This archaeological survey focused on previously identified areas of the base determined to have moderate to high potential for archaeological resources. These 34 areas, totaling approximately 120 acres, were identified through a previous archaeological reconnaissance survey and soils inspection conducted in 1991-1992 (see Report #25-1728). All are located within portions of Hanscom AFB (Bedford, Concord, Lexington, and Lincoln, Massachusetts), which were believed to have the least amount of disturbance to the original ground surface and therefore the greatest likelihood of containing intact soils and archaeological sites. A total of 568 shovel test pits (STPs) including seven radial STPs was excavated, generally at 25 meter intervals. Archaeological testing revealed that previous construction and earthmoving activities, had impacted soils in most of the areas. Of the 34 moderate to high probability areas, only six (Areas 12, 14, 17, 20, 21, and 34) exhibited no disturbances to the original soil profile. All six of these areas were mapped as containing at least some degree of modern soils and some were mapped as completely covered by disturbed soil series. An additional six areas (Areas 2, 6, 7, 10, 30, and 32) had been completely disturbed from recent earthmoving or construction activities and contained no intact soils. Seven of the 34 testing areas contained at least one STP with artifacts from intact soils. However, only Area 31 had sufficient quantities of artifacts to warrant site designation. The remaining areas contained small numbers of 19th- and 20th-century cultural materials in very limited concentrations, which are attributed to “field trash.” A number of dry-laid stone walls were identified, but were not given archaeological site designations. Locations of these stone walls are indicated on figures for each area. The single archaeological site identified in Area 31 (LEX-HA-9) is a discrete, short-term use

dump that dates from ca. the 1910s to the 1930s. The site is located within a wooded area measuring ca. 100 feet east-west and ca. 75 feet north-south, and is visible on the ground surface. Due to standing water at the time of the field survey, no STPs were excavated directly within the surface dump site, although STPs excavated in close proximity revealed artifacts only within the top soil horizon. The majority of the cultural materials collected from the surface of the dump are household and personal artifacts. The dump is located at the extreme southern boundary of Hanscom AFB, adjacent to a stone wall and near the edge of Minute Man National Historical Park. The site LEX-HA-9 represents a domestic refuse dump unassociated with nearby historic structures or sites. Based upon its probable lack of potential to contribute significant information to local or regional history, it is recommended not eligible to the National Register of Historic Places. No further work for site LEX-HA-9 is recommended. Additionally, since no archaeological sites were identified in the rest of the moderate to high probability areas surveyed, no further investigation at any of these locations is warranted. This survey did not specifically search for evidence of the skirmish of April 19, 1775, and no archaeological traces of that event were found in the 34 traces of that were surveyed at Hanscom AFB. We cannot with certainty conclude that battlefield evidence such as spent bullets, buttons, or burials do not still remain in those areas on Hanscom AFB where the engagement took place.

25-1721 Donta, Christopher L.

1998 Archaeological Intensive (Locational) Survey for the Proposed Hockanum School Stabilization Project, Hadley, Massachusetts. 46 pages.

The project area consists of the school grounds surrounding the historic 1840 Hockanum School Field. Testing included 20 shovel test pits and recovered both prehistoric and historic artifacts. A prehistoric site was found on the north side of the school, and avoidance is recommended during construction. Historic artifacts collected relate to the school over the past 150 years. No evidence of earlier structures was found.

25-1722 Decima, Elena, Barbara Donohue-Putnam, and Jeff Carovillano

1997 Intensive Survey of Middlesex Turnpike and Crosby Drive, Bedford and Billerica, MA. 103 pages.

The survey yielded one isolated felsite flake and a single piece of quartz shatter. Neither of the two isolated finds is considered eligible for inclusion in the National Register of Historic Places. The survey also yielded mostly late 19th-to-20th-century historic material, often within mixed contents or in fill layers. It is believed that many of the historic materials are related to the fill activities generated by the road's construction and the commercial development along the turnpike and Crosby Drive. No further archaeological work is recommended. The architectural survey revealed that the historic appearance of the Bowman Tavern (today the 99 Restaurant), built around 1804, has been compromised by structural additions, replacements and alterations, and by the presence of a large new building nearby. It will not be negatively impacted by the road widening. The survey also revealed that the Seth Crosby house, dated to 1810, is no longer standing; the site is unoccupied. No other historic property was located along the corridor.

25-1723 Leveillee, Alan and Burr Harrison

1995 Reconnaissance Archaeological Survey, Conant Land Parcel, Carlisle, Massachusetts. 71 pages.

Research consisted of informant interviews, background research, and multiple walkover inspections. The reconnaissance survey assessed prehistoric and historic archaeological sensitivity and documented recent land use activities. The survey located indications of 19th- and 20th-century agrarian land use. These features include stone walls, stone piles, low densities of 20th-century cultural materials, and a small "crib" foundation. Independent researchers have interpreted the features as Native American markers of celestial events and spiritual expression. This research does

not support these interpretations. Avoidance is recommended in those areas assessed as moderately archaeologically sensitive and for stone piles, stone walls, and the small "crib" foundation in the eastern section of the project area. The higher elevations in the western portions of the survey area are the least likely to contain archaeological resources, and we recommend that any long-range development plans be focused in those sections of the Conant land parcel.

25-1724 Ritchie, Duncan

1992 Intensive Archaeological Survey Elm Bank Water Supply Development, Dover, Massachusetts. 82 pages.

The Elm Bank property is a former estate now listed on the National and State Registers of Historic Places. An initial stratification of the project area was based on a previous reconnaissance survey (see Report #25-1083), background research, and a walkover inspection. Intensive subsurface testing during the survey sampled sections of the project area considered to have high and moderate sensitivity. One small prehistoric site (Locus 1) was identified in the proposed electrical easement between the Charles River and a filled former wetland area. Historic/Modern period cultural resources identified in the survey were not considered to represent potentially significant cultural resources. No further archaeological investigation of the project area is recommended.

25-1725 Garman, James C. and Patricia Fragola

1996 Intensive (Locational) Archaeological Survey of the "Dinah Field" Cemetery (PLY-HA-14), Plymouth, Massachusetts. 37 pages.

The goal of the survey was to identify any potential unmarked burials within the project area. No traces of unmarked burials were identified in any of the 14 trenches excavated during the course of the project. No indications of Native American or EuroAmerican archaeological features were identified. Based on deed research and the results of the archaeological survey, the area of the cemetery is clearly apparent in the field and marked on construction plans. No further survey for the "Dinah Field" Cemetery is recommended provided that protective measures recommended by the Massachusetts Historical Commission to the project proponents are undertaken.

25-1726 Glover, Suzanne and Kevin McBride

1992 Intensive (Locational) Archaeological Survey and Additional Testing, Parcels I, IIA, IIB, III, and Easements Tribal Trust Lands, Gay Head, Massachusetts. 207 pages.

The survey was conducted on approximately 160 acres of Tribal Trust Lands in Gay Head (Aquinnah), Massachusetts. Portions of Parcel I were tested at an earlier date (see Report #25-1164) and a popularized version of archaeological research conducted on Tribal Lands (see Report #25-1364) was also completed. The field investigations identified of 19 prehistoric findspots in the project area. Five of these findspots have been assigned tentative cultural/temporal affiliations dating to the Late Archaic-Transitional Archaic Period (5000-2600 BP) on the basis of projectile points. While these findspots provide information concerning use of the interior upland during this period, they lack sufficient information content to increase an understanding of prehistoric settlement/subsistence systems on Martha's Vineyard. No additional archaeological investigation of these findspots is recommended. Documentary background research and field investigations located and identified ten historic archaeological sites. These sites consist of nine homestead/farmstead-related complexes and the Old Congregational Church site. The structural remains (24 visible foundations/cellar holes), artifact assemblages, food remains, and field systems constitute a complex record of 18th- and 19th-century Native American occupation and land use. The identified historic archaeological resources have the potential to address a number of important research issues related to Native American lifeways during the historic period. They possess important contextual information on environmental, artifactual, and internal site configuration which together contribute to the significance of the project area. The sites individually and as a collective

unit can be considered eligible for inclusion in the National Register of Historic Places as an archaeological district. It is recommended that the results of this study be incorporated into a comprehensive cultural resource management plan by the tribe.

25-1727 Davin, Ann, Virginia H. Adams, Craig Chartier, and Amy McFeeters

1993 Inventory of Historic and Archaeological Resources, Fourth Cliff Recreational Annex, Scituate, Massachusetts. 110 pages.

Fourth Cliff is a 56 acre military property at the northern tip of the Humarock Peninsula. A comprehensive building survey designed to identify and evaluate historic buildings and structures was undertaken. This involved background research, site visits to document the buildings and structures, the application of National Register of Historic Places criteria of eligibility, and the preparation of Massachusetts Historical Commission inventory forms. The survey identified 24 buildings and structures, including seven buildings and three structures dating from ca. 1920-ca. 1943, and 14 buildings dating from 1979 to the present. Survey recommendations concluded that three structures, Battery 208 and the two fire control towers, meet the National Register criteria of eligibility as a small district. An intensive archaeological survey, designed to locate all below-ground cultural resources, involved background research, a walkover inspection, and subsurface testing. The 22 developed acres were ranked as having low potential to contain prehistoric and historic cultural resources due to the vertical and horizontal extent of the disturbance. Subsurface testing was reserved for the 20 undeveloped upland acres in the western part of the property. This area was currently open, but maps dating from the 1940s showed the location of several houses and a road. Due to the presence of nesting locations for two endangered species (the piping plover and terns), a barrier beach on the northern edge, and a tidal saltmarsh to the east, testing was restricted to a 5-6 acre area. During the walkover of this area, structural debris from the former houses and two wells were located. Subsurface testing consisted of 27 50 cm x 50 cm test pits placed along four transects and in a 30 m x 30 m block. Historical cultural material dating to the 20th century was recovered as were cinder blocks and bricks associated with house construction. No earlier historical material and no prehistoric cultural material were found during the subsurface testing. No additional archaeological testing was recommended.

25-1728 King, Marsha K., Edna Feighner, and Duncan Ritchie

1992 Archaeological Reconnaissance Survey of Hanscom Air Force Base, Bedford, Concord, Lexington, and Lincoln, Massachusetts. 133 pages.

The reconnaissance survey included extensive background research, walkover survey, and limited subsurface testing. The major goal of this survey was to locate areas of intact soils and assess their potential to contain undisturbed cultural deposits. The end product of the reconnaissance survey was the stratification of the project area into zones of high, moderate, and low archaeological sensitivity. A total of 40 auger cores and nine test pits were excavated to examine soils. It was determined that the Hanscom Air Force Base project area contained a number of areas of high to moderate archaeological sensitivity, as well as many areas of low sensitivity. One prehistoric site was identified during the subsurface testing near the MIT Lincoln Laboratory facilities. The potential for sites associated with the events of April 19, 1775 also exists within the southern portions of the project area. In addition, 15 historic buildings/structures constructed by or before 1952 were identified within the Hanscom Air Force Base project area. It is recommended that any future development or construction planned within areas of moderate to high archaeological sensitivity, or in the immediate vicinity of identified historic or prehistoric resources, include provisions for intensive archaeological surveys of proposed facility locations (see report #25-1720).

25-1729 Herbster, Holly

1998 Intensive (Locational) Archaeological Survey, Omnipoint Telecommunication Installation,

Omnipoint Site 4DR-5501C, West Tisbury, Massachusetts. 43 pages.

The project parcel is located on a steeply sided hill off Old Courthouse Road in a peripheral section of the North Tisbury community. The project parcel included a 45 sq ft parcel on a hillside terrace and approximately 900 ft of utility and access easement. No previously documented archaeological sites were located within the project parcel. The project parcel was initially given a moderate to high prehistoric archaeological sensitivity and a low historic archaeological sensitivity. It was expected that although no freshwater sources were immediately adjacent, the area could have been used for short-term habitation and/or resource collection by the island's Native American inhabitants. A total of 21 50 cm x 50 cm test pits was excavated along linear transects at 10 m intervals. No cultural resources were identified within the project area, and no additional testing was recommended.

25-1730 Begley, William R. and A. Peter Mair, II

1998 Intensive (Locational) Archaeological Survey, Colonial Cranberry Bogs Project, Halifax, Massachusetts. 64 pages.

A prehistoric resource, the Winnetuxet/ Taunton Site (19-PL-371), is located in the project area. The intensive survey included background research, informant interviews, and field investigations, consisting of a walkover/surface inspection and subsurface testing. A low to moderate density of chipping debris was surface-collected from the Winnetuxet/Taunton Site (quartz, argillite, jasper, hornfels, Blue Hills rhyolite, banded rhyolite). Chipped stone tools included a variety of projectile points of varying raw materials. No surface evidence of prehistoric activity was noted in the remainder of the project area. Subsurface testing consisted of 80 test pits within areas of highest archaeological sensitivity. The absence of any Native American subsurface deposits indicates a poor physical integrity of the Winnetuxet/Taunton Site. Due to the absence of intact Native American or EuroAmerican archaeological deposits, no additional archaeological investigation is recommended.

25-1731 Macpherson, Jennifer and A. Peter Mair, II

1998 Intensive (Locational) Archaeological Survey, South Hadley Golf Course, South Hadley, Massachusetts. 62 pages.

The area surveyed comprised approximately 40 acres of the total project area. Prior surveys of the area, including a reconnaissance survey for the Holyoke Hydroelectric project and a reconnaissance survey along the White Brook sewer easement, did not identify any sites in the project area. Survey efforts included background research, field walkover, and subsurface investigations. A total of 27 50 cm x 50 cm test pits between one block and one transect were excavated to investigate a prominent knoll and a terrace parallel to and west of White Brook. No cultural material was recovered from any of the test pits. A low-density lithic scatter was recorded in a fallow field en route to the survey area.

25-1732 Donta, Christopher L., Thomas L. Arcuti, Carolyn D. Hertz, Richard D. Holmes, and Mitchell T. Mulholland

1998 Archaeological Site Reconnaissance and Locational Surveys for the Proposed Massachusetts Cemetery for Veterans, Agawam, Massachusetts. 78 pages.

Background research identified a number of potentially significant cultural resources located near or within the proposed project area. This included two prehistoric sites, one of which is listed with the state as existing within the project area (19-HD-76), and one historic site (AGA-HA-1), which might include part of the project area. The prehistoric site location was confirmed in an interview with the landowner, who had found Native American material on the property. Reconnaissance survey resulted in the recommendation of three areas for subsurface testing, totaling 172 shovel

test pits. Prehistoric artifacts were identified in the vicinity of the previously recorded site, as well as in a cluster located to the west of this spot that was interpreted as being another locus of the same site, the Tarkill Brook site. Nine prehistoric artifacts were recovered from five test pits. No evidence of any historic sites was found. In April 1998, additional test pits were excavated around a findspot located to the south of the main concentration of prehistoric material. The additional testing proved that this southern outlier was isolated in one test pit. This southern area was not considered significant. Based on the location of a concentration of prehistoric materials within a known prehistoric site, it is recommended that a site preservation restriction be negotiated with the Massachusetts Historical Commission to avoid the site. If construction at the location of the site is necessary, then a site examination archaeological survey is recommended.

25-1733 Begley, William

1998 Reconnaissance Archaeological Survey, Horseneck State Reservation Master Plan, Westport, Massachusetts. 56 pages.

The survey within the 560 acre project area within the Horseneck Beach State Reservation resulted in the stratification of the project area into zones of differing archaeological sensitivity. It is recommended that additional archaeological investigations take place before any new construction, improvements, or upgrades to existing facilities occurs in locations where no previous impacts have taken place and which are within zones of high and moderate archaeological sensitivity.

25-1734 Donta, Christopher L. and Thomas L. Arcuti

1998 Archaeological Site Locational Survey for the Apple D'Or Residential Development, Littleton, Massachusetts. 57 pages.

Background research indicated that no known prehistoric sites were recorded for this area. Historic use of the area was limited and apparently confined to agriculture, particularly as an orchard in recent decades. The project area was divided into three survey units on the basis of topography and proposed impacts and examined for evidence of prehistoric and historic potential. Subsurface testing, using 80 shovel test pits, was conducted in areas having the potential to contain historic and prehistoric sites. No prehistoric or historic artifacts or features were found anywhere in the project area. No further testing is recommended for this project.

25-1735 Fragola, Patricia, Joseph Waller, and Alan Leveillee

1998 Intensive (Locational) Archaeological Survey, Archaeological Site Examinations, Beaver Brook Site, Pasture Site, Fallen Pine Site, Harvard Cellar Hole, Towermarc Golf Course Complex Project Area, Boxborough and Harvard, Massachusetts. 190 pages.

Three intensive surveys had been conducted on various parcels within the overall 323 acre project area in 1988, 1989, and 1996 (see Report #25-1627). These surveys resulted in the discovery of the Beaver Brook (1988), C.T.B., L.G., Oak Hill Wind (1989), Pasture, and Fallen Pine (1996) prehistoric sites, and the Harvard Cellar Hole (1996) historic site. Golf course construction plans include preserving the C.T.B., L.G., and Oak Hill Winds sites within open space. The Pasture, Fallen Pine, and Beaver Brook prehistoric sites and the Harvard Cellar Hole Site could be impacted by proposed construction and were subjected to site examinations. Subsurface testing at the Pasture Site (2100 sq m) recovered a moderate density of prehistoric cultural material reflective of the Laurentian Tradition within the Late Archaic Period. Because of the absence of stratigraphic integrity, no further archaeological investigations were recommended at the Pasture Site. The majority of prehistoric materials from Fallen Pine (1800 sq m) exist in the plowzone stratum; however, a small, truncated feature was noted at the interface of this stratum within undisturbed subsoil. Despite impacts to the site, a differential distribution of lithic debitage can be demonstrated. Chronological association is the Laurentian Tradition of the Late Archaic. It is not, however, considered to have sufficient stratigraphic spatial integrity or future research potential to meet the cri-

teria for listing in the National Register of Historic Places, and no further archaeological investigations are recommended.

25-1736 Donohue, Barbara and Ron Dalton

1998 Reconnaissance Survey for the Attleboro Sewer Installation Project Contracts Nos. 25 and 26, Attleboro, Massachusetts. 69 pages.

Walkovers and background research of the project indicated little visible disturbance in most of the cross-country segments. All cross-country segments of the pipeline are within close proximity to the Bungay River, its associated wetlands, and a recorded prehistoric site. Therefore, most cross-country segments are determined to have high potential for containing prehistoric archaeological sites, with the exception of one segment previously disturbed by pipeline installation. On the basis of historic map and documentary research, only some cross-country segments were determined to have potential for containing historic archaeological sites. Therefore, it is recommended that, prior to any construction-related activities, an intensive (locational) survey be conducted in the cross-country segments designated as having archaeological potential. (See also Reports #25-14 and #25-739.)

25-1737 Jacobson, Victoria

1998 Archaeological Survey of the Great Meadows National Wildlife Refuge for Culvert and Building Construction, Sudbury, Middlesex County, Massachusetts. 53 pages.

The project impact area includes 6 culvert locations on the Headquarters tract and one culvert location plus 279 sq m for the new building location. We used shovel test excavation to survey the project areas. Our survey did not identify any archaeological resources within the project construction area that are eligible for inclusion in the National Register of Historic Places.

25-1738 Cherau, Suzanne G., Jennifer Macpherson, and Timothy Binzen

1998 Historical and Archaeological Reconnaissance Survey, Knightville Dam, Huntington and Chesterfield, Massachusetts. Volume I, 143 pages; Volume II, 308 pages.

The survey covered the approximately 2,430 acre project area, of which approximately 2,231 acres were testable. Prior to examination, the floodplain and terraces roughly 400 acres in size, was assessed as having areas of high prehistoric and historic sensitivity. However, below the 525 ft elevation, it was thought the area was deeply covered with eroded soils, and therefore only about 200 acres were initially calculated to be testable by hand. The upland areas, roughly 1,800 acres in size, were considered to have areas of moderate prehistoric and historic sensitivity. Field investigations resulted in the identification of nine previously unknown prehistoric activity areas (six sites, three findspots), which collectively have the potential to contribute information concerning the prehistory of the Westfield River drainage in western Massachusetts. Their subsurface integrity, as shown by limited testing, is generally very good to excellent, and collected diagnostic materials indicate at least one occupation dating to the Late Woodland Period. Avoidance and protective measures are recommended for the known site locations and archaeologically sensitive prehistoric areas within the Knightville Dam Corps of Engineers property. Prior to the archaeological investigations, there were 40 reported historic archaeological sites within the Knightville Dam project area. Of these 40 sites, 30 were identified during an archaeological survey conducted by the Army Corps of Engineers in 1982. The field investigations conducted for the current reconnaissance survey resulted in the identification of an additional 11 historic archaeological sites, three of which were reported but not found in 1982. The 41 identified historic sites consist of residences, farmsteads, mill complexes, factories, schools, stores, and bridge abutments. The site occupations date primarily from the 19th to early 20th centuries, although several sites appear to extend back to the 18th century. The 41 identified sites can be linked geographically and thematically across the landscape in the context of dispersed and nucleated rural settlement and industrial

development in western Massachusetts. The identified historic sites and those that have yet to he verified could be considered as an archaeological district. Avoidance and protective measures are recommended for the known site locations and archaeologically sensitive historic areas within the Knightville Dam Corps of Engineers property.

25-1739 Atwood, Kathleen A.

1998 West Hill Dam Historic Properties Management Plan. 225 pages.

This document presents the Historic Properties Management Plan (HPMP) for the West Hill Dam project area, which is located in the towns of Mendon, Northbridge, Uxbridge, and Upton, Massachusetts. The required elements of the HPMP as specified by ER 1130-2-540 are organized within this document into four sections: Policy and Guidance, Overview, Landuse Guide, and the Action Plan, and in supplemental appendices. Appendices include correspondence from the Massachusetts State Historic Preservation Officer (Appendix C), site locational data for the West Hill Dam area (Appendix D), and a proposal and cost estimate for an intensive survey of the West Hill Dam area (Appendix E).

25-1740 Begley, William and David K. Schafer

1998 Plymouth Light Relocation Archaeological Investigations, Plymouth, Massachusetts. 109 pages.

The project area contains two documented Native American sites, fortifications dating from the Revolutionary War, War of 1812, and Civil War, and the present and former lighthouse(s). Background research and informant interviews were conducted to establish context statements. Subsurface testing consisted of 32 50 cm x 50 cm test pits, five 1 m x 1 m excavation units, two 1.5 m x 0.5 m trenches, and a single 1 m x 2 m trench within areas that may be impacted by the proposed relocation. Native American and historic cultural material was recovered from disturbed and undisturbed soils. Prehistoric artifacts are associated with previously documented archaeological site 19-PL-805. Subsurface testing within Fort Andrew verified the wide extent of ground disturbances associated with the construction of earthen revetments. Some units located in the exterior and interior of the fort were only moderately disturbed and have partially intact archaeological integrity. Based on the results of fieldwork, the archaeological integrity of the project area has been severely compromised by 200 years of construction and modification within Fort Andrew. No significant archaeological deposits will be disturbed by the Plymouth Light Relocation Project.

25-1741 Donta, Christopher L., Thomas L. Arcuti, Carolyn D. Hertz, Richard D. Holmes, and Mitchell T. Mulholland

1998 A Site Examination Archaeological Survey of a Small Historic Site for the Montachusett Industrial Park Expansion Project, Fitchburg, Massachusetts. 46 pages.

A previous biological field survey had identified a foundation on a small ridge overlooking the existing industrial buildings. Background research did not identify any private use of this area during the first half of the 19th century. A total of 24 shovel test pits and four 50 cm x 2 m trenches were excavated, in addition to clearing a portion of the site. Domestic artifacts were found in low density, consisting primarily of creamware, pearlware, and whiteware, with an estimated occupation of the first half of the 19th century. The limited amount of architectural debris found indicates that the building may have been removed from the foundation. In any case, the site was occupied for only a short time period, and its exact function remains unknown. The site is not recommended for further study.

25-1742 Begley, William

1998 Intensive (Locational) Archaeological Survey, Blackstone Gorge Access Improvements, Blackstone, Massachusetts. 77 pages.

The study consisted of background research, field investigations, and laboratory analysis. The walkover survey identified historic granite gateposts, a cart path, and granite boulders showing evidence of quarrying activity. Twenty 50 cm x 50 cm test pits were excavated within areas assigned moderate or high archaeological sensitivity rankings. Prehistoric cultural material was recovered from one test pit. The Blackstone Gorge Findspot 1 is a low density of quartz chipping debris. No features were identified. The gateposts and cart path are associated with the early 20th-century Blackstone Manufacturing Company cotton mill located south of the project. These features are not significant resources but are character-defining and visually interesting elements of historic-period land use of the area. It has been recommended that the gateposts be relocated and perhaps incorporated into the project design. No further archaeological survey is recommended.

25-1743 Clements, Joyce M.

1998 Report of a Phase II Site Examination: The Jackson Homestead, Newton, MA. 62 pages.

The site examination addressed eight areas where subsurface construction is necessary to stabilize the building's sills, improve drainage, replace existing walkways, and repair accessways. Archaeologists also monitored construction of a utility trench in the western lawn. Subsurface testing revealed landscaping and utility features and disturbance, and evidence of episodic repair and renovation to the structure. To the north of the ell archaeologists exposed a series of stones, possibly a stone foundation or part of a modified well, now located within the structure. Archaeologists concluded that portions of the Homestead have maintained their integrity and offer some potential for further research. Therefore originally proposed drainage pipes were not placed along the ell, and drainage was improved by shovel-shaving upper level soils to create an appropriate slope. Archaeologists determined that the remainder of the project could proceed as originally planned.

25-1744 Rainey, Mary Lynne

1998 Intensive (Locational) Archaeological Survey, Penske Residence Project Area, Nantucket, Massachusetts. 97 pages.

Background research, sensitivity assessment, and subsurface testing were completed for the 30 acre project area. Testing included 86, 50 cm x 50 cm test pits. Two prehistoric sites were found. Locus 1 consisted of three flakes (quartz, quartzite, and rhyolite) and shell. The site is adjacent to a wetland. Locus 2 contained two rhyolite flakes, a quahog shell, and two quartz Orient-style projectile points diagnostic of the Transitional Archaic Period (3000-2600 BP). The site is on a high knoll. The sites were considered potentially significant resources that may contain new information about the nature and sequence of prehistoric activity in Pocomo. Avoidance was recommended. If avoidance is not feasible, site examination studies should be conducted to determine National Register eligibility.

25-1745 Leveillee, Alan

1998 Intensive (Locational) Archaeological Survey, Holliston Pump Station, Holliston, Massachusetts. 43 pages.

The study included background research, a walkover reconnaissance, and systematic excavation of 15 50 cm x 50 cm test pits to determine the presence or absence of potentially significant cultural resources that could be impacted by the proposed undertaking. The project area was approximately 10,000 sq ft and no previous surveys had been conducted. The subsurface testing did not result in the recovery of cultural materials. Since no evidence for potentially significant archaeological sites was recovered, we recommend that no additional archaeological investigations of the proposed pump station be required.

25-1746 Boire, Kerrylynn and Suzanne G. Cherau

1998 Intensive (Locational) Archaeological Survey, Talbots Office Expansion, Hingham, Massachusetts. 85 pages.

Documentary research and subsurface testing were used to locate and identify potentially significant archaeological resources within the project area. Prehistoric sensitivity was defined by the presence of a recorded prehistoric site (19-PL-29) within the project area. Historic sensitivity was defined on the basis of agricultural land use in the immediate vicinity. It was expected that evidence of the prehistoric site and remains associated with historic agricultural activities would be present within the project area. Subsurface testing located two prehistoric activity areas, designated the Talbots Site and Findspot 1. The Talbots Site contains a moderate density of chipping debris and one shell fragment. No cultural features or diagnostic artifacts were identified in association with the Talbots Site. Findspot 1 consists of a single piece of chipping debris. Both the site and the findspot may be associated with the previously recorded prehistoric site that was identified on the north shore of a small pond in 1939. Background research indicates, however, that the existing Talbots Headquarters building was constructed over this pond and likely destroyed the recorded site area. Due to a lack of information content and physical integrity in the immediate area, the Talbots Site and Findspot 1 are not considered to represent a potentially significant archaeological resource. No further archaeological investigation is recommended.

25-1747 Donta, Christopher L. and Thomas L. Arcuti

1998 Archaeological Site Locational Survey for the Proposed Gordon Owen Riverway Extension Project, Taunton, Massachusetts. 76 pages.

Background research determined that no prehistoric archaeological sites were known to exist in the immediate project area. However, two historic archaeological sites (TAU-HA-6 and TAU-HA-58) were found to lie near the project area. Historic information indicates that the general vicinity of the project area was primarily agricultural until the 19th century, when it became important as a brick manufactory. In recent decades, little development has taken place here, and the project area itself is undeveloped, consisting of woodlands and meadow. The project entailed the testing of three survey units, totaling 95 shovel test pits. A total of 767 historic artifacts were recovered throughout the project area from 83 of the test units. These artifacts were found in fill deposits related to the nearby brick manufactory. Two prehistoric sites were found, one in Survey Unit 2 and the other in Survey Unit 3. None of these sites appears to contain intact soils, and none included any significant features. No further survey of this project area is recommended.

25-1748 Decima, Elena B., Jeff Carovillano, and Barbara Donohue-Putnam

1997 Intensive Archaeological Survey, West Plymouth Recreational Site, Plymouth, Massachusetts. 33 pages.

An archaeological survey was conducted in a 26.6 acre parcel to be developed by the town of Plymouth. The survey consisted of a preliminary walkover and cartographic research, test-pit sampling of the parcel (92 test pits, in two blocks and five transects, were excavated), and limited additional research. The testing did not uncover any prehistoric or historic archaeological sites, and no artifacts were recovered. No additional work is recommended for this parcel.

25-1749 Strauss, Alan E.

1993 Intensive Archaeological Survey of the Proposed Cut River Point Condominiums in Marshfield, Massachusetts. 69 pages.

Background research indicated that one recorded prehistoric site was situated within the project

area. No historical sites were reported for the study area. Field investigations for the project included a surface inspection, followed by the excavation of 22 shovel test pits within the project area. A total of 1,419 pieces of prehistoric stone debitage was recovered during the subsurface investigations. Two Late Woodland Levanna point bases (Ca. 1,300-400 BP) were recovered as well as five quartz biface fragments, two steep-edge scrapers, a quartz edge tool, eight tool fragments, and four utilized flakes. A possible piece of a steatite pipe bowl was found. The remains were recovered from what appeared to be an old plowzone and from the B-horizon subsoil. Based on the artifacts, the site dates to at least the Late Woodland period. Because of the high density of chipping debris and tools across the entire site and the site's potential to contain prehistoric subsurface features, it is believed that the site is potentially eligible for nomination to the National Register under Criterion D. Therefore, a site examination is recommended to determine the boundaries of the site, its chronological and cultural affinities, and its eligibility for National Register status. See also Report #25-1503.

25-1750 Rainey, Mary Lynne, Joseph Waller, and Alan Leveillee

1998 Archaeological Investigations within the ANP-Bellingham Energy Project Area, Archaeological Site Examination, Blue Flag Prehistoric Site, Bellingham, Massachusetts. 74 pages.

Archaeological site examination has demonstrated that the Blue Flag Site encompasses 600 sq m. Excavation units were placed around an anomaly discovered during the initial intensive (locational) archaeological survey in an attempt to determine its characteristics, associations, and function. The anomaly proved to be a cluster of small pits and a hearth dating to the Middle to Late Woodland periods. No additional features were identified within the site. Recovered artifacts included low densities of quartz, quartzite, hornfels, and rhyolite chipping debris, and 2 biface fragments. Subsurface testing of the site area indicates that most of the materials were confined to a well-developed plowzone with the exception of a clustered area of quartzite chipping debris within the southernmost limits of the site area. This plowing has altered the spatial distribution of most of the artifacts. The activities represented at the Blue Flag Site are interpreted as limited variety and of short duration. Activities included lithic tool manufacture and/or tool maintenance. A hearth/refuse pit, and an associated postmold resulted from the site's occupation. Archaeological site examination did not produce high densities or temporally diagnostic artifacts and the majority of artifacts were recovered from disturbed plowzone contexts. With the exception of Excavation Units 06 and 09, test pits and excavation units failed to identify additional features or soil anomalies beyond those discovered during the initial intensive survey. Excavation Units 06 and 09 were excavated to investigate Feature 1, which was subsequently radiocarbon dated to 2,000 ±70 years ago. The feature and an associated postmold, was excavated completely. Additional subsurface testing at the site is not expected to produce data beyond those collected to date. The site is not considered to meet eligibility criteria for listing in the National Register of Historic Places. Therefore, we recommend that no additional archaeological investigations are warranted for the Blue Flag Site.

25-1751 Reinke, Rita

1998 Report on the Archaeological Monitoring of the Communications Trench, Main Street, Deerfield. 57 pages.

This report covers a 4,000 ft trench excavated under the sidewalk on the east side of Main Street, Deerfield Village. The trench was excavated by backhoe, using a one- or two-foot bucket. The trenching process was observed by archaeologists, profiles examined, recorded, and occasionally photographed. Limited artifact collection was carried out. Numerous features were revealed, including small pits, buried sidewalks, building foundations and rubble and other, smaller soil disturbances. A layer of burned soil just above the subsoil, and interpreted as large-scale brush clearing at the time of English settlement, was observed intermittently throughout the village. No sign of the 17th-century palisade around the center portion of the village was recovered. The project has highlighted the extent, variability, and richness of archaeological resources preserved in Deerfield and underscored the need to take these resources into consideration before undertaking any

future construction.

25-1752 Macpherson, Jennifer and Duncan Ritchie

1998 Intensive (Locational) Archaeological Survey, Ponkapoag Golf Course Drainage and Irrigation Improvements, Canton, Massachusetts. 160 pages.

The disturbance assessment consisted of background research into several phases of construction at this golf course and a walkover survey/surface inspection. Background research and judgmental sampling with soil augers during the walkover survey were used to delineate archaeologically sensitive areas within the golf course. The majority of the proposed irrigation and drainage lines within the project area were considered archaeologically sensitive. The present golf course contains two known prehistoric sites (19-NF-220, 19-NF-221) and is within the boundaries of the Ponkapoag plantation, a historic period Native American settlement. During the walkover survey, the location of a historic period mill (Ezekiel Fisher Mill) on Ponkapoag Brook described in various documentary sources was also confirmed. One prehistoric site and 18 smaller loci or findspots of prehistoric cultural material were identified within the project area. The Ponkapoag Golf Course Site was found in Course 2 and yielded a non-diagnostic bifacial tool blade and an assemblage of chipping debris. The 18 loci were found primarily in Course 2, north of Ponkapoag Brook and consist of isolated projectile points and bifacial tool blades or small amounts of chipping debris. Diagnostic projectile points from several loci were Middle Archaic (Neville) and Late Archaic (Brewerton, Small Stemmed) types. The locations of the Ponkapoag Golf Course Site, Ezekiel Fisher Mill, and the 18 findspots have been impacted by grading and landscaping during several episodes of golf course construction. These cultural resources do not retain sufficient physical integrity to make them potentially significant. No further archaeological investigations are recommended. It is recommended that the remaining sections of the Ezekiel Fisher Mill Site be preserved in place and protected from future construction or improvements to the course.

25-1753 Herbster, Holly and Suzanne G. Cherau

1995 Intensive (Locational) Archaeological Survey, Wampanoag Family Entertainment Complex, New Bedford, Massachusetts. 116 pages.

The intensive survey of the approximately 175 acre project area included background and documentary research, followed by a preliminary walkover/surface inspection and subsurface testing. A total of 306 test pits, each 50 cm x 50 cm, was excavated within 30 m x 30 m blocks, along linear transects, and as judgmental test pits. Four prehistoric sites and one historic site area were located and identified. While no diagnostic artifacts were recovered, the cultural material assemblage and location of the prehistoric site areas appear to fit the pattern of small, temporary resource procurement associated with Late Archaic through Early Woodland (5000-1600 BP) periods. Low densities of chipping debris were recovered from two of the site areas. The Rogue Site (Locus 1 and 2) contained chipping debris and organic remains in association with fire and/or storage pit features. This site may represent a larger or longer-term occupation. Archaeological deposits recovered at the Second Fairway Site may be related to the occupation identified at the Rogue Site. One historic-period house foundation/cellarhole (the Johnson House Site) was located. The artifact assemblage, construction techniques, and documentary research support a post-1911 construction date and occupation for the house. No further archaeological investigations are recommended for the Third Tee, Twelfth Green, and Johnson House sites. The Rogue and Second Fairway sites contain potentially significant cultural deposits, and site evaluation investigations are recommended to determine eligibility for the National Register of Historic Places.

25-1754 Herbster, Holly and James C. Garman

1996 Results of an Intensive (Locational) Archaeological Survey and a Burial Verification Study, Apple Ridge III, Ashland, Massachusetts. 101 pages.

The intensive survey identified four archaeological sites (Magunco I through IV). Magunco I is a low-density scatter of lithic chipping debris that probably represents the occasional manufacture or modification of hunting tools. Given the lack of defined archaeological features and the low density of material, the site is unlikely to contribute to interpretations of Native American occupation of Magunco Hill and is therefore not eligible for listing in the National Register of Historic Places. No further archaeological survey is recommended for Magunco I. Magunco II is a single projectile point find and may represent a pre-Contact component of the Magunco III Site. No further investigations are recommended. The Magunco III Site is a potentially significant site that is likely associated with the Praying Indian Town of Magunkaquog. In addition to the late-17th/early-18th-century EuroAmerican material found at the site, evidence of structural remains also survives. If the Magunco III Site cannot be avoided by construction activities, site examination-level investigations are recommended to determine the boundaries of the site and its eligibility for listing in the National Register of Historic Places. Magunco IV was originally interpreted as a potential unmarked burial. In accordance with Massachusetts laws protecting unmarked burials, the site was investigated and determined that it is not a burial but likely relates to boulder-quarrying at an indeterminate date in the occupation of Magunco Hill. No further archaeological survey is recommended for Magunco IV. See also Report # 25-1755.

25-1755 Garman, James C. and Holly Herbster

1996 Results of a Site Examination Survey of the Magunco III Archaeological Site (ASH-HA-5) Apple Ridge III, Ashland, Massachusetts. 82 pages.

The goals of the site examination were to define the limits of Magunco III (ASH-HA-5) and to evaluate the site's eligibility for inclusion in the National Register of Historic Places. The scope of work included additional background research and excavation of portions of the site. Investigations have established that the Magunco III archaeological site is associated with a late (ca. 1690-1715) occupation of the Magunkaquog Praying Indian Town. The site has intact archaeological deposits that have already added important information to this poorly-understood period of the history of Native Americans in Massachusetts. Prior to the identification of Magunco III, archaeological evidence of the seven original Praying Indian Towns was limited to human burials. Magunco III represents the only domestic site related to one of the seven towns located and studied by archaeologists. Thus the site is eligible for inclusion in the National Register of Historic Places. The "broad pattern" of Christianization and English efforts to convert Native Americans to Christianity, which both reflected and engendered other efforts across the continent, renders Magunco III eligible under Criterion A. The site's association with John Eliot, a zealous and energetic preacher, renders the site eligible under Criterion B. Finally, the site has yielded and can continue to yield information important to the history of 17th and 18th-century Native Americans, rendering it eligible under Criterion D. Avoidance of the Magunco III site is recommended. If the site cannot be avoided the development of an archaeological data recovery plan to mitigate the adverse impact of the project construction is recommended. See also Report #25-1754.

25-1756 Milne, Claudia, William Begley, A. Peter Mair, II, and James C. Garman

1998 Intensive (Locational) Survey, Site Examination G. Davis Archaeological Site North End Elementary School Project, Fall River, Massachusetts. 105 pages.

During the two phases of investigation, a total of 121 test pits and four excavation units were excavated. A single EuroAmerican site, the "G. Davis" Site, was identified and evaluated. Initially identified as a possible late 19th-century farmstead, the "G. Davis" Site now appears to have two components: a pair of small, 19th-century ice houses, and a trailer or other undocumented occupation in the 1950s or 1960s. Supplemental background research confirmed the low-intensity use of the project area in the 19th century. Based on its limited information content and its lack of importance to local, state, and national history, the "G. Davis" Site is not recommended for inclusion in the State or National Registers of Historic Places. No further archaeological survey is recommended.

25-1757 Boire, Kerrylynn and William Brett

1997 Intensive Archaeological Survey Blackstone National Golf Club, Sutton, Massachusetts. 137 pages.

The archaeological survey located and identified three Native American sites and two Native American findspots. Subsurface testing recovered one piece of quartz chipping debris at each of the findspots and 5-58 pieces of chipping debris at the site areas. The precise type, function, and specific prehistoric temporal-cultural affiliation of the prehistoric sites and findspots are unknown at the present time. The three sites have the potential to contribute information concerning the prehistory of the Blackstone River drainage. Their subsurface integrity is very good to excellent, and they are considered potentially significant archaeological resources. Avoidance of each is recommended to determine potential eligibility to the National Register of Historic Places. The two findspots, consisting of one isolated quartz flake each are not considered significant archaeological resources and no additional archaeological investigations are recommended. Background research, informant interviews, and field investigations identified three documented historic sites: two residence/farmsteads (HS-1 and HS-2) and one rural industrial dam (HS-3). HS-1 and HS-3 are in generally very good to excellent physical condition and have the potential to address research themes related to 18th- and 19th-century rural agricultural landscapes, historic households, rural industrial activities, and dam construction techniques. Avoidance of HS-1 and HS-3 is recommended to determine potential eligibility for the National Register of Historic Places. HS-2 was heavily impacted by construction activities. No further research is recommended for this site. The three Native American sites are to be protected by the implementation of a Protection Plan.

25-1758 Strauss, Alan E.

Intensive Archaeological Survey of the Waterford Park Development Western Project Area in Marlborough, Massachusetts. 34 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area. The results of the archaeological reconnaissance survey are provided in a separate report (see Report #25-1668). Field investigations included field reconnaissance, followed by the excavation of shovel test pits in the western project area. The survey determined that all areas except the western portion of the project were severely disturbed by sand and gravel removal. No prehistoric artifacts or historic sites were found. Subsurface testing was conducted in those portions of the project area that were considered archaeologically sensitive. No testing was done in areas that were poorly drained, steep, contained surface bedrock, or were within the 75 to 100-foot wetland buffer. A total of 76 shovel test pits was excavated during the project. One prehistoric site was identified that contained a very low-density scatter of quartz and one felsite flake. Because the prehistoric site lacks research potential and is not eligible for National Register nomination, no further archaeological investigations are recommended for the project.

25-1759 Dudek, Martin G.

1998 Archaeological Site Examination Jefferson at Wheeler Hill, Marlborough, Massachusetts. 62 pages.

The site boundaries within the project area were defined through 24 systematic shovel tests. The site has a maximum width of 30 m (east-west) and extends 15 m south of the wall (north-south), for an area of at least 375 sq m. The site continues beyond the project area onto private property to the north, where the bulk of the site is believed to lie. The landowner denied access to the area to test for the site boundaries. Two excavation units (1 m x 1 m) investigated internal site characteristics. The site examination recovered 343 prehistoric chipped stone artifacts, in addition to the 26 found during the intensive survey, including three intact gray felsite points: a Susquehanna-like, a Broad Eared/Susquehanna-like, and a Small Stemmed III-like point. Other lithics include a felsite

point tip fragment, 3 utilized flakes (2 argillite, 1 felsite), and felsite debitage, with argillite, chert, quartz, quartzite, slate, and shale present. Other items recovered include 3 modified granite stones, 3 fire-cracked rocks, 6 calcined prehistoric bone fragments, and 2 pieces of historic redware. The site is interpreted as a Late Archaic hunting camp. The excellent integrity of the site, the evidence for a hunting and processing camp in an upland interior location, and the co-occurrence of two Late Archaic lithic traditions (Susquehanna-like and Small Stemmed) give this site significance. The site is potentially eligible for inclusion in the National Register of Historic Places under Criterion D.

25-1760 Clements, Joyce M.

1998 Final Report of Archaeological Monitoring: Marlborough Middle School. 18 pages.

This report presents the results of archaeological monitoring during site preparation work for the Marlborough Middle School expansion project. The Middle School is located within the general vicinity of the 17th-century, 6,000 acre Praying Indian Town of Okommakamesit. Because intact historical horizons were exposed during an intensive (locational) archaeological survey, archaeologists monitored site preparation work in two sections of the project area (see Report #25-1594). Soil stripping in Area A revealed no potentially significant archaeological features or sites. Archaeological features exposed during soil stripping in Area B indicated intact cultural deposits, including a series of postmolds, a truncated refuse or storage pit, possible paleosols, and charcoal lenses. These features were documented prior to construction at the Middle School and no further work is required at this time. However, if unforeseen circumstances alter the location for the proposed accessway the consulting archaeologist and the Massachusetts Historical Commission must be offered the opportunity to review those changes.

25-1761 Donohue-Putnam, Barbara and Jeff Carovillano

1998 Intensive (Locational) Survey Commerce Park Development, Braintree, Massachusetts. 45 pages.

Historic research, a walkover, and test-pit excavation were part of the scope of work. The intensive survey recovered one prehistoric artifact in an area that has witnessed extensive disturbance in recent times. No additional archaeological work is recommended.

25-1762 Leveillee, Alan

1998 Intensive (Locational) Archaeological Survey Within the IDC-Bellingham Project Area, Bellingham, Massachusetts. 48 pages.

The survey of the approximately 50 acre project area included background research, a walkover survey, sensitivity assessment, and subsurface testing. The archaeological investigations resulted in the recovery of a very low density of historic-period cultural material. No prehistoric cultural materials were recovered. The materials recovered from within the project area do not represent potentially significant cultural resources. No additional archaeological investigations are recommended.

25-1763 Donohue-Putnam, Barbara and Karen Michalec

1997 Intensive Archaeological Survey Forges Field, Plymouth, Massachusetts. 65 pages.

Previous archaeological work (see Reports #25-1266, #25-1349, and #25-1628) established that the Forges Field project area had the potential to contain prehistoric and historic archaeological resources. While few prehistoric materials were recovered during the intensive survey, a Late Archaic point and felsite flake were among the few prehistoric finds in this section of Plymouth and found as a result of a cultural resource survey. The project area had been part of the property hold-

ings of Eben Jordan, Jr. who developed it as an English country-style estate in the late 19th century. Remains of a game preserve and/or poultry farm were visible within the northern section of the project area. Historic research revealed that while Jordan initially developed a game preserve in this section of his estate, it had been used as a poultry farm from at least 1906 until the 1930s. The intensive survey was able to document the current features and configuration of the former poultry farm and relate them to a 1921 plan of the poultry farm.

25-1764 Fragola, Patricia and A. Peter Mair, II

1998 Intensive (Locational) Archaeological Survey Peabody Municipal Golf Course, Peabody/Salem, Massachusetts. 63 pages.

The intensive survey included background research, a walkover survey, and subsurface testing. Based on the walkover survey, a specific number of locations within the project area were considered to have high or moderate archaeological sensitivity. A total of 169 50 cm x 50 cm test pits were excavated in these areas of sensitivity. Subsurface testing conducted within the project area yielded a low density of historical cultural material including brick, glass, ceramic, and nails. This material is not considered to be a significant cultural deposit or to be associated with a specific site. No prehistoric cultural material was recovered within the project area. Based on these results, no further work is recommended.

25-1765 Herbster, Holly and Suzanne G. Cherau

1997 Archaeological Site Examinations Spinning Wheel (19-BR-382), Spikey Pine (19-BR-384), and Sleeping Toad (19-BR-383) Sites and Additional Intensive (Locational) Survey HS-5, HS-6, HS-7, and Lot 11, Acushnet Golf Course Project, Acushnet, Massachusetts. 166 pages.

These pre-Contact Native American sites (Spinning Wheel, Spikey Pine, and Sleeping Toad) were identified during the intensive (locational) archaeological survey (see Report #25-1545). The current report details the results of additional intensive survey work at several previously untested parcels within the project area. No significant archaeological resources were identified within these parcels. The site examinations at the Spinning Wheel, Spikey Pine, and Sleeping Toad sites provided sufficient data on size, complexity, and temporal association to determine their significance. The Spinning Wheel Site consists of a fairly uniform scatter of chipping debris with no identified features or concentration areas. The recovery of a Susquehanna-like triangular projectile point and a Neville point suggest the site was utilized over several temporal periods as a temporary resource procurement/processing area. Additional testing is unlikely to yield additional significant classes of data, and the site is therefore not eligible for listing on the National Register. The two identified loci at the Spikey Pine Site contained small, clustered deposits of chipping debris and tools, but no identified features. The pattern and density of recovered materials suggests that this site also functioned as a temporary work or camp site. A dense deposit of chipping debris and tool fragments dating to both the Late Archaic and Late Woodland periods was located at the edge of the tested area, suggesting that more extensive deposits may lie to the east. The deposits identified within the project parcel have limited research value, and are not considered eligible for listing on the National Register. Any additional deposits located outside the project parcel may, however, be significant. The variety of artifacts, floral and faunal remains, and features identified in distinct activity areas at the Sleeping Toad Site suggest that it functioned as a base camp or seasonal campsite. Diagnostic artifacts and radiocarbon-dated charcoal and hazelnut shells indicate that occupation spanned from the Middle Archaic through Middle Woodland periods. The site was used for lithic manufacture and maintenance, food preparation and processing, and possibly storage. The Sleeping Toad Site's location adjacent to the Acushnet River allows the recovered data to be tied into settlement and subsistence patterns for the region. The integrity of the site is excellent, and testing to date indicates that the site has a high potential to yield important new data on settlement and land use in the region. The Sleeping Toad Site is eligible for listing to the National Register under Criteria A and D. A data recovery program is being implemented for the portion of the site that will be impacted by the golf course project.

25-1766 Leveillee, Alan, Joseph N. Waller, and Paul Russo

1998 Reconnaissance and Intensive (Locational) Archaeological Surveys within the ANP Blackstone Energy Project Area, Blackstone and Mendon, Massachusetts. 90 pages.

Subsurface testing included the excavation of 112 50 cm x 50 cm shovel test pits placed at 10 m intervals along transects within the proposed easement corridor as well as four test pit arrays around specific finds. Extensive gravel mining in the vicinity of the proposed power plant footer precluded subsurface testing in these areas. Over 98% of the excavated test pits within the proposed joint electric and gas utility easement were sterile. No historic period artifacts were recovered. Two pieces of lithic debitage, one piece each of quartz and rhyolite, were recovered from test pits in Transect A. Four-pit arrays placed around each findspot produced only one additional piece of chipping debris. These limited flake occurrences appear to represent localized episodes of stone tool sharpening/ maintenance. A Squibnocket projectile point, diagnostic of the Late Archaic Period, was recovered from a test pit in Transect E, just below the leaf litter. The subsequent four-pit array failed to produce any additional artifacts. The occurrences of isolated flakes and a project point do not appear to represent potentially significant archaeological deposits. No additional archaeological testing is recommended.

25-1767 Adams, Virginia H., Nicolas C. Avery, William Brett, James Clark, Deborah C. Cox, Mary Kate Harrington, Holly Herbster, Jennifer Macpherson, James Mooney, Joshua N. Safdie, Nancy C. Tinker, Kathleen Wheeler, and Richard Will

1997 Cultural Resources Investigations Joint Pipeline Project Massachusetts, New Hampshire, Maine, FERC Docket No. CP97-238. Volume 1, Archaeological Survey, 599 pages; Volume 2, Historic Structures and Landscapes Survey, 622 pages; Volume 3, Survey Addends for Volumes 1 and 2, 78 pages; Survey Addendum II 100 pages.

