *Rumex acetosella* (Medium/Low), *Taraxacum officinale*
Global: Vulnerable Plants: *Arnoglossum muehlenbergii* (G4, VA state-rare), *Euphorbia purpurea* (G3, Southern Blue Ridge endemic), *Heuchera alba* (G2Q), *Heuchera caroliniana* (G3), *Panax quinquefolius* (G3G4, under collection pressure), *Scutellaria arguta* (G1?Q), *Scutellaria saxatilis* (G3), *Tsuga caroliniana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (22-Feb-2010). This vegetation type appears to be largely restricted to base-rich soils on the higher ridges of the Central Appalachians, where it constitutes a large-patch community. Extensive occurrences north of Virginia and West Virginia are unlikely. Sites occupied by this community are highly favorable for timber production, and a substantial percentage of known stands occur on U.S. Forest Service lands subject to harvesting. In addition to logging, threats to this type include oak decline and invasive exotic weeds.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba - Quercus rubra - Quercus prinus / Collinsonia canadensis - Podophyllum peltatum* Forest (CEGL007692) is very similar but more southern in distribution; the Southern Blue Ridge analogue of CEGL008518.
- *Quercus prinus - Quercus rubra - Carya ovalis / Carex pensylvanica - (Calamagrostis porteri)* Forest (CEGL008516) occurs in the same region, at similar elevations, and on similar topographic positions, but occurs on drier, more acidic sites over sedimentary and metasedimentary rocks; composition is much less mesophytic, with an herb layer usually patch-dominated by dry-site graminoids.
- *Quercus rubra - (Quercus alba) / Ilex montana / Dennstaedtia punctilobula - Lysimachia quadrifolia* Forest (CEGL008506) occupies higher-elevation sites with infertile soils.
- *Quercus rubra - Fraxinus americana - Acer saccharum / Actaea racemosa - Caulophyllum thalictroides* Forest (CEGL004256) is a rich, high-elevation red oak forest of the Southern Appalachians.
- *Quercus rubra - Quercus prinus - Carya ovalis / (Cercis canadensis) / Solidago caesia* Forest (CEGL008514) occurs at lower elevations in the Blue Ridge and western Piedmont, on dry-mesic sites over mafic and granitic rocks.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This community is uncommon south of the New River in Virginia, owing to the scarcity of suitably base-rich geologic

substrates. This type is a Central Appalachian rich montane oak-hickory forest that, as currently circumscribed, occurs on mafic and calcareous sedimentary substrates of the Northern Blue Ridge and Ridge and Valley from about 750 to 1,150 m (2,500-3,800 feet) elevation. It mostly occurs on gentle, deep-soiled upper slopes and has an extremely lush herb layer that resembles that of a rich cove forest. It is especially extensive on metabasalt ridges of the Northern Blue Ridge, which dominate Shenandoah National Park. Oak recruitment is poor, and *Acer saccharum* and other mesophytic trees are invading many stands of the type.

Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: In the Shenandoah National Park vegetation mapping project, if *Fraxinus americana* was dominant in an advanced successional stage with some *Quercus* and *Carya* present and an intact native shrub and herb layer, the stand was classified as Central Appalachian Montane Oak - Hickory Forest (Basic Type) (CEGL008518) because *Fraxinus americana* is a nominal and frequent codominant in that type.

Global Classification Comments: As currently circumscribed, this association encompasses three community types classified by Fleming and Coulling (2001) based on limited plot data from discrete portions of western Virginia. Subsequently, much more extensive plot data were collected across the area, and the compositional and geographic distinction of these "types" became less clear. Recent analysis of a Virginia statewide dataset of 255 montane oak-hickory plots (Fleming and Patterson 2009b) supported the merger of these types as a single association appropriate at the scale of the U.S. National Vegetation Classification. This unit was represented by 77 plots. It is somewhat variable in composition, but consistent in its environmental affiliations and easily recognizable in the field. To an extent, the original classified units can be recognized as "variants" of this association, varying in the relative abundances of some species, in affiliations with geologic substrates, and in soil type or chemistry. A common characteristic of all variants is relatively high concentrations of soil manganese. Several recent studies of montane forest vegetation (Newell and Peet 1996b, Newell 1997, Coulling and Rawinski 1999) have identified a strong positive relationship between manganese levels and species richness. In this community type, however, abundant manganese may explain the total cover and, in part, the composition of the herb layer, but total herb diversity may be more a function of total base saturation and the abundance of other soil cations. In addition, the abundance of both *Carya* spp. and *Fraxinus americana* in these stands is no doubt a reflection of the higher base status of soils supporting this association. An intensive study of forest vegetation in the Southern Appalachians comprising nine landscapes and >1100 plots identified no vegetation type in which either *Carya ovalis* (included in *Carya glabra*) or *Carya ovata* constitutes an important component (Newell 1997). The tendency of *Carya* spp. to occupy more fertile soils was long ago noted (Guthrie 1820), and the relative paucity of *Carya* in Central and Southern Blue Ridge forests may reflect the exceptionally high base status of many Central Appalachian soils.

Several stands of this type, particularly those in northern Shenandoah National Park, experienced severe oak mortality following sustained defoliation by gypsy moth and coincident drought in the late 1980s and early 1990s.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is found from the southern part of the Central Appalachians north along the AT into western Virginia and adjacent West Virginia and north into Maryland. It is uncommon south of the New River in Virginia and very common in Shenandoah National Park. It was sampled in Maryland at Gathland State Park; in Virginia at Bald Face Mountain, Cole Mountain, Devils Ditch, Floyd Mountain, Gravel Springs, Holston Mountain, James River Face Wilderness, Kelly Knob, Potts Mountain, Smith Roach Gap, South Marshall, Tar Jacket Ridge, and Thunder Hill; and in West Virginia at Blue Ridge.

Global Range: This community is known from the southern part of the Central Appalachians in western Virginia and adjacent West Virginia, on upper slopes and ridge crests with deep, base-rich soils weathered from mafic and calcareous parent material. It is a recurring type that forms extensive patches in suitable habitat of the Northern Blue Ridge, and somewhat more locally in the Ridge and Valley province. Outlying occurrences extend into the extreme northern portions of the Southern Blue Ridge, Southern Ridge and Valley, and Cumberland Mountains (High Knob Massif) and western Maryland. It is possible this type extends into central Pennsylvania, but low relief almost certainly limits, if not precludes, its distribution north of Virginia and West Virginia.

Group	Northeastern Oak - Hickory Forest & Woodland (G650)
Alliance	*Quercus alba* - *Carya* spp. - *Fraxinus americana* Forest Alliance (A2053)

ELEMENT CONCEPT

Global Summary: This community is currently known from a narrow range in the Northern Blue Ridge and adjacent inner Piedmont of Virginia, Maryland, and West Virginia. It is restricted to the western Piedmont foothills and lower- to middle-elevation slopes and spurs of the main Blue Ridge. Elevation ranges from 140 to 950 m (450-3100 feet). The type is generally associated with base-rich soils weathered from mafic igneous and metamorphic rocks, including metabasalt, amphibolite, pyroxene-bearing granulite, charnockite, and actinolite schist. It also occurs less frequently on granitic rocks and calcareous metasiltones and phyllites. Habitats are more-or-less rocky, gentle to steep, submesic to subxeric slopes with a wide range of aspects. Midslope topographic positions are typical, but stands occasionally occur on lower or upper slopes and crests. This association is a true oak-hickory forest with mixed canopy dominance by several *Quercus* spp. and *Carya* spp. In particular, *Carya ovalis, Quercus rubra*, and *Quercus prinus* are consistent codominants and have the highest importance values based on standard forestry statistics generated from stem-diameter measurements. *Quercus alba, Quercus velutina, Carya alba, Carya glabra, Fraxinus americana*, and *Liriodendron tulipifera* are less constant canopy species but achieve codominance in some stands. *Carya* spp., *Quercus* spp., *Acer rubrum, Nyssa sylvatica, Fraxinus americana*, and *Sassafras albidum* are well-represented in lower tree strata. *Cercis canadensis* (at lower elevations) and, to a lesser extent, *Cornus florida* dominate the shrub and lowest tree layers, while *Viburnum acerifolium* is a common low shrub. A large number of herbaceous species occur in the type.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This basic oak-hickory forest is known only from metamorphic geologic substrates and base-rich soils restricted to the Northern Blue Ridge north of Roanoke, Virginia, and adjacent inner Piedmont of Virginia, Maryland, and West Virginia. Elevation ranges from 140 to 950 m (450-3,100 feet). It was sampled at 16 locations in the Central Appalachian project area.

Sites range from gentle to somewhat steep mid to upper slopes and summits of mostly eastern or western aspects. Soils are moderately well- to well-drained silt loam, sandy loam and loam. The unvegetated surface is typically dominated by leaf litter but may also consist of some exposed bedrock, large and small rocks, downed wood and bare soil. Evidence of disturbance includes past fire, trails, wind-ice damage, grazing/browsing, chestnut blight, insect/disease damage, and the presence of exotic plant species.

Global Environment: This association is restricted to the western Piedmont foothills and lower- to middle-elevation slopes and spurs of the main Blue Ridge. Elevation ranges from 140 to 950 m (450-3100 feet). The type is generally associated with base-rich soils weathered from mafic igneous and metamorphic rocks, including metabasalt, amphibolite, pyroxene-bearing granulite, charnockite, and actinolite schist. It also less frequently occurs on granitic rocks and calcareous metasiltones and phyllites. In 75 plot-sampled stands, elevation ranges from 140 to 950 m (450-3100 feet), with a mean of 485 m (1590 feet). Occurrences above 850 m (2800 feet) are uncommon and restricted to warm, south- to west-facing slopes. Habitats are more-or-less rocky, gentle to steep (mean = 17°), submesic to subxeric slopes with a wide range of aspects. Middle-slope topographic positions are typical, but stands occasionally occur on lower or upper slopes and crests. Surficial cover of outcrops and boulders in plots averages about 10%. Soils are dark, very stony, clay, silt, or silty-clay loams. Although pH ranges from extremely acidic to circumneutral, these soils consistently have moderately high levels of calcium, magnesium, and manganese.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The mixed canopy is dominated by *Carya ovalis, Quercus rubra*, and *Quercus prinus*. *Quercus alba, Quercus velutina, Carya ovata, Carya glabra, Fraxinus americana*, and *Liriodendron tulipifera* are less constant canopy species but achieve codominance in some stands. *Fraxinus americana, Cercis canadensis* (at lower elevations), *Cornus florida, Asimina triloba, Lindera benzoin, Amelanchier arborea, Hamamelis virginiana, Ostrya virginiana*, and/or *Acer rubrum* dominate the lowest tree and shrub layers. Common herbs include *Galium circaezans, Festuca subverticillata, Maianthemum racemosum ssp. racemosum, Dioscorea quaternata, Solidago caesia, Circaea lutetiana ssp. canadensis, Desmodium nudiflorum, Podophyllum peltatum*, and/or *Sanguinaria canadensis*. This community also supports VA-state critically imperiled *Bromus ciliatus*.

Global Vegetation: This association is a true oak-hickory forest with variable mixed canopy dominance by several *Quercus* spp. and *Carya* spp. *Carya ovalis, Quercus rubra*, and *Quercus prinus* are consistent codominants and have the highest importance values (IV) based on standard forestry statistics generated from stem-diameter measurements. *Quercus alba, Quercus velutina, Carya alba, Carya glabra, Fraxinus americana*, and *Liriodendron tulipifera* are less constant canopy species but achieve codominance in some stands. *Carya* spp., *Quercus* spp., *Acer rubrum, Nyssa sylvatica, Fraxinus americana*, and *Sassafras albidum* are well-represented in lower tree strata. *Cercis canadensis* and, to a lesser extent, *Cornus florida* dominate the shrub and lowest tree layers, while *Viburnum acerifolium* is a common low shrub. *Cercis canadensis*, however, is elevation-limited in this region and is commonly absent from stands on the main Blue Ridge. Small patches of *Vaccinium pallidum* and *Vaccinium stamineum* may be present, but as a rule, ericads are sparse. Additional shrubs and small trees of irregular but local importance include *Ostrya virginiana, Asimina triloba, Ulmus rubra, Amelanchier arborea*, and *Hamamelis virginiana*. Climbing lianas of *Toxicodendron radicans, Parthenocissus quinquefolia*, and *Vitis* spp. are common. The herb layer varies from somewhat sparse to fairly dense. A large number of herbaceous species occur in the type, but *Desmodium nudiflorum, Solidago caesia, Dioscorea quaternata, Galium circaezans, Circaea lutetiana ssp. canadensis, Amphicarpaea bracteata, Botrychium virginianum, Geum virginianum, Phryma leptostachya, Actaea racemosa (= Cimicifuga racemosa), Aristolochia serpentaria*, and *Cardamine concatenata* are particularly characteristic. The latter species, *Thalictrum thalictroides*, and *Claytonia virginica* completely dominate the early spring herbaceous aspect, carpeting the ground with their small white flowers. *Solidago curtisii* usually replaces *Solidago caesia* at the higher end of the elevational range. Herbs that may be locally common or abundant include *Dryopteris marginalis, Desmodium glutinosum*, and *Aralia nudicaulis*. Species richness of plot-sampled stands ranges from 43 to 103 taxa per 400 square meters (mean = 70).

Global Dynamics: The proportion of *Liriodendron tulipifera* increases with canopy disturbance. Consequently, in many stands logged during the 20th century, *Liriodendron* is codominant with the oaks and hickories. Some stands of this association have been modified by repeated cutting and are now heavily dominated by *Liriodendron tulipifera*. *Symphoricarpos orbiculatus, Polygonum caespitosum var. longisetum*, and exotics such as *Ailanthus altissima, Rubus phoenicolasius*, and *Celastrus orbiculata* often become established in canopy gaps following timber harvests or gypsy moth damage. In recent years, the abundance of *Cornus florida* has been significantly reduced by mortality resulting from dogwood anthracnose.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Amphicarpaea bracteata*, *Asimina triloba*, *Carya ovalis*, *Cornus florida*, *Festuca subverticillata*, *Fraxinus americana*, *Galium circaezans*, *Ostrya virginiana*, *Quercus alba*, *Quercus prinus*, *Quercus rubra*, *Solidago caesia*, *Toxicodendron radicans*
Global: *Actaea racemosa*, *Amphicarpaea bracteata*, *Aristolochia serpentaria*, *Carya alba*, *Carya glabra*, *Carya ovalis*, *Cercis canadensis*, *Cornus florida*, *Desmodium nudiflorum*, *Fraxinus americana*, *Galium circaezans*, *Liriodendron tulipifera*, *Maianthemum racemosum*, *Phryma leptostachya*, *Quercus prinus*, *Quercus rubra*, *Solidago caesia*, *Uvularia perfoliata*, *Viburnum acerifolium*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Bromus ciliatus* (G5, VA state-critically imperiled); **Invasive/Exotic Plants**: *Ailanthus altissima* (Medium), *Alliaria petiolata* (High/Medium), *Berberis thunbergii* (High/Medium), *Ligustrum obtusifolium* (Medium/Low), *Lonicera japonica* (High/Medium), *Lonicera morrowii* (High/Medium), *Microstegium vimineum* (High/Medium), *Nepeta cataria*, *Prunus avium* (High/Low), *Rubus phoenicolasius* (Medium), *Taraxacum officinale*, *Torilis japonica*, *Verbascum thapsus* (Medium)
Global: Vulnerable Plants: *Panax quinquefolius* (G3G4, under collection pressure), *Scutellaria saxatilis* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3G4 (23-Feb-2004). Although currently known from a relatively small geographic range, this community type covers large areas at low elevations on the Northern Blue Ridge and some of its Piedmont foothills. In recent years, the abundance of *Cornus florida* has been significantly reduced by mortality resulting from dogwood anthracnose. Stands are threatened by removal of commercially valuable timber species (e.g., *Quercus rubra, Quercus prinus, Quercus alba, Carya* spp.). Some stands of this association have been modified by repeated cutting and are now heavily dominated by *Liriodendron tulipifera*. *Symphoricarpos orbiculatus, Polygonum caespitosum var. longisetum*, and exotics such as *Ailanthus altissima, Rubus phoenicolasius*, and *Celastrus orbiculata* often become established in canopy gaps following timber harvests or gypsy moth damage.

RELATED CONCEPTS

Global Similar Types:

- *Quercus alba - Carya glabra - Fraxinus americana / Muhlenbergia sobolifera - Elymus hystrix* Forest (CEGL006216) is mostly in the Piedmont in more xeric habitats with shallow or hardpan soils.
- *Quercus alba - Quercus prinus - Carya glabra / Cornus florida / Vaccinium pallidum* Forest (CEGL008515) is an acidic oak-hickory forest of sedimentary and metasedimentary substrates, particularly shale, in the Central Appalachians.
- *Quercus prinus - Quercus rubra - Carya ovalis / Carex pensylvanica - (Calamagrostis porteri)* Forest (CEGL008516) occupies drier sites at higher elevations in the Central Appalachians; usually lacks *Liriodendron tulipifera, Cercis canadensis*, and other low-elevation species.
- *Quercus prinus - Quercus rubra / Hamamelis virginiana* Forest (CEGL006057)
- *Quercus prinus - Quercus rubra / Vaccinium pallidum - (Rhododendron periclymenoides)* Forest (CEGL008523)
- *Quercus rubra - Carya ovata - Fraxinus americana / Actaea racemosa - Hydrophyllum virginianum* Forest (CEGL008518) occupies rich sites over calcareous and mafic rocks at higher elevations of the Central Appalachians; composition is more mesophytic, with a lush herb layer of leafy, colonial, nutrient-demanding forbs.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: In the AT corridor, this type occurs strictly on the Blue Ridge north of Roanoke, at low to middle elevations, on base-rich granite and metabasalt substrates (at middle to high elevations on these substrates, it is replaced by Central Appalachian Montane Oak - Hickory Forest (Basic Type) (CEGL008518)). It is known only from metamorphic geologic substrates of the Blue Ridge and western Piedmont, and is not found anywhere in the Ridge and Valley province. This is a Central Appalachian oak-hickory forest that occurs on mafic and base-rich granitic substrates of the Blue Ridge and its western Piedmont foothills. The elevational range of the type is from <300 m (<1,000 feet) to about 950 m (3,100 feet) on warm slopes (lower on sheltered slopes and in northern Virginia); plots in this analysis range from about 400 to 960 m, and mostly lack some of the lower-elevation species (e.g., *Cercis canadensis* and *Solidago caesia*) that are common in the type.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: Virginia plots earlier assigned to Northern Hardpan Basic Oak - Hickory Forest (CEGL006216) were reclassified to this type (CEGL008514). The proportion of *Liriodendron tulipifera* increases with canopy disturbance. Consequently, in many stands logged during the 20th century, *Liriodendron* is codominant with the oaks and hickories. Some stands of this association have been modified by repeated cutting and are now heavily dominated by *Liriodendron tulipifera*. *Symphoricarpos orbiculatus, Polygonum caespitosum var. longisetum*, and exotics such as *Ailanthus altissima, Rubus phoenicolasius*, and *Celastrus orbiculata* often become established in canopy gaps following timber harvests or gypsy moth damage. In recent years, the abundance of *Cornus florida* has been significantly reduced by mortality resulting from dogwood anthracnose.
Global Classification Comments: In the context of the VDNH George Washington / Jefferson National Forest dataset (VDNH unpubl. data), *Desmodium nudiflorum* has the highest unscaled adjusted Indicator Value among herbs of this community type. However, plots representing this association were also analyzed in a 477-plot dataset of Piedmont and Inner Coastal Plain vegetation, where *Desmodium nudiflorum* attained much higher indicator status in other vegetation types. Because of these results, *Solidago caesia* was chosen as a nominal herb for this community, instead of *Desmodium nudiflorum*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is restricted to the Northern Blue Ridge north of Roanoke, Virginia, and adjacent inner Piedmont of Virginia, Maryland, and West Virginia. It was sampled in Pennsylvania, Maryland (including Weverton Cliffs), West Virginia (including Harpers Ferry, Loudoun Heights, Potomac Wayside), and Virginia (including Dickey Hill, Jarman Gap, Rockfish Gap).
Global Range: This community type is currently known from a narrow range in the Northern Blue Ridge and adjacent inner Piedmont of Virginia, Maryland and West Virginia, extending into the northern periphery of the Southern Blue Ridge. The type appears to be co-extensive with several mafic, igneous and metamorphic rocks, but also occurs on granitic substrates, metasiltstone and phyllite.

G161. PITCH PINE BARRENS

Group Summary Description: This group encompasses woodlands dominated by *Pinus rigida*, or by *Pinus rigida* mixed with oak species, occurring on dry and nutrient-poor soils and mostly maintained by fire. *Quercus rubra, Pinus strobus*, and *Betula populifolia* are common associates in the north, while *Quercus stellata* is characteristic in the south. A tall-shrub layer of *Quercus ilicifolia, Quercus prinoides*, and, south of New England, *Quercus marilandica* are commonly present, although portions of some barrens (or occasionally the entire barrens) lack the scrub oak component. A well-developed low-shrub layer is typical, with lowbush *Vaccinium* spp., *Gaylussacia baccata*, and *Comptonia peregrina* characteristic. The main constituents of this group are the associations that characterize the pine barrens of sandy substrates in the northeastern United States; the group also contains associations in which *Pinus rigida* dominates thin-soiled rocky hilltops. Substrates are of two major types: (1) deep sandy soils of outwash plains, stabilized inland sand dunes, and glacial till; and (2) less commonly, thin-soiled outcrops of acidic bedrock along exposed low-elevation ridgelines and upper slopes. The soils are consequently coarse-textured, acidic, mostly well-drained to xeric, and low in nutrients. *Pinus rigida* is the usual dominant, and cover may range from closed-canopy forest to (more typically) open woodlands.

A0524 *Pinus rigida* Woodland Alliance

Alliance Summary Description: This alliance is dominated by *Pinus rigida*, usually characterized by a well-developed tall-shrub layer dominated by *Quercus ilicifolia* overtopping a low heath layer comprising *Vaccinium angustifolium, Vaccinium pallidum*, and *Gaylussacia baccata*. The herbaceous layer is usually patchy, but is better developed where the shrub layer is less dense. Characteristic herbs include *Carex pensylvanica, Cypripedium acaule, Danthonia spicata, Gaultheria procumbens, Melampyrum lineare*, and *Pteridium aquilinum*. This alliance occurs on rock outcrops, summits, exposed slopes, or sandy soils of sand plains, flat glacial outwash plains, and till.

[CEGL006116] *Pinus rigida / (Quercus ilicifolia) / Photinia melanocarpa / Deschampsia flexuosa* Woodland

Translated Name: **Pitch Pine / (Bear Oak) / Black Chokeberry / Wavy Hairgrass Woodland**
Common Name: **Pitch Pine Rocky Summit**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Pitch Pine Barrens (G161)
Alliance	*Pinus rigida* Woodland Alliance (A0524)

ELEMENT CONCEPT

Global Summary: This northeastern pitch pine community occurs on dry rocky ridges and summits of low to moderate elevations. Soils are derived from acidic bedrock and are typically shallow, well- to excessively drained, coarse sands or gravels that develop in pockets of the exposed bedrock expanses. The canopy is open and trees are often stunted, usually less than 15 m in height and may be under 10 m. Tall shrubs are scattered and not abundant. The dwarf-shrub layer is moderately to well-developed (>20% cover, often more dense). Herbs are sparse. The bryoid layer is of variable cover, with lichens prominent. The ground cover is bare rock and deciduous and coniferous litter. The canopy is dominated by *Pinus rigida* with a variable mixture of associates, such as *Betula populifolia, Quercus rubra, Quercus prinus, Carya glabra, Pinus strobus, Pinus resinosa, Betula lenta, Acer rubrum*, and *Prunus serotina*. The tall-shrub layer is composed of scattered *Quercus ilicifolia, Quercus prinoides*, or less commonly *Nemopanthus mucronatus*. The shrub layer is dominated by heaths, such as *Vaccinium angustifolium, Vaccinium pallidum, Vaccinium myrtilloides*, and *Gaylussacia baccata*, as well as other shrubs, such as *Comptonia peregrina* and *Photinia melanocarpa (= Aronia melanocarpa)*. The herbaceous layer typically includes *Pteridium aquilinum, Schizachyrium scoparium, Deschampsia flexuosa, Danthonia spicata, Carex pensylvanica* and/or *Carex lucorum, Maianthemum canadense, Aralia nudicaulis, Melampyrum lineare, Fragaria*

virginiana, Rumex acetosella, Erechtites hieraciifolia, Corydalis sempervirens, Trientalis borealis, and *Cypripedium acaule*. In the northern Appalachian Mountains, this community generally occurs at elevations from near sea level to 520 m (1700 feet) and may include species of northern affinity, such as *Viburnum nudum, Kalmia angustifolia, Betula papyrifera, Picea rubens*, and *Rhododendron canadense*. Periodic fires are probably necessary for persistence of this type, except at the most extreme sites. This association is differentiated from *Pinus rigida / Corema conradii* Woodland (CEGL006154) by the absence of *Corema*, and from other *Pinus rigida*-dominated woodlands of rocky habitats by the absence or very low cover of the scrub oak *Quercus ilicifolia*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: These pitch pine rocky summits occur at low to moderate elevations; sampled site elevations range from 387-792 m (1,270-2,598 feet). They have shallow acidic, well-drained sandy to gravelly soils. Sites range from gentle to steep upper slopes and summits (rock outcrops) with mostly northern and southern aspects. Soils are dry to xeric rapidly to well-drained sand, sandy loam and silt loam. The unvegetated surface consists of exposed bedrock/large rocks or leaf litter, with small amounts of downed wood, bare soil and/or small rocks. Evidence of disturbance includes trails and trampling from recreational use, fire, and wind/ice damage.

Global Environment: This northeastern pitch pine community occurs on dry rocky ridges and summits of low to moderate elevations. Soils are derived from acidic bedrock and are typically shallow, well- to excessively drained, coarse sands or gravels that develop in pockets of the exposed bedrock expanses. In the northern Appalachian Mountains, this community generally occurs at elevations from near sea level to 520 m (1700 feet), while in the Central Appalachians, this community occurs at elevations up to 1340 m (4400 feet).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: *Pinus rigida* is the dominant (tree- or shrub-sized) with a variable mixture of canopy associates, such as *Quercus prinus, Betula populifolia, Quercus rubra, Acer rubrum, Pinus strobus*, and/or *Carya glabra*. *Quercus ilicifolia* and *Photinia melanocarpa* are characteristic in the tall-shrub layer. *Kalmia latifolia* is often present. *Gaylussacia baccata* and *Vaccinium angustifolium* are dominant dwarf-shrubs. *Deschampsia flexuosa* and *Maianthemum canadense* are common in the herb layer. High lichen cover on exposed bedrock and large rocks is characteristic.

Global Vegetation: The canopy is open and trees are often stunted, usually less than 15 m in height and may be under 10 m. Tall shrubs are scattered and not abundant. The dwarf-shrub layer is moderately to well-developed (>20% cover, often more dense). Herbs are sparse. The bryoid layer is of variable cover, with lichens prominent. The ground cover is bare rock and deciduous and coniferous litter. The canopy is dominated by *Pinus rigida* with a variable mixture of associates, such as *Betula populifolia, Quercus rubra, Quercus prinus, Carya glabra, Pinus strobus, Pinus resinosa, Betula lenta, Acer rubrum*, and *Prunus serotina*. The tall-shrub layer is composed of scattered *Quercus ilicifolia, Quercus prinoides*, or less commonly *Nemopanthus mucronatus*. The shrub layer is dominated by heaths, such as *Vaccinium angustifolium, Vaccinium pallidum, Vaccinium myrtilloides*, and *Gaylussacia baccata*, as well as other shrubs, such as *Comptonia peregrina* and *Photinia melanocarpa (= Aronia melanocarpa)*. The herbaceous layer typically includes *Pteridium aquilinum, Schizachyrium scoparium, Deschampsia flexuosa, Danthonia spicata, Carex pensylvanica* and/or *Carex lucorum, Maianthemum canadense, Aralia nudicaulis, Melampyrum lineare, Fragaria virginiana, Rumex acetosella, Erechtites hieraciifolia, Corydalis sempervirens, Trientalis borealis*, and *Cypripedium acaule*. In the northern Appalachian Mountains, this community may include species of northern affinity, such as *Viburnum nudum, Kalmia angustifolia, Betula papyrifera, Picea rubens*, and *Rhododendron canadense*.

Global Dynamics: Periodic fires are probably necessary for persistence, except at the most extreme sites.

G162. VIRGINIA PINE - TABLE MOUNTAIN PINE WOODLAND & BARRENS

Group Summary Description: Vegetation of this group encompasses predominantly evergreen woodlands and forests occupying very exposed, convex, often rocky south- and west-facing slopes, ridge spurs, crests, and clifftops in the Central Appalachians, Southern Ridge and Valley and Southern Blue Ridge, as well as distinctive shale barrens of low to mid elevations in the Central and Southern Appalachians. They typically occur at moderate to upper elevations (450-1200 m [1500-4000 feet]), with the more southerly examples at the higher elevations. In the Southern Blue Ridge, this group is best developed above 700 m (2300 feet) in elevation, but some examples may be found at lower elevations. The underlying rock is acidic and sedimentary or metasedimentary (e.g., quartzites, sandstones and shales). The soils are very infertile, shallow and droughty. A thick, poorly decomposed duff layer, along with dead wood and highly volatile ericaceous shrubs, creates a strongly fire-prone habitat. Most examples are dominated by *Pinus pungens*, often with *Pinus rigida* and/or *Pinus virginiana*, and occasionally *Tsuga caroliniana*. The canopy is usually patchy to open, but areas of closed canopy may be present, especially where *Tsuga caroliniana* is prominent, or where fire has been absent. The shrub layer may be well-developed, with *Gaylussacia baccata, Vaccinium pallidum*, or other acid-tolerant species most characteristic. Herbs are usually sparse but may include *Pityopsis graminifolia* and *Tephrosia virginiana*. Fire is a very important ecological process in this group. Frequent, low-intensity fires coupled with periodic severe fires is one factor that determines the occurrence of this vegetation rather than hardwood forests under natural conditions. The pines may be able to maintain dominance due to edaphic conditions, such as very shallow soil or extreme exposure in some areas, which can produce sustained drought conditions, but most sites appear eventually to succeed to oak dominance in the absence of fire. Fire is also presumably a strong influence on vegetation structure, producing a more open woodland canopy structure and more herbaceous ground cover.

In floristically distinctive shale barrens examples, the exposed aspects, parent material with high levels of toxic metals, and lack of soil create extreme conditions for plant growth. Vegetation is mostly of a woodland physiognomy, but may include large open areas of sparse vegetation. The dominant trees are primarily *Quercus prinus* and *Pinus virginiana*. On higher-pH shale barrens, which are less common, the primary trees include *Juniperus virginiana* and *Fraxinus americana*, but these are placed in a different group. Shale barrens endemics are diagnostic in the herb layer. The substrate includes areas of solid rock as well as unstable areas of shale scree, usually steeply sloped. The fully exposed areas are extremely dry. These barrens are high in endemic species.

A0677 *Pinus pungens - Pinus rigida - Quercus prinus* Woodland Alliance

Alliance Summary Description: This alliance encompasses woodlands dominated by some combination of *Pinus pungens, Pinus rigida*, and *Pinus virginiana*, often with *Quercus prinus*. Common canopy and subcanopy associates include *Acer rubrum, Castanea dentata, Nyssa sylvatica, Oxydendrum arboreum*, and *Quercus coccinea*. Typical shrubs include *Fothergilla major, Gaylussacia baccata, Gaylussacia ursina, Kalmia latifolia, Leiophyllum buxifolium, Leucothoe recurva, Quercus ilicifolia, Rhododendron catawbiense, Rhododendron carolinianum, Rhododendron maximum, Vaccinium angustifolium, Vaccinium corymbosum, Vaccinium pallidum, Vaccinium simulatum*, and *Vaccinium stamineum*. Understory species composition will vary within the range of this alliance,

but commonly found forb and subshrub species in this usually sparse stratum include *Carex pensylvanica, Comptonia peregrina, Epigaea repens, Galax urceolata, Gaultheria procumbens, Pteridium aquilinum var. latiusculum*, and *Xerophyllum asphodeloides*. These woodlands may be found from Pennsylvania, Maryland and West Virginia south and west to Tennessee, Georgia, and South Carolina in the Central and Southern Appalachians, Ridge and Valley, and southern Piedmont. This vegetation tends to occur under extreme conditions, including rock outcrops, summits, and exposed slopes, including steep, shaley slopes that maintain the open structure of the vegetation. Fire plays a role in the maintenance of the structure and composition of this vegetation, and without periodic fire, these woodlands may gradually transition into forests dominated by *Quercus prinus* and *Quercus coccinea*, except on the most extreme sites, where this vegetation is more self-perpetuating.

[CEGL004996] *Pinus (pungens, rigida) - Quercus prinus / (Quercus ilicifolia) / Gaylussacia baccata* Woodland

Translated Name: **(Table Mountain Pine, Pitch Pine) - Chestnut Oak / (Bear Oak) / Black Huckleberry Woodland**

Common Name: **Central Appalachian Pine - Oak / Heath Woodland**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Virginia Pine - Table Mountain Pine Woodland & Barrens (G162)
Alliance	*Pinus pungens - Pinus rigida - Quercus prinus* Woodland Alliance (A0677)

Element Concept

Global Summary: This association represents mixed woodlands occupying xeric, convex, often rocky south- and west-facing slopes, ridge spurs, crests, and clifftops in the Central Appalachians and peripherally in the Piedmont and Southern Blue Ridge. Stands occur at elevations from 275 to 1200 m (900-4000 feet) on various substrates but most commonly on acidic, sedimentary and metasedimentary substrates (e.g., quartzites, sandstones, and shales). Soils are very infertile, shallow, and droughty. A thick, poorly decomposed duff layer, along with dead wood and highly volatile ericaceous shrubs, create a strongly fire-prone habitat. *Pinus pungens* and *Pinus rigida*, individually or together, codominate the canopy with *Quercus prinus*. The physiognomy of this community can approach that of a closed-canopy forest in some situations as a result of fire exclusion. Scattered canopy and subcanopy associates may include *Quercus coccinea, Quercus rubra, Quercus marilandica, Pinus virginiana, Castanea dentata, Acer rubrum, Sassafras albidum, Nyssa sylvatica*, and *Amelanchier arborea*. *Quercus ilicifolia* often dominates a moderately open to very dense tall-shrub layer, while variable combinations of *Kalmia latifolia, Gaylussacia baccata, Vaccinium pallidum, Vaccinium angustifolium, Vaccinium stamineum, Pieris floribunda, Rhododendron catawbiense*, and other ericads form a generally dense low-shrub layer. *Smilax rotundifolia* and *Smilax glauca* may be prominent climbers among the shrubs. Herbaceous species, often very sparse, are rooted in small openings among the shrubs, on rocks, and in disturbed areas where mineral soil is exposed. Typical herbs and subshrubs include *Epigaea repens, Gaultheria procumbens, Xerophyllum asphodeloides, Iris verna, Pteridium aquilinum var. latiusculum, Melampyrum lineare var. latifolium, Stenanthium gramineum var. micranthum, Uvularia puberula, Lycopodium tristachyum, Aralia hispida* (usually on outcrops), and *Carex tonsa*. Periodic fire is an important ecological process that provides opportunities for the regeneration of both canopy pines and less competitive herbaceous species, while setting back successional encroachment of xeric oaks. On many sites (e.g., clifftops, quartzite ledges), the vegetation is self-perpetuating due to extreme edaphic conditions.

Environmental Description

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This pine - oak / heath woodland occurs on xeric, convex, often rocky south- and west-facing slopes, ridge spurs, crests, and clifftops at elevations from 275 to 1,200 m (900-4,000 feet). It was sampled at 12 locations in the Central Appalachian project area. Sites range from somewhat to very steep, upper slopes and summits with mostly western aspects. Soils are dry to xeric, rapidly to well-drained sandy loam, silt loam and sand. The unvegetated surface is dominated by leaf litter with some downed wood and large/small rocks; one site is dominated by exposed bedrock. Evidence of disturbance includes trails, wind/ice damage, impacts from recreational climbing and camping, oak decline, and gypsy moth and pine bark beetle damage.

Global Environment: These mixed woodlands occupy xeric, convex, often rocky south- and west-facing slopes, ridge spurs, crests, and clifftops in the Central Appalachians and peripherally in the Piedmont and Southern Blue Ridge. Stands occur at elevations from 275 to 1200 m (900-4000 feet) on various substrates but most commonly on

acidic, sedimentary and metasedimentary substrates (e.g., quartzites, sandstones, and shales). Soils are very infertile, shallow, and droughty. A thick, poorly decomposed duff layer, along with dead wood and highly volatile ericaceous shrubs, create a strongly fire-prone habitat. On many sites (e.g., clifftops, quartzite ledges), the vegetation is self-perpetuating due to extreme edaphic conditions. There are significant differences in site conditions associated with variations in this community type. One major variant, often associated with *Pinus pungens* abundance, occurs at low to middle elevations and tends to occupy cliffs and steep sideslopes with significant rock cover. Another variant, often associated with high *Pinus rigida* cover, occurs at middle to high elevations and tends to occupy moderately steep to sublevel upper slopes and crests with little rock cover and very dense duff. Although strongly fire-prone habitats influence vegetation structure and composition of both subtypes, the rock outcrop variant tends to be more influenced by edaphic stresses because of its frequent association with cliffs and outcrop areas.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Pinus rigida* and/or *Pinus pungens* share canopy dominance with *Quercus prinus* and/or *Quercus coccinea*. *Acer rubrum* and *Nyssa sylvatica* are common in the subcanopy. *Pinus virginiana* is absent to minor. The shrub layer includes *Kalmia latifolia, Quercus ilicifolia, Amelanchier arborea, Gaylussacia baccata*, and *Vaccinium pallidum*. Herbs are variable and sparse, although *Pteridium aquilinum var. latiusculum, Schizachyrium scoparium, Epigaea repens*, and *Gaultheria procumbens* are common. This community also supports VA-state imperiled *Buckleya distichophylla*.
Global Vegetation: The canopies of stands of this type are codominated by *Pinus pungens* and *Pinus rigida*, either individually or together, with *Quercus prinus*. Scattered canopy and subcanopy associates may include *Quercus coccinea, Quercus rubra, Quercus marilandica, Pinus virginiana, Castanea dentata, Acer rubrum, Sassafras albidum, Nyssa sylvatica*, and *Amelanchier arborea*. *Quercus ilicifolia* often dominates a moderately open to very dense tall-shrub layer, while variable combinations of *Kalmia latifolia, Gaylussacia baccata, Vaccinium pallidum, Vaccinium angustifolium, Vaccinium stamineum, Pieris floribunda, Rhododendron catawbiense*, and other ericads form a generally dense low-shrub layer. *Smilax rotundifolia* and *Smilax glauca* may be prominent climbers among the shrubs. Herbaceous species, often very sparse, are rooted in small openings among the shrubs, on rocks, and in disturbed areas where mineral soil is exposed. Typical herbs and subshrubs include *Epigaea repens, Gaultheria procumbens, Xerophyllum asphodeloides, Iris verna, Pteridium aquilinum var. latiusculum, Melampyrum lineare var. latifolium, Stenanthium gramineum var. micranthum, Uvularia puberula, Lycopodium tristachyum, Aralia hispida* (usually on outcrops), and *Carex tonsa*. Although fully intergradational, two variants recognized in Virginia are very distinct in their typical expressions. Both share *Quercus prinus* as a codominant canopy tree and have a similar ericaceous shrub layer composed largely of *Kalmia latifolia, Gaylussacia baccata*, and *Vaccinium pallidum*. However, in the first variant, which is usually associated with cliffs and rocky slopes, *Pinus pungens* is the most constant and abundant pine. In the second variant, most often associated with xeric upper slopes and crests, *Pinus rigida* is the most constant and abundant pine. Recognition of these variants as formal types or subtypes has proven problematic due to intergradation of both habitats and floristic composition. Piedmont stands of this community (e.g., on Bull Run Mountain, Virginia, and Sugarloaf Mountain, Maryland) are similar to montane stands but lack *Quercus ilicifolia* and other species characteristic of higher elevations. In 57 plot samples classified as this association from Virginia, mean species richness was 19 species per 400 m2, ranging from 9-27 species per 400 m2.
Global Dynamics: The canopy closure can approach forest physiognomy in some situations as a result of fire exclusion. Periodic fire is an important ecological process which provides opportunities for the regeneration of both canopy pines and less competitive herbaceous species, while setting back successional encroachment of xeric oaks. On many sites (e.g., clifftops, quartzite ledges), the vegetation is self-perpetuating due to extreme edaphic conditions. Much of this vegetation in Virginia has been devastated in the 1990s by infestations of southern pine beetle (*Dendroctonus frontalis*). These outbreaks have resulted in extensive mortality of the dominant pines and changed physiognomies, at least temporarily, to a shrubland condition.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Gaultheria procumbens*, *Gaylussacia baccata*, *Kalmia latifolia*, *Nyssa sylvatica*, *Pinus pungens*, *Pinus rigida*, *Quercus ilicifolia*, *Quercus prinus*, *Vaccinium pallidum*
Global: *Buckleya distichophylla*, *Carex polymorpha*, *Galax urceolata*, *Gaultheria procumbens*, *Gaylussacia baccata*, *Iris verna*, *Kalmia latifolia*, *Lycopodium tristachyum*, *Melampyrum lineare* var. *latifolium*, *Nyssa sylvatica*, *Pinus pungens*, *Pinus rigida*, *Quercus coccinea*, *Quercus ilicifolia*, *Quercus prinus*, *Sassafras albidum*, *Vaccinium pallidum*, *Xerophyllum asphodeloides*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Buckleya distichophylla* (G3, globally vulnerable & VA state-imperiled)
Global: Vulnerable Plants: *Buckleya distichophylla* (G3, Subtype 1), *Carex polymorpha* (G3, Subtype 2), *Tsuga caroliniana* (G3), *Vaccinium myrtilloides* (G5, VA state-rare)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4 (1-Oct-2001). This community is widely but locally distributed in the Central Appalachians, forming large patches at some sites. It is apparently secure, although fire suppression and insect pathogens represent ongoing stand-altering disturbances.

RELATED CONCEPTS

Global Similar Types:
- *Pinus pungens - Pinus rigida - (Quercus prinus) / Kalmia latifolia - Vaccinium pallidum* Woodland (CEGL007097)
- *Pinus rigida - (Pinus pungens) / Rhododendron catawbiense - Kalmia latifolia / Galax urceolata* Woodland (CEGL004985)
- *Pinus rigida - Quercus prinus / Gaylussacia baccata / Carex pensylvanica* Woodland (CEGL004821)
- *Pinus rigida / (Quercus ilicifolia) / Photinia melanocarpa / Deschampsia flexuosa* Woodland (CEGL006116)
- *Pinus virginiana - Pinus (rigida, echinata) - (Quercus prinus) / Vaccinium pallidum* Forest (CEGL007119)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This is the Central Appalachian analogue of Blue Ridge Table Mountain Pine - Pitch Pine Woodland (Typic Type) (CEGL007097). It scarcely differs except for the absence of *Gaylussacia ursina* and *Vaccinium hirsutum* and the presence of *Quercus ilicifolia* in the shrub layer of some stands. The latter has high constancy in the plots used for this analysis (all from south of the James River), but over the whole region, it is somewhat inconstant (thus its parenthetical status). It can intergrade with both major xeric oak / heath forests, i.e., Central Appalachian-Northern Piedmont Chestnut Oak Forest (CEGL006299) and Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271).
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: This community type is closely related to other xeric pine and pine-oak associations. It is thought to differ in the frequent shrub layer dominance of *Quercus ilicifolia*, a northern species which is absent in similar communities south of Virginia, as well as the absence of a number of uncommon but characteristic southern species such as *Gaylussacia ursina, Rhododendron carolinianum, Rhododendron minus, Leiophyllum buxifolium*, and *Fothergilla major*. In 68 plots from Virginia, the most constant (≥62%) species, in order of descending constancy, are *Kalmia latifolia, Vaccinium pallidum, Quercus prinus (= Quercus montana), Gaylussacia baccata, Quercus ilicifolia, Sassafras albidum, Nyssa sylvatica, Pinus rigida, Acer rubrum*, and *Amelanchier arborea*. Other less constant species from this community with more northern affinities, which are absent or infrequent south of Virginia, are *Pieris floribunda* and *Vaccinium angustifolium*. Long-term, widespread

fire exclusion is an ongoing problem which may be causing some stands to succeed to closed, mixed oak-pine forest. However, on many sites occupied by this community, edaphic conditions are so stressful that tree oaks are marginally competitive, and even long fire-return intervals (e.g., >25 years) are sufficient to maintain pine codominance. Within the past ten years, much of this vegetation in Virginia has been devastated by infestations of southern pine beetle (*Dendroctonus frontalis*). These outbreaks have resulted in extensive mortality of the dominant pines and changed physiognomies, at least temporarily, to a shrubland condition. Two subtypes formerly recognized in Virginia have proven problematic in recent analyses and are better regarded as intergrading variants.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community occurs in the Central Appalachians from Lehigh County, Pennsylvania, south to Bland County, Virginia. It was sampled in Maryland, Pennsylvania, and Virginia at Brushy Mountain, Dragons Tooth, James River Face Wilderness, Peters Mountain, Sawmill Run Overlook, Trout Creek West, and Turk Run Overlook.
Global Range: This community occurs in the Central Appalachian region of Virginia, West Virginia, Maryland, and Pennsylvania, with very local outliers in the western Piedmont of Virginia and Maryland (e.g., Sugarloaf Mountain). In Virginia, the type as a whole ranges through the Blue Ridge and Ridge and Valley provinces north of the New River. Outliers occur on Bull Run Mountain (Fauquier County), Willis Mountain (Buckingham County), and other Virginia Piedmont foothills.

[CEGL007097] *Pinus pungens - Pinus rigida - (Quercus prinus) / Kalmia latifolia - Vaccinium pallidum* Woodland

Translated Name: **Table Mountain Pine - Pitch Pine - (Chestnut Oak) / Mountain Laurel - Blue Ridge Blueberry Woodland**
Common Name: **Blue Ridge Table Mountain Pine - Pitch Pine Woodland (Typic Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Virginia Pine - Table Mountain Pine Woodland & Barrens (G162)
Alliance	*Pinus pungens - Pinus rigida - Quercus prinus* Woodland Alliance (A0677)

ELEMENT CONCEPT

Global Summary: This association includes mostly evergreen woodlands dominated by *Pinus pungens* and/or *Pinus rigida*, occurring over a dense ericaceous shrub stratum, on sharp ridges, mostly above 610 m (2000 feet) elevation in the Southern Blue Ridge. This type is also found in limited areas of the inner Piedmont and Cumberland Mountains. This woodland occurs across a wide elevational range (485-1220 m [1600-4000 feet]), on exposed ridges and upper slopes with southerly and westerly exposures, over thin, excessively drained, nutrient-poor soils, and can be associated with rock outcroppings. Canopy coverage can often approach that of a forest, especially in areas where fire has been excluded and deciduous species have significant coverage. Deciduous species that can be important, particularly in the subcanopy, include *Quercus prinus, Quercus coccinea, Quercus stellata, Nyssa sylvatica, Acer rubrum*, and *Oxydendrum arboreum*. *Pinus virginiana, Pinus echinata*, and *Pinus strobus* can have high coverage and even codominate on some sites. The shrub stratum is dominated by ericaceous species, typically *Kalmia latifolia* and *Leucothoe recurva* in the tall-shrub stratum and *Vaccinium pallidum* as a low shrub. Other shrub species vary with location but include *Vaccinium stamineum, Vaccinium simulatum, Vaccinium pallidum, Vaccinium hirsutum, Vaccinium corymbosum, Rhododendron maximum, Rhododendron minus, Gaylussacia ursina, Gaylussacia baccata, Buckleya distichophylla, Pyrularia pubera*, and *Fothergilla major*. Species commonly found in the sparse herb stratum include *Chimaphila maculata, Galax urceolata, Pteridium aquilinum var. latiusculum, Xerophyllum asphodeloides, Chamaelirium luteum, Comptonia peregrina, Leiophyllum buxifolium, Gaultheria procumbens, Iris verna, Dichanthelium* spp., and *Epigaea repens*, although herbaceous species composition will vary within the range of this community. *Smilax glauca* is a common vine. Without periodic fire, this community will gradually succeed into forests dominated by *Acer rubrum* or *Quercus prinus* and *Quercus coccinea*, except on the most extreme sites, where this vegetation is self-perpetuating. It is thought that woodlands dominated by *Pinus pungens* are associated with more xeric conditions than woodlands dominated by *Pinus pungens* in combination with other tree species.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: Southern Appalachian examples of this pine woodland are generally found above 610 m (2,000 feet) elevation. Sites range from moderate to steep mid and upper slopes and ridgetops with mostly southern aspects. Soils are mesic to xeric, moderately well- to rapidly drained loam, clay loam, and sandy loam. The unvegetated surface is dominated by leaf litter with some downed wood and occasional large/small rocks and bare soil. Evidence of disturbance includes fire and fire suppression (thick duff layer), trails, hemlock/fir adelgid and pine bark beetle damage, chestnut blight, and wind/ice damage.

Global Environment: This association is typically found on sharp ridges mostly above 610 m (2000 feet) elevation in the Southern Blue Ridge. This woodland occurs across a wide elevation range from 488 to 1220 m (1600-4000 feet) in the Southern Appalachians, on exposed ridges and upper slopes with southerly and westerly exposures, over thin, excessively drained, nutrient-poor soils, and can be associated with rock outcroppings. It is thought that woodlands dominated by *Pinus pungens* are associated with more xeric conditions than woodlands dominated by *Pinus pungens* in combination with other tree species (Zobel 1969, Barden 1977).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: In the Southern Blue Ridge, stands include *Pinus pungens* and/or *Pinus rigida*, without *Quercus ilicifolia* present. The canopy is dominated by *Pinus pungens* and/or *Pinus rigida*, possibly with *Pinus virginiana*, but this not dominant. Additional tree species include *Acer rubrum, Oxydendrum arboreum, Pinus strobus, Quercus coccinea, Quercus prinus*, and *Sassafras albidum*. Characteristic shrubs include *Kalmia latifolia, Vaccinium pallidum, Gaylussacia baccata, Lyonia ligustrina var. ligustrina*, and *Vaccinium stamineum*. Herbs are sparse but *Epigaea repens* is a common herb; *Smilax glauca* is a common vine. This community also supports TN-state imperiled *Buckleya distichophylla*.

Global Vegetation: These mostly evergreen woodlands are characteristically dominated by *Pinus pungens* and/or *Pinus rigida*, occurring over a dense ericaceous shrub stratum. Deciduous species that can be important, particularly in the subcanopy, include *Quercus prinus, Quercus coccinea, Quercus stellata* (in lower elevation occurrences), *Nyssa sylvatica, Acer rubrum*, and *Oxydendrum arboreum*. *Pinus virginiana, Pinus echinata*, and *Pinus strobus* can have high coverage and even codominate on some sites. The shrub stratum is dominated by ericaceous species, typically *Kalmia latifolia* and *Leucothoe recurva* in the tall-shrub stratum and *Vaccinium pallidum* as a low shrub. Other shrub species vary with location, but include *Vaccinium stamineum, Vaccinium simulatum, Vaccinium pallidum, Vaccinium hirsutum, Vaccinium corymbosum, Rhododendron maximum, Rhododendron minus, Gaylussacia ursina, Gaylussacia baccata, Buckleya distichophylla, Pyrularia pubera, Castanea dentata, Castanea pumila*, and *Fothergilla major*. Species commonly found in the sparse herb stratum include *Chimaphila maculata,*

Galax urceolata, Pteridium aquilinum var. latiusculum, Xerophyllum asphodeloides, Chamaelirium luteum, Comptonia peregrina, Leiophyllum buxifolium, Gaultheria procumbens, Iris verna, Melampyrum lineare, Dichanthelium spp., and *Epigaea repens*, although herbaceous species composition will vary within the range of this community. *Smilax glauca* is a common vine. Species in this community which have the bulk of their worldwide range in the Southern Blue Ridge include *Leiophyllum buxifolium, Pieris floribunda, Pinus pungens*, and *Xerophyllum asphodeloides*. Other rare species include *Fothergilla major, Robinia hispida var. fertilis, Robinia hispida var. rosea*, and *Robinia viscosa var. viscosa*.

Global Dynamics: Fire contributes to the maintenance of this community by destroying the litter layer, opening the canopy, releasing seed from the serotinous cones, and killing competing vegetation. Red squirrels are known to cut branches to remove the *Pinus pungens* cones. It is thought this "squirrel grazing" may decrease the growth and vigor of trees (Zobel 1969). Canopy removal by icestorms stimulate oak sprouting and release advanced regeneration (Williams and Johnson 1992). Canopy coverage in stands of this association can often approach that of a forest, especially in areas where fire has been excluded and deciduous species have significant coverage. Without periodic fire, this community will gradually succeed into forests dominated by *Quercus prinus* and *Quercus coccinea*, except on the most extreme sites, where this vegetation is self-perpetuating (Newell and Peet 1994). However, recent regional pine beetle kills throughout large areas of the Southeast have accelerated the rate of succession in most of these stands. This acceleration of succession may lead to conversion of these forests to hardwoods in the long term (M. Jenkins pers. comm.).

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Epigaea repens*, *Pinus pungens*
Global: *Comptonia peregrina*, *Epigaea repens*, *Fothergilla major*, *Galax urceolata*, *Gaultheria procumbens*, *Leiophyllum buxifolium*, *Pinus pungens*, *Xerophyllum asphodeloides*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Buckleya distichophylla* (G3, globally imperiled), *Castanea dentata* (G4, TN state-imperiled), *Rhododendron minus* (G4, TN state-imperiled)
Global: Vulnerable Plants: *Buckleya distichophylla* (G3), *Canoparmelia amabilis* (G1), *Fothergilla major* (G3, Southern Appalachian endemic), *Robinia hispida* var. *fertilis* (G4T1Q), *Robinia hispida* var. *kelseyi* (G4T1), *Robinia hispida* var. *rosea* (G4T3?), *Robinia viscosa* var. *viscosa* (G3T3), *Tsuga caroliniana* (G3), *Vaccinium hirsutum* (G3); **Other Plants**: *Pieris floribunda* (G4, Southern Blue Ridge endemic)

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (30-Apr-1998). This community is endemic to the southern Appalachian Mountains where it is maintained by periodic fire or extreme site conditions. Recent studies show that acreage of this community has decreased due to fire suppression (Turrill and Buckner 1995) and that many remaining examples have substantial hardwood invasion. Lightning-set and high-intensity controlled burns are necessary to maintain and re-establish this community type. In addition, recent pine beetle outbreaks have killed off large areas of this

community type in the past five years (1998-2003) in the Southeast. Due to this, the global rank may soon need to be adjusted to G2.

Related Concepts

Global Similar Types:

- *Pinus (pungens, rigida) - Quercus prinus / (Quercus ilicifolia) / Gaylussacia baccata* Woodland (CEGL004996) is more northern and with *Quercus ilicifolia*.
- *Pinus rigida - (Pinus pungens) / Rhododendron catawbiense - Kalmia latifolia / Galax urceolata* Woodland (CEGL004985) occurs at higher elevations (1220-1555 m [4000-5100 feet) and usually includes *Rhododendron catawbiense*.
- *Pinus rigida - Quercus prinus / Gaylussacia baccata / Carex pensylvanica* Woodland (CEGL004821)
- *Pinus virginiana - Pinus (rigida, echinata) - (Quercus prinus) / Vaccinium pallidum* Forest (CEGL007119)

Classification

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Southern Appalachian pine-oak/heath vegetation. Most stands were dominated by one or the other pine in the name. This woodland can intergrade with xeric oak/heath forests (i.e., Chestnut Oak Forest (Subxeric Ridge Type) (CEGL006271)).
Global Classification Comments: Other communities with *Pinus pungens* occur in central Pennsylvania and in Virginia. These northern types are thought to have a different species composition and geology than the forests described here. Species associated with *Pinus pungens* in the northern part of its range that do not occur in this community include *Quercus ilicifolia, Viburnum acerifolium*, and *Vaccinium angustifolium*. [See *Pinus (pungens, rigida) - Quercus prinus / (Quercus ilicifolia) / Gaylussacia baccata* Woodland (CEGL004996).] Examples of this association studied on lands of the Eastern Band of the Cherokee Indians in Cherokee County, North Carolina, include a substantial amount of *Pinus echinata* and lack *Pinus pungens*. These stands occur on low ridges (520-670 m [1700-2200 feet]) and otherwise, floristically, are a good match for this forest type. It is believed that they are transitional to low-elevation stands dominated by *Pinus echinata* in the Cumberlands and Southern Ridge and Valley. In the Appalachian Trail classification study, 22 plots from Georgia, North Carolina, Tennessee, and Virginia were classified as this association with a homoteneity of 68% (Fleming and Patterson 2009a). The most constant species (≥64%), in order of descending constancy, are *Kalmia latifolia, Acer rubrum, Quercus prinus, Quercus coccinea, Pinus rigida, Pinus pungens, Gaylussacia baccata, Gaylussacia ursina, Oxydendrum arboreum, Vaccinium pallidum, Nyssa sylvatica, Galax urceolata*, and *Gaultheria procumbens*. Less constant species with high mean cover values (≥5 cover class) in these plots are *Pinus pungens, Pinus rigida, Gaylussacia baccata, Gaylussacia ursina*, and *Vaccinium hirsutum*.

Element Distribution

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This woodland is scattered in and near the AT corridor in the southern two-thirds of the Southern Blue Ridge. It just ranges into southwestern Virginia at Feathercamp Ridge West and Holston Mountain. It was also sampled in Georgia, North Carolina, at Cliff Ridge and elsewhere in Tennessee.
Global Range: This community ranges throughout the Southern Blue Ridge and Cumberland Mountains, from southwestern Virginia and southeastern Kentucky, south through western North Carolina and eastern Tennessee, into northeastern Georgia and northwestern South Carolina.

A3312 *Pinus virginiana - Quercus prinus* Acidic Shale Woodland Alliance

Alliance Summary Description: These mixed evergreen-deciduous woodlands and sparse woodlands are dominated by some combination of *Juniperus virginiana var. virginiana, Pinus virginiana, Pinus rigida*, and *Quercus prinus*. Hardwood associates include *Carya glabra, Carya ovalis, Carya ovata, Fraxinus americana, Quercus rubra, Quercus stellata*, and *Quercus velutina*. The shrub layer includes *Amelanchier arborea, Gaylussacia baccata, Quercus ilicifolia, Vaccinium pallidum*, and *Vaccinium stamineum*. The herbaceous layer is generally sparse; grass and other graminoid species include *Carex pensylvanica, Danthonia spicata, Deschampsia flexuosa, Dichanthelium linearifolium*, and *Schizachyrium scoparium*. Forbs include *Cunila origanoides, Heuchera americana, Hieracium venosum, Penstemon hirsutus, Phlox subulata, Symphyotrichum cordifolium*, and *Viola pedata*. Lichens such as *Cladonia* spp. and *Cladina* spp. are abundant in some areas. These woods are found on acidic shale substrates from Maryland, Pennsylvania, Virginia and West Virginia.

[CEGL008525] *Pinus virginiana - Quercus prinus / Quercus ilicifolia / (Hieracium greenii, Viola pedata)* Woodland

Translated Name: **Virginia Pine - Chestnut Oak / Bear Oak / (Maryland Hawkweed, Bird's-foot Violet) Woodland**

Common Name: **Central Appalachian Xeric Shale Woodland (Virginia Pine / Sparse Herbs Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Virginia Pine - Table Mountain Pine Woodland & Barrens (G162)
Alliance	*Pinus virginiana* - *Quercus prinus* Acidic Shale Woodland Alliance (A3312)

ELEMENT CONCEPT

Global Summary: This shale barren mixed woodland is endemic to the Central Appalachian region of west-central Virginia and eastern West Virginia and the Ridge and Valley physiographic province in Maryland. There it is widely but locally distributed in shale districts of the Ridge and Valley on strongly convex, mostly southeast- to west-facing slopes and adjacent divide crests. It is very locally represented in similar Blue Ridge landscapes underlain by shale-like metamorphic rocks. Stands range in elevation from about 300-730 m (1000-2400 feet) on moderate to steep slopes. These environments are xeric and drought-prone, with high soil temperatures and evaporation rates during the summer months. Substrates appear to be relatively stable and lack the ongoing erosional processes of the larger, steeper shale barrens. Vegetation is an open woodland dominated by *Pinus virginiana* and *Quercus prinus*, usually as a mixture but occasionally with one strongly dominant. *Pinus pungens* and *Quercus rubra* are occasional canopy associates. Mean canopy cover is usually <50%, and dominant pines are <15 m tall. A sparse understory of younger *Pinus virginiana* and *Quercus prinus* 6-10 m tall is usually present, often with *Amelanchier arborea*. The sparse shrub layer is characterized by patchy *Quercus ilicifolia* and tree saplings. Low-growing *Vaccinium pallidum* is the most abundant component of the short-shrub layer, sometimes occurring with *Vaccinium stamineum*. The herbaceous flora of this vegetation is depauperate. *Carex pensylvanica* and *Danthonia spicata* are typical, although at low cover. Forbs tend to be variable among sites; the most typical are *Hieracium greenei, Viola pedata,*

Houstonia longifolia, and *Solidago bicolor*. Scattered individuals of the shale-barren endemics *Antennaria virginica, Packera antennariifolia (= Senecio antennariifolius), Paronychia montana*, and *Eriogonum allenii* occasionally occur in this community, particularly where stands border well-developed shale barrens. A characteristic feature of some examples of this type is ground-level dominance of *Cladina* spp. lichens. This association differs from related shale-barren associations in its extremely depauperate flora, absence of *Juniperus virginiana*, and presence of *Hieracium greenei* and *Quercus ilicifolia*. *Pinus pungens* may occur in this type and is very rarely found in other shale barren types.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This xeric Virginia pine shale woodland occurs on moderate to steep slopes from 300-730 m (1,000-2,400 feet) elevation. It is endemic to the Central Appalachian region of west-central Virginia and eastern West Virginia, possibly reaching into Maryland, as well as in the Ridge and Valley of Virginia. It was sampled at two locations in the AT corridor. One site is a steep, south-facing midslope, the other a somewhat steep, southeast-facing bedrock outcrop. Soils are rapidly drained. The unvegetated surface at both sites is dominated by rocks with some leaf litter, downed wood and bare soil. Disturbance includes trampling, damage from pine bark beetle and past fire events.

Global Environment: This association is widely but locally distributed in shale districts of the central Ridge and Valley on strongly convex, mostly southeast- to west-facing slopes and adjacent divide crests. It is very locally represented in similar Blue Ridge landscapes underlain by shale-like metamorphic rocks. Plot-sampled stands range in elevation from about 300 to 730 m (1000-2400 feet) and have slopes varying from 11-33° (mean = 25°). These environments are xeric and drought-prone, with high soil temperatures and evaporation rates during the summer months. Substrates appear to be relatively stable and lack the ongoing erosional processes of the larger, steeper shale barrens. Surface cover of channery and mineral soil is high, but shale outcrops occupy only a minor portion of the surface substrate. Very little litter or duff accumulates on the slopes, preventing or discouraging fires from burning through these habitats. Low pH, base cation, and micronutrient values in soil samples collected from plots indicate an oligotrophic nutrient regime that contrasts sharply with the higher fertility of shale barren soils.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This xeric shale woodland is dominated by *Pinus virginiana*. *Pinus pungens* and *Quercus prinus* can codominate in the canopy. *Quercus ilicifolia* and *Vaccinium pallidum* form a sparse shrub layer. Other shrubs may include *Amelanchier arborea, Kalmia latifolia*, and *Vaccinium stamineum*. Herbs are sparse but can include *Carex pensylvanica, Carex umbellata, Schizachyrium scoparium, Dichanthelium depauperatum, Paronychia argyrocoma, Dicentra eximia*, and *Solidago bicolor*.

Global Vegetation: Vegetation is an open woodland dominated by *Pinus virginiana* and *Quercus prinus*, usually as a mixture but occasionally with one strongly dominant. *Pinus pungens* and *Quercus rubra* are occasional canopy associates. Mean canopy cover is usually <50% and dominant pines are <15 m tall. A sparse understory of younger *Pinus virginiana* and *Quercus prinus* 6-10 m tall is usually present, often with *Amelanchier arborea*. The sparse shrub layer is characterized by patchy *Quercus ilicifolia* and tree saplings. Low-growing *Vaccinium pallidum* is the most abundant component of the short-shrub layer, sometimes occurring with *Vaccinium stamineum*. The herbaceous flora of this vegetation is depauperate. *Carex pensylvanica* and *Danthonia spicata* are typical, although at low cover. Forbs tend to be variable among sites; the most typical are *Hieracium greenei, Viola pedata, Houstonia longifolia*, and *Solidago bicolor*. Scattered individuals of the shale-barren endemics *Antennaria virginica, Packera antennariifolia (= Senecio antennariifolius), Paronychia montana*, and *Eriogonum allenii* occasionally occur in this community, particularly where stands border well-developed shale barrens. A characteristic feature of some examples of this type is ground-level dominance of *Cladina* spp. lichens. Several mosses, including *Leucobryum glaucum, Polytrichum* sp., and *Dicranum* sp., were also present in plots. This association has extraordinarily low species richness (range in Virginia plots = 9-20 taxa per 400 square meters; mean = 15).

Global Dynamics: Edaphic conditions appear to be the controlling factor that maintains pine dominance in this association. Plot-sampled stands at Peters Mountain in Alleghany County, Virginia, have numerous long-dead standing and fallen logs and no evidence of fire (Fleming and Moorhead 2000). Normally a fast-growing, short-lived, shade-intolerant invader of abandoned fields, *Pinus virginiana* is very tolerant of dry soils but is easily killed by intense fires (Fowells 1965). Under the harsh, open-canopy environment of the shale slopes, this pine is able to reproduce well and succeed itself, while severe drought and perhaps low nutrient availability stunt potential hardwood successors such as *Quercus prinus, Quercus alba*, and *Carya* spp. The lack of fire allows the dominant pines to reach relatively old ages and probably contributes to high ground cover of lichens and low cover of herbs. Increment cores taken from representative dominant pines in Peters Mountain plots indicated ages of approximately

95, 113, and 118 years despite relatively small sizes (22, 31, and 26 cm dbh [9,12, and 10 inches], respectively), reflecting slow growth rates (Fleming and Moorhead 2000).

OTHER NOTEWORTHY SPECIES

Global:

CONSERVATION STATUS RANK

Global Rank & Reasons: G3 (24-Feb-2010). This association appears to be restricted to a small (approximately 10-county) area in the Ridge and Valley region of west-central Virginia and eastern West Virginia. However, there are probably at least 100 and possibly several hundred occurrences of this community type in Virginia alone.

RELATED CONCEPTS

Global Similar Types:

- *Pinus rigida - Quercus prinus / Gaylussacia baccata / Carex pensylvanica* Woodland (CEGL004821)
- *Pinus virginiana - Juniperus virginiana - Quercus rubra / Solidago arguta var. harrisii - Opuntia humifusa* Woodland (CEGL006288)
- *Quercus prinus / Quercus ilicifolia / Danthonia spicata* Woodland (CEGL008526) is a deciduous or mixed shale woodland with higher shrub and herb cover and overall species richness.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This type is characterized by open *Pinus virginiana* or mixed woodlands with very depauperate lower strata and heavy ground cover of *Cladonia* species. It is one of the most barren of the Central Appalachian shale barrens.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: Plot samples from Virginia classified as this association (n=13) have a homoteneity of 64%. The most constant (≥62%) species, in order of descending constancy, are *Pinus virginiana, Quercus ilicifolia, Quercus prinus (= Quercus montana), Vaccinium pallidum, Amelanchier arborea, Quercus rubra*, and *Danthonia spicata*. Species richness in these very depauperate shale woodlands ranges from 9-20 species per 400-m2 sample, averaging 15 species per 400-m2 sample. Fieldwork in 2011 on Dan's Mountain WMA in Maryland confirmed this type on southwest-facing exposures over the Jennings Shale Formation. More inventory work is needed to confirm number of occurrences in Maryland.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is endemic to the Central Appalachian region of west-central Virginia and eastern West Virginia, possibly reaching into Maryland, and is also found in the Ridge and Valley of Virginia. It was sampled at James River Face Wilderness in Bedford County, Virginia.
Global Range: This community is endemic to the Central Appalachian region of west-central Virginia and eastern West Virginia, and the Ridge and Valley physiographic province in Maryland. In Virginia, it is mostly confined to

Ordovician, Silurian, and Devonian shales of the Ridge and Valley province. There are a few very localized occurrences on Cambrian (Harpers Formation) metasiltstone and phyllite of the Northern Blue Ridge. The principal range in West Virginia includes Pendleton, Greenbriar, and Monroe counties.

Translated Name: **Virginia Pine / Blue Ridge Blueberry / Little Bluestem - Pennsylvania Sedge Woodland**
Common Name: **Blue Ridge Acidic Shale Woodland**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Virginia Pine - Table Mountain Pine Woodland & Barrens (G162)
Alliance	*Pinus virginiana* - *Quercus prinus* Acidic Shale Woodland Alliance (A3312)

ELEMENT CONCEPT

Global Summary: This community occurs on steep, shaley slopes in the Southern Appalachians and has an open to closed, stunted canopy and sparse herb and shrub strata characterized by species able to grow in loose shale fragments. It is known from the Hot Springs Window, in the Blue Ridge Mountains, and occurs elsewhere in the Southern Appalachians, such as the Chauga Basin, South Carolina, and from Chilhowee Mountain, Tennessee. The canopy (5-25 m tall, 25-75% cover) is dominated by *Pinus virginiana*, with *Quercus prinus* and *Quercus rubra* sometimes present in substantial numbers in less extreme habitats. The shrub layer is very sparse, and may include scattered individuals of *Kalmia latifolia, Vaccinium stamineum*, and *Vaccinium pallidum*. The herb layer is very sparse to patchy, and is dominated by *Schizachyrium scoparium, Carex pensylvanica, Danthonia spicata, Dichanthelium linearifolium*, with scattered individuals of *Coreopsis major, Houstonia longifolia (= Houstonia tenuifolia), Hieracium venosum*, and *Euphorbia corollata*. Lichens are frequent, particularly on in-place outcrops, and include *Cladina rangiferina* and *Cladonia* spp. Loose shale fragments cover 50-90% of the ground surface. It is apparently a long-lived community, maintained by harsh edaphic conditions of steep slopes and shifting shale substrate. The community can vary quite widely from a very open canopy to one that is almost closed in cases where the slope is less steep and/or the rock underlying the stand is more stable.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This acidic shale woodland is found below 610 m (2,000 feet) elevation. The sampled stand is on a steep, west-facing lower slope.
Global Environment: This community occurs on steep, shaley slopes in the Southern Appalachians and has a sparse herb and shrub strata characterized by species able to grow in loose shale fragments. Loose shale fragments cover 50-90% of the ground surface. It is apparently a long-lived community, maintained by harsh edaphic conditions of steep slopes and shifting shale substrate. The community can vary quite widely from a very open canopy to one that is almost closed in cases where the slope is less steep and/or the rock underlying the stand is more stable.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is primarily dominated by *Pinus virginiana*, with *Quercus prinus* and *Quercus rubra* sometimes present in substantial numbers in less extreme habitats. The shrub layer is very sparse and may include scattered individuals of *Kalmia latifolia, Vaccinium stamineum*, and *Vaccinium pallidum*. Herbs are diverse but sparse.
Global Vegetation: The stunted open to closed canopy (5-25 m tall, 25-75% cover) of stands of this type is dominated by *Pinus virginiana*, with *Quercus prinus* and *Quercus rubra* sometimes present in substantial numbers in less extreme versions of this habitat. The shrub layer is very sparse, and may include scattered individuals of *Kalmia latifolia, Vaccinium stamineum*, and *Vaccinium pallidum*. The herb layer is very sparse to patchy, and is dominated by *Schizachyrium scoparium, Carex pensylvanica, Danthonia spicata, Dichanthelium linearifolium*, with scattered individuals of *Coreopsis major, Houstonia longifolia (= Houstonia tenuifolia), Hieracium venosum*, and *Euphorbia corollata*. Lichens are frequent, particularly on in-place outcrops, and include *Cladina rangiferina* and *Cladonia* spp.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Pinus virginiana*, *Vaccinium stamineum*
Global: *Carex pensylvanica*, *Pinus virginiana*, *Schizachyrium scoparium*, *Vaccinium pallidum*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Philadelphus hirsutus* (G5, NC state-imperiled), *Symphyotrichum oblongifolium* (G5, NC state-critically imperiled)
Global: Vulnerable Plants: *Heuchera caroliniana* (G3), *Vaccinium hirsutum* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (19-Feb-2004). As defined, this community is limited to the rare outcrops of shale in the Blue Ridge and in the transition between the Blue Ridge and Ridge and Valley physiographic provinces in extreme western North Carolina and eastern Tennessee. There is some possibility that this type may be somewhat more widespread in the Ridge and Valley of Tennessee, southwestern Virginia, and northern Alabama, although no new locations have been found to date (Feb 2004). It is distinguished from the various shale barren types of western Virginia, eastern West Virginia, western Maryland, and south-central Pennsylvania by the complete absence of the distinctive endemic flora of that region. Most examples are not highly threatened by development or timber harvesting because of their occurrence on steep slopes and the low value/poor quality timber present. This community type is threatened by the invasive exotic *Paulownia tomentosa*, which can colonize this community type where it is near a seed source. Although the current condition of the examples of this type are good, the fact that there are only three known Element Occurrences requires us to give this a high priority Global Rank.

RELATED CONCEPTS

Global Similar Types:

- *Quercus prinus - Juniperus virginiana - (Pinus virginiana) / Philadelphus hirsutus - Celtis occidentalis* Woodland (CEGL007720) on steep, rocky, riverine bluffs in the Southern Blue Ridge with exposed and eroding shale.
- *Quercus prinus - Pinus virginiana - (Pinus pungens) / Schizachyrium scoparium - Dichanthelium depauperatum* Woodland (CEGL008540) of Virginia, Maryland and West Virginia, is strictly a woodland of non-shale substrates.
- *Quercus prinus / Quercus ilicifolia / Danthonia spicata* Woodland (CEGL008526) on dry shale slopes of the Central Appalachians.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This is a distinctive type on a distinctive substrate, with a stunted canopy and sparse herb and shrub strata characterized by species able to grow in loose shale fragments.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: This is a woodland of erosive shale substrates. Compositionally, this type is very similar to Central Appalachian Chestnut Oak - Virginia Pine Woodland (CEGL008540) of the Central Appalachians which is strictly a woodland of non-shale substrates.
Global Classification Comments: Five plots from the area of Hot Springs, North Carolina, are classified as this association in the Appalachian Trail classification study (Fleming and Patterson 2009a). These plots have 27 species with ≥60% constancy. Species with ≥80% constancy include, in order of descending constancy, *Pinus virginiana, Quercus prinus, Quercus rubra, Vaccinium stamineum, Campanula divaricata, Coreopsis major, Andropogon virginicus var. virginicus, Hieracium venosum, Juniperus virginiana var. virginiana, Danthonia spicata*, and *Acer rubrum*. This type is distinguished from the various shale barren types of western Virginia, eastern West Virginia, western Maryland, and south-central Pennsylvania by the complete absence of the distinctive endemic flora of that region. L.L. Gaddy (pers. comm.) reports this association from the Chauga Basin, South Carolina, and it is known from Chilhowee Mountain, Tennessee.

This association shares many floristic elements with *Quercus prinus - Pinus virginiana - (Pinus pungens) / Schizachyrium scoparium - Dichanthelium depauperatum* Woodland (CEGL008540), a Central Appalachian acidic woodland of various substrates other than shale, occurring in Virginia, Maryland and West Virginia. The two associations emerged as distinct in cluster analysis (Fleming and Patterson 2009a); however, when comparing the constant species (≥60%) of the two groups, only three species, *Andropogon virginicus var. virginicus, Carya pallida*, and *Ulmus alata*, were present in samples of this association (CEGL003624) (n=5) and not in those of CEGL008540 (n=28). In this comparison, less constant species which are unique to CEGL008540 are *Chionanthus virginicus, Cornus florida, Gaylussacia baccata, Quercus ilicifolia*, and *Quercus stellata*, but with a larger sample of CEGL003624, those differences may not hold.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community occurs at Hot Springs Window, in Pisgah National Forest (Lovers Leap) in Madison County, North Carolina, on steep slopes above the French Broad River.
Global Range: This forest is found in the Southern Appalachians of the Carolinas and Tennessee. It is reported from somewhat calcareous shales in the Hot Springs Window, in the Blue Ridge of North Carolina and Tennessee, from the Chauga Basin, South Carolina, and from Chilhowee Mountain, Tennessee.

Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Virginia Pine - Table Mountain Pine Woodland & Barrens (G162)
Alliance	*Pinus virginiana* - *Quercus prinus* Acidic Shale Woodland Alliance (A3312)

ELEMENT CONCEPT

Global Summary: This community is a mixed oak-pine woodland with a canopy of stunted, often gnarled trees, varying from semi-open to very open. It occurs on steep convex slopes, ridge spurs, and clifftops which have high solar exposure. Most are on moderate to steep slopes with much exposed mineral soil. Sites are confined to lower elevations (<770 m [2500 feet]), are distinctly xeric, and usually have southeast to southwest aspects. Underlying bedrock includes quartzite, metasandstone and sandstone, granite, shale, and other acidic rocks. Surface cover of outcrops and loose stones is relatively high. Soils are extremely acidic. The canopy is typically codominated by *Quercus prinus* and *Pinus virginiana* in variable proportions; in some slightly more mesic occurrences, *Quercus rubra* may occur with or in place of *Quercus prinus*. *Pinus pungens* is an important, even dominant, associate in a minority of stands. Minor but relatively constant tree associates include *Carya glabra, Amelanchier arborea*, and *Sassafras albidum*. Minor, inconstant tree associates include *Quercus coccinea, Quercus velutina, Quercus stellata, Quercus marilandica, Quercus alba, Carya alba, Carya ovata, Juniperus virginiana, Pinus strobus*, and *Fraxinus americana*. The shrub layer varies from moderately dense to sparse, with *Vaccinium pallidum* and *Vaccinium stamineum* the most constant and abundant species. *Quercus ilicifolia, Kalmia latifolia, Rhus copallinum, Rhus aromatica, Rosa carolina, Castanea pumila, Viburnum acerifolium*, and *Toxicodendron pubescens* are inconstant, but occasionally common, in the type. Herbaceous composition and density vary with shrub density. Graminoid-rich openings dominated by *Schizachyrium scoparium, Dichanthelium depauperatum, Carex pensylvanica, Danthonia spicata*, and *Dichanthelium commutatum* are frequent. Also present is a surprising variety of low-cover forbs, among the most characteristic of which are *Hieracium venosum, Solidago erecta, Potentilla canadensis, Campanula divaricata, Viola sagittata, Houstonia longifolia, Antennaria plantaginifolia, Aureolaria laevigata, Helianthus divaricatus, Cunila origanoides, Symphyotrichum undulatum (= Aster undulatus), Coreopsis verticillata, Tephrosia virginiana, Lespedeza frutescens, Polygonatum biflorum var. biflorum, Taenidia integerrima, Asplenium platyneuron*, and *Clitoria mariana*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This xeric chestnut oak - Virginia pine woodland is confined to lower elevations (<770 m [2,500 feet]) in habitats usually with abundant outcrops with southeast to southwest aspects on steep convex slopes, ridge spurs, and clifftops. It was sampled at three locations in the Central Appalachian project area. Sites are somewhat steep to steep, south- and southeast-facing, upper-slope cliffs (sandstone outcrops) with xeric sandy loam and clay loam soils. The unvegetated surface is dominated by either leaf litter or exposed bedrock with some downed wood, large rocks and bare soil. Evidence of disturbance includes the presence of exotic plant species.
Global Environment: This association occurs on steep convex slopes, ridge spurs, and clifftops which have high solar exposure. Most habitats are characterized by moderate to steep (mean = 24°) slopes with much exposed mineral soil. Sites are confined to lower elevations (<770 m [2500 feet]), are distinctly xeric, and usually have southeast to southwest aspects. Underlying bedrock at plot-sampling sites in VA, MD, and WV includes Antietam quartzite, ferruginous metasandstone of the Harper's Formation, acidic granites, acidic phases of Catoctin metabasalt, schistose metasedimentary rocks of the Mather Gorge Formation, shales and sandstones of the Hinton formation in the Mauch Chunk group, and ancient alluvium composed of quartzitic cobbles. Surface cover of outcrops and loose stones is relatively high (mean = 38% in MD and VA plots). Soils are extremely acidic (mean pH = 4.4) and very low in base status, except for high aluminum levels and sometimes relatively high potassium levels. One somewhat anomalous site is located on massive alluvial fans that overlie the floor of the Great Valley of Virginia along the foot of the Blue Ridge in Augusta County. Here, stands occupy barren, elevated cobble terraces bordering a stream and representing the floodplain level of an earlier erosional cycle.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Pinus virginiana* and *Quercus prinus* codominate the canopy. *Carya glabra, Fraxinus americana, Quercus stellata, Quercus marilandica*, and/or *Pinus pungens* may also be present. *Amelanchier arborea, Vaccinium pallidum*, and *Vaccinium stamineum* are common shrubs. *Quercus ilicifolia* is absent. *Schizachyrium scoparium, Carex pensylvanica, Danthonia spicata, Antennaria plantaginifolia, Hypericum punctatum, Dichanthelium commutatum, Asplenium platyneuron, Potentilla canadensis*, and *Houstonia longifolia* are common herbs.

Global Vegetation: The canopy cover of stunted, often gnarled trees varies from semi-open to very open. *Quercus prinus* and *Pinus virginiana* are usually codominant in variable proportions; in some slightly more mesic occurrences, *Quercus rubra* may occur with or in place of *Quercus prinus*. *Pinus pungens* is an important, even dominant, associate in a minority of stands. Minor but relatively constant tree associates include *Carya glabra, Amelanchier arborea*, and *Sassafras albidum*. Minor, inconstant tree associates include *Quercus coccinea, Quercus velutina, Quercus stellata, Quercus marilandica, Quercus alba, Carya alba, Carya ovata, Juniperus virginiana, Pinus strobus*, and *Fraxinus americana*. The shrub layer varies from moderately dense to sparse, with *Vaccinium pallidum* and *Vaccinium stamineum* the most constant and abundant species. *Quercus ilicifolia, Kalmia latifolia, Rhus copallinum, Rhus aromatica, Rosa carolina, Castanea pumila, Viburnum acerifolium*, and *Toxicodendron pubescens* are inconstant, but occasionally common, in the type. Herbaceous composition and density vary with shrub density. Graminoid-rich openings dominated by *Schizachyrium scoparium, Dichanthelium depauperatum, Carex pensylvanica, Danthonia spicata*, and *Dichanthelium commutatum* are frequent. Occasional stands feature patch-dominance by *Sorghastrum nutans* or *Andropogon gerardii*. Also present is a surprising variety of low-cover forbs, among the most characteristic of which are *Hieracium venosum, Solidago erecta, Potentilla canadensis, Campanula divaricata, Viola sagittata, Houstonia longifolia, Antennaria plantaginifolia, Aureolaria laevigata, Helianthus divaricatus, Cunila origanoides, Symphyotrichum undulatum (= Aster undulatus), Coreopsis verticillata, Tephrosia virginiana, Lespedeza frutescens, Polygonatum biflorum var. biflorum, Taenidia integerrima, Asplenium platyneuron*, and *Clitoria mariana*. Additional herbs occurring less frequently include *Lespedeza hirta, Solidago odora, Deschampsia flexuosa, Coreopsis major, Solidago puberula var. puberula, Solidago bicolor, Solidago arguta var. caroliniana, Solidago sphacelata, Hypericum hypericoides ssp. multicaule (= Hypericum stragulum), Lysimachia quadrifolia, Asclepias amplexicaulis, Sericocarpus asteroides, Dicentra eximia, Paronychia fastigiata, Sericocarpus linifolius, Ionactis linariifolius, Symphyotrichum laeve, Phlox subulata, Pellaea atropurpurea, Polygonum scandens var. cristatum, Viola x palmata, Arabis laevigata*, and *Zizia trifoliata*. Vascular plant species richness of plot-sampled stands ranges from 17 to 56 taxa per 400 square meters (mean = 37). Nonvascular cover tends to be sparse and characterized by fruticose lichens, including *Cladina arbuscula (= Cladonia arbuscula)*.

Global: Vulnerable Plants: *Allium oxyphilum* (G2), *Monarda fistulosa* ssp. *brevis* (G5T1T2), *Taenidia montana* (G3)

Conservation Status Rank

Global Rank & Reasons: G3? (8-Feb-2008). Although this community is likely to have a broader distribution in the Central Appalachians than present documentation suggests, it is a small-patch vegetation type restricted to special habitat conditions.

Related Concepts

Global Similar Types:
- *Pinus rigida - Quercus prinus / Gaylussacia baccata / Carex pensylvanica* Woodland (CEGL004821)
- *Pinus virginiana / Vaccinium pallidum / Schizachyrium scoparium - Carex pensylvanica* Woodland (CEGL003624) on dry shale slopes of the Southern Appalachians.
- *Quercus prinus - Juniperus virginiana - (Pinus virginiana) / Philadelphus hirsutus - Celtis occidentalis* Woodland (CEGL007720) on steep, rocky, riverine bluffs in the Southern Blue Ridge with exposed and eroding shale.
- *Quercus prinus / Quercus ilicifolia / Danthonia spicata* Woodland (CEGL008526) on dry shale slopes of the Central Appalachians.

Classification

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This is a Central Appalachian acidic woodland of various substrates other than shale. The occurrences of this type along the AT in Roanoke County, Virginia, are some of the largest and finest known.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: The classification of this type is supported by analysis of 28 Virginia, 3 Maryland, and 8 West Virginia plot samples. Additional inventory and data collection are needed to clarify the geographic range, classification, and environmental context of this type. The known range of this community is limited to the Northern Blue Ridge, Ridge and Valley, Cumberlands, and Piedmont in Virginia, West Virginia, and Maryland, but geologic substrates and site conditions similar to those supporting the known examples occur elsewhere in the Central Appalachians, and a broader geographic range seems likely. Recent data indicating possible rock chemistry and compositional gradients may result in future splitting of the type, or expansion of the concept (G. Fleming pers. comm. 2009).

Element Distribution

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community is limited to the Northern Blue Ridge, Ridge and Valley, and western Piedmont in Virginia, West Virginia and Maryland. It was sampled in Virginia at McAfee Knob and Catawba Mountain.
Global Range: The known range of this community is limited to the Northern Blue Ridge, Ridge and Valley, and western Piedmont in Virginia, West Virginia and Maryland, but geologic substrates and site conditions similar to those supporting the known examples occur elsewhere in the Central Appalachians, and a broader geographic range seems likely.

A0144 *Tsuga caroliniana* Woodland Alliance

Alliance Summary Description: These forests have dense to open canopies dominated by *Tsuga caroliniana*. Occurrences in gorges sometimes have a substantial admixture of *Tsuga canadensis*. Other associated species may include *Pinus pungens, Pinus rigida, Pinus virginiana, Quercus prinus*, and *Quercus rubra*. The shrub stratum is dense and dominated by ericaceous species, such as *Gaylussacia baccata, Kalmia latifolia, Rhododendron carolinianum, Rhododendron catawbiense, Rhododendron maximum*, and *Vaccinium* spp. Trees may be wind-shorn, gnarled and twisted in exposed situations. These forests occur mostly on cliffs, rocky slopes and ridges, and less commonly on more gentle slopes and flat areas in valleys. Soils are usually nutrient-poor and rocky, with much exposed rock surface. Occurrences of these forests tend to be small and have distinct boundaries. *Tsuga caroliniana* is an Appalachian endemic with a very limited range, scattered in the Southern Blue Ridge and occasional in the Piedmont and Ridge and Valley.

[CEGL006178] *Tsuga caroliniana - Pinus (rigida, pungens, virginiana)* Forest

Translated Name: **Carolina Hemlock - (Pitch Pine, Table Mountain Pine, Virginia Pine) Forest**
Common Name: **Carolina Hemlock Forest (Pine Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Virginia Pine - Table Mountain Pine Woodland & Barrens (G162)
Alliance	*Tsuga caroliniana* Woodland Alliance (A0144)

ELEMENT CONCEPT

Global Summary: This association is known from shallow soils over sedimentary and metasedimentary rock strata on exposed ridges and southwest-facing slopes above 610 m (2000 feet) elevation in the Southern Blue Ridge and upper Piedmont of North Carolina and Tennessee. This xeric forest community is dominated by a mixture of *Tsuga caroliniana* and any or all of the following pine species: *Pinus rigida, Pinus virginiana*, and/or *Pinus pungens*. Additional canopy species may include *Quercus prinus, Quercus rubra*, and *Carya glabra*. The structure of the canopy varies from closed to open depending on disturbance history and environment. The patchy to open shrub layer of Tennessee occurrences is characterized by *Buckleya distichophylla* and *Rhododendron minus* in the upper shrub layer, and *Vaccinium pallidum* and *Gaultheria procumbens* in the lower shrub layer. The patchy to open herbaceous layer is characterized by *Schizachyrium scoparium*. As much as 25% of the ground cover may contain lichens, including *Cladina rangiferina* and *Cladina subtenuis*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This Carolina hemlock forest was sampled at two locations in the park. The sites occur on ridgetops at 680 to 700 m elevation. Soils are rapidly drained loam. The unvegetated surface consists of leaf litter at one site and is a mix of exposed bedrock, large/small rocks, downed wood and bare soil at the other. Evidence of disturbance includes hemlock woolly adelgid damage and some southern pine beetle damage.
Global Environment: This association is known from shallow soils over sedimentary and metasedimentary rock strata on exposed ridges and southwest-facing slopes above 610 m (2000 feet) elevation in the Southern Blue Ridge and upper Piedmont of North Carolina and Tennessee.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by *Tsuga caroliniana*, with codominance by *Pinus pungens* and *Pinus virginiana*. *Pinus rigida* and *Pinus strobus* are common along with some dry-site oaks, including *Quercus prinus*. Stands vary from closed to open depending on disturbance history and environment. The shrub layer is patchy to open, with *Rhododendron minus, Vaccinium pallidum*, and *Gaultheria procumbens*. Herbs are sparse; typically there is a nonvascular layer that includes lichens such as *Cladina rangiferina* and *Cladina subtenuis* and/or mosses such as *Dicranum scoparium*. This community also supports TN-state imperiled *Buckleya distichophylla*.

Tree canopy	Needle-leaved tree	*Pinus pungens*, *Pinus rigida*, *Pinus virginiana*, *Tsuga caroliniana*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area):
Global: *Pinus pungens*, *Pinus rigida*, *Pinus virginiana*, *Tsuga caroliniana*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Buckleya distichophylla* (G3, globally imperiled), *Castanea dentata* (G4, TN state-imperiled), *Rhododendron minus* (G4, TN state-imperiled), *Tsuga caroliniana* (G3)
Global: Vulnerable Plants: *Buckleya distichophylla* (G3), *Tsuga caroliniana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (31-Dec-1997). *Tsuga caroliniana* communities, in general, have a restricted range, occurring only in the Southern Blue Ridge and upper Piedmont and are probably endemic to North Carolina and Tennessee. Occurrences are typically small and restricted to rocky, bluff habitats. All occurrences are threatened by fire suppression and the hemlock woolly adelgid (*Adelges tsugae*), an exotic pest which causes tree decline and ultimately death in *Tsuga canadensis* and *Tsuga caroliniana*.

RELATED CONCEPTS

Global Similar Types:
- *Tsuga caroliniana / Kalmia latifolia - Rhododendron catawbiense* Forest (CEGL007139)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Global Classification Comments: This association is currently recognized as distinct from *Tsuga caroliniana / Kalmia latifolia - Rhododendron catawbiense* Forest (CEGL007139), due to the presence of *Pinus* species, which may be related to landform and exposure or past fire history or both. The long-term impact of hemlock woolly adelgid on *Tsuga caroliniana* needs systematic study. The role of fires in the ecology of *Tsuga caroliniana* communities is also unclear, since evidence of stand expansion following both fires and periods of fire exclusion have been noted (Schafale and Weakley 1990). Three plots from the Cherokee National Forest (CHER.28, CHER.39, APPA.597), from slopes and ridgetops over the Doe and Nolichucky rivers, were classified as this association in the Appalachian Trail classification project (Fleming and Patterson 2009a). Species with 100% constancy in these three plots include *Tsuga caroliniana, Pinus pungens, Pinus virginiana, Rhododendron minus*, and *Oxydendrum arboreum*.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community occurs uncommonly along and near the AT in Unicoi and Carter counties in Tennessee.
Global Range: This association is known to occur in the Southern Blue Ridge of North Carolina and Tennessee. It may also range into Virginia, but its presence there is not currently verified.
Nations: US
States/Provinces: NC, TN
TNC Ecoregions: 51:C, 52:C
USFS Ecoregions (1994/95): 231Aa:CCC, M221Db:CCP, M221Dc:CCC, M221Dd:CCC
Federal Lands: NPS (Appalachian Trail [Southern Blue Ridge], Blue Ridge Parkway?); USFS (Cherokee, Nantahala, Pisgah)

[CEGL007139] *Tsuga caroliniana / Kalmia latifolia - Rhododendron catawbiense* Forest

Translated Name: **Carolina Hemlock / Mountain Laurel - Catawba Rosebay Forest**
Common Name: **Carolina Hemlock Forest (Typic Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Appalachian-Northeastern Oak - Hardwood - Pine Forest & Woodland (M502)
Group	Virginia Pine - Table Mountain Pine Woodland & Barrens (G162)
Alliance	*Tsuga caroliniana* Woodland Alliance (A0144)

ELEMENT CONCEPT

Global Summary: These forests occur with canopies dominated by *Tsuga caroliniana*, without admixtures of *Pinus* species, although *Quercus prinus* may be present as a minor component. Shrub strata tend to be dense and dominated by ericaceous species such as *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron minus*. Other minor components may include *Pinus virginiana, Pinus rigida, Pinus pungens, Nyssa sylvatica*, and *Quercus coccinea*. Other characteristic species can include *Xerophyllum asphodeloides, Leucothoe recurva, Polypodium appalachianum, Smilax rotundifolia*. This forest occurs in the upper Piedmont and Southern Blue Ridge, on narrow ridges and upper north-facing rocky slopes.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This Carolina hemlock forest was sampled at three locations in the park. The sites range from moderate to somewhat steep midslopes and ridgetops at 577 to 942 m elevation on west, northwest and southeast aspects. Soils are xeric, well-drained clay loam. The unvegetated surface is dominated by leaf litter with some downed wood, large rocks and bare soil. Evidence of disturbance includes natural canopy gaps and hemlock/fir woolly adelgid damage.
Global Environment: Over the full range of this type, stands typically occur on narrow ridges and upper, north-facing rocky slopes. Four documented Virginia stands, including three plot-sampled by DCR-DNH ecologists and one studied intensively by Rentch et al. (2000), occurred at elevations from 591-1075 m (1940-3525 feet). Sites include a narrow spur ridge crest, one upper slope, and two middle slopes, with south, southwest, and north aspects. Slopes are strongly convex. Two sites have substantial surface cover of rocks (70% and 31%), while the other two sites have negligible rock cover. Soils are extremely acidic (mean pH = 3.8), with very low calcium and magnesium levels and high iron and aluminum levels.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by *Tsuga caroliniana*, with little or no pines. Tree oaks, including *Quercus rubra, Quercus alba*, and *Quercus prinus*, may be common to abundant in the canopy. Shrub strata tend to be dense and characterized by ericaceous species such as *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron minus*. This community also supports TN-state imperiled *Buckleya distichophylla*.
Global Vegetation: These forests occur with canopies dominated by *Tsuga caroliniana*, without admixtures of *Pinus* species, although *Quercus prinus* may be present as a minor component. Shrub strata tend to be dense and dominated by ericaceous species such as *Kalmia latifolia, Rhododendron catawbiense*, and *Rhododendron minus*. Other minor components may include *Pinus virginiana, Pinus rigida, Pinus pungens, Nyssa sylvatica*, and *Quercus coccinea*. Other characteristic species can include *Xerophyllum asphodeloides, Leucothoe recurva, Polypodium appalachianum*, and *Smilax rotundifolia*.

Virginia stands are strongly dominated by *Tsuga caroliniana*, with *Quercus prinus* the most important canopy associate. *Quercus rubra, Quercus alba*, several *Pinus* spp., *Nyssa sylvatica*, and *Acer rubrum* are minor canopy associates. *Acer rubrum, Amelanchier arborea*, and *Sassafras albidum* are common understory trees, while *Rhododendron catawbiense, Kalmia latifolia*, and *Hamamelis virginiana* are dominant shrubs. Additional shrubs include *Pieris floribunda, Vaccinium pallidum, Rhododendron periclymenoides*, and *Gaylussacia baccata*. The herb layer is generally sparse with scattered individuals or patches of *Aralia nudicaulis, Carex pensylvanica, Chimaphila maculata, Cunila origanoides*, and *Hexastylis virginica*. Species richness ranges from 12 to 19 taxa per 400 m2 (mean = 16).

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Kalmia latifolia*, *Quercus alba*, *Quercus prinus*, *Rhododendron catawbiense*, *Rhododendron minus*, *Tsuga caroliniana*
Global: *Leucothoe recurva*, *Pieris floribunda*, *Polypodium appalachianum*, *Rhododendron catawbiense*, *Smilax rotundifolia*, *Tsuga caroliniana*, *Xerophyllum asphodeloides*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Buckleya distichophylla* (G3, globally imperiled), *Castanea dentata* (G4, TN state-imperiled), *Tsuga caroliniana* (G3)
Global: Vulnerable Plants: *Buckleya distichophylla* (G3), *Tsuga caroliniana* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (31-Dec-1997). *Tsuga caroliniana* communities, in general, have a restricted range, occurring primarily in the Southern Blue Ridge, with scattered occurrences in the upper Piedmont and Ridge and Valley of North Carolina, Tennessee, South Carolina, and Virginia. Occurrences are typically small and restricted to rocky bluff habitats. All occurrences are threatened by fire suppression and the exotic pest the hemlock woolly adelgid (*Adelges tsugae*) which causes tree decline and ultimately death in *Tsuga canadensis* and *Tsuga caroliniana*. The taxonomy of *Tsuga caroliniana* communities needs further assessment.

RELATED CONCEPTS

Global Similar Types:
- *Quercus prinus / Rhododendron catawbiense - Kalmia latifolia* Forest (CEGL008524)
- *Tsuga caroliniana - Pinus (rigida, pungens, virginiana)* Forest (CEGL006178)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This small group of *Tsuga caroliniana - Quercus* spp. forest plots was crosswalked to Carolina Hemlock Forest (Typic Type) (CEGL007139) for lack of a suitable alternative. Composition of the group, however, differs from the NVC description of CEGL007139 by its low density of ericaceous shrubs and its more mixed rather than purely *Tsuga*-dominated character. Only one of the plots has substantial ericad cover, and that does not even approach 50%. Oaks (*Quercus alba, Quercus prinus*, and/or *Quercus rubra*) essentially share dominance in all but one plot (Fleming and Patterson 2009a).
Global Classification Comments: Although no doubt a rare, small-patch community type in Virginia, additional examples are likely and should be sought. The long-term impact of hemlock woolly adelgid on *Tsuga caroliniana* needs systematic study. The role of fires in the ecology of *Tsuga caroliniana* communities is also unclear, since evidence of stand expansion following both following fires and periods of fire exclusion have been noted (Schafale and Weakley 1990). Rentch et al. (2000) found that *Tsuga caroliniana* dominating a site in Bottom Creek Gorge (Montgomery County, Virginia) was long-lived, very tolerant of drought stresses, and had reproduced episodically over the past 200 years. No evidence of fire is mentioned in this paper.

Six plots from Tennessee and Virginia were classified as this association in the Appalachian Trail classification project (Fleming and Patterson 2009a). These plot samples vary from the core association concept in that they have only moderate coverage (≥ 25%) by ericaceous shrubs and a mixed canopy with 10-75% cover by *Tsuga caroliniana*, with *Quercus rubra, Quercus prinus*, and *Quercus alba*. The most constant species (≥67%) in these plots, in order of descending constancy, are *Tsuga caroliniana, Quercus rubra, Acer rubrum, Quercus prinus, Quercus alba, Nyssa sylvatica, Betula lenta, Pinus strobus, Acer pensylvanicum*, and *Viburnum acerifolium*.

Examples in North Carolina include Hickorynut Gorge, Linville Gorge, Hanging Rock State Park.

M013. Eastern North American Ruderal Forest

G032. Eastern North American Exotic Ruderal Forest

Group Summary Description: This native ruderal forest group is found in the cool temperate regions of the eastern United States and Canada, from the East Coast, west to the Great Lakes and Tallgrass Prairie region and south to the south-central United States. The vegetation of this group shows evidence of former and heavy human disturbance, particularly to the soils, such as through plowing, grading, skidding, etc., but has otherwise been allowed to succeed more-or-less spontaneously. The vegetation is a disparate mix of exotic species, and the ecological and floristic organization of the vegetation is not clear. The tree layer is dominated (>80% cover) by exotic tree species. The list of exotic tree species include Conifers: *Pinus thunbergiana* and Hardwoods: *Acer platanoides, Ailanthus altissima, Malus fusca*, and *Robinia pseudoacacia*. Although *Robinia pseudoacacia* is a native in the central hardwoods region, it is so widely planted outside of its range that it is exotic in character. Understory shrub and herb species vary from exotic invasives to native generalists. Invasive shrub species include a variety of honeysuckles (*Lonicera japonica, Lonicera morrowii, Lonicera tatarica, Lonicera x bella), Rhamnus cathartica*, and others. The most common exotic tree species found in abandoned plantations include *Larix decidua, Picea abies*, and *Pinus sylvestris*. Sites are often on dry-mesic to wet-mesic sites, suitable for agriculture or forest plantations.

A3230 *Acer platanoides - Ailanthus altissima - Pinus* spp. Exotic Ruderal Forest Alliance

Alliance Summary Description: This alliance includes semi-natural forests dominated by naturalized *Acer platanoides, Ailanthus altissima, Paulownia tomentosa, Pinus nigra*, or *Pinus thunbergiana*. These are all exotic tree species that have locally established in the region. *Pinus thunbergiana* stands occur in the northeastern coastal region and likely beyond, on well-drained to xeric sandy soils, usually on sand dunes or near-coastal glacial tills. Stands are of variable canopy height and closure and dominated by *Pinus thunbergiana* or *Pinus nigra*. *Ailanthus altissima* is a native of eastern Asia. This forest occurs mostly in disturbed areas, along roadsides, urban abandoned lands, and on limestone clifftops. In some parts of the range, this forest is associated with calcareous soils. *Acer platanoides* stands often occur to the exclusion of virtually all other canopy species. Most documented stands are at low elevations, on flat or rolling topography both above and below the glacial boundary. In some stands, native trees, including *Fraxinus americana* and *Acer saccharum* (the latter especially susceptible to exclusion by *Acer platanoides*), may be present in very limited amounts. Other stands may have non-native associates, including *Pinus nigra, Pinus sylvestris*, or *Robinia pseudoacacia*. The deep shade cast by *Acer platanoides* limits understory growth, aside from regeneration of *Acer platanoides*, or incursions by non-native shrubs such as *Rosa multiflora, Berberis vulgaris, Lonicera japonica*, or *Lonicera morrowii*. Native herbs are few, especially compared to more natural deciduous forests in similar settings. A few native or exotic herbaceous species or vines may occupy the ground layer, such as *Alliaria petiolata, Eurybia divaricata (= Aster divaricatus), Toxicodendron radicans*, and *Vinca minor*. *Paulownia tomentosa*, a native of Asia, has become naturalized in portions of the eastern United States, where it occurs as small, scattered populations along roadsides, in disturbed woodlots, and in streamside forests.

[CEGL007191] *Ailanthus altissima* Ruderal Forest

Translated Name: **Tree-of-Heaven Ruderal Forest**
Common Name: **Ruderal Tree-of-Heaven Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Exotic Ruderal Forest (G032)
Alliance	*Acer platanoides - Ailanthus altissima - Pinus* spp. Exotic Ruderal Forest Alliance (A3230)

Element Concept

Global Summary: This forest association generally occurs on nutrient-rich substrates, in disturbed situations on slopes, urban abandoned lands, and on rocky limestone slopes, in association with a wide variety of other exotic species and generalist native species. There are floodplain forests in which invasive exotic *Ailanthus altissima*

makes up 25-50% of the canopy; with other associated canopy species of *Fraxinus pennsylvanica* and *Acer saccharinum*. At this time, these forests are treated as D-ranked examples of native types.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This successional tree-of-heaven forest was sampled at two locations in Clarke County, Virginia, in the Central Appalachian project area. Sites are moderate, east-facing midslopes with dry-mesic, moderately well-drained silt loam or sandy loam soils. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. Evidence of disturbance includes the presence of exotic plant species.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: These are disturbed forests comprised of non-native and early-successional native trees.
Global Environment: This community occurs generally on nutrient-rich substrates, in disturbed situations on slopes, urban abandoned lands, and on rocky limestone slopes.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This successional community is dominated by exotic species in all strata. The sparse (20-40% cover) canopy and subcanopy layers are dominated by *Ailanthus altissima*. Other tree species may include *Fraxinus americana, Liriodendron tulipifera, Paulownia tomentosa*, and *Robinia pseudoacacia*. The sparse (up to 40%) shrub layers include *Celastrus orbiculata, Lindera benzoin, Robinia pseudoacacia*, and *Rosa palustris*. The herb layer is dominated by *Verbesina alternifolia* and by the invasive exotic *Microstegium vimineum*. Vines, mostly *Vitis* spp., often cover the ground or climb into the canopy.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The forest canopy is dominated by *Ailanthus altissima*.
Global Vegetation: This southeastern forest association is strongly dominated by the alien *Ailanthus altissima*.

G030. EASTERN NORTH AMERICAN NATIVE RUDERAL FOREST

Group Summary Description: This native ruderal forest group is found in the cool temperate regions of eastern United States and Canada, from the East Coast, west to the Great Lakes and Tallgrass Prairie region and south to the south-central United States. The vegetation of this group shows evidence of former and heavy human disturbance, particularly to the soils, such as through plowing, grading, skidding, etc., but has otherwise been allowed to succeed more-or-less spontaneously. The vegetation is a somewhat disparate mix of weedy and native species, and the ecological and floristic organization of the vegetation is not clear. The tree layer is dominated (>50% cover) by "weedy" or generalist native tree species, sometimes accompanied by exotic/invasive tree species. The list of ruderal tree species is as follows: Conifers: *Juniperus virginiana, Pinus rigida, Pinus strobus, Pinus virginiana*. Hardwoods: *Acer negundo, Acer rubrum, Amelanchier* spp., *Betula populifolia, Crataegus* spp., *Crataegus crus-galli, Crataegus mollis, Diospyros virginiana, Fraxinus americana, Gleditsia triacanthos, Gymnocladus dioicus, Juglans nigra, Liquidambar styraciflua, Liriodendron tulipifera, Morus* spp., *Malus fusca, Morus rubra, Populus tremuloides, Prunus pensylvanica, Prunus serotina, Prunus americana*, and *Robinia pseudoacacia*. Naturalized exotics include the conifer *Pinus thunbergiana* and hardwoods *Acer platanoides* and *Ailanthus altissima*. *Robinia pseudoacacia*,

although a native in the central hardwoods region, is so widely planted outside of its range that it is essentially exotic in character. The weedy natives often form mono-dominant or mixed dominance stands. Understory shrub and herb species vary from exotic invasives to native generalists. Invasive shrub species include a variety of honeysuckles (*Lonicera japonica, Lonicera morrowii, Lonicera tatarica, Lonicera x bella), Rhamnus cathartica*, and others. Sites show evidence of former and heavy human use, particularly with extensive and intensive soil disturbances, including plowing, grading, skidding, etc. Sites are often on dry-mesic to wet-mesic sites, suitable for agriculture or forest plantations.

A3229 *Acer rubrum - Prunus serotina - Pinus strobus* Ruderal Forest Alliance

Alliance Summary Description: This early-successional forest vegetation of the northeastern United States occurs on sites that are becoming reforested after having been cleared for agriculture or otherwise heavily modified in the past. Environmental setting varies, but generally sites are dry-mesic to mesic, with small seepage inclusions in some examples. Physiognomy of this vegetation is highly variable, ranging from closed forest to open woodland and scrub. The generalist set of native, non-planted species include a combination of tree species, such as *Acer rubrum, Fraxinus americana, Liriodendron tulipifera, Pinus strobus*, and *Prunus serotina*. Other associates can include *Acer negundo, Acer saccharinum, Ailanthus altissima, Amelanchier* spp., *Betula lenta, Betula populifolia, Juglans nigra, Juniperus virginiana, Pinus strobus, Populus grandidentata, Quercus* spp., *Robinia pseudoacacia, Sassafras albidum*, and *Ulmus americana*. The low-shrub layer, if present, is usually characterized by the presence of *Rubus* spp. such as *Rubus allegheniensis, Rubus flagellaris, Rubus hispidus*, or *Rubus phoenicolasius*. This layer is often dominated by exotic species such as *Berberis thunbergii, Crataegus* spp., *Lonicera morrowii, Lonicera tatarica, Rhamnus cathartica*, and *Rosa multiflora*. The herbaceous layer is variable, often containing grasses and forbs of both native and exotic origin. The invasive species *Alliaria petiolata, Microstegium vimineum*, and *Polygonum caespitosum* can be abundant in this disturbed forest type. These forests are often young and resulted from the colonization of old agricultural fields by woody species. Recent disturbance or abundant invasive species give these forest stands a weedy character. It is unlikely that these stands will succeed to a natural plant community dominated by native species.

[CEGL006628] *Acer saccharum - Betula* spp. - *Fagus grandifolia* Ruderal Forest

Translated Name: **Sugar Maple - Birch species - American Beech Ruderal Forest**
Common Name: **Ruderal Sugar Maple - Northern Hardwood Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Acer rubrum - Prunus serotina - Pinus strobus* Ruderal Forest Alliance (A3229)

Element Concept

Global Summary: This is an early-successional variant of the widespread typic northern hardwood forest (CEGL006631) dominated by a monotypic canopy of *Acer saccharum* and/or some combination of young, small-diameter *Acer saccharum, Fraxinus americana, Prunus serotina, Betula alleghaniensis, Fagus grandifolia*, and/or *Betula papyrifera*. A disturbed shrub layer may be present with exotics or, more commonly, there is no shrub layer. The herbaceous layer is patchy and most often consists of a mix of ferns, clubmosses (Lycopodiaceae), and other herbs. This community arises from cutting, farming, or extended grazing. It occurs on acidic soils in central New England and at lower elevations in northern New England and upstate New York.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This is an early-successional variant of the widespread typic Northern Hardwood Forest (CEGL006252) that arises from cutting, farming, or extended grazing. It occurs on acidic soils in central New England and at lower elevations in northern New England and upstate New York.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This community occurs on acidic soils in central New England and at lower elevations in northern New England, New Hampshire, and Maine.

Global Environment: This is an early-successional variant of the widespread typic northern hardwood forest (CEGL006631) that arises from cutting, farming, or extended grazing. It occurs on acidic soils in central New England and at lower elevations in northern New England and upstate New York.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This is an early-successional variant of the widespread typic northern hardwood forest, *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006252), dominated by a monotypic canopy of *Acer saccharum* and/or some combination of young, small-diameter *Acer saccharum, Fraxinus americana, Prunus serotina, Betula alleghaniensis, Fagus grandifolia* and/or *Betula papyrifera*. A disturbed shrub layer may be present with exotics or more commonly, there is no shrub layer. The herbaceous layer is patchy and most often consist of a mix of ferns, clubmosses (Lycopodiaceae), and other herbs.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This community is an early-successional variant of widespread typic northern hardwood forest, with either a monotypic canopy of *Acer saccharum*, or a canopy dominated by some combination of young, small-diameter, even-aged *Acer saccharum, Fraxinus americana, Prunus serotina, Betula alleghaniensis, Fagus grandifolia, Pinus strobus*, and/or *Betula papyrifera*. It arises from cutting and has either a disturbed shrub layer with exotics or no shrub layer. The herb layer is patchy and most often a mix of ferns, clubmosses (Lycopodiaceae), and other herbs.
Global Vegetation: This is an early-successional variant of the widespread typic northern hardwood forest (CEGL006252) dominated by a monotypic canopy of *Acer saccharum* and/or some combination of young, small-diameter *Acer saccharum, Fraxinus americana, Prunus serotina, Betula alleghaniensis, Fagus grandifolia*, and/or *Betula papyrifera*. A disturbed shrub layer may be present with exotics or, more commonly, there is no shrub layer. The herbaceous layer is patchy and most often consists of a mix of ferns, clubmosses (Lycopodiaceae), and other herbs.

- *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006631)
- *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632)

CLASSIFICATION

Status: Provisional
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: In the Lower New England map, Ruderal Sugar Maple - Northern Hardwood Forest (CEGL006628) and Northeastern Ruderal Hardwood Forest (CEGL006599) are mutually-exclusive The geographic break between these two associations is where *Liriodendron tulipifera* drops out in northern CT, with CEGL006599 to the south and often having *Liriodendron* and CEGL006628 to the north. One stand in Rutland, VT, arose from a century or two of grazing where the "forest" consisted of witness-tree *Acer saccharum* surrounded by pole-stage *Acer saccharum* with no shrubs and a herb layer of *Poa* sp. and *Thelypteris noveboracensis*. This association was originally referred to as CEGL006252.9.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This association consists of successional and disturbed vegetation. It is an early-successional variant of the widespread typic northern hardwood forest *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006631).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This successional forest occurs on acidic soils in central New England from northern Connecticut through Massachusetts and at lower elevations in northern New England in Vermont, New Hampshire and upstate New York.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This community occurs in central New England and at lower elevations in northern New England, New Hampshire, and Maine.
Global Range: This successional forest occurs on acidic soils in central New England and at lower elevations in northern New England and upstate New York.

ELEMENT CONCEPT

Global Summary: This vegetation type is associated with generally infertile sites that have been altered by logging and fires. Its distribution is centered in the Central Appalachians. Stands are floristically depauperate and characterized by even-aged, nearly pure *Betula lenta, Acer rubrum*, or mixtures of the two. Associated species, minor in importance, vary somewhat with geography and include *Betula alleghaniensis, Fraxinus americana, Fagus grandifolia, Prunus serotina, Quercus rubra, Quercus alba, Quercus velutina, Liriodendron tulipifera, Populus tremuloides, Populus grandidentata*, and/or *Robinia pseudoacacia*. *Magnolia acuminata* and *Magnolia fraseri* are sometimes associates in the southern portion of the range. The subcanopy, when developed, consists mainly of *Fagus grandifolia*. *Tsuga canadensis* forms a scattered canopy or understory in some stands. *Ilex montana* is a characteristic shrub in the southern portion of the type's range, and *Lindera benzoin* is typical elsewhere. Shrub associates include *Kalmia latifolia, Acer pensylvanicum, Hamamelis virginiana, Amelanchier arborea, Viburnum prunifolium, Fagus* sprouts, *Rhododendron calendulaceum, Rhododendron periclymenoides*, and *Rhododendron maximum*. Herb layers may be dominated by dense and extensive colonies of *Lycopodium annotinum*, often in association with *Lycopodium dendroideum, Lycopodium clavatum*, and/or *Lycopodium digitatum*, or by *Dennstaedtia punctilobula*. Herbaceous associates include *Thelypteris noveboracensis, Polystichum acrostichoides, Carex swanii*, and others.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This successional birch-maple forest often originates after severe disturbance such as fire, clear-cutting, or gypsy moth outbreaks. It was sampled at four locations in the Central Appalachian project area. Sites range from gentle to steep upper slopes and summits occurring on infertile and altered soils. Soils are dry, rapidly to well-drained loam. The unvegetated surface consists of a variable mix of leaf litter, large and small rocks, and downed wood. No evidence of disturbance was reported.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This successional birch-maple forest was sampled on a somewhat steep, northeast-facing upper slope rock outcrop with dry well-drained soil. The unvegetated surface is a mix of leaf litter, downed wood, exposed bedrock, and large/small rocks. No evidence of disturbance was reported.

Global Environment: This vegetation type is associated with generally infertile sites that have been severely altered by logging and fires. It occupies various slope and aspect positions. The type is rarely found on bouldery or rocky sites. Soils vary but are often acidic and low in base status. Deep surficial duff, with small pieces of charred wood or thin charcoal lenses are typical of soils at Virginia sampling sites (Fleming and Moorhead 1996).

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This successional Central Appalachian mesophytic hardwood forest is codominated by *Betula lenta* and *Acer rubrum* in the canopy and shrub layers. *Nyssa sylvatica* may also be common. Shrub associates include *Kalmia latifolia, Gaylussacia frondosa, Rhus glabra*, and *Vaccinium pallidum*. *Lycopodium* spp., *Dennstaedtia punctilobula*, and *Polypodium virginianum* may be found in the ground layer.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is made up of successional even-aged *Betula lenta* and *Acer rubrum*. Shrubs are sparse. Dense *Lycopodium* sp. or *Dennstaedtia punctilobula* form the ground cover. *Polytrichum juniperinum* is an abundant moss.

Global Vegetation: Stands are floristically depauperate and characterized by even-aged, nearly pure *Betula lenta, Acer rubrum*, or mixtures of the two. Associated species vary somewhat with geography and include *Betula alleghaniensis, Fraxinus americana, Fagus grandifolia, Prunus serotina, Quercus rubra, Quercus alba, Quercus velutina, Populus tremuloides, Populus grandidentata*, and/or *Robinia pseudoacacia*. *Magnolia acuminata* and *Magnolia fraseri* are sometimes associates in the southern portion of the range. The subcanopy, when developed, consists mainly of *Fagus grandifolia*. *Tsuga canadensis* forms a scattered canopy or understory in some stands. *Ilex montana* is a characteristic shrub in the southern portion of the type's range, and *Lindera benzoin* is typical elsewhere. Shrub associates include *Kalmia latifolia, Acer pensylvanicum, Amelanchier arborea, Viburnum prunifolium, Fagus* sprouts, *Rhododendron calendulaceum, Rhododendron periclymenoides*, and *Rhododendron*

maximum. Herb layers may be dominated by dense and extensive colonies of *Lycopodium annotinum*, often in association with *Lycopodium dendroideum, Lycopodium clavatum*, and/or *Lycopodium digitatum*, or by *Dennstaedtia punctilobula*. Herbaceous associates include *Thelypteris noveboracensis, Polystichum acrostichoides, Carex swanii, Dryopteris intermedia, Smilax rotundifolia, Medeola virginiana, Maianthemum canadense, Monotropa uniflora*, and *Oclemena acuminata (= Aster acuminatus)*. Mean species richness of plot-sampled stands in Virginia is 15 taxa per 400 m2.