Volume 1 summarizes the results of the archaeological investigations conducted for the project, which included background research and archaeological sensitivity assessments, subsurface testing, and analysis of identified cultural resources. The survey located five prehistoric findspots in Massachusetts (M-28, Dracut) and New Hampshire (R-86, R-107, R-197, R-21 I), each consisting of between one and three pieces of chipping debris. These sites are not considered to be potentially significant and further testing is not recommended. Three historic sites were located within the right-of-way in Maine. Additional archaeological investigations were also undertaken at three previously identified prehistoric sites in Massachusetts. The Crystal Lake West (19-ES-650), Crystal Lake Darm (19-ES-649), and Lake Street (19-ES-65 1) sites, all in Haverhill, contain artifacts and features dating from the Late Archaic through Woodland periods and are eligible for listing on the National Register of Historic Places. Mitigation of any adverse impacts to significant portions of each of these sites is recommended, either in the form of avoidance or additional excavation. Volume 2 presents the results of a survey and evaluation of historic structure and landscape. The survey included background research, fieldwork, and analysis. It incorporated historic resources previously documented in State Historic Preservation Office (SHPO) inventory and National Register files. Approximately 200 historic resources were identified through reconnaissance survey within the initial area of potential effect (APE), defined as a ¼ mile corridor on either side of the pipeline centerline. The potential for visual effects, as noted in the field, was used to refine the APE to those properties from which the pipeline alignment was visible, as well as those properties that might be directly effected by pipeline construction activities. Within this group, properties worthy of further examination were subject to intensive survey and recorded on state inventory forms for evaluation. Certain portions of the project area were not surveyed because either information on this project component was not available at the time of survey; or property owner permission for access had not been obtained. A total of 18 historic resources within the refined APE were either listed, formally considered eligible for listing, or evaluated as eligible for listing in the National Register. The resources consist of one district and one individual property listed in the National Register, one district previously considered eligible for listing, and three districts and twelve indi-

vidual properties that were evaluated as eligible for National Register listing. They encompass four historic resources in Massachusetts, six in New Hampshire, and eight in Maine. Potential project effects have been identified for 13 of the 18 historic resources. A discussion of each of these properties and potential project effects includes an assessment of project effects and recommendations for further consultation between FERC and the SHPOs. Volume 3 presents an addendum that details the results of investigations within accessible mainline tracts, reroutes, the Haverhill Lateral, and evaluation-level results for the M-11 Findspot. This addendum serves as the final summary for all archaeological work completed to date on the project. Any and all tracts that remain inaccessible will be surveyed as soon as access permission has been obtained. A total of 150 test pits was excavated during the archaeological survey. Subsurface testing was concentrated along stream crossings, sandy terraces, and within intact, wooded areas. Archaeological investigations of the project area located two prehistoric findspots, one within Tract 213 (M-11) in Dracut, and the other within Tract 38 (E-147) in Haverhill. Eight pieces of chipping debris of various material and one possible feature was identified at the M-11 findspot. Seven pieces of chipping debris (mostly quartz) were recovered from the J-45 Findspot. The M-11 Findspot was assessed as being potentially significant, and a site examination was conducted following its discovery. The low density of material and lack of diagnostic artifacts from each findspot suggests that these sites do not represent potentially significant cultural resources. Neither findspot is likely to yield additional information that could contribute to our understanding of prehistoric Native American activity in the eastern New England region and do not meet eligibility criteria A or D of the National Register of Historic Places (36 CFR 60.4). No additional archaeological investigations are recommended for the M-11 and J-45 findspots; Tracts 16, 176, 183, 208, 212, 213, and 224; Reroutes J-4, J-8, J-28, J-45 or the Haverhill Lateral. Survey Addendum II identified one additional findspot, the Hawkes Brook Findspot, that does not appear to meet eligibility criteria A or D of the National Register of Historic Places (36 CFR 60.4). No additional archaeological investigations are recommended for the Hawkes Brook Findspot.

25-1768 Duranleau, Deena L.

1999 Reconnaissance Archaeological Survey Dracut Comprehensive Wastewater Management Plan, Dracut, Massachusetts. 63 pages.

Environmental, historical, and geographical information was gathered, and a walkover survey of the areas that would be impacted by the planned wastewater-collection system was conducted to evaluate the archaeological potential of these cross-country segments. Factors considered in this evaluation included proximity to water, proximity to known archaeological sites, degree of slope, level of disturbance, and soil drainage, as well as each segment's proximity to historical roads, aboriginal trails, and rock outcroppings. There are two non-diagnostic prehistoric archaeological sites, 19-MD-706 and 19-MD-783, and one historic site, DRA-HA-01. Site 19-MD-783 is near a proposed pipeline route, but the other two sites will not be impacted. These pipeline routes are preliminary in nature and before any work is carried out, a more detailed evaluation of a segment's archaeological potential will be produced.

25-1769 Rainey, Mary Lynne and Duncan Ritchie

1998 Intensive Archaeological Survey, School Perimeter Road Project Area, Nantucket, Massachusetts. 97 pages.

Tasks carried out during the intensive survey included background research on the history of Newtown Cemetery, a walkover inspection, and subsurface testing. Most of the project area was considered to have high to moderate sensitivity for prehistoric and historic-period cultural resources. The section of the easement crossing the eastern end of Newtown Cemetery had the potential to contain unmarked historic-period burials. An electrical resistivity survey identified six anomalies. These anomalies were investigated with seven, 50 cm x 100 cm trenches. Additional subsurface testing within the proposed road easement included 40 50 cm x 50 cm test pits along two transects. After hand testing, the topsoil was removed mechanically to ensure that no unmarked burials were

located in the section of the road easement crossing the eastern end of the Newtown Cemetery parcel; none were found. A single piece of quartz chipping debris (designated as School Perimeter Road Locus 1) was the only prehistoric site identified in the project area. A scatter of historic-period cultural material was found in deep deposits of sandy loam at the southern end of the project area. The only features found during machine stripping of topsoil were two small pit features containing mammal bone and a few historic-period artifacts. School Perimeter Locus 1 is similar to other findspots of prehistoric cultural material in the terminal moraine/outwash plain zone of Nantucket. The scatter of historic period material and two pit features appeared to be 19th-century household refuse dumped in a low lying area near Cow Pond. None of the identified cultural resources identified in the project area are considered to be potentially significant. No additional archaeological investigation is recommended.

25-1770 Fragola, Patricia and A. Peter Mair, II

1998 Intensive (Locational) Archaeological Survey Omnipoint Antenna Project, Canton, Massachusetts. 77 pages.

The area was identified as potentially containing archaeological deposits associated with the 18th-century Doty Cottage and the later, 19th-century Davenport house. Fourteen test pits, placed at 5 m intervals, were excavated along four transects over the 1 acre project area. A moderate density of intermixed historic period material, spanning the last quarter of the 18th to 20th centuries, was recovered from fill and/or plowzone. The presence of fill layers and the absence of structural remains and/or associated features indicate the project area has been previously disturbed by the dismantling of the structure and filling of the site during the mid-20th century. No further archaeological investigations are recommended.

25-1771 Donta, Christopher L. and Richard Greenwood

1998 Archaeological Investigation of the Blackstone Canal Millbury Segment, Spillway Structure, Millbury, Massachusetts. 52 pages.

An archaeological investigation of a stone structure was undertaken as part of a HAER documentation study of the Blackstone Canal. The Blackstone Canal was constructed between 1825 and 1828 and used as a canal until 1846. After 1846 the canal became incorporated into the rural water-power system along the Blackstone Valley. Details about its construction, use, and history were documented with respect to the section to be impacted by the proposed construction near the Worcester/Millbury town line. The stone structure was identified as a spillway dam that provided water power to the Burling Mills (post 1846). A timber dam or waste weir once helped control the flow of water along the canal. Portions of the timber dam remain and were a specific focus of archaeological investigation. Details of the stone construction, iron culvert, and timber dam remnants were drawn, photographed, and recorded.

25-1772 Fragola, Patricia and Duncan Ritchie

1998 Site Examination Archaeological Investigation Highfields 1 and Pratt-Keith Sites Highfields of Grafton Project, Grafton, Massachusetts. 95 pages.

The site examination was conducted on two archaeological sites identified in a previous intensive survey (see Report #25-1665). Highfields 1 was a small prehistoric site that appeared to contain a Middle Archaic period component. The Pratt-Keith Site was the location of a late 18th-, early 19th-century house. Background research was carried out during the site examination to reconstruct the ownership of the property containing the Pratt-Keith Site. Subsurface testing during the site examination was designed to determine the horizontal and vertical boundaries, internal structure, content, and integrity of the Pratt-Keith and Highfields 1 Sites.

25-1773 Macpherson, Jennifer

1998 Intensive (Locational) Archaeological Survey Conrail 5.7-Acre Parcel, Westborough, Massachusetts. 80 pages.

The 5.7 acre project area is situated on a low, open knoll surrounded on three sides by wetlands. Background research indicated that the project area was within the Cedar Swamp Archaeological District and had the potential to contain prehistoric resources. Over 30 known prehistoric sites are listed on the MHC inventory in and around Cedar Swamp, with several in close proximity to the project area. The project area also had the potential to contain unrecorded historic-period archaeological sites given its proximity to historic Flanders Road. A total of 50 test pits was excavated in the project area. Two test pits on the eastern edge of the project area contained intact soils (Transect C-8 and Array 2-270°), consisting of a well-developed gray loamy A_1 horizon overlying a deeper yellow-brown B_1 soil horizon. A total of 14 pieces of chipping debris of various materials was recovered from the project area, during the intensive archaeological survey. No further testing was recommended.

25-1774 Stokinger, William

1998 Archaeological Assessment for the Placement of Clivus Multrum Toilets on Bumpkin, Grape and Gallop's Islands, Boston Harbor Islands State Park. 44 pages.

The archaeological assessment of Department of Environmental Management's Clivus Multrum (medium-sized, self-contained, self-composting, toilets) installation project was designed to minimize construction-related impacts to known and potential prehistoric and historic cultural resources on Gallup's, Bumpkin and Grape Islands. The islands lie within or are adjacent to the National Register of Historic Places' Boston Harbor Islands Archaeological District. Proposed locations for Clivus Multrum units were moved and tested because of anomalies or questionable contexts. Ten locations were tested to varying degrees to accommodate the five units. While various soil profiles were indicative of historic-period agricultural and/or construction activities, no locations produced conclusive evidence of prehistoric occupations. Two loci, one on Bumpkin Island and one on Grape Island, exhibited soil anomalies which may have resulted from human activities. Both of these locations were abandoned in favor of other locations, thereby preserving the potential evidence of past activities.

25-1775 Richard, Rose and Neil DePaoli

1989 Management Summary/Memorandum Proposed Roxbury Heritage Park Intensive Archaeological Survey of Lots at 161 and 173 Roxbury Street. 9 pages.

The two vacant lots comprising the project area were located between the Dillaway/Thomas House and Ionic Hall. Background research included a review of cartographic and documentary sources to determine the location of structures and yard areas in both the vacant lots. The research indicated that the structures were residences. One or two structures were located at 161 Roxbury Street through the 19th century. In the early 20th century there may have been two different buildings on the lot. A single structure left on the lot was demolished between 1963 and 1974. In 1884, the 173 Roxbury Street lot contained three houses that faced the street and other structures in the rear. At least eight structures occupied the lot by 1915. Five buildings were demolished in the 1960s. Subsurface testing included 50 cm x 50 cm test pits and machine excavated trenches. Excavations at 161 Roxbury Street exposed a foundation constructed of cut granite with concrete sills and cellar floor and filled with sand/gravel containing modern debris. A trench in the rear yard did not yield any evidence of intact domestic refuse deposits or other features. Another trench placed in the yard encountered a brick foundation wall built on conglomerate (Roxbury Puddingstone) bedrock. No evidence of any associated refuse deposits or features was found. The test pits at 173 Roxbury Street confirmed that there were deep deposits of fill and demolition rubble in this section of the project area. Two machine trenches placed on the location of a structure standing in 1884 exposed deposits of demolition rubble overlying conglomerate bedrock and a deep cellar

filled with modern debris. Other trenches placed in the interior of a foundation possibly belonging to a Federal period house and the surrounding yard area exposed a concrete cellar floor and modern period demolition debris. The only other feature found in this lot was a brick cistern filled with gravel. No Native American cultural material was found despite the presence of a prehistoric site in the adjacent yard of the Dillaway/Thomas House. No further archaeological investigation of these lots is recommended.

25-1776 Garman, James C. and Warren Riess

1997 Reconnaissance Archaeological Survey Planning and Environmental Services Braintree-Weymouth Marine Pipeline Project MWRA Contract No. 6119, Quincy and Weymouth, Massachusetts. 44 pages.

Tasks for the reconnaissance survey included a review of archaeological site files and local history, walkover survey of the landward points of the pipeline, and an underwater remote sensing survey of the pipeline's route through the Fore River. Review of site files indicated that no known sites exist along the proposed pipeline route. Both the Sprague Energy Site and the Nut Island terminus are severely disturbed and have a low sensitivity for Native American or EuroAmerican archaeological sites. No further archaeological survey is recommended for the terrestrial portions of the Braintree-Weymouth Pipeline. The underwater remote sensing survey identified a total of 34 anomalies in the Fore River. Given the long history of shipping in this portion of coastal Massachusetts, a relatively high percentage of the identified anomalies had the potential to be undocumented wrecks. An intensive underwater survey for submerged archaeological resources is recommended when the final route of the pipeline is established.

25-1777 Decima, Elena B. and Barbara Donohue-Putnam

1997 Intensive Survey and Site Examination Maple Commons Subdivision, Norton, Massachusetts. 41 pages.

The intensive survey of the 80 acre project area (background and documentary research, walkover, and excavation) located two prehistoric sites, the Block A and Transect C sites. Block A yielded two flakes, and Transect C consisted of a concentration of 20 flakes, fire-cracked rock, and two possible postmolds. The Block A site has no potential for eligibility in the National Register of Historic Places and no additional work is recommended. The Transect C site was thought to have the potential to contain significant archaeological deposits. A site examination followed. In total, 16 50 cm x 50 cm test pits and three 1 m x 1 m units were excavated, 2.6% of the calculated area of the site. The recovered material from the Transect C site includes 110 felsite flakes, 1 yellowish flake of unidentified material, two gray rhyolite flakes, eight gray chert flakes, one yellow and one gray felsite decortification flake, nine pieces of possible fire-cracked rock, a small amount of charcoal, and one large felsite stemmed point with a missing tip. The Maple Commons Transect C site seems to be a small encampment (Late Archaic to Woodland). The horizontal distribution is concentrated around a very small area; the vertical distribution is shallow. It is believed that the site examination recovered a large fraction of the significant data of the site; the site contains no new information to establish its eligibility for inclusion in the National Register of Historic Places. No additional work is recommended.

25-1778 Begley, William, Steve Olausen, Duncan Ritchie, and Mary Kate Harrington

1998 Reconnaissance Archaeological Survey and Intensive (Locational) Archaeological and Architectural Survey Pine Hills Community Project Area, Plymouth, Massachusetts. 132 pages.

This reconnaissance archaeological survey and intensive architectural survey covered the entire project area of about 3,037 acres. The intensive archaeological survey was carried out within a smaller area of about 480 acres. The project area included several historic period EuroAmerican and Native American cultural resources including the Old Sandwich Road corridor, the Cornish

Tavern and Rye Field, and Sacrifice Rock (PLY-HA-9). The reconnaissance survey identified six zones of high and moderate sensitivity for Native American cultural resources. One zone of high sensitivity for EuroAmerican cultural resources was identified in the area surrounding the Cornish Tavern. A large zone of moderate sensitivity extended on both the east and west sides of Old Sandwich Road. Other zones of moderate sensitivity in the rest of the project area were located near Great Island Pond, Beaver Dam Road, and the intersection of Old Sandwich and Savery Roads. During the intensive survey subsurface testing a total of 472 50 cm x 50 cm test pits was excavated. Two findspots of Native American cultural material were found. Locus 1 was an isolated recovery of a Middle Archaic period (Neville) projectile point. Locus 2 was a single piece of quartz chipping debris found near a kettle hole and pond feature. Two deposits of historic period cultural material were also found. Locus 3 was a scatter of ceramic sherds, bottle glass, and brick found to the east of Old Sandwich Road. It did not appear to be associated with the former location of a house or other structure and may have been an isolated dumping episode. Locus 4 was a deposit of modern household refuse exposed on the surface behind the current location of the Cornish Tavern. The intensive architectural survey identified four historic/modern-period resources. They are a section of Old Sandwich Road, the Cornish Tavern and Rye Field, and remnants of the former location of Thrasherville, a late 18th- to late 19th-century settlement at the intersection of Old Sandwich and Joe Savery Roads. Other resources in the rest of the project area include the Robert B. and William C. Symington Cranberry Bogs and Sacrifice Rock. None of the four loci are considered to be potentially important cultural resources. The Cornish Tavern and Rye Field is considered to be potentially eligible for listing on the National Register of Historic Places. It is also recommended that when the remainder of the Pine Hills project area becomes available for development, the other above ground resources, the Robert B. and William C. Symington Cranberry Bogs be evaluated for their potential eligibility for listing on the National Register of Historic Places.

25-1779 Cross, John

1991 Reconnaissance Survey Report Chicopee River Technology Park, Chicopee, Massachusetts. 33 pages.

Background research and a walkover inspection were used to divide the project area into zones of expected archaeological sensitivity. The project area is located on 178 acres in Springfield and Chicopee on the south bank of the Chicopee River. No prehistoric sites were recorded for the project area in the files of the Massachusetts Historic Commission (MHC); three sites have been recorded for the north bank of the Chicopee River between Chicopee Falls and Bircham Bend (MHC site numbers 19-HD-60, 19-HD-63 and 19-HD-72). Historic background research indicated the location of three 19th-century houses and associated outbuildings, an impoundment area of Poor Brook, a small impoundment/channel, a historically documented ford, and remains of structures associated with the Springfield Armory rifle range. During the walkover, soil cores were taken in the area of the Oxford Country Club golf course to determine soil stratigraphy. Areas of high probability for prehistoric and historic sites were identified and recommended for subsurface testing.

25-1780 Mahlstedt, Thomas F.

1998 Metropolitan District Commission Reservations and Historic Sites Archaeological Assessment Report, Oakham, Massachusetts. 9 pages.

An intensive archaeological survey was conducted on a 4.5 acre parcel. Since most of the project area had been disturbed by gravel removal operations, 10 shovel test pits were excavated within the remaining undisturbed area of approximately 1.5-2 acres. No artifacts were encountered. Soil profiles showed little evidence of disturbance despite recent logging in the project area.

25-1781 Blake, Marni L.

1998 An Archaeological Assessment of the Royall House Site, Medford, Massachusetts. 94 pages.

Using information obtained from deeds, maps, probate records, and other documents, as well as secondary sources, this research traces the historical development of the Royall House site from the 17th century to the present. The goal of this research was to identify potentially archaeologically sensitive areas and likely sources of disturbances to the archaeological record. Areas near the "Slave Quarters," in the west "courtyard," and in the Royall House Park appear to have good archaeological potential. Further research in these areas may reveal important material evidence of poorly documented aspects of life at the Royall House and in Medford.

25-1782 Macomber, Gerald M.

1996 Archaeological Investigations at the Cape Cod Air Force Station in Bourne, Massachusetts. 40 pages.

The reconnaissance survey was conducted to identify archaeologically sensitive areas within the boundaries of the CCAFS. The survey determined that, because of rugged terrain and the scarcity of existing or past water resources on or near the CCAFS property, the archaeological potential for the presence of prehistoric sites was low. No evidence of significant historical sites was found. The 'Technical Facility' building at the center of the property and within the high-security fenced compound, however, has been determined by the US Air Force to be eligible for the National Register of Historic Places under the Cold War context. For the intensive survey of the proposed water supply facilities, 15 shovel test pits were excavated. A small amount of recent historical material was recovered. This material was not associated with any features or structures and was of such recent nature that it was not considered to be archaeologically significant. No prehistoric cultural material was recovered. No further archaeological investigations were recommended.

25-1783 Missio, Nicole A. and Sally Pendleton

1995 Intensive Archaeological Survey of a Portion of Ellisville Harbor State Park in Plymouth, Massachusetts. 66 pages.

The survey assessed cultural resources in two fields that are slated to be leased for agricultural purposes and to generate management recommendations for the treatment of those cultural resources in the development of the park. The survey consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. Background research identified two prehistoric sites in or adjacent to the project area and a history of historical activity since at least the late 18th century and probably earlier. The Harlow family established a farm there by the 18th century. Some buildings from the dairy complex remain. During the walkover nine prehistoric artifacts, including a Small-Stemmed projectile point, were found on the surface in the southern field, and both fields were found to be suitable for subsurface testing. A charcoal or burn layer of possible prehistoric origin was identified in the eroding face of a barrier knoll and portions of the wooded area east of the fields and the area surrounding the farm buildings were considered to have potential for undocumented prehistoric remains. Subsurface testing was conducted in two stages. A series of 110 shovel test pits were excavated in a 2-meter grid pattern across all accessible and apparently undisturbed portions of the two fields. Then 91 shovel test pits around, and 10 m from, all of the initial test pits that produced prehistoric artifacts were excavated. Artifacts were recovered from both fields consisting of 307 prehistoric artifacts, 434 historic artifacts, and 72 fragments of organic material. The prehistoric artifacts, which are associated with site 19-PU-174, came from both fields, but the highest concentration of materials was in the southern field. In addition to the Small Stemmed point surface find, a complete Small Triangle projectile point and two untyped point tips were found in excavated contexts; a possible fragment of prehistoric pottery was also recovered. Based on these materials, the site dates in part to the Late Archaic/Early Woodland period and possibly the Middle or Late Woodland period. These materials are considered potentially significant and further archaeological investigations are recommended for the two fields. A small quantity of historical materials was recovered. None of these were directly associated with a struc-

ture or feature and are not considered to be potentially significant. Other areas of the park, however, are considered to have archaeological potential. Archaeological investigations are recommended for the barrier knoll, the wooded area east of the fields, and the area surrounding the farm buildings.

25-1784 Wheeler, Kathleen

1998 Results of the Archaeological Monitoring of a Replacement Sewer Line at Cogswells Grant, Essex, Massachusetts. 22 pages.

The installation of a PVC sewer line proceeded with little variance from an earlier trench where two generations of sewer lines were exposed and removed. In one instance, the old drainage trench was found to run over a large boulder that raised the grade of the drainage pipes to an ineffective level, and a 4-m length of new trench was cut around the obstacle. In the new trench a stone foundation wall that served as the eastern wall of a small outbuilding was revealed. The structure apparently was abandoned and filled sometime in the second quarter of the 19th century and is likely related to the reorganization of the farm by Adam Boyd. As a result of the findings of the sewer monitoring, it is strongly recommended that additional archaeological exploration be devoted to the small foundation. Future archaeological investigation should minimally delimit the size of the building; determine its construction date; collect a reliable sample of the cellar fill to ascertain the demolition date; and verify whether the brick drainage feature is related to the building.

25-1785 Wheeler, Kathleen

1997 Findings from the Paine-Dodge House, Ipswich, Massachusetts: Results from Two Phases of Archaeological Investigation in 1996. 145 pages.

Two phases of archaeological investigation were undertaken. The objective of the first phase of work was to test along the paths of proposed drainage lines and dry wells and a shallow crawl space planned beneath the floor of the north lean-to to allow some air flow. A second phase of work was contracted when two early features were discovered in the first phase, including a subfloor room inside the lean-to and a foundation wall on the north side of the lean-to. In the second stage of work, a poorly constructed stone wall was found to run the length of the north foundation of the lean-to, it was only about 40 cm north of the wall line. Both sides of the stone wall were packed with clay, suggesting that the wall was constructed as a check dam to divert water from the north side of the house. A 19th-century occupation horizon covers the wall and appears beneath it, dating its construction to the second quarter of the 19th century. Inside the north lean-to, the western end housed an internal dairy or milk room. Measuring 2 m x 3 m, the room was 40-50 cm lower than the rest of the floor level of the lean-to and had a brick floor. A layer of demolition debris directly overlaid the fragmentary bricked floor and contained materials dating to the third quarter of the 18th century. At the bottom of the demolition debris, several nearly intact redware vessels were found resting on or near the floor. A thick layer of sand and shell lenses with a high quantity of fish bone covered the demolition debris. It is posited that those who abandoned the dairy filled the room with demolition debris and salvaged materials from a nearby shell midden to bring the floor level of the west end of the lean-to up to elevations matching the rest of the ground floor. The dairy has been tentatively dated from the 1720s to the 1770s and could represent the participation of the household in a colonial cash economy of butter production.

25-1786 Strauss, Alan E. and Lauren J. Cook

1998 Archaeological Reconnaissance Survey of the Cummingsville Branch Replacement Sewer Project MWRA Contract No. 6092, Winchester and Woburn, Massachusetts. 68 pages.

Background research and field reconnaissance indicated that, while no recorded prehistoric sites were located within the project corridors, a number of areas are sensitive for the presence of prehistoric and historic cultural resources. Documentary evidence shows that the Middlesex Canal ran

under a street where sewer construction is planned, but there is limited oral historical evidence that affected portions of it may have been disturbed or removed earlier in the century. Twelve historic buildings within the project area are noted in MHC files, one of which is listed on the National Register of Historic Places; these should be avoided during construction. An intensive-level (locational) survey is recommended at five locations considered sensitive for prehistoric archaeological resources and at one location to investigate a possible historical archaeological resource. Monitoring and recording during construction are recommended for a portion of the Canal route where a lock of indeterminate integrity is located.

25-1787 Cook, Lauren J.

1999 Intensive (Locational) Archaeological Survey of the Cummingsville Branch Replacement Sewer Project MWRA Contract No. 6092, Winchester, Massachusetts. 49 pages.

A total of 18 shovel test units and one 1 m x 1 m excavation unit were excavated within the project impact area. While the present landforms within the project area appeared on the basis of surface examination to be natural, subsurface testing indicated that the deposits and landforms were the result of extensive intentional filling associated with or subsequent to construction of the MSS 86 sewer. While these are archaeological deposits clearly resulting from human activity, including domestic and structural refuse, material within them is probably in secondary or tertiary depositional contexts. As a result, the research value of the assemblage is minimal, and the deposits within which it was recovered are neither significant nor eligible for listing in the National Register of Historic Places. As it appears that the project will not have an adverse impact on archaeological resources in Segments C and D, it is recommended that construction be allowed to proceed as planned. It is recommended that the project avoid any modifications that might affect the dam remains in Segment C, which are east of the present impact area. Please also see Report # 25-1786.

25-1788 Dimmick, Frederica R.

1996 Archaeological Investigations for the Handicapped Ramp at Longfellow National Historic Site 1988-1989. 71 pages.

Seventeen test units of varying depths and dimensions were excavated north of the woodshed. These yielded evidence of several features, including a brick pavement, a wooden fence, foundation walls, and a possible privy. Artifacts and features generally related to the 19th-century occupation of the Longfellow house. The area of impact was part of a garden complex during Longfellow's time and, following his tenure, was-used as a service yard for the house. Following the archaeological investigations, the handicapped ramp was installed over the features, which may still exist in partial condition. Further construction in the area should be avoided.

25-1789 Griswold, William A. and Steven R. Pendery

1998 Intensive Archaeological Testing at the Longfellow National Historic Site, Cambridge, Massachusetts. 94 pages.

Intensive archaeological testing was conducted on the north and west sides of the Carriage House and along the west side of the Longfellow Mansion at Longfellow National Historic Site (NHS) in Cambridge, Massachusetts. The project included background historical research and excavation of 50 cm x 50 cm and 1 m x 1 m test pits west of the Carriage House and 1 m x 1 m test pits to the west of the Mansion. Mitigation measures are recommended for the design of the parking lot to minimize site disturbance. The foundation of a manure cellar was identified north of the Carriage House, and a cobble paving was located along the north lot line of the Longfellow NHS. The manure cellar walls will be preserved in situ. The cobble paving will be subject to data recovery. No significant archaeological features were identified during the testing for the utility corridor west of the mansion. However, Stratum 4, a deposit containing artifacts from the occupation of the site by

John Vassall, Jr. should be more intensively sampled before project construction begins. Archaeological trenches will be excavated through the front walkway prior to its restoration. The proposed location for the lightning protection triangular ground grid will be tested. (See Report 25-1788)

25-1790 Beaudry, Mary C.

1997 Archaeological Testing of Area Proposed for a Septic Leaching Field Spencer-Peirce-Little Farm, Newbury, Massachusetts. 39 pages.

A total of 62 shovel test pits was excavated, resulting in the recovery of 1,681 artifacts, mostly 19th-century "field trash" deposited during manuring of the open field. No prehistoric remains of any sort were recovered. Discovery of unexplained clay pad features, presumably agricultural in nature and 19th-century in date, in the eastern sector of the test area leads to the recommendation that construction of the leach field be permitted in the western portion of the survey area, where no significant cultural remains will be disturbed. The clay pad features should be preserved for investigation at a future date. (See Reports 25-1248, 25-1249, 25-1250, 25-1251, 25-1252, 25-1367, 25-1404, 25-1818.)

25-1791 Wheeler, Kathleen, Steven Bayley, and Edward Bouras

1999 Results from a Phase I Archaeological Survey of the Haverhill Raw Water Transmission Main, Haverhill, Massachusetts (MHC Permit # 1511). 41 pages.

One prehistoric site was discovered on the Essex County Greenbelt Property on a small terrace overlooking the west side of a wetland. Artifacts recovered included a nearly complete Genesee-type point of North Shore felsite and two felsite flakes that were not associated with the point. The site is a small-scale, short-term occupation situated to exploit resources associated with the nearby wetland and shares similarities with several Late Archaic sites along the Merrimack River drainage.

25-1792 Clayton, David E., Ricardo J. Elia, and Nancy S. Seasholes

1993 Archaeological Investigations at the Peter Faneuil School Site on Beacon Hill in Boston, Massachusetts. 93 pages.

The project area consisted of two former schoolyards associated with the Peter Faneuil School on Beacon Hill between Joy and South Russell streets. Constructed in 1909, the Peter Faneuil School property now occupies the site of several historical houselots that were originally created during the first settlement of this part of Beacon Hill in the late 18th century. Houses on Joy Street were owned and occupied by members of Boston's African-American community; South Russell Street was predominantly occupied by Anglo Americans. Documentary research identified the patterns of historical development. Archaeological testing was conducted to investigate the nature and integrity of archaeological deposits. Six test trenches, totaling 26 sq m, were excavated. Two trenches revealed the presence of sterile subsoil directly below the brick paving of the school yard. Three trenches encountered concrete basement floors filled with demolition rubble representing a mixture of chronological periods. One test trench, on the South Russell side of the project area, located thin, apparently undisturbed strata dating to the late 18th early 19th century. The research potential of this area appears to be limited, especially in light of the absence of features and the predominance of later disturbance in the surrounding area. The Peter Faneuil School site is not considered eligible for inclusion in the National Register of Historic Places, and no additional archaeological investigations are recommended.

25-1793 Begley, William

1998 Intensive (Locational) Archaeological Survey of the Heidi Lane Subdivision, Middlebor-

ough, Massachusetts. 76 pages.

This project is located within a core area of Native American activity along the Nemasket River where there are a number of known archaeological sites. A walkover inspection delineated zones of archaeological sensitivity. Most of the project area was found to have high and moderate sensitivity for Native American cultural resources. All of the project area was considered to have low sensitivity for EuroAmerican cultural resources. An area of previous disturbance with low sensitivity was found along an existing road and surrounding a modern-period house. Subsurface testing was conducted in archaeologically sensitive areas. A total of 45 test pits was excavated. Two test pits contained Native American cultural material (quartz chipping debris). Heidi Lane Loci 1 and 2 were small, low-density deposits of quartz chipping debris. Close interval (5 m) subsurface testing around these loci did not yield any additional cultural material. The temporal/cultural affiliation of these loci is unknown. While these materials suggest that the project area was used on a limited basis for the expedient manufacture of chipped stone tools, they do not represent potentially significant prehistoric resources. No additional archaeological investigations are recommended.

25-1794 Begley, William and Duncan Ritchie

1996 Intensive (Locational) Archaeological Survey Pond View Farms, Raynham, Massachusetts. 69 pages.

The project area is located within the Taunton River drainage, a section of southeastern Massachusetts that is considered highly sensitive for prehistoric resources. Background research indicated the project area was highly sensitive due to the presence of known prehistoric sites in the immediate vicinity, most notably in Titicut Swamp. Background research indicated the project area was highly sensitive for historic resources based on the presence of a sawmill on Hewitt Pond during the early historic period. Field investigations began with a walkover survey of the entire project area. Areas were ranked according to the potential for prehistoric and historic sites to be present, and subsurface testing was conducted within areas that had the highest potential to contain archaeological deposits. Fifty-three 50 cm x 50 cm test pits were excavated during the intensive survey. No prehistoric cultural material was recovered. Small amounts of historical material were recovered from a plowzone context in one transect. This low density of material did not represent a potentially significant cultural resource and no additional testing was recommended.

25-1795 Macpherson, Jennifer and A. Peter Mair, II

1999 Intensive (Locational) Archaeological Survey Chelmsford Phase IVA Sewer Project Area, Chelmsford, Massachusetts. 55 pages.

The survey included background research, a walkover inspection of the project area, and subsurface testing. The project area contained many locations of previous disturbance from commercial and residential development as well as locations of poorly-drained, low-lying areas adjacent to wetlands. These areas were ranked as having low archaeological sensitivity. A total of 37 shovel test pits was placed in areas considered to have moderate archaeological sensitivity. No Native American or EuroAmerican archaeological sites were identified. The proposed Doral Drive to Meadowbrook Road Pump Station lateral will cross the historic North Chelmsford Canal, a feeder canal constructed in 1823 to channel water from Stony Brook to Newfield Pond (Freeman Lake) and then to industrial plants. The proposed installation of the lateral calls for “jacking” the pipe beneath the canal to avoid any impacts.

25-1796 Macpherson, Jennifer and A. Peter Mair, II

1999 Intensive (Locational) Archaeological Survey Chicopee River Business Park, Chicopee and

Springfield, Massachusetts. 93 pages.

The scope of work included background research, walkover survey, and subsurface investigations of areas of moderate and high archaeological sensitivity. A total of 171 test pits was excavated within nine 30 m x 30 m blocks, six judgmental linear transects, and one array. The survey identified one locus of Native American activity (a single artifact), a scattering of historic cultural material interpreted as field debris, and one historic site (Cooley House Site). The Native American Findspot 1 is an isolated find and the Cooley House Site has undergone extensive disturbance, destroying the site. No further archaeological investigations are recommended.

25-1797 Leveillee, Alan

1998 “An Old Place, Safe and Quiet”: Program of Archaeological Data Recovery Millbury III Cremation Complex, Millbury, Massachusetts. Volumes I and II, 415 pages.

A series of archaeological studies, culminating in data recovery, have been conducted at the Millbury III prehistoric Native American archaeological site. These studies focused upon a cluster of Susquehanna Tradition secondary burial cremation features. The features that constitute the Millbury III cremation complex were created approximately 3,500 years ago within parameters dictated by social and cultural criteria. Spanning more than 950 years, they reflect a continuity of ideology transferred and reinforced through ceremonialism. On the social system level, ceremonialism was an important element in maintaining Susquehanna cultural continuity and reinforcing ideology. Data regarding age and gender of the represented population indicate that both sexes and all ages were included in cremation and burial at Millbury III. Insuring that logistical and ideological obligations were met would have been facilitated by a centralization of responsibility within a shamanistic order.

25-1798 Rainey, Mary Lynne

1998 Archaeological Reconnaissance Survey Proposed Siasconset Wastewater Treatment Facility Locations: Airport Site (#30), Former Navy Base Site (#25), and Coast Guard Site (#18A), Nantucket, MA. 49 pages.

The three project areas are located in southeastern Nantucket. The Airport Site (#30) is 30 acres, the Former Navy Base Site (#25) is 3.6 acres, and the Coast Guard Site (#18A) is 11 acres. Background research and walkover surveys were conducted. All three sites have areas with moderate to high prehistoric site sensitivity. Historic sensitivity was considered low for all three. Intensive surveys were recommended in sensitive locations to determine the presence and disposition of any potentially significant archaeological sites.

25-1799 Garman, James C. and Leslie C. Shaw

1992 Archaeological Investigations at Derby and Central Wharves, Salem Maritime National Historic Site, Salem, Massachusetts. 29 pages.

Sub-surface investigations took place on Derby Wharf as required by two work orders. Work Order 1 had as its primary goal the location and documentation of early timber cribbing remains from the interior of the wharf. Extensive backhoe trenching revealed two significant categories of archaeological resources: 1) intact cribbing elements from the 18th-century construction of Derby wharf; and 2) a granite foundation wall, complete with entrance bays, of an early 19th-century warehouse that stood along the eastern edge of the wharf from 1805 to 1907. The discovery of this foundation wall necessitated the issue of Work Order 2, to examine the structure and to search for others. These later investigations exposed a cobble/clay barrier in the warehouse basement and the cobble layer in the location of a second 19th-century warehouse. Testing was also conducted along a proposed utility pipeline on nearby Central Wharf where several features were found including a bulkhead associated with an 18th-century wharf, an 18th-century warehouse(s), and a 20th-century

foundation slab. This report serves as a preliminary management summary including a summary of the archaeological work and recommendations for protecting archaeological resources on the wharves during construction. A more detailed final report will follow pending further analysis.

25-1800 Donta, Christopher L., Lorinda B. R. Goodwin, F. Timothy Barker, and Mitchell T. Mulholland

1998 Archaeological Monitoring and Investigations for the Central Wharf Site Development, Salem Maritime National Historic Site, Salem, Massachusetts. 150 pages.

Task Order 6. The goals of this survey were to establish the presence or absence of early remains of the northern end of the eastern bulkhead on Central Wharf and its associated 18th- and 19th-century structures, and to provide accurate locational data of these remains. Task Order 7. This project included archaeological monitoring on Central Wharf. Construction included the installation of a 178-ft concrete deadman and tie-rod reinforcing system. Task Order 8. The project consisted of archaeological investigations on the northern portions of Central Wharf to be impacted by the construction of a restroom building foundation and four utility lines. A total of 14 trench segments 4 ft in width and 271 ft in length was excavated. Portions of wharves constructed in 1764, 1791-1792, 1806-1811, 1896-1897, and 1938 were examined, as well as a stone foundation for the fourth warehouse built on Central Wharf, constructed in 1791-1792. A small number of historic artifacts associated with the 230-year long history of this location was recovered. No prehistoric materials were recovered in the project area.

25-1801 Garman, James C., Leslie C. Shaw, F. Timothy Barker, and Mitchell T. Mulholland

1998 Archaeological Investigation at Derby and Central Wharves, Salem Maritime National Historic Site, Salem, Massachusetts. 338 pages.

Investigations took place on Derby and Central Wharves as required by five separate task orders (also see Reports 25-1799 and 25-1800). Task Order 1 had as its primary goal the location and documentation of early timber remains from the interior of Derby Wharf. Extensive backhoe trenching revealed two significant categories of archaeological resources: intact cribbing elements from the 18th-century construction of Derby Wharf; and a granite foundation wall of John Prince's Store, complete with entrance bays. The discovery of the John Prince's Store foundation wall necessitated the issue of Task Order 2, to examine this structure and to search for others. These later investigations exposed a cobble/clay surface in the warehouse basement, as well as a cobble surface in the location of a second 19th-century warehouse to the north of the first building. Testing was also conducted along a proposed utility pipeline on the nearby Sanborn-Whipple-White section of Central Wharf where several features were found including a bulkhead associated with an 18th-century wharf, an 18th-century warehouse, and a 20th-century foundation slab. Under Task Order 3 the remainder of the proposed Central Wharf water pipeline was tested, resulting in the documentation of an early-19th-century storage structure and part of the flooring of an unidentified building. This survey was conducted on the Sanborn-Whipple-White and Ingersoll-Forrester sections of Central Wharf. These excavations (Task Order 4) revealed an earlier, undocumented wooden bulkhead-and-tieback system near the center line of the modern wharf, a system that was excavated and documented completely. Although original plans and specifications for the project stipulated the construction and excavation of two coffer dams, a method of stabilizing the seawall of Derby Wharf without excavating the interior of the structure was developed. The additional time was used to work in the existing cofferdam. Task Order 5 included additional background research, report writing, and analysis and curation of artifacts collected during Task Orders 1-4. This report serves as the final summary of the five task orders issued to date. It includes a summary of the archaeological work conducted and recommendations for protecting archaeological resources on the wharves during scheduled construction activities. Three additional task orders were conducted for the Salem project and are reported separately.

25-1802 Donta, Christopher L., Thomas L. Arcuti, and Mitchell T. Mulholland

1999 Archaeological Investigation of Plymouth Comfort Station, Plymouth, Massachusetts. 91 pages.

During excavation of a foundation for a proposed comfort station, the project contractor encountered historic timbers. An archaeological investigation was conducted prior to further construction. Background research indicated that the area was in use from approximately 1850. A crib wharf structure was found near the center of the proposed building foundation, lying on the sterile harbor bottom. This was presumably the earliest feature at the site, related to the initial construction of a wharf around 1850, built to create a platform for use as a lumberyard. A second wooden bulkhead was found to the exterior side of the first feature, dating to a reconstruction ca. 1896-1899. The two wharf features were documented, samples were taken, and associated artifacts were collected. No evidence of warehouses or other uses of the site were found. The site appears to represent typical maritime construction practices for the 19th century. No prehistoric resources were encountered. No further survey of the project area is recommended.

25-1803 Macpherson, Jennifer, Holly Herbster, and Suzanne G. Cherau

1999 Intensive (Locational) Archaeological Survey Down Island Golf Club Project Oak Bluffs, Martha's Vineyard, Massachusetts. 119 pages.

The intensive survey included background research, walkover survey, and subsurface testing to identify any potentially significant archaeological resources. Specialized historical research was conducted to assist in documenting several old roads/trails that traverse the project area. Three Native American site areas were identified within the project area. Area 1 yielded moderate to high densities of chipping debris, stone tools, and tool fragments along with a quartz cobble feature and several fragments of shell and animal bone. These deposits are considered to be potentially eligible for listing in the National Register of Historic Places under Criteria A and D, based largely on their possible association with the previously recorded Head of the Lagoon Site, reported to be one of the most extensively and continuously occupied prehistoric sites on Martha's Vineyard. Avoidance and preservation of Area 1 is recommended. The Bergeron Site yielded a moderate density of chipping debris along with evidence of historic-period activity. The site is potentially eligible to the National Register due to its potential to yield information related to prehistoric and historic period settlement in this part of the island. Avoidance and preservation is recommended. The third prehistoric site area, designated Findspot 1, yielded one piece of chipping debris and is not recommended for further archaeological investigations.

25-1804 Mulholland, Mitchell T., Thomas L. Arcuti, and Christopher L. Donta

1998 Archaeological Reconnaissance Survey of the Bristol Brothers Golf Course Development, Weymouth, Massachusetts. 55 pages.

The project area is located immediately east of the Old Swamp River wetland. The project is divided into two areas. The northern portion is not presently planned for construction, so it was only covered in the background research. The southern portion was the focus of this survey. While the Old Swamp River wetland is prominently mapped in historic documents, background research and the walkover revealed no recorded historic sites in the project area. Several 19th-century houses are mapped within one-quarter mile of the project area, and a historic mill, "Porter's Mill," is shown on a 1794 map. During the walkover, the swamp was completely dry, but in prehistoric times, the swamp would have been the predominant water source in the vicinity of the project area. People exploiting swamp resources might have made small camps in the project area. Review of the site files and the literature resulted in no previously recorded prehistoric sites in the project area or the immediate vicinity. A large gravel quarry has been in operation in the southern portions of the project area for the past year or so, destroying approximately two-thirds of the project area. Three areas north of the quarry have a high potential to contain prehistoric sites and subsurface testing is recommended. The current research showed that the majority of the southern portion of the area does not require further survey. The northern portion of the project area is

level, well drained, and less stony. Should development be proposed in this area, an archaeological survey is recommended.

25-1805 Holmes, Richard D., Toni R. Goar, Timothy Binzen, and Richard M. Reycraft

1999 Reconnaissance Survey of the ESI-New Bedford LLC Project Parcel and Site Examination of the Missio Site (19-BR-338), New Bedford, Bristol County, Massachusetts. 32 pages.

Work consisted of a reconnaissance survey of the sloping western portion of the parcel, and testing of the western part of the Missio site (19-BR-338), which has a Middle Archaic component. Land was previously used as a woodlot. The reconnaissance survey located no archaeologically sensitive areas, and no supplementary archaeological testing was recommended. An upright stone was investigated and is interpreted as a boundary marker. A stone fence was mapped. Testing included 43 shovel test pits and five 1 m x 1 m units. Researchers found no features. Three non-diagnostic quartz flakes, nine angular debris, and one core were in subsurface contexts. The portion of 19-BR-338 tested is not eligible for the National Register of Historic Places. Avoidance or further investigations are not required for the project area.

25-1806 Donta, Christopher L.

1999 Archaeological Site Examination of the Blassberg Site for the Turners Falls Heritage Park, Turners Falls, Massachusetts. 78 pages.

Earlier research in the area documented the Blassberg prehistoric site (19-FR-328). Historic remains associated with a 19th-century hotel were considered likely to be encountered during these excavations, but the focus of this project was the evaluation of the prehistoric site. The survey area covered 1,500 sq m. The site examination resulted in the recovery of 256 prehistoric artifacts from 24 of the 35 units excavated. The majority of the material was quartz chipping debris, with several other raw materials present, a small number of tools, and 13 sherds of prehistoric pottery dating to approximately the Middle to Late Woodland period. No temporally diagnostic lithic specimens or features were found. Road construction and structural foundations have heavily disturbed the area surrounding the artifact scatter. Any remains in these areas are likely to have been disturbed. The site is of the Woodland period, possibly related to the larger sites, including the Riverside Archaeological District, to the north. It is not expected that further excavation would document any intact features or provide a more definitive sample of artifacts. No further research on is recommended.

25-1807 Mulholland, Mitchell T. and Christopher L. Donta

1999 Archaeological Site Locational Survey for the Proposed Vineyard Acres Golf Development Project, Edgartown, Massachusetts. 76 pages.

Background research determined that the area has seen little human use in the past. No evidence of any prehistoric sites is recorded within the project area. Historic sources indicate that the area has been used as a woodlot for many decades, with no recorded habitation. An old dirt road, known as Dr. Fisher's Way (or Road), passes through the project area, and is the only historic feature observed. The project entailed the testing of four survey units, totaling 112 shovel test pits. No artifacts were recovered, and no sites were found. Testing along the ancient way failed to recover evidence of any historic features, sites, or artifacts. No evidence of any prehistoric activity was encountered. No further survey is recommended.

25-1808 Blancke, Shirley

1999 Archaeological Data Recovery at Sleepy Hollow North Cemetery Expansion: Final Report, Phase I, Concord, Massachusetts, 1999. 35 pages.

A volunteer data recovery was conducted for the west side of the area planned for expansion of the Concord Sleepy Hollow Cemetery (19-MD-100). Testing supplemented previous surveys in the project area (see Reports #25-1657 and #25-1679). A total of 173 50 cm x 50 cm shovel test pits were excavated at 5 and 10 m intervals within an area measuring 230 m x 30 m. Seven areas were tested with 1 m x 1 m units. Six features were observed of which three were of special interest. These included a shallow trench containing charcoal radiocarbon dated to the third millennium BP, an Archaic firepit radiocarbon dated to the fourth millennium BP, and a thin blackened area or "platform" for which several possible interpretations were offered, including a Native American house floor and a canoe-making area. It was recommended that additional testing be conducted in order to determine the nature of the black platform and to explore the area around the firepit.

25-1809 Donta, Christopher L. and Thomas L. Arcuti

1999 Archaeological Site Locational Survey for the BBB Properties, Billerica, Massachusetts. 53 pages.

Background research indicated that no known prehistoric sites were recorded for the project area, although two known sites (19-MD-776 and 19-MD-777) are known just to the south. Historic use of the area was limited, apparently to agriculture, beginning in the later 19th century. One historic site (BIL-HA-4) lies just to the north of the project area. Following background research, the project area was divided into two survey units based on topography and proposed impacts. The property was examined for prehistoric and historic archaeological potential and subsurface testing, using 100 shovel test pits, was conducted in areas with potential. No prehistoric artifacts or features were found anywhere in the project area. No significant historical features were found anywhere in the project area, although a small number of items dating from the latter half of the 20th century were found in a few of the test pits. No further testing is recommended for this project.

25-1810 Donohue-Putnam, Barbara

1997 Intensive archaeological Survey Taunton Elementary and Middle Schools, Taunton, Massachusetts. 57 pages.

The project area had been part of the property holdings of the Taunton Almshouse (now the Taunton Nursing Home,) since at least 1830. One Native American site (19-BR-63) is located within and adjacent to the project area. In addition, an historic earth and concrete dam and historic dump (TAU-HA-63) are located within the project area. The intensive survey revealed the location of a second historic dump (Feature Fl), a concentration of historic materials in the southeastern section of the project area (Historic Site HS1), as well as a scatter of historic materials throughout the western half of the project area. A minimum amount of prehistoric materials, defined as two spot finds were also recovered.

25-1811 Donohue, Barbara

1998 Site Examination of the Taunton Elementary and Middle School Project, Taunton, Massachusetts. 164 pages.

This site examination consisted of the excavation of 75 shovel test pits, eight excavation units and one trench, within three areas of a 0.5 km x 1.5 km parcel of land on the property of the former Taunton Almshouse (1826-1931). An earlier survey identified an area of unusual concentrations of artifacts and soil anomalies (Area A) and two historic dumps (Areas B and C) (see Report #25-1811). The site examination recovered 22,911 late 19th- to early 20th-century artifacts. It was determined that Area A had witnessed considerable disturbance through landscaping activities, which made it impossible to interpret. No further testing was recommended. The dump in Area B yielded many near-intact items from well-defined strata, suggesting several dumping episodes. The historic dump in Area C yielded many small, broken items in mottled soils, suggesting a single dump episode. Both dumps had a large number of medicine/prescription bottles, reflecting re-

sponses to a range of health problems within the early 20th-century almshouse. The materials recovered from both dumps have the potential to contribute important information to our understanding of the relief of the poor and of medical practices associated with the poor and the sick. It is recommended that any disturbance to the Area B dump is preceded by a Data Recovery Plan. No further testing was recommended for the Area C dump.

25-1812 Wheeler, Kathleen and Ellen Marlatt

1999 Findings from the 1998 Site Examination at the Dwight Derby-House, Medfield, Massachusetts. 121 pages.

Fieldwork was completed prior to renovations at the house including foundation repair and landscaping to improve drainage. Archaeological sampling was restricted to areas of greatest impact from grading and foundation work, leaving a large portion of the yard untested. The Dwight-Derby House is an 18th-century woodframe building, with portions of a 17th-century parlor and chamber and later additions. Secondary sources assert that Timothy Dwight, one of the first settlers and organizers of the town, built the house. Two successive families lived in the house throughout the 17th, 18th, and 19th centuries: the Dwights(ca. 1652 until the 1790s) and the Townsend/Derby family (-1880). The house has been approved for nomination to the National Register of Historic Places. More than 7,000 artifacts were collected from 26 excavation units, including six prehistoric flakes from the north side of the house. In the south yard, few artifacts were found, and it is expected that grading will impact few to no archaeological resources. On the west side of the house, sampling along the foundation did not reveal evidence of the date of construction. The density of artifacts was not sufficiently great to warrant further investigation prior to landscaping. The back yard provided the highest density of artifacts. Testing along the north foundation revealed a repair trench that disturbed the initial builders' trench. The owners of the property may want to consider further archaeological investigation of the back yard, because so little of its area was sampled. The east yard provides evidence of what may have been an urban dooryard, with access to and from the east parlor during the last quarter of the 18th century and the first quarter of the 19th century. High quantities of redware were discovered in the east yard along with what may be stone piers for an outbuilding. The east yard was bounded by the house on two sides, providing a protected area for dairying and other household tasks. Because landscaping is expected to be most severe in the east yard, it is strongly recommended that further archaeological investigation continue here prior to any landscaping or grading.

25-1813 Garman, James C., Paul A. Russo, and Lauren J. Cook

1998 Archaeological Site Examination of the Osborn-Read-Page Pottery at the Ahepa/Penelope 120 Assisted Living Project. 130 pages.

Excavation of seven machine-assisted trenches, in concert with column sampling and other controlled means of artifact collection, indicates that the Osborn-Read-Paige pottery archaeological site in Peabody, Massachusetts includes extensive archaeological deposits associated with both the 19th- and 20th-century pottery industry on the North Shore. Although portions of the site have been disturbed by demolition and post-abandonment processes, enough stratified deposits remain in the central portion of the site to establish the site's integrity. Current data suggest that its period of significance is 1830, toward the end of Amos Osborn's tenure, to 1944, the end of Moses B. Paige's tenure. Although the site boundaries are the historical boundaries of AHEPA/Penelope 120 Parcel 11, the site has a central core of stratified deposits and archaeological integrity. The Osborn-Read-Paige pottery is recommended as eligible for inclusion in the National and State Registers of Historic Places under Criteria A, B, and D. Project plans call for construction of a parking lot in the area defined as the limit of intact archaeological deposits. It is recommended that construction techniques be evaluated that could avoid or minimize impacts to the site. If disturbance to the site cannot be minimized, an archaeological data recovery may be necessary as a mitigation strategy.

25-1814 Pinello, Martha E.

1999 An Archaeological Site Examination of the Peach Wall at the Vale, the Lyman Estate, Waltham, Massachusetts. 81 pages.

The 450-foot, free-standing brick wall was constructed in 1794 to hold espaliered fruit frees. It is part of an English styled estate garden system installed by Theodore Lyman (1753-1839), a wealthy merchant and patron of horticulture. Excavations revealed the original, and still functioning, rubble-filled drainage trench on the north side of the wall. A path or promenade, 5 to 6 feet wide, was once paved with sand, gravel and coal ash, and covered the surface of the trench. Another path surface was identified on the south side of the wall. This path surface may have included shell, coal ash, and gravel. The garden bed south of the wall has been in continual use since the 1790s and thus contained rich organic soil and a modern planting hole. The north lawn topography was leveled, probably as the result of Victorian period changes.

25-1815 Dunford, Frederick J.

1987 An Archaeological Reconnaissance Survey of Pleasant Bay, Massachusetts. 57 pages.

Prehistoric and historical background research indicates that the Pleasant Bay study area has a high potential to contain both prehistoric and historic sites. Specifically, the known archaeological record, as compiled by the Massachusetts Historical Commission, lists 45 prehistoric or contact sites for the Pleasant Bay study unit and approximately 60 sites for the greater Pleasant Bay area. An additional 24 sites were located during this study. Interestingly, the 72 sites discussed here represents approximately 10% of the known site record for all of Barnstable County, indicating a significantly high site density for this area. Development and coastal erosion will therefore have a significant impact on the archaeological record of Pleasant Bay. An examination of prehistoric archaeological site distribution data indicates that well-drained areas with sandy soil and minor slope that are within 1,000 feet of a freshwater source and the resources of a marine ecosystem have a very high potential to contain prehistoric archaeological sites. Areas with these characteristics should be avoided during the course of development.