Global Dynamics: This community occurs on infertile sites that have been severely altered by disturbance including but not limited to logging and fires.

Global: *Acer rubrum*, *Betula lenta*, *Dennstaedtia punctilobula*, *Lycopodium annotinum*, *Lycopodium clavatum*, *Lycopodium dendroideum*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Carex arctata* (G5, VA state-rare), *Pyrola elliptica* (G5, VA state-rare), *Schizachne purpurascens* (G5, VA state-rare), *Trillium simile* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (21-Jun-2001). This association appears to be an early-successional but persistent vegetation type resulting from major anthropogenic disturbances. It has some significance for conservation in Virginia, however, since its successional development most likely will result in one of the state-rare community types that are confined in Virginia to Allegheny Mountain. For conservation planning in Virginia it is best considered a low-quality occurrence of *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest (CEGL006088) or *Picea rubens / Betula alleghaniensis / Bazzania trilobata* Forest (CEGL008501).

RELATED CONCEPTS

Global Similar Types:

- *Quercus rubra - Acer rubrum - Betula* spp. - *Pinus strobus* Ruderal Forest (CEGL006506) occupies similar mid-successional settings but is generally more northern (*Betula papyrifera* more typical than *Betula lenta*)and contains a component of white pine.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This successional mesophytic hardwood community occurs primarily in the High Allegheny Mountains and Allegheny Plateau and is most common along the AT corridor in Pennsylvania. It is common in West Virginia because so much of the state is in the High Alleghenies. In Virginia, it is uncommon.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This successional Central Appalachian northern hardwood forest extends just into the Lower New England project area at Delaware Water Gap and West Mountain Bear Mountain State Park in New York.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: Because of the consistent dominance of *Betula lenta* and/or *Acer rubrum* and locally dense *Lycopodium* or *Dennstaedtia punctilobula* ground cover, this community type is readily identifiable in the field. *Lycopodium* spp. as well as *Dennstaedtia punctilobula* are specialized colonizers of moist, sterile, exposed mineral soils, which were plentiful in these habitats after the burning off of the original forest humus. Current stand composition suggests that the likely successors to this association in Virginia are *Tsuga canadensis - Fagus grandifolia - Quercus rubra* Forest (CEGL006088) or *Picea rubens / Betula alleghaniensis / Bazzania trilobata* Forest (CEGL008501). However, potentially devastating impacts of beech bark disease and hemlock woolly adelgid on Allegheny Mountain could alter some of the present successional trends (Fleming and Moorhead 1996).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: The distribution of this community is centered in the High Allegheny Mountains and Allegheny Plateau but extends north to New York, New Jersey and Pennsylvania; it is common in West Virginia, less common in Virginia. It was sampled in Cumberland, Dauphin, and Lehigh counties in Pennsylvania in the Central Appalachian project area.
Appalachian National Scenic Trail (Lower New England Project Area) Range: The distribution is centered in the Central Appalachians but extends north to New York, New Jersey and Pennsylvania. It was sampled at West Mountain Bear Mountain State Park in New York.
Global Range: This community has been documented from the Central Appalachians in Virginia and West Virginia, north to New York, Pennsylvania and New Jersey. Its range may extend further in the northeastern United States.

Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Acer rubrum - Prunus serotina - Pinus strobus* Ruderal Forest Alliance (A3229)

Element Concept

Global Summary: This is a common successional deciduous woodland/forest of the northern Appalachian Mountains, from New England, New York and adjacent Canada across to the northern Great Lakes. Small patches of this type are found on the Coastal Plain but are dominated by one or more of the following: *Populus tremuloides, Populus grandidentata* or the non-native *Populus alba*, and *Betula populifolia*. It occurs in various settings, often over thin glacial till. Elevation and aspect vary. The community is broadly defined and includes vegetation developing after severe disturbance such as logging, fires, severe hurricanes, or simply heavily fragmented residential development. This community can occur as closed-canopy forest or open woodland; in a few very exposed areas, it has been seen to grade to shrubland. Understory shrub cover varies from sparse to well-developed depending primarily on canopy closure. Herbs are typically sparse but may be locally dense. Bryoids are typically minor. The tree canopy is a heterogeneous mixture of light-requiring, wind-dispersed trees usually composed of several codominant species, including *Populus tremuloides, Populus grandidentata, Betula papyrifera, Betula populifolia, Populus balsamifera, Acer rubrum, Prunus serotina*, and/or *Prunus pensylvanica*. More minor components can include *Pinus strobus, Picea rubens, Abies balsamea, Acer saccharum, Quercus rubra, Fraxinus americana, Fraxinus pennsylvanica*, or *Ulmus americana* in the northern portions of the range. Scattered individuals of *Juniperus virginiana* may occur in southern examples of this community. The shrub layer can include *Viburnum dentatum, Lonicera morrowii, Frangula alnus (= Rhamnus frangula), Rhus typhina, Rhus copallinum, Morella pensylvanica, Rubus* spp., and/or *Viburnum dentatum*, in the southern portion of the range, or *Sorbus americana, Acer pensylvanicum, Viburnum nudum var. cassinoides*, or *Hamamelis virginiana*. *Vaccinium angustifolium, Kalmia angustifolia, Gaylussacia baccata*, and *Comptonia peregrina* may form a dwarf-shrub layer in the northern portion of the range. Associated herbs to the north typically include *Pteridium aquilinum, Deschampsia flexuosa, Festuca trachyphylla (= Festuca ovina), Cornus canadensis, Doellingeria umbellata (= Aster umbellatus), Eurybia macrophylla (= Aster macrophyllus), Danthonia spicata, Carex lucorum* and related species, and *Maianthemum canadense*. Typical bryoids include *Polytrichum commune, Polytrichum juniperinum, Dicranum* spp., and *Cladonia* spp. Herbs in southern examples of this community are typically old-field grasses and *Solidago* spp. In the absence of major disturbance, these forests mostly succeed to northern hardwood, spruce-fir, mixed northern hardwood-spruce-fir, or red oak - northern hardwood forests in the northern portion of the range.

Environmental Description

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This early-successional aspen - birch woodland was sampled on sites that range from gentle to somewhat steep, mostly south- and north-facing slopes with mesic to dry-mesic moderately well- to well-drained sandy loam, loam and silt loam soils. The unvegetated surface consists of leaf litter, with lesser amounts of downed wood and bare soil. Evidence of disturbance includes a minor presence of exotic plants and tornado blowdowns (in Massachusetts).
Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is known from 300 to 900 m (985-2,950 feet) in elevation occurring on low to midslopes. Slopes are flat to moderate and occur on all aspects. Soils are moderately well-drained to well-drained mesic sandy loams.
Global Environment: It occurs in various settings, often over thin glacial till. Elevation and aspect vary. The community is broadly defined, and includes vegetation developing after severe disturbance such as logging, fires, severe hurricanes, or simply heavily fragmented residential development.

Vegetation Description

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This successional northern hardwood community ranges from closed-canopy forest to open woodland. It is dominated by some combination of *Populus tremuloides, Populus grandidentata, Populus alba, Betula papyrifera*, and/or *Betula populifolia*; *Populus balsamifera, Acer rubrum, Prunus serotina, Acer saccharum*, and/or *Prunus pensylvanica* may also be common.

The shrub layer can be sparse or include *Lonicera morrowii, Frangula alnus, Rubus* spp., and/or *Viburnum dentatum*. Old-field grasses and forbs are common in herb layer as are herbs typical of northern hardwood forests, such as *Dryopteris intermedia, Maianthemum canadense, Trientalis borealis*, and *Polygonatum pubescens*.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by forest to woodland vegetation with highly variable canopies dominated by early-successional hardwood species, including *Acer rubrum, Betula papyrifera, Populus grandidentata*, and *Populus tremuloides*. Numerous other canopy associates may occur and a well-developed subcanopy is common. Canopy associates may include *Betula alleghaniensis, Acer saccharum, Betula lenta, Fagus grandifolia, Fraxinus americana, Picea rubens*, and *Prunus serotina*. The shrub layer is often characterized by a dense layer of tree saplings of species occurring in the canopy. Typical shrub species include *Corylus cornuta, Hamamelis virginiana, Prunus virginiana*, and *Viburnum lantanoides*. The herbaceous layer is typically dominated by fern species, including *Athyrium filix-femina, Dryopteris intermedia*, and *Dennstaedtia punctilobula*, although numerous forbs and graminoids may occur.
Global Vegetation: This community can occur as closed-canopy forest or open woodland; in a few very exposed areas, it has been seen to grade to shrubland. Understory shrub cover varies from sparse to well-developed depending primarily on canopy closure. Herbs are typically sparse, but may be locally dense. Bryoids are typically minor. The tree canopy is a heterogeneous mixture of light-requiring, wind-dispersed trees usually composed of several codominant species including *Populus tremuloides, Populus grandidentata, Betula papyrifera, Betula populifolia, Populus balsamifera, Acer rubrum, Prunus serotina*, and/or *Prunus pensylvanica*. More minor components can include *Pinus strobus, Picea rubens, Abies balsamea, Acer saccharum, Quercus rubra, Fraxinus americana, Fraxinus pennsylvanica*, or *Ulmus americana*. The shrub layer in the northern portion of the range includes *Sorbus americana, Acer pensylvanicum, Viburnum nudum var. cassinoides*, or *Hamamelis virginiana*. *Vaccinium angustifolium, Kalmia angustifolia, Gaylussacia baccata*, and *Comptonia peregrina* may form a dwarf-shrub layer. Associated herbs to the north typically include *Pteridium aquilinum, Deschampsia flexuosa, Festuca trachyphylla (= Festuca ovina), Cornus canadensis, Doellingeria umbellata (= Aster umbellatus), Eurybia macrophylla (= Aster macrophyllus), Danthonia spicata, Carex lucorum* and related species, and *Maianthemum canadense*. Typical bryoids include *Polytrichum commune, Polytrichum juniperinum, Dicranum* spp., and *Cladonia* spp. Herbs in southern examples of this community are typically old-field grasses and *Solidago* spp. Small patches of this type are found on the Coastal Plain but are dominated by one or more of the following: *Populus tremuloides, Populus grandidentata*, or the non-native *Populus alba*, and *Betula populifolia* (usually not *Betula lenta* or *Betula alleghaniensis*).
Global Dynamics: In the absence of major disturbance, these forests mostly succeed to northern hardwood, spruce-fir, mixed northern hardwood-spruce-fir, or red oak - northern hardwood forests.

RELATED CONCEPTS

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community can occur as closed-canopy forest or open woodland; in a few very exposed areas, it has been seen to grade to shrubland. One example at Warner Hill in Massachusetts consists of an open *Prunus serotina, Betula populifolia*, and *Betula papyrifera* canopy (5% total cover) over a *Dennstaedtia punctilobula* herbaceous layer.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: This community can succeed into a number of northern hardwood community associations, including but not limited to Semi-rich Northern Hardwood Forest (CEGL006211) and Northern Hardwood Forest (CEGL006252).
Global Classification Comments: Given the recent use of this community outside of the spruce-fir zone, the concept used at Acadia National Park was broadened to include all of the Northeast stands dominated by *Populus (tremuloides, grandidentata) - Betula (populifolia, papyrifera)* regardless of the spruce-fir component.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Beartown State Forest, Warner Hill and Mount Williams Reservoir in Massachusetts, and in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is known from Carter Notch and Rattle River in New Hampshire and Saddleback Mountain, Jones Pond and Joe's Hole in Maine.
Global Range: This is a common successional deciduous woodland/forest of the northern Appalachian Mountains, from New England, New York and adjacent Canada across to the northern Great Lakes. Small patches of this type are found on the Coastal Plain.

Alliance	*Acer rubrum - Prunus serotina - Pinus strobus* Ruderal Forest Alliance (A3229)

ELEMENT CONCEPT

Global Summary: This early-successional woody vegetation of the northeastern United States occurs on sites that are becoming reforested after having been cleared for agriculture or otherwise heavily modified in the past. Environmental setting varies, but generally sites are dry-mesic to mesic, with small seepage inclusions in some examples. Physiognomy of this vegetation is highly variable, ranging from closed forest, open forest, tall dense shrubland, to more open tall shrubland. Early-successional woody species dominate the canopy in a widely variable mix, depending on geographic location. In the Central Appalachians and Mid-Atlantic Piedmont, many stands represent decadent forests that were once dominated by *Robinia pseudoacacia* but are now mixed with various mid-successional hardwoods; other stands in this region regenerated as mixed stands. Tree species often include some combination of *Prunus serotina, Liriodendron tulipifera, Fraxinus americana, Robinia pseudoacacia*, and *Acer rubrum*. Other associates can include *Juglans nigra, Sassafras albidum, Betula populifolia, Juniperus virginiana, Acer negundo, Acer saccharinum, Ailanthus altissima, Ulmus americana, Quercus* spp., *Betula lenta, Amelanchier* spp., *Pinus strobus*, and *Populus grandidentata*. Other woody species may contribute to the canopy or form a tall-shrub layer, including *Lindera benzoin* and *Carpinus caroliniana*. The low-shrub layer, if present, is usually characterized by the presence of *Rubus* spp. such as *Rubus flagellaris, Rubus allegheniensis, Rubus phoenicolasius*, or *Rubus hispidus*. This layer is often dominated by exotic species such as *Lonicera tatarica, Lonicera morrowii, Rhamnus cathartica, Crataegus* spp., *Rosa multiflora*, and *Berberis thunbergii*. The herbaceous layer is variable, often containing grasses and forbs of both native and exotic origin. Common species include *Ageratina altissima var. altissima, Polygonum persicaria, Impatiens capensis, Glechoma hederacea, Polystichum acrostichoides, Calystegia sepium ssp. sepium, Galium aparine, Oxalis stricta, Polygonum virginianum, Dennstaedtia punctilobula, Arisaema triphyllum, Allium vineale*, and *Veronica officinalis*, among many others. The invasive species *Alliaria petiolata, Microstegium vimineum*, and *Polygonum caespitosum* can be abundant in this disturbed forest type. Vines can be absent or abundant. In stands with high vine cover, the vegetation structure can be altered by the weight of the vines pulling down trees and shrubs. Common vines include *Parthenocissus quinquefolia, Toxicodendron radicans, Vitis labrusca*, and the invasive vines *Celastrus orbiculata* and *Lonicera japonica*. These forests are often

young and resulted from the colonization of old agricultural fields by woody species. Recent disturbance or abundant invasive species give these forest stands a weedy character. It is unlikely that these stands will succeed to a natural plant community dominated by native species.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This common, variable, disturbed forest of the Northeast is typically an upland forest but can occur in floodplains and wet settings. It was sampled at 14 locations in the Central Appalachian project area. Sites range from flat to somewhat steep, lower and upper slopes with variable aspects. Soils vary from dry to mesic, rapidly to moderately well-drained silt loam, loam, silty clay, and clay loam. The unvegetated surface may be dominated by leaf litter or can consist of a mix of large and small rocks, downed wood and/or bare soil. Evidence of disturbance includes past logging/clearing, agriculture, grazing, and the abundance of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This common, variable, disturbed forest of the Northeast is typically an upland forest, but can occur in wet settings such as floodplains and seasonally or temporarily flooded lowlands. Sites range from flat to somewhat steep mid and upper slopes with mostly eastern aspects. Soils are generally dry-mesic and include moderately well- to well-drained loam and sandy loam but can also be poorly drained in flat areas. The unvegetated surface consists of leaf litter, with lesser amounts of large/small rocks, bare soil, and/or downed wood. Evidence of disturbance includes a heavy presence of exotic plants.

Global Environment: This vegetation occurs on sites that have been cleared for agriculture or otherwise heavily modified in the past. Generally sites are dry-mesic and may have small seepage inclusions in some examples. Occasionally this type may occur in formerly agricultural bottomlands, in which case the soils may be temporarily flooded or saturated.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: These anthropogenically-disturbed stands are a variable mixture of young, even-aged hardwoods, especially *Robinia pseudoacacia, Sassafras albidum, Fraxinus americana, Prunus serotina, Liriodendron tulipifera, Acer rubrum, Celtis occidentalis, Juglans nigra, Morus alba, Prunus avium*, and/or *Ailanthus altissima*, any one of which can dominate over small areas. The understory is heavily invaded by exotics *Rosa multiflora, Celastrus orbiculata, Ligustrum vulgare, Rubus phoenicolasius, Berberis thunbergii, Elaeagnus umbellata*, and/or *Lonicera japonica*, among others. *Rubus allegheniensis* and *Vitis* spp. are also common. Herbs are sparse to abundant based on canopy closure, environmental setting and disturbance level. Common upland herbs include *Dactylis glomerata, Polygonum persicaria, Microstegium vimineum*, and other ruderal old-field species.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This forest is a variable mixture of young, even-aged native and non-native hardwoods, especially *Robinia pseudoacacia, Sassafras albidum, Fraxinus americana, Prunus serotina, Liriodendron tulipifera, Acer saccharum, Acer rubrum*, and *Ailanthus altissima*, any one of which can dominate over small areas. The understory heavily invaded by exotics *Rosa multiflora, Celastrus orbiculata*, and *Lonicera japonica*. *Ageratina altissima, Potentilla simplex*, and *Solidago rugosa* are common herbs.

Global Vegetation: Early-successional woody species dominate the canopy in a widely variable mix, depending on geographic location. In the Central Appalachians and Mid-Atlantic Piedmont, many stands represent decadent forests that were once dominated by *Robinia pseudoacacia* but are now mixed with various mid-successional hardwoods; other stands in this region regenerated as mixed stands. Tree species often include some combination of *Prunus serotina, Liriodendron tulipifera, Fraxinus americana, Robinia pseudoacacia*, and *Acer rubrum*. Other associates can include *Juglans nigra, Sassafras albidum, Betula populifolia, Juniperus virginiana, Acer negundo, Acer saccharinum, Ailanthus altissima, Ulmus americana, Quercus* spp., *Betula lenta, Amelanchier* spp., *Pinus strobus*, and *Populus grandidentata*. Other woody species may contribute to the canopy or form a tall-shrub layer, including *Lindera benzoin* and *Carpinus caroliniana*. The low-shrub layer, if present, is usually characterized by the presence of *Rubus* spp. such as *Rubus flagellaris, Rubus allegheniensis, Rubus phoenicolasius*, or *Rubus hispidus*. This layer is often dominated by exotic species such as *Lonicera tatarica, Lonicera morrowii, Rhamnus cathartica, Crataegus* spp., *Rosa multiflora*, and *Berberis thunbergii*. The herbaceous layer is variable, often containing grasses and forbs of both native and exotic origin. Common species include *Ageratina altissima var. altissima, Polygonum persicaria, Impatiens capensis, Glechoma hederacea, Polystichum acrostichoides, Calystegia sepium ssp. sepium, Galium aparine, Oxalis stricta, Polygonum virginianum, Dennstaedtia punctilobula, Arisaema triphyllum, Allium vineale*, and *Veronica officinalis*, among many others. The invasive species *Alliaria petiolata, Microstegium vimineum*, and *Polygonum caespitosum* can be abundant in this disturbed forest type. Vines can be absent or

abundant. In stands with high vine cover, the vegetation structure can be altered by the weight of the vines pulling down trees and shrubs. Common vines include *Parthenocissus quinquefolia, Toxicodendron radicans, Vitis labrusca*, and the invasive vines *Celastrus orbiculata* and *Lonicera japonica*.

Global Dynamics: These forests are often young and resulted from the colonization of old agricultural fields by woody species. Recent disturbance or abundant invasive species give these forest stands a weedy character. It is unlikely that these stands will succeed to a natural plant community dominated by native species.

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Ailanthus altissima* (Medium, invasive/exotic), *Alliaria petiolata* (High/Medium, invasive/exotic), *Berberis thunbergii* (High/Medium, invasive/exotic), *Celastrus orbiculata* (High/Medium, invasive/exotic), *Dactylis glomerata* (Medium/Insignificant, invasive/exotic), *Duchesnea indica* (Low/Insignificant, invasive/exotic), *Elaeagnus umbellata* (High, invasive/exotic), *Ligustrum sinense* (High/Medium, invasive/exotic), *Lonicera japonica* (High/Medium, invasive/exotic), *Lonicera morrowii* (High/Medium, invasive/exotic), *Microstegium vimineum* (High/Medium, invasive/exotic), *Morus alba* (High/Medium, invasive/exotic), *Polygonum perfoliatum* (Medium, invasive/exotic), *Polygonum persicaria* (invasive/exotic), *Prunus avium* (High/Low, invasive/exotic), *Rosa multiflora* (Medium/Low, invasive/exotic), *Rubus phoenicolasius* (Medium, invasive/exotic)

Appalachian National Scenic Trail (Lower New England Project Area): Invasive/Exotic Plants: *Barbarea vulgaris* (Low/Insignificant), *Berberis thunbergii* (High/Medium), *Elaeagnus umbellata* (High), *Hesperis matronalis* (Medium/Low), *Lonicera morrowii* (High/Medium), *Microstegium vimineum* (High/Medium), *Rhamnus cathartica* (High/Medium), *Rosa multiflora* (Medium/Low)

Global: Invasive/Exotic Plants: *Alliaria petiolata* (High/Medium), *Berberis thunbergii* (High/Medium), *Elaeagnus umbellata* (High), *Lonicera morrowii* (High/Medium), *Lonicera tatarica* (High/Medium), *Microstegium vimineum* (High/Medium), *Polygonum caespitosum*, *Polygonum persicaria*, *Rhamnus cathartica* (High/Medium), *Rosa multiflora* (Medium/Low)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (29-Nov-2004). This vegetation is modified by human activity and not of conservation concern.

RELATED CONCEPTS

Global Similar Types:

- *Juglans nigra / Verbesina alternifolia* Ruderal Forest (CEGL007879)
- *Liriodendron tulipifera - Quercus* spp. Ruderal Forest (CEGL007221) is more strongly dominated by *Liriodendron* and is generally in a later successional state as evidenced by taller trees and more closed canopy.
- *Prunus serotina - Sassafras albidum - (Fraxinus americana) / Juniperus virginiana* Ruderal Forest (CEGL004133)
- *Robinia pseudoacacia* Ruderal Forest (CEGL007279)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This forest represents successional vegetation and is thus not of high conservation concern.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This community should be a high-priority target for forest restoration efforts.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This forest represents successional and often heavily invaded vegetation and is thus not of high conservation concern. Many examples lack *Liriodendron tulipifera* and/or other nominals.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This vegetation is broadly defined and varies widely in composition across its range, presenting a classification challenge at the alliance level. The northern end of its range occurs where *Liriodendron tulipifera* drops out.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled in Pennsylvania (including between Rauch Gap and Swatara Gap) and Virginia (Angels Rest, Front Royal, Shenandoah National Park). It is especially common along the trail near parking lots and other heavily used and impacted areas.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Connecticut at Housatonic River Bottom and Mt. Prospect; at Unionville East and Unionville West in New Jersey; and at Bellvale Mountain South in New York.
Global Range: This vegetation is currently described from Pennsylvania, New York, and New Jersey but is of broader distribution in the northeastern U.S.

Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Acer rubrum - Prunus serotina - Pinus strobus* Ruderal Forest Alliance (A3229)

ELEMENT CONCEPT

Global Summary: This deciduous to mixed forest of northern New England is a broadly defined community, usually developing after severe disturbance, including clearing, pasturing, logging, fires, severe hurricanes, or simply heavily fragmented residential development. While in some cases it is a successional type, it may persist in some settings, particularly where soils are limited, for example along ridgelines. The canopy trees are mostly 40-100 years old. The canopy ranges from somewhat open to closed; the shrub, herb and bryoid layers are patchy and rarely extensive. Composition is variable depending on site history. The canopy is usually mostly deciduous, dominated by a heterogeneous mixture of *Quercus rubra, Acer rubrum, Pinus strobus*, and *Fagus grandifolia*. Typically these occur in association with light-requiring, wind-dispersed trees such as *Populus tremuloides, Populus grandidentata, Betula papyrifera, Betula populifolia, Fraxinus americana*, and *Prunus serotina*. Minor associates include *Picea rubens* and *Acer saccharum*. Understory species tend to reflect predisturbance conditions and include *Acer pensylvanicum, Corylus cornuta, Viburnum acerifolium*, or *Hamamelis virginiana* in the shrub layer. *Vaccinium angustifolium* is a typical low shrub, although it does not form a coherent layer. *Pteridium aquilinum* is characteristic and may be abundant in the herbaceous layer; other common herbs include *Trientalis borealis, Maianthemum canadense, Deschampsia flexuosa*, and *Aralia nudicaulis*. The bryophyte layer is of variable cover and may include *Polytrichum commune* and *Dicranum polysetum*. This association is differentiated from similar forests and woodlands by its thin canopy that usually includes early-successional species, particularly *Acer rubrum*, low abundance of tolerant hardwoods other than red oak, and the lack of a well-developed heath shrub layer (as is typical in oak-pine woodlands). Unlike oak and oak-pine forests to the south, *Quercus rubra* is the only oak species present in any abundance.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This successional oak - red maple forest develops after severe disturbance including clearing, pasturing, logging, fires, severe hurricanes, or simply heavily fragmented residential development. It is widespread throughout northern and central New England. Sites are mesic moderate low and midslopes with southern and western aspects. Soils are well-drained sand, sandy loam and loam. The unvegetated surface consists of leaf litter, with small amounts of large rocks and downed wood. Evidence of disturbance includes past logging and recent and past fire. Despite being a disturbance community, exotic plants were reported.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This association is known from one location at 530 m (1,740 feet) in elevation on a moderately steep high slope with a southern aspect. Soils is a rapidly drained sandy loam with a well-developed layer of litter and duff.

Global Environment: This deciduous to mixed forest of northern New England is a broadly defined community, usually developing after severe disturbance including clearing, pasturing, logging, fires, severe hurricanes, or simply heavily fragmented residential development. While in some cases it is a successional type, it may persist in some settings, particularly where soils are limited, for example along ridgelines.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This early- to mid-successional forest has variable canopy composition depending on site history. *Quercus rubra, Acer rubrum, Pinus strobus* (often emergent), and *Fagus grandifolia* occur in association with light-requiring, wind-dispersed trees such as *Populus tremuloides, Populus grandidentata, Betula populifolia, Fraxinus americana*, and *Prunus serotina*. *Betula papyrifera* and *Picea rubens* are occasional minor associates in northern examples. Shrubs are sparse. *Dennstaedtia punctilobula* is the dominant herb, and *Mitchella repens* is characteristic.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The only known stand of this association has a canopy strongly dominated by *Quercus rubra*. *Pinus strobus* and *Picea rubens* are present in the canopy and subcanopy, but at low cover. The shrub layer is strongly dominated by the heath *Vaccinium angustifolium*. The herbaceous layer is dominated by the lawn-forming sedge *Carex lucorum*. Other herbaceous species present include *Botrychium dissectum, Brachyelytrum erectum, Carex debilis, Carex swanii, Deschampsia flexuosa*, and *Uvularia sessilifolia*.

Global Vegetation: Canopy trees are mostly 40-100 years old. The canopy ranges from somewhat open to closed; the shrub, herb, and bryoid layers are patchy and rarely extensive. Composition is variable depending on site history. The canopy is usually mostly deciduous, dominated by a heterogeneous mixture of *Quercus rubra, Pinus strobus*, and *Fagus grandifolia*. Typically these occur in association with light-requiring, wind-dispersed trees such as *Acer rubrum, Populus tremuloides, Populus grandidentata, Betula papyrifera, Betula populifolia, Fraxinus americana*, and *Prunus serotina*. Minor associates include *Picea rubens* and *Acer saccharum*. Understory species tend to reflect predisturbance conditions and include *Acer pensylvanicum, Corylus cornuta, Viburnum acerifolium*, or *Hamamelis virginiana* in the shrub layer. *Vaccinium angustifolium* is a typical low shrub. *Pteridium aquilinum* is characteristic, and may be abundant, in the herbaceous layer; other common herbs include *Trientalis borealis, Maianthemum canadense, Deschampsia flexuosa*, and *Aralia nudicaulis*. The bryophyte layer is of variable cover and may include *Polytrichum commune* and *Dicranum polysetum*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This association was first described from the Northern Appalachian-Acadian ecoregion, where it approaches a matrix landscape pattern in the southern portions of the region while being absent from areas to the north. Similar forests extend southward. Further work in Lower New England suggests that this type may represent an earlier successional version of *Pinus strobus - Quercus (rubra, velutina) - Fagus grandifolia* Forest (CEGL006293), and possibly of other later-successional types, distinguished by the preponderance of *Acer rubrum* in the canopy.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Housatonic Valley - Buck Hill in Connecticut; at Dalton Gulf and East Mountain State Forest in Massachusetts; and at Bear Mountain in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is only known from Mount Hayes in New Hampshire.
Global Range: This forest occurs in northern and central New England and adjacent Canada, south to Pennsylvania.

A3227 *Juniperus virginiana - Pinus virginiana - Pinus echinata* Ruderal Forest Alliance

Alliance Summary Description: This semi-natural forest is found in locally disturbed areas, most commonly in old fields and pastures, and cleared land. Three dominance-based suballiances may be recognized: (1) *Juniperus virginiana var. virginiana* stands occur widely and are more common on calcareous sites. Stand may be very dense, and the stature may be rather low. Associated species include *Acer rubrum, Carya alba, Carya ovata, Cercis canadensis, Fraxinus americana*, and *Pinus virginiana*. The midstory is typically sparse, with canopy species, as well as *Cornus florida, Ilex opaca, Liquidambar styraciflua*, and *Prunus serotina var. serotina*. The vegetation may vary in structure from open-canopy woodland (particularly as it invades herbaceous old fields) to dense, closed-canopy forest. (2) A mixed *Juniperus virginiana var. virginiana - Quercus* spp. suballiance represents stands that may be fire-suppressed native stands, and may not be natural in character. Various oaks (including *Quercus coccinea, Quercus phellos, Quercus rubra, Quercus velutina*) are present. (3) *Pinus* spp. (especially *Pinus echinata, Pinus strobus*, and *Pinus virginiana*) stands occur on old fields (often from abandoned farmland), old pastures, clearcuts, and eroded areas. Soils are typically dry, acidic, and infertile. This forest typically has a very dense canopy of *Pinus virginiana* and little understory vegetation. The dense canopy may also include admixtures of other *Pinus* species (e.g., *Pinus taeda, Pinus echinata, Pinus rigida, Pinus strobus*) or other early-successional deciduous trees (e.g., *Acer rubrum, Liquidambar styraciflua, Prunus serotina, Liriodendron tulipifera, Fraxinus americana, Nyssa sylvatica*). Associated woody and herbaceous species vary with geography but are typically ruderal or exotic species. Shrub and herb layers are frequently very sparse. *Lonicera japonica* and *Rosa multiflora* are common. The herb layer is characterized by weedy natives and exotics such as *Lycopodium digitatum, Achillea millefolium var. occidentalis, Hieracium caespitosum*, and *Lespedeza cuneata*.

[CEGL006024] *Juniperus virginiana* Ruderal Forest

Translated Name: **Eastern Red-cedar Ruderal Forest**
Common Name: **Northeastern Ruderal Red-cedar Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Juniperus virginiana - Pinus virginiana - Pinus echinata* Ruderal Forest Alliance (A3227)

ELEMENT CONCEPT

Global Summary: This association is a broadly defined old-field early-successional community occurring in a variety of environmental settings in the northeastern states. Canopy closure and height are variable, as are shrub and herbaceous associates. *Juniperus virginiana* dominates the canopy layer. Common associates, typically occurring as scattered individuals, may include *Pinus strobus, Acer rubrum, Liriodendron tulipifera, Quercus* spp., and *Prunus serotina*. Shrub cover varies, with the most forested stands having little or no shrub cover. Exotic shrubs such as *Elaeagnus umbellata, Lonicera morrowii, Ligustrum vulgare*, and *Rosa multiflora* are characteristic, along with *Rubus* spp. Herbaceous cover likewise varies. Common species in the more open-canopy stands include old-field denizens such as *Schizachyrium scoparium, Festuca rubra, Anthoxanthum odoratum, Agrostis gigantea, Andropogon virginicus, Elymus repens (= Elytrigia repens), Solidago rugosa, Solidago gigantea, Euthamia graminifolia, Monarda fistulosa, Toxicodendron radicans, Achillea millefolium*, and *Daucus carota*. In dense forest stands, herbs may be absent or limited to scattered shade-tolerant species such as *Alliaria petiolata* and *Allium vineale*, and *Dennstaedtia punctilobula*. These forests are often young and result from the colonization of old agricultural fields by *Juniperus virginiana* over native and exotic forbs and grasses. These stands may eventually succeed to other forest types as mid- and late-successional canopy species colonize and subsequently overtop the *Juniperus*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This association is a broadly defined old-field early-successional community occurring in a variety of environmental settings on former agricultural land and other disturbed or degraded environmental settings. Soils are mesic to dry-mesic and moderately well-drained to well-drained.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This early-successional, common community is found throughout the Northeast. It is a broadly defined old-field early-successional community occurring in a variety of environmental settings on former agricultural land and other disturbed or degraded environmental settings. Soils are mesic to dry-mesic and moderately well-drained to well-drained.

Global Environment: This is a broadly defined old-field early-successional community occurring in a variety of environmental settings, typically on former agricultural land and other disturbed or degraded environmental settings. Soils are mesic to dry-mesic and moderately well-drained to well-drained.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Juniperus virginiana* is the sole dominant in these shrublands. Canopy closure and height are variable, as are shrub and herbaceous associates.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This community comprises *Juniperus virginiana*-dominated old fields. Canopy closure and height are variable, as are shrub and herbaceous associates.

Global Vegetation: *Juniperus virginiana* dominates the canopy layer in stands of this type, which ranges from broadly-spaced woodlands to dense and nearly impenetrable thickets. Common associates, typically occurring as scattered individuals, may include *Pinus strobus, Acer rubrum, Liriodendron tulipifera, Quercus* spp., and *Prunus serotina*. Shrub cover varies according to canopy closure, with the most forested stands having little or no shrub cover. Exotic shrubs such as *Elaeagnus umbellata, Lonicera morrowii, Ligustrum vulgare*, and *Rosa multiflora* are most characteristic, along with *Rubus* spp. Herbaceous cover likewise varies. Common species in the more open-canopy stands include old-field denizens such as *Schizachyrium scoparium, Andropogon virginicus, Festuca rubra, Anthoxanthum odoratum, Agrostis gigantea, Elymus repens (= Elytrigia repens), Solidago rugosa, Solidago gigantea, Euthamia graminifolia, Monarda fistulosa, Toxicodendron radicans, Achillea millefolium*, and *Daucus carota*. In dense forest stands, herbs may be absent or limited to scattered shade-tolerant species such as *Alliaria petiolata, Allium vineale*, and *Dennstaedtia punctilobula*.

Global Dynamics: These forests are often young and result from the colonization of old agricultural fields by *Juniperus virginiana* over native and exotic forbs and grasses. These stands may eventually succeed to other forest types as mid- and late-successional canopy species colonize and subsequently overtop the *Juniperus*.

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (10-Oct-2001). This forest represents early-successional, modified, or silviculturally managed vegetation and is thus not of high conservation concern and does not receive a conservation status rank. This vegetation may be easily restorable by either management, time, or restoration of ecological processes.

[CEGL007944] *Pinus strobus* Ruderal Forest

Translated Name: **Eastern White Pine Ruderal Forest**
Common Name: **Ruderal Eastern White Pine Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Juniperus virginiana - Pinus virginiana - Pinus echinata* Ruderal Forest Alliance (A3227)

ELEMENT CONCEPT

Global Summary: This is an early-successional forest dominated by *Pinus strobus*, typically with a very dense canopy and little understory. It is considered ruderal because it is commonly associated with anthropogenic disturbance (e.g., former old fields and formerly cleared flats along streams) that have caused a mix of species not found with natural disturbances. Associated woody and herbaceous species vary with geography. In the northeastern states, the tree canopy is often monotypic and even-aged, with occasional associates including *Acer rubrum, Juniperus virginiana, Liriodendron tulipifera* (within its range), or scattered *Quercus rubra* or *Quercus velutina*. In regions where northern hardwoods are more prevalent, canopy associates include *Fraxinus americana* and *Acer saccharum*. In the Southern Blue Ridge and nearby areas, typical canopy and subcanopy associates include *Liriodendron tulipifera, Acer rubrum, Pinus rigida*, and *Liquidambar styraciflua*, with *Tsuga canadensis* often forming a dense shrub stratum. The understory is typically poorly developed or characterized by scattered individuals found in the canopy. The herbaceous cover is variable depending on the density of tree and shrub cover, and may be characterized by ruderal or exotic species that favor openings or disturbance. In more open stands, typical species are those associated with old fields, including *Solidago rugosa, Solidago gigantea, Anthoxanthum*

odoratum, Poa pratensis, Schizachyrium scoparium, Elymus repens (= Elytrigia repens), Bromus inermis, Agrostis gigantea, Euthamia graminifolia, Achillea millefolium, and *Daucus carota*. In stands that are more heavily forested, typical herbs include *Aralia nudicaulis, Ageratina altissima, Galium triflorum, Maianthemum canadense, Trientalis borealis, Mitchella repens, Polystichum acrostichoides*, and *Lycopodium* species. The particular composition of the herb layer will vary with geography. The substrate is usually covered by a thick layer of pine needle duff. In the Daniel Boone National Forest of Kentucky, *Pinus strobus* is spreading from plantings, especially in the Red River Gorge.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This wide-ranging successional forest is commonly associated with anthropogenic disturbance and could potentially occur anywhere within the range of *Pinus strobus*. It typically occurs on former agricultural lands and old fields that are no longer intensively mowed, plowed or managed, developing as *Pinus strobus* colonizes the open fields. Associated woody and herbaceous species vary with geography but are typically ruderal or exotic species that favor openings or disturbance.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This is a successional eastern white pine or eastern hemlock forest (in VT). The sites are typically abandoned pine plantations. One site is a moderate, northwest-facing slope with dry-mesic well-drained sandy loam. The unvegetated surface consists of leaf litter, with a very small amount of large rocks and downed wood. Evidence of disturbance includes previous tree plantings and the presence of exotic plants.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This wide-ranging successional forest is commonly associated with anthropogenic disturbance and could potentially occur anywhere within the range of *Pinus strobus*. It typically occurs on former agricultural lands and old fields that are no longer intensively mowed, plowed or managed, developing as *Pinus strobus* colonizes the open fields. Associated woody and herbaceous species vary with geography but are typically ruderal or exotic species that favor openings or disturbance.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This is an early-successional white pine forest that arises from disturbance and not evidently from planting.