25-1816 Pendery, Steven R.

1998 Bedford Lane Archaeological Survey Minute Man National Historical Park, Lincoln, Massachusetts. 20 pages.

Archaeological testing was conducted at Minute Man National Historical Park. Eleven 50 cm x 50 cm shovel test pits were excavated in the project area. No prehistoric artifacts were discovered, and no significant historic-period resources were documented. No additional research is recommended for this project area.

25-1817 Cherau, Suzanne G. and Beth P. Miller

1996 Intensive (Locational) Archaeological Survey Beale House Preservation and Rehabilitation Project, Quincy, Massachusetts. 109 pages.

The Beale House is a late 18th-century Georgian/Federal-style building, with a late 19th-century Carriage House, which sits on a 3.68 acre parcel of land. The survey consisted of background research and subsurface testing to identify archaeologically sensitive portions of the property. Because of the proximity of Furnace Brook and well-drained sandy soils, it was expected that prehistoric resources would be located in relatively intact portions of the parcel. One prehistoric site was identified within the Beale House property. This site contains a moderate density of chipping debris, chipped stone tools, and food remains. A variety of lithic materials used by local prehistoric groups from at least the Middle Archaic through the Late Woodland periods are represented in the

assemblage. The presence of calcined bone (deer species) indicates that food processing occurred on-site. The prehistoric deposits were recovered from intact subsoils and disturbed topsoils. Because nearly half of the prehistoric artifacts (including the calcined bone) were in relatively intact soils, the prehistoric site was determined to possess good physical integrity. It has the potential to provide information relating to prehistoric settlement and subsistence systems in the Furnace Brook section of the lower Neponset River drainage. Historic archaeological remains include late 18th- through 20th-century domestic and construction-related artifacts. These materials were recovered around the main and carriage house foundations, in the North Lawn, along the driveway and turnaround, and in the north, east, and west meadows. In most cases, temporally-sensitive artifacts were intermixed in sandy fill soils. Other historic deposits include a refuse pit near a possible privy or well feature in the North Meadow. A concentration of machine-cut nails was found in association with a stone footing in the North Lawn area between the main and carriage houses. This was the site of a ca. 1867 stable formerly connected to the northeast side of the main house. The below-ground stone footing and associated nail assemblage are likely associated with the stable. This structure had four large arched bays and was built without a raised foundation. The refuse pit stone footing, and intact areas of documented historic resources have the potential to contribute information relating to the land use and occupational history of the Beale House property. Further archaeological study of the prehistoric and historic deposits is recommended.

25-1818 Beaudry, Mary

1997 Volume A: Archaeological Investigations at the Spencer-Peirce-Little Farm, 1996, Newbury, Massachusetts. 21 pages.
2003 Volume B: Report of Archaeological Testing, Fencing Improvements, 2003, Spencer-Pierce-Little Farm, Newbury, Massachusetts. 28 pages.
1998 Volume C: Archaeology of the Spener-Pierce-Little Farm, Newbury, Massachusetts, Interim Report No. 6, Results of Archaeological Testing: Granary/Horse Barn Foundation and West Hayfield, Spencer-Pierce-Little Farm, Newbury, Massachusetts. 60 pages.

The 1996 field season at the Spencer-Peirce-Little Farm had two major components. The first of these was conducted as an archaeological field and workshops. Excavation focused on the northern boundary of the farmyard, excavating within the existing Carriage Shed and along a former fence line and range of outbuildings stretching between the Carriage Shed and Tenant House. The second component was an intensive shovel test pit survey in the field to the north of the farmyard, (see Reports #25-1248, #25-1249, #25-1250, #25-1251, #25-1252, #25-1367, #25-1404, and #25-1790). The 1998 fieldwork was conducted in advance of grading and drainage improvements where a large horse barn once stood. The limited evidence recovered suggestst ha the 1811 barn (identified as a granary) was reworked into a stable or horse barn in the 1860s or 1870s when other major changes to the house and farmyard were undertaken. A transect of 10 shovel test pits produced features (foundation segment, pit or dry well, etc), and cultural material. Archaeological testing was conducted in 2003 where fencing improvments are proposed. A total of 7 test pits were excavated. Artifacts included brick fragments and coal clinkers, however the finds indicate very low-density use of this area of the property.

25-1819 Decima, Elena, Barbara Donohue, and Alison Dwyer

1998 Reconnaissance Survey for the Minimum Operating Section of the South Boston Piers Transitway Turn-Around Loop (CC01). 41 pages.

Most of the Minimum Operable Segment (MOS) has been cleared by previous archaeological studies (see Reports #25-898, #25-988, and #25-1336). The area between Beach and Essex streets was identified as the only portion of the project not surveyed previously. The historic research revealed that mainly indentured servants settled the study area, which did not fully join the large-scale maritime trade of Boston until the Early Industrial Period, when the coal trade developed. The residents of this section continued the earlier demographic pattern of living adjacent to their work places. By the end of the 19th century, most of the wharves were taken over by rail lines,

culminating in the construction of South Station in 1896. Prehistoric sites may exist along the 17th-century shoreline or in the tidal flats created by rising sea levels, however they are fragile and subject to destruction by European construction. Early European sites within the MOS corridor are also most likely to be found along the original shoreline. While historic research indicates that a saw pit, garden and orchard of one of the original settlers were located near the southeastern edge of the peninsula in the late 17th century, it is not known whether buildings were also located near the shoreline. The project area experienced various fill operations in its historic development, often associated with wharfing-out. The history of disturbance and intense development of this section of Boston indicates that the cultural resources associated with its occupation are not likely to have retained integrity. No archaeological investigations are recommended.

25-1820 Strauss, Alan E.

1998 Intensive Archaeological Survey (Phase I) MWRA Quabbin Reservoir Disinfection Facilities, Ware and Ludlow, Massachusetts. 46 pages.

Background research indicated that no recorded prehistoric or historic sites were situated within the project area, although there are a number of recorded sites in the region. Investigations for the project included a surface inspection, followed by the excavation of 25 shovel test pits in an area of approximately 1 acre at each project location. The shovel testing revealed that soils in the Ware project area were plowed and one crystal quartz flake was recovered from the plow-zone. Bracket testing around the flake failed to locate additional cultural remains. The isolated flake suggests that some ephemeral prehistoric activity took place in the project area. Soils in the Ludlow project area were unplowed and rocky. No cultural remains were recovered from the Ludlow project area. No further archaeological investigations are recommended for the two project areas.

25-1821 Donohue-Putnam, Barbara and Karen Michalec

1997 Intensive Archaeological Survey Briggs Recreational Site, Plymouth, Massachusetts. 31 pages.

The proposed 36 acre project area is located southeast of Indian Brook Road, to the north of Indian Brook, and to the south and west of Indian Brook Elementary School. A preliminary assessment of the property indicated that the area had both prehistoric and historic archaeological potential and warranted an intensive (locational) survey. The intensive survey, which consisted of an additional walkover, historical background research, and test-pit excavation, included the excavation of 92 systematic and 12 judgmental test pits. No cultural materials—either prehistoric or historic—were recovered; thus, no additional work is recommended.

25-1822 Strauss, Alan E.

1998 Archaeological Machine Excavations at Lot 48 Berkshire Trail Subdivision in Barnstable, Massachusetts. 35 pages.

The project consisted of background research, field reconnaissance, and subsurface testing. Background data indicated that a possible Native American burial ground was located near the project area based on oral tradition and a surveyors map from 1975. An on-site inspection was made with Mr. Tysto Ranta a local resident who knew the location of the burial ground. Mr. Ranta established that the possible burial ground was located a few hundred feet to the east of the project area. Lot 48 contained a small knoll and level plateau and had moderate potential to contain prehistoric cultural resources and a possibility of possessing human burials. Seven, north-south oriented, machine trenches were excavated across the project area. The trenches excavated with a “Bobcat” excavator were 5 feet in width and between 38 and 59 feet in length. Four of the trenches on the plateau had to be excavated with a backhoe, these trenches were about 3 feet wide and 90 cm deep. No evidence of human burials or other prehistoric activity was identified in any of the trenches, which were excavated into the light-colored, B-2 horizon soils. No further archaeological investi-

gations are recommended.

25-1823 Clements, Joyce M.

1999 Report of a Phase II Archaeological Site Examination, The Stetson House, Hanover, Massachusetts. 42 pages.

The site examination consisted of documentary and contextual research, and excavation of 7 test trenches (50 cm x 1 m) within the construction footprint. Subsurface excavations produced moderate quantities of artifacts dating from the 18th to the 20th centuries. Subsurface horizons consisted of strata redeposited during household renovation and construction of modern drainage features. The test area contains no intact significant archaeological deposits, and archaeologists therefore recommend that the proposed utility trenches be constructed as planned.

25-1824 Fragola, Patricia

1998 Intensive (Locational) Archaeological Survey, Stop & Shop Plaza Redevelopment Project, Sandwich, Massachusetts. 72 pages.

The intensive (locational) survey included 37 shovel test pits excavated within the project area. The low density of historic period cultural material recovered is not believed to be related to any specific activities occurring at the Roberti Dairy Farm and are not considered to be a significant archaeological deposit. No prehistoric cultural material was recovered during this survey. No additional archaeological investigations are recommended.

25-1825 Macpherson, Jennifer and Duncan Ritchie

1999 Intensive (Locational) Archaeological Survey Middle Fort Pond Sewer Project. 78 pages.

Background research and a walkover inspection were used to assess the present condition and archaeological sensitivity of the project area in Acton, Massachusetts. Subsurface testing within these areas was carried out with 5 m x 5 m blocks containing five 50 cm x 50 cm test pits. The three stream crossings were sampled with judgmentally placed 50 cm x 50 cm test pits and transects. The proposed treatment plant and operations building sites were examined with 30 m x 30 m blocks containing 13 50 cm x 50 cm test pits, a single test pit transect, and two test pit arrays. A total of 85 test pits was excavated during the survey. Subsurface testing identified two prehistoric archaeological sites. At the Hawk Pine Site, found within the proposed treatment plant, cultural material included a Brewerton-like projectile point and pieces of rhyolite, quartz, mylonite, and chert chipping debris. A probable pit feature was found in an area with a concentration of chipping debris. The mylonite chipping debris and projectile point indicate that the site may contain Middle and Late Archaic period components. Locus 1, characterized by few pieces of rhyolite and quartz chipping debris, was found on the proposed location of the operations building. It appears to be a small activity area and is unlikely to yield additional information. It is not considered potentially significant. The Hawk Pine Site appeared to be a moderate sized, multi-component site and a potentially significant cultural resource. It was recommended that construction of the proposed treatment plant avoid this site, if possible. No further archaeological investigation of Locus 1 was recommended (see report# 25-1876).

25-1826 Fragola, Patricia and James C. Garman

1999 Intensive (Locational) Survey Mayor Michael J. Neville Manor, Cambridge, Massachusetts. 116 pages.

The survey identified two archaeological sites: the Charles Foster Site (ca. 1790-1840), which may represent a dump or a post-abandonment landscaping event; and Neville Manor I. Background research indicates that the Charles Foster Site is likely associated with an early 19th-century domes-

tic site. The site, which lacks any evidence of a cellar hole or other structure, has poor stratigraphic integrity. Neville Manor I, identified in a test pit and delineated through array testing, contained six flakes in poor stratigraphic context. No other archaeological sites were identified in the major impact areas, which demonstrated evidence of land filling and grading. An isolated fragment of human bone identified on the site approximately 20 years ago may have been brought in from an unmarked cemetery as part of the fill required to reach the proper grade for the terrace. The results of the survey strongly suggest that neither site is eligible for inclusion in the State and National Register of Historic Places. Given the limited potential significance of the Charles Foster Site and the Neville Manor I Findspot, no further archaeological survey is recommended for the redevelopment of Neville Manor.

25-1827 Decima, Elena B.

1997 Final Report for Intensive Archaeological Survey Indian Pond Estates, Kingston, Massachusetts. 54 pages.

The survey tested (via blocks of test pits, transects, and judgmental test pits) several areas within the project. The survey located four small prehistoric sites (A, C, D1, D2) in the flat areas by a group of seasonal pools/water holes. The four sites are small, with a low density of artifacts, and lack finished tools and diagnostic artifacts. In total, 30 flakes (felsite and quartz), six shatter (quartz), and two possible cores (quartz) were recovered. Remains of historical activities were also encountered in different areas of the parcel: a small dump near Brook Street and surface trash by Duke's Hole and by the many dirt roads and trails that crisscross the property. The sites could reflect activities associated with a possible Native American trail (known as Duke's Hole Road). The sites may represent the remains of small foraging camps, perhaps brief stopovers in the seasonal movements between the Jones River, Indian Pond, Smelt Pond, Muddy Pond, and the many ponds and brooks that encircle the project. It is recommended that a site examination of Sites A, C, D1, and D2 be conducted.

25-1828 Macpherson, Jennifer

1998 Intensive (Locational) Archaeological Survey Flagship Property, Hopkinton, Massachusetts. 93 pages.

The project area encompasses approximately 168 acres located east and west of South Street, north of the Hopkinton/Milford town line. The intensive survey included background research, a walkover survey, and subsurface testing. Based on the walkover survey, a specific number of locations within the project area were considered to have high or moderate archaeological sensitivity. Shovel test pits excavated in these areas recovered historic-period artifacts associated with two foundations and chipping debris associated with two areas of prehistoric activity. Historic Foundation 1 contains cultural material dating to the late-18th, early-19th centuries in an undisturbed context and additional archaeological investigations in the form of site examination should be conducted if proposed development impacts this area. No further work is required for Historic Foundation 2 or Native American Findspots 1 and 2.

25-1829 Hoffman, Curtiss

1996 Middleborough Little League Playing Fields Path, Middleborough, Massachusetts, Archaeological Intensive Survey and Supplementary Research Report. 196 pages.

The project areas are adjacent to the Soccer Field Site, 19-PL-520. The first area was tested with shovel test pits in two transects at 15 m intervals. Sixty-two lithic artifacts were found in 19 test-pits, and 21 more were found on the surface. These expand the known range of occupation from the Early Archaic period (a LeCroy bifurcate point) to the Contact period (three ballast flint gunspalls) and a chiastolite charm stone. Five probable pit features were observed. In the second area, 26 test pits were excavated. Diagnostic artifacts recovered included an Orient Fishtail point, and

several Small-Stemmed Points and point fragments, and a steatite bowl fragment.

25-1830 Lewis, Lynne G. and Jared W.E. Bryson

1997 Through Rain and Snow and Cold: Archaeological Reconnaissance for the Studio Drainage Correction Project at Chesterwood, Stockbridge, Massachusetts, November 1996. 37 pages.

Six units of varying sizes were excavated outside and within the basement of the Daniel Chester French Studio. The two exterior units (measuring 4.5 ft x 4 ft and 3 ft x 5 ft) showed significant disturbance. The remaining four units were excavated in the cellar and were each at least 1 ft x 1 ft in size. All artifacts recovered from the cellar were of 20th-century origin. None of the excavation units provided clear evidence of earlier (pre-French) occupations at the site.

25-1831 Fragola, Patricia

1996 Technical Report: Intensive (Locational) Archaeological Survey of the Proposed Adams Farm Residential Subdivision, and Archaeological Site Examinations of the Dragonfly and Ellis Cellarhole Sites, Walpole, Massachusetts. 141 pages.

Five archaeological sites were identified in the approximately 338 acre proposed Adams Farm Residential Subdivision. Two (Hawks Rockshelter, Dusty Dog) are Native American sites representing temporary or sporadic land use while a third (Dragonfly) encompasses three loci of lithic tool manufacture and maintenance. The Ellis Site, a farmstead occupied as early as the 1720s and later destroyed by fire, yielded a high density of artifacts indicating intensive occupation during the mid-18th century. The nearby Stone Ring Site appears to be a hunting blind or pen. The Ellis Site, that has associations to early Walpole history, was recommended for inclusion in the National Register of Historic Places.

25-1832 Goodby, Robert G.

1993 The 1992 Massachusetts Audubon Society Archaeological Field School at 19BN87, Wellfleet, Massachusetts. 41 pages.

Following work conducted by Linda Towle (see reports #25-576, #25-673, and #25-785) and Fred Dunford, the Field School continued investigations of Joe Brown's Asparagus Field (19-BN-87), an approximately 450 sq m site occupied intermittently from the Late Archaic through the Late Woodland period. Two areas were tested with the goal of defining the limits of concentrations of artifacts, with a total of 13 50 cm x 50 cm shovel test pits. The concentrations were sampled with three 1 m x 1 m units. Locus 1 was an area noted by Towle to have a high density of ceramics. Results from the nine shovel test pits and one 1 m x 1 m unit included ceramics (two with cord-wrapped stick impressions) indicative of Late Woodland occupation; there was also evidence of tool manufacture. Locus 2 investigated an area of felsite chipping debris with four shovel test pits and one 1 m x 1 m unit. Materials (ceramics and lithics) were suggestive of Late Woodland occupation.

25-1833 Thomas, Peter A.

1979 In the Maelstrom of Change: The Indian Trade and Cultural Process in the Middle Connecticut River Valley: 1635-1665. 566 pages.

This dissertation examines southern New England Native American-European trading activity (especially the fur trade) between 1635 and 1665, particularly the articulation between facets of economic, political, and social life in the New England Indian and English communities. Archaeological evidence is presented from the Squakheag site of Fort Hill (1663-1664) in Hinsdale, New Hampshire.

25-1834 Mueller, James W., Steven R. Pendery, and William A. Griswold

1998 “The Fort on the First Hill in Dorchester:” Archaeological Investigations of Colonel Gridley’s Revolutionary War Star Fort at Dorchester Heights National Historic Site, South Boston, Massachusetts. 227 pages.

Background studies and field testing resulted in the discovery of parts of a star fort that was built on Dorchester Heights in May 1776. Remains of the gate complex, the ditch surrounding the fort, and the powder magazine were recovered. Testing was done by monitored backhoe trenches and manual excavation units over the approximately 1.25 acres of the project area. Fragments of an officer’s epaulet and some musket balls were the only military artifacts recovered. The evidence indicated that the ditch had not undergone modifications during the War of 1812 while the powder magazine had been repaired or re-built in 1814.

25-1835 Cherau, Suzanne G. and Claudia Milne

1998 Intensive Archaeological Survey: Forty Acres within Area 14A, Modified Site Examinations of Two Historic Sites, Main Training Area, Devens Reserve Forces Training Area, Devens, Massachusetts. 145 pages.

The survey covered an approximate 40 acre section of Area 14A located in the northeast quadrant of the Main Training Area (former South Post of Fort Devens) in Lancaster, Massachusetts. The modified site examinations were conducted at the locations of two previously identified historic sites and previously identified prehistoric deposits also situated in the northeast quadrant of the Main Training Areas (see Report #25-1378 and #25-1435). Field investigations of Area 14A did not identify any significant archaeological resources. Field investigations and archival research of the previously identified archaeological sites (HS 1S [formerly 2S], HS 3S, and the Range Control Site [19-WR-563] which includes the 19-WR-358 site area) determined that these sites have been compromised by 20th-century military disturbances. These sites are not recommended as eligible for inclusion in the National Register of Historic Places. No further archaeological investigations of these sites or the 40 acre section of Area 14A in the Main Training Area of DRFTA are recommended.

25-1836 Waldbauer, Richard, William A. Griswold, and Steven R. Pendery

1999 Cultural Land Use Mapping Study: New Bedford Whaling National Historic Park. 94 pages.

The report documents the expected locations of a variety of significant archaeological resources within the proposed New Bedford Whaling National Historic Park, a 23 acre parcel in New Bedford, Massachusetts. It also identifies a few potentially significant sites just outside the boundary, such as the Baker-Robinson Oil and Candle Works and the Rotch-Jones-Duff House. The archaeological potential of the County Street Historic District, Merrill’s Wharf Historic District, and select nearby National Historic Landmarks is also evaluated in a general way. Issues pertaining to the management of archaeological resources with the Park are reviewed. Historic land use maps are included.

25-1837 Milne, Claudia and Duncan Ritchie

1999 Reconnaissance Archaeological Survey: BankBoston Great Woods Development. 77 pages.

This survey assessed the archaeological sensitivity of approximately 500 acres within the southern half of the Great Woods district, a large tract of woodland extending across the Norton/Mansfield town line. Background research involved a review of historic maps, town histories, and several earlier cultural resource management surveys. Two historic-period cultural resources were identified in the project area during the walkover survey and surface inspection: a foundation for a small

house with an associated well and a fieldstone culvert or bridge over Great Brook. Modern period structural remains included a concrete foundation for a house near Route 140 and a group of wood frame sheds used to store construction or farm equipment. Background information also indicated that a historic period farmstead could be located in the northern section of the project area. The walkover identified zones of high sensitivity for cultural resources near Great Brook and other small streams and wetlands. Zones of moderate and low sensitivity expected to contain unrecorded prehistoric and historic period sites were also designated.

25-1838 Doucette, Dianna

1997 Annasnappet Pond: 9,000 Years in Carver, Massachusetts: A Popular Report on the Archaeology in Carver, Massachusetts for the Route 44 Reconstruction Project. 16 pages.

The popular report summarizes the field methods and findings of the data recovery project on the sites in the Annasnappet Pond Archaeological District (see Report #25-1692). The sites were occupied from the late Paleoindian period through the Middle Woodland, with the greatest use occurring in the Middle Archaic. Debitage, points, soapstone bowl fragments, and atlatl weights were among the recovered artifacts. There was also a human burial in the District.

25-1839 Macpherson, Jennifer and A. Peter Mair, II

1999 Intensive (Locational) Archaeological Survey: Nickel Hill Energy Project, Dracut, Massachusetts. 47 pages.

Favorable environmental attributes as well as a nearby 18th-century nickel mine contributed to a high sensitivity ranking for portions of the project area. Additionally, the southern portions of the project area were considered sensitive for prehistoric and historic resources due to the close proximity of the Merrimack River. A total of 116 test pits was excavated. Subsurface testing focused on moderate and high sensitivity areas within the wooded areas around the northern and western periphery of an active quarry, and along the Merrimack River. Archaeological investigations yielded a small number of 20th-century historic artifacts and a small, concrete foundation that is not considered potentially significant. No cultural material reflecting prehistoric Native American use of the project area was recovered.

25-1840 Donta, Christopher L. and Thomas L. Arcuti

1999 Archaeological Survey and Architectural Review of the Harlow House and Farmstead, Ellisville Harbor State Park, Plymouth, Massachusetts. 89 pages.

A total of 72 shovel test pits was excavated in the project area of approximately six acres. No direct evidence of historic structures from the earlier use of this property was found. There are no indications of any intact subsurface remains of historic features directly around the Harlow House, or anywhere else on the property. The only indication of earlier historic use comes from a substantial percentage of the artifacts in Survey Unit 1, which date from the 18th and 19th centuries. Three shovel test pits were excavated in the basement of the farmhouse, to assess impacts related to removing oil-contaminated soils. Most of the project area appears to be part of a single, large prehistoric site, which extends to the northeast, into the area investigated previously by Boston University, and cataloged as prehistoric site 19-PL-174 (see Report #25-1783). Thirty-eight of the 72 test pits excavated by UMAS contained prehistoric material, totaling 210 artifacts. The two diagnostic specimens collected during this project point to a Woodland Period occupation but may also include earlier components. A 1939 residence and several farm-related outbuildings were evaluated. Some of the outbuildings are slated for demolition. The study found that most of the outbuildings are in very poor condition, were constructed in the 20th century, and are not eligible for inclusion in the National Register of Historic Places. An MHC Area Form was completed for the parcel.

25-1841 Leveillee, Alan

1997 Assessment Summary: Archaeological Reconnaissance of the Taunton Municipal Airport, East Taunton, Massachusetts. 4 pages.

A reconnaissance level survey of the approximately 1 sq km area of the airport showed the area to have undergone severe ground disturbance through prior construction. Background research indicated the presence of known prehistoric sites in the general vicinity, but only one findspot in the immediate area. No further survey was recommended.

25-1842 Pappalardo, A. Michael, Cecelia Saunders, Faline Schneiderman-Fox, and Jo Deaton

1999 Intensive Level (Phase 1) Archaeological Survey, Naval Reserve Center, Pittsfield, Massachusetts and Architectural and Historical Documentation. 157 pages.

The Naval Reserve Center (NRC) is a 10.7 acre (4.3 hectare) rectangular parcel. Based on the results of two prior reconnaissance surveys, NRC Pittsfield was determined to possess sensitivity for archaeological resources. This survey involved background research, a walk-over survey, and the excavation of 169 shovel test pits measuring 20 inches by 20 inches (50 cm by 50 cm). Several test pits yielded 19th-century artifacts, but these small, uniformly broken pieces of earthenware and glass do not represent potentially significant deposits. A total of three isolated prehistoric artifacts were recovered, one chert and one quartz flake, and one quartz cobble. No additional prehistoric artifacts were recovered through tighter interval testing at these locations. Modern refuse encountered at or below the level at which prehistoric materials were encountered indicates some degree of soil disturbance. The project site does not meet the criteria for National Register eligibility; further archaeological research would likely yield redundant data.

25-1843 Donta, Christopher L., Thomas L. Arcuti, and Timothy Binzen

1999 Archaeological Site Reconnaissance and Locational Surveys for the Proposed Greenfield Liquid Natural Gas Tank Project, Deerfield and Whately, Massachusetts. 91 pages.

The initial field survey consisted of five areas under consideration for the gas tank; three areas were added later. This report presents evaluations of all eight areas, testing of three survey units, and recommendations. Background research and the reconnaissance survey indicate that the proposed project areas were located in a region of high prehistoric site density. Two sites are known to lie within proposed gas tank locations, while numerous others exist within meters of these areas. Areas with the highest potential for site location were recommended for avoidance. These included Survey Units 1, 3, 9A, and 9B. These, as well as Survey Unit 7, were eliminated for consideration, in preference for either Survey Unit A or B. Subsurface testing was completed at each. Survey Unit C was added later and also subsurface tested. A total of 112 STPs was excavated. Field testing did not recover any indications of prehistoric or historic resources. No further subsurface testing is recommended for these areas. It is recommended that the project proceed as planned.

25-1844 Donta, Christopher L., Richard D. Holmes, Claire C. Carlson, and Thomas L. Arcuti

1999 Archaeological Site Locational Survey for the Proposed Boltwood Walk Parking Garage, Amherst, Massachusetts. 115 pages.

Background research indicated that the project area was a pasture until the early 19th century, when Noah Webster obtained the property and made a garden. This reportedly included a well and is known to have included other outbuildings. The area remained unchanged until approximately 1880, when it was developed commercially and contained several buildings and foundations. The lot remained commercial until the 1970s, when the remaining buildings were razed and the area

converted to a parking lot. Four archaeological trenches were excavated, in locations chosen on the basis of historic maps to intercept structural features and the probable location of Webster's well. Foundations of four structures were found, all built in the late 19th century and used for up to 100 years. Artifacts found in association with the structures correlate with historic maps and support the interpretation of a substantial development of this area during the 1880s. The structures were fully documented in plans and photographs. No evidence was found of a garden well constructed in the early 1800s.

25-1845 Chereau, Suzanne G. and Donna Ingham

1999 Intensive (Locational) Archaeological Survey: Ogilvie Property-Lighthouse Road, Aquinnah, Massachusetts. 71 pages.

The 3.2 acre property contains surface indications of a Native American cemetery (boundaries unknown), a rectilinear stone enclosure, and a stone wall running in an east-west direction between the stone enclosure and the marked cemetery. The survey included background research, walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by construction. Field investigations determined that there are no human remains or other significant archaeological deposits within the project impact areas. However, the cemetery grave stones and several visible elements relating to an 18th-century Native American home/farmstead (filled-in cellar hole, three circular depressions, three stone piles, and stone walls) are present on the property. The home/farmstead remains and cemetery are considered significant archaeological resources that have the potential to contribute to an understanding of Aquinnah Wampanoag lifeways. These resources could be eligible for listing in the National Register of Historic Places under Criteria A and D. Since the current survey did not include identifying the cemetery boundaries or a full investigation of the home/farmstead remains, it was recommended that a buffer zone be established to adequately protect these resources from future developments. Due to an absence of significant cultural resources within the project impact areas, no further archaeological investigations were recommended for those portions of the Ogilvie Property.

25-1846 Donta, Christopher L. and Thomas L. Arcuti

1999 Archaeological Site Locational Survey for the Proposed Regional Biosolids Processing Project, Fairhaven, Massachusetts. 72 pages.

Background research on the approximately 2 acre project area revealed the presence of several prehistoric sites and a historic period cemetery, which indicated that the project area was close to a locus of Native American habitation and use. Historic use of the property itself appears to have been limited to agriculture. Six of the 48 shovel test pits excavated contained prehistoric material from the plow horizon and undisturbed subsoil, including pottery and lithic tools. This area was designated the Taber's Brook prehistoric site and was recommended for avoidance or a site examination survey. No historic structures or sites were found.

25-1847 Donta, Christopher L. and Thomas L. Arcuti

1999 Archaeological Reconnaissance and Site Locational Survey for the Northampton Segment of the Eastern Express Pipeline, Southwick, Massachusetts. 78 pages.

The survey route encompasses 2.4 miles of pipeline, two pipeyards, and three access roads. Background research indicated that the project area contains no previously reported prehistoric or historic sites, but is close to several known prehistoric sites and is in an area known to have been inhabited for at least 8,000 years. Historic maps show little development in the area until the late 19th century, when several residences and a schoolhouse were built close to the project area. Two hundred and forty-eight shovel test pits were excavated in five survey units. No prehistoric artifacts or features were found anywhere in the project area. Two small clusters of historic artifacts were found in Survey Unit HSM-1, as were historic materials around a small dump in Survey Unit

HSM-2. Neither location included intact foundations or other historic features. No evidence of historic structures was found in any part of the project area. No further archaeological testing is recommended for this segment of the project.

25-1848 Volmar, Michael A. and Mary Fuhrer

1999 Archaeological Site Reconnaissance and Locational Survey for the Fruitlands Museums Historic District, Harvard, Massachusetts. 184 pages.

This survey examined the Fruitlands Museums Historic District, a 218 acre parcel. No previous archaeological research had been carried out in the project area. We performed documentary and background research, surface reconnaissance, remote sensing, and subsurface testing. The survey included 409 40 cm x 40 cm shovel test pits excavated in clusters at 7.5 m intervals and 16 50 cm x 2 m trenches. The survey revealed one prehistoric and four historic sites. They include the Bailey site (HA-62) which is associated with a late-19th century brick works; the Ridge site (HA-61) a concentration of historic materials; the Willard-Atherton site (HA-63), an 18th- and 19th-century habitation site; two 19th-century mill pond-like structures and one Late Archaic site (19-WR-662). The survey also tested several known historic sites, areas around extant structures, and topographic features likely to yield prehistoric and historic archaeological remains. The previously known sites in the project area include the Richmond (HA-26), the Fruitlands farmhouse (HA-199), the original location for the Knight-Dudley house (HA-52), the Pergolas site (HA-25), and the Coffee site (HA-51). Future development activities at the museum should always include enough time and resources to conduct archaeological impact assessments, especially in known culturally sensitive areas. This survey has identified some of those areas. More archaeological survey work needs to be conducted to adequately sample the museum property.

25-1849 Binzen, Timothy L., Christopher L. Donta, and Mitchell T. Mulholland

1999 Archaeological Site Reconnaissance and Site Locational Survey for the Proposed Well Supply and Pipeline, Russell, Massachusetts. 82 pages.

Background research on the project area near Strathmore Park indicates that the lower Westfield River drainage in the project area was extensively occupied during the prehistoric era, particularly at modern Westfield and at fishing locations on the river. Historic use of the area began in the mid-17th century; the town of Russell emerged as a residential, lumber, and paper production area in the late 18th century. The project area was tested for prehistoric and historic resources. Three survey units were recommended for further investigation, which was completed as a site locational survey. These units are located on the floodplain of the Westfield River and encountered a plow zone with deep flood deposits. No prehistoric artifacts were recovered during the testing. A small volume of historic artifacts was found, but no significant features or other historic materials were encountered. Due to the reconfiguration of a pump house and sections of pipeline on an upper terrace adjacent to Route 20, a fourth survey unit was tested. Five pieces of quartz were recovered from one test pit, but did not represent a significant cultural resource. A total of 61 test pits (50 cm x 50 cm) was excavated in the four survey units, which were located in an area measuring approximately 1,000 ft (300 m) north to south and 500 ft (150 m) east to west. The test pits were placed at 7.5-m (25-ft) intervals. No further testing is recommended for this project.

25-1850 Donta, Christopher L. and Timothy Binzen

1999 Archaeological Site Locational Survey for the Proposed Dartmouth High School Project, Dartmouth, Massachusetts. 76 pages.

The project consisted of background research, a walkover of the project area, and subsurface testing of areas considered to have high archaeological potential. Background research indicated that the general Dartmouth area was a locus of Native American settlement, associated with the Wampanoag Indian tribe and that the vicinity had been an agricultural area prior to the 19th century, by

which time the project area appears to have been utilized as a wood lot. A total of 89 test units was completed in the project area. No prehistoric material was observed. Two units contained historic plow zone trash. Several stone piles seen in the project area are interpreted as the result of field clearing during the historic era. No further survey is recommended.

25-1851 Tuma, S. John, Jr.

1999 Phase I.5 Archaeological Survey, Doty Tavern, Canton, Massachusetts. 122 pages.

The established importance of Doty Tavern was its function as a meeting place for the Suffolk County Congress, which drew up the Suffolk Resolves, a direct predecessor to the American Declaration of Independence. The Suffolk Resolves were first presented to the Suffolk County Congress at Doty Tavern in 1774. Doty Tavern was also connected to a number of well-known individuals who were connected with the rebel faction in the American Revolutionary War. Archaeologists continued the investigations initiated by the Phase I Part I intensive survey (see Report #25-482). The current work concentrated on the identification of features observed in the earlier survey and included 6 discretionary shovel test pits, one 1 m x 1 m excavation unit, and the completion of a 1.5 m x 40 cm trench. These test units centered on Features 1, 2, and 4. By concentrating on these units archaeologists hoped to better understand the limits, compositions, and identities of these features. The project archaeologist recommended continued investigations at Doty Tavern to develop a more complete understanding of the complex deposition processes there. Continued research in conjunction with the Friends of Prowse Farm will preservation efforts and scholastic research. Archaeologists are not aware of any plans for major development in the project area. The project archaeologist recommends further excavations prior to any major land moving efforts at this location (See also Reports #25-1623, #25-1770, and #25-1871).

25-1852 Hatfield, June

1999 Uncovering the Past: Northeastern University and its Environs. 58 pages.

This is an exhibit catalog that presents a portrait of the Northeastern University neighborhood from the early Native American inhabitants through the 20th century. Artifacts included in this exhibit are from the Southwest Corridor excavations (See reports #25-1067, #25-1068, #25-1069, #25-1070, #25-1071, #25-1072, #25-1073, #25-1074).

25-1853 Berg, Shary Page

1999 The Civilian Conservation Corps: Shaping the Forests and Parks of Massachusetts A Statewide Survey of Civilian Conservation Corps Resources. 124 pages.

The report includes a complete inventory of those surviving buildings, landscapes, sites, and structures within the state Forests and Parks system that serve as a visible reminder of the legacy of the CCC. The inventory has been designed as both a historical record and as a planning tool. In addition to providing a narrative of the story of the CCC in Massachusetts, the survey will guide the Department of Environmental Management in protecting, preserving, and interpreting these unique resources.

25-1854 Clements, Joyce M.

1999 Final Report of Archaeological Investigations, Burr Lane Cemetery, Canton, Massachusetts; Human Remains from Burr Lane Cemetery, Canton, Massachusetts (2 volumes). 126 pages.

The proposed Burr Lane Estates subdivision is located on the former site of a sand and gravel quarry where an unmarked Native American cemetery was discovered and partially salvaged in the late 1960s by the Peabody Museum, Harvard University. Within the project area, archaeologists monitored machine soil stripping and documented several graveshafts as they were exposed

along the western face of the proposed subdivision. The remaining burial ground measures approximately 21 m x 7.5 m and contains 12 distinctive graveshafts, one possible graveshaft, and a small assemblage of disturbed human remains. The individuals were buried in rectangular, conifer and hardwood coffins, devoid of ornamentation, and sealed with hand-forged iron nails. Prior to interment the dead were wrapped in coarse burial shrouds attached with plain, copper or brass pins, placed fully extended in the coffin, and buried about a meter below ground. The investigation indicates that the Burr Lane Cemetery has considerable archaeological integrity and meets eligibility criteria A, B, and D for listing on the National Register of Historic Places. A Preservation Restriction and a Preservation Plan have been developed for the property. It is possible that a portion of the cemetery may extend westward.

25-1855 Clements, Joyce M.

1999 Results of a Phase II Archaeological Site Examination: The Mashpee Wampanoag Tribal Museum, Mashpee, Massachusetts. 69 pages.

The site has been nominated to the National Register of Historic Places and includes a 19th-century dwelling and two non-contributing outbuildings on .58 acres of land. Subsurface investigations revealed that the project area had been leveled, graded, and filled. Only very small areas of undisturbed soils remained around the dwelling and in the landscaped lawns. Trenches placed adjacent to the structure indicated modest differences between the dwelling foundations and those of the adjoining ell. Modification to the structure's sill and foundations in the 1970s, however, obliterated evidence of earlier construction trenches. To the rear of the structure archaeologists exposed the sanitary drain trench that empties into the cesspool beneath the south lawn. Throughout the site archaeologists encountered dense fill deposits. These site-wide deposits extend no less than 20 cm beneath grade and were brought to the site as landscaping material in the 1970s. In some portions of the site the fill extended 60 cm beneath grade, indicating where the natural topography had been increased. Because of the extensive disturbance and fill there are few intact horizons in the property area. The remaining contents consist of imported fill, some of which is historical, and historical artifacts that date to the 19th century and 20th century. A few late-18th-century artifacts were found at the site, but the artifactual evidence is consistent with a 19th-century building. The artifacts are spatially arrayed as sheet refuse, and no extant historical features were encountered. The site possesses little research potential or potential significance as an archaeological site.

25-1856 Clements, Joyce M.

1999 Results of a Reconnaissance Archaeological Survey Greycourt: The Charles H. Tenney Estate, Methuen, Massachusetts. 40 pages.

The purpose of the survey of the 26 acre project area is to evaluate the archaeological potential of the Tenney estate and consider how proposed stabilization and restoration efforts may impact archaeological resources. The survey specifically excludes those portions of the original estate that have been separated from the publicly-owned property (the stock stables and farm buildings, the lily pond, gardener's cottage/Munroe house, deer park and driving track, and the walled fruit and vegetable garden). The reconnaissance included documentary research of the Massachusetts Historical Commission's site files, previously published reports from the general area, and a review of historical maps and atlases. The walkover survey was designed to provide a preliminary evaluation of the archaeological potential of the estate. The Mansion House Ruins, Gate House, Pergola, and Tea House were all found to have very high archaeological sensitivity and the Bungalow to have high sensitivity. The areas of the Entrance Drive, the Robie and Rollins Dwellings, Meadowland adjacent to Park Street, and the boundary wall were found to have moderate to low sensitivity.

25-1857 Skinas, David C.

1999 Intensive Archaeological Investigation of the Billington Sea Project (P-1) and Prehistoric

Site 19-PL-843, Plymouth, Plymouth County, Massachusetts. 22 pages.

Construction of the Billington Sea On-Site Disposal System would disturb well-drained, sandy soils located with 300 ft of the Billington Sea potentially having an adverse effect on significant cultural resources. One precontact Native American habitation site was identified and designated 19-PL-843. Four of the eight shovel test pits placed within the project boundaries produced 15 flakes, three ceramic fragments, and one rough core. Three additional flakes were found on the surface approximately 150 ft from the shoreline. The recovery of medium- and small-sized flakes suggests that stone tool refurbishing or sharpening activities occurred at this site. The quartz rough core had several large flakes removed and one edge appeared to have been used as a scraping or chopping tool. The three undecorated ceramic fragments probably came from the same vessel perhaps used to store liquids or food. Based on the limited artifacts recovered from the area of potential effect it appears that this is a single-component site occupied sometime during the Woodland period. Much of the site has been disturbed. The recovery of limited precontact Native American artifacts and data classes suggested that site 19-PL-843 had no research potential and was thus not eligible for listing in the National Register of Historic Places.

25-1858 Strauss, Alan E.

1999 Phase III Archaeological Data Recovery at the Norumbega Site (19-MD-725) in Weston, Massachusetts. 128 pages.

Fieldwork for this survey consisted of the excavation of 87 shovel test pits in the Shaft N area, 32 in the proposed shaft location, 40 in the overall work area, and 15 additional brackets. Fieldwork for the site examination included four shovel test pits, two 40 cm x 100 cm units, and three meter units. Four apparently Middle Woodland preforms were recovered. A radiocarbon date was obtained during the data recovery from scattered charcoal in one of the meter units. An Early Woodland date of 2,590±45 BP was obtained from the charcoal. The data recovery project consisted of the excavation of four meter units and three 40 cm x 50 cm shovel test pits. A total of 3,136 flakes and ten tools was recovered from all phases of work at the site. A total of 12.5 sq m or 16.67% of the prehistoric site was excavated. No subsurface features, diagnostic finished tools, or faunal or floral remains were found. The site was determined to be a high-density lithic workshop consisting primarily of locally available felsites. The site most likely dates to the Middle Woodland period based on the preform styles although the radiocarbon date was some 700 years earlier. The site no longer has potential to be of research value and no further archaeological investigations are recommended.

25-1859 Clements, Joyce M.

1998 Report of a Reconnaissance Archaeological Survey, Foundry Pond Dam Emergency Repair Project, Hingham, Massachusetts. 33 pages.

The reconnaissance survey entailed small-scale archival and field research with an overview of the existing archaeological features and the industrial context in which they were developed. Principal features within the project area included structural foundations, and a sluice box, dam, and sluiceway, in addition to broken stone walls, a fishladder, and a partially collapsed stone channel. No incontrovertible evidence of Benjamin Thomas's earliest foundry is visible from the ground surface, and those foundations that are extant may represent the last in a series of industrial concerns located in the vicinity of the existing parking lot. The area with the highest archaeological potential is the small upland, now covered with brush, between the western and eastern spillways. This area is shown as the location for a small building in Parrott's 1851 plan, and soils exposed at the base of an uprooted tree were blackened and contained charcoal and slag. During future repairs and stabilization around Foundry Pond two areas should be avoided in order to protect archaeological data: the entire perimeter of Feature 1, dry-laid structural foundations, and the area beneath the western dam.

25-1860 Clements, Joyce M.

1999 Report of a Reconnaissance Archaeological Survey, *The Woods at Westminster*, Westminster, Massachusetts. 35 pages.

This report presents the results of a survey of the Woods at Westminster, a proposed 18-hole golf course on approximately 180 acres in the northern portion of Westminster. Local residents expressed concern that extant fieldstone foundations near the project area could be damaged during construction of the golf course. A Memorandum of Agreement has been generated to establish procedures for protecting the historic and archaeological resources during construction of the golf course. The survey substantiated three historical sites on the property. The three sites were spatially defined, surveyed, and set apart from the construction impact area in order to protect the historical remains and associated archaeological deposits. Taken to represent the first agricultural homesteads in the Proprietor's 2nd Division of Narragansett No. 2 these sites are potentially significant because they can contribute to our understanding of under-documented rural sites in Central Massachusetts.

25-1861 Clements, Joyce M.

1999 Results of a Phase II Site Examination and Phase III Data Recovery: The Abbott Site (BED-HA-4), Bedford, Massachusetts. 221 pages.

This report presents the combined results of an archaeological site examination and data recovery at the Abbott Historic Site (BED-HA-4). The Abbott Site was first identified during investigations of the Governor Winthrop residential subdivision (see Reports #25-1591, #25-1076, and #25-1003). Previous investigators identified one structural feature, a chaise and loom house, within this portion of the site. The structure was built around the turn of the 18th century and remained in use until after the middle of the 19th century. The current investigation revealed 27 strata and 10 features within the project impact area, providing information on ground preparation and site layout (a buried A horizon, builders' trench, stone cellar steps), the building's dimensions and internal configuration, and features associated with agricultural activities (post holes, a cart path, wagon ruts). Historical research investigated the site occupants and their extended family, revealing endogamous marriage patterns which concentrated wealth and transferred property through successive generations of the Abbott family. Contextual and documentary research identified the agricultural strategies adopted by the Abbott men, in addition to women's activities such as spinning and weaving, cheese and butter manufacture, and candle and soap production. The research incorporated a feminist orientation emphasizing the role of women in agricultural subsistence and exploring their contribution to farmstead survival. This analysis will provide comparative information for future researchers exploring the role of women in the early Massachusetts economy.

25-1862 Cassedy, Daniel F., Todd Cleveland, and Jeffrey Holland

1999 Cultural Resources Survey of the Massachusetts Portion of the AES Londonderry Lateral Pipeline, Middlesex County, Massachusetts. 76 pages.

A 2.8 mile stretch of the realignment and replacement of a gas pipeline in Dracut was surveyed. The entire corridor was walked and inspected, and soil profiles were examined to evaluate depositional integrity within the project area. This evaluation determined that virtually the entire existing corridor has been disturbed by construction of the two pipelines. However, several temporary 25-foot-wide workspaces were undisturbed and surveyed using 50 cm x 50 cm shovel test pits at 10 m intervals. No archaeological sites were identified. No further archaeological studies are recommended for the project as currently designed. A historic structure survey of the corridor was also conducted. Because the pipeline replacement will occur below ground and the finished work will not be visible above ground, the Area of Potential Effects for structures was limited to locations where vegetation would be cleared creating the potential for a change in visual setting at or near a historic structure. Although several historic structures were located in the vicinity of the corridor, none fell within the Area of Potential Effects; thus, no structures were surveyed for the project. No

further historic structure studies are recommended for the project as designed. During survey, it was observed that six rock walls and an area of wall fragments lie within the corridor. Should the six intact walls be disturbed as part of the pipeline replacement work, it is recommended that the proponent return these features to their pre-work appearance once the replacement work is complete.

25-1863 Volmar, Michael A.

1998 The Micromorphology of Landscapes: An Archaeological Approach in Southern New England. 328 pages.

This dissertation focuses on studying entire landscapes to understand the total range of human effects present at archaeological sites by examining soil micromorphology. Soil micromorphology provides a detailed view of soil microstructure, and enables archaeologists to recognize very discrete alterations to the landscape that would otherwise be undetectable. The research suggests that the landscape is not easily divisible into cultural and non-cultural, site and non-site, or feature and non-feature areas. Rather, the entire landscape is more appropriately viewed as a continuum of areas with low to high evidence of cultural disturbance.

25-1864 Duranleau, Deena

1999 Final Report of a Phase I Intensive Archaeological Survey along Peppermint Brook in Dracut, Massachusetts. 46 pages.

One hundred twenty-six test pits were dug along the route of the proposed pipeline, which follows Peppermint Brook and has a high potential for containing archaeological resources. No significant historical resources were recovered. One Normanskill chert Genesee type projectile point was identified, but no other prehistoric artifacts were recovered in the brackets around the test pit with the point or in any other test pits. No further testing is recommended.

25-1865 Alterman, Michael L., Bruce Bevan, and J. Lee Cox, Jr.

1995 Terrestrial and Marine Archaeological Remote Sensing and Archaeological Monitoring. 194 pages.

This report describes two archaeological projects undertaken at Salem (Massachusetts) National Historic Site. The first project entailed remote sensing of both the terrestrial and maritime portions of the park. The second project involved archaeological monitoring of geotechnical testing conducted at Derby and Central wharves. Terrestrial remote sensing and archaeological testing suggested that there might be evidence of Derby Wharf expansion and construction, demolition, and landscaping episodes. The areas around the Derby and Hawkes houses were found to have low archaeological potential due to extensive 19th- and 20th-century disturbance, while the rear yard of the Custom House was found to have high potential. It was felt that Hatch's Wharf would retain greater architectural and archaeological integrity than either Derby or Central Wharf. (Also see Report #25-1366, #25-1799, #25-1800, and #25-1801.)

25-1866 Duranleau, Deena

1999 Final Report of a Phase I Intensive Survey at Pumping Station Locations along Center Bridge and Neck Roads in Lancaster, Massachusetts. 34 pages.

One 10 m block of five test pits was excavated down to sterile subsoil at each proposed pumping station location. Historic artifacts dated back to the early 19th century and included creamware and cut nails, but no prehistoric cultural material was recovered. No further archaeological excavation is recommended at these two locations.

25-1867 Donta, Christopher L. and Norene Roberts

1999 Archaeological Reconnaissance Survey for the Proposed MMWEC Stony Brook Natural Gas Pipeline, Baystate Alternative 1, Ludlow, Massachusetts. 59 pages.

Background research determined that no known prehistoric sites lie within or near the proposed corridor. Historic occupation along the proposed route dates primarily from the 19th century, with older communities located to the east nearer the town center. The MMWEC project area contains no buildings on the National Register of Historic Places that will be endangered or impacted by the pipeline. The major effort of this project was a walkover of the 0.94-mile long pipeline route. Based on the background research and the reconnaissance, four survey units are recommended for subsurface testing, totaling 0.49 miles in length.

25-1868 Binzen, Timothy, Suzanne G. Cherau, and Kerrylynn Boire

1998 Marion Community-Wide Reconnaissance Archaeological Survey: Marion, Massachusetts. 399 pages.

The town of Marion covers an area of approximately 14 sq mi. The survey was designed to identify known and potential prehistoric and historic period archaeological sites in Marion; develop town-wide archaeological sensitivity maps with an accompanying user's guide; and develop management recommendations for the protection of identified resources and sensitive area. The survey identified 11 new Native American site locations bringing the total number of Native American sites to 34. These sites range from single projectile point finds to extensive shell middens and habitation areas dating from the Early Archaic through Woodland, Contact, and possibly early EuroAmerican periods. The survey also identified 19 historic archaeological sites based on local informant interviews and field verified when possible. These sites include domestic (house, barn foundations), industrial (mills), and maritime (saltworks, wharves, lighthouse-related) resource types dating from the 19th and possibly 18th centuries. Management recommendations for the protection of identified archaeological resources and sensitive areas include: limited or comprehensive by-laws for archaeological resource protection, agency review of some or all forms of permitted earth-moving activities for information pertaining to archaeological resources; acquisition of open spaces by local and regional land trust organizations—archaeological sites and archaeologically sensitive areas; preservation restrictions by local and regional land trust organizations; designation of a fully-appointed Marion Historical Commission; and partnerships among Marion Historical Society, Natural History Museum, Sippican Lands Trust, and other interested parties.

25-1869 Mulholland, Mitchell T., Christopher L. Donta, and Thomas L. Arcuti

1998 Community-wide Archaeological Reconnaissance Survey of Chilmark, Massachusetts. 194 pages.

This survey was conducted to identify known and potential cultural resource areas within the town. Data recovered during this survey are part of a management plan that is to be integrated with a local comprehensive plan for future town development. The project included: 1) background research into the prehistoric and historic uses of town lands; 2) stratification of town lands into areas of low to high potential to contain cultural resources; 3) a walkover inspection of known sites and selected areas of high potential; 4) interviews with local informants and town personnel; and 5) integration of this information into a narrative of the town's past and development of a management plan. The project concludes that the town has an unusually high frequency of prehistoric sites, especially in the eastern and western portions of town. Most of these sites are in areas that have had limited disturbance and have a high potential to contribute important archaeological information. There are also several historic industrial sites and house foundations in town, which may be significant. Of particular interest is a large 19th-century brickyard complex in the north of town.

Recommendations are made for protecting archaeological sites in town.

25-1870 Rainey, Mary Lynne

1998 Technical Report Archaeological Site Examination Locus 1 Site Penske Residence Project Area. 103 pages.

The project area is a 30 acre lot bordering Nantucket Harbor's southern coastline. Proposed development of the site consists of a residential and recreational family compound. An intensive survey resulted in the discovery of two small prehistoric sites that were considered to be potentially significant cultural resources. The Locus 1 Site was found within the building footprint for the main Penske residence. The Locus 2 Site was found in an area where proposed developments were in preliminary design and could be changed. The site examination of Locus 1 provided information to evaluate significance and eligibility for listing on the National and State Register of Historic Places. Locus 1 covers an area of at least 200 sq m, exhibits internal complexity and integrity, and was radiocarbon dated to AD 650 to 885 (Beta-123001) indicating occupation during the Middle to Late Woodland period. Based on functional classifications of recovered cultural materials and features, the site has been interpreted as a single-component domestic encampment resulting from the activities of a small group of people for a relatively short period of time. A Levanna projectile point; unifacial tool; cobble hammerstone; quartz, rhyolite, and quartzite chipping debris; ceramic vessel fragments; and charcoal fragments were recovered. Features found on the site were a deep pit and a lithic workshop. The site examination of the Penske project area represents the first systematic evaluation of an archaeological resource in the Pocomo area. Locus 1 was considered to be significant and potentially eligible for listing on the National and State Register of Historic Places under Criterion D. Avoidance of this archaeological site to avoid adverse effects of the proposed development is recommended. If avoidance is not a feasible alternative, mitigation of adverse effects through an archaeological data recovery program should be considered.

25-1871 Garman, James C. and A. Peter Mair, II

1999 Site Examination Archaeological Survey Doty Tavern Site (CAN-HA-7), Reebok Headquarters, Canton, Massachusetts. 44 pages.

Field investigations of the project area were staged in three phases. A walkover inspection was conducted to review project area conditions and to identify the locations of the Doty Tavern Site (CAN-HA-7) and other historic period sites. A total of 18 50 cm x 50 cm test pits was placed at a predetermined interval to identify intact archaeological deposits within the impact area. Two 1 m x 50 cm excavation units were placed to further investigate the area in the vicinity of the tavern site. Archaeological investigations within the area of impact produced a small amount of cultural material (ceramics, bottle and window glass, nails, brick fragments, etc.) confirming the early EuroAmerican occupation of the area. All materials were recovered from fill and plowzone soils and the fragmentary nature of the material suggests that the area has been extensively reworked, destroying any intact archaeological deposits. Subsurface investigations failed to identify any evidence of features. None of the material recovered can be confidently attributed to the Doty Tavern or other historic period sites. It is unlikely that additional investigations within the area of impact will further our understanding of the historic activities that took place in this area. No further archaeological investigations are recommended (see also Reports #25-482, #25-1623, #25-177-, and #25-1851).

25-1872 Fragola, Patricia and James C. Garman

1999 Intensive (Locational) Archaeological Survey, Proposed Veterans Memorial Cemetery, Winchendon, Massachusetts. 67 pages.

A reconnaissance survey was conducted of the entire 250 acre project area, followed by an intensive survey of the 110 acre parcel designated for the cemetery. Subsurface testing, resulted in the

identification of one Native American archaeological site (Millers River I) and one findspot of Native American cultural material. The Millers River I site is likely a short-term campsite at which a variety of activities may have occurred. The campsite was most likely used as part of a pattern of resource procurement in the surrounding uplands. If avoidance of the Millers River I site is not possible, a site examination is recommended. In the event of future development of the this parcel, an intensive (locational) survey within portions of the 140 acre southern parcel considered to have high or moderate potential for archaeological sites is recommended.

25-1873 Waller, Joseph N. and Deborah C. Cox

1999 Intensive (Locational) Archaeological Survey: The Boch Center of the Performing Arts, Mashpee, Massachusetts.

A review of the project plans determined that the proposed location could contain Native American and/or historic period archaeological resources. Subsurface archaeological investigation included the excavation of 45 50 cm x 50 cm test pits from within two 30 m x 30 m testing blocks and four linear test pit transects. Testing covered the project impact areas. Test pits typically terminated at depths between 50 cm and 60 cm below surface and exhibited natural soil development. The survey failed to recover any artifacts associated with either Native American or EuroAmerican occupation. No further archaeological investigations for the Boch Center for the Performing Arts project area is recommended.

25-1874 Cherau, Suzanne G. and Kerrylynn Boire

1999 Intensive (Locational) Archaeological Survey, Conference Center Parking Lot and Archaeological Site Examination, NR-7 Shaker Building Conference Center, MCI Shirley Correctional Facility, DCAM Project No. P9610 DC1, Shirley, Massachusetts. 150 pages.

The investigations consisted of an intensive survey of a proposed parking lot and a site examination of Building NR-7 (former Shaker dormitory) and its yard areas. Documentary research and subsurface testing (hand and machine-assisted excavations) were used to locate, identify, and evaluate potentially significant and National Register-eligible archaeological resources. The below-ground remains of documented Shaker period (late 18th to early 20th century) structures were found at the north and south ends of NR-7. These include granite steps and the sidewall of a covered basement stairway (north end) and the fieldstone foundation of an ell addition (south end). These structural remains had been impacted by early 20th-century modifications to the former Shaker dormitory, and no further archaeological work was recommended. The foundation remains and associated artifact assemblage of a documented Shaker Period structure were identified to the rear of NR-7. It is associated with a former wooden building that formed the rear row of Shaker buildings in Church Family complex. The foundation site is eligible for listing in the National Register of Historic Places as a contributing element of the Shirley Shaker Village Historic District. Avoidance during project construction was recommended. An undocumented Shaker period stone feature was also identified in the far (south) side yard of NR-7. It could be related to a collapsed well or some other type of water or waste control structure. This resource has been determined potentially eligible for listing in the National Register of Historic Places and should be avoided during project or any future construction activities.

25-1875 Fragola, Patricia

1999 Intensive (Locational) Archaeological Survey, Segment 19, New Bedford 115 kV Power Supply, New Bedford and Acushnet, Massachusetts. 70 pages.

Subsurface testing identified one prehistoric archaeological site, the Acushnet Slough Site, in the central portion of the project area. The site yielded a moderate density of chipping debris as well as a single fragment of calcined bone. The horizontal distribution of recovered material suggests that the most intensively occupied portion of the area is closest to the river, near the known Law-

son Site (19-BR-378) and other collection areas along the river. Given the proximity of the sites it is possible that they may be related, possibly representing an extended occupation area. This report recommends the development of a plan to avoid adverse impacts to the Acushnet Slough Site. If avoidance is not a feasible alternative, additional archaeological site examination is recommended. A low density of historic cultural material was recovered from the area south of the substation. This material cannot be associated with a specific historic period site and is therefore not considered to be a significant deposit. No further archaeological investigations are recommended for this portion of the project area.

25-1876 Waller, Joseph N. and Duncan Ritchie

1999 Archaeological Site Examination of the Pine Hawk Site, Middle Fort Pond Brook Sewer Project, Acton, Massachusetts. 82 pages.

The Pine Hawk Site covers an area of about 1 acre on an elevated terrace overlooking the Assabet River within the proposed location of a wastewater treatment plant (see Report #25-1825). Site examination at the Pine Hawk Site involved background research, subsurface testing, and radiocarbon analysis. A total of 54 50 cm x 50 cm test pits, placed at a 10 m interval within a grid pattern, were excavated on the Pine Hawk Site. Following delineation of site boundaries with test pits, six 1 m x 1 m excavation units were used to investigate concentrations of cultural material and features and to collect information on the density, complexity, and temporal range of occupations. The site examination established that the Pine Hawk Site extends over a 3300 sq m area. Cultural materials recovered included over 300 pieces of chipping debris of various materials such as rhyolite, quartz, quartzite, and mylonite from local and non-local sources. Diagnostic projectile points recovered from the site include Middle Archaic (Stark) and Late/Terminal Archaic (Atlantic, Wayland Notched, small stemmed) types. Hornfels chipping debris and a ceramic sherd are associated with a Middle Woodland component. Two hearth features radiocarbon dated to 3910±80 years BP (Beta-129445) and 4440±100 years BP (Beta-129446) are associated with Late Archaic period activity on the site. The Pine Hawk Site was considered to be potentially significant and eligible for listing on the National and State Register of Historic Places. Management recommendation for the Pine Hawk Site included avoidance and development of a data recovery program if avoidance of this site was not feasible. (See also Report #25-1825.)

25-1877 MacPherson, Jennifer and Duncan Ritchie

1998 Intensive (Locational) Archaeological Survey AT&T Signal Tower, Canton, Massachusetts. 88 pages.

The project area is adjacent to the Fowl Meadow section of the Neponset River and background research indicated that the project was within a core area of prehistoric Native American settlement/land use. A number of known prehistoric sites were located in the immediate vicinity in both riverine and upland environmental settings. The project area was known to contain sections of a large area of prehistoric settlement known as the Neponset/Wamsutta Site (19-NF-70). Previous investigations by avocational archaeologists on the crest of the hill identified concentrations of cultural material and features associated with Archaic and Woodland period use. A possible Paleoindian component on the hillcrest had also been reported by avocational archaeologists. Historic period settlement in and around the project area consisted of farmsteads and large parcels agricultural land. A walkover confirmed that the project area had minimal evidence of alteration or disturbance and was expected to have high archaeological sensitivity. One small section of the access road easement on the upper slope of Signal Hill was considered to have low archaeological sensitivity because of previous disturbance. Subsurface testing in zones of high archaeological sensitivity was done with a judgmentally placed transect containing 50 cm x 50 cm test pits placed at 10 m intervals. The crest of the hill was investigated with a single, 10 m x 10 m sampling block containing five 50 cm x 50 cm test pits. Six judgmentally placed 50 cm x 50 cm test pits were also used to sample this area. Findspots of prehistoric cultural material were investigated with arrays of four test pits placed in the cardinal directions 5 meters from the original recovery. Subsurface test-

ing within the access road identified three loci of prehistoric cultural material. Designated as Access Road Loci 1, 2 and 3, they yielded low to moderate amounts of rhyolite, quartz, and hornfels chipping debris and a hammerstone. Access Road Locus 3 contained hornfels chipping debris as well as a probable hearth feature and is likely to have a Middle to Late Woodland period component. Subsurface testing within a known locus of prehistoric activity on the crest of Signal Hill identified one high-density concentration of rhyolite and quartz chipping debris. Access Road Locus 1 contains low densities of cultural material and is not considered a potentially significant cultural resource. Access Road Loci 2 and 3 and the crest of Signal Hill contain moderate to high density deposits of cultural material and features likely to be associated with both Archaic and Woodland period use of the Neponset/Wamsutta Site. Site examinations of Access Road Loci 2 and 3 and the crest of Signal Hill are recommended to evaluate their potential significance and eligibility to the National and State Register of Historic Places.

25-1878 Leveillee, Alan

1999 Intensive Archaeological Survey Wrentham Municipal Water Well, Lake Pearl, Wrentham, Massachusetts. 62 pages.

This survey of a small peninsula along the southwest shore of Lake Pearl consisted of archival research and subsurface testing to identify potentially significant archaeological deposits. Because of its proximity to Lake Pearl, which was formed in part by the damming of Eagle Brook and known to have been a focal point of Native American activity, the project area was considered to have high archaeological sensitivity. Subsurface testing was conducted at and surrounding the site of the proposed well. A total of 27 test pits have been dug to date. Native American cultural materials have been recovered at depths ranging between 10 and 60 cm from nine different test pits. Temporally diagnostic artifacts include a Middle Archaic Stark-like projectile point and a Late Archaic Squibnocket Triangle reworked as a drill/perforator. Other lithic artifacts include a scraper/spokshave, biface fragments, and debitage. The prehistoric archaeological deposits have been designated the Dunn Hollow Site. The intensive (locational) archaeological survey has resulted in the identification of a potentially significant multi-component site. Recommendations included that Dunn Hollow Site be evaluated at the site examination level to determine its eligibility for listing on the National Register of Historic Places and to determine the effects of the proposed undertaking on this resource.

25-1879 Boire, Kerrylynn and Suzanne G. Cherau

1998 Archaeological Site Examination, Abington Station Historic Site (ABI-HA-6), Abington Station Access Road Project, Abington, Massachusetts. 69 pages.

This project included an archaeological site examination at the Abington Station Historic Site (ABI-HA-6). The site area contained the remains of a suspected structural feature and associated 19th-century cultural material assemblage that were located during the intensive archaeological survey (see Report #25-1279). Documentary research and subsurface testing were used to collect information needed to determine the archaeological significance of the historic site. A chain-of-ownership was established for the property containing the historic site area. Subsurface testing consisted of ten 50 cm x 50 cm test pits and three excavation units (1 m x 1 m and 1 m x 50 cm). As a result of site examination testing and informant interviews, the previously identified structural remains were interpreted as 20th-century nursery debris brought into this area by the Babb family for disposal through means of open air burning. The recovered archaeological materials temporally date to the late 19th- and 20th-century Littlefield-Wyman nursery. Due to a lack of information content and poor physical integrity, the Abington Station Historic Site (ABI-HA-6) is not considered eligible to the National Register of Historic Places. No further archaeological investigations were recommended.

25-1880 Chereau, Suzanne G., Jennifer Macpherson, and Kathleen A. Atwood

1999 Historical and Archaeological Reconnaissance Survey, Littleville Lake: Chester and Huntington, Massachusetts. 2 volumes. 222 pages.

The survey covered the approximately 1,567 acre project lands, of which approximately 1,200 acres were testable. Prior to the archaeological survey, the forested uplands with moderate to steep slopes (roughly 1,100 acres) were assessed as having low to moderate archaeological sensitivity. The riverine terraces, (roughly 100 acres) were assessed as having a high archaeological sensitivity. Field investigations identified one previously unknown prehistoric site that has the potential to contribute information concerning the prehistory of the Westfield River basin. The site's subsurface integrity is excellent, although no diagnostic materials were recovered. The reconnaissance survey identified areas of moderate and high sensitivity for additional prehistoric resources and avoidance and protective measures are recommended for these areas and the known site location. Prior to the archaeological investigations, there were 46 documented historic sites and two (now relocated) historic cemeteries within the project area. The current survey identified 13 historic sites (10 documented, three previously undocumented) comprising residences and farmsteads dating from the 19th to 20th centuries. The sites can be linked geographically and thematically across the landscape of Chester in the context of rural settlement and small-scale industrial development in western Massachusetts. The 36 remaining historic site locations were inspected for visible surface remains. The majority of these site locations lie below the 520 ft elevation, in areas currently beneath the permanent pool known as Littlevillle Lake, which is normally maintained at 518 ft NGVD on a year-round basis. The 26 unidentified historic sites situated below 510 ft NGVD were assigned a low potential for survival. The seven unidentified historic sites situated between 510 ft and 520 ft NGVD, at or near the border of the permanent pool, were assigned a moderate potential for survival, as were three unidentified historic sites that lie above 520 ft NGVD. The identified historic sites and unidentified but documented sites could be considered as an archaeological district, associated with the villages of Dayville and Littleville in the town of Chester. Avoidance and protective measures are recommended for the known site locations and archaeologically sensitive historic areas within the Littleville Lake project area.

25-1881 Mahlstedt, Thomas F.

1999 Archaeological Assessment Report: Caddy Park, Quincy Shore Reservation, Quincy, Massachusetts. 10 pages.

Ten 50 cm x 50 cm shovel test pits, located every 10 meters were excavated on a transect that ran down the center of the hummock of the highest elevation of Caddy Park, the approximate long axis of the proposed children's play area. The shovel test pits and the walkover survey indicated that the area had seen significant disturbance through regrading. No prehistoric artifacts were found, and the historic materials recovered are all of 20th-century origin. The archaeologist recommended monitoring of any construction activity given the overall sensitivity of the site area despite the lack of findings in the initial testing. These recommendations proved well-founded as a unique collection of materials were encountered in the construction of the play area, including an 18-inch stone blade, a gouge, a polished atlatl weight, and a pendant. These materials were all covered with red ochre. The site appears to date between 1,200 and 6,000 years ago.

25-1882 Mahlstedt, Thomas F.

1999 Archaeological Assessment Report: Brook Farm Historic Site, West Roxbury. 16 pages.

The project within the 179 acre Brook Farm Historic Site consists of the addition of a 265 ft fence and the relocation of kiosks and signage. The holes for the fence posts and four footings for the kiosk were excavated as archaeological test pits. A brick feature was encountered under the footings for the kiosk and may relate to a similar feature noted in previous work at Brook Farm (see Report #25-1257). The brick features were not excavated, the kiosk was moved and testing of the new location revealed no significant cultural resources. Although artifacts were encountered in virtually all of the excavated units, they were neither quantitatively nor qualitatively significant to

warrant further study or require relocation of either the fence or kiosk. The most important conclusion that can be drawn from this modest effort is that despite obvious disturbances, intact archaeological features of unknown age and function exist in the vicinity of the Hive and Print Shop. The property has the potential to retain significant archaeological deposits and features.

25-1883 Begley, William

1999 Intensive (Locational) Archaeological Survey of the Cape Club Project Area, Mashpee and Barnstable, Massachusetts. 83 pages.

The intensive survey of the 284 acre (115 hectare) parcel of land abutting Santuit Pond and the Santuit River for a proposed golf course consisted of background research and field investigations. Subsurface testing was conducted in moderate and high archaeologically sensitive portions of the project area. A total of 174, 50 cm x 50 cm test pits was excavated within 30 m x 30 m blocks and along judgmental linear transects (10 m interval). Two loci of prehistoric Native American cultural material were identified, the Santuit River I and Santuit River II sites. These loci have the potential to contain information relevant to a range of research issues, such as settlement patterns, resource use, and the intensity of activity in upper Cape Cod, specifically during the Late Archaic and Woodland periods. Avoidance is recommended.

25-1884 Begley, William and Duncan Ritchie

1999 Intensive (Locational) Archaeological Survey of the Family Camp at Hanscom Air Force Base, Bedford, Massachusetts. 58 pages.

The U.S. Air Force is proposing improvements to a 25 acre parcel located north of the main Hanscom Air Force Base property and runways. Background research indicated that the FAMCAMP project area was relatively undisturbed and had the potential to contain archaeological sites. Known prehistoric sites are located in the vicinity of the project area near Elm Brook and south of Hanscom AFB along a watershed between the Shawsheen and Charles River drainages. Historic/modern period land use in the area was primarily agricultural/pastoral with scattered farmsteads. Modern period standing structures in the project area (Buildings T214, T804) were evaluated in a previous study. A walkover inspection was used to delineate zones of archaeological sensitivity. Most of the project area was found to have high and moderate sensitivity for Native American and EuroAmerican cultural resources and subsurface testing was conducted in these areas. A total of 52, 50 cm x 50 cm test pits was excavated within two, 30 m x 30 m blocks and along four judgmentally placed linear transects. Test pits were placed at 10 m intervals. Subsurface testing did not identify any archaeological sites. No further archaeological investigation is recommended.

25-1885 Rainey, Mary Lynne and A. Peter Mair, II

1999 Intensive Archaeological Survey, The International Golf Club, Bolton, Massachusetts. 78 pages.

The approximate 215 acre parcel is situated in a largely rural section of northeastern Worcester County, approximately one mile east of the Nashua River basin and core population centers of Lancaster and Clinton. During the intensive survey, 186 test pits were excavated in high and moderate archaeologically sensitive areas. Three prehistoric and two historic period sites were discovered. The Locus 1 and Locus 2 sites were discovered along a branch of Runaway Brook. The Locus 1 site included a small quartz workshop, areas of scattered quartz chipping debris, a quartz Squibnocket projectile point, and charcoal flecks. The Locus 2 Site included one quartz Small Stemmed point and five quartz flakes. The Locus 3 Site consists of a single flake found in an upland area adjacent to a kettle hole. Avoidance of the Locus 1 Site is recommended otherwise a site examination is recommended. No additional work at the Locus 2 and 3 sites is recommended. Historic activity areas were identified along Ballville Road and Mill Street. The Ballville Road Site

consists of a low-density scatter of domestic and architectural debris, believed to be the result of 19th- and possibly 20th-century landscape disturbances. The Mill Road Site consists of an 11' x 19' cellar hole consisting of concrete cinder blocks and a conglomerate of concrete, brick, and fieldstones. 20th-century domestic debris was found and no further investigations were recommended.

25-1886 Strauss, Alan E.

1999 Intensive Archaeological Survey of Lot 50 Upland Circle in Brewster, Massachusetts. 42 pages.

Background research indicated no previously recorded prehistoric or historic sites. Field investigations for the project included a surface inspection and excavation of 60 shovel test pits and three meter units within the house lot. A total of 319 pieces of prehistoric debitage, four sherds of pottery, one broken biface, two tool or point fragments, and three diagnostic points were recovered. The points include two quartz, Small Triangle Points and one quartz Small Stemmed Point. The pottery includes sherds that are sand tempered and shell tempered, some of which show surface treatments. It appears possible that the site contains a Late Archaic and a Woodland component. Bracketing in the vicinity of the cultural materials failed to produce substantial prehistoric deposits. No subsurface features were identified. The site seems to be limited to an area of 25 m x 55 m in size with a higher density area comprising an area of about 25 m x 25 m. No historical cultural remains were recovered except for one white clay pipebowl fragment. Because of the fairly low density of prehistoric remains and lack of subsurface features and internal site complexity, it is believed that the site is not eligible for nomination to the National Register of Historic Places. No further archaeological work is recommended.

25-1887 Atwood, Kathleen A.

1999 Final Historic Properties Management Plan, Littleville Lake, Chester and Huntington, Massachusetts. 199 pages.

The purpose of the Historic Properties Management Plan (HPMP) is to provide a comprehensive program to direct the historic preservation activities and objectives at the Littleville Lake Flood Control Project and to effectively manage and protect each historic property. The HPMP has several sections, only certain sections are described here. The Overview (Section V) provides a project description, historic contexts, and results of archaeological investigations (see Report #25-1880). The Landuse Guide (Section VI) details the types of agency activities that should have no effect on cultural resources and those that may impact historic properties. The Action Plan (Section VII) outlines specific tasks, procedures, and priorities that must be accomplished to satisfy Section 110 requirements.

25-1888 Mulholland, Mitchell T., Timothy Binzen, and Christopher L. Donta

1999 Community-wide Archaeological Reconnaissance Survey of Oak Bluffs, Massachusetts. 223 pages.

The community-wide archaeological reconnaissance of Oak Bluffs was conducted to identify known and potential cultural resource areas. Data recovered during this survey are part of a management plan that is to be integrated with a local comprehensive plan for future town development. The project included: 1) background research; 2) stratification of the town into areas of low to high potential to contain cultural resources; 3) a walkover inspection of selected known sites and areas of high potential; 4) interviews with local informants and town personnel; and 5) integration of this information into a narrative of the town's past and development of a management plan. At the outset of the project, 26 prehistoric sites and 11 historic archaeological sites were on record at the Massachusetts Historical Commission. This project added 19 historic sites and two prehistoric sites to the record. The project concludes that the town has a high frequency of prehis-

toric sites, with the highest concentration along Lagoon and Sengekontacket ponds. Other sites are located along other brackish water ponds in the northwest and northeast portions of town. Native use of the reserved 18th-century "Indian Lands" is discussed. Some sites are located along established Native American trails. Many of these sites are in areas that have had limited disturbance and have a high potential to contribute information of importance to archaeology. There are several historic industrial sites and house foundations in town that may be significant. Recommendations are made for protecting archaeological sites in the town.

25-1889 Mulholland, Mitchell T., Timothy Binzen, and Christopher L. Donta

1999 Community-wide Archaeological Reconnaissance Survey of West Tisbury, Massachusetts. 207 pages.

The community-wide archaeological reconnaissance survey of West Tisbury was conducted to identify known and potential cultural resource areas. Data recovered during this survey are part of a management plan that is to be integrated with a local comprehensive plan for future town development. The project included: 1) background research; 2) stratification of town lands into areas of low to high potential to contain cultural resources; 3) a walkover inspection of known sites and selected areas of high potential; 4) interviews with local informants and town personnel; and 5) integration of this information into a narrative of the town's past and development of a management plan for identified resource areas. At the outset of the project, 17 prehistoric sites (including collection areas) and 6 historic archaeological sites were on record at the Massachusetts Historical Commission. This project added 15 historic sites. At the end of the survey, there are 38 sites on record. During the survey, 26 sites were visited. The project concludes that the town has a high frequency of prehistoric sites, especially along brackish water ponds in the southern and southeastern portions of town. Most of these sites are in areas that have had limited disturbance and have a high potential to contribute information of importance to archaeology. There also are several historic industrial sites and house foundations in town that may be significant. Recommendations are made for protecting archaeological sites in the town.

25-1890 Carlson, Claire, Robert Paynter, Kerry Lynch, and Rita Reinke

1999 Report of the 1998 Field School Study of Lot 33, Deerfield, Massachusetts. 76 pages.

The University of Massachusetts Summer Field School in Archaeology, in association with Historic Deerfield, Inc., conducted a site examination of the southwest corner of Lot 33 in Deerfield Village. Three public buildings are known to have stood here in the late 18th and 19th centuries. Four 1 m x 1 m test units were excavated to further investigate a feature which was located during archaeological monitoring in 1997 (see Report #25-1751). It was hypothesized that the feature, a stratum of burned wood, charcoal, and 19th-century artifacts, was found in the approximate location of Philo Munn's 19th-century shoe shop and fancy goods store. The 1998 field season concentrated on locating more of this burned feature to see if it was the remains of Munn's store. No direct evidence for the remains of Munn's store was recovered during the field school. Thirty-six discrete strata of fill were identified up to about 180 cm below the present ground surface. The upper layers of fill are mixed and rocky. The lower layers of fill contain evidence of burned wood, artifacts, and architectural debris. A concentration of loose, unmortared stones was encountered at approximately the same depth as the layers with burned debris. Artifacts associated with these lower fills span the entire 19th century; therefore, tight dating of any of the layers was not possible. Further investigation of these stones is recommended to clarify their relationship to Philo Munn's store.

25-1891 Russo, Paul and Matthew Kierstead

1999 Middlesex Canal: Archaeological Reconnaissance Survey, Massachusetts. 225 pages.

The project involved a comprehensive survey of archaeological properties along the entire route of

the historic Middlesex Canal. The 27-mile-long canal was constructed between 1793 and 1803. It played a significant role in the early industrial development of the nine towns through which it passes (Charlestown, Medford, Somerville, Winchester, Woburn, Wilmington, Billerica, Chelmsford, and Lowell). The primary goal of this project was to locate and document known and potential archaeological resources along the corridor. The survey recorded 12 historical archaeological sites associated with the canal and assessed the archaeological sensitivity of the canal corridor. Included among the sites were the Baldwin/Carter Farm Bridge Abutments site (WOB-HA-1) in Woburn, and the Brown's Footbridge Abutments site (BIL-HA-36) in Billerica. The survey also recorded two aqueduct abutment sites in Wilmington, the Ipswich River (Settle Meadow) Aqueduct Abutments site (WMG-HA-4), and the Sinking Meadow (Lubber's Brook) Aqueduct Abutments site (WMG-HA-5). Recorded sites also included two sluiceways in Billerica, the Content Brook Sluiceway (BIL-HA-37) and the Richardson's Mill Sluiceway (BIL-HA-38) sites; and two culvert sites, one associated with the Richardson's Mill Sluiceway site and the other (BIL-HA-42) located on Lowell street in Billerica. Located in the Wilmington Town Forest, the Maple Meadow Aqueduct Stone Quarry site (WMG-HA-2) was also surveyed. Within the quarry boundaries, the survey recorded the location of the Tow Line Grooved Boulder site (WMG-HA-3). The survey recorded four sites in Billerica that directly related to the operation of the canal. The Floating Towpath Peninsula site (BIL-HA-39) and the Floating Towpath Anchor Stone site (BIL-HA-40) were part of a system of bringing the canal through a mill pond on the Concord River. A short distance away was a lock chamber (BIL-HA-9) under a parking deck in the Talbot Mill yard. Finally, the survey recorded the Red Lock Basin Retaining Wall site (BIL-HA-41). Further research is recommended including a subsurface testing program to verify the archaeological sensitivity of those portions of the canal not visible on the surface; this includes most of the canal corridor south of Winchester.

25-1892 Alterman, Michael L. and Richard M. Affleck

1999 Archaeological Investigations at the Former Town Dock and Faneuil Hall, Boston National Historic Park, Boston, Massachusetts. (In 3 volumes). 1005 pages.

An archaeological testing program of the area below the basement floor of Faneuil Hall, a National Historic Landmark in Boston, was undertaken from November 1990 through January 1991 to examine the integrity of archaeological deposits that might be affected by rehabilitation of the building. The building was erected in 1742 and served as a public market, with the upper floor used for town meetings. The first basement was excavated during the 1805-1806 enlargement of Faneuil Hall, which doubled the size of the building's footprint. Major renovation occurred in 1898-1899, when the building was fireproofed and the column footings were replaced. Despite the disturbances that resulted from this renovation, the 1990-1991 archaeological excavations recovered historic landfill deposits below layers of basement flooring and 19th-century intrusions. The artifact remains from this landfill deposit are consistent with the historical evidence that Faneuil Hall was erected on a portion of the former Town Dock that was filled in 1728. Although it had been suggested from an earlier analysis of maps that the southern portion of the building might have been erected on landfill related to the initial development of the dock in the 1630s, no 17th-century artifacts were recovered. Deposits containing early 18th-century artifacts were found at depths of one to six feet below the present floor. The artifacts recovered from the site include faunal material, leather, botanical remains, architectural debris, glassware, and ceramics. The assemblage provides significant evidence of colonial trade, crafts, and lifeways. One unusual structural feature was uncovered four to six feet below the basement floor (10-12 ft below present street grade). The feature consisted of 4.5 ft planks supported by two rough-hewn logs; the planking was covered with boulders overlain by clay and brick ruble. The exposed portion of this feature was 18.5 ft long. Excavations demonstrated that the feature did not extend beneath the exterior wall that was constructed in 1742. It is either a spread-footer or structural support from a building that predated Faneuil Hall, or a platform that was used in 1742 during construction of the stone foundation for Faneuil Hall.

25-1893 Begley, William R. and A. Peter Mair, II

1999 Intensive (Locational) Archaeological Survey of the Route 44 Project Area: Raynham to Carver, Massachusetts. 261 pages.

A reconnaissance archaeological survey of the approximately 20.7 km (12.6 mile) Route 44 improvement project was undertaken, identifying areas of high, moderate, and low archaeological sensitivity; an intensive survey was also conducted. Background research indicated that the Route 44 project corridor lies within an area of high sensitivity for the presence of prehistoric Native American archaeological sites. There are a number of archaeological sites in the immediate vicinity, with the greatest density occurring along the banks of the Nemasket River in Middleborough. Subsurface testing was conducted in moderate and highly archaeologically sensitive portions of the project area to locate and identify any potentially significant archaeological resources. A total of 969 test pits were excavated (40 cm x 50 cm) along 66 judgmental linear transects, with 49 judgmental test pits and array testing (127 test pits) to further sample findspots. The survey identified 13 prehistoric loci and 10 findspots of prehistoric cultural material. Seven loci and one findspot are considered potentially significant and may contribute information relevant to a range of research issues, such as settlement patterns, resource use, and the intensity of activity within the middle Taunton River drainage, during the Late Archaic and Woodland periods. The sites identified in the survey, with one exception, appear to be small, possibly single-deposition loci located immediately adjacent to wetlands. The one exception (S8-Locus 1) is the east bank of the Taunton River and may represent a moderate to large-sized multicomponent (habitation) site occupied during the Late Archaic Period and subsequently reoccupied during the Late Woodland Period. Avoidance of the eight potentially significant sites is recommended. Where avoidance is not possible, it is recommended that additional archaeological investigations at the site examination level be conducted.

25-1894 Waller, Joseph N., Alan Leveillee, and Matthew Kierstead

1999 Intensive (Locational) Archaeological Survey of the Wayland Communication Complex. 73 pages.

Omnipoint Communications is planning the construction of a telecommunications complex west of Sudbury Road and north of Boston Post Road, in the central section of the town of Wayland adjacent to the Wayland Center Historic District. The majority of the proposed construction will occur within an abandoned rail easement. Elements of the former rail system exist within the project area and the proposed project has the potential to impact these resources. The construction-related access road will likely impact remaining track and associated infrastructure, the platform, and lamppost, handcar house foundation, and water tank foundation. The proposed road may also impact the integrity of the adjacent Wayland Railroad Station. Installation of the cellular telephone tower itself may have a visual impact on the Wayland Center National Register and Local Historic districts and the nature of visual impacts should be considered as an element of site evaluation. Consultation and coordination with the Massachusetts Historical Commission and the Wayland Historic District Commission is recommended in the future planing of the proposed undertaking. The significance of identified resources should be evaluated relative to National Register criteria. The identified 19th-century rail features could warrant expansion of the Wayland Center National Register Historic District and the Local Historic District. If avoidance of these features is neither prudent nor feasible site evaluation should involve an architectural survey. The archaeological elements of the evaluation of the Wayland Telecommunication Complex project area should involve exposure, photographic documentation, and detailed mapping of the constituent railroad features within the project area. An architectural survey is also recommended.

25-1895 Macpherson, Jennifer

1998 Reconnaissance Archaeological Survey, Southbridge Industrial Park, Southbridge and Charlton, Massachusetts. 89 pages.

This survey assessed the known Native American and EuroAmerican cultural resources and expected archaeological sensitivity of settings within the 402 acre parcel. During the walkover inspection, the location and condition of archaeological sites identified from cartographic evidence and deeds were confirmed. In addition, undisturbed sections of the project area outside the landfill and airport were examined to assess their expected archaeological sensitivity. Six historic/modern period cultural resources were identified in the Southbridge Industrial Park project area: four fieldstone foundations, one mill complex on McKinstry Brook, and occupied modern period residence. No Native American sites were identified during the reconnaissance survey. The walkover inspection identified zones of high sensitivity around the historic portion of Barefoot Road, McKinstry Brook, and large wetlands in the center of the project area. Zones of moderate sensitivity expected to contain unrecorded prehistoric and historic/modern period sites were also designated. Areas ranked as having low sensitivity were the existing airport and landfill deposits, other disturbed/altered land, and wetlands.

25-1896 Duranleau, Deena

1999 Report of a Reconnaissance Survey for the Tall Pines Development, Clinton, Massachusetts. 41 pages.

The survey revealed the presence of three known prehistoric sites, as well as a rock shelter, a perched stone that may have symbolic meaning for Native Americans, and a number of historic features including a 19th-century barn and other evidence of a farm, and an early 20th-century recreational area. The recommendations from the survey will be used to determine which areas of the project area should be subjected to an intensive (locational) survey, in case project impacts to potential subsurface archaeological resources are not avoidable.

25-1897 Herbster, Holly and Suzanne G. Cherau

2000 Intensive (Locational) Archaeological Survey, Oak Bluffs Wastewater Treatment System, Oak Bluffs, Martha's Vineyard, Massachusetts. 137 pages.

The intensive survey included background research, walkover survey, and subsurface testing to locate and identify potentially significant archaeological resources that may be affected by project construction. The intensive survey resulted in the location and identification of one prehistoric findspot (Ocean Park Findspot) and two diffuse historic archaeological deposits (Ocean Park Site, Camp Meeting Association Site). While these archaeological materials provide additional data on the use of the Oak Bluffs Village area during the prehistoric and historic past, they do not represent potentially significant archaeological deposits. No additional archaeological testing is recommended; however, the Unanticipated Discoveries Plan should be implemented during the construction phase of the project for all archaeologically sensitive untestable impact areas.

25-1898 Cavanaugh, Maureen A, Suzanne G. Cherau, Stephen A. Olausen, and Deborah C. Cox

1999 Cultural Resources Management Plan, Deerfield River Hydroelectric Project, Ferc Project No. 2323. 113 pages.

The National Register-eligible Deerfield River Hydroelectric Project consists of eight developments, each with a number of historically significant individual properties (in Buckland, Charlemont, Conway, Florida, Monroe, Rowe, and Shelburne, Massachusetts). The CRMP provides an inventory of historic properties; summarizes historic and current land use patterns; identifies operation, maintenance, and construction activities that will and will not impact historic properties; and outlines an action plan for the management of historic properties within the APE. The action plan contains procedures for USGenNE staff to follow in complying with the stipulations of the Deerfield River Hydroelectric Project PA. It addresses the integration of the CRMP into the license master planning process; protection of historic properties and mitigation of adverse effects; completion of the identification of historic properties within the project's APE; monitoring ar-

chaeological sites, sensitive areas, and historic structures; preparation of annual reports; processes for dealing with unanticipated discoveries of previously unidentified properties and human remains; and USGenNE's commitment to a program designed to educate the public about the historic and archaeological values of the project.

25-1899 Waller, Joseph N., Alan Leveillee, and Jennifer Macpherson

1999 Intensive (Locational) Archaeological Survey of the Hill Property, Bellingham, Massachusetts. 96 pages.

The survey included background research, a walkover survey, and subsurface testing. A total of 179 50 cm x 50 cm test pits was excavated in areas of moderate and high archaeological sensitivity. The survey resulted in the identification of above and below-ground remains of one historic farmstead site (the Adams/Ray Farmstead Site), and two Native American archaeological sites (the Long Shadow Site and the Hill #1 Site). The large, multi-component Long Shadow Site yielded moderate to high densities of chipping debris, stone tools and tool fragments, and evidence of two features. Diagnostic artifacts associate these occupations date to the Middle Archaic through Middle Woodland Periods. Based on the results of this survey, additional archaeological site examination investigations have been recommend for the Long Shadow Site and the Adams/Ray Farmstead Site.

25-1900 Donta, Christopher L., Thomas L. Arcuti, Margaret Kelly, and Mitchell T. Mulholland

1999 Archaeological Intensive (Locational) Survey for the Proposed Route 2 Crosby Corner Transportation Improvements Project, Concord and Lincoln, Massachusetts.

Background research determined that five prehistoric archaeological sites were recorded within or immediately adjacent to the project area (19-MD-188, 19-MD-399, 19-MD-117, 19-MD-177, and 19-MD-252). Artifacts from these sites date from the Middle to Late Archaic period (8,000–3,000 years ago). Documentary evidence suggested that the project area has been used predominantly for agriculture, with the large 19th-century Brooks farm located in the western portion of the project. Significant extant resources include an 1808/1834 Federal house (MHC LIN-62) and an 1865 French Second Empire house, and a 17th/18th/19th-century house (MHC LIN-63) just outside the project area. The project route traverses the Walden Woods landscape, a 2,680 acre area in the towns of Concord and Lincoln (MHC CON-932), which the Massachusetts Historical Commission has determined to be eligible for listing in the State and National Registers of Historic Places. The project tested 12 survey units, totaling 444 shovel test pits. Twelve sites were found (9 prehistoric, 3 historic). Of the 12 sites, seven are considered potentially significant for their research value. They are Historic Site I (SU 3), Prehistoric Site H (SU 4), Prehistoric Site D (SU 5), Historic Site E (SU 5), Historic Site F (SU 5), Prehistoric Site A (SU 8), and Prehistoric Site B (SU 11), which was previously recorded as 19-MD-118 (SU 11). All but Prehistoric Site A were identified within the limits of Preferred Alternative 8. The subsequent redesign of the service road for Preferred Alternative 8 eliminates impacts to all of the other potentially significant sites except Historic Site E (SU 5), Prehistoric Site H (SU 4), and Prehistoric Site B (SU 11). Site examinations are recommended for these three sites.

25-1901 Begley, William and Duncan Ritchie

1999 Intensive Archaeological Survey of the BankBoston Great Woods Development, Norton and Mansfield, Massachusetts. 101 pages.

Based on the results of a reconnaissance survey it was recommended that an intensive archaeological survey be conducted on the two, known historic period cultural resources (bridge/culvert, foundation and well) and the identified zones of high and moderate archaeological sensitivity. These zones included approximately 280 acres of the total project area. A total of 297 50 cm x 50 cm test pits was excavated. Four small loci (Great Woods Loci 1-4) of Native American activity,

each containing low densities of quartz chipping debris, were identified. The temporal/cultural affiliation of these loci is unknown. Subsurface testing of the foundation and associated well yielded a few pieces of 19th-century ceramics and window glass. The small fieldstone bridge/culvert on Great Brook was documented with photographs. A second historic period feature, consisting of a low, circular, earthen berm or mound was identified, however test pits in and around this feature did not yield any cultural material. These structures may have been small camps or shelters used in the historic/modern period by individuals while hunting, logging, or conducting similar activities. None of the archaeological sites identified in the intensive survey were considered to be potentially significant cultural resources. No further archaeological investigation was recommended. The fieldstone bridge/culvert should be avoided and preserved in place, however. This feature is within a stream/wetland buffer zone and will require protection (See Report #25-1837).

25-1902 Milne, Claudia

1999 Intensive (Locational) Archaeological Survey of the Holmes Building Project Area. 64 pages.

The parcel of land, in Milford, Massachusetts, to be developed contains approximately 48 acres, of which 11 acres are designated wetlands. Approximately 12 acres in the northern section of the parcel are slated for development. The 58 50 cm x 50 cm test pits were concentrated in areas to be impacted by construction. The test pits were arranged in eight judgmental transects (A-H), two clusters with one associated four-pit array, and three judgmentally placed test pits (JTP). Two test pits contained cultural material. One locus of Native American activity is represented by the blade and mid-section of a chert, Meadowood projectile point, dating to the Early Woodland Period (ca. 3000-1600 BP), and there is a possible locus of EuroAmerican activity represented by a pipe bowl fragment, 20th-century bottle glass, and pieces of iron pipe. The Native American locus was on an elevated terrace overlooking wetlands. A cluster of 5 test pits at 10 m intervals was excavated here and an array of four test pits at 5 m intervals was placed around the positive test pit, but no other cultural material was recovered. This artifact is likely from a brief, transitory hunting episode. A small rock overhang, which is part of a larger formation, was also tested with three JTPs. Historic artifacts dating to the 19th and 20th centuries were recovered in JPT2. This survey has not identified any potentially significant cultural resources. No additional archaeological survey is recommended.

25-1903 Mulholland, Mitchell T., Christopher L. Donta, and Thomas L. Arcuti

1999 Archaeological Reconnaissance and Intensive (Locational) Survey of the Bristol Brothers Golf Course Development, Weymouth, Massachusetts. 61 pages.

The background research and walkover inspection of the 125 acre project area determined that the majority of the project area did not require subsurface testing. Most of this area had been badly disturbed by a gravel and sand quarry. In the southern portion, approximately three acres of promontory and terrace were determined to require subsurface testing. Subsurface testing consisted of 64 shovel test pits, none of which recovered any cultural materials. It is therefore recommended that no further survey be required for this project.

25-1904 Donohue, Barbara and Deena L. Duranleau

1998 Reconnaissance Archaeological Survey Notice of Project Change Wachusett Mountain Expansion Project, Princeton and Westminster, Massachusetts. 63 pages.

A reconnaissance survey was conducted for the approximately 12 acres of land that will be disturbed by the proposed ski trail modifications and ski lift construction on the north side of Mt. Wachusett. Previous investigations included documentary research, a walkover of the project area, and oral interviews with Native American representatives. This documentary and field research revealed the existence of 16 historic/archaeological resources and also demonstrated that native

people regard the mountain as a sacred place. A (locational) survey conducted near Parking Lot No. 3 revealed a small prehistoric site. The present survey revealed only one area that has a high potential for containing a prehistoric site. This area is on a terrace with a large stone outcropping that abuts a small stream and is within 250 m of the "Old Indian Trail." The remaining areas have a low potential for containing archaeological resources. (See also Report #s: 25-1549, 25-1551, and 25-1905.)

25-1905 Duranleau, Deena

2000 Report of an Intensive Archaeological Survey Notice of Project Change Wachusett Mountain Expansion Project, Princeton and Westminster, Massachusetts. 43 pages.

No archaeological resources indicating Native American or historic presence were identified around or inside a rock outcropping located on a small terrace about halfway up the northern side of Mt. Wachusett. This small terrace had a high potential for containing Native American artifacts because it was adjacent to a small stream and within 250 m of a trail now known as the "Old Indian Trail." None of the twelve 50 cm x 50 cm test pits contained evidence of habitation. (See also Reports #25-1549, #25-1551, and #25-1904.)

25-1906 Donta, Christopher L. and Timothy Binzen

1999 Archaeological Intensive (Locational) Survey for the Proposed CVS Pharmacy, Marshfield, Massachusetts. 63 pages.

Twenty-four shovel test pits were completed in six areas. The project area was found to contain evidence of prehistoric activity along the northern edge of the property. One test pit yielded a single artifact. This findspot is part of the larger South River Valley site (19-PL-620) that continues to the west and south to Ocean Street. However, most of the remaining part of the present property to the south has been heavily disturbed. The disturbance includes areas of excavation, filling, and grading, which were later reclaimed by the forest. Building construction prior to the present CVS foundation excavations has further disturbed the southernmost part of the parcel. The northern, undisturbed portion of the site is not scheduled for any impacts during the present project. No further survey is recommended.

25-1907 Hoffman, Curtiss

2000 1998 Archaeological Intensive Survey and Site Examination, Middleborough Little League Site, Middleborough, Massachusetts. 233 pages.

The undisturbed portion of the site, an area of ca. 4,500 sq m, contains significant Middle through Transitional Archaic period deposits and intact features. A total of 517 lithic artifacts, 3,168 flakes, and 45 previously undiscovered features were recovered from 28.5 sq m excavated during the 1998 investigation, and 142 artifacts and 527 flakes were recovered from the surface. Several radiocarbon dates were obtained. This portion of the site contains significant information concerning mining for glacial cobbles, tool manufacture, hide and/or meat processing, ceremonialism, and trade. The density of these deposits is of sufficient significance and integrity to consider nominating the site to the National Register of Historic Places on Criteria A, C, and D. However, it is possible to delineate areas of higher and lower concentrations of pre-European cultural material. The Middleborough Little League is advised of its responsibilities in this matter and it is recommended that a change of design be considered to avoid the most sensitive portions of the site. This would entail a small-scale Data Recovery operation in a limited area (100 sq m) of the site. (See Report #25-1829.)

25-1908 Donta, Christopher L. and Timothy L. Binzen

2000 Archaeological Intensive (Locational) Surveys for Two Compensatory Flood Storage Areas and One Park-And-Ride Lot Associated with the Route 3 North Transportation Improvements Project, Tyngsborough, Billerica, and Bedford, Massachusetts. 72 pages.

While background research found that no recorded archaeological sites were known for the proposed impact areas, the reconnaissance identified one area of historic activity. All three sites had high prehistoric potential. In Tyngsborough subsurface testing and map research during this survey resulted in the discovery of a 19th-century house that was occupied into the 20th century. No intact subsurface structural features were identified. The razing of the buildings and bulldozing of the property in 1971 has heavily damaged this historic site and has resulted in poor archaeological integrity. The two compensatory flood storage areas in Bedford and Billerica did not contain any evidence of prehistoric or historic archaeological sites. A total of 64 shovel test pits was completed in three survey units. Because no potentially significant archaeological sites were found within the proposed impact areas, no further survey is recommended for this project.

25-1909 Donta, Christopher L. and Timothy Binzen

2000 Archaeological Intensive (Locational) Survey for the Proposed Gas Pipeline, Lynnfield, Massachusetts. 65 pages.

Background research for the 535 m long by 4.5 m wide project area identified one known prehistoric site in the project area along the Saugus River (Montrose Plot site, 19-MD-426) and a small burial ground adjacent to the project area related to the Tarbell family in the early 1800s. Twenty-four shovel test pits were excavated at 7.5 m intervals in the areas of highest potential. No prehistoric artifacts were recovered in the project area. No surface or subsurface indications of the Tarbell burial ground were found. The burial ground appears to have been covered over in the process of landscaping the residence located uphill, despite a deed restriction to avoid such impacts. A historic site was found to the southwest of the burial ground, but outside the present project area, consisting of a large dry-laid stone foundation with an interior stone-lined well. The project impacts are limited to a corridor adjacent to but not including the recorded location of the burial ground. No further survey is recommended.

25-1910 Begley, William

1999 Intensive (Locational) Archaeological Survey: Sandy Point State Reservation, Ipswich, Massachusetts. 65 pages.

Background research completed as part of this survey indicated that there was a high potential for prehistoric resources within the project area (Bar Head Site, 19-ES-309). Subsurface testing included close-interval (5 m) test pits (N=22) within archaeologically sensitive sections of the project area and produced chipping debris, aboriginal pottery, and non-diagnostic chipped stone tools, as well as evidence of intact subsurface features. Based on the variety and types of archaeological evidence recovered, the Bar Head Site is considered a significant resource and may be eligible to the National Register of Historic Places. Test pit excavation along the drumlin path confirmed that the majority of the existing path has been heavily eroded, and no further work is recommended for this portion of the project area. The proposed observation platform at the top of the drumlin has the potential to impact intact portions of the Bar Head Site and avoidance is recommended; additional testing of the pier locations is recommended if avoidance is not possible.

25-1911 Begley, William and Duncan Ritchie

1999 An Intensive (Locational) Archaeological Survey of Proposed Office Building, Canton, Massachusetts. 86 pages.

An important prehistoric period archaeological site, the Neponset/Wamsutta Site (19-NF-70) is located within the project area, which is adjacent to the Neponset River. This site is eligible for

listing on the National and State Register of Historic Places and contains evidence of Native American occupation from the Paleoindian to Late Woodland periods. Background research included a review of previous archaeological investigations by both professional and avocational archaeologists within the Neponset/Wamsutta Site. A walkover inspection delineated zones of archaeological sensitivity and assessed previous disturbance, which included areas of previous professional and avocational archaeological investigations, backfilling/grading, and construction activities. Intact portions of the project area were considered to have high sensitivity for Native American cultural resources. All of the project area was considered to have low sensitivity for Euroamerican cultural resources. Subsurface testing included sampling of soil profiles with handheld augers to confirm areas of previous disturbance and subsurface testing with 50 cm x 50 cm test pits in zones of high archaeological sensitivity. A total of 40, 50 cm x 50 cm test pits was excavated at 5 m intervals. A small amount of Native American cultural material, quartz and rhyolite chipping debris, was found in one section of the project area. These materials are associated with Locus 4 of the Neponset/Wamsutta Site. A previous archaeological site examination indicated that Locus 4 contains a Middle Woodland Period (ca. 1650—1000 years B.P.) component (see Report #25-1877). This locus is known to contain lithic workshop features. The project proponent has modified the project design to minimize alteration to intact sections of the project area. It is recommended that the construction of the proposed office building be planned so that Loci 3 and 4 of the Neponset/Wamsutta Site can be avoided, otherwise a data recovery plan should be developed to mitigate the adverse effects of construction on these two loci.

25-1912 Leveillee, Alan and Jennifer Macpherson

1999 Intensive (Locational) Archaeological Survey Christina Estates at Baker Hill, Hingham, Massachusetts. 72 pages.

Subsurface testing was conducted in stratified moderate and high archaeologically sensitive portions of the 90 acre project area. A total of 66, 50 cm x 50 cm test pits was excavated within the proposed development along 10 judgmental linear transects. A total of 109 historic/modern period artifacts was recovered from the project area. No prehistoric cultural material or features were identified during the intensive survey. These investigations of the project area did not yield any potentially significant cultural materials. No further archaeological investigations were recommended.

25-1913 Fragola, Patricia and Alan Leveillee

1999 Intensive (Locational) Archaeological Survey, Water Pipe Subdivision, Bourne, Massachusetts. 118 pages.

Subsurface testing was conducted within high to moderate sensitivity portions of the 23 acre project area. Portions of the project area considered to have low potential for archaeological resources were not tested. The areas around both Chamber Rock and Wishing Rock were tested. Subsurface testing within the Water Pipe Subdivision did not recover cultural material. Information provided by representatives of local Native American tribes indicates that Chamber Rock and Wishing Rock are important links to their past and continue to be visited. It is currently unclear whether these are foci of ceremonial activity. Based upon the current data, the glacial boulders known locally as Chamber Rock and Wishing Rock may constitute Traditional Cultural Objects. As such they should be considered further in planning the subdivision. If prudent and feasible these rock features should be preserved in place. The project proponents intend to grant easements to preserve and maintain, in their original positions, both Chamber Rock and Wishing Rock, and insure their preservation via a conservation and/or preservation easement. Chamber Rock is currently situated within a Conservation Easement (Appendix D). If in the future preservation in place is no longer prudent or feasible, further investigation is recommended to consider project-specific impacts to these features, to further document them as potential traditional cultural objects, and to develop mitigative strategies.

25-1914 Pretola, John P., Ellen-Rose Savulis, and John O. Curtis

1999 Intensive Archaeological Survey of the Danforth Farm, Wilbraham, Massachusetts. 165 pages.

This study sought to identify content, size, age, and boundaries of the B.F. Green Site (19-HD-11) and additional archaeological sites. An architectural survey was conducted of the Bliss/Danforth House, and studies to locate the Bay Path were carried out. The project area was stratified and 84, 40 cm x 40 cm shovel test pits spaced 5 or 10 m apart on transects and three 1 m x 1 m test pits were excavated. The B.F. Green Site occupies 3 acres with an approximately 5,000-year-old Brewerton component, although other archaeological cultures and time periods may be represented. The site may be eligible for listing in the National Register of Historic Places. Protective easements and shallow plowing are recommended. It was concluded that the Bay Path crossed outside the project area. Architecturally, the Bliss/Danforth House has been greatly modified and surrounding ground heavily disturbed. More archaeological testing in areas immediately adjacent to the house should precede additional renovations. Archaeological reconnaissance is recommended on town property on Wilbraham Mountain and in Monson.

25-1915 Fragola, Patricia and Duncan Ritchie

2000 Intensive (Locational) Archaeological Survey of the Boxborough Primary School Project Area, Boxborough, Massachusetts. 69 pages.