Global Environment: This wide-ranging semi-natural forest is commonly associated with anthropogenic disturbance. It typically occurs on former agricultural lands and old fields that are no longer intensively mowed, plowed or managed, developing as *Pinus strobus* colonizes the open fields. Associated woody and herbaceous species vary with geography but are typically ruderal or exotic species that favor openings or disturbance.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: These successional or planted forests typically have a very dense canopy (greater than 60% cover of canopy/overstory combined) of *Pinus strobus* and little understory. They are usually of mixed-age and include a mixture of other successional species.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: These are successional stands of *Pinus strobus* and, in some cases in Vermont, *Tsuga canadensis*. *Acer rubrum, Betula lenta, Fraxinus americana*, and/or *Prunus serotina* may be common in canopy and/or subcanopy. *Rubus flagellaris* and *Rubus occidentalis* are common in the shrub layer. Herbs include *Dryopteris intermedia, Maianthemum canadense*, and *Veronica officinalis*.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: The tree canopy ranges from woodland to forest closure, with 25-85% cover. It is often monotypic and even-aged *Pinus strobus*, with occasional associates, including *Acer rubrum, Betula lenta, Juniperus virginiana*, or scattered *Quercus rubra* or *Quercus velutina*. In regions where northern hardwoods are more prevalent, canopy associates include *Fraxinus americana* and *Acer saccharum*. In the Southern Blue Ridge and nearby areas, typical canopy and subcanopy associates include *Liriodendron tulipifera, Acer rubrum, Pinus rigida*, and *Liquidambar styraciflua*, with *Tsuga canadensis* often forming a dense shrub stratum. The understory is poorly developed or characterized by scattered individuals found in the canopy. Shrubs are often present in the more open stands and include native species, such as *Cornus racemosa, Rhus glabra, Viburnum prunifolium*, and *Rubus* spp., as well as exotics, such as *Elaeagnus umbellata, Rosa multiflora, Lonicera morrowii*, and *Berberis thunbergii*. The herbaceous cover is variable depending on the density of tree and shrub cover, and may be characterized by ruderal or exotic species that favor openings or disturbance. In more open stands, typical species are those associated with old fields, such as *Solidago rugosa, Solidago gigantea, Anthoxanthum odoratum, Poa pratensis, Schizachyrium scoparium, Elymus repens (= Elytrigia repens), Bromus inermis, Agrostis gigantea, Euthamia graminifolia, Achillea millefolium*, and *Daucus carota*. In stands that are more heavily forested, typical herbs include *Aralia nudicaulis, Ageratina altissima, Galium*

triflorum, Maianthemum canadense, Medeola virginiana, Polystichum acrostichoides, Trientalis borealis, Mitchella repens, and *Lycopodium* species. The particular composition of the herb layer will vary with geography. The substrate is usually covered by a thick layer of pine needle duff.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This successional even-aged or mixed-age forest is composed of *Pinus strobus* with greater than 40% cover of the canopy. It may also contain a mixture of other successional species, including *Quercus* spp., *Acer* spp. and/or *Betula* spp. Shrubs, often exotic species, may be present. Old-field grasses and forbs may be common in the herbaceous layer.

Global Vegetation: The tree canopy ranges from woodland to forest closure, with 25-85% cover. It is often monotypic and even-aged *Pinus strobus*, with occasional associates, including *Acer rubrum, Betula lenta, Juniperus virginiana*, or scattered *Quercus rubra* or *Quercus velutina*. In regions where northern hardwoods are more prevalent, canopy associates include *Fraxinus americana* and *Acer saccharum*. In the Southern Blue Ridge and nearby areas, typical canopy and subcanopy associates include *Liriodendron tulipifera, Acer rubrum, Pinus rigida*, and *Liquidambar styraciflua*, with *Tsuga canadensis* often forming a dense shrub stratum. The understory is poorly developed or characterized by scattered individuals found in the canopy. Shrubs are often present in the more open stands and include native species, such as *Cornus racemosa, Rhus glabra, Viburnum prunifolium*, and *Rubus* spp., as well as exotics, such as *Elaeagnus umbellata, Rosa multiflora, Lonicera morrowii*, and *Berberis thunbergii*. The herbaceous cover is variable depending on the density of tree and shrub cover, and may be characterized by ruderal or exotic species that favor openings or disturbance. In more open stands, typical species are those associated with old fields, such as *Solidago rugosa, Solidago gigantea, Anthoxanthum odoratum, Poa pratensis, Schizachyrium scoparium, Elymus repens (= Elytrigia repens), Bromus inermis, Agrostis gigantea, Euthamia graminifolia, Achillea millefolium*, and *Daucus carota*. In stands that are more heavily forested, typical herbs include *Aralia nudicaulis, Ageratina altissima, Galium triflorum, Maianthemum canadense, Medeola virginiana, Polystichum acrostichoides, Trientalis borealis, Mitchella repens*, and *Lycopodium* species. CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (23-Jun-2013). This forest represents semi-natural vegetation, i.e., the vegetation contains combinations of species that are not found under natural disturbance regimes, many of them exotic. Thus it is not of high conservation concern and does not receive a conservation status rank.

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This forest represents successional vegetation and is thus not of high conservation concern.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This forest represents successional vegetation and is thus not of high conservation concern.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: In one part of Vermont, *Tsuga canadensis* is replacing *Pinus strobus* in the canopy. These stands are the result of disturbance 30-50 years ago, and most of these areas are not notably affected by hemlock woolly adelgid.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Classification Comments: This community is known to occur along the trail, but no plots or observation points were collected.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This association was not sampled along the trail in the Southern Blue Ridge section; however, it was observed within the AT corridor in the Southern Blue Ridge during mapping reconnaissance. It can be differentiated from white pine plantations by the lack of rows and successional understory.
Global Classification Comments: This semi-natural type may be expected to occur throughout the range of the alliance but has primarily been attributed in areas where The Nature Conservancy ecoregional planning or other project-specific needs have documented its occurrence. Rangewide review should greatly expand its geographic scope. Association may need to be split based on northern hardwood associates and central hardwood associates.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This successional type may be expected to occur from Maine and New Hampshire south to Georgia and Tennessee.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled at Sharon Mountain in Connecticut and at Norwich River Lagoon, Moseley Hill and elsewhere in Vermont.
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This community is known to occur along the trail, but no plots or observation points were collected.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This association is present to common in Tennessee from Tanyard Gap north to Cross Mountain.
Global Range: This semi-natural type may be expected to occur throughout the range of the alliance (i.e., from Michigan, northern Wisconsin, northern and eastern Minnesota, extreme northeastern Iowa, and from Maine and New Hampshire south to Georgia and Tennessee, as well as in Ontario, Canada). It has been documented primarily in areas where project-specific needs have required it.

[CEGL002591] *Pinus virginiana* Ruderal Forest

Translated Name: **Virginia Pine Ruderal Forest**
Common Name: **Ruderal Virginia Pine Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Juniperus virginiana - Pinus virginiana - Pinus echinata* Ruderal Forest Alliance (A3227)

ELEMENT CONCEPT

Global Summary: This ruderal Virginia pine forest of the southeastern states occurs in areas where canopy removal has created dry, open conditions and bare mineral soil, allowing for the establishment of *Pinus virginiana*. These habitats include old fields, old pastures, clearcuts, and eroded areas; soils are typically dry, acidic, and infertile. It is common on abandoned farmland. This forest typically has a very dense canopy of *Pinus virginiana* and little understory vegetation. The dense canopy may also include admixtures of other *Pinus* species (e.g., *Pinus taeda, Pinus echinata, Pinus rigida, Pinus strobus*) or other early-successional deciduous trees (e.g., *Acer rubrum, Liquidambar styraciflua, Prunus serotina, Liriodendron tulipifera, Fraxinus americana, Nyssa sylvatica*).

Associated woody and herbaceous species vary with geography but are typically ruderal or exotic species. Shrub and herb layers are frequently very sparse. Stands are short-lived, generally less than 75 years.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This Virginia pine planted/successional semi-natural forest occupies flat to moderately sloping land that was heavily plowed or grazed and eroded in the recent past (10-60 years). It was sampled at two locations in the Central Appalachian project area in Cumberland and Perry counties, Pennsylvania. Sites are moderate west-facing slopes with dry, well-drained sandy loam and silt loam soils. The unvegetated surface is dominated by leaf litter with some downed wood. Evidence of disturbance includes past logging/clearing and the presence of exotic plant species.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This early-successional Virginia pine forest is the result of disturbance less than 25 years ago. The one sampled stand is found on a moderate, south-facing ridge with moderately well-drained clay loam soil. The unvegetated surface is dominated almost exclusively by needle litter with some downed wood. Evidence of disturbance includes past logging and pine bark beetle damage.

Global Environment: This community occurs in areas where canopy removal has created open conditions and bare mineral soil, allowing for the establishment of *Pinus virginiana*. These conditions can include old fields, old pastures, clearcuts, and eroded areas. In the Ridge and Valley of Tennessee, northeastern Monroe County, early successional forests with *Pinus virginiana* dominance were found on low slopes in areas that were cleared for agriculture prior to the 1970s, when Tellico Lake was created (Andreu and Tukman 1995). In the Central Appalachians, this vegetation occurs where soft shales have been farmed (in valleys or on plateaus), resulting in stands with nothing but successional species in the understory. Soils underlying these communities are of two general types, i.e., those derived in residuum from calcareous shale and calcareous sandstone of the Middle Ordovician and those of some other origin. Series of the former type include Dandridge (Lithic Ruptic-Alfic Eutrochrepts), Tellico (Typic Rhododults), and Steekee (Ruptic-Ultic Dystrochrepts). Other soil series that this forest type may occur on include Litz, Dewey, Alcoa, Bland, Etowah, Lobdell and Neubert. All of these soils are well-drained and range in pH from moderate acidic to very strongly acidic.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The moderately dense (50-60% cover) canopy is dominated by *Pinus virginiana* and may include *Acer rubrum, Pinus rigida*, and *Sassafras albidum* which may also form a sparse to moderate subcanopy along with other species such as *Amelanchier arborea, Betula lenta, Carya glabra*, and *Quercus rubra*. The sparse to moderate shrub layers include canopy species as well as *Hamamelis virginiana, Kalmia latifolia, Lindera benzoin, Rubus* spp., *Vaccinium pallidum, Vaccinium stamineum*, and *Viburnum prunifolium*. The herbaceous layer may be sparse or, in separate instances, be covered by a dense layer of *Gaultheria procumbens* or *Lycopodium digitatum*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: *Pinus virginiana* dominates the canopy. *Pinus echinata* or *Pinus rigida* may be occasional. *Acer rubrum* dominates the subcanopy. There is little to no *Quercus* spp. except sometimes abundant *Quercus prinus* in extremely fire-suppressed examples. There are few herbaceous or understory species. Vines including *Smilax rotundifolia, Toxicodendron radicans* and *Parthenocissus quinquefolia* are common. *Lycopodium digitatum* and a few other herbs do occur in the sampled plot.

Global Vegetation: This forest typically has a very dense canopy of *Pinus virginiana* and little understory vegetation. *Pinus taeda, Pinus echinata*, or *Pinus strobus* may co-occur with *Pinus virginiana* in the canopy. The canopy can also have significant admixtures of early-successional deciduous trees (e.g., *Acer rubrum, Liquidambar styraciflua, Prunus serotina, Liriodendron tulipifera, Fraxinus americana, Oxydendrum arboreum, Betula lenta, Nyssa sylvatica*). Older stands on abandoned farmland may have tall canopies (>20 m) of decadent *Pinus virginiana* overtopping the shade-tolerant *Tsuga canadensis*, which often dominates the subcanopy and shrub layers. Scattered *Pinus rigida* may be mixed in these stands. Associated woody and herbaceous species vary with geography but are typically ruderal or exotic species; *Lonicera japonica* and *Rosa multiflora* are common. The herb layer is characterized by weedy natives and exotics such as *Lycopodium digitatum, Achillea millefolium var. occidentalis, Hieracium caespitosum*, and *Lespedeza cuneata*. Shrub and herb strata, where present at all, are usually sparse in coverage. In eastern Tennessee, the subcanopy may contain *Acer saccharum* and *Cornus florida*; other associated species may include *Cercis canadensis, Parthenocissus quinquefolia, Lonicera japonica*, and *Microstegium vimineum* (Andreu and Tukman 1995). In the Central Appalachians, associates include *Pinus strobus, Pinus echinata*, and *Pinus rigida*. Some stands may have a dense ericaceous shrub stratum containing *Vaccinium* spp., *Gaylussacia* spp., *Kalmia latifolia*, and *Rhododendron* spp. This community contains many exotics species such as

Albizia julibrissin, Lonicera japonica, and *Pueraria montana var. lobata*. *Lonicera japonica* when present has an average cover of 27%. The associated species in all strata are highly variable.
Global Dynamics: This is an early-successional forest type. Damage from ice storms was the main disturbance observed in these stands in the Tellico Pilot Project study area. In addition, fire and insect infestation are likely damaging agents.

MOST ABUNDANT SPECIES

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Pinus virginiana*
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Acer rubrum*, *Lycopodium digitatum*, *Pinus virginiana*, *Smilax glauca*, *Toxicodendron radicans*
Global: *Pinus virginiana*, *Tsuga canadensis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Lonicera morrowii* (High/Medium), *Polygonum persicaria*
Global: Invasive/Exotic Plants: *Albizia julibrissin* (High/Low), *Lonicera japonica* (High/Medium), *Microstegium vimineum* (High/Medium), *Pueraria montana* var. *lobata*, *Rosa multiflora* (Medium/Low)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (13-Jun-2000). This forest represents early-successional vegetation and is thus not of high conservation concern.

RELATED CONCEPTS

Global Similar Types:
- *Pinus echinata - Quercus prinus - Quercus (coccinea, velutina)* Forest (CEGL004761)
- *Pinus echinata* Ruderal Forest (CEGL006327) occurs in similar environments but is dominated (>50% of canopy) by *Pinus echinata* instead of *Pinus virginiana*.
- *Pinus taeda - Liquidambar styraciflua* Ruderal Forest (CEGL008462) is commonly found in the same area as CEGL002591 in the Piedmont. CEGL008462 contains at least 50% *Pinus taeda* in the canopy, whereas CEGL002591 is mostly *Pinus virginiana*.

- *Pinus taeda / Liquidambar styraciflua - Acer rubrum var. rubrum / Vaccinium stamineum* Ruderal Forest (CEGL006011) occurs in similar environments with similar disturbance histories but is dominated by (>50% of canopy) *Pinus taeda* instead of *Pinus virginiana*.
- *Pinus virginiana - Juniperus virginiana var. virginiana - Ulmus alata* Ruderal Forest (CEGL007121) on more calcareous or circumneutral substrates.
- *Pinus virginiana - Pinus (rigida, echinata) - (Quercus prinus) / Vaccinium pallidum* Forest (CEGL007119) can have a very similar canopy in the Piedmont and Blue Ridge ecoregions, but CEGL007119 is generally created and maintained by fire and/or logging but not heavy plowing and/or erosion. CEGL002591 generally has signs of heavy agricultural use such as sparse herbaceous or shrub layers, large percentage of invasive exotics such as *Lonicera japonica* in the herbaceous layer, old plowlines, human debris, and extremely even-aged canopy, whereas CEGL007119 generally has a more intact herbaceous/shrub layer (especially *Vaccinium pallidum*) and less signs of severe human disturbance.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: This forest represents early-successional vegetation and is thus not of high conservation concern.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This successional forest was sampled in Tennessee. It occurs throughout the Southern Blue Ridge and Central Appalachian sections of the trail.
Global Classification Comments: Early-successional *Pinus virginiana* vegetation occurring over calcareous substrates is classed in *Pinus virginiana - Juniperus virginiana var. virginiana - Ulmus alata* Ruderal Forest (CEGL007121) and has species indicative of calcareous substrates. Like many ruderal USNVC communities, this community has a wide geographic range and vegetation composition of associated species varies over this range.

After conducting fieldwork on Maryland's Inner Coastal Plain during the USFWS Patuxent Research Refuge vegetation mapping project, it was determined that near-pure stands of *Pinus rigida* and stands mixed with *Pinus virginiana* or early-successional deciduous trees such as *Acer rubrum* need to be reflected in the global concept of this type. It is unclear how these stands have developed or been managed, but contemporary fire suppression is an obvious factor as are signs of historical clearing for agriculture and military use (J. Harrison pers. comm. 2011).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was sampled in Cumberland and Perry counties, Pennsylvania.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This successional forest was sampled in Tennessee. It occurs throughout the Southern Blue Ridge and Central Appalachian sections of the trail.
Global Range: This successional community is possible in the Piedmont from New Jersey and Pennsylvania south to Alabama and ranges west into the Appalachians, Ridge and Valley, the Cumberland Plateau, and in scattered locales of the Interior Low Plateau.

A3228 *Liriodendron tulipifera - Juglans nigra - Robinia pseudoacacia* Ruderal Forest Alliance

Alliance Summary Description: This alliance includes deciduous forests dominated by *Gleditsia triacanthos, Juglans nigra, Liriodendron tulipifera*, or *Robinia pseudoacacia* primarily in areas which were once clearcut, old fields, or cleared by fire or other natural disturbances, and then planted to these species, but with no regular maintenance. Three suballiances are recognized based on dominant species: (1) *Liriodendron tulipifera* stands occur on old clearcut sites and old fields. This suballiance includes pure, often even-aged stands of *Liriodendron tulipifera*. Associated species vary with geographic location. Throughout most of the range of this suballiance *Acer rubrum, Robinia pseudoacacia, Betula lenta, Acer saccharum*, and *Acer negundo* are common components. (2) *Juglans nigra - Gleditsia triacanthos* stands are often associated with former homesites or other disturbances on fertile alluvial deposits. Associated canopy trees vary from site to site and can include *Liriodendron tulipifera, Juglans cinerea, Robinia pseudoacacia, Fraxinus americana, Ulmus americana, Platanus occidentalis, Acer saccharum, Acer nigrum*, and *Morus rubra*. The shrub layer may or may not be well-developed; common species include *Asimina triloba, Viburnum prunifolium, Lindera benzoin, Corylus americana*, and the exotic invasive *Rosa multiflora*. (3) *Robinia pseudoacacia* stands occur in pure stands or makes up the majority of the canopy. These are short-lived forests that typically result from planting or invasion following land abandonment or fire, or from other severe disturbance.

[CEGL004184] *Crataegus punctata - Crataegus flabellata* Ruderal Forest

Translated Name: **Dotted Hawthorn - Fanleaf Hawthorn Ruderal Forest**
Common Name: **Southern & Central Appalachian Ruderal Hawthorn Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Liriodendron tulipifera - Juglans nigra - Robinia pseudoacacia* Ruderal Forest Alliance (A3228)

ELEMENT CONCEPT

Global Summary: Stands of this ruderal orchard-like open to closed-canopy woodland are dominated by *Crataegus punctata* and *Crataegus flabellata*. In addition, *Amelanchier laevis* and *Prunus pensylvanica* may be present in the canopy. Some dominant tall herbs include *Ageratina altissima var. roanensis, Angelica triquinata, Helenium autumnale*, and *Solidago puberula*. Open-canopied stands may have *Rubus allegheniensis* or shrubs beneath.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This dotted hawthorn successional woodland/forest/orchard is found at high elevations of 1,000-1,525 m (3,200-5,000 feet) in the Southern and Central Appalachians. Vegetation typically occurs over well-drained, loamy soils underlain by Precambrian gneisses, schists and granites. These soils are classified as Typic, Umbric, or Lithic Dystrochrepts, and Typic Haplumbrepts (Golden 1974). Vegetation could occur on most of the major mountain ranges within its range, on broad ridges and mid to upper slopes. Moisture regimes are typically dry-mesic to mesic. A large patch occurs along the AT in the saddle between Beech and Whitetop mountains in Virginia.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This high-elevation successional orchard, tall shrubland, or forest occurs in the Southern Appalachians and southern portion of the Central Appalachians at elevations between 1,000 and 1,525 m (3,200-5,000 feet). The rooting substrate contains less than 50% and usually less than 10% surface rocks and boulders. There is a well-drained, well-developed soil layer present.

Global Environment: The environment of this association is essentially similar to that of high-elevation northern red oak forests of the Southern Appalachians and southern portion of the Central Appalachians, at elevations of 1000-1525 m (3200-5000 feet). Vegetation typically occurs over well-drained, loamy soils underlain by Precambrian gneisses, schists and granites. These soils are classified as Typic, Umbric, or Lithic Dystrochrepts, and Typic Haplumbrepts (Golden 1974). Vegetation could occur on most of the major mountain ranges within its range, on broad ridges and mid to upper slopes. Moisture regimes are typically dry-mesic to mesic.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: *Crataegus punctata* dominates this successional woodland/forest/orchard. It is a forest of moderate stature (5-15 m). The canopy may be mixed with some combination of *Quercus rubra, Betula alleghaniensis, Prunus pensylvanica*, and/or *Aesculus flava*. If stands have an open canopy, they may have *Rubus allegheniensis* or shrubs beneath; or they may have residual grasses and graminoids, either *Danthonia compressa, Carex pensylvanica*, and/or *Phleum pratense*. Some other dominant tall forbs include *Eurybia chlorolepis* and/or *Oclemena acuminata*.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This community is a forest or tall shrubland of moderate stature. The canopy is composed of *Crataegus punctata*, possibly mixed with some combination of *Quercus rubra, Betula alleghaniensis, Prunus pensylvanica*, and/or *Aesculus flava*. *Rubus allegheniensis* can be a common shrub. Old-field grasses and forbs are common under more open canopies.

Global Vegetation: Stands of this forest are dominated by *Crataegus punctata* and *Crataegus flabellata*. The tree and tall-shrub stratum is 5 to 15 m tall and ranges from approximately 25-60% cover. In addition, *Amelanchier laevis* and *Prunus pensylvanica* may be present in the canopy. Some dominant tall herbs include *Ageratina altissima var. roanensis, Angelica triquinata, Helenium autumnale*, and *Solidago puberula*. If stands have an open canopy, they may have *Rubus allegheniensis* or shrubs beneath; or they may have residual grasses and graminoids, either *Danthonia compressa, Agrostis perennans, Carex pensylvanica*, and/or *Phleum pratense*. Some other dominant tall forbs include *Eurybia chlorolepis* and/or *Oclemena acuminata*.

Global Dynamics: This vegetation is transitional between, and located adjacent to, high-elevation northern red oak forests and grass/shrub balds. It is distinctive from either of these, having a composition different from northern red oak forests, and a physiognomy distinctive from grass and shrub balds. It may arise from the relaxation of grazing pressure and other management actions in the grassy balds, or it could have arisen from removal of northern red oak, under which an understory of *Crataegus* may occur.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): *Crataegus punctata*
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Crataegus punctata*
Global: *Amelanchier laevis*, *Crataegus flabellata*, *Crataegus punctata*, *Prunus pensylvanica*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Ageratina altissima* var. *roanensis* (G5T3T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (4-Nov-2010). This type has increased in its cover and abundance because of the reduction of fire frequency and grazing intensity. It may arise from the relaxation of grazing pressure and other management actions in the grassy balds, or it could have arisen from removal of northern red oak, under which an understory of *Crataegus* may occur.

RELATED CONCEPTS

Global Similar Types:
- *Quercus rubra / Carex pensylvanica - Ageratina altissima var. roanensis* Forest (CEGL007298)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: *Crataegus punctata* is a major old-field invader at high elevations of the Southern and Central Appalachians.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Some examples of High-Elevation Red Oak Forest (Tall Herb Type) (CEGL007298) may have a *Crataegus* understory.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: *Crataegus punctata* is a common old-field invader at high elevations of both the Southern and Central Appalachians.
Global Classification Comments: This type has increased in its cover and abundance because of the reduction of fire frequency and grazing intensity. Stands only seem to be found where the grazing effects are particularly strong, where grazing was unusually heavy, prolonged, or recent. For conservation target purposes, it can be treated as a complex with the other shrub and grass bald types with which it typically co-occurs, or conversely as a component of the adjacent northern hardwoods forest.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: A large patch occurs along the AT in the saddle between Beech and Whitetop mountains in Virginia in the Central Appalachian project area.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This vegetation was observed in the saddle between Beech and Whitetop mountains in Virginia.
Global Range: This vegetation is found on the higher elevations of major mountain ranges in the Southern and Central Appalachians.

[CEGL007879] *Juglans nigra / Verbesina alternifolia* Ruderal Forest

Translated Name: **Black Walnut / Wingstem Ruderal Forest**
Common Name: **Ruderal Black Walnut Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Liriodendron tulipifera - Juglans nigra - Robinia pseudoacacia* Ruderal Forest Alliance (A3228)

ELEMENT CONCEPT

Global Summary: This successional black walnut forest of the eastern United States occurs in a variety of habitats, all associated with disturbance, and frequently associated with rich or circumneutral soils, usually having a neutral to basic pH. These habitats include ridgetops, slopes, floodplains, alluvial terraces, and the floors of sinkholes. These are all generally areas that were cleared for agriculture or homesites. It has been documented from various-sized drainages. The community was originally defined from former homesites in Great Smoky Mountains National Park, where this association is an open, successional forest. It has since been found on some old pasture sites, associated with former settlements, from Georgia northeast to Pennsylvania, and is potentially a wide-ranging type. It has also been sampled from the floors of sinkholes and other related areas at Mammoth Cave National Park. The canopy can be closed to somewhat open. *Juglans nigra* forms at least half of the canopy and is often the sole canopy tree. Associated canopy trees vary from site to site and can include *Liriodendron tulipifera, Juglans cinerea, Robinia pseudoacacia, Fraxinus americana, Ulmus americana, Platanus occidentalis, Acer saccharum, Acer nigrum, Morus rubra*, and *Aesculus flava*. Additional tree species in the subcanopy can include *Carya cordiformis* and *Celtis occidentalis*. *Sassafras albidum* and/or *Carpinus caroliniana* may be present as small trees. The shrub layer may or may not be well-developed; common species include *Asimina triloba, Viburnum prunifolium, Lindera benzoin, Corylus americana*, and the exotic invasive *Rosa multiflora*. The herb layer is variable, often with one or a few species providing most of the cover. *Verbesina alternifolia* (within its range) and *Ageratina altissima* are characteristic and may be dominant; other herbs include *Ambrosia trifida, Amphicarpaea bracteata, Agrimonia pubescens, Apios americana, Cryptotaenia canadensis, Galium triflorum, Osmorhiza longistylis, Dichanthelium clandestinum, Packera aurea, Polygonum virginianum, Rudbeckia laciniata, Podophyllum peltatum, Impatiens capensis, Circaea lutetiana ssp. canadensis, Viola striata*, and *Ambrosia trifida*. The invasive exotics *Microstegium vimineum, Alliaria petiolata, Rosa multiflora*, and *Polygonum caespitosum* can be common in this community.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This successional black walnut forest is frequently found on post-cultivation soil or former orchard sites around old homesites. It was sampled at five locations in the Central Appalachian project area. Sites are gentle to moderate low and mid slopes with dry-mesic, moderately well- to well-drained silt loam soil. The unvegetated surface is dominated by leaf litter with some downed wood, large/small rocks and/or bare soil. Evidence of disturbance includes the presence of exotic plant species.

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This successional black walnut forest is frequently found on post-cultivation soil or former orchard sites around old homesites.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This successional black walnut forest was sampled twice in the park, but it is common along the trail. One site is a gentle, northwest-facing summit with mesic, well-drained loam soil; the other is in a valley floor. These forests are frequently found on post-cultivation soils or former orchard sites around old homesites. The unvegetated surface is made up almost entirely of leaf litter. Evidence of disturbance includes past logging and the presence of exotic species.

Global Environment: This successional community occurs in a variety of habitats, all associated with disturbance, and frequently associated with rich or circumneutral soils. These habitats include ridgetops, slopes, floodplains, alluvial terraces, and the floors of sinkholes. These are all generally areas that were cleared for agriculture or homesites. It has been sampled on former homesites along streams at 460-610 m (1500-2000 feet) elevation in the Smokies, as well as on ridgetops, slopes, and stream areas in the Cumberlands, Alleghenies, and Central Appalachians at 430-1070 m (1400-3500 feet). In addition, the association was sampled from the Piedmont of South Carolina in low-lying, poor-drainage areas from approximately 170-200 m (550-650 feet) in elevation. At Mammoth Cave National Park, it was most frequently sampled from terraces in the bottoms of sinkholes. Along the Delaware River and nearby waters, the substrate varies from silt loam to gravelly sandy loams.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: This forest is dominated by *Juglans nigra* with an understory of *Verbesina* spp. and/or *Symphoricarpos orbiculatus*. Other common and/or abundant trees may include *Acer negundo, Acer rubrum, Celtis occidentalis, Robinia pseudoacacia, Fraxinus americana, Prunus serotina*, and/or *Ulmus rubra*. *Lindera benzoin* and *Viburnum prunifolium* are dominant shrubs along with exotics such as *Lonicera morrowii, Ligustrum vulgare*, and *Rubus phoenicolasius*. Vines include exotics *Lonicera japonica* and *Celastrus orbiculata*. Dominant herbs can include *Carex* spp., *Polygonum virginianum, Sanicula canadensis*, and the invasive exotic *Microstegium vimineum*. *Parthenocissus quinquefolia* is a common vine.

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: This forest is dominated by *Juglans nigra* with an understory of *Lindera benzoin* and an herbaceous layer dominated by *Verbesina* spp. or *Sanicula canadensis*; *Celtis occidentalis* may be abundant.

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This forest is dominated by *Juglans nigra* with an understory of *Verbesina occidentalis* and/or *Symphoricarpos orbiculatus*. Additional tree species may include *Acer negundo, Acer rubrum, Carpinus caroliniana, Cercis canadensis, Liquidambar styraciflua*, and *Tsuga canadensis*. *Lindera benzoin, Symphoricarpos orbiculatus*, and/or *Viburnum prunifolium* are dominant shrubs. Common and/or abundant herbs include *Ambrosia trifida, Verbesina occidentalis*, and *Microstegium vimineum* (exotic).

Global Vegetation: The canopy can be closed to somewhat open. *Juglans nigra* forms at least half of the canopy and is often the sole canopy tree. Associated canopy trees vary from site to site and can include *Liriodendron tulipifera, Juglans cinerea, Robinia pseudoacacia, Fraxinus americana, Ulmus americana, Platanus occidentalis, Acer saccharum, Acer nigrum, Morus rubra*, and *Aesculus flava*. Additional tree species in the subcanopy can include *Carya cordiformis* and *Celtis occidentalis*. *Sassafras albidum* and/or *Carpinus caroliniana* may be present as small trees. The shrub layer may or may not be well-developed; common species include *Asimina triloba, Viburnum prunifolium, Lindera benzoin, Corylus americana*, and the exotic invasive *Rosa multiflora*. The herb layer is variable, often with one or a few species providing most of the cover. *Verbesina alternifolia* (within its range) and *Ageratina altissima* are characteristic and may be dominant; other herbs include *Amphicarpaea bracteata, Agrimonia pubescens, Apios americana, Cryptotaenia canadensis, Galium triflorum, Osmorhiza longistylis, Dichanthelium clandestinum, Packera aurea, Polygonum virginianum, Rudbeckia laciniata, Podophyllum peltatum, Impatiens capensis, Circaea lutetiana ssp. canadensis, Viola striata*, and *Ambrosia trifida*. The invasive exotics *Microstegium vimineum, Alliaria petiolata*, and *Polygonum caespitosum* can be common in this community.

Global Dynamics: Since this community is the product of an anthropogenic catastrophic disturbance, the canopy is likely to change drastically as new species of trees colonize gaps left by senescent walnuts. *Juglans nigra* may obtain canopy dominance it is resistant to grazing pressure on young seedlings due to the unpalatable juglone present in the leaves and stems. This allelopathic compound also inhibits the growth of *Rubus argutus, Rubus allegheniensis*, and other related species (blackberries), which would help keep the shrub layer open and reduce species diversity.

Element Concept

Global Summary: This early-successional or semi-natural vegetation occurs at approximately 700-1220 m (2300-4000 feet) elevation in the southern Appalachian Mountains and Appalachian Plateaus. Examples are typical of areas which were once clearcut, old fields, strip-mined, graded for road construction, or otherwise cleared. Stands are typically revegetated from root and stump sprouts and wind dispersed seeds. Stands have canopies which are typically dominated by *Liriodendron tulipifera* and *Acer rubrum*, with lesser amounts of *Robinia pseudoacacia*. *Robinia pseudoacacia* is listed as a nominal to indicate the Appalachian distribution of this type. Associated species may vary. Some examples may contain *Pinus virginiana*. Tall shrubs (*Rhododendron periclymenoides, Rhododendron calendulaceum, Kalmia latifolia, Calycanthus floridus*) sprout from root stocks and occur as scattered, dense clumps, while shorter shrubs (*Gaylussacia ursina, Leucothoe fontanesiana, Rubus* spp., *Vaccinium* spp.) can have dense, continuous cover. Composition of the herbaceous stratum varies with site conditions and moisture regime and may contain field-adapted species, tolerant of high light intensities, as well as many shade-tolerant forest herbs. *Lycopodium digitatum* may also form dense cover.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This early-successional or semi-natural forest was sampled twice in the park. One site is on a gently midslope with dry-mesic sandy loam soil; the other is a steep, southeast-facing slope with moderately well-drained silt loam soil. The unvegetated surface is dominated by leaf litter with occasional downed wood and bare soil. These sites are very disturbed, the result of clearing, and contain exotic species.
Global Environment: This community occurs on gentle to moderately steep, middle to upper slopes at approximately 700-1220 m (2300-4000 feet) elevation. Important environmental factors, such as solar irradiation, soil moisture/temperature, and air temperature, vary within and between sites and are related to the size of the opening, age of the stand, and slope direction (Phillips and Shure 1990). Soils are primarily Hapludults and Dystrochrepts. This successional forest occurs on upland areas in the southern Appalachian Mountains and Appalachian Plateaus. It typically occurs as 8- to 16-ha patches in the landscape. These forests are typical of areas which were once clearcut, old fields, strip-mined, or cleared by fire or other natural disturbances.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: These young forests are dominated by *Liriodendron tulipifera*, sometimes codominated by *Robinia pseudoacacia* and/or *Acer rubrum* with less than 25% cover of oaks. More diverse examples are dominated by a variable mixture of successional hardwoods, including *Acer rubrum, Acer saccharum, Robinia pseudoacacia, Betula lenta, Betula alleghaniensis, Oxydendrum arboreum, Amelanchier laevis, Nyssa sylvatica*, and *Magnolia fraseri*. Herbs are generally sparse.
Global Vegetation: Some stands of this successional vegetation have canopies which are dominated by *Liriodendron tulipifera* and *Acer rubrum*, with lesser amounts of *Robinia pseudoacacia*. Other stands may have *Liriodendron tulipifera* at lower cover, and instead be dominated by a variable combination of other successional hardwoods, including *Acer rubrum, Robinia pseudoacacia, Sassafras albidum, Betula lenta, Amelanchier laevis, Prunus serotina, Nyssa sylvatica*, and/or *Magnolia fraseri*. The subcanopy may contain *Oxydendrum arboreum* and/or *Cornus florida*. Some examples may contain *Pinus virginiana*. Associated species vary. Taller shrubs include *Rhododendron periclymenoides, Rhododendron calendulaceum, Ilex montana, Pyrularia pubera, Kalmia latifolia*, and *Calycanthus floridus*; shorter shrubs include *Gaylussacia ursina, Leucothoe fontanesiana, Rubus* spp., and *Vaccinium* spp. Composition of the herbaceous stratum varies with site conditions and moisture regime and may

contain field-adapted species which are tolerant of high light intensities, as well as many shade-tolerant forest herbs. *Lycopodium digitatum* may also form dense cover. Most of the regeneration is from stump and root sprouts, however, *Liriodendron tulipifera* establishment is primarily from seedlings. The upper canopy ranges from 5-9 m, but most of the regeneration is in a shrub/sapling layer at 1-3 m. Cover of woody species may be patchy to dense and is characterized by clumps of *Robinia pseudoacacia* and *Acer rubrum*, occurring as stump sprouts. Scattered thickets of evergreen ericads (*Rhododendron* and *Kalmia*) are also typical. Other species occurring as shrubs/saplings include *Calycanthus floridus, Halesia carolina, Pinus strobus, Castanea dentata, Prunus serotina, Pyrularia pubera, Sassafras albidum, Castanea pumila, Hydrangea arborescens, Viburnum acerifolium, Gaylussacia ursina, Rubus* spp., and *Vaccinium* ssp. Short shrubs (<2 m), such as *Gaylussacia ursina, Rubus* spp. and, *Vaccinium* ssp., often form a dense, continuous vegetation layer. Herbaceous species and tree seedlings occur in openings and beneath the shrub cover and include ferns (*Thelypteris noveboracensis, Dennstaedtia punctilobula, Polystichum acrostichoides*, and *Pteridium aquilinum*), other forests forbs (*Potentilla* spp., *Viola* spp., *Ageratina altissima*, Asteraceae spp., *Solidago* spp., *Galium latifolium, Lysimachia quadrifolia*, and *Desmodium* spp.) and grasses (*Arundinaria gigantea, Panicum* spp., and *Dichanthelium* spp.). Vines are also an important component in these forests with *Vitis* spp., *Smilax* spp., *Parthenocissus quinquefolia*, and *Dioscorea villosa* typical.

Global Dynamics: Presumably, individuals arising from sprouts are more susceptible to wind breakage because of constricted vascular tissue at the stump attachment (Phillips and Shure 1990). This is an early-successional forest, on recently cut-over land, dominated by pioneer species. Prior to cutting these areas were dominated by *Pinus strobus* and/or *Quercus* spp. (*Quercus alba, Quercus prinus, Quercus rubra*), occurring with other upland hardwood species such as *Carya* spp. and *Liriodendron tulipifera*. Canopy closure occurs rapidly after time of harvest, and by the fourth year, little unshaded, unvegetated area remains. Mid- and late-successional species will slowly re-establish dominance. Considerable competition of tree species with *Vitis* spp. and *Rhododendron* spp. may affect future stand development on some sites (McGee and Hooper 1970).

Herb (field)	Flowering forb	*Ageratina altissima*, *Potentilla* spp., *Viola* spp., Asteraceae spp.
Herb (field)	Graminoid	*Arundinaria gigantea*, *Dichanthelium* spp., *Panicum* spp.
Herb (field)	Fern (Spore-bearing forb)	*Dennstaedtia punctilobula*, *Thelypteris noveboracensis*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Acer rubrum*, *Acer saccharum*, *Betula lenta*, *Liriodendron tulipifera*, *Robinia pseudoacacia*

Global: *Acer rubrum*, *Betula lenta*, *Castanea dentata*, *Castanea pumila*, *Cornus florida*, *Desmodium* spp., *Dioscorea villosa*, *Galium latifolium*, *Halesia carolina*, *Hydrangea arborescens*, *Liriodendron tulipifera*, *Lysimachia quadrifolia*, *Nyssa sylvatica*, *Parthenocissus quinquefolia*, *Pinus strobus*, *Prunus serotina*, *Pteridium aquilinum*, *Pyrularia pubera*, *Robinia pseudoacacia*, *Sassafras albidum*, *Solidago* spp., *Viburnum acerifolium*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Invasive/Exotic Plants: *Holcus lanatus* (High/Medium), *Miscanthus sinensis* (Medium)
Global: Vulnerable Plants: *Anemone quinquefolia* var. *minima* (G5T3), *Isotria medeoloides* (G2?)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (7-Dec-2000). This forest represents early successional vegetation or vegetation resulting from anthropogenic activities and is thus not a conservation priority. These forests are typical of areas which were once clearcut, old fields, strip-mined, or cleared by fire or other natural disturbances.