The project area is adjacent to Guggins Brook and background research indicated that it had the potential to contain evidence of prehistoric Native American settlement/land use. A number of known prehistoric sites were located in the vicinity. Historic period settlement in and around the project area consisted of farmsteads and large parcels of land in agricultural/pastoral use. A walkover inspection confirmed that most of the project area had minimal evidence of prior alteration or disturbance. A section of the southwestern portion of the project area was considered to have low archaeological sensitivity due to disturbance from small sand/gravel pits. Zones of high and moderate archaeological sensitivity were designated on knolls and terraces bordering wooded wetlands and the crest of a hill in the central portion of the project area. Subsurface testing was done with judgmentally placed transects of 50 cm x 50 cm test pits placed at 10 m intervals. Eight judgmentally placed transects with a total of 37 test pits were used to sample the project area. No prehistoric or historic period archaeological sites were identified within the project area. The only cultural resource identified was a fieldstone and earth filled dam crossing Guggins Brook along the western boundary of the project area. This modern-period dam was built in association with the Blanchard Memorial School and is not considered to be a potentially significant cultural resource. Current plans indicate that the dam will be placed within a 200-ft-wide river front buffer zone and should be outside the area of construction impact.

25-1916 Mair, A. Peter, II

2000 Intensive (Locational) Archaeological Survey: Chelmsford Phase IVB Sewer Project Area, Chelmsford, Massachusetts. 64 pages.

Stratification of the project area into zones of expected archaeological sensitivity was based on the results of background research and walkover inspection. This preliminary evaluation indicated that the project area contained many locations of previous disturbance from residential development as well as locations that contained poorly-drained, low-lying areas adjacent to wetlands. These areas were ranked as having low or no archaeological sensitivity. The remainder of the project area was ranked as having moderate to low archaeological sensitivity. Fifty-two test units were placed to sample these areas. No Native American or European American archaeological sites were identified during the fieldwork aspect of the survey, and no further work is recommended.

25-1917 Ingham, Donna and A. Peter Mair, II

2000 Intensive (Locational) Archaeological Survey: YMCA Well Field Expansion Project Area, Halifax, Massachusetts. 69 pages.

A review of the known prehistoric database for Halifax identified prehistoric resources in the immediate project area, including the Camp Ousamequin I Site (19-PL-446). The intensive archaeological survey included background research, a walkover, and subsurface testing. Subsurface testing consisted of the excavation of 22 test pits in areas of high archaeological sensitivity. A low-density distribution of predominantly non-diagnostic historic debris was likely deposited as a result of the recreational/institutional use of the project area. Five pieces of non-diagnostic quartz interpreted as field shatter were recovered. No evidence of significant artifact concentrations or intact subsurface features was encountered, and no further archaeological investigation is recommended.

25-1918 Fragola, Patricia and A. Peter Mair, II

1999 Intensive (Locational) Archaeological Survey of The Definitive Subdivision, King Street and Sunnyside Avenue, Hanover, Massachusetts. 83 pages.

A total of 53, 50 cm x 50 cm test pits were excavated within areas considered to have high and moderate archaeological sensitivity. Subsurface testing investigated a known foundation within the project area and identified two prehistoric archaeological sites: the Red Mushroom Site and the Screeching Hawk Site. A high density of prehistoric cultural material, including chipping debris and a Brewerton eared projectile point, was recovered from the Red Mushroom Site. A moderate density of prehistoric cultural material was recovered from the Screeching Hawk Site. Activities at both sites included lithic tool manufacture and maintenance and resource procurement. Cultural material from the historic foundation indicates recent occupation/use and is not significant. Both the Red Mushroom Site and the Screeching Hawk Site represent potentially significant archaeological deposits and avoidance is recommended. If avoidance is not feasible, site examination is recommended to establish site boundaries and evaluate each site's internal complexity and temporal affiliation.

25-1919 Donta, Christopher L., Timothy Binzen, and Margaret Kelly

2000 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Eagle Ridge Estates, Lancaster, Massachusetts. 101 pages.

Background research on the 173 acre project areas identified three known historic sites in the project area: a reputed late 17th-century animal pound (LAN-HA-75), a historic town boundary marker (LAN-HA-76), and a series of fieldstone walls (LAN-HA-77). Historic maps did not indicate any structures in this area. Subsurface testing consisted of 115 shovel test pits and one 2 m long trench. One prehistoric site was identified, yielding a retouched quartz flake, one piece of quartzite, and two pieces of quartz shatter. The three, recorded historic sites were relocated and information updated. The reputed animal pound was found to be 20th century rather than dating to the 17th century. Two additional historic town boundary markers were located, totaling three along a boundary between Lancaster and Sterling established in 1781 and changed to its present location in 1908. Two other historic archaeological sites were found: a series of fieldstone piles, which are part of unfinished stone wall construction; and an earthen mill dam. Thus, within the project area are located seven historic sites and one prehistoric site. A recommendation was made to avoid the dam during construction. Treatment of the town boundary markers are covered by specific state regulations. The pound, stone walls, and piles were not found to have any research potential. The prehistoric site contained a low density of artifacts and has no further research potential. No further survey was recommended.

25-1920 Binzen, Timothy and Margaret Kelly

2000 Archaeological Site Reconnaissance and Intensive (Locational) Survey for the Proposed Utilities Corridor and Parking Area and for Construction and Restoration at the Forecourt, Lime Walk, and Greenhouse, The Mount, Lenox, Massachusetts. 78 pages.

The Mount is an estate designed and occupied in the early 20th century by novelist Edith Wharton. It is a National Historic Landmark. Following background research and a surface reconnaissance, specific locations on the property were tested for prehistoric and historic cultural resources. Effort was also directed at the identification and description of subsurface historic features to enable restoration activities. Four survey units were recommended for archaeological investigation. Soils recorded included natural stratigraphy, plow zones, and layers of fill associated with the construction of the mansion. No prehistoric artifacts were recovered during the testing. Although the volume of historic artifacts recovered was low overall, multiple historic features were identified at the forecourt and greenhouse. A total of 13 exploratory trenches (50 cm x 2 m) and 82 shovel test pits were excavated in the four survey units. The exploratory trenches were excavated at the forecourt, lime walk, and greenhouse. These units revealed indications of construction techniques, landscaping, and gardening activities dating to ownership of the property by Edith Wharton. Test pits were placed at intervals of 7.5 m (25 ft) in the proposed utilities corridor, proposed parking area, and in the forecourt. No further testing is recommended.

25-1921 Mangan, Patricia Hart, Christopher Donta, Mitchell Mulholland, and Thomas Arcuti

2000 Archaeological Intensive (Locational) Survey for the Carroll Holmes Recreational Area, Lake Wyola State Park, Shutesbury, Massachusetts. 123 pages.

This survey included an architectural study of standing structures on the property and completion of an Area Form and a National Register Criteria Statement Form. No prehistoric sites had been recorded previously for this area. Historic use of the area is extensive and dates back to the late 18th century when a tavern was built on the site. The original structure was added onto and expanded into a hotel business in the late 19th century. A barn has been standing on the property for at least 100 years. The buildings were used as a residence in the 20th century and as a recreation center for a beach. Seven areas were tested. Historic artifacts dating to the late 19th and early 20th centuries were found in several areas. A heavily used 19th-century historic midden, possibly related to the Ames family, was located behind the barn. As a result, the water and sewer lines planned for this area were rerouted to an old roadbed south of the house. The front lawn between the house and Lakeville Road contains a large number of historic artifacts and could be a house site. The midden area and front lawn should be avoided. The property with its buildings and fields exemplifies a rural, 19th-century retreat and a 20th-century, rural mountain bathing and tourist establishment. The complex is potentially eligible for inclusion in the National Register of Historic Places. The main house, which is a Federal-period building, may be eligible on its architectural merit. The archaeological survey suggests that the midden has potential to contribute information of importance to archaeology. As such, the site is eligible under National Register Criteria A, C, and D.

25-1922 Herbster, Holly and Suzanne G. Cherau

2000 Technical Report, Data Recovery Program, Sleeping Toad Site, 19-BR-383, Acushnet Golf Course Project Area, Acushnet, Massachusetts. 182 pages.

The Sleeping Toad Site (19-BR-383), located on a high, broad knoll adjacent to the Acushnet River, was identified by previous study as one of three potentially significant prehistoric deposits in the Acushnet Golf Course project area (see Reports #25-1545 and #25-1765). Consultation with the project proponent determined that the majority of the 6,800 sq m site area could be avoided by the project and protected during and after construction. As part of the project, the Town of Acushnet has agreed to implement a long-term protection and preservation plan for this portion of the Sleeping Toad Site. A data recovery program was developed to mitigate adverse impacts to the remaining 3,000 sq m of the site area. A total of 49 sq m was excavated within the Sleeping Toad

Site during the data recovery, resulting in the identification of eight cultural features (small storage/refuse pits, hearths) and more than 1,500 pieces of cultural material. Although lithic debitage comprised more than 95% of this total, diagnostic Small Stemmed and Levanna points and radiocarbon dates tie site occupations to the Late Archaic and Middle and Late Woodland periods. The archaeological investigations indicate that the Sleeping Toad Site was selected by Native American groups as a short-term activity area from the Middle Archaic through Late Woodland periods. Floral and faunal remains recovered in shallow, undisturbed soils suggest that the site's natural environment was extremely stable and productive during each period. The pattern of identified sites in the vicinity indicates that prehistoric groups used near-interior resource areas as they did the Sleeping Toad Site, for short-term activity areas rather than semi-permanent habitation areas.

25-1923 Atwood, Kathleen A.

2000 Final Historic Properties Management Plan, Westville Lake, Sturbridge and Southbridge, Massachusetts. 199 pages.

The purpose of the HPMP is to provide a comprehensive program to direct the historic preservation activities and objectives at the Westville Lake Flood Control Project and to effectively manage and protect each historic property. Historic contexts, results of archaeological investigations, and a land use guide are included (see Report # 25-1224).

25-1924 Atwood, Kathleen A.

2000 Final Historic Properties Management Plan, Barre Falls Dam, Barre, Hubbardston, Oakham, and Rutland, Massachusetts. 209 pages.

The purpose of the HPMP is to provide a comprehensive program to direct the historic preservation activities and objectives at the Barre Falls Dam and to effectively manage and protect each historic property. Historic contexts, results of archaeological investigations, and a land use guide are included (see Report # 25-1112).

25-1925 Donta, Christopher L., Timothy Binzen, and Margaret Kelly

2000 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed West Union Sewer Project, Ashland, Massachusetts. 57 Pages.

Background research, an archaeological site reconnaissance, and an intensive survey were conducted for the proposed 210 m West Union sewer line. The project area is located approximately 2 km south of the historic Magunkaguog Praying Indian Town vicinity. While multiple prehistoric Native American sites have been recorded nearby, no cultural resources have previously been recorded within the proposed impact area. Twenty-five shovel test pits were completed at 7.5 m intervals along the sewer route, yielding historic artifacts from eight units. The artifacts primarily consisted of domestic refuse from two 20th-century dumping locations. No historic features or prehistoric cultural materials were recovered. No further survey is recommended.

25-1926 Dalton, Ronald and Barbara Donohue

2000 Intensive (Locational) Survey for the Plymouth Force Main Project, Plymouth, Massachusetts. 65 pages.

The archaeological survey examined slightly less than one mile of the total 4.5 mile-long pipeline route. The survey consisted of documentary research, background research, a walkover, and subsurface testing. Background research included a review of relevant data and previous archaeological surveys related to this project. Subsurface testing was conducted in areas determined to have high or moderate archaeological potential. Subsurface testing along five cross-country project segments included a total of 57, 50 cm x 50 cm shovel test pits. Thirty-two test pits were placed at

10 m intervals; 10 were judgmentally located in areas of high potential. Fifteen test pits were excavated at 15 m intervals along cross-country segments with moderate potential. In all, 338 historic and modern artifacts were recovered. Interviews with long-time residents provided information regarding the use of portions along the project route. The segments where most artifacts were recovered were used as an open dump for many years. These items do not represent a significant archaeological deposit. No further archaeological investigations were recommended.

25-1927 McHargue, Georgess

1996 An Interpretive Plan for the Archaeology of the Central Artery/Tunnel Project, Boston, Massachusetts. 91 pages.

The plan sets forth interpretive strategies for the CA/T Project and for a geographic region wider than the immediate metropolitan Boston area. All of the data recovery sites, especially the extraordinarily well-preserved materials from Feature 4 at the Cross Street Back Lot site, generated results that are scientifically significant beyond the immediate vicinity of Boston. The period covered by this plan is that of the occupation of the sites selected for data recovery excavation, roughly AD 400 to AD 1830. The plan is divided into three sections: development of interpretive themes, evaluation of interpretive techniques, and recommendations.

25-1928 Tuttle, Michael C.

1999 Final Report: Underwater Archaeological Survey for the Proposed Utility Line Between Long Island and Spectacle Island, Boston Harbor, Massachusetts for the Central Artery/Tunnel Project. 41 pages.

The findings of the intensive remote sensing and diver investigation of the marine portion of the proposed utility right-of-way included four minor and one large magnetic anomaly associated with observable shore materials, one small modern boat, one apparent rock outcrop, and one disarticulated timber. None of the anomalies, acoustic targets, or observed objects indicated the presence of a historic submerged cultural property. It is therefore recommended that no further archaeological survey be required within the present project area.

25-1929 Hasenstab, Robert J. and Paul J. Mohler

1999 Summary Report: Intensive Archaeological Survey, Central Artery/Tunnel Project, Overland Portion, Proposed Utility Line between Long Island and Spectacle Island, Boston Harbor, Massachusetts. 58 pages.

The total length of the overland portion surveyed is 150 m (500 ft) and includes two proposed utility manhole installations. The project area is part of a designated National Register Archaeological District. Background research and field reconnaissance failed to reveal any prehistoric or historical resources within the project area. Subsurface testing, consisting of 55 shovel test pits, revealed prehistoric lithic flakes in undisturbed contexts in two test pits. No features were encountered. The upper portion of the project area was found to be disturbed and lacks archaeological integrity. The middle portion was covered with a mantle of fill, slope wash, or flood deposit overlaying an intact, buried natural soil horizon containing a very low density scatter of prehistoric artifacts. The lower portion of the project area consisted entirely of recent beach deposits with no archaeological potential. The overall impact of the proposed construction on the National Register Archaeological District is considered to be negligible. No further archaeological survey is recommended.

25-1930 LoGuidice, Susan and Barbara Putnam

1995 Archaeological Reconnaissance Survey, Condor Street Site, East Boston, MA: Central Artery/Tunnel Project, Boston, Massachusetts. 97 pages.

Historic and cartographic research revealed that the main buildings of the Glendon Rolling Mill, as well as the buildings of the site's occupants until 1921, were located south of present day Condor Street. Many occupants had used the area north of Condor Street, within the confines of the original water lot sold to the Glendon Rolling Mill, as a wharf and storage facility until 1921. At that time, Boston Sand and Gravel assumed ownership of the lot and began production of concrete in the former wharf/storage area. Archaeological monitoring of the soil borings confirmed the findings of the historical research. There were no concentrations of iron or other iron working by-products that could be associated with Glendon Rolling Mill or any other architectural or cultural remains that could be associated with other owners of the property. Stratigraphic analysis revealed two layers of fill within the original wharf area. The early fill sequence associated with the Glendon Rolling Mill was void of cultural remains. A modern fill sequence, which had a high level of gravel and concrete debris, was associated with Boston Sand and Gravel. Two wooden barges were noted at the eastern and western sides of the wharf. The eastern barges were sunken and visible only at low tide, while the western barges remained visible at high tide. The barges probably date to the early 20th century and are not considered historically significant. No significant cultural resources remain within the Condor Street site.

25-1931 McHargue, Georgess

2000 Piety and Profit: Three Archaeological Sites from Boston's Past. 33 pages.

This popular report provides an overview of the Central Artery/Tunnel Project and its related archaeological investigations. Following a synopsis of Boston's 10,000 years of human history, the report discusses the basics of archaeological field and laboratory methods. Finally, three archaeological sites from the North End are presented in more detail: the Cross Street Backlot; the Paddy's Alley site; and the Mill Pond site.

25-1932 Cook, Lauren J. and Joseph Balicki

1998 Archaeological Data Recovery: The Paddy's Alley and Cross Street Back Lot Sites (BOS-HA-12/13), Boston, Massachusetts. Four volumes. 1,512 pages total.

The Paddy's Alley site (BOS-HA-12) yielded information on two residential properties; excavations encountered a warehouse, used as a workshop by a pewterer, trash middens, wood-lined privies, and various land modification activities. The second site, Cross Street Back Lot (BOS-HA-13), contained sanitation and drainage features. The sites are adjacent to each other, within the block bounded by Ann, Cross, Middle (or Hanover) and Paddy's Alley (or Center) Streets. The Paddy's Alley site contained deposits assigned to two properties: Paddy's Alley East and Paddy's Alley West. Beginning ca. 1650 and continuing until 1728, members of the Jepson family owned the Paddy's Alley West property. Over the next 80 years the property changed hands 14 times, with the majority of the owners being absentee landlords. The archaeological resources date primarily to the Jepson period. A 1728 plat indicates that the excavations were located in the northeast corner of the property, designated as a garden, and two shallow wood-lined privies excavated in the area date to the 1720s. The Paddy's Alley East property contained primarily evidence of an early 18th-century drain belonging to a merchant, and a midden and warehouse/workshop of John Carnes, who occupied the property during the second and third quarters of the 1700s. The area investigated at the Cross Street site was used for sanitation and drainage. The early privy, Feature 4, was brick-lined, with primary deposits dating to the 17th century, during the occupation of Katherine Nanny Naylor's family. This privy was sealed and replaced by a drainage feature composed of a tub and wooden drain dating to the early 18th century. The drainage feature was sealed in the early 18th century, but later this area was reused for two late 18th- and early 19th-century wood-lined, shallow privies. A variety of contextual analyses in conjunction with historical and archaeological data were used to address issues relating to land use, urban lifeways, class, status, gender, and ethnicity. These studies of the pollen, beetle fauna, parasites, faunal and floral remains, textiles and shoe leather were especially useful in interpreting the lifeways of the people that used the 17th-century privy. The primary results come from the Nanny-Naylor household, from the third

quarter of the 17th century, and the Carnes household of the second and third quarters of the 18th century. Both households were in the upper levels of Boston society, although they had somewhat different household structures. The Nanny-Naylor family was headed by a divorced woman from the merchant class, and the Carnes household by one of the most prosperous artisans of the time. Each household expressed their position in society in a number of expected ways. The contents of the Nanny-Naylor privy contained a variety of artifacts traditionally used by women, which allowed an exploration of gender, status, and class in her household. The debris from the Carnes household also allowed examination of these issues. The expression of ethnicity was examined for different groups of English colonists and for the enslaved African-American servants that many of the occupants of the lots owned. The study of English ethnicity examined data from other colonies and focused on foodways. Material evidence of the presence of African-Americans, although sparse, is present. The report also examines appearance and residential patterning to explore to what extent people expressed class and status through material culture. Commerce within the expanding British trading system was also examined. An extensive study of the food provisioning system is undertaken using the faunal remains from these two sites as well as the Mill Pond site (see Report #25-1933).

25-1933 Cheek, Charles D. and Joseph Balicki

2000 Archaeological Data Recovery: The Mill Pond Site (Bos-HA-14), Boston, Massachusetts. Three volumes. 1271 pages total.

The data recovery at the Mill Pond Site consisted of documentary research and field investigation including manual excavation of 2l 5 ft x 5 ft units, test trenching, and mechanical stripping in an approximately 4,299 sq ft (390 sq in) area. The data recovery excavations identified five major archaeological resources: an early wharf, probably dating to the last quarter of the 17th century; a bulkhead and dock dating to the last quarter of the 18th century; an early land surface, ca. 1700; a land surface from the middle-to-late 18th century; and landfill from three periods: Plantation (1630-1675), Colonial (1675-1775), and Early Republic (1775-1830). Research focused on commerce (social and economic context of the wharf and bulkhead-dock; the social and economic context and the source of the fill; the folkways of wharf and bulkhead-dock construction and dates of construction), the reconstruction of the environment around the wharf (pollen profiles produced a record of environmental and landscape changes from 1630 to 1823; evidence for changing land use addressed the development of the cultural landscape and the personal-health environment of Boston's residents was considered in discussing historic sanitation practices with respect to landfills), and urban lifeways (use of material culture to express ethnicity, social class, and gender; consumption patterns by household, household type, and neighborhood; changes in consumption patterns over time comparing Boston with other port cities). Underlying themes guiding the study included whether regional English cultures carried their distinctiveness to the New World is correct when viewed from the archaeological record and whether regional cultures eventually blended together and when this occurred. The data on foodways did suggest there were regional differences that continued into the 19th century and that there were regional differences in the speed in which the culture of consumption spread. More data is necessary to support conclusions about the regional comparison of social and cultural change from an historic archaeological perspective.

25-1934 Smith, Leith, Barbara Donohue, and Matin Dudek

2000 Emergency Archaeological Data Recovery of the South Boston Flint Glass Works and The American Glass Company (formerly reported as Crown Glass Works), Contingency Plan Implementation Contos Property, Parcel 60-CS-1 Central Artery/Tunnel Project, Boston, Massachusetts. Two Volumes. 461 pages total.

This survey, conducted on a 26,040 sq ft parcel, consisted of documentary research, the excavation of a quarter of a wood-lined privy and four test units, and mapping of architectural features. Archaeological deposits consisting of architectural remains, a furnace foundation, as well as glass and ceramic crucible fragments associated with the South Boston Flint Glass Works and the Bos-

ton Glass Manufactory (1812-1827); a deposit of pressed tumbler bases (probably cullet) associated with an intermediate period of glass production (1830s to 1840s); and a wood-lined feature filled with a mixture of fecal deposits and glass factory refuse, a furnace foundation and a stone-lined well associated with the American Glass Company (1843-1857) were identified. This research contributes to current scholarship on the development of the American glass industry and the role of South Boston and provides a resource for comparison with contemporary glass factories.

25-1935 Edens, Christopher M. and Robert G. Kingsley

1998 The Spectacle Island Site: Middle to Late Woodland Adaptations in Boston Harbor, Suffolk County, Massachusetts, Central Artery/Tunnel Project, Boston Massachusetts. Two Volumes. 477 pages total.

An archaeological data recovery was conducted at the Spectacle Island site (19-SU-38), a prehistoric shell midden. An earlier intensive archaeological survey of Spectacle Island (see report #25-897) determined the site to be a significant archaeological resource and eligible for inclusion in the National Register of Historic Places. Excavation of 100 sq m of the shell midden revealed a Middle-Late Woodland occupation, dated by 12 radiocarbon dates to between AD 535 and AD 1590. Though multiple reoccupations of the site were in evidence, vertical and horizontal stratigraphy was homogeneous throughout. Three small submidden features were identified, the functions of which are uncertain. More substantial features, discrete activity areas, or other evidence of intensive or protracted habitation was lacking. A sparse and typologically diverse lithic assemblage was recovered, as was a more substantial bone-tool industry oriented toward the production of barbed and unbarbed points. Ceramics were infrequent and nearly all were shell tempered. Faunal remains indicated a primary subsistence focus on harvesting of soft-shell clam, followed by cod fishing. Mammals and birds were also procured. Hickory nuts were recovered, but evidence for agriculture was lacking. The site appears to represent an intensively used, seasonally reoccupied, specialized resource procurement locus within a larger, logistically organized subsistence-settlement system. The principal occupations of the site occurred during the fall and early winter, with some use also taking place in the spring. The Spectacle Island site is thought to be most closely culturally related to Middle-Late Woodland communities focused on the Neponset River estuary.

25-1936 Luedtke, Barbara

1976 Report on the Excavation of a Portion of the HL-8 Site (19-NF-6) on Grape Island, Boston Harbor, (Weymouth,) Massachusetts. 12 pages.

This report summarizes the results of excavations of 5, 1 sq m excavation units around the location proposed for a new pier. These excavations recovered prehistoric and historic artifacts of the same ages as had been found previously (see Report #25-107), but increased the range of types found including a small-stemmed point variant, celt, fish bone bead, hammerstones, and worked mussel shell. These new findings do not contradict the previous conclusion that that the site was occupied intermittently from the Middle Archaic through the Modern period.

25-1937 Sara, Timothy R.

1994 Prehistoric Landscape Use in the Upper Swift River Valley (Quabbin Resevoir) of Central Massachusetts. 176 pages.

This thesis explores the relationship between selected environmental features and prehistoric site locations in the upper Swift River Valley (Quabbin Reservoir) of central Massachusetts. Changes in site locations from Paleoindian through Late Woodland periods are examined in relation to biotic resource potential offered by geomorphic landform and associated surface water features. Geologic, geomorphic, paleoenvironmental, and prehistoric overviews of the region are presented. Prehistoric landscape use in the study area is examined with regard to how prehistoric subsistence

and settlement systems can be reconstructed and compared with existing prehistoric land use models in the Northeast and New England.

25-1938 Wall, Robert D., R. Michael Stewart, Timothy R. Sara, Edward M. Morin, Martha H. Bowers, and Henry M. R. Holt

1994 A Preliminary Archaeological Survey and Cultural Resources Assessment of Quabbin Reservoir, Ware River, and Wachusett Reservoir Watersheds. 248 pages.

This report describes the archaeological survey of selected survey tracts within the Metropolitan District Commission's (MDC) Quabbin Reservoir, Ware River, and Wachusett Reservoir watershed lands. A locational predictive model for the occurrence of prehistoric sites in central Massachusetts was employed as a guideline for this study. The survey involved the examination of approximately 1,200 acres of MDC lands within the three watersheds. A total of 27 prehistoric sites were identified along reservoir shorelines and within survey tracts in the three watersheds during the course of the survey. While most of the sites may be defined as lithic scatters, further testing of these sites is expected to yield more substantial data regarding site function and age. Diagnostic material was recovered from only one of the identified sites; this site (Quabbin Prehistoric Site 17) consists of a Late Archaic or Early Woodland pond-edge encampment at Quabbin Reservoir. Overall results of the survey indicate prehistoric preference for stream edge, pond edge, and wetland settings. Remote upland wetlands areas were also found to have been significantly utilized. In contrast, at all three watersheds, upland reaches with little or no surface water settings contained no archaeological sites. Further archaeological investigations are recommended to refine the predictive prehistoric model developed for this study and to conduct more intensive, site-specific test excavations at selected sites. Recommendations for forest and reservoir management practices are offered to mitigate the effects of ground-disturbing operations on archaeological resources within MDC lands. A total of 24 historic period sites, including the Daniel Shays Farmstead, were investigated to assess their integrity in the face of impacts from logging, forest road construction, recreational activity, and vandalism. In addition to the Daniel Shays Farmstead, a mill complex, a tavern, a schoolhouse, and numerous 19th-century farmsteads were recorded.

25-1939 Binzen, Timothy and Margaret Kelly

2000 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Runway Relocation and Airport Beacon Tower and Fence Construction, Harriman and West Airport, North Adams and Williamstown, Massachusetts. 48 pages.

An archaeological survey was conducted at the Harriman and West Airport. Following background research and a surface reconnaissance, specific locations were tested for prehistoric and historic cultural resources. No previous archaeological testing had been conducted at the airport. Two survey units, each slightly greater than 1 acre in size, were recommended for archaeological investigation. Soils recorded in the project area consisted of plow zones. No prehistoric artifacts were recovered during the testing. The volume of historic artifacts recovered was low overall and was consistent with agricultural land use in the late 19th and 20th centuries. A total of 48 shovel test pits (40 x 40 cm) were excavated in the two survey units. Test pits were placed at intervals of 7.5 m (25 ft) in the proposed construction areas. Because of concerns that the proposed beacon tower might affect the viewsheds of historic structures near the airport, the likelihood of visual impact to be caused by the installation was assessed. No further survey is recommended for the proposed construction undertakings. The proposed beacon tower will not impact viewsheds.

25-1940 Waller, Joseph and Suzanne G. Cherau

2000 Intensive (Locational) Archaeological Survey and Cemetery Delineation Delano/Blankinship Cemetery Expansion Project. 88 pages.

The investigations of the 2 acre project area in Marion, Massachusetts, consisted of back-

ground/archival research, walkover/surface inspection, and hand and machine-assisted excavations. Background research focused on land evidence and cemetery commission records to obtain information relating to the establishment, configuration, and chain-of-ownership for the historic cemetery and surrounding lands. Cemetery delineation field investigations consisted of the excavation of four hand trenches, each measuring 0.5 m x 1 m, placed along the south and east sides of the cemetery stonewall enclosure. Additional machine stripping in the form of three parallel trenches was conducted along the east side of the cemetery stonewall; the area to the south of the cemetery had been subjected to previous severe ground disturbances associated with road maintenance activities. Intensive survey fieldwork consisted of the excavation of 12, 50 x 50 cm test pits at 8 m and 10 m intervals along three judgmental transects and as a single judgmental test pit. No cultural resources, including unmarked grave shafts, were identified. No further archaeological investigations were recommended.

25-1941 Donta, Christopher L. and N. A. Roberts

2000 Archaeological Intensive (Locational) Survey of the Northern Variation, Western Corridor, for the Proposed Massachusetts Municipal Wholesale Electric Company Natural Gas Pipeline, Ludlow, Massachusetts. 116 pages.

The project area consisted of a 9 km (5.6 mile) long by 22 m (75 ft) wide corridor running north from the Massachusetts Turnpike, north of the town center, and west to the Stonybrook Energy Center. Reconnaissance information from several previous surveys resulted in the recommendation of shovel testing in 14 different locations. Three unrecorded archaeological sites were found, consisting of the Clark-Forslund Historic site, two barn foundations and a standing 19th-century house; the Corey Historic site, a disturbed probable cellar hole of the 19th century; and the Camp White Prehistoric findspot, an isolated white quartz small-stemmed projectile point. None of the three sites was recommended for further study.

25-1942 Hautaniemi, Susan I. and Robert Paynter

1999 Archaeological Investigations, Final Report, Permit 1265, Moors Homelot, Deerfield, Massachusetts. 156 pages.

The research teams conducted subsurface archaeological investigations around and beneath the 1848 house on the Moors Homelot, owned by Historic Deerfield, Inc. Research was designed to explore land use issues in the yards immediately adjacent to the house and to field test remote sensing results. Features and soil strata related to the construction of the house and the homesite were the principal discoveries. In addition, features associated with the use of the house, mostly involving the disposal of wastewater, were also discovered. Documentary information on site residents can be linked to these archaeological features. As a result, the investigations yielded preliminary interpretations about house construction and class relations, and landscape use and gendered domestic work. The Moors home lot continues to be a fertile area for archeological research and is especially suited to the study of work and gender relations in this dynamic period of United States history. Investigations to date have centered on the house and yards. Exploration of the agricultural and social reproduction areas of the home lot remains to be done.

25-1943 Volmar, Michael

2000 Archaeological Excavations at the Willard-Atherton Site (HA-197) Fruitlands Museums Historic District, Harvard, Massachusetts. 99 pages.

The Willard-Atherton site (HA-197) is an 18th and 19th-century site identified during a 1998 survey (see Report #25-1848). Archaeological evidence confirmed that the site burned in the mid-19th century as evidenced by vast amounts of architectural debris with some domestic refuse. Data suggest at least two construction episodes at this house site. Three outbuildings were identified including a barn, a small workshop or shed, and another structure of unknown purpose. The site

provides important information on construction practices and spatial analysis of an 18th and 19th-century farm. The site has the potential to inform us about domestic life although primary refuse disposal locations identified to date did not contain significant quantities of these materials. More research is recommended to determine the nature of domestic life at this site.

25-1944 Dudek, Martin G. and Thomas R. Doyle

2000 Phase I Intensive Archaeological Survey for a Nextel Tower Complex in Mendon, MA. 27 pages.

The survey was conducted at an area known as the Nipmuck Trading Post, located on a terrace spur of Pond Hill. Due to the existence of an archaeological site on the north shore of Nipmuck Pond in close proximity to the proposed project site, it was considered likely that prehistoric archaeological resources were within the project area. The project area consisted of 653.6 sq m, with 349.7 sq m at the alternate tower location and 303.9 sq m for the access road. The intensive survey recovered six pieces of quartz chipping debris from four of 23 test pits (16 systematic, 6 bracket, and 1 judgmental). These pieces of debitage appeared to be isolated occurrences, as nearby test pits and bracketing test pits failed to identify a continuation of these distributions. The rocky terrace that formed the project area appeared to contain a low density and diffuse scatter of quartz debitage, which may be related to the use of the outcrop for short-term visits by Native Americans, possibly as a hunting station or hunting blind. No artifact concentrations were identified, nor were any temporally diagnostic artifacts recovered. Despite the presence of natural quartzite outcrops and quartz veins at the locale, the quality of these resources does not appear suitable for use in making stone tools. The site is not considered potentially significant because of its diffuse nature and minimal presence of cultural materials.

25-1945 Macpherson, Jennifer and Suzanne Cherau

2000 Archaeological Site Examinations The Area 1 Site and the Bergeron Site, Down Island Golf Club Project Area, Oak Bluffs Martha's Vineyard, Massachusetts. 136 pages.

A previous survey located archaeological materials in three distinct areas referred to as the Area 1 Site, the Bergeron Site and Native American Findspot 1 (see Report #25-1803). Site examinations were conducted at the Area 1 Site and the Bergeron Site. No further archaeological investigation of Native American Findspot 1 was necessary. Testing at the Bergeron Site determined that cultural materials cover a 522 sq m area, consisting of low to moderate densities of lithic chipping debris and stone tool artifacts. The recovery of a quartz Squibnocket Triangle projectile point and predominantly quartz chipping debris suggests a Late Archaic occupation. Further archaeological investigations were not recommended for the Bergeron Site. The Area 1 Site covers approximately 6 acres, and yielded over 4,000 pieces of cultural material within undisturbed soil horizons. Lithic deposits indicated Late Archaic to Late Woodland Period occupation, based on both diagnostic artifacts and radiocarbon-dated wood charcoal. Artifact types indicate the site was used for stone tool production and maintenance, and the presence of cultural features and pottery suggests some degree of food processing, storage, and/or disposal. The Area 1 Site is considered eligible for listing on the National Register of Historic Places under Criteria A and D. Avoidance of these sites is recommended if possible; if not, mitigation measures will be warranted.

25-1946 Donohue, Barbara and Tom Doyle

2000 Reconnaissance Survey for the Framingham Common, Framingham, Massachusetts. 54 pages.

The town's South Common is recorded in the MHC's Inventory of Historic and Archaeological Assets of the Commonwealth as 19-MD-359, as it may contain burials associated with the Nip-

muck Native American community. Previous archaeological investigation of the Common (see Report #25-222) included an intensive survey in limited areas prior to landscaping activities. That survey concluded that tested areas were considerably disturbed to a depth of 2 to 3 ft (61—91 cm). To predict the locations where significant resources might exist and to determine the limits of previous disturbance, documentary research and a systematic soil probe survey were conducted. Soil probes were planned to reach the depth of planned restoration activities (91 cm) in this 30 by 75 m parcel. Documentary research revealed considerable landscape activity from the 19th through 20th centuries. Of the 99 soil probes, placed at 3 m intervals along six transects, only 13% reached 91 cm because of compacted soils. As the survey produced inconclusive results, further investigation is warranted.

25-1947 Donta, Christopher L., Timothy L. Binzen, and Margaret Kelly

2000 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Well #4 Greensand Filtration Facility, Brewster, Massachusetts. 63 pages.

Background research, an archaeological site reconnaissance, and an intensive survey were conducted on a 1 acre parcel of land near Upper Millpond. The property lies 250 m southeast of the previously recorded Run Hill Road site (19-BN-592), which contained a large lithic scatter and one intact hearth. Subsurface testing for the present project totaled 10 shovel test pits, yielding a single prehistoric artifact (a rhyolite flake), which is interpreted as an isolated outlier from the larger site. No significant prehistoric or historical archaeological deposits or features were encountered. No additional survey is recommended.

25-1948 Mohler, Paul J., John W. Kelley, and Stephen A. Mrozowski

2000 Archaeological Investigations at the Orchard House, Concord, Massachusetts. 87 pages.

The Orchard House was built by the Hoar Family in the late 17th to early 18th-century, while also maintaining an additional tenant house to the rear. The property was purchased in 1857 by A. Bronson Alcott, a leader of the Transcendentalist movement, and served as the setting for Louisa May Alcott's novel *Little Women*. The house is listed on the National and State Registers of Historic Places because of its connection with the Transcendentalist movement and its value as an example of Colonial architecture. With no prior surveys conducted in the project area, a Phase I site survey of the property surrounding the Orchard House, approximately 50 sq m, provided significant information about the site's land use history. The property retained excellent evidence of historic landscaping conducted by A. Bronson Alcott in the mid 19th-century. Based on documentary research and subsurface testing, archaeologists were able to link the intellectual history of a family like the Alcotts with the landscapes they created. A total of 90 test units, each 50 sq cm in size along a 5 m staggered grid interval, revealed various historical archaeological landscape features dating to the Alcott occupation, which will aid in the planning of developmental projects associated with an interpretive program. Based on the results of the Phase I survey, additional investigations are warranted in specific areas if future plans involved subsurface disturbance.

25-1949 Dalton, Ronald and Deena Duranleau

2000 Final Report of An Intensive (Locational) Survey for the Improvements at Great Brook Farm State Park, Carlisle, Massachusetts. 41 pages.

The survey consisted of documentary research, background research, a walkover, and subsurface testing. Background research included a review of relevant data and previous archaeological surveys related to this project. A walkover was conducted in order to stratify the project area into varying zones of archaeological potential and to identify any areas of previous disturbance. Sub-

surface testing was conducted in areas that were determined to have high archaeological potential. In all, 61 historic and modern artifacts, as well as one rhyolite flake were recovered. No further archaeological investigations are recommended.

25-1950 Wheeler, Kathleen

2000 Results of the Archaeological Site Examination at Nancy Circle, Canton, Massachusetts. 21 pages.

This area abuts the west side of a known Native American burial site, the Burr Lane Cemetery (CAN-HA-3). The cemetery has been investigated three times since its inadvertent discovery in the late 1960s (see Report #25-1854). A preservation restriction is in place on the known dimensions of the cemetery, but the complete and full limits of the burying yard have not been established. The archaeological site examination verified that no unmarked graves were within areas of potential effect from the construction of the house, garage, and driveway. Historic deed analysis suggests that the existing stone wall marking the boundary between this parcel and the burying yard has a long-standing record of dividing two distinct parcels and may have served to delineate the west edge of the cemetery. Time and funding constraints did not allow the complete excavation of the entire site, but the site examination did indicate that construction of the new house would not affect unmarked graves.

25-1951 Fragola, Patricia and Donna Ingham

2000 Intensive (Locational) Archaeological Survey Massachusetts Military Reservation Regional Water Supply Project, Cape Cod, Massachusetts. 63 pages.

Proposed project impacts consist of the construction of test wells, along with associated temporary access roads and observation wells. In addition to the wells and access roads, water pipelines and interconnects to existing water supply systems will be constructed. Three proposed well locations (2, 3, and 4), associated temporary access roads and observation wells, as well as proposed water pipelines along Barlow and Knot Hollow roads, are located in areas ranked as having high to moderate archaeological sensitivity. A total of 139 test pits were excavated. No cultural material was recovered at any of the locations. No additional archaeological investigations are recommended.

25-1952 Pinello, Martha E. and Carolyn White

2000 An Archaeological Site Examination for the Historic Plant Nursery at The Vale, the Lyman Estate, Waltham, Massachusetts. 76 pages.

In 1999, the Historic Plant Nursery Project area at The Vale was the subject of an archaeological site examination. The impacted area was formerly a cutting and greens garden bordered by pathways and boxwood hedge. These gardens were part of an English style estate garden system at The Vale, originally configured by Theodore Lyman (1753—1839), a wealthy merchant and horticulture patron. Excavations revealed the dimensions of the cutting garden depicted on the 1936 Historic Architecture Building Survey map. A path that encircled the cutting garden and the materials used in successive phases of the paths were identified. Excavations also distinguished the nature of the garden interior deposits: heavily-tilled modern garden soils. A modern planting hole and a posthole and postmold were identified. The builder’s trench for the Camellia Greenhouse and a large drainage system were identified. The plans for the Historic Plant Nursery took the archaeological potential into account so that only the modern garden soils would be impacted by the vertical excavations. The nursery was designed to take advantage of the historical configuration of the garden and to make use of the historical boundaries.

25-1953 Hoffman, Curtiss

1999 Howe Street Regional Water Treatment Facility Locational Archaeological Survey. 122 pages.

This report describes an archaeological intensive (locational) survey on the premises of the proposed Howe Street Regional Water Treatment Facility in Ashland and Hopkinton, Massachusetts. Sixty 50 cm x 50 cm test units were excavated to investigate three loci: Howe 1, the area of a new chemical building on the north side of Howe Street; Howe 2, the area of two proposed lagoons on the south side of Howe Street; and Howe 3, the location of two new well sites on the north side of Howe Street. In addition to the excavation and analysis of cultural materials, the report contains a description of the history of ownership of the property, as well as ancillary analyses. Howe 1 and 2 were found to have been subjected to significant historic-period disturbances. Recoveries of pre-European and historic cultural material are for the most part in disturbed context. No further work was recommended. Howe Street 2 was relatively undisturbed, apparently unplowed, and cultural materials from this locus were restricted to the pre-European period. They included non-diagnostic stone artifacts, flakes, quartz shatter, charcoal, fire-burnt rock, and possible sub-surface features.

25-1954 Rainey, Mary Lynne

2000 Intensive (Locational) Archaeological Survey, South Shore Links Golf Course Project Area, Nantucket, Massachusetts. 54 pages.

The investigated parcel is situated east of the Nantucket Airport along Madequecham Valley in the central outwash plains region. Background research and a walkover survey concluded that most of the project area was archaeologically sensitive for prehistoric or historic period Native American sites. A Late/Transitional Archaic period, stemmed projectile point was found on a jeep trail leading to the project area. During the intensive survey fieldwork 114, 50 x 50 cm test pits were completed within the high sensitivity area (estimated 50 acres) and 78 test pits were completed within the moderate sensitivity area (estimated 79 acres). Sampling strategies included 30 x 30 m blocks (min. 10.2 m interval) and transects (10 m interval). The survey resulted in the recovery of one small piece of unidentified, calcined mammal bone. Evidence to support cultural origins for this item was not discovered, and no further work is recommended.

25-1955 Mohler, Paul J.

2000 Archaeological Investigations at Nathan Tufts Park, Somerville, Massachusetts. 55 pages.

The Phase I reconnaissance survey of 65,000 sq ft around the Old Powder House was directly linked to planned renovations to both the structure and the surrounding grounds. Nathan Tufts Park derives its primary significance from the Old Mill/Old Powder House. Based on documentary research, the structure was built as a mill between 1704 and 1720. Twenty-five, 50 x 50 cm shovel test pits were positioned along a staggered, 5 m grid system around the Old Powder House. One hundred thirty-six augur borings were positioned along a staggered 10 m grid system in order to examine the rest of the Park. Based on subsurface testing, the property surrounding the Old Powder House appears to possess high historical significance. Given the extensive degree of landscaping across the Park, however, much of the archaeological record has been destroyed. The archaeological investigation provided a glimpse of the property's land use history since the late 19th century. In addition to the Old Powder House itself, the Park has retained evidence of the historic landscaping conducted by James H. Bowditch in 1892, increasing our knowledge of park construction and design during the Progressive Period.

25-1956 Rainey, Mary Lynne and Alan Leveillee

2000 Archaeological Site Examination Dunn Hollow Prehistoric Site, Wrentham Municipal Well Project Area, Lake Pearl, Wrentham, Massachusetts. 75 pages.

A site examination was conducted at the Dunn Hollow Site, which was identified during a previ-

ous survey on a small peninsula on the southwest shore of Lake Pearl (see Report #25-1878). The site examination involved excavation of 63, 50 x 50 cm test pits on a 5 m grid, and four, 1 x 1 m excavation units. The Dunn Hollow Site has been interpreted as a multi-component encampment used for brief periods of time during the Middle and Late Archaic periods and the Middle Woodland Period. Recovered chipping debris, projectile point fragments, edge tools, and several spokeshave-like implements reflect a range of potential site activities. Charcoal from a suspected living surface was dated to the Middle Woodland Period at 1620 ± 40 B.P. (Beta 139265); cal B.P. 1585 to 1410. Due to the low density of features and artifacts, absence of important data classes (faunal, floral), and redundancy of information, the site was not considered eligible for listing on the National Register of Historic Places.

25-1957 Herbster, Holly and Suzanne G. Cherau

2000 Archaeological Reconnaissance Survey, Town of Edgartown, Martha's Vineyard, Massachusetts. 296 pages.

This town-wide, reconnaissance-level survey was designed to produce a database and comprehensive inventory of known and potential archaeological resources within Edgartown, to be used by local and regional review organizations involved in planning, permitting, and preservation issues. The survey included background research, informant interviews, and drive-over fieldwork and resulted in the identification 23 previously unrecorded archaeological sites, and a determination that the town possesses a generally high sensitivity for additional cultural resources to be present. Data gathered during the survey was used to produce prehistoric and historic archaeological sensitivity maps of the entire town, a user's guide for the maps, a written summary report, and suggested bylaws and management recommendations.

25-1958 Strauss, Alan E.

2000 Intensive Archaeological Survey of Lot 18 John Wings Lane in Brewster, Massachusetts. 21 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area. Field investigations for the project included a surface inspection, followed by the excavation of 25 shovel test pits. No cultural resources were recovered from the project area. No further archaeological investigations are recommended for the project.

25-1959 Duranleau, Deena and Leith Smith

2000 Report of an Intensive (Locational) Archaeological Survey for the Westminster Elementary School, Westminster, Massachusetts. 44 pages.

Thirty-four test pits were excavated in the 78 x 40 m Merriam House parcel, the location of the proposed parking lot. Ten test pits were excavated in the Upton School yard, which measures approximately 50 x 50 m and will be undergoing landscaping modifications. Historic cultural material, some of which dates to the middle of the 19th century, was recovered from 36 of the 42 total test pits. One quartzite flake was identified, but four, bracket test pits were excavated around this test pit, and no further prehistoric cultural material was recovered. Since the two project areas have undergone extensive land modifications already, no further archaeological investigations are recommended for the two locations.

25-1960 Atwood, Kathleen A.

2000 Final Historic Properties Management Plan Colebrook Lake, Colebrook, Connecticut and Sandisfield and Tolland, Massachusetts. 290 pages.

The purpose of the Historic Properties Management Plan (HPMP) is to provide a comprehensive

program to direct the historic preservation activities and objectives at the Colebrook Lake Flood Control Project and to effectively manage and protect each historic property. The HPMP provides a project description, historic contexts, results of archaeological investigations, and a landuse guide. An Action Plan outlines specific tasks, procedures, and priorities that must be accomplished to satisfy Section 110 requirements. To date the follow tasks have been accomplished: an archaeological reconnaissance survey, background research, a walkover, and limited subsurface testing identified 129 historic period sites within the project area. The majority of the identified sites were located on flowage easement. A site visit made by the NAE Archaeologist during preparation of this HPMP determined that three of the five historic sites will require additional investigations or evaluation to determine eligibility for the National Register of Historic Places. In addition, several areas previously identified in the 1980 survey as possessing prehistoric archaeological sensitivity were subjected to a walkover to reassess the likelihood of the presence of prehistoric sites. The HPMP provides recommendations for further inventory of these archaeologically sensitive areas, and evaluation of the three identified sites. In order to accomplish the objectives set forth in ER 1130-2-540, a four step Action Plan is recommended.

25-1961 Strauss, Alan E.

2000 Intensive Archaeological Survey of the Rebecca Estates Development in Middleborough, Massachusetts. 23 pages.

Background research on the project area indicated that 110 prehistoric or historical sites were recorded within the project area. Field investigations for the project included a field reconnaissance, followed by the excavation of 75 shovel test pits. The field reconnaissance identified several wood—frame structures from a mink farm that existed in the project area in the 1970s and 1980s. No historical buildings or structures were found in the project area. No prehistoric artifacts were found on the property during the shovel testing. No further archaeological work is recommended.

25-1962 Waller, Joseph N., James C. Garman, Paul Russo, and Alan Leveillee

2000 Intensive (Locational) Archaeological Survey, Proposed Center School, Winthrop, Massachusetts. 96 pages.

Preliminary background research indicated that the project area is located within the Contact Period Mystic core area of Native American occupation. The greater project area appears to be part of a large Contact Period burial complex dispersed across neighboring blocks. The initial subsurface testing strategy was designed to identify 17th-century burials and other features through close interval testing. A total of 40, 50 x 50 cm test pits were excavated. In many cases, the presence of deep, highly compact fill inhibited the identification of intact land surfaces, which might be sealed by the fill. Additional testing was necessary to determine whether unmarked human burials survive in the project area. Additional machine-assisted testing indicated that it was a variably impacted landscape. Topsoils across the majority of the proposed construction area were removed and fill was deposited concurrent with late 19th and early 20th-century building and landscaping episodes. Data resulting from a machine trench, MT-9, in the north parking lot of the existing Willis School indicated that one section of original topsoil, measuring approximately 50 ft x 90 ft, remains beneath 8—36 inches of pavement and fill. The discovery of a shell pocket and hearth feature (radiocarbon dated to 243O±8 BP) within the trench indicated that additional prehistoric features could exist in meaningful contexts in this small remnant of ancient landscape. Preservation in place of the remnant topsoil zone is recommended.

25-1963 Leveillee, Alan

2000 Intensive (Locational) Archaeological Survey, Rochester Municipal Building Project Area. 44 pages.

A survey of the 9 acre parcel resulted in the stratification of the parcel into projected zones of ar-

chaeological sensitivity; 6 acres were disturbed and assessed as being low sensitivity, and 3 acres were assessed as moderately sensitive. The excavation of 39, 50 cm x 50 cm test pits resulted in the recovery of low densities of 19th and 20th-century ceramic, glass, and metal fragments from a well-defined plowzone context. Additionally, a rhyolite Brewerton-eared projectile point and 10 pieces of chipping debris (6 rhyolite, 4 quartz) were recovered from the plowzone context. The Native American cultural material is likely an element of the reported/recorded site (19-PL-227). The greater project area has been landscaped and it is considered unlikely that archaeological materials within meaningful stratigraphic contexts remain. No further investigations were recommended.

25-1964 Pasquariello, Raymond D., Susan G. Chereau, and Kerrylynn Boire

2000 Archaeological Reconnaissance Survey, Charles River Natural Valley Storage, Bellingham, Dedham, Dover, Franklin, Holliston, Medfield, Medway, Millis, Natick, Needham, Newton, Norfolk, Sherborn, Walpole, Wrentham, and West Roxbury, Massachusetts. 271 pages.

An archaeological reconnaissance survey of the Charles River Natural Valley Storage (CRNVS) Project in Middlesex, Norfolk, and Suffolk Counties was conducted. The survey consisted of archival research and limited field investigations to identify site locations and predict site types and densities. The field investigations were only undertaken for the fee-owned lands, encompassing approximately 3,210 acres (640 acres of upland; 2,570 acres of wetlands). The approximately 4,891 acres held in restrictive flowage easement were subjected to archival research and a sensitivity assessment based on the fieldwork conducted in fee-owned lands. The research identified 33 recorded prehistoric sites within and immediately adjacent to the property. Archival research also determined that there are 12 potential historic sites on NAE property, based on town histories and historical maps. The limited field investigations included the excavation of 206, 50 x 50 cm test pits placed at 10 m intervals along judgmental transects, as judgmental test pits (JTPs), and as test pit arrays. This testing resulted in the location and identification of four prehistoric sites. No documented historic sites could be verified on fee-owned lands. The archaeological sensitivity of the CRNVS Project lands was determined based on the results of the reconnaissance survey and refined project-specific predictive models. A total of 1,321 acres within fee-owned land and 1,262 acres on flowage easement property are assessed as having moderate and high potential to contain additional prehistoric resources. A total of 420 acres within fee-owned land and 389 acres of flowage easement property are assessed as having moderate and high potential to contain historic resources.

25-1965 Ingham, Donna and Alan Leveilee

2000 Intensive (Locational) Archaeological Survey, Jerusalem Road Estates, Cohasset, Massachusetts. 89 pages.

A survey of a 45 acre subdivision in northern Cohasset was conducted. The rocky, undulating project area was stratified into zones of variable archaeological sensitivity, with subsurface testing concentrated in representative sample areas considered likely to have supported small, short-term prehistoric campsites and in the vicinity of historic-period structural remains. A total of 86 shovel test pits was excavated across the greater project area. Single pieces of chipping debris, one quartz and one rhyolite, were recovered from isolated test pits. Additional testing in proximity to these debitage find spots failed to recover additional materials. A small historic period complex of domestic and utilitarian structures was identified and investigated. They are the remains of an ancillary caretaker's residence associated with the nearby George E. Curtis estate, the main buildings of which are located at 600 Jerusalem Road, outside of the investigated project area. The low densities of prehistoric cultural material and the remains of the caretaker's residence were not considered potentially significant cultural resources. No further archaeological investigations were recommended.

25-1966 Donohue, Barbara, Martin Dudek, and Leith Smith

2000 Site Examination of Historic Site No. 1 in The Planned South Street Development in Hopkinton, Massachusetts. 111 pages.

An intensive survey for the project area determined that a historic foundation (HF-1) that belonged to David Littlefield in the 19th century had the potential to provide information about the early land use of the area and that, if the site could not be avoided, a site examination should be conducted. The current survey included documentary research and field testing. Forty-seven systematic and judgmental test pits (0.5 x 0.5 m) and six excavation units (five 1 x 1 m and one 0.5 x 1 m) were excavated. As a result of the survey, the remains of three separate structures—a dwelling, an outbuilding and a barn—were documented, as well as a stone-lined well and two terraces associated with two of the structures. A single, small pit feature used for refuse disposal was also revealed. Over 99% of the recovered materials consisted of domestic and architectural materials dating from the later 18th to the third quarter of the 19th century. The results of the intensive survey and site examination indicate that the Littlefield Farm Site has the potential to contribute information important to our understanding of rural farmsteads after the Revolution (1780—1860) in Hopkinton, and specifically to answer research questions about the transformation of farming into a market-driven, capitalist economy.

25-1967 Donohue, Barbara and Leith Smith

2000 Intensive Survey Report for Contracts 31A and 31B Waste Water Project, Billerica, Massachusetts. 73 pages.

This survey consisted of documentary research, a field walkover and the excavation of 72 systematic test pits at 10 m intervals. Two test pits (TP 4-7a and 4-10) revealed prehistoric materials. Bracket test pits placed around 4-7a suggested 4-7a was a find spot while brackets placed around 4-10 revealed a hearth with more prehistoric materials around it. A site examination around 4-10 is recommended.

25-1968 Macpherson, Jennifer, Deborah C. Cox, and William Brett

2000 Intensive (Locational) Survey, Algonquin Gas Transmission Company, Fore River Project, FERC Docket #CP00-34-000, Canton, Randolph, Braintree, and Weymouth, Massachusetts, and Archaeological Site Examination, Broad Meadow Pine Site, Fore River Project, Randolph, Massachusetts. 117 pages.

Intensive survey investigations were conducted in eight of the nine tracts originally identified for subsurface testing. The survey resulted in the identification of one previously unknown prehistoric Native American site (the Broad Meadow Pine Site), as well as scattered historic/modern-period cultural material most likely deposited as field trash by past landowners/occupants. Subsurface testing consisted of 68, 50 cm x 50 cm test pits excavated within areas of high and moderate archaeological sensitivity. A total of 123 pieces of prehistoric and historic cultural material was recovered from 21 of the excavated test pits. Following a review of the intensive survey results, an archaeological site examination was conducted at the Broad Meadow Pine Site. The site examination resulted in the excavation of 27, 50 x 50 cm test pits and four, 1 x 1 m excavation units within the Broad Meadow Pine Site area. A total of 88 cultural items were recovered including 59 pieces of lithic chipping debris (primarily Blue Hills Rhyolite, but also quartz, quartzite, and argillite) and one quartz tool fragment (utilized flake, or scraper). Twenty-six historic items, including one 1906 U.S. quarter, were also recovered. Because of a lack of radiocarbon-datable contexts, diagnostic artifacts, and the low potential for finding such contexts based on the level of subsurface testing conducted to date, it does not appear that the site has the potential to yield significant new classes of data. No further archaeological investigation of this site area is recommended.

25-1969 Cherau, Suzanne G. and Kerrylynn Boire

2000 Intensive Archaeological Survey, Existing Recreation and Campground Areas, Tully Lake, Royalston, Massachusetts. 141 pages.

The survey identified archaeological sites within the established recreation area adjacent to the dam (approximately 10 acres) and an area within the Tully Lake campground (approximately 2-3 acres). The current investigations included boundary determinations of all identified sites and a preliminary determination of site integrity and eligibility to the National Register of Historic Places. One prehistoric and two historic sites were identified within the project areas. The prehistoric Short Site yielded chipping debris, chipped stone tools, and a possible feature. It encompasses approximately 1,872 sq m in the campground area. The site possesses good physical integrity and could be eligible to the National Register. The historic E.W. Dexter Farmstead (HS I) site is a 19th-century farmstead that contains the remains of a barn and silo foundation along with a low-density artifact assemblage. It is located in the existing recreation area north of the dam. The intact portion of the site encompasses approximately 360 sq m. The site possesses poor physical integrity and low research value and is not considered National Register eligible. The historic J.W. Bosworth Farmstead (HS 8) site is a 19th-century farmstead that contains the remains of a dwelling and associated artifact assemblage with household trash midden. The site is located in the campground area west of Tully Lake and east of a dirt path. It encompasses approximately 1,520 sq m. The site possesses a very good physical integrity, high research value, and could be eligible to the National Register.

25-1970 Mair, A. Peter, II

2000 Reconnaissance Archaeological Survey and Historic Structure Assessment, Barnstable Municipal Airport, Barnstable, Massachusetts. 56 pages.

These surveys were designed to identify historic structures within the project area in Barnstable and Yarmouth, MA that are 50 years or older and potentially significant, and to identify areas of low, moderate, and high archaeological sensitivity that may be impacted by the proposed improvements to the airport. Background research and field investigations identified an area of high archaeological sensitivity north of the airport that is recommended for an intensive (locational) archaeological survey if proposed improvements impact this area. Twenty-one standing structures slated for removal or relocation were photographed and field assessed. The majority of buildings represent late 20th-century commercial development of the area. The older buildings (residences) have been modified and converted to businesses or have not been maintained. None of the structures are considered architecturally or historically significant, and no further work was recommended.

25-1971 Leveillee, Alan

2000 Intensive (Locational) Archaeological Survey, Indian Meadows Wells Project Area, Westborough, Massachusetts. 74 pages.

Seventy one test pits were excavated along six transects and in three arrays. A total of 102 pieces of Native American cultural material was recovered, concentrated in the westernmost extent of the project area, in and surrounding a potential pump station construction site. This site is designated Forbes Knoll. Low densities of late 19th and 20th-century cultural materials were also recovered intermittently along the proposed water line easement from within plowzone and topsoil stratigraphic contexts. The Forbes Knoll site yielded moderate densities of chipping debris of quartzite, quartz, and rhyolite, and several bifacially flaked quartzite tool fragments. Inspection of graveled areas bordering the site resulted in the recovery of a quartzite chopper and a full-grooved axe from exposed topsoils. The Forbes Knoll Site is a potentially significant cultural resource that has been considered in planning the proposed water supply well and pipeline. Following this fieldwork, the location of the proposed pump station and water line construction route were reconsidered. It was recommended that if the final construction design is altered and the site is threatened, further investigations would be warranted.

25-1972 Ingham, Donna and Duncan Ritchie

2000 Intensive (Locational) Archaeological Survey of East Grove Street Parcel 11A, Middleborough, Massachusetts. 58 pages.

This small, 1.2 acre project area is located along East Grove Street (Route 28). Background research included a review of previous archaeological investigations by both professional and avocational archaeologists within the Taunton/Nemasket River drainages. The project area is within a section of the Nemasket drainage containing numerous prehistoric sites of varying size and complexity. A walkover inspection was used to delineate zones of archaeological sensitivity and to assess previous disturbance within the project area. Sources of previous disturbance within the project area included a small area of sand/gravel pitting. Intact portions of the project area were considered to have high sensitivity for Native American cultural resources. All of the project area was considered to have low sensitivity for historic/modern period cultural resources. A total of 25 test pits (50 x 50 cm) were excavated. A small amount of Native American cultural material, four pieces of quartz chipping debris, was found in one section of the project area. The Parcel 11A Site appears to be a small, low-density deposit of chipping debris formed during a single brief occupation or stone-tool making event. The temporal/cultural affiliation of this site is unknown, and it is not considered to be a potentially significant cultural resource. No further archaeological investigation is recommended.

25-1973 Waller, Joseph N. and A. Peter Mair

2000 Intensive (Locational) Archaeological Survey of the Continuum Care Park, Easton, Massachusetts. 68 pages.

The survey of this 26 acre parcel consisted of background research and field investigations. Subsurface investigations consisted of the excavation of 54, 50 cm x 50 cm test pits in areas assigned moderate and high archaeological sensitivity. Subsurface investigations of Lot 2 produced low densities of historic period cultural materials in a disturbed context. Subsurface investigation of Plot 23 resulted in the identification of the Morse Pond Site. Artifacts recovered from the site included quartz, argillite, and rhyolite chipping debris, biface fragments, and a quartz Squibnocket triangle projectile point diagnostic of the Late Archaic Period of regional prehistory. Artifact types recovered from the site suggest a range of activities. Although no features were identified, the density and the distribution of the materials in conjunction with the soil types represented at the site suggests that the site has a high potential to contain intact cultural features. Avoidance of the site is recommended.

25-1974 Wheeler, Kathleen

2000 Findings from 1999 Site Examination and Data Recovery, Dwight-Derby House, Medfield. 62 pages.

Follow-up fieldwork at the Dwight Derby House was conducted in 1999 to mitigate effects of foundation repair including a site examination in the northwest yard where no previous testing had taken place and a data recovery in the east yard where 1998 field results indicated that late-18th- and early-19th-century deposits were immediately beneath the 1998 ground surface (see report #25-1812). The northwest yard was found to have poor integrity in the three test units because of various pipelines and trenches crisscrossing the area tested. Now that the pipelines and trenches have been located, future archaeological investigation can be conducted around them where stratigraphic profiles showed distinct layers. In the east yard, early deposits from the first quarter of the 19th century are buried 10—20 cm below the present ground surface. The early 19th-century fill layer lies above the stone footings of an outbuilding that was apparently attached to the southeast corner of the house. The footings of the outbuilding are ephemeral and represented by a series of large flat stones on which were laid the sills and frame of the building. Archaeologists discovered

a round pit feature cutting into the subsoil beneath the historic occupation levels. No artifacts were retrieved from the pit, and it was backfilled with a very dark brown-black organic soil. A complete Merrimack point was retrieved about 20 cm away from the pit. The pit's function remains unclear.

25-1975 Mohler, Paul J., John W. Kelley, and Katherine Howlett

2000 Archaeological Investigations at the Loring-Greenough House, Jamaica Plain, Massachusetts. 143 pages.

Built in 1760 by British Commodore Joshua Loring, The Loring-Greenough House is a Massachusetts Historic Landmark because of its connections with the American Revolution and its value as an example of Colonial architecture. The mansion with adjoining carriage house and gardens is the last of the country estates in Jamaica Plain. A total of 14 0.50 sq m shovel test pits and 11 excavation units, 0.50 m by 1.0 m, were completed. Combining documentary research with the results of the subsurface testing revealed cultural material relating to the 18th or 19th-century occupations of the property. An extensive 18th-century trash pit was located in Excavation Units 3, 9, and 10 under the southeast corner of the Carriage House, while 19th-century porch footings were located along the west facade. Evidence of a late 17th to early 18th-century occupation was discovered, including examples of German Rhenish Stoneware and English Staffordshire, therefore, the property surrounding the Loring-Greenough House appears to possess high historic archaeological integrity.

25-1976 Donta, Christopher L., Timothy Binzen, and Margaret Kelly

2000 Archaeological Intensive (Locational) Survey for the Proposed State Police Driver Training Track, New Braintree and North Brookfield, Massachusetts. 93 pages.

Background research and subsurface testing was conducted for a proposed Police Driver Training Track on a 136 acre parcel in New Braintree and a very small portion of North Brookfield. Documents indicated the presence of a possible rockshelter, four known prehistoric sites, and one area of high historic potential adjacent to an early 19th-century road. Two hundred and one shovel test pits were excavated in clusters of 7.5 m intervals, in three survey units. The rockshelter was located and found to contain a partially intact Middle Archaic component. Two other locations of prehistoric activity were also found in the vicinity of previously recorded sites. Two historic house sites were found, containing intact features and artifact scatters of the late 18th and early 19th centuries. It is recommended that the rockshelter and two historic house sites be avoided by any construction; they are potentially eligible for the National Register. The remaining two prehistoric sites are not considered significant.

25-1977 Macpherson, Jennifer and Alan Leveillee

2000 Site Examination of the Longshadow and Adams/Ray Farmstead Sites within the Hill Property Project Area, Bellingham, Massachusetts. 109 pages.

One hundred eighty, 50 x 50-cm test pits, and 14, 1 x 1 m excavation units were excavated across the abutting prehistoric and historic sites. Site examination fieldwork resulted in the identification of four structures and associated artifact assemblages related to the occupation of the historic Adams/Ray Farmstead Site (see report #25-1899). The site consists primarily of a farmstead with evidence of early 18th through late 19th-century domestic and agriculture-related activities. Visible architectural components include a deep, fieldstone foundation with an ell extending off the north wall (Structure 1) and a large, two-tiered foundation (Structure 2) north of Structure 1. Structure 3, possibly a barn or shed, was located between Structures 1 and 2. It has, however, been demolished and currently consists of a wide pile of large boulders. Subsurface testing identified a fourth structure of unknown function approximately 30 m west of the house foundation. Two wells were identified. The physical integrity of archaeological deposits at the Adams/Ray Farmstead is good to excellent and combined with a high research value, contributes to the site's significance under Cri-

teria A and D of the National Register of Historic Places. The combined presence of domestic and agriculture-based resources at one site, as well as the recovery of three late 17th to early 18th-century British copper coins, suggests that this site may be one of the earliest Euro-American resources in Bellingham. Preservation of the core area of the Adams/Ray Farmstead Site is feasible, and it will not be impacted during planned construction. The prehistoric Longshadow Site represents multiple occupations through the Middle to Late Archaic and Woodland periods. Prehistoric peoples were engaged in resource procurement activities and maintaining their lithic tool kits as they camped along the headwaters of the area's major transportation route. Related sites likely exist in high numbers along the Charles's network of feeder streams and wetlands. Lithic scatters reflecting middle-range tool manufacture and maintenance dominate the Longshadow components. They contribute to the database by providing locational and spatial information and correlates, range of raw material types, limited numbers of temporally diagnostic tools, and occasional features. There are no data for floral and faunal target resources from the Longshadow Site, and intact features are lacking. It is not considered likely that further research on the site will expand on analyses conducted to date. The Longshadow Site was not considered significant in terms of National Register eligibility.

25-1978 Milne, Claudia and Duncan Ritchie

2000 Intensive Archaeological Survey of the Country Club of Massachusetts, Sturbridge, Massachusetts. 122 pages.

Background research, interviews with informants, and a walkover inspection were used to stratify the approximately 300 acre project area into zones of expected archaeological sensitivity. A number of zones with high and moderate archaeological sensitivity were delineated within the project area. The zones of high sensitivity included 14 suspected rock shelter sites and a historic period farmstead (Benson Farmstead, STU-HA-35) previously identified by avocational archaeologists. The locations of the suspected rockshelters and the Benson Farmstead were confirmed during an initial walkover inspection of the project area completed in December 1998. Two new potential rock shelters were identified during the walkover. The zones of high and moderate archaeological sensitivity were sampled with 30 x 30 blocks containing 13, 50 x 50 cm test pits and judgmentally placed test pit transects. The suspected rock shelter sites and the Benson Farmstead were investigated with judgmental test pits. Subsurface testing within the zones of high and moderate sensitivity identified five previously unknown prehistoric sites within the project area. The Forest Lane Rockshelter in the southern end of the project area was found to contain prehistoric cultural material including ceramic sherds, a projectile point, and chipping debris, which indicated a Late Woodland period occupation about 1000 to 500 years ago. The Mountain Road Site contained pieces of chert chipping debris and two hearth/firepit features with fragments of calcined bone. The Hazel Hollow Site was a small find spot with pieces of rhyolite and chert chipping debris. Country Club of Massachusetts Locus 1 was an isolated find spot of a single piece of rhyolite chipping debris. Country Club of Massachusetts Locus 2 was the only previously reported rock shelter (MAS #2B) that yielded prehistoric cultural material: a single piece of quartz chipping debris. Four historic/modern period cultural resources were identified in the project area. The Benson Farmstead Site (STU-HA-35) with fieldstone foundations for a house and barn and stone walls is in the northwestern quadrant of the project area. Test pits excavated in the yard area surrounding the two foundations yielded ceramic sherds, bottle glass, and structural materials dating from the mid 19th century. Other historic period cultural resources in the project area include an intact section of Walker Mountain Road, an early 19th-century roadway bordered on both sides by stonewalls. A fieldstone bridge abutment was found where an abandoned cart path crosses the outlet of an existing pond in the project area. A modern period bottle and can dump was also found in the northeastern portion of the project area near Walker Mountain Road. The Forest Lane Rock Shelter, Mountain Road, and Benson Farmstead sites were considered to be potentially significant cultural resources. Current plans for the proposed Country Club of Massachusetts development will impact the Mountain Road and Benson Farmstead Sites. If avoidance of these sites through redesign is not possible, additional archaeological investigation is recommended for the Mountain Road and Benson Farmstead Sites. It is recommended that the Forest Lane Rock Shelter be preserved in

place and avoided. The section of Walker Mountain Road in the project area will be incorporated into the design of the proposed golf course. During construction it will be used to provide access to portions of the project area. It is recommended that Walker Mountain Road and the stonewalls bordering it be preserved. The historic bridge abutment at the outlet of the existing pond should also be preserved in place. This historic feature is within a buffer zone along the perennial stream draining from the pond. It is recommended that the historic bridge abutment be preserved in place.

25-1979 Ritchie, Duncan and Patricia Fragola

2000 Intensive Archaeological Survey, Southbridge, Industrial Park, Southbridge, Massachusetts. 124 pages.

An archaeological survey of the 402 acre Southbridge Industrial Park project investigated four historic period cultural resources and several zones of high and moderate archaeological sensitivity identified during a reconnaissance survey (see Report #25-1895). Survey tasks included additional background research, walkover survey, and hand and machine-assisted subsurface testing. The Jedidiah Marcy Homestead yielded modern structural materials; the Nathaniel McKinstry Homestead revealed an intact structural feature of local fieldstone, probably a barn foundation; and the Shepard Homestead exposed deposits of fieldstone rubble from recent demolition of several foundations. A fieldstone dam and other features on the John McKinstry Sawmill Site were documented. Three prehistoric sites were identified. The Barefoot Road 1 Site yielded a diagnostic Middle Archaic period projectile point, a unifacial tool and chipping debris. The Barefoot Road 2 and McKinstry Brook Locus 1 Sites were find spots of a single piece of chipping debris. The Barefoot Road 2 Site, McKinstry Brook Locus 1, Jedidiah Marcy Homestead, and Shepard Homestead Sites are not considered significant. The Barefoot Road 1 Site, John McKinstry Sawmill Site, and Nathaniel McKinstry Homestead Site are potentially significant archaeological resources and should be avoided and preserved in place. If these sites cannot be avoided, additional archaeological investigation at the site examination level is recommended.

25-1980 Leveillee, Alan

2000 Intensive (Locational) Archaeological Survey, Avalon Ledges Apartment Complex, Weymouth, Massachusetts. 50 pages.

The 58.5 acre parcel is rocky and elevated in central sections, with peripheral wooded wetlands. Subsurface testing within the highly and moderately sensitive zones across the project area included a total of 51, 50 x 50 cm test pits, dug along seven linear transects and at five judgmentally selected locations. The results of subsurface testing indicated limited plowing in isolated sections between rock outcrops. The recovered cultural material assemblage is consistent with 17th, 18th, and 19th-century agrarian land use, and the collective low-density assemblage may have been associated with the former Arc Lot Site (WEY-HA-1) and/or subsequent historic land use. The survey indicated that the project area is a highly modified landscape resulting from limited rock quarrying, gravel mining, sewer line construction, and most recently construction of adjacent commercial properties. There is isolated evidence to indicate a historical agricultural use prior to the predominantly 20th-century landscape alterations. The earlier historic land use is represented by a remnant plow zone strata in small clustered zones in the southeast project area. Low densities of historical cultural materials including glass, ceramics, nails, and a gunflint were recovered from the plow zone. Some of these materials may have been associated with WEY-HA-1, the Arc Lot Site discovered and collected by C. S. Lord in 1935 and excavated by Boston State College in 1972. We conclude that the Arc Lot Site was situated where the BJs building and associated parking lots now exist, to the immediate west of the project area, and that the site has been destroyed. No further archaeological investigations were recommended.

25-1981 Dudek, Martin

2000 Report on Intensive (Locational) Archaeological Survey, Bumpkin, Gallops, and Grape Islands, Boston Harbor Islands State Park, Boston, Massachusetts. 120 pages.

An intensive (locational) survey was conducted on Bumpkin, Gallops, and Grape Islands in Boston Harbor at the locations for new benches, tree plantings, and trellis shade structures. Initially, 27 shovel test pits (50 x 50 cm) were excavated: twelve on Gallops, five on Bumpkin, and 10 on Grape Island. Additional testing was outstanding on Grape Island, near site 19-NF-6. This area was tested in October 1997 with four shovel test pits and three trenches measuring 1.75 x 0.75 m at bench impact locations within or near site 19-NF-6, a large multi-component shell midden. A final stage of archaeological work took place in April 1998. Twelve tree plantings were monitored on Gallops Island, and three shovel test pits were excavated for tree plantings on Bumpkin Island. In all, 3,518 artifacts, other cultural material, or samples of shell or soil were recovered. This included 94 items from Bumpkin Island, 25 from Gallops Island, and 3,399 from Grape Island. No significant cultural resources were located on Bumpkin or Gallops islands. Historic artifacts dated to the 20th or possibly the late 19th century. One prehistoric flake each was found on Bumpkin and on Gallops Island. On Bumpkin Island the argillite flake appeared to be an isolated occurrence, possibly in fill or redeposited topsoil. On Gallops Island, the quartz flake was an isolated occurrence in fill. On Grape Island, however, two culturally significant areas were encountered. Area A, Site 19-NF-6 (HL-8), had been previously investigated (see Report #25-1936) with Middle and Late Archaic and Middle and Late Woodland artifacts recovered. The three selected bench locations for this area were situated within the site, as were the single footer supports for two adirondack chairs. The results of archaeological excavations at these locations have strengthened the evidence for a Late Archaic and Early Woodland presence based on diagnostic lithics, with pottery types reflecting primarily a Middle or Late Woodland presence, while evidence for a late 17th-to-early 18th-century dwelling was found near the stone 19th-century foundation. A biface recovered from the eroded bank during this investigation may have been an Early Woodland Rossville-like form. The test excavations also recovered a Late Archaic Orient Fishtail point base, a Late Archaic/Early Woodland Small Stemmed point base, and an Early Woodland Rossville point. Middle or Late Woodland cord-marked, stick-impressed, dentate-stamped, and plain or wiped surface grit- or shell-tempered pottery was also recovered. One small sherd may be Early Woodland Vinette I. Other artifacts of note included a single-barbed bone point and two shell beads. Intact areas of the shell midden with features below were encountered at four locations. Features included shallow pits, midden deposits, and concentrations of fire-affected rock. At one location, the foot end of a Native American child’s burial was uncovered immediately below the shell midden. Fourteen foot bones and soil from the top of the feature were turned over to the MHC for repatriation after the bones were identified by the Medical Examiner’s Office as those of a small child. The remainder of the feature was left intact, with most of the burial undisturbed and outside the area of excavation. A fifth location encountered an eroded shore area of shell midden that had retained some integrity. A sixth testing location, some 80 m west of the shell midden, recovered chipping debris. This locale may be an extension of Site 19-NF-6 or a separate site area. It was recommended that Site 19-NF-6 not be impacted in future park modifications. Area E, located on a high area on the east side of Grape Island, had a newly discovered site. One or more flakes of hornfels were recovered from each of four test pits, for a total of 12 flakes of hornfels and one other possible flake. A black chert stemmed biface, probably a reworked Early Woodland Adena-like point, was found in the eroded trail, 6 m south of the bench locations. The minimum site size defined was 15 m north-to-south and 6 m east-to-west.

25-1982 Waller, Joseph N. and A. Peter Mair, II

2000 Intensive (Locational) Archaeological Survey of Sprint PCS Wireless Telecommunication Facility BS23XC471G, Carver, Massachusetts. 52 pages.

This study consisted of background research, walkover/surface inspection, and hand excavation of test pits. Subsurface investigation consisted of the excavation of 13, 50 x 50 cm test pits arranged in a block centered in the middle of the proposed telecommunications compound and nine judgmental test units along the proposed access road. No cultural materials were recovered within the

project area and no further archaeological investigations were recommended.

25-1983 Mahlstedt, Thomas F.

1996 Preliminary Report: Archaeological Testing, Bryant Street, Saugus. 6 pages.

Background research in the Bryant Street area suggested high potential for undisturbed archaeological remains. Excavation of six test pits in a 10 m grid revealed an undisturbed prehistoric archaeological site from the Late Archaic and/or Early Woodland periods, as represented by a quartz, Small-Stemmed Point and a Saugus Jasper Small-Stemmed preform. Calcined bone is suggestive of longer-term occupation and of the potential for recovery of information on diet and seasonal use of the site.

25-1984 Duranleau, Deena and J. N. Leith Smith

2000 Report of a Site Examination on the Morningside Site in Billerica, Massachusetts. 47 pages.

A survey consisting of documentary research, a field walkover, and the excavation of 72 systematic test pits placed at 10 m intervals, plus eight bracket test pits, revealed a single locus of Native American occupation believed to represent a small upland campsite associated with Content Brook. This locus contained an 11 cm-thick layer of fire-affected stones and large fragments of charcoal and ash including calcined bone, a gray rhyolite/felsite decortification flake and a gray-brown argillite uniface. A date of 3,360 +/- 90 years BP was obtained from a sample of the hearth's charcoal. A site examination of this locus, consisting of the excavation of 31 test pits at 5 m intervals and two 1 x 1 m excavation units, revealed two activity areas identified by well-defined artifact clusters. This site, measuring 25 x 30 m, appears to be a typical example of a Late Archaic specialized resource-procurement site. While the site retains excellent integrity, its small size and the extent of data already recovered limit its present research potential. No further work is recommended.

25-1985 Waller, Joseph N., and A. Peter Mair II

2000 Intensive (Locational) Archaeological Survey of Sprint PCS Wireless Telecommunication Facility BS33XC073A, Leicester, Massachusetts. 58 pages.

The Leicester Historical Commission had provided information on a historical archaeological site known as "Judge Menzie's Garrison," a supposed 18th-century garrison location used during the French and Indian War, in the vicinity of the proposed facility. The survey consisted of background research, walkover/surface inspection, subsurface investigations, and inspection of the entire site area with a Whites' 5900/DI PRO SL metal detector. Subsurface investigation consisted of the excavation of five, 50 x 50 cm test pits arranged in a cluster array centered in the middle of the proposed telecommunications compound. No cultural materials were recovered within the project area. No responses to metallic targets were recorded by the metal detector within the proposed access driveway to the facility or at the facility compound location. No further archaeological investigations were recommended.

25-1986 Mair, A. Peter, II

2000 Intensive Locational Archaeological Survey of Sprint PCS Wireless Telecommunications Facility BS33XC010B, Leicester, Massachusetts. 58 pages.

The survey consisted of background research, walkover/surface inspection, and subsurface testing. Subsurface investigation consisted of the excavation of five, 50 x 50 cm test pits arranged in a cluster array centered in the middle of the proposed telecommunications compound and one judgmental test unit adjacent to the compound. No cultural materials were recovered within the project area; no further archaeological investigations were recommended.

25-1987 Lathrop, Hazel H.

2000 The Culture of Flowerpots. 159 pages.

Flowerpots are a class of artifact commonly found but seldom studied. The flowerpot may be considered a mundane and ordinary artifact, yet through an evaluation of the use of this cultural item, it is possible to study people and their changing relationship to the natural world. The sight of a potted plant as part of room decor at the start of the 19th century was rare, yet by the end of the century parlors were overrun with greenery. This paper examines this phenomenon from two perspectives. The first is cultural changes in flower use and presentation and the resultant increase in demand for flowerpots as reflected by information published in books, magazines, and newspapers. The second is the response of the potters in meeting this increasing demand as being primarily due to the invention of William Linton's patented pottery molding machine in 1861. The H. A. Hews Company of Weston and North Cambridge made extensive use of this machine and increased production from 5000 flowerpots in 1861 to more than 700,000 in 1869. Results of archaeological investigations at one pottery and three domestic sites in eastern Massachusetts are included. Guidelines on the identification of flowerpots and comparative vessel forms are included. Domestic sites include the Adams National Historic Site in Quincy, the Boott Mills located in Lowell, and a houselot located in downtown Plymouth. This paper demonstrates that the increasing demand and increasing production of flowerpots during the 19th century evidenced in the literature is supported by archaeological investigations. The Culture of Flowerpots extends beyond their use as a container to hold plants and their identification in the archaeological record to the information revealed about those who used them and their concerns on what constituted beauty and the appropriate use of this cultural item.

25-1988 Strauss, Alan E. and Suzanne Spencer-Wood

1999 Phase II Archaeological Site Examination at the Artist's Guild/Old Poor House Building in Falmouth, Massachusetts. 151 pages.

A Phase II archaeological site examination of the Poor House Site in Falmouth, Massachusetts included extensive background research as well as subsurface testing. Background research indicated that while a vote was made to move the Yost's Tavern from its original location to the present day project, that move may never have taken place. Historical documents suggest that the Almshouse building may have been built around 1824. A total of 19 shovel test pits, eight 50 x 100 cm units, and three meter units was excavated during the Phase II site examination. Subsurface testing was conducted in the area proposed for grading, around the house perimeter where sills will be replaced, and inside the house at the location of new footings. No testing was required for the new handicapped ramp. Test Pits excavated around the perimeter of the house foundation revealed a mix of 19th- and 20th-century artifacts. Excavations in the area proposed for grading identified two layers of fill underlain by a buried topsoil and B horizon. The buried topsoil contained artifacts primarily from the early 19th century and appear to be remnants from the occupation of the Poor House. Only two prehistoric artifacts, sherds of sand-tempered pottery, were recovered from the site. The archaeological data provide new information about the material lifeways of inmates of Falmouth's Poor House. The archaeological data about foodways and other aspects of everyday material life in the early Poor House/Work House adds substantial new information fills in blank areas in the early documentary records about Regulations of the Work House, the behavior of inmates, and actions taken by the Master and Overseers. Aspects of medical practices in treating the inmates were also illuminated by the archaeological remains of patent medicines as well as liquor bottles dating from the entire life of the institution. Lamp glass, buttons, and a tortoise-shell comb further fill out the picture of life at the institution beyond what the records provided. Together the archaeological and documentary data have provided a more complete picture of Falmouth's Poor House that could be constructed from either source of information by itself. A representative sample of the artifacts associated with the Poor House has been collected, and no additional archaeological investigations are recommended.

25-1989 Donta, Christopher L. and Mitchell T. Mulholland

1996 Extended Archaeological Site Examination (Phase II) of the Connor Prehistoric Site, Northampton, Massachusetts. 51 pages.

The Connor Site is associated with the Massachusetts Highway Department's (MHD) proposed Route 66 highway reconstruction and realignment project in Northampton (see report #25-1552). The area investigated consists of part of a small triangular block of land located between Route 66 and Grove Street. Thirty-four shovel test pits (STPs), two 1x1m excavation units, two 1x2m excavation units, and one 2x2m excavation unit were excavated in two loci at the site. Only two STPs and two of the five larger excavation units contained prehistoric material. Soils were found to be disturbed in many locations, but two prehistoric cultural features were identified and fully excavated in the eastern locus. Recovered artifacts included 54 ceramics and one lithic item. The ceramics appear to date to the Middle to Late Woodland period. The highest artifact density was concentrated in the eastern locus, in the vicinity of the feature identified during previous investigations at this site (see Report #25-1552), and the two features found during this survey. Sufficient testing has been completed and the site found to be ineligible for inclusion in the National Register. No additional areas containing cultural features or artifact concentrations were found. No additional survey of this area is recommended.

25-1990 Public Archaeology Laboratory

2000 The Salem Neck Sewerage Plant Site: A Prehistoric Site on Cat Cove, Salem, Massachusetts. 43 pages plus brochure insert.

This popular report on the Salem Neck Sewerage Plant site describes for a lay audience why excavations were conducted at this site and describes the results of the excavations (see report #25-1544). There are sections on lithics, ceramics, features, and faunal remains recovered at this shell midden. The deposits span from the Late Archaic through the Late Woodland Periods. Further information, suggested readings, and a glossary of terms are included.

25-1991 Cavanaugh, Maureen, Suzanne G. Cherau, and Stephen A. Olausen

1998 Cultural Resources Management Plan, Gardners Falls Project, Ferc No. 2334MA-001. 79 pages.

The Gardners Falls Project is located on the Deerfield River in Buckland and Shelburne, Massachusetts, and includes a dam, power canal, and powerhouse. The Gardners Falls facilities were determined eligible for inclusion in the National Register of Historic Places by the MASHPO in 1990. The project's area of potential impact includes lands enclosed by the project boundary and lands or properties outside the project boundary where project operation or project-related recreational development or use may cause changes in the character or use of historic properties. This CRMP provides an historical overview and inventory of historic properties within the area of potential effect (APE); summarizes land use patterns within the APE as well as current project uses for historic properties; identifies activities that will and will not impact historic properties; and outlines an action plan for the management of historic properties within the APE. The Action Plan outlines procedures for complying with the stipulations included in the Gardners Falls PA. The Action Plan addresses integration of the CRMP into the FERC relicensing master planning process; protection of historic properties and mitigation of unavoidable adverse effects; completion of identification of historic properties within the project's APE consisting of intensive archaeological survey and evaluation for proposed actions; monitoring of archaeological sites and sensitive areas; the unanticipated discovery of previously unidentified properties and human remains; and the public interpretation of historic and archaeological values of the project.

25-1992 Sterling, Elise Manning and Karen Hartgen

2000 Report on the Intensive Archaeological Survey for the Southampton Wastewater Facilities Plan (MHC #19186), Town of Southampton, Hampshire County, Massachusetts. 30 pages

An intensive archeological survey was conducted for the proposed Southampton Wastewater Facilities Plan. This project area encompasses an approximate total area of 1,250ft (3,810m). No previous archeological surveys have been conducted within the project area. The survey encompassed documentary research, an archaeological site file search, and subsurface testing. Subsurface testing consisted of the excavation of 61 shovel tests at 8m (25ft) intervals in high sensitivity areas, and 21 shovel tests at 16m (50ft) intervals in areas of low to medium sensitivity. No significant historical or precontact deposits were identified during the intensive archeological survey. No further archeological work is recommended.

25-1993 Mahlstedt, Thomas F.

2000 Final Report, Archaeological Assessment and Survey, Wildlife Viewing Platform, Sandy Point State Reservation, Ipswich, Massachusetts. 14 pages.

Department of Environmental Management (DEM) staff conducted archaeological testing at the location of a proposed wooden wildlife viewing platform that was to be built on the drumlin known as Bar Head at DEM's Sandy Point Reservation in Ipswich. A prehistoric site on Bar Head (19-ES-309) has been known since as early as 1874 and was the focus of limited amateur and professional investigations throughout the 20th century. An intensive (locational) archaeological survey further verified the presence of a prehistoric site here (see report #25-1910). The current testing was restricted to the western edge of the top of the drumlin and included eight test pits that coincided with the platform's supporting piers (ca. 6ft or 1.83m apart) and two test pits for a wooden rail fence. The close sampling interval between test pits suggests a site(s) of some complexity, if not significance. Since only 11 test pits were excavated, however, a definitive analysis of site formation is not possible at this time. Nevertheless, the following observations and interpretations can be offered. The raw materials suggest a strong propensity to use locally obtained raw materials, probably derived from the Newbury Volcanic Complex for tool manufacture, with materials from the Lynn Volcanic Complex also in evidence. A cobble-core manufacturing technique is suggested by a number of smoothed and water-worn decortification flakes. It appears that the location of the viewing platform is not a habitation site, since the principal indices of actual habitation, which included food preparation and consumption i.e., charcoal, fire cracked rock and calcined bone, are largely missing. Instead, the low-density, wide scatter of materials may suggest short-term sporadic use of the drumlin for the manufacturing of stone tools from locally derived beach and other glacially derived deposits. Conversely, the artifact assemblage may suggest that the viewing platform, which is located on the far western edge of the Bar Head drumlin, is on the edge of a "hot spot(s)" or activity area(s) from a larger habitation site, the center of which is located somewhere to the east and toward the center of the drumlin. Save for evidence of recent minor disturbance, which appears to have been limited in horizontal and vertical extent, the Bar Head Site appears to be largely intact and thus has potential for integrity and high research value.

25-1994 Herbster, Holly and Suzanne Cherau

2000 Intensive (Locational) Archaeological Survey, Schlossberg Property, Aquinnah, Massachusetts. 39 pages.

This archaeological survey was conducted in compliance with the Town of Aquinnah Historic and Archaeological Resource Protection Bylaw, administered through the Aquinnah Planning Board. The intensive survey included background research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by project construction. A total of 16, 50x50cm shovel test pits was excavated within proposed project impact areas. The survey located one lithic findspot, consisting of several lithic flakes collected in a fill deposit. While the materials help document prehistoric land use around Squibnocket Pond, they do not rep-

resent a potentially significant archaeological deposit. No further testing was recommended.

25-1995 Herbster, Holly and Suzanne Cherau

2000 Intensive (Locational) Archaeological Survey, Motland Property, Aquinnah, Massachusetts. 47 pages.

This archaeological survey was conducted in compliance with the Town of Aquinnah Historic and Archaeological Resource Protection Bylaw, administered through the Aquinnah Planning Board. The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources that may be affected by project construction. A total of 18, 50x50cm shovel test pits was excavated within proposed project impact area. The survey located and identified one historic site, a low-density scatter of 19th-century domestic wares within a disturbed/plowzone soil horizon. While these archaeological materials provide additional data on 19th-century Aquinnah Wampanoag land use in the Lighthouse Road area, they do not represent potentially significant archaeological deposits. No further testing was recommended.

25-1996 Herbster, Holly and Suzanne Cherau

2001 Intensive (Locational) Archaeological Survey, Pioggia Property, Aquinnah, Massachusetts. 49 pages.

This archaeological survey was conducted in compliance with the Town of Aquinnah Historic and Archaeological Resource Protection Bylaw, administered through the Aquinnah Planning Board. The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources that may be affected by project construction. A total of 29, 50x50cm shovel test pits was excavated. The intensive survey located and identified one prehistoric site, consisting of a fragmentary rhyolite bifurcate-base projectile point and two pieces of quartz chipping debris. The bifurcate base projectile point represents a unique find; to date there is no record of diagnostic tools of this type from in situ contexts on Martha's Vineyard. The recovery of the point within a plowzone horizon and in the absence of additional deposits such as features, limits its information content. The two pieces of quartz debitage recovered in the adjacent test pits lack any specific diagnostic attributes that could tie these materials to the Early Archaic Period. While these archaeological materials provide new data on the use of the island's interior by prehistoric groups, additional testing within the proposed project impact area would not be expected to yield additional classes of significant data. The Saxifrax Knoll Findspot does not represent a potentially significant archaeological resource, and no additional archaeological testing is recommended.

25-1997 Herbster, Holly and Suzanne G. Cherau

2001 Intensive (Locational) Archaeological Survey, Johnson Property, Aquinnah, Massachusetts. 46 pages.

This archaeological survey was conducted in compliance with the Town of Aquinnah Historic and Archaeological Resource Protection Bylaw, administered through the Aquinnah Planning Board. The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources that may be affected by project construction. A total of 28, 50x50cm shovel test pits was excavated within proposed project impact areas. The survey located and identified one prehistoric findspot, consisting of a single quartz flake collected in the topsoil horizon. While this archaeological material provides additional data on the use of interior Aquinnah wetland margins by prehistoric residents, it does not represent a potentially significant archaeological deposit. No further testing is recommended.

25-1998 Donohue, Barbara

2000 Reconnaissance Survey for the Beverly Drainage Project, Chubbs Brook and Lawrence Street Brook Project Areas, Beverly, Massachusetts. 102 pages.

Both project areas contain previously recorded ancient Native American archaeological sites. The research design for the Beverly Drainage Project included documentary research, interviews, and a field walkover. One area of prehistoric potential was identified in the Chubbs Brook project area. Three areas of prehistoric potential and one area of both prehistoric and historic potential were identified in the Lawrence Street Brook project area. Further archaeological investigation is recommended for the areas of prehistoric and historic potential prior to any construction-related activities.

25-1999 Donohue, Barbara

2000 Intensive (Locational) Archaeological Survey for the Brinbal Section of the Lawrence Street Brook Drainage Improvement Project. Beverly, Massachusetts. 35 pages.

Seven test pits were excavated within a proposed channel (created by cut and fill construction) approximately 240ft (73m) long and 24ft (7.3m) wide. A reconnaissance survey had determined this to be an area of high potential for prehistoric archeological resources. Thirty-four artifacts (mixed historic and modern materials) were recovered from one test pit. As no prehistoric or early historic materials were recovered, no additional archaeological testing is recommended.

25-2000 Donohue, Barbara

2001 Intensive (Locational) Archaeological Survey for the Villages at Quail Run, Hudson, Massachusetts. 84 pages.

After a field walkover, documentary research and the excavation of 47 systematic (10m interval), 15 judgmental, and 15 bracket test pits, three prehistoric sites were identified and 192 artifacts were recovered in a 32.97 acre parcel. Previously, an isolated surface find of a quartzite point that dated to the Late Archaic/Middle Woodland, recorded as 19-MD-641, was recovered from the project area. In the course of the intensive survey, one site was identified as an isolated find while two others were identified as possible small encampments/activity areas with a low density of recovered materials, no identified features and no recovered diagnostics. Testing by a possible rock shelter revealed a cache of charred hickory nuts, but no hearth feature and no prehistoric materials were associated with it. No further archaeological testing is recommended.

25-2001 Ingham, Donna and A. Peter Mair, II

2000 Intensive (Locational) Archaeological Survey, Chelmsford Phase IVC Sewer Project Area, Chelmsford, Massachusetts. 53 pages.

The initial stratification of the project area into zones of expected archaeological sensitivity was based on the results of background research and a walkover inspection. The project area contained many locations of previous disturbance from commercial and residential development as well as locations that contained poorly drained, low-lying areas adjacent to wetlands. These areas were ranked as having low archaeological sensitivity. A total of 20 test pits was placed in areas of moderate to low archaeological sensitivity. No Native American or Euro-American archaeological sites were identified during the fieldwork aspect of the survey. No additional archaeological investigation was recommended.

25-2002 Hodge, Christina

2001 Remote Sensing at the Nathan and Polly Johnson House, New Bedford, Massachusetts. 49

pages.

On November 18, 2000, remote sensing was conducted at the Nathan and Polly Johnson House at 21 Seventh Street, New Bedford, Massachusetts. This non-destructive testing was done as a class project by three Boston University students, but was also an initial step toward future archaeological work at the site. The Johnson House, owned by the New Bedford Historical Society, is a National Historic Landmark and will undergo significant renovation and construction in the near future. Geophysical prospecting methods included conductivity, magnetometry, and ground penetrating radar. Hoped-for evidence of previous foundations and construction in the back yard was not identified. Because of significant and varied sources of electromagnetic disturbance, it was concluded that radar was the most rewarding method of remote sensing on this small urban property (and on similar sites). The most significant anomalies targeted for future investigation are located near the northern back lot boundary (in Grid A), the southern back lot boundary (in Grid B), and the midpoint of the back yard's longest east-west section (southwestern corner of Grid A).

25-2003 Binzen, Timothy L. and Margaret Kelly

2000 Archaeological Intensive (Locational) Survey for Drainage Pipes and Utilities Line Installation the Sycamores, South Hadley, Massachusetts. 49 pages.

An archaeological survey was conducted at the Sycamores, a historic house in South Hadley. Col. Ruggles Woodbridge built the Sycamores ca. 1788, and during the historic period it served various functions as a residence, school, and college dormitory. It is presently owned by the South Hadley Historical Society and is being restored. Archaeological testing was conducted prior to the installation of drainage pipes and an underground utility line adjacent to the house foundation. The testing indicated that soil stratigraphy at the Sycamores is generally made up of historic and modern fill deposits; plow zone and subsoil deposits were identified in several locations. No prehistoric artifacts were recovered during the testing. A moderate volume of artifacts dating to the late 18th through mid-20th centuries was recovered. A total of 13 shovel test pits was excavated along the proposed drainage pipe locations adjacent to the foundation and in the front and rear sides of the building. In addition, two exploratory trenches (one measuring .50x1m and one measuring .50x2.5m) were excavated. Artifacts were recovered from 11 of 13 test pits and from both trenches. The ceramic assemblage contained a variety of decorated wares dating to the late 18th through mid-19th centuries. A high proportion of whiteware appears consistent with the boarding school phase of the Sycamores in the early 19th century. Not unexpectedly, a high volume of refuse related to construction and demolition episodes at the Sycamores was encountered.

25-2004 Donta, Christopher L., Ellen-Rose Savulis, and Thomas L. Arcuti

2000 Archaeological Intensive (Locational) Surveys for Proposed Improvement Projects at Hancock Shaker Village, Hancock, Massachusetts. 87 pages.

Three archaeological surveys were conducted at the site of proposed improvements projects at Hancock Shaker Village in 1992, 1995, and 1997. Nine areas were tested, including new entrance and parking areas, new septic system and water lines, and other improvements to the underground water system. Background research determined that non-Native settlers first inhabited the area in the 1760s, and by 1776 Hancock was incorporated as a town with 977 members. Shakers established their community here in the 1780s. The town remained largely agricultural throughout the 19th century, although crafts were also an important economic pursuit. The Shaker village prospered during the 19th century, declining in the 20th century and closing as a functioning community in 1959. A total of 131 shovel test pits and three trench excavations was completed. No prehistoric features or artifacts were identified anywhere in the project area. A trash dump was found in the southern portion of Survey Unit 3, yielding an array of 19th- and 20th-century domestic and architectural artifacts. Examples of the 19th-century water system were documented in several locations. Historical artifacts were found in substantial quantity in the center of the village and were also found thinly scattered across the plow zone of the remainder of the project area. Recovered

artifacts range in date from the late 18th through the 20th centuries and include hand-made and machine-made items, all documenting various aspects of life in the Shaker community. The testing completed to date indicates that intact subsurface features are present within the Village along with numerous associated artifacts, all of which could be informative about the lives of Shakers. Additional research-oriented archaeological investigation would benefit the interpretation and educational mission of Hancock Shaker Village.

25-2005 Donta, Christopher L. and Timothy L. Binzen

2000 Archaeological Intensive (Locational) Survey for the Proposed Wilder Brook Estates, Gardner, Massachusetts. 72 pages.

Background research and subsurface testing was conducted for a proposed 280 acre housing complex in Gardner. Documents indicated the possible presence of a late 18th-century dam, mill, and farm associated with the Wilder family. No previous surveys had been conducted and no resources had been recorded in the project area. One hundred twenty-four shovel test pits were excavated in clusters of 7.5m intervals, in three survey units. The Wilder Dam was identified and is partially intact. It consists of an 18th-century stone and earthen structure, now breached at the center by the brook. No evidence of the mill, residence, or farm was found, probably due to heavy disturbance from a nearby quarry. One prehistoric findspot, the Wilder Brook Prehistoric findspot, was located but does not appear to represent an intact site. The site contained three worked quartz flakes. No further subsurface testing is recommended. It is recommended that the Wilder Dam site be protected from any development.

25-2006 Donta, Christopher L.

2000 Archaeological Intensive (Locational) Surveys for Billington Street Dam Removal Project, Plymouth, Massachusetts. 82 pages.

Background research, an archaeological site reconnaissance, and an intensive survey were conducted for the proposed removal of the Billington Street Dam from Town Brook. Background research identified one potential prehistoric site in the vicinity, but project impacts were considered unlikely to affect this resource. The dam was originally constructed ca. 1790, with an anchor forge and succession of mills occupying the site from ca. 1800 until the late 1960s. Historic maps of the project area indicated that the earthen dam now present was constructed between 1902-1905, and that the earlier mill structure was located over the brook, north of the dam. No remains from the 19th century were expected in the proposed impact area. Three trenches of varying sizes were excavated using a backhoe to look at the dam construction fabric. The dam is earthen with no visible interior structural elements. A number of brick pilings were found within the earthen fill, spaced at regular intervals across the length and width of the dam. These, and a brick wall at the southeastern edge of the dam, are foundation elements of the expanded portion of the mill building, which was completed just after the turn of the century. A partially collapsed stonewall on the north side of the dam appears to be the only remnant of the earlier dam and mill building. No further survey was recommended for this project.

25-2007 Binzen, Timothy L. and Margaret Kelly

2000 Archaeological Site Reconnaissance and Intensive (Locational) Survey for Proposed Utility, Steam, and Communication Lines and Other Construction at the Springfield Armory, Springfield, Massachusetts. 72 pages.

The Phase I intensive (locational) archaeological survey conducted at the Springfield Armory National Historic Site and the adjacent campus of Springfield Technical Community College, which uses former armory buildings, was done in preparation for the proposed construction of underground lines for utilities, steam, and communications; the paving of a former playground; and re-

pair of a historic gate. Following background research and a surface reconnaissance, specific locations on the property were tested. The majority of the work was conducted at the eastern end of the armory parade ground and also adjacent to the Springfield Armory Museum. Five survey units were recommended for archaeological investigation. Survey Area 1—for a 3-foot wide and 3 to 4-foot deep underground utility line—is located in the Parade Ground and 40 feet west of, and parallel to, Building 16 (Administration Building, North and South Shops) and 30 feet north of, and parallel to, Building 14 (Middle Arsenal), and Building 15 (East Arsenal). Survey Area 2—for an underground steam line—is located in a narrow grassed area on the north side of Building 17 (ca. 1970 college building) parallel to the building and adjacent to a parking area, then extending northward from Building 17 to Building 19 (Caserene) beneath asphalt. Survey Unit 3—for a playground—is located between the northern ends of Building 19 and Building 28 (modern college building). Survey Unit 4—for an underground communications line—is located from the northwest corner of the Armory Museum (Main Arsenal) to the center of Building 1, following the west side of a sidewalk. Survey Unit 5—for the Byers Street Gate repair—is located at the extreme southwest corner of the Springfield Armory property, at the intersection of Byers Street and State Street. A total of 55 shovel test pits was excavated in the five survey units. Test pits were placed in transects or clusters at intervals of 7.5m (25ft) in the proposed construction areas. Soil stratigraphy was generally made up of historic and modern fill deposits, although truncated subsoils were identified in several locations. A moderate volume of 19th- and early 20th-century artifacts was recovered. Three historic features, consisting of a postmold, the edge of a filled trench, and an isolated granite block were identified. None was considered significant. Although no significant archaeological deposits or features were identified, cultural materials recovered during the survey have yielded insights into the history of the Springfield Armory.

25-2008 Leveillee, Alan and Mary Lynne Rainey

2001 Intensive (Locational) Archaeological Survey, Proposed Saugus Residential Development, Saugus, Massachusetts. 46 pages.

The approximately 80 acre project area, is dominated by steeply sloping granite outcrops, surface boulders, ledge, and deeply cut valleys. Fifty-nine test pits were dug as part of the intensive survey. Investigation of suspected lithic source areas and rock shelters identified by a local informant did not provide evidence to indicate Native American use or occupation of these locations. While the survey did not result in verification of suspected rock shelters, two isolated surface finds and a subsurface deposit of chipping debris in a single test pit (Saugus Hill 1 Site), were identified, indicating a prehistoric presence. The isolated projectile point was found on the surface of a footpath north of Steven's Pond. It provides a temporal association of general Native American occupation of the area during the Late/Transitional Archaic Period, between 5,000 and 3,000 years ago. The results of the survey support a general prehistoric land use model of larger, more complex single and multi component sites, in high densities clustered along the Saugus River, with smaller, task-specific and short-duration sites in the interior uplands away from the river. While the Saugus Hill 1 Site has provided information about Native American land use of the project area, it does not meet the criteria for potential significance. No further archaeological investigations are recommended.

25-2009 Hoffman, Curtiss

2001 Middleborough Little League Site, Middleborough, Massachusetts, 2000 Annual Report. 65 pages.

This report describes the preliminary results of an ongoing Data Recovery operation undertaken at the Middleborough Little League Site (19-PL-520) during the 2000 field season by the Principal Investigator assisted by students from Bridgewater State College and volunteer members of the Massachusetts Archaeological Society (see reports #25-1829, #25-1907). The 2000 season retrieved a total of 1631 lithic artifacts, 3468 pieces of debitage, 5331 fire-burnt rocks, 3238 pieces

of organic material, and 1444 historic-period artifacts. A total area of 34.25sq m was excavated. A series of five new radiocarbon dates have been obtained from features at the site. The main activities in the excavated portion of the site remain the excavation of pits for the extraction of cobbles for lithic reduction, tool-making, hide-processing, and the manufacture of items for ceremonial purposes.

25-2010 Binzen, Timothy L. and Margaret Kelly

2001 Archaeological Site Reconnaissance and Intensive (Locational) Survey for Sprint PCS Wireless Communications Facility, Amherst, Massachusetts. 36 pages.

This project area is located within the boundaries of a previously recorded archaeological site (MHC site 19-HS-109) that has yielded artifacts associated with Native American settlement of the area between 3,000 and 4,000 years ago. Because professional archaeologists have not systematically surveyed the site, however, its precise boundaries are not known. Following background research and a surface reconnaissance, specific locations within the proposed construction area were tested for prehistoric and historic cultural resources. In all, 12 shovel test pits were excavated, arranged in clusters of four test pits within an area measuring approximately 120sq ft. Stratigraphic profiles in the test pits indicated episodes of modern grading and filling in one section of the project area that is presently a meadow, while less disturbed plow zone and subsoil stratigraphy was recorded in a lightly wooded, adjoining section of the project area. No archaeological features or deposits were encountered during testing, and cultural materials were recovered.