RELATED CONCEPTS

Global Similar Types:
- *Liriodendron tulipifera - Quercus* spp. Ruderal Forest (CEGL007221) resulting from less severe disturbance; a more widespread type as well.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Global Classification Comments: Some examples of this type are not dominated by, and may not even contain, *Liriodendron tulipifera*. It is restricted to the Appalachian ecoregions (TNC Ecoregions 50 and 51) in contrast to other successional *Liriodendron tulipifera* forests (CEGL007220, CEGL007221). This community differs from *Liriodendron tulipifera - Quercus* spp. Ruderal Forest (CEGL007221) by its lack or relative lack of *Quercus* spp. It differs from other successional *Liriodendron tulipifera* types by the presence of *Robinia pseudoacacia* as well as other hardwoods characteristic of the Southern Appalachians (e.g., *Betula lenta, Amelanchier laevis, Magnolia fraseri*).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community was sampled in North Carolina and Tennessee.
Global Range: This community occurs in upland areas of the Blue Ridge escarpment where there has been removal of the above-ground portion of canopy trees within the past ten years. It occurs in North Carolina, South Carolina, Georgia, and Tennessee, in the Blue Ridge Physiographic Province and is likely in the Cumberland Plateau and Ridge and Valley Province.
Nations: US
States/Provinces: GA, KY, NC, SC, TN, VA

[CEGL007221] *Liriodendron tulipifera - Quercus* spp. Ruderal Forest

Translated Name: **Tuliptree - Oak species Ruderal Forest**
Common Name: **Ruderal Tuliptree Forest (Typic Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Liriodendron tulipifera - Juglans nigra - Robinia pseudoacacia* Ruderal Forest Alliance (A3228)

ELEMENT CONCEPT

Global Summary: This broadly defined ruderal or successional community is one of several described upland associations dominated by *Liriodendron tulipifera*. It ranges from the southern Cumberland Plateau, Piedmont, and Interior Low Plateau of the southeastern U.S. north to the northern Piedmont of New Jersey. These successional forests often follow cropping, clearcut logging, or other severe disturbance, and are successional to mixed oak-hickory forests. Examples are common across large areas of the upland landscape which have previously been disturbed. Soils usually exhibit evidence of disturbance and may have little to no organic horizon development. They are typically acidic and well-drained, dry to moist sand, sandy loam, sandy clay loam, or silt loam. Environmental setting is variable, ranging from level to gently sloping uplands to well-drained floodplains and stream terraces. Species found in stands attributable to this type may include a fairly diverse and varied composition. *Acer rubrum, Quercus* spp., *Betula lenta, Oxydendrum arboreum, Acer saccharum*, and occasionally *Liquidambar styraciflua, Ilex opaca*, or *Robinia pseudoacacia* may be common in stands of this type. Where oaks are present, they are frequently multi-stemmed, resulting from coppicing. The conifer *Tsuga canadensis* is abundant in the understories of some stands. Shrub composition is variable but may include *Sambucus nigra ssp. canadensis, Rhododendron maximum, Hamamelis virginiana*, and *Vaccinium pallidum*. Herbs are likewise variable; West Virginia samples feature *Dioscorea quaternata, Lysimachia quadrifolia, Maianthemum racemosum, Solidago curtisii, Symphyotrichum prenanthoides, Polystichum acrostichoides, Dryopteris intermedia, Arisaema triphyllum ssp. triphyllum, Packera aurea, Amphicarpaea bracteata, Thelypteris noveboracensis, Lycopodium digitatum*, and *Geranium maculatum*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: This typic successional acidic tuliptree - oak forest was sampled at three locations in this section of the park. It also occurs in the Southern Blue Ridge. The sites are moderate mid and lower slopes with well-drained sandy loam soil. The unvegetated surface is dominated by leaf litter with some downed wood and large rocks. These sites are likely the result of past stand-initiating disturbance such as logging or fire, further evidenced by the presence of exotic plant species.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This widely distributed and common successional tuliptree forest was sampled at nine locations in the park. Sites range from gentle to somewhat steep, lower and upper slopes and ridges. Soils are typically mesic, well-drained loam. The unvegetated surface is dominated by leaf litter (up to 98% cover) with small amounts of large rocks and downed wood. Evidence of disturbance includes past clearing.
Global Environment: These ruderal upland deciduous forests are found primarily in areas which were once clearcuts, old fields, or were cleared by fire or other natural disturbances. These successional forests often follow cropping, clearcut logging, or other severe disturbance, and are successional to mixed oak-hickory forests. Examples are common across large areas of the upland landscape which have previously been disturbed. Soils usually exhibit evidence of disturbance and may have little to no organic horizon development. Environmental setting is variable, ranging from level to gently sloping uplands to well-drained floodplains and stream terraces.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The dense (up to 90% cover) 20- to 35-m tall canopy is dominated by *Liriodendron tulipifera*. Additional tree species include *Acer rubrum, Betula lenta, Carya cordiformis, Cornus florida, Nyssa sylvatica, Quercus rubra, Quercus alba, Quercus coccinea*, and *Quercus prinus*. The sparse (up to 20%) shrub layers include canopy species as well as *Rubus allegheniensis, Lindera benzoin* (in small amounts), and *Vaccinium pallidum*. Herbs include *Dennstaedtia punctilobula*. *Toxicodendron radicans* is a dominant vine; *Smilax rotundifolia*, and *Vitis* sp. are also common.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The dense canopy is dominated by *Liriodendron tulipifera* and often codominated by young *Quercus* spp., *Acer rubrum*, and/or *Betula alleghaniensis* (greater than 25% of understory/canopy). In sampled stands, *Liriodendron tulipifera* is the clear dominant, but other common and/or abundant trees may include *Acer rubrum, Acer saccharum, Carya glabra, Fraxinus americana, Halesia tetraptera var. monticola*, and *Nyssa sylvatica*. *Rubus allegheniensis* dominates the

shrub layers; additional shrubs may include *Acer pensylvanicum, Carya ovalis, Castanea dentata, Cornus florida, Fagus grandifolia*, and *Toxicodendron radicans*. Common and/or abundant herbs include *Ageratina altissima, Desmodium nudiflorum, Eupatorium purpureum, Solidago curtisii (= Solidago caesia var. curtisii)*, and *Stellaria pubera*.

Global Vegetation: The canopy of this ruderal upland association is dominated by *Liriodendron tulipifera*. *Quercus* species (*Quercus alba, Quercus rubra, Quercus falcata, Quercus nigra, Quercus velutina*) are often present; additional associates may include *Acer barbatum, Acer rubrum, Carya* spp., *Fagus grandifolia, Nyssa sylvatica, Cornus florida*, and *Robinia pseudoacacia*. *Betula lenta* is a common associate at the northern range limit. Shrub layers may include saplings of the canopy species and *Acer pensylvanicum, Amelanchier arborea, Hamamelis virginiana, Lindera benzoin* (in small amounts), and *Vaccinium pallidum*. Herbs vary across the range but may include *Actaea racemosa, Dichanthelium clandestinum, Dioscorea quaternata, Galium circaezans, Geranium maculatum, Goodyera pubescens, Medeola virginiana, Potentilla simplex, Scutellaria serrata, Thelypteris noveboracensis*, and *Uvularia perfoliata*. *Lycopodium digitatum* may be abundant in some stands.

Global Dynamics: This community is widespread in areas that had stand-initiating disturbance such as heavy logging or plowing in the recent past. In areas that have been protected for more than 80 years, this community is uncommon.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Invasive/Exotic Plants: *Lonicera japonica* (High/Medium), *Microstegium vimineum* (High/Medium)

Global: Vulnerable Plants: *Hexastylis naniflora* (G3), *Trillium rugelii* (G3), *Trillium simile* (G3)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (19-Aug-2002). This forest represents early-successional vegetation and is thus not a priority for conservation. This is a successional vegetation type composed of native species. Its conservation value is limited, but mature examples could provide buffer for communities of greater conservation value. It may also support rare animal and plant species.

RELATED CONCEPTS

Global Similar Types:
- *Liriodendron tulipifera - Acer negundo* Ruderal Forest (CEGL007184) a bottomland type.
- *Liriodendron tulipifera - Acer rubrum - Robinia pseudoacacia* Ruderal Forest (CEGL007219) is generally found on steeper slopes and/or shallow soils and with a more intense history of disturbance.
- *Liriodendron tulipifera / (Cercis canadensis) / (Lindera benzoin)* Ruderal Forest (CEGL007220) is generally found on calcareous or at least pH neutral soils.
- *Liriodendron tulipifera* Ruderal Forest (CEGL007218) more early-successional.
- *Prunus serotina - Liriodendron tulipifera - Acer rubrum - Fraxinus americana - (Robinia pseudoacacia)* Ruderal Forest (CEGL006599)
- *Prunus serotina - Sassafras albidum - (Fraxinus americana) / Juniperus virginiana* Ruderal Forest (CEGL004133)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Distinguished from Ruderal Tuliptree Forest (Rich Type) (CEGL007220) by the presence of oaks in canopy and/or subcanopy (>10% cover) and understory lacking calcium-rich indicators. Can occur with nearly all *Liriodendron* in canopy.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: None.
Global Classification Comments: It differs from other described types within its range based on the lack of a significant pine component [see *Liriodendron tulipifera - Pinus taeda* Ruderal Forest (CEGL007521)] and the absence of species affiliated with circumneutral conditions [see *Liriodendron tulipifera / (Cercis canadensis) / (Lindera benzoin)* Ruderal Forest (CEGL007220)]; it is later successional and more diverse than *Liriodendron tulipifera* Ruderal Forest (CEGL007218) and tends to be found on more stable soil substrates and less steep slopes than *Liriodendron tulipifera - Acer rubrum - Robinia pseudoacacia* Ruderal Forest (CEGL007219).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was observed in Dauphin County in central Pennsylvania, at Harpers Ferry, West Virginia, and in Clarke County, in the Frogtown area of Virginia.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This association ranges from the Southern Appalachians to the Central Appalachians. It was sampled in Georgia (8 sites) and Tennessee (1 site) along the trail.
Global Range: This association is known from the southern Cumberland Plateau, Piedmont, and Interior Low Plateau of the southeastern U.S. and may also occur in the Upper East Gulf Coastal Plain. It ranges north to the northern Piedmont of New Jersey and adjacent Pennsylvania. It is also known from Alabama, Georgia, Kentucky, Maryland, North Carolina, South Carolina, Tennessee, West Virginia, Virginia, and possibly Delaware.

Alliance	*Liriodendron tulipifera - Juglans nigra - Robinia pseudoacacia* Ruderal Forest Alliance (A3228)

ELEMENT CONCEPT

Global Summary: This ruderal or successional community dominated by *Liriodendron tulipifera* occurs in the Ridge and Valley of Tennessee and Virginia, the Interior Low Plateau of Kentucky, and the Central Appalachians, Piedmont and inner Coastal Plain regions of Virginia, West Virginia, Pennsylvania, and Maryland. Plots attributable to this type are also known from the Piedmont of Georgia. It may also occur in similar regions of Delaware. It is distinguished from other upland communities dominated by *Liriodendron tulipifera* by the presence of species associated with soils with moderately high base saturation levels (rich soils). Species found in stands attributable to this type may be fairly diverse and result in a varied composition. In addition to *Liriodendron tulipifera*, other canopy species may include *Liquidambar styraciflua, Acer saccharum, Aesculus flava, Platanus occidentalis, Quercus rubra, Acer rubrum, Robinia pseudoacacia, Juglans nigra, Halesia tetraptera, Fraxinus americana, Fagus grandifolia, Magnolia acuminata, Ulmus rubra, Quercus imbricaria, Quercus muehlenbergii*, and *Carya ovata*. Species often found in the subcanopy include *Acer saccharum, Cercis canadensis, Ulmus alata, Fraxinus americana, Morus rubra*, and *Cornus florida*. Shrubs include saplings of the subcanopy and canopy species, as well as *Lindera benzoin, Symphoricarpos orbiculatus, Asimina triloba, Staphylea trifolia, Acer negundo*, and *Juniperus virginiana var. virginiana*. Exotic shrubs, including *Rosa multiflora, Rubus phoenicolasius*, and *Lonicera japonica*, are present at some sites. Herb-layer species include the exotics *Microstegium vimineum, Alliaria petiolata*, and *Veronica hederifolia*, as well as *Toxicodendron radicans, Parthenocissus quinquefolia, Smilax tamnoides, Actaea racemosa, Caulophyllum thalictroides, Laportea canadensis, Impatiens pallida, Hydrophyllum canadense,*

Adiantum pedatum, Polygonatum pubescens, Verbesina alternifolia, Amphicarpaea bracteata, and *Polystichum acrostichoides*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Environment: These early-successional, post-disturbance forests are typically 50-75 years old. They occur on relatively fertile substrates. Sites are gentle to somewhat steep midslopes with dry-mesic rapidly to moderately well-drained sandy loam and silt loam soils. The unvegetated surface is dominated by leaf litter with some downed wood and occasional rocks and bare soil. Evidence of disturbance includes past clearing and the presence of exotic species.
Appalachian National Scenic Trail (Lower New England Project Area) Environment: These early-successional, post-disturbance forests are typically 50-75 years old. They occur on relatively fertile substrates. Sites are gentle to somewhat steep midslopes with dry-mesic rapidly to moderately well-drained sandy loam and silt loam soils. The unvegetated surface consists of leaf litter with some downed wood and occasional rocks and bare soil. Evidence of disturbance includes past clearing and the presence of exotic species.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: These are early-successional, even-aged, post-disturbance forests, which are typically 50-75 years old. They occur in a variety of landscape settings, most often abandoned old fields, on high calcium or base rich soils. Evidence of disturbance includes past clearing and an abundance of exotic plant species.
Global Environment: These forests are found on disturbed mesic areas underlain by rich soils with moderately high base saturation levels. It occurs on abandoned farmland and townsites, old strip mines, old clearcuts, burned areas, and other areas where the canopy was removed or heavily disturbed in the past. Small patches may occur in areas where canopy disturbance has resulted from natural causes such as windfall or landslides. Soils may be underlain by a variety of geologic strata that weather to base-rich soils including limestone, dolomite, calcareous shale, shell deposits, metabasalts and granitic complexes. In Kentucky this association may occur on calcareous substrates in the Dripping Springs Escarpment. At Shenandoah National Park in Virginia, this community is underlain by Catoctin metabasalt or a pyroxene-bearing granitic complex. In West Virginia, parent materials include sandstone, shale, and alluvium. Soils in plots were described as moderately well-drained to well-drained clay, silt loam, and sandy loam with pH ranging from 5.0 to 7.5, with relatively high levels of organic matter, estimated N release, Ca, Cu, K, Mg, and Mn, and relatively low levels of S, Al, B, Fe, P, and Zn compared to average values in the area.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Vegetation: The canopy is dominated by *Liriodendron tulipifera* with greater than 30% cover of the canopy. Additional trees, any one of which may be codominant in some stands, include *Acer rubrum, Carya glabra, Fraxinus americana*, and/or *Quercus rubra*. Understory species are indicative of high-calcium or base-rich soils, such as *Cercis canadensis, Symphoricarpos orbiculatus*, or *Lindera benzoin* (clear dominant in the sampled plots). Common herbs include *Arisaema triphyllum, Circaea lutetiana ssp. canadensis, Galium circaezans, Polygonum virginianum*, and *Viola* spp. Invasive exotic shrubs, including *Rosa multiflora, Rubus phoenicolasius*, and/or *Lonicera japonica*, may be common. In addition, this community supports VA-state critically imperiled *Bromus ciliatus* and *Cardamine clematitis*.
Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is dominated by *Liriodendron tulipifera*. Understory species are indicative of high-calcium or base-rich soils, such as *Lindera benzoin*. Common herbs include *Circaea lutetiana ssp. canadensis, Galium circaezans, Polygonum virginianum*, and *Viola* spp. Invasive exotic shrubs, including *Rosa multiflora, Rubus phoenicolasius*, and/or *Lonicera japonica*, may be common.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy is dominated by *Liriodendron tulipifera* with greater than 50% cover of the canopy. Additional trees may include *Acer rubrum, Carya glabra, Fraxinus americana*, and *Quercus rubra*. Understory species are indicative of high calcium or base rich soils such as *Cercis canadensis, Symphoricarpos orbiculatus*, or *Lindera benzoin* (clear dominant in the sampled plots). Common herbs include *Arisaema triphyllum, Circaea lutetiana ssp. canadensis, Galium circaezans, Polygonum virginianum*, and *Viola* spp. In addition, this community supports VA-state critically imperiled and regional endemic *Cardamine clematitis*.
Global Vegetation: Stands are dominated by *Liriodendron tulipifera* but also include various other species, including ones indicative of nutrient-rich or circumneutral environments. Other species include *Liquidambar styraciflua, Acer saccharum, Aesculus flava, Platanus occidentalis, Quercus rubra, Acer rubrum, Robinia pseudoacacia, Juglans nigra, Halesia tetraptera, Fraxinus americana, Fagus grandifolia, Magnolia acuminata, Ulmus rubra, Quercus imbricaria, Quercus muehlenbergii*, and *Carya ovata* (NatureServe Ecology unpubl. data,

VDNH unpubl. data, WVNHP unpubl. data.). Species often found in the subcanopy include *Acer saccharum, Cercis canadensis, Ulmus alata, Morus rubra, Sassafras albidum*, and *Cornus florida*. *Cercis canadensis* is often abundant on soils underlain by carbonate strata. Shrubs include saplings of the subcanopy and canopy species, as well as *Symphoricarpos orbiculatus, Lindera benzoin, Asimina triloba*, and *Juniperus virginiana var. virginiana*. *Lindera benzoin* is often abundant in occurrences of this community in the Central Appalachians, Piedmont and Inner Coastal Plain regions of Virginia, West Virginia, and Maryland. Exotic shrubs, including *Rosa multiflora, Rubus phoenicolasius*, and *Lonicera japonica*, are present at some sites. Vines, which may be abundant, include *Aristolochia macrophylla, Toxicodendron radicans, Parthenocissus quinquefolia, Smilax tamnoides*, and *Vitis aestivalis var. bicolor*. Herbaceous species include the exotics *Microstegium vimineum, Alliaria petiolata*, and *Veronica hederifolia*, as well as *Actaea racemosa, Ageratina altissima, Arisaema triphyllum, Asarum canadense, Caulophyllum thalictroides, Cryptotaenia canadensis, Galium triflorum, Laportea canadensis, Impatiens pallida, Hydrophyllum canadense, Osmorhiza longistylis, Adiantum pedatum, Polygonatum pubescens, Polystichum acrostichoides, Verbesina alternifolia, Amphicarpaea bracteata, Solidago caesia*, and *Polystichum acrostichoides*. (Andreu and Tukman 1995, NatureServe Ecology unpubl. data, VDNH unpubl. data, WVNHP unpubl. data). Examples at Fort Donelson that have been very heavily disturbed may have local dominance by *Celtis laevigata* and *Juglans nigra*.

Global Dynamics: This community occurs in successional situations, generally where forest clearing has a taken place in the past. In West Virginia, this type is found in areas that have been logged repeatedly, as well as on abandoned farmland and mines.

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Central Appalachian Project Area): Vulnerable Plants: *Bromus ciliatus* (G5, VA state-critically imperiled), *Cardamine clematitis* (G3, globally vulnerable & VA state-critically imperiled); **Invasive/Exotic Plants**: *Ailanthus altissima* (Medium), *Alliaria petiolata* (High/Medium), *Celastrus orbiculata* (High/Medium), *Glechoma hederacea* (Low), *Lonicera japonica* (High/Medium), *Microstegium vimineum* (High/Medium), *Polygonum cuspidatum* (High/Medium), *Polygonum persicaria*, *Rosa multiflora* (Medium/Low), *Stellaria media* (Low)
Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Cardamine clematitis* (G3, VA state-critically imperiled); **Invasive/Exotic Plants**: *Ailanthus altissima* (Medium,

invasive/exotic), *Alliaria petiolata* (High/Medium, invasive/exotic), *Celastrus orbiculata* (High/Medium, invasive/exotic), *Glechoma hederacea* (Low, invasive/exotic), *Lonicera japonica* (High/Medium, invasive/exotic), *Microstegium vimineum* (High/Medium, invasive/exotic), *Polygonum persicaria* (invasive/exotic), *Rosa multiflora* (Medium/Low, invasive/exotic), *Stellaria media* (Low, invasive/exotic)
Global: Vulnerable Plants: *Cardamine clematitis* (G3), *Panax quinquefolius* (G3G4, under collection pressure), *Penstemon smallii* (G3), *Schisandra glabra* (G3), *Scutellaria saxatilis* (G3), *Trillium rugelii* (G3); **Invasive/Exotic Plants**: *Alliaria petiolata* (High/Medium), *Lonicera japonica* (High/Medium), *Microstegium vimineum* (High/Medium), *Rosa multiflora* (Medium/Low), *Rubus phoenicolasius* (Medium), *Veronica hederifolia*

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (28-Oct-2003). This forest represents successional vegetation and is thus not of high conservation concern. It is composed largely of native species, though exotics may be locally abundant. Its conservation value is limited, but mature examples could provide buffer for communities of greater conservation value.

RELATED CONCEPTS

Global Similar Types:
- *Liriodendron tulipifera - Pinus taeda* Ruderal Forest (CEGL007521) supports a significant pine component.
- *Liriodendron tulipifera - Quercus rubra - Fraxinus americana / Asimina triloba / Actaea racemosa* Forest (CEGL006186)
- *Liriodendron tulipifera - Quercus* spp. Ruderal Forest (CEGL007221) on more acidic substrates, lacks species affiliated with circumneutral conditions.
- *Liriodendron tulipifera* Ruderal Forest (CEGL007218) is less diverse and earlier successional.

CLASSIFICATION

Status: Standard
Classification Confidence: 3 - Weak
Appalachian National Scenic Trail (Central Appalachian Project Area) Classification Comments: Oaks are generally absent, with a large presence of understory species indicative of high-calcium or base-rich soils such as *Cercis canadensis, Symphoricarpos orbiculatus*, or *Lindera benzoin*.
Appalachian National Scenic Trail (Central Appalachian Project Area) Other Comments: This is common in successional association that occurs on the landscape with modified successional forests, abandoned farmland, townsites, old strip mines, old clearcuts, burned areas, and other areas where the canopy was removed or heavily disturbed in the past.
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This community was observed by UMESC during summer 2012 mapping reconnaissance.
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Limited to the northern portion of the Southern Blue Ridge in southwestern Virginia and more common in the Central Appalachians. This community was not sampled but is probable in the project area.
Global Classification Comments: This type was originally described from the work of Andreu and Tukman (1995) but was later modified to emphasize stands with moderately high base saturation levels. It is apparently a widespread successional forest of relatively fertile substrates in all provinces of the Mid-Atlantic states and in parts of the Southeast.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Central Appalachian Project Area) Range: This community was observed at Angels Rest, Bluff City North, the Frogtown area, Front Royal, Kimberling Creek, and McAfee Knob in Virginia. One observation point is from Lebanon County in central Pennsylvania.
Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was observed by UMESC in New Jersey and New York during summer 2012 mapping reconnaissance.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This is a relatively uncommon type in APPA and is mostly restricted to Virginia. In the Central Appalachian project area, it was sampled at Angels Rest, Bluff City North, and McAfee Knob.
Global Range: This type occurs in the Ridge and Valley and Cumberland Plateau of Tennessee, the Interior Low Plateau of Kentucky, the Upper East Gulf Coastal Plain of Mississippi, and the Central Appalachian, Piedmont and Inner Coastal Plain regions of Virginia, West Virginia, Maryland, Pennsylvania, and possibly Delaware. Plots attributable to this type are also known from the Georgia Piedmont. Its full range has not been documented.

[CEGL007279] *Robinia pseudoacacia* Ruderal Forest

Translated Name: **Black Locust Ruderal Forest**
Common Name: **Ruderal Black Locust Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Eastern North American Ruderal Forest (M013)
Group	Eastern North American Native Ruderal Forest (G030)
Alliance	*Liriodendron tulipifera - Juglans nigra - Robinia pseudoacacia* Ruderal Forest Alliance (A3228)

ELEMENT CONCEPT

Global Summary: This black locust ruderal forest is found locally throughout the eastern United States. Stands often establish on old fields abandoned after agricultural cropping or pasturing or around old homesites. In some areas it occurs on post-agricultural floodplain terraces. This vegetation has also become established following the

planting of *Robinia pseudoacacia* to stabilize and enrich nutrient-poor soils that are subject to erosion. The vegetation is dominated by *Robinia pseudoacacia*. Associated woody species vary from site to site and include *Prunus serotina, Juniperus virginiana, Ulmus americana, Ulmus rubra, Carya ovata, Celtis occidentalis, Juglans nigra, Quercus rubra, Ulmus rubra*, and in some areas *Acer platanoides* or *Ailanthus altissima*. Understory vegetation is highly variable depending on site history and often includes *Toxicodendron radicans*; *Lindera benzoin* is sometimes present. The invasive non-native *Rosa multiflora* may be present as a shrub, along with the non-native bramble *Rubus phoenicolasius*. Non-native species such as *Alliaria petiolata, Chelidonium majus, Glechoma hederacea*, and *Convallaria majalis* can characterize the herb layer, which may also have a native component.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This black locust successional forest is frequently found in abandoned fields and other post-cultivation lands. Sampled sites are moderate to somewhat steep upper slopes and summits at elevations ranging from 850 to 1,200 m. Soils are mesic, moderately well- to well-drained loam. The unvegetated surface is made up entirely by leaf litter or with a small amount of downed wood. Evidence of disturbance includes past clearing, fire, and the presence of exotic plant species.

Global Environment: This type often establishes on old fields abandoned after agricultural cropping or pasturing or around old home sites. This vegetation has also become established following the planting of *Robinia pseudoacacia* to stabilize and enrich nutrient-poor soils that are subject to erosion (Rabie 2000). Soils are variable and may be highly acidic, especially where established on old mine sites.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The relatively sparse canopy is dominated by *Robinia pseudoacacia*; additional canopy or subcanopy trees can include *Fraxinus americana, Liriodendron tulipifera*, and *Quercus rubra*. Shrubs are sparse but include *Rubus occidentalis*. Dominants in the dense herbaceous layer may be *Dichanthelium clandestinum, Verbesina alternifolia*, and/or *Verbesina occidentalis*.

Global Vegetation: The vegetation is dominated by *Robinia pseudoacacia* forming a partial to nearly complete canopy. Associated woody species vary from site to site and include *Prunus serotina, Juniperus virginiana, Ulmus americana, Ulmus rubra, Carya ovata, Celtis occidentalis, Juglans nigra, Quercus rubra, Ulmus rubra, Acer rubrum, Nyssa sylvatica*, and in some areas *Acer platanoides* or *Ailanthus altissima*. In addition, *Cornus florida* may be present in the subcanopy. Understory vegetation is highly variable depending on site history and often includes *Toxicodendron radicans*; *Lindera benzoin* is sometimes present. The invasive non-natives *Rosa multiflora* and *Elaeagnus umbellata* are typically the most common shrubs, along with the non-native bramble *Rubus phoenicolasius*. Non-native species such as *Alliaria petiolata, Chelidonium majus, Glechoma hederacea, Dactylis glomerata, Daucus carota*, and *Convallaria majalis* can characterize the herb layer, which may have a native component as well, for example with (depending on geography) *Ageratina altissima, Dichanthelium clandestinum, Elymus hystrix var. hystrix, Leersia virginica, Parthenocissus quinquefolia, Pilea pumila, Solidago canadensis, Solidago rugosa, Verbesina alternifolia, Verbesina occidentalis*, and *Viola* spp.

Most Abundant Species

Herb (field)	Graminoid	*Dichanthelium clandestinum*

Global

Stratum	Lifeform	Species
Tree canopy	Broad-leaved deciduous tree	*Robinia pseudoacacia*

Characteristic Species

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Dichanthelium clandestinum*, *Robinia pseudoacacia*, *Rubus occidentalis*, *Verbesina alternifolia*

Global: *Acer rubrum*, *Robinia pseudoacacia*, *Rosa multiflora*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Invasive/Exotic Plants: *Alliaria petiolata* (High/Medium, invasive/exotic), *Leonurus cardiaca* (invasive/exotic), *Lonicera japonica* (High/Medium, invasive/exotic), *Lonicera morrowii* (High/Medium, invasive/exotic), *Taraxacum officinale* (invasive)
Global: Invasive/Exotic Plants: *Acer platanoides* (High/Medium), *Ailanthus altissima* (Medium), *Alliaria petiolata* (High/Medium), *Chelidonium majus* (Medium/Insignificant), *Convallaria majalis*, *Dactylis glomerata* (Medium/Insignificant), *Daucus carota* (Low), *Elaeagnus umbellata* (High), *Glechoma hederacea* (Low), *Rosa multiflora* (Medium/Low), *Rubus phoenicolasius* (Medium)

CONSERVATION STATUS RANK

Global Rank & Reasons: GNA (ruderal) (24-Oct-2002). Although *Robinia pseudoacacia* is a native species found in the Central Appalachians and Ozark Mountains, it does not typically become a dominant species in these natural habitats (Elias 1980). It is now widespread in the eastern U.S. in disturbed habitats. This forest represents early-successional vegetation and is thus not of high conservation concern and does not receive a conservation status rank.

RELATED CONCEPTS

Global Similar Types:

- *Prunus serotina - Liriodendron tulipifera - Acer rubrum - Fraxinus americana - (Robinia pseudoacacia)* Ruderal Forest (CEGL006599) can have *Robinia* as an important canopy component but is not dominated by it as is this type.
- *Prunus serotina - Sassafras albidum - (Fraxinus americana) / Juniperus virginiana* Ruderal Forest (CEGL004133)
- *Robinia pseudoacacia - Celtis occidentalis - (Fraxinus americana, Liriodendron tulipifera)* Ruderal Forest (CEGL007281)

M014. Laurentian-Acadian Mesic Hardwood - Conifer Forest

G632. Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest

Group Summary Description: These are upland spruce-fir forests and woodlands, or spruce-fir-hardwood forests of eastern North America. They are found within the range of *Picea rubens*, at progressively higher elevations from the Central to the Southern Appalachians. They occur in cool, mostly mesic settings on ridgetops and steep slopes with thin soils. Substrate geology also varies, although soils are generally acidic. At their southern extent, these forests occur only at the highest elevations (above 1370 m [4500 feet]). *Picea rubens* is generally present, and often dominant, but the canopy may be dominated by *Abies fraseri*. Typical canopy associates include *Betula alleghaniensis* and *Tsuga canadensis*. The density and composition of shrub and herbaceous strata vary with association and geographic location. Characteristic shrubs include *Acer spicatum, Rhododendron catawbiense, Rhododendron maximum, Vaccinium erythrocarpum*, and *Viburnum lantanoides*. Characteristic herbs rangewide include *Clintonia borealis, Dryopteris campyloptera, Mitchella repens, Oxalis montana*, and *Trillium undulatum*. The bryophyte layer is generally very well-developed, characterized by *Bazzania trilobata, Dicranum* spp., *Pleurozium schreberi*, and many others. Mosses, liverworts, and lichens grow densely on fallen logs, tree trunks, and the forest floor, giving these forests a distinctive carpeted appearance.

A0136 *Picea rubens - Abies fraseri* Forest Alliance

Alliance Summary Description: Canopies can be dominated by *Abies fraseri* and/or *Picea rubens*; *Betula alleghaniensis* and other northern hardwood species may be codominant in mixed stands. Canopy/subcanopy species of minor importance can include *Acer spicatum, Acer pensylvanicum, Amelanchier laevis, Betula alleghaniensis, Prunus pensylvanica*, and *Sorbus americana*. Forests on extreme sites may have an open canopy, with stunted appearance and, in some communities, standing dead stems of *Abies fraseri* are common, with extensive patches of *Abies fraseri* seedlings in canopy gaps. The density and composition of the shrub and herbaceous strata vary among associations in this alliance. Forests in this alliance typically have a well-developed bryophyte layer. Mosses, liverworts, and lichens grow densely on fallen logs, tree trunks, and the forest floor, giving these forests a distinctive carpeted appearance. This alliance contains many species endemic to the Southern Blue Ridge or that have the bulk of their worldwide range in that region. This vegetation is restricted to the highest mountain systems of the Southern Blue Ridge, in eastern Tennessee, western North Carolina, and southwestern Virginia, as well as outliers in the Central Appalachians of West Virginia, primarily within the distributional range of *Abies fraseri*. These forests occur on all topographic positions except the steepest rocky cliffs. Elevations range from 1350-2300 m (4400-6600 feet), with pure *Abies fraseri* associations best developed above 1830 m (6000 feet). The dominant soils are Inceptisols with scattered occurrences of Spodosols at the highest elevations. Generally, soils can be described as rocky, with well-developed organic and A horizons. All soils in these high-elevation forests are low in base saturation, high in organic matter, and are acidic in reaction (pH 3-5), with a high aluminum content. The moisture regimes of these areas are mesic to wet due to high rainfall, abundant cloud cover, fog deposition, and low temperatures. The climate has been classified as perhumid, with the temperature varying elevationally from mesothermal to microthermal. The regional geology is dominated by complexly folded metamorphic, sedimentary, and igneous rocks of the Precambrian and early Paleozoic age, including phyllites, slates, schists, sandstones, quartzites, granites, and gneisses. These forests are affected by debris avalanches, wind and ice disturbance, and lightning fire. Because of the rocky soils and extreme wind exposure, these forests are susceptible to large blowdowns, particularly in areas damaged by the invasive balsam woolly adelgid (*Adelges piceae*).

[CEGL006308] *Abies fraseri / (Rhododendron catawbiense, Rhododendron carolinianum)* Forest

Translated Name: **Fraser Fir / (Catawba Rosebay, Carolina Azalea) Forest**
Common Name: **Fraser Fir Forest (Evergreen Shrub Type)**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest (G632)
Alliance	*Picea rubens - Abies fraseri* Forest Alliance (A0136)

ELEMENT CONCEPT

Global Summary: This community occurs as island-like stands in the southern Appalachian Mountains of eastern Tennessee, and western North Carolina. It occurs on rocky spurs, steep ridges, and south-facing slopes above 1830 m (6000 feet) elevation, often adjacent to montane shrublands. This forest has a canopy strongly dominated by *Abies fraseri*, occurring over a shrub stratum dominated by evergreen species, typically *Rhododendron catawbiense, Rhododendron carolinianum*, or *Rhododendron maximum*. *Abies fraseri* in the canopy are 17-23 cm in diameter and 10-11 m tall, giving these forests a stunted appearance. Other species that may occur with low coverage in the canopy or subcanopy are *Picea rubens, Sorbus americana, Betula alleghaniensis, Prunus pensylvanica*. Herbaceous cover is typically sparse. On steep, rocky, northerly slopes, coverage by mosses, liverworts, and lichens can approach 100%. Bryophyte species include *Hylocomium splendens, Ptilium crista-castrensis, Sphagnum* spp., and *Polytrichum ohioense*. This forest may grade into forests dominated by *Picea rubens* and *Abies fraseri*, montane grasslands, high-elevation shrublands, or high-elevation rock outcrop communities.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: No data are available.
Global Environment: These forests occur on rocky spurs, steep ridges, and south-facing slopes above 1830 m (6000 feet) elevation, often adjacent to montane shrublands. These forests occur on all topographic positions except the steepest rocky cliffs of the highest summits. Soils that support this community are classified as Inceptisols and are shallow, rocky, and often have a thick organic layer. Moisture regimes are mesic to wet, due to high rainfall, abundant cloud cover, fog deposition, and low temperatures. This forest may grade into forests dominated by *Picea rubens* and *Abies fraseri*, montane grasslands, high-elevation shrublands, or high-elevation rock outcrop communities.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: *Abies fraseri* is dominant and occurs over a shrub stratum dominated by evergreen species, typically *Rhododendron catawbiense, Rhododendron maximum*, and *Rhododendron carolinianum*.
Global Vegetation: This needle-leaved evergreen forest has greater than 75% canopy coverage by *Abies fraseri*. *Abies fraseri* in the canopy are 17-23 cm in diameter and 10-11 m tall, giving these forests a stunted appearance. Other species that may occur with low coverage in the canopy or subcanopy are *Picea rubens, Sorbus americana, Betula alleghaniensis, Prunus pensylvanica*. The tall-shrub stratum is dominated by evergreen species and, although there may be considerable variation, is usually quite dense. Typical shrub dominants include *Rhododendron catawbiense, Rhododendron carolinianum*, and *Rhododendron maximum*. Herbaceous cover is typically sparse. On steep, rocky, northerly slopes, coverage by mosses, liverworts, and lichens can approach 100%. Bryophyte species include *Hylocomium splendens, Ptilium crista-castrensis, Sphagnum* spp., and *Polytrichum ohioense*. Rare or regionally rare vascular plant species associated with this community include *Abies fraseri, Betula papyrifera var. cordifolia, Cardamine clematitis, Glyceria nubigena, Phegopteris connectilis, Poa palustris, Rhododendron vaseyi, Stachys clingmanii*, and *Streptopus amplexifolius*. Rare nonvascular plants include *Bazzania nudicaulis, Brachydontium trichodes, Leptodontium excelsum, Metzgeria temperata, Nardia scalaris, Plagiochila corniculata*, and *Sphenolobopsis pearsonii*.
Global Dynamics: This community is affected by debris avalanches, wind disturbance and lightning fire. Because of the shallow soils and extreme wind exposure, this forest is susceptible to large blowdowns. Logging and damage by the balsam woolly adelgid has greatly increased the effect of natural windfall. An exotic insect, the balsam woolly adelgid (*Adelges piceae*), invaded the Southern Appalachians in the late 1950s and has drastically altered the last undisturbed remnants of this community. This exotic pest kills mature *Abies fraseri* within seven years of infestation. This community is a late-successional type, but it is subject to repeated disturbance. *Prunus pensylvanica* is a dominant species immediately following disturbance. In later successional stages, *Betula alleghaniensis* increases in dominance. In areas where mature *Abies fraseri* has been lost to woolly adelgid infestation, thickets of *Rubus* spp., *Abies fraseri* seedlings and saplings, *Betula alleghaniensis*, and *Sorbus americana* are dominant. Over time, *Picea rubens, Betula alleghaniensis, Abies fraseri, Acer spicatum*, and *Sorbus americana* increase in the tree layer, while *Abies fraseri, Menziesia pilosa, Rubus idaeus ssp. strigosus*, and *Sambucus racemosa* increase in the shrub layer (White et al. 1993). Succession is especially slow after severe disturbance such as logging and slash fires. The most severely disturbed sites are predominately *Prunus pensylvanica* and *Rubus* spp. and may remain in a non-forested stage of succession for 60 years or more.

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Abies fraseri*, *Rhododendron carolinianum*, *Rhododendron catawbiense*, *Rhododendron maximum*
Global: *Abies fraseri*, *Rhododendron carolinianum*, *Rhododendron catawbiense*, *Rhododendron maximum*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): Vulnerable Plants: *Abies fraseri* (G2)
Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Bazzania nudicaulis* (G2G3, regionally rare), *Betula papyrifera* var. *cordifolia* (G5T5, regionally rare), *Brachydontium trichodes* (G2G4, regionally rare), *Cardamine clematitis* (G3, regionally rare), *Glyceria nubigena* (G2G3, endemic to Great Smoky Mountains and adjacent areas near the park), *Leptodontium excelsum* (G2), *Metzgeria temperata* (G4, regionally rare), *Nardia scalaris* (G5, regionally rare), *Phegopteris connectilis* (G5, regionally rare), *Plagiochila corniculata* (G4?, regionally rare), *Poa palustris* (G5, regionally rare), *Rhododendron vaseyi* (G3, NC/Southern Blue Ridge endemic), *Solidago glomerata* (G3), *Sphenolobopsis pearsonii* (G2?), *Stachys clingmanii* (G2), *Streptopus amplexifolius* (G5, regionally rare); **Other Plants**: *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (4-Jan-2000). This community has a naturally restricted distribution, occurring only on the highest elevation peaks of the southern Appalachian Mountains. It exists in only a small portion of its original range due to the impact of early 20th century, post-logging fires and the ongoing outbreak of balsam woolly adelgid, an exotic pest that infests and kills mature *Abies fraseri*. Well-developed, undisturbed examples of this community are extremely rare. Most remaining examples of this community exist as patches of dense young trees or dense *Rubus* thickets beneath forests of dead snags or tangles of fallen logs.

RELATED CONCEPTS

Global Similar Types:

- *Abies fraseri / Viburnum lantanoides / Dryopteris campyloptera - Oxalis montana / Hylocomium splendens* Forest (CEGL006049) is a similar forest with a canopy dominated by *Abies fraseri* but lacking an evergreen-dominated shrub stratum.
- *Picea rubens - (Abies fraseri) / (Rhododendron catawbiense, Rhododendron maximum)* Forest (CEGL007130) *Abies fraseri* can codominate with *Picea rubens*.
- *Picea rubens - (Abies fraseri) / Vaccinium erythrocarpum / Dryopteris campyloptera / Hylocomium splendens* Forest (CEGL007131) *Abies fraseri* can codominate with *Picea rubens*.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Great Smoky Mountains National Park only, known the highest peaks; can cover an extensive area. Substantial fir regeneration and recruitment is underway at Great Smoky Mountains National Park especially with the release of fir resulting from spruce mortality from spruce budworm. Release seems to encourage evergreen shrub growth, too.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: No data are available.
Global Range: This community occurs as island-like stands on the highest areas, above 1830 m (6000 feet), in the southern Appalachian Mountains of eastern Tennessee, western North Carolina, and southwestern Virginia. It is extremely limited in distribution and is restricted to the following mountain areas: Great Smoky Mountains, Black Mountains, Balsam Mountain, Plott Balsam Mountain, Grandfather Mountain, and Mount Rogers (Ramseur 1960).
Nations: US
States/Provinces: NC:S1, TN
TNC Ecoregions: 51:C
USFS Ecoregions (1994/95): M221Dc:CCC, M221Dd:CCC
Federal Lands: NPS (Appalachian Trail [Southern Blue Ridge], Blue Ridge Parkway?, Great Smoky Mountains); USFS (Cherokee, Pisgah)

Alliance	*Picea rubens - Abies fraseri* Forest Alliance (A0136)

ELEMENT CONCEPT

Global Summary: This community occurs as island-like stands in the southern Appalachian Mountains. It occurs on steep ridges and mesic, north-facing slopes above 1830 m (6000 feet) elevation, although it may extend lower on some sites. Occurrences of this community have shallow, rocky soils and are often steep and bouldery with seepage areas. This forest has at least 75% of the canopy coverage composed of *Abies fraseri*, occurring over a sparse to moderate shrub stratum dominated by deciduous species, a diverse herb stratum, and, typically, a well-developed bryophyte layer. The tree canopy has standing dead stems of *Abies fraseri* and extensive patches of *Abies fraseri* saplings in canopy gaps. *Oxalis montana, Dryopteris campyloptera*, and *Athyrium filix-femina* are often dominant in the herbaceous stratum. Other characteristic species include *Vaccinium erythrocarpum, Sambucus racemosa var. racemosa (= Sambucus racemosa var. pubens), Rubus allegheniensis, Rubus idaeus ssp. strigosus, Oclemena acuminata (= Aster acuminatus), Eurybia chlorolepis (= Aster chlorolepis), Clintonia borealis, Solidago glomerata, Rugelia nudicaulis, Ageratina altissima var. roanensis, Chelone lyonii, Circaea alpina ssp. alpina, Streptopus lanceolatus var. roseus (= Streptopus roseus), Viola macloskeyi ssp. pallens, Geum radiatum, Huperzia lucidula, Ptilium crista-castrensis, Rhytidiadelphus triquetrus*, and *Hylocomium splendens*. This is a relatively broadly defined community element with much structural and compositional variation.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This forest association occurs at the highest elevations (above 1,830 m [6,000 feet]) and in areas formerly strongly dominated by Fraser fir, now with many standing and dead trees, occurring as isolated islands on exposed summits, usually with heavy fir regeneration.

Global Environment: This community typically occurs on steep ridges and north-facing slopes above 1830 m (6000 feet) elevation, although it may extend lower on some sites. These forests occur on all topographic positions except the steepest rocky cliffs of the highest summits. Soils that support this community are classified as Inceptisols and are shallow, rocky, and often have a thick organic layer. Moisture regimes are mesic to wet, due to high rainfall, abundant cloud cover, fog deposition, and low temperatures.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This needle-leaved evergreen forest has greater than 75% canopy coverage by *Abies fraseri*, typically with many standing dead trees. Other species that may occur in the canopy or subcanopy with low coverage are *Picea rubens, Sorbus americana, Betula alleghaniensis, Prunus pensylvanica*, and *Acer spicatum*. A deciduous shrub layer is present; *Viburnum lantanoides* is characteristic, or the shrub layer may be dominated by *Picea rubens* or *Abies fraseri*. The herb layer is diverse with *Oxalis montana, Dryopteris campyloptera, Athyrium filix-femina ssp. asplenioides, Clintonia borealis, Oclemena acuminata*, and *Eurybia chlorolepis* common. However, some stands are so dense with heavy fir regeneration that they have no herb layer.

Global Vegetation: This needle-leaved evergreen forest has greater than 75% canopy coverage by *Abies fraseri*, typically with many standing dead stems. Canopy trees are of small diameter (less than 20 cm) and short stature (less than 10 m tall), giving these forests a stunted appearance. Other species that may occur in the canopy or subcanopy with low coverage are *Picea rubens, Sorbus americana, Betula alleghaniensis, Prunus pensylvanica*, and *Acer spicatum*. There may be considerable variation in the density of shrub cover, but it is typically low (<20%) and dominated by deciduous species. Typical shrub species include *Viburnum lantanoides, Vaccinium erythrocarpum, Sambucus racemosa var. racemosa (= Sambucus racemosa var. pubens), Menziesia pilosa, Rubus allegheniensis*, and *Rubus idaeus ssp. strigosus*. Where shrubs are sparse, herb cover is usually dense, with *Oxalis montana, Athyrium filix-femina ssp. asplenioides*, and *Dryopteris campyloptera* often dominant. Other common herbs include *Oclemena acuminata (= Aster acuminatus), Eurybia chlorolepis (= Aster chlorolepis), Clintonia borealis, Solidago glomerata, Rugelia nudicaulis, Ageratina altissima var. roanensis, Chelone lyonii, Circaea alpina ssp. alpina, Streptopus lanceolatus (= Streptopus roseus), Viola macloskeyi ssp. pallens, Geum radiatum*, and *Huperzia lucidula*. Mosses, liverworts, and lichens grow densely on fallen logs, tree trunks, and the forest floor, giving the community a distinctive carpeted appearance. Characteristic bryophyte species include *Hylocomium splendens, Ptilium crista-castrensis, Rhytidiadelphus triquetrus*, and *Hylocomiastrum umbratum*.

Global Dynamics: This community is affected by debris avalanches, wind disturbance and lightning fire. Because of the shallow soils and extreme wind exposure, this forest is susceptible to large blowdowns. Logging and damage by the balsam woolly adelgid has greatly increased the effect of natural windfall. This community is a late-successional type, but it is subject to repeated disturbance. *Prunus pensylvanica* is a dominant species immediately following disturbance. In later successional stages, *Betula alleghaniensis* increases in dominance. An exotic insect, the balsam woolly adelgid (*Adelges piceae*), invaded the Southern Appalachians in the late 1950s and has drastically altered the last undisturbed remnants of this community. This exotic pest kills mature *Abies fraseri* within seven years of infestation. *Abies fraseri* is the only rare plant species associated with this vegetation in Virginia. In areas where mature *Abies fraseri* has been lost to woolly adelgid infestation, thickets of *Rubus* spp., *Abies fraseri* seedlings and saplings, *Betula alleghaniensis*, and *Sorbus americana* are dominant. Over time, *Picea rubens, Betula alleghaniensis, Abies fraseri, Acer spicatum*, and *Sorbus americana* increase in the tree layer, while *Abies fraseri, Menziesia pilosa, Rubus idaeus ssp. strigosus*, and *Sambucus racemosa* increase in the shrub layer (White et al. 1993). Succession is especially slow after severe disturbance such as logging and slash fires. The most severely disturbed sites are predominately *Prunus pensylvanica* and *Rubus* spp. and may remain in a non-forested stage of succession for 60 years or more.

CLASSIFICATION

Status: Standard

Classification Confidence: 1 - Strong

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This is the classic Southern Appalachian Fraser fir forest, restricted to the highest elevations (plots averaging >1800 m elevation).

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community occurs near the AT in Great Smoky Mountains National Park, on Roan Mountain, and on Mount Rogers. Only one plot within the AT corridor was sampled at Roan Mountain on Pisgah National Forest in North Carolina.

Global Range: This community occurs as island-like stands on the highest areas (>1830 m [6000 feet]) in the southern Appalachian Mountains of eastern Tennessee, western North Carolina, and southwestern Virginia. It is

extremely limited in distribution and is restricted to the following mountain areas: Great Smoky Mountains, Black Mountains, Balsam Mountain, Plott Balsam Mountain, Grandfather Mountain, and Mount Rogers (Ramseur 1960).
Nations: US
States/Provinces: NC:S1, TN, VA:S1
TNC Ecoregions: 51:C
USFS Ecoregions (1994/95): M221Dc:CCC, M221Dd:CCC

Translated Name: **Red Spruce - (Fraser Fir) / (Catawba Rosebay, Great Laurel) Forest**
Common Name: **Red Spruce - Fraser Fir Forest (Evergreen Shrub Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest (G632)
Alliance	*Picea rubens - Abies fraseri* Forest Alliance (A0136)

ELEMENT CONCEPT

Global Summary: This community is restricted to the highest mountain systems of the Southern Appalachians in eastern Tennessee, western North Carolina, and southwestern Virginia. These forests are typically found on moderately steep to steep, convex slopes at elevations between 1550 and 1830 m (5100-6000 feet). This association includes forests of the Southern Appalachians, within the range of *Abies fraseri*, currently dominated by *Picea rubens* but showing some evidence of the historical presence of *Abies fraseri* (either standing dead individuals or ample regeneration), over a shrub stratum dominated by evergreen species, typically *Rhododendron catawbiense* and *Rhododendron maximum*. Herb coverage is characteristically low, but on moist north-facing sites, mosses, ferns and forbs may be dense beneath the shrub stratum.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: The community occurs at lower elevations within the spruce-fir zone (1,555-1,830 m [5,100-6,000 feet]). The sampled sites include a somewhat steep, northwest-facing slope and moderately sloping ridgetops. Soils include well-drained sandy loam and moderately well-drained loam. The unvegetated surface is dominated by needle litter with occasional rocks,

boulders, and downed wood. Evidence of disturbance includes past catastrophic fire, past logging, trails, erosion, wind/ice damage, balsam woolly adelgid damage, and possible impacts from ozone and nitrogen deposition.
Global Environment: This forest is best developed between 1550 and 1830 m (5100-6000 feet) elevation but may occur at lower elevations and is typically found on moderately steep to steep, convex slopes. Soils are highly variable, from deep mineral soils to well-developed boulderfields, where a thin organic layer and moss mat overlie the rocks and there are pockets of mineral soil in deep crevices between boulders. The dominant soils are Inceptisols with scattered occurrences of Spodosols at the highest elevations (White et al. 1993). Generally, soils can be described as rocky, with well-developed organic and A horizons. All soils in these high-elevation forests are low in base saturation, high in organic matter, and are acidic in reaction (pH 3-5), with a high aluminum content. The moisture regimes of these areas are mesic to wet due to high rainfall, abundant cloud cover, fog deposition, and low temperatures. The climate has been classified as perhumid, with the temperature varying elevationally from mesothermal to microthermal. The regional geology is dominated by complexly folded metamorphic, sedimentary, and igneous rocks of the Precambrian and early Paleozoic age, including phyllites, slates, schists, sandstones, quartzites, granites, and gneisses.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The evergreen tree canopy (at least 75% cover by evergreen needle-leaved trees) is dominated by *Abies fraseri* and/or *Picea rubens*. The evergreen shrub layer (at least 75% cover) is typically dominated by *Rhododendron catawbiense* and *Rhododendron maximum*, along with *Abies fraseri* regeneration. Additional shrubs may include *Sorbus americana, Ilex montana*, and *Vaccinium simulatum*. Herbs are typically sparse, but there may be significant cover (up to 50%) by mosses, including *Dicranum scoparium* and *Hypnum curvifolium*.
Global Vegetation: This association includes forests of the Southern Appalachians, within the range of *Abies fraseri*, currently dominated by *Picea rubens* but showing some evidence of the historical presence of *Abies fraseri*. Other species may occur in the canopy/subcanopy but with low coverage. The shrub stratum is moderate to dense and dominated by evergreen species such as *Rhododendron catawbiense, Rhododendron maximum*, and *Rhododendron carolinianum*. Shrub coverage is most dense on drier, convex slopes. Other shrub species with minor coverage may include *Vaccinium simulatum, Vaccinium erythrocarpum, Viburnum nudum var. cassinoides, Diervilla sessilifolia*, and *Viburnum lantanoides*. Extensive patches of *Abies fraseri* seedlings and standing dead stems of *Abies fraseri* may be common. Herb coverage is typically low, but moist, north-facing sites may have *Oxalis montana, Athyrium filix-femina ssp. asplenioides, Dryopteris campyloptera*, and mosses (including *Dicranum scoparium* and *Hypnum curvifolium*) dominating beneath the shrub stratum.
Global Dynamics: Natural disturbances in this community include lightning fire, debris avalanches, wind disturbance, and ice storms (White and Pickett 1985, Nicholas and Zedaker 1989). The natural fire regime is estimated at longer than 500-1000 years. Human-initiated disturbances have included logging, slash fires, livestock grazing, and damage by atmospheric pollutants. An exotic insect, the balsam woolly adelgid (*Adelges piceae*), invaded the Southern Appalachians in the late 1950s and has drastically altered the last undisturbed remnants of this community. This exotic pest kills mature *Abies fraseri* within seven years of infestation. In areas where mature *Abies fraseri* has been lost to woolly adelgid infestation, thickets of *Rubus* spp., *Abies fraseri* seedlings and saplings, *Betula alleghaniensis*, and *Sorbus americana* are dominant. Over time, *Picea rubens, Betula alleghaniensis, Abies fraseri, Acer spicatum*, and *Sorbus americana* increase in the tree layer, while *Abies fraseri, Menziesia pilosa, Rubus idaeus ssp. strigosus*, and *Sambucus racemosa var. pubens* increase in the shrub layer (White et al. 1993). Succession is especially slow after severe disturbance such as logging and slash fires. The most severely disturbed sites are predominately *Prunus pensylvanica* and *Rubus* spp. and may remain in a non-forested stage of succession for 60 years or more.

Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Bazzania nudicaulis* (G2G3), *Brachydontium trichodes* (G2G4), *Cardamine clematitis* (G3), *Carex ruthii* (G3), *Geum geniculatum* (G2), *Glyceria nubigena* (G2G3, endemic to Great Smoky Mountains and adjacent areas near the park), *Gymnoderma lineare* (G3), *Hypericum graveolens* (G3), *Krigia montana* (G3), *Leptodontium excelsum* (G2), *Penstemon smallii* (G3), *Prenanthes roanensis* (G3, Southern Blue Ridge endemic), *Pseudevernia cladonia* (G2G4), *Rhododendron vaseyi* (G3, NC/Southern Blue Ridge endemic), *Rugelia nudicaulis* (G3), *Solidago glomerata* (G3), *Sphenolobopsis pearsonii* (G2?), *Stachys clingmanii* (G2); **Other Plants**: *Betula papyrifera* var. *cordifolia* (G5T5), *Botrychium oneidense* (G4), *Calamagrostis canadensis* (G5), *Carex projecta* (G5), *Chelone lyonii* (G4), *Metzgeria temperata* (G4), *Nardia scalaris* (G5), *Phegopteris connectilis* (G5), *Plagiochila corniculata* (G4?), *Poa palustris* (G5), *Stellaria corei* (G4), *Streptopus amplexifolius* (G5), *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G1 (23-Feb-1999). This community has a naturally restricted distribution and has been subject to major acreage reduction during the early part of the 20th century and rapid condition decline in the past 30 years. Modern threats include atmospheric pollution deposition and damage by the exotic balsam woolly adelgid (*Adelges piceae*). Well-developed, undisturbed examples of this community are extremely rare.

RELATED CONCEPTS

Global Similar Types:
- *Abies fraseri / (Rhododendron catawbiense, Rhododendron carolinianum)* Forest (CEGL006308)
- *Abies fraseri / Viburnum lantanoides / Dryopteris campyloptera - Oxalis montana / Hylocomium splendens* Forest (CEGL006049)
- *Picea rubens - (Abies fraseri) / Vaccinium erythrocarpum / Dryopteris campyloptera / Hylocomium splendens* Forest (CEGL007131) is a similar forest that has an understory dominated by deciduous shrubs, herbs, and bryophytes and occurs on more mesic sites than the one described here. Similar forests occur in the Central and Northern Appalachians, but have *Abies balsamea* as the fir component, less dense herb and bryophyte cover, and lack a *Rhododendron*-dominated understory (Oosting and Billings 1951, Whittaker 1956, Crandall 1958).
- *Picea rubens - (Tsuga canadensis) / Rhododendron maximum* Forest (CEGL006152)

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: The group of plots for this association along the AT are characterized by very low species richness and a dense evergreen shrub layer under *Picea rubens* overstory. *Abies fraseri* dominates one plot, *Betula alleghaniensis* codominates another; tree canopy is thin in two plots. Stands that may represent this type have been seen on both Mount Rogers and Whitetop Mountain in Virginia, but have not been carefully inventoried or sampled.
Global Classification Comments: This community includes forest vegetation where *Picea rubens* and *Abies fraseri* make up 75% of the canopy cover, each contributing 25-75% to the total canopy cover and occurring over a shrub stratum dominated by evergreen species. Other species total less than 25% of the canopy.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community appears to be rare along the AT in the highest section from the Great Smoky Mountains to Roan Mountain, Pisgah National Forest in North Carolina and in eastern Tennessee.
Global Range: This community is restricted to the highest mountain systems of the Southern Appalachians in eastern Tennessee, western North Carolina, and southwestern Virginia.

Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest (G632)
Alliance	*Picea rubens - Abies fraseri* Forest Alliance (A0136)

ELEMENT CONCEPT

Global Summary: This community is restricted to the highest mountain systems of the Southern and Central Appalachians in eastern Tennessee, western North Carolina, and southwestern Virginia, with disjunct northern outliers on the summits of the Allegheny Mountains of West Virginia. It is found on all topographic positions and is best developed between 1680 and 1990 m (5500-6200 feet) elevation. In West Virginia, it occurs on ridgetops at elevations above 1350 m (4400 feet). This association includes forests of the Southern and Central Appalachians, primarily within the range of *Abies fraseri*, dominated by *Picea rubens*, with or without *Abies fraseri*, occurring over deciduous shrubs, herbs and bryophytes. This community has a characteristic understory of Southern Appalachian endemic species and a conspicuous bryophyte layer. The tree canopy may have standing dead stems of *Abies fraseri* and extensive patches of *Abies fraseri* seedlings in canopy gaps. Characteristic species include *Sorbus*

americana, Acer spicatum, Viburnum lantanoides, Athyrium filix-femina ssp. asplenioides, Eurybia chlorolepis (= Aster chlorolepis), Rugelia nudicaulis, Houstonia serpyllifolia, Solidago glomerata, Ptilium crista-castrensis, and *Bazzania trilobata*.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This community occurs at lower elevations within the spruce-fir zone (1,675-1,890 m [5,500-6,200 feet]), usually on slightly more sheltered sites, and is strongly dominated by *Picea rubens*. It was sampled at four locations in the park. The sites range from gentle to somewhat steep low and mid slopes and ridgetops with north, northeast, east, and southwest aspects. Soils are well-drained. The unvegetated surface is typically dominated by leaf litter but may include significant amounts of exposed bedrock and large rocks. Evidence of disturbance includes past catastrophic fire, trails, wind/ice damage, and possible impacts from ozone and nitrogen deposition.

Global Environment: Over much of its range, this forest community reaches its best development between 1680 and 1990 m (5500-6200 feet) elevation, but it is also found at somewhat lower elevations. Stands occur on all topographic positions. Soils are highly variable, from deep mineral soils to well-developed boulderfields, where a thin organic layer and moss mat overlie the rocks, and there are pockets of mineral soil in deep crevices between boulders. The dominant soils are Inceptisols with scattered occurrences of Spodosols at the highest elevations. Generally, soils are shallow and rocky, with well-developed organic and A horizons. All soils in these high-elevation forests are low in base saturation, high in organic matter, and are acidic in reaction (pH 3.0-5.0), with high aluminum content. The moisture regimes of these areas are mesic to wet due to high rainfall, abundant cloud cover, fog deposition, and low temperatures. The climate has been classified as perhumid, with the temperature varying elevationally from mesothermal to microthermal. The regional geology is dominated by complexly folded metamorphic, sedimentary, and igneous rocks of Precambrian and early Paleozoic age, including phyllites, slates, schists, sandstones, quartzites, granites, and gneisses. The disjunct, outlier stands in the Allegheny Mountains occur only at the very highest elevations in the coldest climate niche in the state, on Pennsylvanian sandstone.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This community is more strongly dominated by *Picea rubens* than other communities in the spruce-fir zone. Additional canopy species may include *Abies fraseri, Acer pensylvanicum*, and *Betula alleghaniensis*. The deciduous shrub layer includes *Vaccinium erythrocarpum, Rubus canadensis*, and *Viburnum lantanoides*. The diverse and often dense herb layer includes ferns *Dryopteris campyloptera, Athyrium filix-femina ssp. asplenioides, Dennstaedtia punctilobula, Dryopteris intermedia, Huperzia lucidula, Polypodium appalachianum*, and *Thelypteris noveboracensis*, and forbs *Oxalis montana, Clintonia borealis*, and *Maianthemum canadense*.

Global Vegetation: These forests are dominated by needle-leaved evergreen trees and have a characteristic understory of Southern Appalachian endemic species and a conspicuous bryophyte layer. Canopies are dominated by *Picea rubens*, with or without *Abies fraseri*, sometimes with lesser amounts of *Betula alleghaniensis* and *Sorbus americana*. The subcanopy contains canopy species as well as *Acer spicatum* and *Amelanchier laevis*. The shrub strata are dominated by deciduous species and can be sparse to dense. Typical shrub species include *Viburnum lantanoides, Vaccinium erythrocarpum, Vaccinium simulatum, Sambucus racemosa var. racemosa (= Sambucus racemosa var. pubens), Rubus allegheniensis, Ilex montana, Rhododendron catawbiense*, and *Rubus canadensis*. Extensive patches of *Abies fraseri* seedlings and standing dead stems of *Abies fraseri* are common. Herb density can be high but is inversely related to the density of the shrub layer. Common herbaceous species include *Oxalis montana, Athyrium filix-femina ssp. asplenioides, Dryopteris campyloptera*, and *Clintonia borealis*. Other herbs include *Oclemena acuminata (= Aster acuminatus), Eurybia chlorolepis (= Aster chlorolepis), Carex gynandra, Carex pensylvanica, Chelone lyonii, Circaea alpina ssp. alpina, Houstonia serpyllifolia, Huperzia lucidula, Maianthemum canadense, Rugelia nudicaulis, Solidago glomerata, Streptopus lanceolatus var. roseus (= Streptopus roseus var. roseus)*, and *Viola macloskeyi ssp. pallens*. Bryophytes and lichens make up a considerable percent of the vegetative coverage in this community, occurring on the surface of the soil, trees, and fallen logs. Characteristic nonvascular species include *Hylocomium splendens, Ptilium crista-castrensis, Leptodontium excelsum, Bazzania trilobata, Bazzania nudicaulis, Alectoria fallacina, Hypotrachyna virginica, Dicranum scoparium*, and *Dicranum fuscescens*. Disjunct, outlier stands on summits in the Allegheny Mountains of West Virginia lack *Abies* and exhibit a dense canopy of *Picea rubens*, with a sparse to dense understory of *Vaccinium erythrocarpum*, on a luxuriant carpet of *Bazzania trilobata* and mosses. In Virginia, the rare plants *Abies fraseri, Cardamine clematitis*, and *Prenanthes roanensis* are minor components of this community.

Canopy structure and composition are fairly uniform, but understory composition changes continuously along a moisture gradient. Whittaker (1956) described five variations of the understory of Red Spruce - Fraser Fir Forests:

(1) Valley subtype: moss, *Oxalis*, and low shrub cover <5%, high herb cover 30% and high shrub cover 20%; (2) North slopes and flats: moss and *Oxalis* cover 25-55%, low and high shrub cover 5-20%, high herb strata is dominated by *Dryopteris* with other mesic herbs; (3) Intermediate east- and west-facing slopes: moss, *Oxalis* and fern cover 15-30%, low and high shrub cover 5-10%; (4) South slope subtype: all five strata are <10% cover; and (5) Ridge and steep upper slope: rhododendron heath approaches full coverage of understory.

Global Dynamics: Natural disturbances in this community include lightning fire, debris avalanches, wind disturbance, and ice storms (White and Pickett 1985, Nicholas and Zedaker 1989). The natural fire regime is estimated at longer than 500-1000 years. Stand-replacing fires may affect large-patch sizes but occur rarely, at 300- to 1000-year intervals; wind events are likely at more frequent intervals of 100 to 200 years (Gorman 2007). Human-initiated disturbances have included logging, slash fires, livestock grazing, and atmospheric pollutants. An exotic insect, the balsam woolly adelgid (*Adelges piceae*), invaded the Southern Appalachians in the late 1950s and has drastically altered the last undisturbed remnants of this community. This exotic pest kills mature *Abies fraseri* within seven years of infestation. In areas where mature *Abies fraseri* has been lost to woolly adelgid infestation, thickets of *Rubus* spp., *Abies fraseri* seedlings and saplings, *Betula alleghaniensis*, and *Sorbus americana* are dominant. Over time, *Picea rubens, Betula alleghaniensis, Abies fraseri, Acer spicatum*, and *Sorbus americana* increase in the tree layer, while *Abies fraseri, Menziesia pilosa, Rubus idaeus ssp. strigosus*, and *Sambucus racemosa var. pubens* increase in the shrub layer (White et al. 1993). Succession is especially slow after severe disturbance such as logging and slash fires. The most severely disturbed sites are predominately *Prunus pensylvanica* and *Rubus* spp. and may remain in a non-forested stage of succession for 60 years or more.

CONSERVATION STATUS RANK

Global Rank & Reasons: G2 (1-Jun-2009). This community is restricted to the highest mountain systems of the Southern Appalachians in eastern Tennessee, western North Carolina, and southwestern Virginia, with outliers in the highest elevations in the Allegheny Mountains of West Virginia. It has a naturally restricted distribution and has been subject to major acreage reduction during the early part of the 20th century and rapid condition decline in the past 30 years. Modern threats include atmospheric pollution deposition and damage by the exotic balsam woolly adelgid (*Adelges piceae*). Well-developed, undisturbed examples of this community are extremely rare.

RELATED CONCEPTS

Global Similar Types:

- *Abies fraseri / (Rhododendron catawbiense, Rhododendron carolinianum)* Forest (CEGL006308)
- *Abies fraseri / Viburnum lantanoides / Dryopteris campyloptera - Oxalis montana / Hylocomium splendens* Forest (CEGL006049)
- *Picea rubens - (Abies fraseri) / (Rhododendron catawbiense, Rhododendron maximum)* Forest (CEGL007130) is a similar forest that has a shrub stratum dominated by evergreen species and occurs on less mesic sites than the one described here. Similar forests occur in the Central and Northern Appalachians, but have *Abies balsamea* as the fir component and less dense herb and bryophyte cover (Oosting and Billings 1951, Whittaker 1956, Crandall 1958).
- *Picea rubens - (Tsuga canadensis) / Rhododendron maximum* Forest (CEGL006152)
- *Picea rubens / Betula alleghaniensis / Bazzania trilobata* Forest (CEGL008501) is the dominant red spruce forest type within West Virginia; stands interfinger at the highest elevations in West Virginia.

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Locally common along and near the AT at Great Smoky Mountains National Park, on Roan Mountain, and on Mount Rogers.
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Other Comments: This group represents forests dominated or codominated by *Picea rubens*; *Abies fraseri* and *Betula alleghaniensis* are each important associates in about half the plots.
Global Classification Comments: West Virginia stands assigned here (2009) differ from *Picea rubens / Betula alleghaniensis / Bazzania trilobata* Forest (CEGL008501) (the "core" red spruce in WV) in their position at the highest elevations and thereby experiencing the coldest temperatures. Significant indicators that differentiate this type from WV's "core" red spruce are *Vaccinium erythrocarpum* and *Dryopteris campyloptera*. Thirteen plots in three counties represent this type in West Virginia. An occurrence on the edge of the Ridge and Valley Province in southwestern Virginia occurs over sandstone on Clinch Mountain.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This community is restricted to the highest mountain systems of the Southern Appalachians in eastern Tennessee, western North Carolina, and southwestern Virginia, with northern outliers on the summits of West Virginia. It was sampled in Tennessee and at Whitetop Mountain in Virginia but also occurs near the AT in Great Smoky Mountains National Park, on Roan Mountain, and on Mount Rogers.

Global Range: This community is restricted to the highest mountain systems of the Southern Appalachians in eastern Tennessee, western North Carolina, and southwestern Virginia, with northern outliers on the summits of West Virginia.

A0138 *Picea rubens - Betula alleghaniensis - Aesculus flava* Forest Alliance

Alliance Summary Description: These are evergreen or mixed forests and woodlands dominated by *Picea rubens* with or without some combination of *Aesculus flava, Betula alleghaniensis*, and *Tsuga canadensis*. Other species that may occur with low coverage in the canopy or subcanopy are *Acer pensylvanicum, Acer spicatum, Amelanchier laevis, Halesia tetraptera var. monticola, Prunus pensylvanica*, and *Sorbus americana*. Density and composition of shrub and herbaceous strata vary with association and geographic location. Exposed, drier sites, such as upper convex slopes or slopes with a southerly aspect, will often have high coverage of evergreen shrub species. Typical shrubs include *Crataegus* spp., *Ilex montana, Kalmia latifolia, Leucothoe fontanesiana, Photinia melanocarpa (= Aronia melanocarpa), Rhododendron carolinianum, Rhododendron catawbiense, Rhododendron maximum, Smilax rotundifolia, Vaccinium angustifolium, Vaccinium erythrocarpum, Vaccinium simulatum, Viburnum lantanoides*, and *Viburnum nudum var. cassinoides*. Herbaceous cover is typically sparse, but where the shrub stratum is more open, a moderate herb stratum may develop. Characteristic herbaceous species include *Athyrium filix-femina, Clintonia borealis, Dryopteris campyloptera, Galax urceolata, Huperzia lucidula, Lycopodium clavatum, Lycopodium dendroideum, Lycopodium obscurum, Medeola virginiana, Mitchella repens, Oxalis montana, Rugelia nudicaulis, Schizachne purpurascens*, and *Trillium undulatum*. Nonvascular plants are common and often abundant, especially on moister sites, where they grow on branches and around the base of trees and shrubs. Bryophyte species include *Bazzania trilobata, Hylocomium splendens, Polytrichum ohioense, Ptilium crista-castrensis*, and *Sphagnum* spp. These forests occur in the Central Appalachians and Southern Blue Ridge, from West Virginia south to western North Carolina and eastern Tennessee, on steep, seepy boulderfields, and on ridges and steep slopes with northeast to southwest exposures, above 1370 m (4500 feet) elevation. It descends to 1000 m (3100 feet) in the Central

Appalachians. In local landscapes of the Southern Blue Ridge and Central Appalachians, this vegetation tends to occur bimodally, on high ridges and summits and steep, rocky upper slopes, and at lower elevations in frost pocket situations, where *Picea rubens* apparently has a competitive advantage because of moist, acidic, organic soils and/or cold-air drainage.

[CEGL004983] *Picea rubens - (Betula alleghaniensis, Aesculus flava) / Rhododendron (maximum, catawbiense)* Forest

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest (G632)
Alliance	*Picea rubens - Betula alleghaniensis - Aesculus flava* Forest Alliance (A0138)

Element Concept

Global Summary: This association occurs in the broad elevational transition zone between spruce-fir and northern hardwoods in the Southern Blue Ridge (approx. 1400-1550 m [4600-5100 feet]). Sites are steep to very steep, slopes often associated with cliff faces, rock outcroppings, or bouldery situations, and subject to disturbance by wind, ice, and landslides. The canopy is composed of *Picea rubens* codominating with deciduous species *Betula alleghaniensis, Fagus grandifolia*, and *Aesculus flava*, occurring singly or in combination. At higher elevations, *Abies fraseri* may be a minor canopy component. The shrub layer is well-developed and dominated by *Rhododendron maximum* or *Rhododendron catawbiense*. In the Great Smoky Mountains, *Leucothoe fontanesiana* can be the dominant shrub. Other minor shrubs include *Ilex montana, Viburnum lantanoides, Vaccinium erythrocarpum*, and *Rubus allegheniensis*. The thick, evergreen shrub layer precludes the establishment of seedlings or herbaceous plants and creates a heavy, slowly decomposing litter layer. Bryophyte cover can be high (over 50%), and the ground is covered with downed and decaying logs.

Environmental Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This association occurs in the broad elevational transition zone between spruce-fir and northern hardwoods in the Southern Blue Ridge (approx. 1,400-1,550 m [4,600-5,100 feet]). Sites are steep to very steep, slopes often associated with cliff faces, rock outcroppings, or bouldery situations, and subject to disturbance by wind, ice, and landslides.
Global Environment: In southwestern Virginia, the type occurs at the highest elevations (1340-1433 m [4400-4700 feet]) of the Ridge and Valley on summits and upper slopes of Clinch Mountain. Soils are organic and shallow to bedrock.

Vegetation Description

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The mixed evergreen-deciduous tree canopy is composed of 25-50% cover by evergreen needle-leaved *Picea rubens* with 25-50% cover by deciduous broad-leaved *Betula alleghaniensis, Fagus grandifolia*, and *Aesculus flava*. The shrub layer is well-developed and dominated by *Rhododendron maximum* or *Rhododendron catawbiense*. In the Great Smoky Mountains, *Leucothoe fontanesiana* can be dominant.
Global Vegetation: Virginia stands on Clinch Mountain are codominated by *Picea rubens* (most abundant), with variable codominance by *Betula alleghaniensis* and *Fagus grandifolia*. In some areas, *Picea rubens* dominates the canopy and hardwoods dominate a lower, subcanopy layer. *Sorbus americana* is a minor understory tree. The shrub layer is dense with *Rhododendron maximum* generally dominant and *Rhododendron catawbiense* codominant in many areas. Other shrubs occurring at low cover include *Acer pensylvanicum, Kalmia latifolia*, and *Vaccinium simulatum*. The ground is thickly covered by coarse woody debris and bryophytes, with few herbaceous species present.

MOST ABUNDANT SPECIES

Tree canopy	Needle-leaved tree	*Picea rubens*
Tree canopy	Broad-leaved deciduous tree	*Aesculus flava*, *Betula alleghaniensis*, *Fagus grandifolia*
Shrub/sapling (tall & short)	Broad-leaved evergreen shrub	*Rhododendron catawbiense*, *Rhododendron maximum*

Global

Stratum	Lifeform	Species
Tree canopy	Needle-leaved tree	*Picea rubens*
Tree canopy	Broad-leaved deciduous tree	*Aesculus flava*, *Betula alleghaniensis*, *Fagus grandifolia*
Tall shrub/sapling	Broad-leaved evergreen tree	*Rhododendron catawbiense*, *Rhododendron maximum*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Southern Blue Ridge Project Area): *Aesculus flava*, *Betula alleghaniensis*, *Fagus grandifolia*, *Picea rubens*, *Rhododendron catawbiense*, *Rhododendron maximum*
Global: *Betula alleghaniensis*, *Picea rubens*, *Rhododendron maximum*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Rugelia nudicaulis* (G3), *Solidago glomerata* (G3); **Other Plants**: *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G1? (2-Jan-2013). The community is geographically and environmentally restricted to the highest elevations of the Southern Blue Ridge and, in southwestern Virginia, to the highest elevations of Clinch Mountain in the Ridge and Valley province. Very few occurrences are known to exist, and it has only been described from the Great Smoky Mountains and the Beartown Wilderness in southwestern Virginia.

RELATED CONCEPTS

Global Similar Types:

- *Betula alleghaniensis - (Tsuga canadensis) / Rhododendron maximum / (Leucothoe fontanesiana)* Forest (CEGL007861)
- *Picea rubens - (Betula alleghaniensis, Aesculus flava) / Viburnum lantanoides / Solidago glomerata* Forest (CEGL006256)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: This association is known from the Great Smoky Mountains of Tennessee.
Global Classification Comments: This association should be compared with other vegetation farther north in the Appalachians. Examples of this community on more exposed, rocky sites may transition to heath shrublands. At high elevations, this community grades into *Picea rubens*-dominated forests. Similar vegetation has been observed and sampled on Beartown, Clinch Mountain in Tazewell County, Virginia (1433 m [4700 feet] elevation), and this association was added to the Virginia State Classification (Fleming and Patterson 2012) based on that observation. Data collected by Steve Adams and Steve Stephenson in the 1980s from spruce forests with a *Rhododendron catawbiense* shrub layer on Beartown, Clinch Mountain in Russell County, Virginia (1403 m [4600 feet] elevation) also seem to match this type and will be targeted for inventory by Virginia DNH ecologists. These sites are out of the range of *Abies fraseri* and have considerable hardwood codominance in places, so *Picea rubens - (Abies fraseri) / (Rhododendron catawbiense, Rhododendron maximum)* Forest (CEGL007130) was not applicable, though it has been documented on Whitetop Mountain, Virginia.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: This association is known from the Great Smoky Mountains of Tennessee.
Global Range: This association is known from the Great Smoky Mountains of Tennessee, Clinch Mountain in southwestern Virginia, and the Blue Ridge of North Carolina.

[CEGL006256] *Picea rubens - (Betula alleghaniensis, Aesculus flava) / Viburnum lantanoides / Solidago glomerata* Forest

Translated Name: **Red Spruce - (Yellow Birch, Yellow Buckeye) / Hobblebush / Clustered Goldenrod Forest**
Common Name: **Red Spruce - Northern Hardwood Forest (Herb Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest (G632)
Alliance	*Picea rubens - Betula alleghaniensis - Aesculus flava* Forest Alliance (A0138)

ELEMENT CONCEPT

Global Summary: This association occurs in the broad elevational transition zone between spruce-fir and northern hardwoods in the Southern Blue Ridge at approximately 1400 to 1555 m (4600-5100 feet) elevation. This association occurs on steep slopes and protected ridges, over shallow, stony soils. The canopy is composed of *Picea rubens* codominating with the deciduous species *Betula alleghaniensis, Fagus grandifolia*, and *Aesculus flava*, occurring singly or in combination. At higher elevations, *Abies fraseri* may be a minor canopy component. The shrub stratum is open to absent. *Viburnum lantanoides* is a common shrub, and *Acer pensylvanicum* and *Amelanchier laevis* often occur as small trees. The herbaceous stratum is lush and diverse. Typical herbs include *Oclemena acuminata (= Aster acuminatus), Carex pensylvanica, Dryopteris campyloptera, Dryopteris intermedia, Maianthemum canadense, Oxalis montana, Solidago glomerata*, and *Rugelia nudicaulis* (in the Great Smoky Mountains).

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This red spruce - northern hardwood forest occurs on steep slopes and protected ridges in the transition zone between spruce-fir and northern hardwoods in the Southern Blue Ridge at approximately 1,400 to 1,555 m (4,600-5,100 feet) elevation.