25-2011 Dudek, Martin, Deena Duranleau, Kristen Gardella, Jean Marie Johnson, and Mark Wolf

2001 Final Report Intensive (Locational) Archaeological Survey and Site Examination for the Prelude Estates in Middleborough, Massachusetts. 92 pages.

An intensive survey for a proposed development in Middleborough was conducted on approximately 65 acres. A total of 110 50x50cm test pits were excavated in high potential areas. Four potentially significant prehistoric sites were identified and recommended for site examinations: the Prelude 1 Coyote Site and the Prelude 2, 3, and 4 sites each contained cultural lithic materials that provide insight into how Native groups used the Taunton River drainage system. Four other sites were identified that contained insignificant amounts of prehistoric lithics (the Prelude 5, 6, 7, and 8 Sites). After review only the Prelude 1 Coyote Site was determined significant enough for further investigation. The other sites were not significant because of low density and limited variety of materials. The site examination at the Prelude 1 Coyote Site was conducted late summer, with a total of 249 50x50cm test pits at 5m intervals in a grid pattern and two 1m units. The site examination located site boundaries, identified spatial patterns of lithic use, and recovered two rhyolite Neville-Variant points diagnostic of the Middle Archaic. The abundance of quartz and rhyolite artifacts suggested at least two temporal components, although no diagnostic quartz artifacts were recovered. Some 513 chipped lithics or modified cobbles were recovered. As defined, the Prelude 1 Coyote site is approximately 90m east to west and 125m north to south (11,250sq m). Given the lack of associated features or preserved animal or plant remains, the Prelude 1 Coyote Site is not considered significant and is not eligible for listing in the National Register of Historic Places.

25-2012 Strauss, Alan E.

2000 Intensive Archaeological Survey and Site Examination of the Proposed Karen Way Subdivision in Marshfield, Massachusetts. 169 pages.

Background research indicated that one, recorded prehistoric site (based on surface flakes) was situated within the project area. No historical sites were reported for the study area although the Winslow Estate was located nearby. Field investigations for the project included a surface inspection, followed by the excavation of 82, shovel test pits during the Phase I and 71 test pits and 8 1m

units during the Phase II. A total of 8,472 pieces of prehistoric stone debitage was recovered during the subsurface investigations. In addition to chipping debris, 25 stone tools were found during the Phase I including a Middle Archaic Neville Point, a Late Archaic Small Triangle, and a Middle Woodland Lanceolate Base. A total of 83 stone tools was recovered during the Phase II. A Middle Archaic Neville Point, Late Archaic Susquehanna Points, and an Atlantic Point, Middle Woodland Lanceolate Points, and 22 Late Woodland Levanna points or fragments thereof were recovered as well as 42 bifaces, three unifaces, 10 tool fragments, 12 preforms (six are Levanna), 11 point tips, and 12 cores. A total of 612 sherds of prehistoric ceramics, 198 of which were decorated, were also recovered. The artifacts were recovered primarily from the plowzone and from features. Six prehistoric features were identified as well as one tree burn. The features for the most part date to the Woodland period. All of the features appear to represent refuse pits that contained broken pottery, stone tools, calcined animal bone, shell, and lithic debris. Based on the artifacts recovered, the site represents a multi-component site that dates to the Middle Archaic, Late Archaic, Middle Woodland, and Late Woodland periods. Because of the high density of chipping debris, numerous diagnostic points, and identification of several large features located in Lot 3, it is believed that the site is potentially eligible for nomination to the National Register under Criteria A and D. A Phase III Data Recovery Operation is recommended.

25-2013 Linebaugh, Donald W.

1996 “The Road to Ruins and Restoration”: Roland W. Robbins and the Professionalization of Historical Archaeology. 578 pages in 2 volumes.

Roland W. Robbins helped to pioneer the profession of historical archaeology. As the discipline professionalized, he found himself increasingly excluded. This study analyzes Robbins’s career within the context of the disciplines of archaeology and historic preservation and considers the professionalization process, current cultural resource management practice, the value of early data, and the importance of public archaeology. The study also explores archaeology as Robbins’s solution to his long personal crisis of vocation. He reacted to his coming of age during the Depression by searching for personal foundations and also responded to larger cultural needs, including a quest for the roots of the past. The dissertation focuses on Robbins’s field and research approaches at several important sites. Although Robbins’s techniques initially were little different from the developing practice, he did not embrace changing professional standards, choosing to maintain his own approaches to archaeology in the face of rejection by the new professionals. Robbins also lacked credentials; he had no college education or permanent, stable position, and he came from a labor background that did not mix well with the aspiring middle class academics. Robbins was an enthusiastic populist and developed a successful business approach to archaeological consulting. Beginning in the 1960s, an anthropological versus restoration approach was introduced into historical archaeology. While Robbins continued to seek ruins as a means of rekindling the past, academic archaeologists dug to expose and dissect the past, looking at cultural and social processes. As the methodological and ideological gulf widened, Robbins became bitter and resentful of what he perceived to be academy control of the past. In Robbins’s approach, business success, historical knowledge, and popular appreciation of the past went hand in hand. His rivals eschewed both business and popularity in pursuit of professionalism. The study finds that the contest over professionalism concealed many similarities of practice between Robbins and his critics. Ironically, the professionals in the field have ultimately embraced many of Robbins’s positions and practices in terms of consulting, the meaning and use of ruins, and the importance of public participation and support.

25-2014 Macpherson, Jennifer and Duncan Ritchie

1999 Reconnaissance Archaeological Survey, Essex Water Pollution Abatement Project, Essex, Massachusetts. 95 pages.

This survey evaluated the archaeological sensitivity of eight sites (Sites 4, 6, 7, 26, 28, 31, 36, 39) under consideration as locations for the proposed facilities. Five of the sites for proposed facilities

contained known prehistoric period archaeological sites (19-ES-124, 125, 126, 399, 482, 629, 697). One alternative includes Cogswell's Grant, an historic property owned by the Society for the Preservation of New England Antiquities. Cogswell's Grant is listed on the National and State Registers of Historic Places. Three other alternatives, Thornhill Farm, Cape Ann Golf Course, and Bothways Farm are protected by perpetual conservation restrictions held by the Trustees of Reservations. Thornhill Farm is also within the Parker River/Essex Bay Area of Critical Environmental Concern (ACEC). Background research, interviews with landowners and informants, and a walkover inspection were used to stratify the eight alternative sites into zones of expected archaeological sensitivity. Background research and informant interviews indicated that the Essex/Castle Neck River estuary contains evidence of intensive settlement by Native American populations. Both avocational and professional archaeologists have identified prehistoric sites in and around the project area. The project area was used throughout the historic/modern period for agriculture, boat building, shell fishing, and other activities. A number of historical farmsteads and landscapes are located within the project area. During the walkover inspection, judgmental sampling with handheld (40cm) augers was used to examine the present condition and integrity of soil profiles in the eight sites. Interviews with property owners also provided information on past and present land use. Evidence of prehistoric sites exposed on the surface such as shell fragments from midden-like deposits and cultural material was noted. Based on background research and the walkover inspection, five of the alternative sites (Sites 26, 28, 31, 36, 39) were found to contain zones of high archaeological sensitivity that included the known prehistoric sites in the project area. Zones of moderate archaeological sensitivity with some potential to contain unrecorded prehistoric and historic period sites were found in five of the alternatives (Sites 4, 6, 7, 28, 36). Archaeologists monitored soil borings to make preliminary evaluations of soil characteristics in the eight alternative sites during the reconnaissance survey. Some of these borings were located in zones of high and moderate archaeological sensitivity. The only cultural material recovered from these borings were a few pieces of rhyolite chipping debris found on Alternative Site 28. The borings conducted on the eight alternative sites indicated that they would not be suitable. No further archaeological investigation is recommended unless these alternative sites are selected for future development.

25-2015 Rainey, Mary Lynn

1998 Intensive (Locational) Archaeological Survey, John D. C. Little Dwelling Lot, Nantucket, Massachusetts. 110 pages.

Archaeologists completed an intensive archaeological survey of a 7,062sq ft vacant lot located on Cliff Road in Nantucket in preparation for the construction of a new dwelling. Background research concluded that the parcel had moderate sensitivity for prehistoric or Contact Period Native American site types. Historically, it was the setting of the 18th and 19th-century Benjamin Brown family homestead and the late-19th century Matthew Barney home. Archaeologists excavated 19, 50x50cm test pits and one, 50cmx1m trench. A large assemblage of historical architectural and domestic refuse was collected from fill contexts associated with the Brown and Barney periods of occupation, ending in 1897. A small amount of prehistoric cultural material was also found. Because the recovered artifacts lack contextual integrity, they do not represent potentially significant historic cultural resources. No further archaeological investigations were recommended.

25-2016 Dudek, Martin

2001 Archaeological Monitoring for the King Street Old Burying Grounds Cemetery Improvements, Littleton, Massachusetts. 114 pages.

Archaeological monitoring was conducted for 13 tree or shrub plantings within the historic King Street Old Burying Grounds in Littleton, active between 1717 and 1909. The installation of a water line hookup outside the cemetery was also monitored. The archaeological monitoring within the cemetery included the discovery and avoidance of two grave shafts, both identified near the top of the B horizon. The discovery of displaced footstones was documented, with seven footstones being rediscovered apart from their original locations. Cultural materials included a scatter-

ing of late 18th- through recent 20th-century materials; late 19th- to early 20th-century refuse was recovered below three redeposited 18th-century footstones inside the west stone wall. Historical data documented earlier cemetery renovation efforts, tree plantings, and tree removals. Archaeological data indicate that cemetery landscaping, the addition of later monuments, and the redeposition of footstones are all elements of an archaeological landscape history.

25-2017 Ingham, Donna and Alan Leveillee

2000 Intensive (Locational) Archaeological Survey Parcel A, Bellingham, Massachusetts. 58 pages.

Archaeologists completed a survey of a 7.7 acre area targeted for development. Subsurface testing was conducted within portions of the project area judged to possess a moderate archaeological sensitivity. A total of 79 test pits was excavated, resulting in the recovery of single prehistoric lithic artifacts from each of two locations. No historic-period cultural resources were identified during the intensive (locational) survey. The prehistoric cultural resources identified during the survey are not considered to be potentially significant considering their limited spatial extent and limited research potential. No further archaeological investigations were recommended.

25-2018 Macpherson, Jennifer and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey, Belchertown United States Post Office, Belchertown, Massachusetts. 70 pages.

Archaeologists conducted a survey of a vacant 2 acre parcel off Main Street for the proposed Belchertown United States Post Office. The survey included background research and field investigations. A total of 19 test pits was excavated in areas of moderate to high archaeological sensitivity. Test pits were 50x50cm in size, and were arranged in one, 30x30m test pit block and two test pit transects. The survey did not identify any Native American cultural material. A low-density scatter of historic/modern debris, particularly window glass, ceramic, and brick fragments, was recovered within a plow zone and disturbed/fill soil horizons. Collectively, the window glass, ceramic fragments, and brick fragments are consistent with 19th- and early-20th-century refuse and is most likely associated with a house that once stood on the property. The material was recovered from extensively disturbed soil horizons, however, not intact archaeological deposits. No further archaeological investigations were recommended.

25-2019 Donta, Christopher L. and Timothy L. Binzen

2001 Archaeological Site Reconnaissance and Intensive (Locational) Surveys for the Alexan Subdivision at Arbor Hill, Weymouth, Massachusetts. 59 pages.

Background research, reconnaissance, and subsurface testing were conducted on a 29.5 acre parcel in central Weymouth, south of Whitmans Pond. Ninety STPs were excavated in order to test areas to be impacted by a proposed residential subdivision. No archaeological sites were found. The area had been impacted by previous condominium construction, and intact soils were found to be shallow. No further survey is recommended.

25-2020 Waller, Joseph N. and Alan Leveillee

1998 Archaeological Reconnaissance Survey, Summit Power Proposed Power Facility, Westfield, Massachusetts. 49 pages.

Archaeologists conducted an archaeological reconnaissance survey of the 60 acre parcel, including background research and a walkover survey and assessment of existing conditions. Examination of environmental and project area conditions resulted in projection of an overall low probability to encounter archaeological materials in the predominately disturbed parcel. At the time of the re-

connaissance final routes for gas and electric interconnects had not been selected. After the reconnaissance survey, the entire project was abandoned, eliminating the need for further consideration of potential impacts to cultural resources.

25-2021 Cook, Lauren J., Alan E. Strauss, and Stephen J. Oberon

2000 Intensive (Locational) Archaeological Survey of the MWRA Combined Sewer Overflow (CSO) Project, North Dorchester Bay and Reserved Channel Consolidation Conduits and Reserved Channel CSO Facility. 145 pages.

Archaeologists conducted a reconnaissance and intensive archaeological survey of 13 projects in Boston, Cambridge, and Chelsea to evaluate prehistoric and historical archaeological sensitivity of all the route segments and facility sites included in the MWRA CSO control project. The survey included background research on the prehistory, environment, and historical development of the project areas. The intensive survey consisted of an evaluation of detailed utility maps and an examination of evidence relating to the location of the original shoreline and historical filling and shoreline development. Thirteen areas within the North Dorchester CSO project were identified as archaeologically sensitive, including an area near a locality historically known as Powwow Point, reportedly a focus for Native American cultural activity, and the site of the House of Reformation and the House of Correction on Site J. Based on the results of this research, recommendations were developed for subsurface testing deemed necessary to complete the intensive survey.

25-2022 Mair, A. Peter, II

2000 Supplemental Reconnaissance Archaeological Survey, North Dorchester Bay and Reserved Channel Combined Sewer Overflow Project, Boston, Massachusetts. 37 pages.

Archaeologists conducted a supplemental reconnaissance archaeological survey of seven elements of the North Dorchester Bay and Reserved Channel Combined Sewer Overflow (CSO) project. The survey was conducted as a supplement to an Intensive (locational) archaeological survey (see report #25-2021). A summary of historical development and a field review of each area were conducted to inventory existing conditions. Management recommendations for additional archaeological survey were presented for each location. Of the seven elements surveyed, only the 20" Force Main along N Street warrants additional investigations. The remaining six areas are merely redesigns at the original outfall locations or are located within existing street or filled lands that have low archaeological potential due to long history of urban development and utility and roadway construction and maintenance.

25-2023 Garman, James C. and A. Peter Mair, II

2000 Site Examination of Site J, North Dorchester Bay and Reserved Channel Combined Sewer Overflow Project, Boston, Massachusetts. 56 pages.

Archaeologists conducted a site examination on Site J of the North Dorchester Bay and Reserved Channel Combined Sewer Overflow (CSO) project. A reconnaissance survey (see report #25-2021, #25-2022) had determined that Site J was potentially significant for archaeological evidence associated with prehistoric and historic use of the area. A total of eight machine-assisted trenches, one hand-excavated trench, and three test pits were excavated in order to locate and assess components of the Suffolk County House of Correction. Testing indicated that the clothing workshop, cut lengthwise in half and heavily contaminated by asbestos, was the only partially intact building remaining on site. Post abandonment use by the Boston Elevated Railway Co., later the Metropolitan Transit Authority, which became the Massachusetts Bay Transit Authority, compromised the stratigraphic integrity of nearly the entire site. The site of the first Suffolk County House of Correction does not possess the integrity to warrant further archaeological investigation.

25-2024 Mohler, Paul J.

2000 Archaeological Investigations at Houghton Garden, Newton (Chestnut Hill), Massachusetts. Cultural Resource Management Study No.6. 53 pages.

Archaeologists conducted a limited Phase I Reconnaissance Survey of Houghton Garden. With no previous surveys conducted in the area, the reconnaissance survey of 10 acres around Houghton Pond was directly linked to the rehabilitation of the paths and the construction of informational kiosks. Houghton Garden is listed in the State and National Registers of Historic Places as a resource that contributes to the significance of the Old Chestnut Hill Historic District. The Garden derives its primary significance from the semi-naturalistic rock garden started in 1906 by Clement S. and Martha G. Houghton. Seventy-seven shovel test pits, each measuring 50x50cm, were positioned along a staggered 20m grid system across the property. Two judgmental test pits were positioned at the base of a large rock outcropping, believed to be a rockshelter. Based on the subsurface testing, the property encompassing Houghton Garden appears to possess low to medium archaeological significance. The extensive degree of landscaping across the property has since destroyed much of the archaeological record. The investigation provided a slight glimpse of the property's land use history since the late 19th-century. In addition to the Rock Garden itself, the public garden has retained evidence of the early 20th-century landscaping conducted by Warren M. Manning, increasing our knowledge of park construction regarding water features and naturalistic gardens.

25-2025 Leveillee, Alan and Donna Ingham

1999 Intensive (Locational) Archaeological Survey, Westborough Elementary School Construction Area, Westborough, Massachusetts. 82 pages.

The archeological survey of the ±20 acre parcel included background research and fieldwork, including the excavation of 148 shovel test pits (50x50cm) across the project area. Subsurface testing resulted in the identification of four distinct prehistoric archaeological sites, designated Nourse/Andrews 1, Nourse/Andrews 2, Nourse/Andrews 3, and Nourse/Andrews 4. The Nourse/Andrews 1 Site materials included a quartzite Neville projectile point and a Neville-based quartzite drill fragment. Nourse/Andrews 2 yielded moderate densities of quartzite, quartz, and rhyolite debitage. The Nourse/Andrews 3 assemblage was similar to Nourse/Andrews 2, with quartzite, quartz, and rhyolite chipping debris recovered from 5 test pits. The Nourse/Andrews 4 materials were distinctive and included a fragment of calcined bone, hornfels chipping debris, and quartzite and quartz debitage. All four sites were considered potentially significant and preservation in place was recommended. For those sites that cannot be preserved in place, archaeological site examinations were recommended.

25-2026 Ingham, Donna

2000 Technical Report, Site Examination, The Nourse/Andrews 1, 2, and 3 Sites, Westborough Elementary School Construction Area, Westborough, Massachusetts. 148 pages.

This project area includes 16 acres and is the proposed setting for a school complex. An initial intensive (locational) survey was conducted in July and August, 1999 (see report #25-2025). Four prehistoric sites (the Nourse/Andrews 1, 2, 3, and 4 Sites) and three isolated prehistoric findspots were identified. The Nourse/Andrews 1, 2, and 3 sites are small (less than 500sq m), single-occupation, Middle Archaic period sites characterized by relatively low spatial complexity and consistently associated with a similar range of activities. Each site exhibits excellent integrity with meaningful horizontal and vertical patterning preserved within the distribution of cultural material. The assemblage of cultural material recovered from the three sites consists almost entirely of lithic material, including chipping debris and chipped stone tools. Chipped stone tool types diagnostic of the Middle Archaic period, approximately 7500 to 5000 years before present (5500 to 3000 BC), were recovered from each of the three sites. Data sufficient to address research contexts of local and regional scope were recovered during the site examination of the Nourse/Andrews 1, 2, and 3

sites. Each site provided new information about the prehistoric use of the middle to upper Assabet River drainage in general and about settlement and subsistence systems in the uplands portions of the region during the Middle Archaic period in particular. Based on the results of the site examinations, the Nourse/Andrews 1, 2, and 3 sites were considered to be significant and eligible for listing on the National and State Registers of Historic Places under Criterion D. It was recommended that the Nourse/Andrews 1, 2, and 3 sites be avoided. If avoidance is not feasible, a program including, but not limited to, data recovery should be developed to mitigate the adverse effects of the proposed construction on any of the affected sites.

25-2027 Ritchie, Duncan and Holly Herbster

1997 Archaeological Reconnaissance Survey of the Quarry Hills Complex, Quincy and Milton, Massachusetts. 75 pages.

Archaeologists conducted an archaeological reconnaissance survey of the Quarry Hills Recreational Complex. This survey assessed the known prehistoric and historic period cultural resources and expected archaeological sensitivity of settings within this 355 acre project area. This project area contains a section of the West Quincy granite-quarrying district and two large landfills operated by the towns of Quincy and Milton. Known prehistoric and historic/modern period cultural resources in the project area include the Massachusetts Hill Hornfels/Braintree Slate Quarry, Lyons Turning Mill complex, and Fuller Quarry sites, which are listed on the National and State Registers of Historic Places. Background research involved a review of cultural resource management surveys previously conducted in sections of the project area in both Quincy and Milton. During a walkover inspection, the location and condition of archaeological sites identified in previous surveys was confirmed. In addition, undisturbed sections of the project area outside the Quincy and Milton landfills were examined to assess their expected archaeological sensitivity. A total of 23 prehistoric and historic/modern period cultural resources were identified in the Quarry Hills Recreation Complex project area. Most of these sites were historic period granite quarries and associated facilities that were operated from the early 19th to early 20th century. The known prehistoric sites were two sections (19—NF—105, 19—NF—106) of the Massachusetts Hill Hornfels/Braintree Slate Quarry. The walkover inspection identified zones of high sensitivity around the National and State Register listed properties and historic granite quarries. Zones of moderate sensitivity expected to contain unrecorded prehistoric and historic/modern period sites were also designated. Areas ranked as having low archaeological sensitivity included existing landfill deposits, other disturbed/altered land, and wetlands. Based on the results of the reconnaissance survey, it was recommended that the National and State Register of Historic Places listed sites in the project area be avoided and shielded from adverse impacts through implementation of a resources protection plan. It was also recommended that the other archaeological sites in zones of high sensitivity be studied further at the intensive survey level. An intensive level survey was also recommended for all areas of moderate archaeological sensitivity within the project area.

25-2028 Ritchie, Duncan and Holly Herbster

1998 Intensive (Locational) Archaeological Survey of the Quarry Hills Recreation Complex, Quincy and Milton, Massachusetts. 196 pages.

A previous reconnaissance survey (see report #25-2027) had identified zones of high sensitivity around the National and State Register listed properties and historic granite quarries. One complex of features associated with a historic granite quarry (Cashman’s Quarry) was identified in a prior intensive survey. During a walkover inspection, a number of prehistoric and historic/modern period sites and features were identified. They included a prehistoric quarry/workshop and several previously unrecorded historic period granite quarries and associated features. Subsurface testing within zones of high and moderate sensitivity was done with judgmentally placed test pit transects. Test pits were placed at 10m intervals along these transects. Judgmental test pits were also used to investigate specific sites related to granite quarrying activities. Seven prehistoric archaeological sites were identified in the in the Quarry Hills Recreation Complex project area. They ranged from

several small findspots of chipping debris to larger sites that may have been temporary camps used by groups obtaining lithic material at the Massachusetts Hill Hornfels/Braintree Slate Quarry. An extensive quarry/workshop considered to be a section of the Massachusetts Hill Hornfels/Braintree Slate Quarry Complex (Site 19–NF–106) was found near the Quincy landfill. Twenty-three historic/modern period cultural resources were also investigated during the intensive survey. All of these historic period sites were granite quarries and associated features or facilities (stone cutting sheds, footings for machinery) that were operated from the early/mid 19th to early 20th century. Based on the results of the intensive survey, it was recommended that four of the prehistoric sites (Buzzard, Quarry Lane, Quarry Hills Locus 2, Site 19–NF–106/North Section) be studied further at the site examination level to determine their boundaries and potential significance. The other prehistoric sites and most of the historic/modern period granite quarries were not considered to have sufficient integrity or information content to be potentially significant. Five historic period granite quarries (Jones and Desmond LePage, Little Blue, McDonnell Quarries Q15, Q18, unnamed quarry) were considered to have enough integrity to be potentially significant. Although not all of the features associated with quarries in the project were considered to be potentially significant, it was recommended that they be avoided and preserved in place. The project proponent has agreed to avoid and preserve features within the former MDC parcel (Cashman's Quarry Complex, building associated with Deane and Horrigan Quarry, LePage/Little Blue, Townsend/Clements Quarries, concrete explosive storage bunkers). It was also recommended that the sites in the project area listed on or considered eligible to the National and State Register of Historic Places (Lyons Turning Mill, Lyons Quarry, Fuller Quarry) be avoided and shielded from adverse effects or impacts through implementation of a resources protection plan.

25-2029 Ritchie, Duncan and Holly Herbster

1997 Site Examination of the Buzzard, Quarry Lane, Quarry hills Locus 2, 19-NF-106/North Section Sites within Quarry Hills Recreation Complex Project Area, Quincy and Milton, Massachusetts. 108 pages.

Archaeologists conducted an archaeological site examination of four prehistoric sites within the Quarry Hills Recreational Complex. The proposed Quarry Hills Recreation Complex will be located on land including the site of the Quincy municipal landfill. This project is being planned to restore and rehabilitate the site of this inactive landfill and adjacent industrial land. Prior studies of the project area included a preliminary archaeological sensitivity assessment, reconnaissance and intensive surveys (see reports #25-2027, 25-2028). Based on the results of the intensive survey, it was recommended that four of the prehistoric sites (Buzzard, Quarry Lane, Quarry Hills Locus 2, Site 19-NF-106/North Section) proceed to a site examination to determine their boundaries and potential significance. The other prehistoric sites and most of the historic/modern period granite quarries were not considered to have sufficient integrity or information content to be potentially significant. Subsurface testing of the four sites to determine boundaries and sample contents was done with test pits judgmentally placed along transects. Test pits were placed at 5 and 10m intervals along these transects. Judgmental test pits were used in selected locations to refine site boundaries. Investigation of concentrations of cultural material and features was done with 1x1m excavation units. The Buzzard Site consisted of a small, low to moderate density deposit of chipping debris and bifacial tool blade fragments. A single Susquehanna Broad/Wayland Notched projectile point indicated the site has a Late Archaic period component. The Quarry Lane Site is a larger, more complex site with numerous high to moderate density concentrations of chipping debris that were probably lithic workshop loci. These concentrations are surrounded by low-density depositions of chipping debris and stone tools. The probable lithic workshop loci contain chipping debris and bifacial tool blade fragments of various rhyolites. Several Braintree Slate preforms for ground stone tools were also found. The Quarry Hill Locus 2 Site is a small site with some very dense deposits of chipping debris and stone tools of Braintree Slate, various rhyolites, and quartz. These deposits were formed by intensive lithic workshop activity; several Squibnocket Triangle and Small Stemmed points indicated occupation of the site during the Late Archaic period. On the 19-NF-106/North Section Site, two general zones of activity were identified. The southern half of the site contains a talus slope quarry where large fragments and boulders of Braintree Slate were

the focus of procurement and extraction of raw material. The north half of the site was found to contain some small, spatially discrete workshop loci with concentrations of Braintree Slate chipping debris and preforms for ground stone tools. All four sites investigated in the site examination were found to contain information relevant to Middle and Late Archaic period settlement in the Blue Hills, quarrying, the spatial patterning of different stages of stone tool making and other aspects of lithic resource use. All four of the prehistoric sites studied during this investigation were considered to be potentially significant and eligible for listing on the National Register of Historic Places. Due to changes in project scope, the Buzzard Site in Milton was excluded from the Quarry Hill Recreational Complex project area. It was recommended that the proposed development avoid the three other sites and preserve them in place.

25-2030 Ingham, Donna and Alan Leveillee

2001 Intensive Archaeological Survey Blackstone Municipal Water and Sewer Improvements, Blackstone, Massachusetts. 102 pages.

A survey was conducted of sections of the proposed Blackstone Water and Sewer Improvements project area in Blackstone. Subsurface testing was conducted for the portions of the two cross-country water main alignments considered archaeologically sensitive. No cultural materials were located. Subsurface testing of a proposed cross-country alignment to the corrosion control facility resulted in the recovery of prehistoric and historical cultural material, the identification of a below-ground historic-period feature, and the identification of the remains of three nearby structures including associated elements of stream channel modification for the delivery of water power. The historic cultural resources, including the structural and engineering remains, are associated with site BLK-HA-03, a domestic/industrial/agricultural complex dated c. 1830 to c. 1898 and occupied/operated by multiple generations of the Aldrich family. Prehistoric materials from this site consist of 164 pieces of quartz, quartzite, rhyolite, and unidentified lithic material debitage, as well as two quartz biface fragments. Avoidance of the potentially significant cultural resources located within the proposed cross-country alignment to the corrosion control facility was recommended. If avoidance is not feasible, an archaeological site examination is recommended.

25-2031 Griswold, William A. and Steven R. Pendery

1999 Supplementary Archeological Testing at the Longfellow National Historical Site, Cambridge, Massachusetts. 19 pages.

Archeological testing was conducted at the Longfellow National Historic Site in Cambridge to supplement archaeological compliance work done in 1998 in advance of construction involving ground disturbance to the south, west, and northwest of the Longfellow Mansion. Construction will include excavating a utility corridor to the Mansion and Carriage House, installation of a lightning protection system grounding grid, new parking, a new access ramp, and landscaping. Testing included the excavation of two 1x1m units to the south of the house, one slit-trench across the brick walkway to the south of the house, three 3x0.5m long trenches across the driveway, and a 1x1m and 1x0.50m test pit to the south of the Carriage House. Excavation of the two 1x1m units to the south of the mansion revealed no significant features or artifacts. An earlier brick walkway was, however, located below the existing brick walkway to the south of the house. The five excavations along the driveway were placed to evaluate three different proposed routes for the utility corridor. The trenches showed evidence of disturbance from the installation of earlier utilities, and the two test pits revealed earlier driveway deposits with relatively few artifacts. The preferred alternative for the utility corridor based on archeological preservation considerations is Alternative 3, which extends between Brattle Street and the Carriage House and follows earlier utility corridors.

25-2032 Dalton, Ronald

2001 Archaeological Investigations Intensive Survey and Site Examination, Attleboro Sewer Installation Project, Contract Nos. 24, 25A, 25B, Attleboro, Massachusetts. 2 Volumes, 260 pages.

Archaeological investigations were conducted along several cross-country segments of proposed sewer line construction. Following an earlier reconnaissance survey (see report #25-1736), the intensive (locational) survey included background research, systematic excavation, machine-assisted excavation, and laboratory analysis. The cross-country project study corridor included subsurface testing of approximately 6,990ft (2,040m) with a total of 230, 50 cm-square shovel test pits excavated at 10m intervals. Several significant archaeological deposits were located that were potentially eligible for inclusion in the National Register of Historic Places. One archaeological deposit near the Blackington Pond (the Nerney site) contained a mix of Native American, historical, and modern material in a disturbed context. No additional archaeological investigations were recommended. At another location where the sewer will be constructed in close proximity to Woodlawn Cemetery, it was recommended that a professional archaeologist be present to monitor sewer line excavation along the current northern boundary of the cemetery. Site examinations were conducted at three locations along the Bungay River: the Gretchen site, encompassing approximately 2,925sq m; the Dude site, encompassing approximately 6,500sq m; and the Jon site, encompassing approximately 1,350sq m. A total of 232, 50 cm-square shovel test pits were excavated in grid patterns at 5m intervals. In addition, a total of eight 1x1m test squares were excavated. One other site, the Trail site, was discovered along a well-worn trail near the construction corridor. Radiocarbon age determination from non-feature contexts and temporally diagnostic stone tools indicate these sites were in use beginning approximately 7,500 years ago and may have had a continuity of use until 500 years ago. Subsurface features containing calcined bone and stone tools, together with a wide variety of stone material from both local and distant sources, was recovered from undisturbed soil contexts. Features interpreted as surface fires and numerous expedient flake tools indicate that resources seasonally available along the river and its associated wetlands were collected and processed at these locations. A significant central portion of the sites will be destroyed as a result of sewer line construction. A program of data recovery was recommended for the Gretchen site, the Dude site, and the Jon site, however, after review of the site examination results, it was determined that these sites were unlikely to yield significant information that would help to answer important questions about the past and were not potentially eligible for listing in the National Register.

25-2033 Ritchie, Duncan and Kristen Heitert

2001 Intensive (Locational) Archaeological Survey, Mashpee Commons, Mashpee, Massachusetts. 74 pages.

The 140 acre project area is located at the rotary intersection of Routes 28 and 151. Background research included a review of previous archaeological investigations by both professional and avocational archaeologists within the town of Mashpee and surrounding sections of Cape Cod. The project area is in close proximity to the Mashpee and Quashnet river drainages, which contain prehistoric sites of varying size and complexity. The vicinity of the project area was also occupied through the historical period by the Mashpee Wampanoag and had the potential to contain cultural resources associated with this Native American group. A walkover inspection delineated zones of archaeological sensitivity and assessed previous disturbance within the project area. Sources of disturbance within the project area included previous development. Intact portions of the project area were considered to have high and moderate sensitivity for the presence of Native American cultural resources. Other sections of the project area were considered to have moderate and low sensitivity for historic/modern period cultural resources. Subsurface testing was conducted in zones of high and moderate archaeological sensitivity designated during the walkover inspection of the project area. This testing was done with 30x30m sampling blocks and judgmentally placed transects of varying length. A total of 142 test pits, 50x50cm in size, were excavated during the intensive archaeological survey. A small amount of Native American cultural material consisting of one piece of rhyolite chipping debris and a small fragment of shell was found in the Trout Pond section of the project area. The Trout Pond Locus 1 Site appears to be a small, isolated deposit of

chipping debris formed during a single brief occupation or stone tool making event. The Trout Pond Locus 1 Site is unlikely to yield additional information and is of unknown temporal/cultural affiliation, it is not considered to a potentially significant cultural resource. No further archaeological investigation is recommended.

25-2034 Donta, Christopher L., Timothy L. Binzen, and Margaret Kelly

2001 Archaeological Site Reconnaissance and Intensive (Locational) Surveys for the Proposed Weaving Subdivision, Bourne, Massachusetts. 71 pages.

Background research, an archaeological site reconnaissance, and an intensive survey were conducted on a 34.9 acre parcel of land in the northeastern section of Bourne. The property lies immediately north of a previously recorded artifact collection area (site 19-BN-550), where artifacts from the Late Archaic and Woodland periods have been found. Subsurface testing for the present project was confined to a 1.07 acre area on a terrace overlooking a marsh. Sixteen shovel test pits were completed in clusters of four, placed throughout the proposed development area. Prehistoric artifacts were recovered in 13 shovel test pits and all four clusters, and came from both the plow zone and undisturbed subsoil. In all, 82 artifacts were recovered, consisting of chipping debris of gray, green, and red rhyolite in addition to white quartz. Several flakes exhibited retouch, and two were bifacially worked. A low-density scatter of historical artifacts was found near a former garden and collapsed shed dating to the 20th century. Based on the presence of a high concentration of prehistoric artifacts throughout the area tested, it is recommended that a site examination survey be conducted to define site boundaries, determine site age and function, and assess potential eligibility for the National Register of Historic Places.

25-2035 Russo, Paul A. and A. Peter Mair, II

1999 Intensive (Locational) Archaeological Survey, Fall River Municipal Airport Urban Renewal Plan, Fall River, Massachusetts. 46 pages.

The project area, located north of the City of Fall River, occupies 153 acres, 63 of which are paved runway and tarmac. The intensive survey consisted of background research, a walkover to verify the archaeological sensitivity of the project area, and subsurface investigations. The walkover, supplemented by auger coring, indicated that the grading and earthmoving activities associated with the construction and maintenance of the former airport extended to the project boundaries on all sides. A total of 61 test units, placed in selected locations, revealed disturbed soil profiles, confirming the initial findings that the property has experienced extensive disturbance. The potential for intact archaeological deposits is low or none and no further archaeological investigations were recommended.

25-2036 Herbster, Holly, Jennifer Macpherson, and Suzanne Cherau

2000 Intensive (Locational) Archaeological Survey, Houlahan/Bayside West Subdivision Project Area, and Archaeological Site Examination, Katama Bluff Site, Edgartown, Massachusetts. 108 pages.

The Katama Bluff prehistoric site was identified during an intensive survey of a proposed 37 acre subdivision along the western shore of Katama Bay. Intensive survey included 106, 50x50cm test pits that resulted in the identification of scattered 19th-century field trash deposits and ditch-and-mound field divisions that roughly correspond to late 18th-century maps. Lithic chipping debris, tool fragments, and a Rossville projectile point were recovered from a 120x150m area along the Katama Bay project boundary, and a site examination was completed in this portion of the project. Additional testing in the form of 66 test pits and 4, 1x1m EUs identified diffuse scatters of chipping debris and small, concentrated rhyolite and quartzite lithic workshops. Low densities of shellfish remains, animal bone, and charcoal were also recovered within the site area. Temporally diagnostic materials include an Early Woodland Period Rossville projectile point and a large storage

pit feature radiocarbon dated to the Middle Woodland Period. The site examination collected the majority of the data available within the site area, and the Katama Bluff Site was not considered eligible for listing on the National Register

25-2037 Mrozowski, Stephen A., Paige Newby, and Paul Russo

2000 Archaeological Investigations, 25 Huntington Avenue, Boston, Massachusetts. 47 pages.

This project involved a monitoring program to determine if portions of the Boylston Street Fishweir were present on the site. These investigations also included a paleostratigraphic survey that was conducted prior to the monitoring program and which involved collecting a series of cores from across the site. Results of this survey indicated that conditions existed that were consistent with those in other portions of the Back Bay where weir remains had been previously discovered. Although conditions were found to be similar to those in other portions of the Back Bay, no weir remains were discovered. The project did provide a more refined picture of paleo conditions in the Back Bay that can help in future investigations.

25-2038 Mrozowski, Stephen A., Paige Newby, and Paul Russo

1999 Archaeological Investigations, 10 St. James Avenue, Boston, Massachusetts. 44 pages.

Archaeologists conducted archaeological investigations of 10 St. James Avenue in Boston's Back Bay in May and June of 1999. This work involved a monitoring program to determine if portions of the Boylston Street Fishweir were present on the site. These investigations also involved a paleostratigraphic survey that was conducted prior to the monitoring program. Using information from cores collected as part of the project it was determined that conditions existed that were consistent with those in other portions of the Back Bay where weir remains had been previously discovered. Although conditions were found to be similar to those in other portions of the Back Bay, no weir remains were discovered. The project did provide a more refined picture of paleo conditions in the Back Bay that can help in future investigations.

25-2039 Leveillee, Alan and Mary Lynne Rainey

2001 Intensive (Locational) Archaeological Survey, Avalon Orchards Subdivision, Marlborough, Massachusetts. 90 pages.

Archaeologists completed an intensive (locational) survey of the proposed Avalon Orchards development. Subsurface testing included 103, 50x50cm test pits within six, 30x30m blocks, along one test pit transect, one array, and five judgmental test pits. A wide variety of 18th through 20th-century debris was recovered from plowzone contexts across this project area, along with a low-density scatter of rhyolite, quartzite, and quartz chipping debris and occasional small fragments of calcined bone. One rhyolite Orient fishtail projectile point (in two pieces) provides evidence for a Transitional Archaic Period presence. Six test pits in the southern corner of the parcel contained gray rhyolite chipping debris in good contexts, not impacted by plowing. Shell and bone were found in association with the chipping debris. This area has been designated the Mowry Brook Site; it has the potential to contribute information regarding prehistoric Native American land use in the Marlborough area and may be eligible for listing on the National Register of Historic Places. Its regional research value is based largely on the potential to gain a better understanding of the nature of Native American site activities along the small feeder streams of the Sudbury River drainage. Site examination and evaluation is recommended. Intensive testing in proximity to the Stow/Williams/Temple house yielded a mix of architectural and domestic debris spanning the 300-year historical occupation of the site. Two potential structural features were discovered. Several fragments of 18th-century Rhenish stoneware and hand-wrought nails represent early occupation of the property. The question of a possible 18th-century human burial, as well as consideration of potential structural features associated with the early history of the Stow/Williams/Temple house, warrants further investigation. Based upon results of this survey, the most parsimonious

approach to the further consideration of historic-period features, including structural remains, truncated privies, buried wells, and potential human burials, would be machine-assisted topsoil removal and exposure of the subsoil in a series of trenches across the yard. We recommend supplemental, machine-assisted trenching across the Stow/Williams/Temple north, south, and east yard areas.

25-2040 Mair, A. Peter, II

2000 Reconnaissance Archaeological Survey, Newburyport's Waterside Inn, Newburyport, Massachusetts. 72 pages.

Archaeologists conducting an archaeological reconnaissance survey for the proposed Waterside Inn conducted background research, including a review of literature and maps and local informant interviews, and a walkover survey. The reconnaissance survey assigned a low to moderate archaeological sensitivity to the project area. Much of the project area was within the limits of the Merrimack River during the prehistoric period, and subsequent historic development has most likely destroyed any intact prehistoric Native American archaeological deposits. Historically, the project area experienced significant shoreline alterations as wharves were built, expanded, and ultimately filled. Throughout much of this history the property has been associated with the storage and sale of coal, lumber, and other commodities. The back lot of the property is not expected to contain significant archaeological deposits relating to the history of the property. Furthermore, intact archaeological resources are not expected to provide any information not already in documentary sources.

25-2041 Waller, Joseph N. and Alan Leveillee

2001 Archaeological Site Examination, Mowry Brook Site and Supplemental Machine-Assisted Survey, Stow/Williams/Temple House Yard Site, Avalon Orchards Subdivision. 70 pages.

Archaeologists completed an archaeological site examination of the Mowry Brook Site and supplemental investigation of the Stow/Williams/Temple House Yard Site (see report #25-2039). The site examination established that the prehistoric Mowry Brook Site extends over a 1,000 sq m area. The assemblage of cultural material recovered from the site included several hundred pieces of chipping debris; Late Archaic, Transitional Archaic, and Middle Woodland period projectiles; and a channeled gouge manufactured out of Braintree Slate. No Native American features were identified. Most of the cultural materials were recovered from disturbed or impacted stratigraphic contexts such as plow zone, colluvial, or bioturbated soils. The post-depositional history of the Mowry Brook Site severely limits the amount of spatial and vertical integrity maintained at the site and limits the site's research potential. Investigation in the vicinity of the Stow/Williams/Temple House Yard Site failed to identify any evidence of graves or other historical features within a 10m radius of the existing house. The vague data provided by secondary sources regarding the location of the reputed grave(s) leaves open the possibility that one or more Revolutionary War graves might be situated within the proposed subdivision. Following the archaeological fieldwork, no further archaeological testing was recommended for the Mowry Brook Site or the Stow/Williams/Temple House Yard Site.

25-2042 Binzen, Timothy and Margaret Kelly

2001 Archaeological Intensive (Locational) Survey for the Proposed Route 68 Sewer Extension, Templeton, Massachusetts. 46 pages.

The project area is north of the Otter River and east of the community of Otter River. The project route traverses a vegetated area north of a wetland. In its western segment, the line follows an easement along the backyards of residential houses. On the south side of the wetland is extensive evidence of modern trash dumping. Thirty-five 40x40cm shovel test pits (STPs) were excavated at 7.5m intervals. Soil profiles indicated moderate disturbance and episodes of filling, but also some

intact subsoil. No prehistoric cultural materials were recovered. A very low volume of historical and modern artifacts was recovered (with a total of 10 artifacts coming from two of the shovel test pits). The artifacts consisted of yellowware, nails, window and bottle glass, and brick and are consistent with refuse disposal since the late 19th century. No additional survey was recommended.

25-2043 Donta, Christopher L. and Mitchell Mulholland

2001 Archaeological Intensive (Locational) Survey for Harvard Forest Soil Test Plot Locations within Cape Cod National Seashore. 80 pages.

Subsurface testing was conducted in Provincetown, Truro, Wellfleet, and Eastham as part of a vegetation study. The purpose of the survey was to ensure that archaeological sites would not be impacted by the vegetation study. One hundred and four (104) areas were selected for analysis by Harvard Forest, all of which were researched by the archaeological team for cultural resources, with 94 STPs completed in 71 of the soil test plot locations. Eight sites or findspots were located in Truro and Wellfleet. Six previously unrecorded sites (three prehistoric and three historic) were found. MHC site forms were completed for all of the findspots and sites. No further survey was recommended because the project will have no further subsurface impacts.

25-2044 Ritchie, Duncan and Donna Ingham

2000 Reconnaissance and Intensive Archaeological Survey, Presidential Farms Subdivision, Northbridge, Massachusetts. 86 pages.

The reconnaissance survey covered the entire 135-acre project area. The intensive archaeological survey was carried out within a smaller area of about 72 acres that forms the Phase I, residential development area for the Presidential Farms project. An approximately 20-acre parcel of land in the eastern portion of the project area has been designated as open space where development will be limited to a bicycle or hiking path and approximately 35 acres of existing farmland will remain in agricultural use. The project area consisted of upland terrain typical of landscapes along the Blackstone River drainage. Background research and a walkover survey helped to determine the sensitivity for cultural resources. Within the project area, the reconnaissance survey identified zones of high and moderate sensitivity for Native American cultural resources. Zones of high sensitivity for Euro-American cultural resources were designated around four, small boulder quarries (Quarry Loci 1-4) identified during the walkover survey. Other sections of the project area were considered to have moderate sensitivity for historic period cultural resources. Zones of low sensitivity were primarily wetlands and sections of the project area previously disturbed by a natural gas pipeline easement and rough grading of proposed roadways. During the intensive survey subsurface testing was conducted with three, 30x30m sampling blocks, seven test pit transects, one test pit array and 16 judgmental test pits. One small findspot of Native American cultural material was found on a knoll near a wooded wetland. Presidential Farms Locus 1 contained a few pieces of quartz chipping debris. Subsurface testing in Quarry Loci 1-4 yielded several pieces of historic-period cultural material (iron, bottle glass). Other modern bottle glass found in the project area was not associated with a specific site and probably represents domestic refuse discarded in former farmland. Presidential Farms Locus 1 is unlikely to yield additional information about Native American settlement/land use and is not considered to be a potentially significant cultural resource. None of the four loci of historic/modern period quarrying identified in the project area are considered to be potentially important cultural resources. No further archaeological investigation of these cultural resources is recommended, however archaeologically sensitive sections of the proposed bicycle or hiking paths within the open space section of the project area be subjected to an intensive archaeological survey.

25-2045 Macpherson, Jennifer, Holly Herbster, and Suzanne Cherau

2001 Intensive (Locational) Archaeological Survey, The 16th Lot and the Enoch Coffin Lot,

Down Island Golf Club Project, Oaks Bluffs, Martha's Vineyard, Massachusetts. 36 pages.

Archaeologists completed a supplemental intensive archaeological survey of two additional parcels for the proposed Down Island Golf Club project. These parcels constitute an additional 63 acres of undeveloped woodland adjacent to the northern and eastern sides of the original Down Island Golf Club project area previously subjected to an intensive archaeological survey (see reports #25-1803, 25-1945). A total of 86, 50x50cm test pits was excavated. Test pits were excavated at 10m intervals along 14 linear transects, within one test pit array (Array 1), and five judgmental test pits were excavated. One prehistoric findspot (designated the Southern Woodlands Findspot) and one historic period land use area (designated the Boulder Quarry Area) were identified. These sites are not considered potentially significant archaeological sites. No further archaeological investigations are recommended.

25-2046 Binzen, Timothy L.

2001 Results of an Archaeological Reconnaissance Survey for the Breaching of the Old Berkshire Mill Dam and Data Recovery for an Historic Timber Dam, Dalton, Massachusetts. 62 pages.

An archaeological reconnaissance survey was conducted prior to the breaching of the concrete Old Berkshire Mill Dam, located on the East Branch of the Housatonic River. Sensitivity for Native American and historic archaeological resources was determined to be low overall in the area of potential effect; however, a 19th-century timber dam was identified. It was located within the impoundment of the concrete Old Berkshire Mill Dam, which was constructed ca. 1910. A section of headrace was identified west of the river, adjacent to both dams. Historically, these facilities had provided water to the Old Berkshire Mill (est. 1801), which was the first papermaking facility in Massachusetts west of the Connecticut River. Because the breaching of the concrete dam would entail the dismantling of the timber dam, a data recovery and recordation of the latter resource was conducted. In its design, the timber dam featured elements of both timber crib and timber frame dam construction prevalent during the 19th century. Near the eastern end of the timber dam, a transition between early, saddle-notched log joinery and later milled lumber and wire nails was recorded. This indicated that the section of the timber dam near the riverbank survived a flood episode and was integrated into the central section of the dam when it was rebuilt. Prior to the construction of the concrete dam, located immediately downstream, the front half of the timber dam had been cut off and removed.

25-2047 Begley, William, and Ann K. Davin

1996 Intensive (Locational) Archaeological Survey, Television Transmission Tower, Bridgewater, Massachusetts. 77 pages.

The project area is located on Sawmill Brook, a tributary stream of the Taunton River, which lies less than one half mile to the south. The Taunton River drainage is considered highly sensitive for Native American resources, and background research further indicated that the project area was highly sensitive due to the presence of numerous known Native American sites in the immediate vicinity. Background research also indicated that portions of the project area were highly sensitive for Euro American resources based on the presence of a mill that was located on Sawmill Brook during the historic period. Fifty-three 50x50cm test pits were excavated during the intensive survey. A number of test pits were used to investigate the remaining mill foundation walls associated with Sawmill Brook. No evidence of Native American activity was found during the intensive archaeological survey. The existing saw mill foundation and related features were mapped and photographed, and the area around the foundation was tested. No subsurface features or materials were located and, given the nature of the activities associated with a sawmill, it is unlikely that additional archaeological deposits would be found. It is recommended that impacts to the mill be avoided during construction.

25-2048 Dalton, Ronald

2001 Archaeological Investigations, Quaboag Regional School, Warren, Massachusetts. 141 pages.

Archaeological investigations included documentary and background research, surface reconnaissance, subsurface testing, and laboratory processing for several areas scheduled for development. These investigations encompassed a parcel of approximately 295,000 sq ft. A previous intensive survey conducted in 1997 (see report #25-1699) identified three activity areas in a disturbed context. Recent archaeological investigations included an intensive survey composed of a total of 101, 50x50cm test pits excavated at 10m intervals in transects and 30m blocks. This testing identified one site area in a disturbed context, two sites in undisturbed context, and one site that was historically plowed. Subsequent site examination testing consisted of 286, 50x50cm test pits and five 1x1m and one 1.5x1m excavation units excavated at the three locations identified during the intensive survey. The Goldstein site encompassed 4,800 sq m. Diagnostic stone tools recovered from the site included a Late Woodland black chert Levanna point, an Early/Middle Woodland chert Rossville point, a Late Archaic rhyolite Brewerton Eared point base, and a variety of undiagnostic tool fragments and chipping waste. Decorated and undecorated Middle and Late Woodland Native American pottery was also recovered. The Button site contained three activity areas with a combined total area 850 sq m. The largest of these areas contained a chipping station that yielded a tan quartzite projectile point base that is similar to a Late Archaic "Snook Kill" stemmed type. A variety of chipping waste was also recovered. The School site encompassed an area of 400 sq m. A small Levanna, quartz triangle point temporally diagnostic of the Late Woodland and one body fragment of grit-tempered, undecorated Native American pottery were recovered. A variety of chipping waste was also present. All of these sites were used as campsites and were elements of a large network of Native American sites known to exist in the vicinity. No additional archaeological investigations were recommended.

25-2049 Begley, William

1997 Intensive (Locational) Archaeological Survey, Berkley Middle School Project Area, Berkley, Massachusetts. 56 pages.

The wooded project area encompasses 65 acres adjacent to the Berkley town cemetery. This survey included background research, a walkover survey, and subsurface testing. Based on background research and the walkover survey, the eastern portion of the project area was considered to have moderate to low archaeological sensitivity. A total of 83, 50x50cm test pits was excavated in the highest sensitivity areas and where project impacts will occur. Minute fragments of bricks and whiteware were observed in the uppermost stratum of three test pits and located next to a cart path, and in two test pits with a plowzone horizon. No archaeological features were identified within the Berkley Middle School project area. No additional archaeological investigations are recommended for the project area.

25-2050 Rainey, Mary Lynne and Alan Leveillee

1996 Archaeological Reconnaissance Survey, Boston Edison Company Right-of-Way Line 274-509 Rebuild Project Area, Medway, Holliston, and Sherborn, Massachusetts. 58 pages.

The goal of this survey was to identify specific impact areas in the project area, evaluate their archaeological sensitivity, and make recommendations regarding the need for archaeological testing. The survey identified specific new pole locations throughout the 9.5mi corridor that would be constructed in areas where prehistoric or historic archaeological resources could be expected. Recommendations for intensive survey testing at specific pole locations were included.

25-2051 Dudek, Martin, Barbara Donohue, and Craig Chartier

2001 Intensive (Locational) Archaeological Survey at Freezer Point, Barnstable, Massachusetts. 102 pages.

An intensive survey was conducted at Freezer Point in Barnstable. The parcel of approximately 7 acres was historically part of a larger parcel with deeds dating back to 1640. This larger parcel included Josiah Lewis's shipyard and wharf during the later 18th century, William Lewis's shipyard from 1820 to 1840, and later 19th-century uses. In 1915 an industrial fish-freezing business was begun, followed by a cranberry business in 1932. Boring logs indicated substantial landfill and buried salt marsh across most of the parcel, except at the sandy southern end. The intensive survey consisted of 20 test locations. Thirteen shovel test pits (50x50cm) were excavated at 10m intervals across the principal axis of the parcel; deep machine-assisted testing extended this. Another seven locations were also investigated by deep machine-assisted testing. Only mid 19th-century to 20th-century materials were recovered. No intact mid 19th-century deposits were identified. At 16 locations, significant depths (>1.5m) of 20th-century fill were encountered, with sterile sand or salt marsh below in places where fill was penetrable. No significant cultural resources were located.