Global Environment: This association occurs in the broad elevational transition zone between spruce-fir and northern hardwoods in the Southern Blue Ridge at approximately 1400 to 1555 m (4600-5100 feet) elevation. This association occurs on steep slopes and protected ridges, over shallow, stony soils.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: The canopy of this mixed evergreen-deciduous forest is composed of 25-50% cover by evergreen needle-leaved *Picea rubens* with 25-50% cover by deciduous broad-leaved *Betula alleghaniensis, Fagus grandifolia*, and *Aesculus flava*. The shrub stratum is open to absent, while the herbaceous stratum is well-developed and may be lush and diverse. Typical herbs include *Oclemena acuminata, Carex pensylvanica, Dryopteris campyloptera, Dryopteris intermedia, Maianthemum canadense, Oxalis montana*, and others.

Global Vegetation: The canopy is composed of *Picea rubens* codominating with the deciduous species *Betula alleghaniensis, Fagus grandifolia*, and *Aesculus flava*, occurring singly or in combination. At higher elevations, *Abies fraseri* may be a minor canopy component. The shrub stratum is open to absent. *Viburnum lantanoides* is a common shrub, and *Acer pensylvanicum* and *Amelanchier laevis* often occur as small trees. The herbaceous stratum is lush and diverse. [CEGL006152] *Picea rubens - (Tsuga canadensis) / Rhododendron maximum* Forest

Translated Name: **Red Spruce - (Eastern Hemlock) / Great Laurel Forest**
Common Name: **Red Spruce Forest (Protected Slope Type)**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Central & Southern Appalachian Red Spruce - Fir - Hardwood Forest (G632)
Alliance	*Picea rubens - Betula alleghaniensis - Aesculus flava* Forest Alliance (A0138)

ELEMENT CONCEPT

Global Summary: This association includes moist slope forests of the Central and Southern Appalachians. *Abies fraseri* is a minor component or entirely absent. These communities can occur on high-elevation boulderfields, ridges and steep slopes, as well as sheltered lower slopes above 945 m (3100 feet). This association occurs in the lower elevations of the range of *Picea rubens*, primarily on protected landforms such as steep to gentle slopes but also on ridges at least in parts of its range. In the Southern and Central Appalachians these are closed-canopy conifer forests dominated by *Picea rubens*, with associates *Tsuga canadensis, Acer pensylvanicum, Amelanchier* spp., *Betula alleghaniensis*, and *Sorbus americana*. This concept includes protected slope forests in the Great Smoky Mountains, as well as in West Virginia in which *Tsuga canadensis* is codominant. The shrub layer is dominated by

Rhododendron maximum, with associates of *Ilex montana, Kalmia latifolia, Viburnum lantanoides*, and *Viburnum nudum var. cassinoides*. In some examples, the shrub layer can include a mixture of *Rhododendron catawbiense* and *Rhododendron maximum*. Other minor shrub components can include *Vaccinium simulatum, Vaccinium erythrocarpum*, and *Photinia melanocarpa (= Aronia melanocarpa)*. Herbaceous cover is typically sparse, but where the shrub stratum is more open, a moderate herb stratum may be developed. This can include *Clintonia borealis, Dryopteris campyloptera, Huperzia lucidula, Lycopodium* spp., *Medeola virginiana, Mitchella repens, Oxalis montana*, and *Rugelia nudicaulis* (in the Great Smoky Mountains).

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Environment: This forest is found on moist protected slopes.

Global Environment: This association occurs on steep to gentle, middle to high slopes between 945 and 1524 m (3100-5000 feet) elevation. Sites range from those that are relatively exposed, rocky and subjected to disturbance by wind and ice, to more sheltered lower slopes. Some stands also occur on nearly flat ridgetops (J. Vanderhorst pers. comm.) Soils are well-drained and high in organic matter. In the vicinity of Mount LeConte in the Great Smoky Mountains, this association occurs on long protected slopes that extend from low to very high elevations. In these sheltered situations *Tsuga canadensis* is a codominant, and the evergreen shrub layer is nearly closed, producing an "ericad desert" with few to no herbaceous species. On more-exposed sites the shrub layer may be more open, and a sparse to moderate herb layer may be present. It descends to 945 m (3100 feet) in the Central Appalachians. In local landscapes of the Southern Blue Ridge and Central Appalachians, this association tends to occur bimodally, on high ridges and summits and steep, rocky upper slopes, and at lower elevations in sheltered frost-pocket situations, where *Picea rubens* apparently has a competitive advantage because of moist, acidic, organic soils and/or cold-air drainage.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Vegetation: This forest is dominated by *Picea rubens* sometimes along with *Tsuga canadensis*. The shrub layer is dominated by *Rhododendron maximum*.

Global Vegetation: In the Southern and Central Appalachians these are closed to partially open conifer forests dominated by *Picea rubens*, with associates *Tsuga canadensis, Acer pensylvanicum, Acer rubrum, Amelanchier* spp., *Betula alleghaniensis*, and *Sorbus americana*. In stands of this type *Abies fraseri* is a minor component or entirely absent. In the vicinity of Mount LeConte in the Great Smoky Mountains, this association occurs on long protected slopes that extend from low to very high elevations. In these sheltered situations *Tsuga canadensis* may be a codominant, and the evergreen shrub layer (primarily *Rhododendron maximum*) is nearly closed, producing stands whose understory is dominated by ericaceous shrubs with few to no herbaceous species (a so-called "ericad desert"). On more-exposed sites the variable shrub layer is dominated by *Rhododendron maximum*, with associates of *Ilex montana, Kalmia latifolia, Viburnum lantanoides*, and *Viburnum nudum var. cassinoides*. In some examples, the shrub layer can include a mixture of *Rhododendron catawbiense* and *Rhododendron maximum*. Other minor shrub components can include *Vaccinium simulatum, Vaccinium erythrocarpum*, and *Photinia melanocarpa (= Aronia melanocarpa)*. The sparse herbaceous layer for more open situations can include *Clintonia borealis, Dennstaedtia punctilobula, Dryopteris campyloptera, Dryopteris intermedia, Huperzia lucidula, Lycopodium clavatum, Lycopodium obscurum, Lycopodium dendroideum, Lycopodium hickeyi (= Lycopodium obscurum var. isophyllum), Medeola virginiana, Mitchella repens, Oxalis montana, Trillium undulatum*, and *Rugelia nudicaulis* (in the Great Smoky Mountains). Nonvascular plants are common, especially on moister sites, where they grow on branches and rocks and around the bases of trees and shrubs. Bryophyte species include *Bazzania trilobata, Hylocomium splendens, Polytrichum* sp., *Brotherella recurvans*, and *Dicranum* sp.

Global: *Picea rubens*, *Rhododendron catawbiense*, *Rhododendron maximum*, *Tsuga canadensis*

OTHER NOTEWORTHY SPECIES

Global: Vulnerable Plants: *Abies fraseri* (G2, Southern Blue Ridge endemic), *Ageratina altissima* var. *roanensis* (G5T3T4, Southern Blue Ridge endemic), *Rugelia nudicaulis* (G3), *Solidago glomerata* (G3); **Other Plants**: *Bazzania trilobata* (G5), *Streptopus lanceolatus var. roseus* (G5T4)

CONSERVATION STATUS RANK

Global Rank & Reasons: G2G3 (15-Mar-2005). This and related vegetation types are environmentally restricted within a somewhat geographically restricted range. Their former extent has been reduced to more-or-less isolated, small patches by logging and subsequent fires (Allard and Leonard 1952, Clarkson 1964, Pielke 1981, Stephenson and Clovis 1983). Grank changed to G2G3 from G2? with merging in of two related associations (March 2005). The range of the combined type is from West Virginia south to North Carolina and Tennessee.

RELATED CONCEPTS

Global Similar Types:

- *Picea rubens - (Abies fraseri) / (Rhododendron catawbiense, Rhododendron maximum)* Forest (CEGL007130)
- *Picea rubens - (Abies fraseri) / Vaccinium erythrocarpum / Dryopteris campyloptera / Hylocomium splendens* Forest (CEGL007131)
- *Picea rubens - Tsuga canadensis - Fagus grandifolia / Dryopteris intermedia* Forest (CEGL006029)
- *Picea rubens / Betula alleghaniensis / Bazzania trilobata* Forest (CEGL008501) dominant matrix red spruce forest type within West Virginia; lacks dense evergreen rhododendron shrub layer

CLASSIFICATION

Status: Standard
Classification Confidence: 1 - Strong
Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Classification Comments: Great Smoky Mountains National Park only, known from a few locations where higher elevation hemlock - spruce forests persist. May be high and cold enough to persist for a few years more and a good location for park intervention.
Global Classification Comments: Classification of this unit is supported by 15 plots in Pocahontas, Randolph, and Tucker counties in West Virginia. This association was determined not to be distinct from former *Picea rubens - Tsuga canadensis / Rhododendron maximum* Forest (CEGL006272) which was merged into this concept. Likewise, former *Picea rubens / Rhododendron catawbiense* Forest (CEGL006163) of West Virginia also was considered floristically indistinct and is now also included in the concept of CEGL006152.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Southern Blue Ridge Project Area) Range: No data are available.
Global Range: This association ranges sporadically at appropriate elevations from the Great Smoky Mountains in the Southern Blue Ridge of North Carolina and Tennessee, north to the Central Appalachians in West Virginia. It is not known from Pennsylvania.

G743. LAURENTIAN-ACADIAN HARDWOOD FOREST

Group Summary Description: This group covers forests around the northern Great Lakes, New England, and adjacent Canada dominated by some combination of northern hardwoods *Acer saccharum, Betula alleghaniensis, Fagus grandifolia, Fraxinus americana, Prunus serotina*, and *Tilia americana*, with presence of conifers, including *Tsuga canadensis* and *Pinus strobus*, or in the eastern part of the range, *Picea rubens* and minor but frequent *Abies balsamea*. They are characteristic of mesic soils, ranging from dry-mesic to wet-mesic settings. Conifers contain <25% cover, and typically include *Tsuga canadensis* and *Pinus strobus*. Early-successional stages may be dominated by *Abies balsamea, Acer rubrum, Betula papyrifera*, or *Populus tremuloides*, often with *Pinus strobus*. With the exception of *Quercus rubra*, oaks are generally unimportant, and then usually on somewhat drier sites or sites with a relatively recent fire history.

A3224 *Acer saccharum - Fagus grandifolia - Betula alleghaniensis* Forest Alliance

Alliance Summary Description: This alliance is composed of rich mesic forests. Stands typically have a closed canopy. Most of the trees are deciduous, but conifers are often scattered throughout the stands. *Acer saccharum* is dominant in the overstory and sapling layer. *Betula alleghaniensis, Fagus grandifolia* (in the eastern two-thirds of this alliance's range), and *Tilia americana* may be codominants. Other common trees include *Abies balsamea, Acer rubrum, Fraxinus americana, Ostrya virginiana, Picea glauca, Pinus strobus, Quercus rubra*, and *Tsuga canadensis*. *Picea rubens* can be found in high-elevation stands in the East. The dense overstory inhibits the growth of an abundant shrub layer. *Acer pensylvanicum* (in the East), *Corylus cornuta, Hamamelis virginiana, Lonicera canadensis, Taxus canadensis*, and *Viburnum acerifolium* are typical shrubs. Many of the common herbaceous species are typical of sub-boreal communities. These include *Aralia nudicaulis, Chimaphila maculata, Clintonia borealis, Lycopodium* spp., *Maianthemum canadense, Osmorhiza claytonii, Oxalis montana, Pteridium aquilinum*, and *Streptopus lanceolatus var. longipes (= Streptopus roseus)*. This alliance is found in the north-central and northeastern United States and adjacent southern Canada. Stands of this alliance are found on moderate to deep (60-150 cm) sandy loam, clay loam, or loamy sand soils that are typically slightly acidic to circumneutral, mesic to wet-mesic and nutrient-rich. Most stands develop on flat to moderate slopes over glacial till. A relatively thick layer of fallen leaves covers the forest floor. Sites that support this alliance are on flat to moderately sloping terrain on glacial features, such as till or moraines, or on calcareous rocks, sandstone, or shale outside the glaciated region.

[CEGL006631] *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest

Translated Name: **Sugar Maple - Yellow Birch - American Beech / Hobblebush Forest**
Common Name: **Northern Hardwood Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hardwood Forest (G743)
Alliance	*Acer saccharum - Fagus grandifolia - Betula alleghaniensis* Forest Alliance (A3224)

ELEMENT CONCEPT

Global Summary: This association, known commonly as "northern hardwood forest," is a widespread matrix forest in central New England and at lower elevations in northern New England, and the montane regions of New York. This forest occurs most commonly on acidic (pH 5-6), moderate to well-drained tills at elevations generally below 762 m (2500 feet). In northern New England, they cover extensive mid-elevation ridges; elsewhere, slope settings are common. The closed-canopy forest has sparse to moderate shrub and herb cover and may have local carpets of tree seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. The closed-canopy forest has sparse to moderate shrub and herb cover and may have local carpets of tree seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. On some rocky, higher-elevation sites, dense ferns and other herbs may form a lush understory (the "fern-glade variant"). The canopy is dominated by *Acer saccharum* mixed with variable amounts of *Fagus grandifolia* and/or *Betula alleghaniensis*. Associated hardwood species include *Acer rubrum, Betula papyrifera*, and *Fraxinus americana*. At the southern end of this type's range, especially in mid-

successional stands, *Betula lenta* may be present. Conifers are usually present at low abundance. Characteristic species include *Pinus strobus, Tsuga canadensis*, and *Picea rubens*. Oaks are generally not present, although *Quercus rubra* is sometimes present in low numbers. The shrub layer is often dominated by saplings of canopy tree species Characteristic understory shrubs or small trees include *Acer pensylvanicum, Ostrya virginiana, Viburnum lantanoides*, and *Acer spicatum*. The patchy herbaceous layer is a mix of ferns, rhizomatous herbs and clubmosses. Characteristic species include *Dryopteris intermedia, Dryopteris carthusiana, Polystichum acrostichoides, Huperzia lucidula, Maianthemum canadense, Clintonia borealis, Trientalis borealis, Oclemena acuminata (= Aster acuminatus)*, and *Uvularia sessilifolia*. Occasional species include *Aralia nudicaulis, Trillium erectum, Trillium undulatum, Dryopteris campyloptera, Streptopus lanceolatus (= Streptopus roseus), Cinna latifolia, Thelypteris noveboracensis, Mitchella repens, Solidago macrophylla*, and *Medeola virginiana*. The bryophyte layer may include *Dicranum* spp. and *Leucobryum glaucum*. Sugar maple leaf litter is high in nitrogen relative to lignin and thus decomposes rapidly, increasing the nutrient pool in the soil organic layer. Structure and composition of the forest are maintained primarily by single small tree-fall gaps. Yellow birch is maintained in the system by mineral soils on "tip-up mounds."

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This widespread matrix forest association is found throughout the Northern Appalachian project area at low to mid elevations ranging from 150 to 700 m (490-2,300 feet) on gentle to steep low to high slopes on all aspects. Soils are typically mesic and composed of sandy loam, loam, and silt loam with abundant litter and duff.

Global Environment: This association, known commonly as "northern hardwood forest," is a widespread matrix forest in central New England, lower elevations in northern New England and montane regions of New York. This forest occurs most commonly on acidic (pH 5-6), moderate to well-drained tills at elevations generally below 760 m (2500 feet). In northern New England, they cover extensive mid-elevation ridges; elsewhere, slope settings are common.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy deciduous forests. Canopies are highly variable and dominated or codominated by *Acer saccharum, Fagus grandifolia*, and/or *Betula alleghaniensis* with *Acer pensylvanicum* often forming an open subcanopy. The conifers *Abies balsamea* and *Picea rubens* are common associates. Early-successional species such as *Betula papyrifera, Populus grandidentata*, and *Prunus serotina* often occur in younger stands at low cover. *Viburnum lantanoides* is the most consistent dominant shrub in stands. However, many sites have a tall-shrub layer heavily dominated by saplings of canopy species. No other shrub species occur with notable frequency. The herbaceous layer is diverse and most frequently dominated by the ferns *Dennstaedtia punctilobula, Dryopteris campyloptera*, and *Dryopteris intermedia*. Numerous forbs and graminoids occur in association and may include *Aralia nudicaulis, Arisaema triphyllum, Brachyelytrum erectum, Carex debilis, Carex intumescens, Clintonia borealis, Maianthemum canadense, Maianthemum racemosum, Medeola virginiana, Oclemena acuminata, Oxalis montana, Streptopus lanceolatus, Trientalis borealis, Trillium erectum, Trillium undulatum*, and *Uvularia sessilifolia*.

Global Vegetation: The closed-canopy forest has sparse to moderate shrub and herb cover and may have local carpets of tree seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. On some rocky, higher-elevation sites, dense ferns and other herbs may form a lush understory (the "fern-glade variant"). The canopy is dominated by *Acer saccharum* mixed with variable amounts of *Fagus grandifolia* and/or *Betula alleghaniensis*. Associated hardwood species include *Acer rubrum, Betula papyrifera*, and *Fraxinus americana*. Conifers are usually present at low abundance. Characteristic species include *Pinus strobus, Tsuga canadensis*, and *Picea rubens*. Oaks are generally not present, although *Quercus rubra* is sometimes present in low numbers. The shrub layer is often dominated by saplings of canopy tree species. Characteristic understory shrubs or small trees include *Acer pensylvanicum, Ostrya virginiana, Viburnum lantanoides*, and *Acer spicatum*. The patchy herbaceous layer is a mix of ferns, rhizomatous herbs and clubmosses. Characteristic species include *Dryopteris intermedia, Dryopteris carthusiana, Polystichum acrostichoides, Huperzia lucidula, Maianthemum canadense, Clintonia borealis, Trientalis borealis, Oclemena acuminata (= Aster acuminatus)*, and *Uvularia sessilifolia*. Occasional species include *Aralia nudicaulis, Trillium erectum, Trillium undulatum, Dryopteris campyloptera, Streptopus lanceolatus (= Streptopus roseus), Cinna latifolia, Thelypteris noveboracensis, Mitchella repens, Solidago macrophylla*, and *Medeola virginiana*. The bryophyte layer may include *Dicranum* spp. and *Leucobryum glaucum*. At higher elevations any of the understory herbs characteristic of montane spruce-fir forests may be locally abundant.

Global Dynamics: Sugar maple leaf litter is high in nitrogen relative to lignin and thus decomposes rapidly, increasing the nutrient pool in the soil organic layer. Structure and composition of the forest are maintained primarily by single small tree-fall gaps. Yellow birch is maintained in the system by mineral soils on "tip up mounds."

Global: *Acer pensylvanicum*, *Acer saccharum*, *Betula alleghaniensis*, *Dryopteris intermedia*, *Fagus grandifolia*, *Ostrya virginiana*, *Pinus strobus*, *Polystichum acrostichoides*, *Tsuga canadensis*, *Viburnum lantanoides*

OTHER NOTEWORTHY SPECIES

Global: Invasive/Exotic Plants: *Berberis thunbergii* (High/Medium), *Microstegium vimineum* (High/Medium)

CONSERVATION STATUS RANK

Global Rank & Reasons: G5 (2-Dec-2014). This association is a widespread matrix forest in central and northern New England, upstate New York, and adjacent Canada.

RELATED CONCEPTS

Global Similar Types:
- *Acer saccharum - (Fraxinus americana) / Arisaema triphyllum* Forest (CEGL006211)
- *Acer saccharum - Betula* spp. - *Fagus grandifolia* Ruderal Forest (CEGL006628)
- *Acer saccharum - Fagus grandifolia - Betula* spp. / *Maianthemum canadense* Forest (CEGL005004)
- *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632)
- *Acer saccharum - Fraxinus americana / Acer spicatum / Caulophyllum thalictroides* Forest (CEGL006636)
- *Acer saccharum - Pinus strobus / Acer pensylvanicum* Forest (CEGL005005)
- *Betula alleghaniensis - Picea rubens / Dryopteris campyloptera* Forest (CEGL006267)
- *Tsuga canadensis - (Betula alleghaniensis) - Picea rubens / Cornus canadensis* Forest (CEGL006129)

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Global Classification Comments: This type is separated from *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632) by the stronger dominance and more consistent presence of *Betula alleghaniensis*, and the occasional presence of *Picea rubens* and *Abies balsamea*. Distinctions in shrub and ground layer species needs further review.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is the matrix-forming vegetation throughout the Northern Appalachian project area at low to mid elevations.
Global Range: This association is a widespread matrix forest from southern Quebec and the Maritime Provinces of Canada south through northern and central New England and montane regions of New York.

A3240 *Acer saccharum - Tilia americana - Fraxinus americana* Forest Alliance

Alliance Summary Description: These are generally known as "rich forests" and "rich northern hardwood forests." The tree canopy of these forests is variable, but *Acer saccharum, Betula alleghaniensis, Fraxinus americana, Populus tremuloides* (in the Great Lakes), and *Tilia americana* are almost always present. Associated canopy trees often include *Acer spicatum, Betula lenta, Fagus grandifolia, Ostrya virginiana*, and *Prunus serotina var. serotina*. The shrub layer is variable in cover depending on site characteristics and canopy density. Common species include *Cornus alternifolia, Corylus americana, Dirca palustris, Hamamelis virginiana, Lonicera canadensis, Sambucus racemosa (= Sambucus pubens), Viburnum acerifolium*, and *Viburnum lantanoides (= Viburnum alnifolium)*. Typical herbs include *Adiantum pedatum, Arisaema triphyllum, Asarum canadense, Cardamine* spp., *Carex platyphylla, Caulophyllum thalictroides, Osmorhiza* spp., *Sanguinaria canadensis, Solidago flexicaulis, Trillium grandiflorum*, and *Viola* spp. This alliance is found in the northern Great Lakes, northeastern United States and southern Canada. Stands of this alliance occur in a variety of settings, including gentle to steep slopes, boulder talus, or in valleys adjacent to floodplains. Soils are usually deep, moderately to well-drained sands, loams, silt loams, moderately acidic to moderately alkaline, and of high fertility, often derived from calcareous parent materials. Soil moisture-holding and cation-exchange capabilities are high.

[CEGL006211] *Acer saccharum - (Fraxinus americana) / Arisaema triphyllum* Forest

Translated Name: **Sugar Maple - (White Ash) / Jack-in-the-Pulpit Forest**
Common Name: **Semi-rich Northern Hardwood Forest**

USNVC CLASSIFICATION

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hardwood Forest (G743)
Alliance	*Acer saccharum - Tilia americana - Fraxinus americana* Forest Alliance (A3240)

ELEMENT CONCEPT

Global Summary: These are northern hardwood forests of slightly enriched soils in the northern Appalachian Mountains and adjacent northeastern United States and Canada. They occur at moderate elevations of 245 to 610 m (800-2000 feet) on slightly enriched soils, often silt loams derived from pelite or other subacidic bedrock. Ridgetops and slight concavities on hillslopes are both typical settings. They may occur as inclusions within typical northern hardwood forests or may occur over larger areas and be the locally dominant northern hardwood forest. The closed-canopy forest has sparse to moderate shrub cover, moderate herb cover, and may have local carpets of *Acer saccharum* seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. The canopy is dominated by *Acer saccharum*, frequently with *Fraxinus americana* as an associate or even canopy codominant. Other associated hardwood species include *Betula alleghaniensis* and *Betula lenta*. *Fagus grandifolia* is often present but less abundant than in matrix northern hardwood forests. *Liriodendron tulipifera* may occur in southern New England. Conifers are usually sparse. Shrubs can include *Cornus alternifolia, Lindera benzoin, Sambucus racemosa (= Sambucus pubens), Acer pensylvanicum*, and *Ostrya virginiana*. Typical herbs of this semi-rich type, which are scarce or absent from standard beech-birch-maple forests, include *Arisaema triphyllum, Viola rotundifolia, Tiarella cordifolia, Actaea pachypoda, Osmunda claytoniana, Osmunda cinnamomea, Carex laxiculmis, Carex platyphylla, Carex pedunculata, Eurybia divaricata, Botrychium* spp., and *Solidago flexicaulis*. These forests are intermediate in nutrient regime and composition between *Acer saccharum - Fraxinus americana / Acer spicatum / Caulophyllum thalictroides* Forest (CEGL006636), *Acer saccharum - Tilia americana / Acer pensylvanicum / Caulophyllum thalictroides* Forest (CEGL006637), *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006631), and *Acer saccharum - Fagus grandifolia - Fraxinus americana / Arisaema triphyllum* Forest (CEGL006632). They are more depauperate than other communities of this alliance, for example lacking rich-soil indicators such as *Adiantum pedatum, Caulophyllum thalictroides*, and *Tilia americana* that are typical of CEGL006636 and/or CEGL006637.

ENVIRONMENTAL DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Environment: This sugar maple - ash forest occurs globally at moderate elevations of 245-610 m (800-2,000 feet) on slightly enriched soils often in cove and toeslope settings, from Pennsylvania north to Maine. Sites range from moderate to steep low to midslopes and toeslopes with mostly southern, western, and northern aspects. Soils are typically mesic well-drained loam and sandy loam. The unvegetated surface consists of leaf litter, with lesser amounts of large rocks and downed wood and occasional exposed bedrock, small rocks, and bare soil. Evidence of disturbance includes trails, past clearing, erosion, fire, wind damage, grazing/browsing, and the presence of many exotic plant species.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This forest association is found scattered throughout the Northern Appalachian project area at low to mid elevations ranging from 200 to 800 m (655-2,625 feet) on gentle to steep low to mid slopes on all aspects. Soils are slightly enriched and composed of mesic sandy clay, sandy loam, loam and silt loam with abundant litter and duff.

Global Environment: These are northern hardwood forests of slightly enriched soils in the northern Appalachian Mountains and adjacent northeastern United States and Canada. They occur at moderate elevations of 245 to 610 m (800-2000 feet) on slightly enriched soils, often silt loams derived from pelite or other subacidic bedrock. Ridgetops and slight concavities on hillslopes are both typical settings.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Lower New England Project Area) Vegetation: The canopy is dominated by a combination of *Acer saccharum, Betula alleghaniensis, Fraxinus americana*, and/or less commonly *Fagus grandifolia*. *Acer pensylvanicum* and *Acer spicatum* are common in the understory. Herbs are semi-rich, including *Viola rotundifolia, Athyrium filix-femina, Arisaema triphyllum, Maianthemum racemosum, Tiarella cordifolia, Actaea pachypoda, Medeola virginiana, Carex laxiculmis, Carex platyphylla, Botrychium* spp., *Solidago flexicaulis, Osmunda claytoniana*, and *Osmunda cinnamomea*. This community lacks strong-enrichment indicator species such as *Caulophyllum thalictroides, Adiantum pedatum, Asarum canadense*, and *Panax quinquefolius*. In addition, this community supports NJ state-critically imperiled *Viburnum lantanoides*, MA and VT state-imperiled *Carex*

aestivalis and *Carex laxiculmis*. However, this community has also been heavily invaded by exotic species; a total of 13 taxa were report from the sampled plots.

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by deciduous forest vegetation dominated by *Acer saccharum* in association with or codominated by *Fraxinus americana* and/or *Betula alleghaniensis*. Shrub species are not prevalent and *Corylus cornuta* and *Viburnum lantanoides* are the most frequent. A rich herbaceous layer is characteristic of this association and numerous species may occur. Stands can be fern-, graminoid- or forb-dominated. The most common species include *Ageratina altissima, Arisaema triphyllum, Aralia nudicaulis, Athyrium filix-femina, Brachyelytrum erectum, Carex gracillima, Carex intumescens, Carex pedunculata, Dryopteris intermedia, Dryopteris marginalis, Onoclea sensibilis, Osmunda claytoniana, Solidago flexicaulis*, and *Thelypteris noveboracensis*.

Global Vegetation: The closed-canopy forest has sparse to moderate shrub cover, moderate herb cover, and may have local carpets of *Acer saccharum* seedlings in the ground vegetation. Bryoids are a minor component of the forest floor. The canopy is dominated by *Acer saccharum*, with associated hardwood species including *Betula alleghaniensis* and *Fraxinus americana*. *Fraxinus* may be a canopy codominant in some areas. *Fagus grandifolia* is often present but less abundant than in matrix northern hardwood forests. Conifers are usually sparse. Shrubs can include *Cornus alternifolia, Sambucus racemosa (= Sambucus pubens), Acer pensylvanicum*, and *Ostrya virginiana*. Typical herbs of this semi-rich type, which are scarce or absent from standard beech-birch-maple forests, include *Arisaema triphyllum, Viola rotundifolia, Tiarella cordifolia, Actaea pachypoda, Botrychium* spp., and *Solidago flexicaulis*.

CLASSIFICATION

Status: Standard
Classification Confidence: 2 - Moderate
Appalachian National Scenic Trail (Lower New England Project Area) Classification Comments: This is a semi-rich northern hardwood forest community. It has a few enrichment indicators such as *Carex deweyana, Arisaema triphyllum*, and *Carex laxiflora* in the herbaceous layer and trees such as *Fraxinus americana* and *Acer saccharum* in the canopy. It includes diffuse seepage runs and rivulet drainages under the canopy. New Jersey examples lack *Ostrya virginiana* and *Tilia americana*. In Shrewsbury in Rutland County, Vermont, *Carex laxiculmis* is a moist and fertile indicator along with high upland sedge diversity (*Carex debilis, Carex gracillima, Carex pedunculata, Carex communis, Carex digitalis, Carex deweyana*).
Appalachian National Scenic Trail (Lower New England Project Area) Other Comments: None.
Global Classification Comments: This type is conceptually well understood, but not well documented in published sources. Additional characterization would be helpful.

ELEMENT DISTRIBUTION

Appalachian National Scenic Trail (Lower New England Project Area) Range: This community was sampled in Massachusetts (Day Mountain, Tully Mountain, Warner Hill), New Jersey (Pochuck Creek, Wawayanda State Park), New York (Sterling Forest), and Vermont (Bear Mountain, Prosper NW Hills, Shrewsbury, Stratton Pond vicinity Wallingford Pond West, Winhall).
Appalachian National Scenic Trail (Northern Appalachian Project Area) Range: This association is found throughout the Northern Appalachian project area at low to mid elevations. Known locations include Lambert Ridge, east of Quintown, east of Mount Cube, Moose Mountain, Franconia Notch, Wildcat Ridge and Old Jackson Road in New Hampshire and Little Wilson Stream, Pleasant River and Nahmakanta Lake in Maine.
Global Range: This forest association occurs in New England west to New York and Ontario and south to Pennsylvania and New Jersey.

[CEGL006636] *Acer saccharum - Fraxinus americana / Acer spicatum / Caulophyllum thalictroides* Forest

Translated Name: **Sugar Maple - White Ash / Mountain Maple / Blue Cohosh Forest**
Common Name: **Northern Sugar Maple - Ash Rich Mesic Forest**

USNVC Classification

Division	Eastern North American Forest & Woodland (1.B.2.Na)
Macrogroup	Laurentian-Acadian Mesic Hardwood - Conifer Forest (M014)
Group	Laurentian-Acadian Hardwood Forest (G743)
Alliance	*Acer saccharum - Tilia americana - Fraxinus americana* Forest Alliance (A3240)

Element Concept

Global Summary: This rich sugar maple - white ash forest is found from the northern regions of the northeastern United States and maritime Canada west to Ontario and Michigan in the central Great Lakes region. Stands occur on nutrient-rich, mesic or wet-mesic settings on sloped to rolling terrain. Slope bottoms, where colluvium collects, are a common landscape position. The surface soils are deep sand, loamy sand, or loam and may be underlain by sandy clay loam to clay loam. The sites are somewhat poorly drained to well-drained and can have a water table 0.4-2 m below the surface. Small (<1 ha) seep areas that may occur within these forests have soils that are usually saturated. This forest community has a well-developed tree canopy composed of deciduous species. Shrubs are scattered, but the herbaceous stratum is generally extensive. Bryoids are only a minor component of the ground layer, which is predominantly nitrogen-rich sugar maple leaves. *Acer saccharum* and *Fraxinus americana* are the dominant trees; *Tilia americana* is frequent but not necessarily abundant. *Ostrya virginiana* is very common as a small tree. *Acer rubrum, Betula alleghaniensis, Fagus grandifolia*, and *Prunus serotina* are typical associates, in small amounts. *Ulmus rubra* and *Juglans cinerea* are occasional. Shrubs that may be found in this community include *Cornus alternifolia, Viburnum lantanoides (= Viburnum alnifolium), Hamamelis virginiana, Dirca palustris*, and *Lonicera canadensis*. The ground flora, including many spring ephemerals, is diverse and consists primarily of nutrient- and light-requiring species. Many of these flower and fruit early in the spring before the tree canopy has fully leafed out. Fern richness is often high. Various sedges are present (particularly the Laxiflorae). These forests are differentiated from less-rich northern hardwood forests, e.g., *Acer saccharum - Betula alleghaniensis - Fagus grandifolia / Viburnum lantanoides* Forest (CEGL006631), primarily by their abundant and diverse herbaceous layer, as well as by the greater prominence of sugar maple and ash in the canopy and reduced importance of beech.

Environmental Description

Appalachian National Scenic Trail (Northern Appalachian Project Area) Environment: This uncommon forest association is only known from two locations in Vermont at 520 to 560 m (1,705-1,840 feet) in elevation on moderate to steep mid to high slopes on eastern aspects. Soils are mesic sandy loams with abundant litter and duff.
Global Environment: In the Northern Appalachian region, sites occur in enriched cove and concave slopes within northern hardwood forests. The elevation of known examples ranges from 115-830 m (380-2700 feet). Ground cover is deciduous litter, predominantly of nitrogen-rich sugar maple leaves.

VEGETATION DESCRIPTION

Appalachian National Scenic Trail (Northern Appalachian Project Area) Vegetation: This association is characterized by closed-canopy deciduous forests dominated by *Acer saccharum* and codominated by or in association with *Fraxinus americana*. *Tilia americana, Fagus grandifolia, Betula alleghaniensis*, and *Ostrya virginiana* are common associates at low cover. *Acer pensylvanicum* commonly forms an open subcanopy. Shrub species have low consistency and cover, and the shrub layer is typically dominated by saplings of canopy species. Shrub species at low cover may include *Cornus alternifolia, Ribes glandulosum, Sambucus racemosa, Viburnum lantanoides*, and *Zanthoxylum americanum*. The herbaceous layer is lush, diverse and forb-dominated, most often by *Laportea canadensis*. Other herbaceous associates may include *Adiantum pedatum, Arisaema triphyllum, Athyrium filix-femina, Carex plantaginea, Caulophyllum thalictroides, Deparia acrostichoides, Dryopteris goldiana, Dryopteris intermedia, Hydrophyllum virginianum, Laportea canadensis, Osmorhiza claytonii*, and *Solidago flexicaulis*.

Global Vegetation: This forest community has a well-developed tree canopy composed of deciduous species. Shrubs are scattered, but the herbaceous stratum is well-represented. *Acer saccharum* and *Fraxinus americana* are the dominant trees; *Tilia americana* is frequent but not necessarily abundant. *Ostrya virginiana* is very common as a small tree. *Quercus rubra, Acer rubrum, Betula alleghaniensis, Fagus grandifolia*, and *Prunus serotina* are typical associates. *Ulmus rubra* and *Juglans cinerea* are occasional. Shrubs that may be found in this community include *Cornus alternifolia, Viburnum lantanoides (= Viburnum alnifolium), Hamamelis virginiana, Dirca palustris*, and *Lonicera canadensis*. The ground flora, much of which is spring ephemerals, is diverse and consists primarily of nutrient- and light-requiring species. Many of these flower and fruit early in the spring before the tree canopy has fully leafed out; *Dicentra cucullaria, Dicentra canadensis, Hepatica* spp., *Asarum canadense, Caulophyllum thalictroides, Viola canadensis, Viola rotundifolia, Actaea pachypoda, Osmorhiza claytonii, Panax quinquefolius, Sanguinaria canadensis*, and *Erythronium americanum* are typical. Fern richness is often high, with characteristic species including *Adiantum pedatum, Cystopteris bulbifera, Deparia acrostichoides (= Athyrium thelypterioides), Dryopteris goldiana, Dryopteris filix-mas, Dryopteris marginalis, Botrychium virginianum, Athyrium filix-femina, Phegopteris hexagonoptera (= Thelypteris hexagonoptera)*, and, especially in seepy spots, *Matteuccia struthiopteris*. Various sedges are present (particularly the Laxiflorae group) such as *Carex laxiflora, Carex platyphylla, Carex plantaginea, Carex leptonervia, Carex hitchcockiana, Carex aestivalis, Carex davisii, Carex bebbii*, and others. The herbaceous flora in seeps often contains *Calamagrostis canadensis, Carex scabrata, Ageratina altissima (= Eupatorium rugosum), Glyceria melicaria, Impatiens capensis* (sometimes *Impatiens pallida* as well), and *Solidago flexicaulis*. One state-rare plant species, *Cuscuta rostrata*, is associated with this vegetation type.

MOST ABUNDANT SPECIES

Appalachian National Scenic Trail (Northern Appalachian Project Area)

Stratum	Lifeform	Species
Tree (canopy & subcanopy)	Broad-leaved deciduous tree	*Acer saccharum*, *Fraxinus americana*
Shrub/sapling (tall & short)	Broad-leaved deciduous shrub	*Cornus alternifolia*, *Ribes glandulosum*, *Sambucus racemosa*, *Viburnum lantanoides*, *Zanthoxylum americanum*
Herb (field)	Flowering forb	*Caulophyllum thalictroides*, *Laportea canadensis*

Global

Stratum	Lifeform	Species
Tree (canopy & subcanopy)	Broad-leaved deciduous tree	*Acer saccharum*
Tree canopy	Broad-leaved deciduous tree	*Fraxinus americana*
Tree subcanopy	Broad-leaved deciduous tree	*Ostrya virginiana*
Shrub/sapling (tall & short)	Broad-leaved deciduous shrub	*Cornus alternifolia*, *Dirca palustris*, *Hamamelis virginiana*, *Lonicera canadensis*, *Viburnum lantanoides*
Herb (field)	Graminoid	*Carex* spp.
Herb (field)	Fern (Spore-bearing forb)	*Adiantum pedatum*, *Botrychium virginianum*

CHARACTERISTIC SPECIES

Appalachian National Scenic Trail (Northern Appalachian Project Area): *Acer saccharum*, *Caulophyllum thalictroides*, *Fraxinus americana*, *Laportea canadensis*

Global: *Acer saccharum*, *Adiantum pedatum*, *Allium tricoccum*, *Botrychium virginianum*, *Cardamine diphylla*, *Carex* spp., *Caulophyllum thalictroides*, *Claytonia caroliniana*, *Dryopteris goldiana*, *Fraxinus americana*, *Milium effusum*, *Phlox stolonifera*, *Tiarella cordifolia*, *Tilia americana*, *Viola blanda*, *Viola canadensis*

OTHER NOTEWORTHY SPECIES

Appalachian National Scenic Trail (Northern Appalachian Project Area): Vulnerable Plants: *Dryopteris goldiana* (G4G5, NH state-imperiled); **Invasive/Exotic Plants**: *Galeopsis tetrahit* (exotic/invasive)
Global: Vulnerable Plants: *Cuscuta rostrata* (G4, VA state-rare), *Panax quinquefolius* (G3G4, under collection pressure)

CONSERVATION STATUS RANK

Global Rank & Reasons: G4? (3-Dec-2014). This community has a wide geographic distribution, but is locally distributed within its range due to specific requirements for mesic sites with fertile soils. In gentler topographic regions, many examples of this community have probably been destroyed for agriculture, and most remaining examples elsewhere have been altered by past logging. Consequently much of the remaining acreage is of variable quality.