25-2052 Ryzewski, Krysta

2001 Medicine Patterns on the Spencer-Peirce-Little Farm: An Analysis of the Shift from the Usage of Home Remedies to Patent Medications. 101 pages.

This study focuses on the transition from home remedies to patent medication on the Spencer-Peirce-Little Farm, an estate in Newbury, Massachusetts, which has been occupied since the 17th century. The transition from home remedies to patent medication is analyzed using excavated glass medicine bottles and botanical remains from deposits that date to various occupational periods. Additional documentary evidence supports the transition to and adoption of mass-produced patent medications. This study illustrates the shift between the two types of medication and associates the transition in treatments to historical movements in consumerism of the late 19th century.

25-2053 Berkland, Ellen Patricia

1999 The Centering of an African-American Community: An Archaeological Study of the African Baptist Society Meeting House, Nantucket, Massachusetts. 212 pages.

This thesis is intended to shed light on the material aspects of just one African-American site in New England, the Nantucket African Baptist Society Meeting House, but one that has enduring significance for African-American history and identity in New England. Archaeological excavations were conducted in 1993 and 1996 of the Nantucket African Baptist Meeting House parcel, Nantucket Massachusetts. This structure, built by and for the African-American community, served as a multi-purpose center during the 19th century. In the early 19th century, churches and meetinghouses were crucial centers in the black community. Often settling in unwelcome environments, African Americans sought to establish a sense of autonomy, a sense of African community, and ultimately, a sense of dignity, place, and belonging. The Nantucket African Baptist society Meeting House became that community center for the many blacks on island, perhaps providing a centering in an otherwise unequal world. The results of the archaeological investigations are found in this thesis, an intensive study that includes not only the contextual analysis of artifacts collected during the 1993 and 1996 excavations, but also analysis and interpretation of evidence pertaining to landscape and architecture. This material evidence can lend insight into the intentions, skills, presentation of self, and community pride of the black community on Nantucket during the 19th century.

25-2054 Maloney, Robin E.

2000 The Narbonne House of Salem Maritime NHS: Pickled Fish and Salted Provision. 21 pages.

The Narbonne House, built around 1670, has been the subject of extensive archaeological study (see reports #25-1357, #25-1366). This popular report presents the historical background of the site and describes the archaeology and the resulting collections for a lay audience.

25-2055 Rainey, Mary Lynne

2001 Intensive (Locational) Archaeological Survey, Proposed Siasconset Waste Water Treatment Facility, Access Road, Force Main, and Pumping Station, Nantucket, Massachusetts. 75 pages.

The project area is located near the southeastern elbow of the island, along the Atlantic shoreline and just west of Siasconset Village. Background research and a walkover survey concluded that much of the project area had the potential to contain Middle through Transitional Archaic Period, or possibly Contact Period Native American site types. During the intensive survey, 159 test pits were excavated within the project area, and along sections of the proposed access road, pipeline route, and pumping station site. The Lost Pheasant Site was discovered along the proposed access road and contained two quartz projectile point fragments, most likely associated with a Late or Transitional Archaic period Native American hunting trip. Additional archaeological investigations are not likely to provide new information about this site, and no further work was recommended.

25-2056 Cherau, Suzanne G., Matthew A. Kierstead, and Joseph N. Waller

2001 Archaeological Site Examination, Wayland Center Railroad Complex, AT&T and Omnipoint Telecommunications Complex, Wayland, Massachusetts. 67 pages.

The scope of the site examination included archival research, field investigations, analysis of recovered cultural materials, and a synthesis of the documentary and archaeological records for the identified railroad-related historical and archaeological features within the project area (see report #25-1894). Subsurface testing consisted of the placement of nine test units (six 50x50cm test pits; two 50cmx1m hand trenches; one 1mx1m excavation unit) at the locations of visible and documented site elements. These activities resulted in the documentation of several railroad-related structures (passenger platform, freight car remains, water tank foundations) and features (switch stand, lamp post, spare rail racks, and a whistle post) adjacent to the north and south sides of the historic track structure. A number of railroad-related structures and features were also identified on both the west and east sides of Route 27 in proximity to the project area. These include the passenger station (standing structure), the freight house (standing structure), the track structure, two switch stands, a stop sign post, a derail mechanism, a stone retaining wall, four telegraph poles, a whistle post, and a possible mile post marker. A documented engine house and turntable pit, historic lumber storage building and a coal pit were also visually verified in proximity to the tracks. These features represent the remains of the late 19th/early 20th-century rail that served commercial enterprises. The Wayland Center Railroad Complex was developed over a period of about 40 years, from 1880 to about 1920. The identified historic and archaeological buildings, structures, and features that comprise the Wayland Center Railroad Complex, both within and adjacent to the project area, are significant resources that should be considered collectively eligible to the National Register of Historic Places under Criteria A, C, and D. The Wayland Center Railroad Complex played an important role in the socioeconomic development and transformation of the town in the late 19th and 20th centuries. The surviving structural and archaeological resources at the complex represent key components of a typical late-19th-century railroad passenger, freight, and locomotive servicing facility. Only a small portion of the Wayland Center Railroad Complex lies within the current boundaries of the Wayland Center National Register Historic District and the Wayland Center Local Historic District. This area contains the passenger station. Because of the National Register eligibility of the whole complex, it is recommended that the boundaries of the current historic district be revised to the west and east to include all of the newly identified railroad-related historical and archaeological resources that surround the passenger station. The railroad complex resources identified within the project area should be avoided during construction, or further documentation (archival and photographic documentation, archaeological testing) may be warranted.

25-2057 Herbster, Holly and Suzanne G. Cherau

1998 Completion Report, Additional Intensive Survey within Archaeologically Sensitive Portions of Lots 5 and 6, Squibnocket Ridge, Chilmark, Massachusetts. 35 pages.

Archaeologists completed additional intensive archaeological survey work within the Lot 5 and Lot 6 parcels (see report #25-1314). The current archaeological work area included a 50ft-wide, inverted L-shaped strip of land between the Lot 5 building envelope boundary and the Lot 5/Lot 6 property line that had not previously been surveyed for cultural deposits. The proposed Lot 5 water utility line was also tested; this corridor begins near the northeastern corner of the Lot 5 building envelope and extends approximately 360ft north to join an existing utility line and the Lot 5 well. Only those portions of the planned utility lines located outside of the building envelope were subjected to the additional testing. Data recovery programs have been completed within the portions of the Lot 5/6 Site situated in the Lot 5 and Lot 6 building envelopes. The additional intensive survey included the excavation of 45, 50x50cm test pits at 5m intervals within the previously untested Lot 5 impact areas, and 37, 50x50cm test pits within previously untested portions of Lot 6. In addition, two 1x1m excavation units were placed over an identified cultural feature along the Lot 5/6 property line. The survey identified more than 1000 pieces of cultural material (shellfish and animal bone remains, stone tool fragments and debitage, and a bone bead) and several shell midden features representative of the Late Woodland Period. Archaeologists identified human cranial fragments within a disturbed utility trench and transported them to MHC for positive identification. Following consultation with Aquinnah Wampanoag Tribal representatives, the MHC, and the landowners, the excavation of several larger test units was requested. This testing identified one in situ human burial, which was preserved in place. Updated archaeological sensitivity maps were produced for both parcels.

25-2058 Donta, Christopher L.

2001 Archaeological Site Examination Survey of the Oak Knoll Prehistoric Site: An Orient Phase Camp, Lincoln, Massachusetts. 136 pages.

An archaeological site examination was conducted at the Oak Knoll prehistoric site (19-MD-835) in Lincoln. The site consists of an approximately 9-m diameter circular scatter of lithics associated with a hearth, living surface, and other features. Excavations completed at the Oak Knoll site during the site locational and site examination surveys consist of 28 STPs, ten 1x1m units, and three excavation units of other sizes, totaling 25 sq m. Some 3,038 artifacts were collected, including 14 projectile point fragments, 11 of which are of the Orient Fishtail type, fragments of eight other bifaces, and one edge tool. Two radiocarbon samples were obtained, returning dates of 340±40 years and 2850±60 years B.P. The first date is interpreted as a recent fire episode in the area during the historic period and is not considered to be a part of the Orient component, while the latter date obtained from charcoal in the hearth is considered to date from the cultural occupation of this location. The feature complex is comprised of a rock-lined hearth, surrounded by a circular-shaped, 4cm to 15cm thick, charcoal-stained living surface. A charcoal and ash lens lies to the south of the hearth, representing a cleaning episode at the time of occupation. Two large pits and a postmold lie to the northwest and west of the hearth in the stained soil. Four other pits of varying sizes lie to the northeast, east, and southeast of the hearth. Within this feature complex and concentrated primarily on the living surface, is a high-density scatter of rhyolite lithic waste and tools. All of the tools and approximately 99% of the debitage were manufactured from the same dark gray porphyritic rhyolite. The primary activities conducted at this site were tool manufacture and use, beginning at the preform stage and continuing to final tool manufacture, retouch, probable use of the Orient Fishtail points as knives, and reworking of utilized tools. The site is interpreted as a locus where Orient Fishtail bifaces were manufactured and utilized approximately 2,850 years ago. On the basis of the information recovered from the surveys, it was clear that the site was eligible for inclusion in the National Register of Historic Places. Excavation of a substantial portion of the site has recovered an adequate sample of the significant information that made the site eligible. This excavation has also necessarily removed a major portion of the site, so that it is now no longer eligible. It is therefore recommended that no further survey be conducted at the Oak Knoll site.

25-2059 Donohue, Barbara

2001 Intensive (Locational) Survey for Three Sections of the Lawrence Street Brook Drainage Improvement Project. Beverly, Massachusetts. 35 pages.

Eight test pits were excavated within three areas (five within a 48m linear segment, two within a 12m linear segment and one in a 18m linear segment) that had previously been determined to have archeological potential in a reconnaissance survey (see report #25-1998, 25-1999). No artifacts were recovered. No additional testing is recommended.

25-2060 A. Peter Mair, II

1999 Reconnaissance Survey Memorandum, Osco Drug Store No. 18-394, Weymouth, Massachusetts. 12 pages.

The project area is located within the Central Square Historic District and includes six contributing historic structures. The project area is also the reported location of L. Tirrells Family Tomb. The survey included deed and probate record review, informant interviews, and field investigations. One historic map, deeds, and probate records mentioned the tomb but did not provide specific locational information. A local informant pointed to a general location in the field but limited subsurface testing could not confirm or deny the presence of the tomb. Based on the results of the reconnaissance survey, additional research, both archival and field, is recommended to confirm the presence/absence of the tomb if the project proceeds.

25-2061 Waller, Joseph N. and Duncan Ritchie

2001 Archaeological Data Recovery Program, Pine Hawk Site (19-MD-793). Acton, Massachusetts. 380 pages.

The site was located on an elevated terrace overlooking the Assabet River within the proposed location of a wastewater treatment plant for the Middle Fort Pond Brook Sewer project (see reports #25-1825, #25-1876). Since avoidance of the site area was not a feasible or prudent alternative, an archaeological data recovery program was developed to mitigate adverse effects to the Pine Hawk Site. The research design developed for the data recovery program contained a set of research issues relating to: 1) site formation/depositional processes and episodes of intensive use on multicomponent riverine zone sites, 2) contrasting patterns of Late/Terminal Archaic Small Stem Point and Susquehanna Tradition settlement/resource use, and 3) prehistoric lithic resource use in the Sudbury/Assabet/Concord drainage. Excavation units placed within Areas I, II, and III during the data recovery program yielded a relatively large sample of cultural material and features. The stone tool assemblage from the site consisted primarily of bifacial tool blades and projectile points. Scrapers, retouched/utilized flakes, hammerstones, quarry blanks, and drills were also found. Ground-stone tools were limited to a few broken fragments (pestle, woodworking tool). The projectile points included diagnostic Middle Archaic (Neville, Stark) and Late/Terminal Archaic (Brewerton, Squibnocket Triangle, Small Stemmed, Wayland Notched, Orient-like) types. A number of other untyped points likely to be of Late/Terminal Archaic affiliation were also found. A few ceramic sherds and other cultural material (jasper, hornfels chipping debris) dispersed through Areas I and II indicated there was also a low density Middle Woodland Period component on the site. Concentrations of rhyolite and mylonite chipping debris marking Middle or Late Archaic lithic workshop loci were identified in Areas I and II. Features found on the site were mostly postmolds and small firepits or hearths with some deep pits and burnt rock concentrations. Radiocarbon dates obtained from feature contexts ranged from 4440±100 B.P., 4260±70 B.P., 4170±60 B.P., 3910±80 B.P., 3710±40 B.P., 3220±70 B.P. and 3150±60 B.P., indicating numerous episodes of site use during the Late and Terminal Archaic. An unusual, deep pit feature radiocarbon dated to 3730±40 years B.P. was found in Area III of the site where it was part of a small Late Archaic deposition. The most recent radiocarbon date of 2100±70 B.P. may be associated

with Terminal Archaic/Early Woodland activity on the site. Specialized analyses carried out on cultural materials and samples collected from the site included petrographic and geochemical analysis of lithic materials, soil micromorphology, and oxidizable carbon ratio dating of charcoal samples. The classes of archaeological data recovered from the Pine Hawk Site were used to assess the research contexts, interpret the site and compare it to others at the local (Sudbury/Assabet/Concord drainage), subregional (southern Merrimack basin), and regional (southeastern New England) scales. The categories of information collected in the data recovery program were considered sufficient to address the research contexts or problems posed for this investigation and mitigate the adverse effects of proposed construction on the Pine Hawk Site. As a result, it was recommended that construction of the proposed wastewater treatment facility proceed as planned.

25-2062 Heitert, Kristin and Suzanne Cherau

2001 Intensive (Locational) Archaeological Survey, Fife Brook Put-In Recreation Area, Bear Swamp Development and Zoar Whitewater Take-Out and Put-In Recreation Area. Deerfield River Hydroelectric Project, Florida, Massachusetts. 72 pages.

Both project areas reported herein are located in Florida on the western bank of the Deerfield River. Background research and subsurface testing were used to locate and identify potentially significant archaeological resources within these two areas. Five 50x50cm test pits were excavated at the Zoar Whitewater project area. Test pits were excavated at 10m intervals along two linear transects within a 25x15m area. No prehistoric or historical cultural material was recovered during testing and no further archaeological testing is recommended for the Zoar Whitewater Take-Out and Put-In recreation enhancement project area. Seventeen 50x50cm test pits were excavated at 10m intervals along a 20x70m terrace at Fife Brook. One prehistoric site, Fife Brook 5, was identified through the recovery of a high density of quartz and quartzite prehistoric cultural material and one cultural feature of unknown function and temporal/cultural affiliation. A site examination investigation is recommended at Fife Brook 5 to determine the significance of the site.

25-2063 Begley, William and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey The Pinehills Community Project Area, Phase II, Plymouth Massachusetts. 144 pages.

This intensive survey covered those sections of the project area that had not been studied in previous reconnaissance and intensive archaeological surveys of the Pinehills Community project (see report #25-1778). Some additional background research on historic/modern period development was conducted for the intensive survey. Zones of high archaeological sensitivity in the northwestern portion of the project area were located around wetlands forming the headwaters of the Eel River and a glacial kettlehole feature near the Route 3 highway corridor. In the southeastern portion of the project area, zones of high sensitivity were located west of Great Island Pond. The largest zones of moderate sensitivity were in the northwest and northern sections of the project area. Smaller moderate sensitivity zones were located in the southeastern portion of the project area southeast of Beaver Dam Road and north of the intersection of Old Sandwich and Savery Roads. During fieldwork, subsurface testing was conducted in those sections of the project area considered to have high and moderate archaeological sensitivity. Subsurface testing within the Pinehills Phase II development area consisted of 125 test pits placed on 10 judgmentally placed transects. The remainder of the Pinehills project area was sampled with 365 test pits arranged within two, 30x30m blocks and 32 judgmentally placed transects. Additional sampling of findspots of prehistoric cultural material and historic-period sites was done with 40 judgmentally placed test pits and 10 test pit arrays. The proposed cart paths and crossings within the Old Sandwich Road corridor buffer zone were sampled with 83 test pits on nine, judgmentally placed transects. Three test pit arrays were used to examine findspots of prehistoric and historic-period cultural material within the buffer zone.

25-2064 Binzen, Timothy L. and Christopher L. Donta

2001 Archaeological Site Examinations of the Crosby Corner Locus of Site 19-MD-118 and the White-Walker Site for the Route 2 Crosby Corner Transportation Improvements Project, Concord and Lincoln, Massachusetts. 90 pages.

Archaeological site examination surveys were conducted at two archaeological sites for the Route 2 Crosby Corner Transportation Improvements Project: the Crosby Corner locus of site 19-MD-118 in Concord; and at Historic Site E, the White-Walker site in Lincoln (see reports #25-1900). The site examination survey at the Crosby Corner locus of site 19-MD-118 resulted in the recovery of 52 prehistoric artifacts from both of the 1x1m units excavated and from 11 of 32 shovel test pits excavated. The majority of the artifacts consisted of rhyolite chipping debris, with three other lithic materials present. Two Brewerton projectile points (eared-notched and corner-notched), dating to the Late Archaic period, were also recovered from the site. No prehistoric features were identified. The main portion of the site measures approximately 10x22m. One artifact was recovered 24m southeast of the main concentration. Originally the site may have been larger, but the northern boundary could not be determined due to the proximity of Route 2 and accompanying road fill. Based on the low density of lithic materials and absence of subsurface features, it is not likely that further testing would produce any additional information. No further survey of Crosby Corner Locus of prehistoric site 19-MD-118 is recommended. According to archival and archaeological evidence, the White-Walker site (Historic Site E) was a farmstead adjacent to the Cambridge Turnpike (Route 2). The foundations of a main house and barn and a depression representing a small carriage house were documented and tested during the site examination. The site measures 60x60m. Sixteen shovel test pits and nine 0.5x2m trenches were excavated. An assemblage of 1,093 artifacts consisting primarily of historic ceramics, nails, and window glass was recovered, indicating domestic occupation of the site between the late 18th century and the late 19th century and corroborating the occupation dates provided by deed research. The research potential of the White-Walker site is limited by disturbance and residential construction that occurred during the 20th century. Additional survey at the site would not be likely to provide additional information beyond that already recovered during the intensive and site examination surveys. Therefore, no further survey is recommended for the White-Walker historic site.

25-2065 Rainey, Mary Lynne

2001 Intensive (Locational) Archaeological Survey Proposed Old South Road and Fairgrounds Road Bicycle Paths, Nantucket, Massachusetts. 86 pages.

The adjoining bicycle paths surveyed are situated in the central, interior section of the island, generally south of Nantucket Harbor the Creeks region. Background research and a walkover survey concluded that most of the project area was archaeologically sensitive for prehistoric or historic-period Native American cultural resources. During the intensive surveys, 188 test pits were completed within the Old South Road bicycle path, and 98 test pits were completed within the Fairgrounds Road bicycle path. Historic-period archaeological sites were not identified. Isolated prehistoric artifacts in roadway fill deposits were recovered from three test pits within the Old South Road bicycle path. Two sites, the Mudbath and Holdgate sites, consisted of low density Native American lithic deposits in archaeological contexts with poor integrity. Additional investigations are not likely to provide new information about the findspots or sites, and no further work was recommended within either bicycle path.

25-2066 Donohue, Barbara, Thomas Doyle, and Martin Dudek

2001 Site Examination and Data Recovery for a Segment of the Middlesex Canal in Billerica, Massachusetts. 102 pages.

An assessment of integrity for a water-filled section of the Middlesex Canal included documentary

research, machine-assisted excavation of two trenches, excavation of two shovel test pits, and monitoring of construction activities**.** While planned documentation (drawings, photography, and measurements) proved impossible as the dewatering effort proved futile, the synthesis of historic research and field observations concluded that dry-laid stone walls were used for embankments along the canal walls and "puddled" clay was used to further waterproof the canal prism. This is the first documented use of "puddled" clay along the canal. No other artifacts associated with the canal were recovered. Enough elements of the physical properties of the canal were observed to suggest that the canal prism, with its distinctive design, materials, and workmanship was intact and retained integrity. While the tow path and berm were not observed due to the adverse field conditions, there is no reason to assume that they were not present.

25-2067 Herbster, Holly and Suzanne Cherau

1998 Intensive (Locational) Archaeological Survey, Meeting House Golf Club Project Area (formerly Martha's Vineyard Gulf Club Project Area), Meeting House Golf Club, Meeting House Way, Edgartown, Massachusetts. 62 pages.

The 162-acre project area contains two standing structures, one that is 35 years old and the other that dates from the 19th (possibly late 18th) century, as well as the former site of the 17th-century Vincent House, which was relocated and restored as a museum. A total of 182, 50x50cm test pits was excavated within 30x30m blocks and along 10m interval transects. A small area of prehistoric Native American deposits was designated as the Mashacket Cove Site and consisted of chipping debris, a Late Woodland Levanna projectile point, pottery sherds, calcined bone, and charcoal in association with a large semi-circular pit feature. Because of its potential National Register eligibility, it was recommended that the site be avoided. Historic 19th and 20th-century archaeological materials were collected in association with the standing MacKenty House and the previously excavated and relocated Vincent House, but the information content from these resources was limited and no further testing was recommended. A possible cellar hole/foundation and associated 17th and 18th-century domestic and structural artifacts were designated the Andrews/Vincent Site and represent an historically important archaeological deposit that may be eligible to the National Register of Historic Places under Criteria A and D. Avoidance of this site area was recommended.

25-2068 Duranleau, Deena

2001 Report of an Intensive (Locational) Archaeological Survey Conducted for the New Seabury Improvements in Mashpee, Massachusetts. 70 pages.

The Mashpee Tribal Council was consulted, walkovers were conducted, and 152 test pits were excavated on the seven pieces of property proposed for development by the New Seabury Corporation. Two pieces of Native American chipping debris were recovered, both from the Spinnaker Cove property. A historic house foundation and possible accompanying well dating to between 1858 and 1877 were identified in the southern portion of the Section 5 property. A site examination at this site is recommended.

25-2069 Binzen, Timothy L.

2001 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Powder Mill Square Development, Andover, Massachusetts. 62 pages.

An archaeological reconnaissance and intensive (locational) survey was conducted for the proposed Powder Mill Square redevelopment. The project area is in an industrial historic district and is located on the east side of the Shawsheen River. It contains a 19th-century mill building and derelict houses. During the Revolutionary period a powder mill was located in the vicinity. Subsurface testing was conducted in unpaved areas in the project area. A total of 40, 40x40cm shovel test pits (STPs) was excavated at 7.5m intervals. Soil profiles indicated extensive modification of the landscape during the historic period. No prehistoric cultural materials were recovered. A mod-

erate volume of historic and modern artifacts was recovered (281 artifacts from 18 of the shovel test pits). The artifacts mainly consisted of creamware and pearlware fragments and cut nails and are consistent with domestic occupation of the houses between the early 19th and early 20th centuries. On the riverbank, foundation segments and a bricked-in tailrace had been integrated into a river retaining wall. These features were recorded, and their preservation was recommended.

25-2070 Atwood, Kathleen A.

2001 Final Historic Properties Management Plan, Charles River Natural Valley Storage, Bellingham, Dedham, Dover, Franklin, Holliston, Medfield, Medway, Millis, Natick, Needham, Newton, Norfolk, Sherborn, Walpole, Wrentham, and West Roxbury, Massachusetts. 356 pages.

The Historic Properties Management Plan (HPMP) provides a comprehensive program to direct the historic preservation activities and objectives at the Charles River Natural Valley Storage (CRNVS) Flood Control Project and effectively manage and protect each historic property. The HPMP has several sections. The Overview, found in Section V, provides a project description, historic contexts, and results of archaeological investigations. The Land use Guide in Section VI details the types of agency activities that should have no effect on cultural resources and those that may impact historic properties. This section describes routine operation and maintenance activities, as well as possible future activities and/or improvements. The Action Plan in Section VII outlines specific tasks, procedures, and priorities that must be accomplished to satisfy Section 110 requirements. Cultural resource management procedures are also explained in this section. Sections VI and VII are the working sections of the HPMP. To date the follow tasks towards meeting compliance requirements have been accomplished: In 2000, an archaeological reconnaissance survey of the fee-owned lands was completed (see rpt # 25-1964) Background research, a walkover, and limited subsurface testing identified four prehistoric sites. The report provided recommendations for further inventory of archaeologically sensitive areas and evaluation of identified sites.

25-2071 Spencer-Wood, Suzanne M.

2001 Phase I Non-Destructive Archaeological Survey of the Souther Tide Mill Site, Quincy, Massachusetts. 102 pages.

A Phase I survey was conducted at the Souther Tide Mill site in Quincy. The project consisted of background research, a non-destructive reconnaissance survey, mapping, identification, and photographing of significant site features and artifacts. The 19th-century Souther tidal gristmill is a significant historic site. It is one of two intact tide mills known to survive in Massachusetts and one of three surviving in New England and New York. The site may be the last surviving intact tidal gristmill and sawmill complex in the United States. The lock built in the milldam for the Quincy Canal is a rare engineering feature and was thought to be the only surviving coastal canal lock in New England before its destruction for flood control by the Army Corps of Engineers in 1993. The Souther Tidal Gristmill processed wheat and corn from 1806 until 1888, after which it was used to store wood trim and other products of the adjoining sawmill. The mill burned down in 1846 and was rebuilt with two cast iron turbines replacing the two wood tub wheels. After the spread of railroads to the west grain from the Midwest was processed at the mill. The Souther Tidal Gristmill became economically untenable as larger more efficient roller mills replaced small mills using millstones. The tide mill was at an additional disadvantage because it could only operate for 2-3 hours after each high tide. A number of significant gristmill and sawmill features and artifacts were mapped, photographed, and identified in this research. The gristmill building included remains of a hurst frame, holes in floors for grain and meal transport, and the framework around a bevel gear still attached to the shaft of the eastern turbine. In the mudflat, remains of the turbine penstocks, sluice gates, tailraces sluice dam, and forebay were visible. Remains were found of an embankment west of the mill built of earth filled timber cribbing faced in stone to form a dam on the south and a lock pier on the southwest corner. Also found were remains of the Quincy Canal lock. The canal was a major force in Quincy's economy, facilitating export of granite and import of a variety of goods, including products of the gristmill and the sawmill. A few

features and artifacts were found in the mudflat site under the sawmill.

25-2072 Cherau, Suzanne G., Matthew A. Kierstead, and Sara B. Chase

2000 Site Repair/Restoration and Creation of Archaeological Interpretive Park Old Colony Railroad Roundhouse Site (WHI-HA-2), Whitman, Massachusetts. 133 pages.

This project took a multi-disciplinary approach in each of its two phases. The first phase consisted of archaeological field excavations conducted to expose and record previously identified and newly exposed site elements. The second phase consisted of the restoration and conservation of historic masonry surfaces in the archaeological park along with the implementation of the park landscape plan. A public involvement and educational program was also developed as part of the project.

25-2073 Dudek, Martin, Ronald Dalton, and Craig Chartier

2001 Intensive (Locational) Archaeological Survey and Site Examination for Contract 21 of the Wastewater Program, Dracut, Massachusetts. 136 pages.

An intensive survey was conducted for eight cross-country pipeline segments in Dracut. A total of 115 systematic and 12 bracket test pits (50x50cm) were excavated at seven proposed cross-country locations. No significant historic resources were identified. Prehistoric resources were identified at one location, the Whortleberry Hill site. A site examination was recommended, approved and conducted for this site. A total of 45 systematic test pits at 5m intervals and three units (two 1x1m and one 1mx50cm) were excavated, with the site boundaries identified as 70m northeast to southwest along a terrace, and 30m northwest to southeast, with a pond (previous wetland) delimiting the eastern boundary and a stone property wall or steep slope delimiting the western boundary. Within this area, three loci were defined, consisting of two areas with quartz and rhyolite tools, chipping debris, and calcined bone. A third locus was a findspot of quartz debitage. A Middle Archaic rhyolite Neville point, rhyolite and quartz chipping debris, cores and tools, and a meta-sediment uniface and flakes were recovered. Rhyolite, including the Neville point, was underlain by quartz artifacts buried deeper, suggesting an earlier quartz component that may date to the Early or Middle Archaic period. Calcined bone recovered from two loci included one turtle-shell fragment from Locus 1 and over 1,200 fragments of deer/mammal bone from a small pit feature in Locus 2 dated to the Terminal Archaic, 2970 $\pm$ 110 ^{14}C years BP (^{13}C corrected; calibrated range at 1 sigma: 3333 to 2955 BP). The unusual presence of a Terminal Archaic calcined deer-bone pit feature on a steep slope, the Middle Archaic diagnostic tool, activity areas with a variety of tools, and the likelihood of other features' existing within this unplowed terrace make this site potentially eligible for listing on the National Register of Historic Places.

25-2074 Chartier, Craig and Barbara Donohue

2001 Report of and Intensive (Locational) Archaeological Survey for the Cypress Street School Interceptor and Forest Hill Drive Segments of the Andover Waste Water System in Andover, Massachusetts. 114 pages.

A total of 211 out of a planned 222 systematic test pits and 18 bracket test pits were excavated within nine cross-country segments (totaling 2272 m) of a proposed sewer installation project that lies within and adjacent to the Shattuck Farm Site (19-ES-196) boundaries. A variety of historic sheet refuse was recovered from various cross-country segments and 10 prehistoric artifacts were recovered from six systematic transect lines and two bracket test pits in one of the transects line. While these artifacts may be associated with the Shattuck Farm Site, they represent small lithic scatters with no associated temporally diagnostic material or features. No further field investigation is recommended.

25-2075 Donohue, Barbara, Alison Dwyer, and Tom Doyle

2001 Worcester Commuter Rail Extension, Intensive Archaeological Survey for the Proposed Ashland and Westborough Stations and Site Examination, Proposed Southborough Station. 138 pages.

A reconnaissance survey (consisting of a walkover and historical research) conducted along the Boston & Worcester rail line recommended further archaeological investigations at the sites of three proposed stations. An intensive survey in Ashland consisted of background research and subsurface testing (39 test pits placed 10m apart along six transects, and three judgmental test pits, all 50x50cm) in two areas one 450x50m and one 1,400m linear segment. Historic research revealed little activity within the project area through time; only a few historic artifacts and two pieces of quartz shatter were recovered during the subsurface testing. An intensive survey in Westborough consisted of background research and subsurface testing (54 soil probes along five transects at 5m intervals and 13 judgmental test pits, 50x50cm in an area 150x150m). Historic research revealed considerable 19th- and 20th-century disturbance within the project area, an impression verified through the subsurface testing. A site examination in Southborough consisted of historic research, a site walkover with an industrial archaeologist, and the excavation of three backhoe trenches of varying lengths (8.5m, 7m, and 4.6m in an area 240x60m). Historic research revealed that the project area was occupied by the Cordaville Mills from ca. 1847 to ca. 1928. Subsurface testing revealed intact foundations, raceways, a penstock, and a wooden partition (section of a privy tower or a water gate). The site, located within the Cordaville Historic District, is significant as it has the potential to contribute information on the industrial development of Southborough. While no further archaeological investigations are recommended for Ashland and Westborough, a data-recovery program is recommended for Southborough.

25-2076 Herbster, Holly

2001 Summary Report, Cultural Resources Reconnaissance Survey, Massachusetts Military Reservation Fuel Spill 1 (FS-1) Area, Upper Quashnet River and Bogs Area, Mashpee, Massachusetts. 62 pages.

A cultural resources reconnaissance survey of an approximately 350-acre parcel in the upper Quashnet River and Bogs area was conducted. The reconnaissance survey was completed as part of the Fuel Spill-1 (FS-1) Pre Design Data Gathering investigation. The goals of the survey were to assess the archaeological and cultural sensitivity of the project area and define areas that may require additional investigation. Project tasks included background research collection, field investigations, and archaeological sensitivity assessments and were completed in consultation with the Wampanoag Tribe of Gay Head/Aquinnah Tribal Historic Preservation Office and the Mashpee Wampanoag Tribe. The survey determined that no previously recorded prehistoric or historic-period archaeological sites were located within the project area; the archaeological sensitivity of the parcel was generally high. Favorable environmental conditions, including the presence of the Quashnet River, and a lack of historic or modern development contributed to an overall moderate to high prehistoric archaeological sensitivity of the parcel. Three 19th-century Mashpee Wampanoag structures were identified within the project area through background research, and although no surficial evidence was identified in the field, there exists a strong likelihood for associated archaeological deposits to be present.

25-2077 Chartier, Craig S. and Martin G. Dudek

2001 Intensive (Locational) Archaeological Survey Report for the Self-Storage Facility at Forestdale Road, Mashpee, Massachusetts. 41 pages.

An Intensive (locational) Survey was conducted on an approximately 4 acre parcel. The area is in close proximity to Mashpee Pond and has level topography, except for one kettle hole. A total of 56 systematic test pits placed in four blocks, plus six judgmental test pits, were excavated. Natural stratigraphy was encountered with sandy well-drained soils. No cultural materials were recovered

and no additional archaeological work is recommended.

25-2078 Macpherson, Jennifer and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey, Fairway Oaks Housing Development and Archaeological Site Examination, Wooden Box Site, Haverhill, Massachusetts. 120 pages.

This intensive survey consisted of background research and field investigations and identified one locus of Native American activity. The Wooden Box Site yielded 27 pieces of chipping debris, the base and midsection of an Orient Fishtail projectile point, the tip and midsection of a large, triangular biface, and a charcoal feature. A site examination was conducted to determine site size, integrity, and complexity to make a determination of eligibility to the National Register of Historic Places. A combination of test pits and excavation units was excavated, defining a site approximately 1,700 sq m in size. A total of 158 Native American cultural materials was recovered, including 116 pieces of chipping debris, two Transitional Archaic projectile points, two bifaces, a scraper, calcined bone, and nut hulls. Two features, a hearth and oxidized living surface, were also identified. The Wooden Box Site is considered eligible for listing in the National Register and avoidance of the site was recommended.

25-2079 Binzen, Timothy L.

2001 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Water Treatment Plant, Billerica, Massachusetts. 62 pages.

The surveyed project area consists of approximately 12 acres of wooded upland adjacent to the Concord River and associated wetlands. Subsurface testing was conducted at high-sensitivity locations where construction has been proposed. A total of 108 40x40cm shovel test pits (STPs) were excavated, using clusters of STPs at 7.5m intervals. Soil profiles indicated that portions of the project area were cultivated during the historic period, while others were never plowed. Three prehistoric Native American sites were recorded. At the Boulder Trail site (19-MD-825), a total of 14 bifacial thinning and sharpening flakes of gray rhyolite were recovered from four test pits, within an area measuring 15m north-south and 20m east-west, in both plow zone and subsoil strata, at depths between 10cm and 40cm below the ground surface. At the Stream site (19-MD-826), a total of 16 bifacial thinning and sharpening flakes of gray rhyolite and quartz were recovered from six test pits, within an area measuring 15m north-south and 20m east-west, in both topsoil and subsoil strata, at depths between 10cm and 40cm below the ground surface. Two projectile point tip/midsections also were recovered from the Stream site. At the Knoll prehistoric findspot (19-MD-827) one thinning flake of black rhyolite was recovered from subsoil at a depth of 40—50 cm below the ground surface. Verification test pits excavated at a close interval around the findspot yielded no additional prehistoric material. A low volume of historic and modern artifacts was recovered in the project area, consistent with agricultural land use during the 19th and early 20th centuries.

25-2080 Dalton, Ronald

2001 Intensive (Locational) Archaeological Survey at a Proposed Telecommunications Tower Location, Littleton, Massachusetts. 31 pages.

This survey consisted of background research and subsurface testing. A total of 8 shovel test pits, 50x50cm, were excavated within the planned tower area and underground utility route. No prehistoric materials were recovered and historic material observed was limited to mid-to-late 20th-century local dumping and road trash. No further archaeological investigations are recommended.

25-2081 Atwood, Kathleen A.

2001 Final Historic Properties Management Plan Birch Hill Dam, Royalston, Templeton, and Winchendon, Massachusetts. 300 pages.

The Historic Properties Management Plan (HPMP) provides a comprehensive program to direct the historic preservation activities and objectives at the Birch Hill Dam Flood Control Project and effectively manage and protect each historic property. The Overview, found in Section V, provides a project description, historic contexts, and results of archaeological investigations. The Land use Guide is located in Section VI. This guide details the types of agency activities that should have no effect on cultural resources and those that may impact historic properties. This section describes routine operation and maintenance activities, as well as possible future activities and/or improvements. The Action Plan in Section VII outlines specific tasks, procedures, and priorities that must be accomplished to satisfy Section 110 requirements. Cultural resource management procedures are also explained in this section. Sections VI and VII are the working sections of the HPMP. To date the follow tasks towards meeting compliance requirements have been accomplished: In 1990, an archaeological reconnaissance survey was completed. Background research, a walkover, and limited subsurface testing identified eight prehistoric sites and 250 historic period sites within the project area. The report provided recommendations for further inventory of archaeologically sensitive areas, and evaluation of identified sites. In 1999, proposed gatehouse repairs led to an historic inventory of the project area and the Birch Hill Dam and appurtenant structures have been determined eligible for the National Register of Historic Places. A four step Action Plan is recommended.

25-2082 Herbster, Holly and Suzanne G. Cherau

2001 Intensive (Locational) Archaeological Survey, Anchor Self-Storage Facility, Mashpee, Massachusetts. 50 pages.

This intensive survey included background research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by project construction. A total of 43, 50x50cm shovel test pits was excavated within the approximately 33,600 sq ft project impact area using a combination of 30x30m test pit blocks and one test pit transect. The combined results of the intensive survey did not identify any documented prehistoric or historic period resources or archaeological deposits within the project area. No further testing was recommended.

25-2083 Atwood, Kathleen A.

2001 Historic Properties Management Plan, Buffumville Lake, Charlton, Massachusetts. 290 pages.

Historic Properties Management Plan (HPMP) provides a comprehensive program to direct the historic preservation activities and objectives at the Buffumville Lake Flood Control Project and to effectively manage and protect each historic property. The Overview, found in Section V, provides a project description, historic contexts, and results of archaeological investigations. To date the follow tasks towards meeting compliance requirements have been accomplished: In 1985, a reconnaissance survey of a proposed low flow augmentation project was conducted. Thirty-three locations around the reservoir were identified as possessing prehistoric archaeological sensitivity and additional investigations were recommended. In 1993, intensive level archaeological investigations were conducted around Buffumville Lake and a reconnaissance level survey was performed for the flowage easement around Pierpoint Meadow Pond. Four prehistoric sites and three historic period sites were identified as part of this investigation. One of the prehistoric sites, the Blue Heron site was further investigated at the site examination level and determined to be eligible for the National Register of Historic Places. The report provided recommendations for further inventory of archaeologically sensitive areas, and evaluation of the other identified sites. In order to accomplish the objectives set forth in ER 1130-2-540, a four step Action Plan is recommended.

25-2084 Chartier, Craig S.

2001 Intensive (Locational) Archaeological Survey for the Little River Sewer Project in Gloucester, Massachusetts. 38 pages.

An intensive (locational) survey was conducted in Little River section of Gloucester for three planned pump stations. The Samoset Road station was located on filled marsh and was determined to have no archaeological potential. The other two locations, Stanwood Point and Lower Banjo Pond, were in high potential areas for archaeological resources because of its proximity to water, travel routes, and previously recorded sites. Fieldwork consisted of 26 test pits (50x50cm) within the two areas (five systematic test pits and four bracket test pits within a 10m block at Stanwood Point and 17 systematic test pits in a 20m block and one transect at Lower Banjo Pond). Prehistoric debitage and historical artifacts were recovered at the Stanwood Point area and historical artifacts were recovered from the Lower Banjo Pond area. The prehistoric artifacts appeared to be either isolated occurrences or part of a larger site, possibly located in the bed of the present Stanwood Point Road. No artifact concentrations were noted nor were temporally diagnostic artifacts recovered, and the site is not considered significant due to the low density of cultural material recovered from the small, concentrated area. No further archaeological testing is recommended at either area.

25-2085 Chartier, Craig

2001 Intensive (Locational) Archaeological Survey for the National Tower, LLC Antenna Site, Athol, Massachusetts. 39 pages.

An intensive (locational) survey was conducted at an existing antenna site where associated infrastructure is scheduled to be added. Testing was located beyond the disturbed edges of the existing access road and tower enclosure. Twenty-five test pits were excavated along three transects. Three historic artifacts were recovered. No prehistoric artifacts were recovered. No additional testing is recommended.

25-2086 Donohue, Barbara

2001 Intensive Survey for the Proposed Hammond Street Building Chestnut Hill Campus Boston College, Newton, Massachusetts. 191 pages.

A three-phase intensive (locational) survey was conducted in a 1.5 acre parcel on the Boston College campus. Previously, a reconnaissance survey had indicated that the project area had potential for historic features associated with the early 19th-century development of the property. Included in this survey were documentary research, subsurface testing, remote-sensing, and machine-assisted excavation. Subsurface testing included the excavation of 62, 50x50cm shovel test pits and seven backhoe trenches for a total length of 185.75m. Sections of intact foundation walls, a brick vault and two drains were revealed. These features were associated with the Thwing/Haynes/Slade residence(s) dating from ca. 1806 to ca. 1895. A site examination is recommended.

25-2087 Ingham, Donna and Alan Leveillee

1999 Intensive (Locational) Archaeological Survey, Bluestone Desalinization Project Area, Dighton, Massachusetts. 108 pages.

Excavation of 49, 50cmx50cm test pits and systematic walkover survey across the 17-acre Bluestone Desalinization complex project area resulted in the discovery of one prehistoric Native American and three historic Euro-American archaeological sites. The P. Glaucus Site is located in the northwestern portion of the project area and is dated by the recovery of diagnostic ceramics to the Late Woodland Period (c. 1000-450 B.P.). The presence of archaeological deposits and intact cultural features at the site indicate a functional association with food and resource processing,

food consumption, refuse disposal, and a limited amount of lithic maintenance and/or manufacturing. The P. Glaucus Site has the potential to add to our knowledge of Late Woodland Period land use and settlement patterns in the lower, estuarine, Taunton River basin and is considered potentially eligible for inclusion in the National Register of Historic Places. The Rose-Matterson-Rawson Homestead and the J. Briggs Homestead are domestic sites located adjacent to the west bank of the Taunton River. Each reflects the most intensive use during the Federal Period (1775-1830), a period that saw the growth of shipbuilding and marine-oriented commerce in Dighton and other towns on the lower Taunton River. Possible secondary functional associations of the sites are with commercial and agricultural activities. The presence of aboveground structural elements and intact belowground archaeological deposits at each site indicate that meaningful horizontal and vertical spatial patterning is retained within each site area. The Rose-Matterson-Rawson Homestead and the J. Briggs Homestead, therefore, each have the potential to add to our understanding of the economic history of Dighton, particularly during the Federal Period, and are potentially eligible for inclusion in the National Register of Historic Places. Rose's Landing is a timber crib and rubble stone wharf located on the western shore of the Taunton River a short distance to the east of the Rose-Matterson-Rawson Homestead. Although partially eroded and under threat because of its exposure at low tide, a significant portion of the structure remains intact. Rose's Landing is one of very few early wharf sites identified in New England and may be unique among wharf sites outside of an urban core. It is believed, on the basis of cartographic evidence, to date to the Federal Period and has the potential to contribute to our knowledge of early 19th-century wharf construction and appearance, as well as to our knowledge of maritime activities and commerce in Federal Period Dighton. The report recommends avoidance of the P. Glaucus Site, the Rose-Matterson-Rawson Homestead, the J. Briggs Homestead, and Rose's Landing and the landforms on which they are situated. In the case of Rose's Landing it was also recommended that a determination of impacts because of alteration of water level, salinity, and temperature resulting from the operation of the Desalinization facility be made and that any identified impacts be avoided. If avoidance is not feasible, site examination was recommended.

25-2088 Fragola, Patricia and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey, Finnel Drive Extension, Weymouth, Massachusetts. 68 pages.

The Finnell Drive Extension project area (formerly Weymouth Industrial Park) is a 45-acre parcel. Background research indicated the project area had the potential to contain small prehistoric sites oriented to wetlands along the Mill River and evidence of historic-period agricultural/pastoral land use. Field investigations consisted of a walkover survey followed by subsurface testing. The walkover survey identified some areas with evidence of previous disturbance from borrow pits, soil stripping, and rough grading of roadways. These previously disturbed areas were considered to have low archaeological sensitivity. Zones of high and moderate archaeological sensitivity for both prehistoric and historic period cultural resources were also identified, and a total of 60 test pits were excavated within these zones. One prehistoric site, the Finnell Site, was identified. Cultural material recovered from the Finnell Site consisted of a single projectile point midsection fragment of chert. This fragment appears to be from a relatively large, broad bladed point, possibly a Late Archaic Period (ca. 3,800–3,200 years ago) Susquehanna tradition type projectile point. Close interval (5m) subsurface testing of the Finnell Site did not yield any other cultural material. No historic period cultural material was recovered from the Finnell Drive Extension project area. Based on the low density of recovered material, the Finnell Site is not considered to be a potentially significant cultural resource. No further investigations are recommended.

25-2089 Rainey, Mary Lynne

2001 A Program of Archaeological Data Recovery Locus 1 East Terrace Site, 19-NF-414, Algonquin Gas Pipeline Interconnect, Bellingham, Massachusetts, FERC Docket No. CP98-100. 274 pages.

This data recovery program was designed to mitigate adverse effects to the East Terrace Locus 1 Site that will be caused by construction of the AGT pipeline interconnect route to the new ANP facility. The data recovery research design included a comprehensive list of local and regional questions about prehistoric settlement patterns and life ways. These investigations and the types and relative densities of recovered artifacts and features suggest an intermittent but long-term site use beginning during the Middle Archaic Period (8000–6000 B.P.). Previously identified Late Archaic through Middle Woodland components have been augmented with additional artifact types, features, and radiocarbon dates. The investigations also documented a rare and regionally distinctive feature, significant in the context of Early Woodland Period pottery production. The project is the first data recovery program to be completed on a prehistoric site in Bellingham. Collectively, the intensive (survey), site examination (evaluation), and data recovery (treatment) studies at the East Terrace Locus 1 Site (19- NF- 414) have generated a diverse collection of new archaeological data. Analyses and interpretations of the artifacts and features have contributed toward contemporary research issues in prehistory on local and regional levels.

25-2090 Cherau, Suzanne G. and Kristen Heitert

2001 Intensive Archaeological Survey, Lost Lake Recreation Area, East Brimfield Lake, Holland, Massachusetts. 156 pages.

The intensive survey was conducted to (re)locate and identify prehistoric and historic sites in the established Lost Lake Recreation Area (approximately 15 acres), which has been determined to have moderate to high archaeological sensitivity. The current archaeological investigations also included boundary determinations of all identified archaeological sites and a preliminary determination of site integrity and eligibility to the National Register of Historic Places. Field investigations consisted of the excavation of 128, 50x50cm test pits divided among three judgmental transects, one 30x30m block, four judgmental test pits, one array, and a series of radiating transects within a coordinate grid system. Transect pits were spaced at 10m intervals and coordinate grid test pits were spaced at 5m and 10m intervals. Background research consisted of a review of local geology, geography, prehistory, and history in order to develop environmental, prehistoric, and historic contexts for the project area and identified sites. Additional map and deed research was conducted for the identified historic sites. The investigations identified and examined two prehistoric and three historic sites. Lost Lake I and Lost Lake II, located along the eastern shore of Lost Lake, yielded low to moderate densities of chipping debris, a complete quartz Small Stem projectile point, and an aboriginal pottery rim fragment with punctate decoration. Preliminary horizontal boundary determinations indicate that each site measures roughly 4,800 sq m, although it is likely that both sites expand beyond those boundaries where natural topographic features (lake, wetland) are not limiting factors. Furthermore, it is likely that the sites are related to one another functionally and temporally and represent an articulated resource exploitation and settlement strategy. Both sites possess good physical integrity and have the potential to yield important information concerning the prehistory of the Quinebaug River drainage in south central Massachusetts. Avoidance or further research is recommended for these site areas. The three historic sites, Lost Lake Cottage I, Lost Lake Cottage II, and Lost Lake Cottage III, are the structural remains of buildings present within the project area from c. 1808 to 1958. Lost Lake Cottage I was a shallow depression with associated ornamental plantings located between Lost Lake and Old East Brimfield Road. Subsurface investigations yielded 561 pieces of cultural material and a deeply buried fieldstone foundation associated with late-18th-century domestic debris. Deed research suggests that the foundation may represent some of the oldest documented occupations of the property dating to 1808 and perhaps earlier. The project boundaries have been established as the historic lot boundaries of Parcel 907. Lost Lake Cottage I has the potential to yield evidence of an early period in Holland's agrarian and architectural history. Avoidance or further research is recommended for this site area. Lost Lake Cottage II was a shallow depression associated with the Lost Lake Colony Trusteeship of the property dating from 1932—1948. Five test pits yielded only a single brick fragment. This site possesses poor physical integrity and low research value/information content. No further archaeological investigations are recommended. Lost Lake Cottage III comprises a small fieldstone foundation surrounded by an earthen berm platform located at the southeastern

edge of Lost Lake. This site yielded a very low density of cultural material form six test pits, including a single piece of window glass and three pieces of chipping debris, the latter of which is probably associated with the adjacent prehistoric occupations of Lost Lake I and II. In spite of the minimal number of recovered artifacts, comparison of the site location with historic maps suggests it may be the remains of the J.B. Gould house, visible on the 1850 map of Holland and situated within the present boundaries of Parcel 906. The foundation remains possess good physical integrity and, because they lie within a nearly undisturbed agrarian setting, the site has the potential to address shifts in land use and standing structures within the project area over time. Avoidance or further research is recommended for this site area.

25-2091 Mohler, Paul J., Katherine Howlett, Anne Hancock, and Blaine Borden

2001 Archaeological Investigations at the Old Manse Boathouse, Concord, Massachusetts. 75 pages.

The Old manse property derives its primary significance as the home to some of America's best known literary figures, including Ralph Waldo Emerson and Nathaniel Hawthorne. Based on documentary research, the boathouse was built during the late 19th-century. Fifteen shovel test pits, each measuring 50x50cm were positioned along a staggered 10m grid in the meadow east of the boathouse. Five judgmental test pits were positioned along the proposed dock. A block of nine excavation units (6mx6m), three of which were excavated, was used to examine the boathouse foundation. Based on subsurface testing, the meadow east of the boathouse appears to possess medium to high prehistoric archaeological integrity. Excavations in and around the boathouse revealed a high degree of modern refuse as well as numerous items dating to the late 19th century when the boathouse was in use. Given the possibility of erosion and sedimentation in the area, much of the archaeological record has disappeared around the boathouse. Our archaeological investigation provided a slight glimpse into the brief history of the boathouse at the turn of the century. In addition to the previous investigations conducted at The Old Manse, the presence of a prehistoric occupation is further substantiated, based on the artifacts discovered, including projectile points and grit tempered ceramic fragments.

25-2092 Fragola, Patricia and Leith Smith

2000 Intensive (Locational) Survey for Unmarked Graves, Glynn Memorial Nursing Home, Haverhill, Massachusetts. 42 pages.

This project area lies within an area that was historically part of the Haverhill Asylum and Town Farm during the 19th century. The Massachusetts Historical Commission (MHC) requested the survey based on the 1990 discovery of human remains within the project area. A total of 10 machine-assisted trenches were excavated. During this survey, artifacts were recovered that dated from the late 19th century to the present. Much of this cultural material reflects operation of the nursing home from its construction to the early 20th century. The artifact assemblage collected contained mostly ceramic sherds from serving vessels, such as plates, bowls, and cups, and a large quantity of food bone. Much of the recovered bone showed evidence of having been butchered. The nursing home kitchen was located in the south end of the east wing, and might account for the presence of a large amount of processed bone in the south yard. Background research indicated that there was a cemetery associated with the Haverhill Asylum/Town Farm, now the Glynn Memorial Nursing Home. This cemetery, however, is not believed to be within the current project area. Based on the results of historic documents surveyed, which included a survey of historic maps and written histories, it is likely that the cemetery is situated to the west or south of the proposed impact area. Based on the results of both background research and field excavations, the report concludes that the bones recovered in 1990 are likely to have been food bones and not human remains. No further archaeological investigations are recommended.

25-2093 Dudek, Martin G.

1999 Summary Report Archaeological Site Examination, Site WW2, Wastewater Management Project, Kingston, Massachusetts. 212 pages.

Site WW2 (the Tura Site) was previously identified during the intensive (locational) survey conducted for the cross-country pipeline segment for the Wastewater Treatment Plan. The Site Examination consisted of 68 systematic test pits (50x50cm), two judgmental test pits (50x50cm), and three excavation units (1x1m). The site boundaries were defined through 64 systematic test pits and two judgmental test pits. Site WW2 has a defined maximum length of 160m (north-south) and a defined maximum width of 160m (east-west), with a tested area of approximately 13,200 sq m (3.26 acres or 1.32 hectares). The site continues out of the project area on private property to the north, south, and east, where zones of disturbance have been defined as boundaries. It is bounded on the west by Stony Brook. Four systematic test pits and three excavation units (1x1m) investigated internal site characteristics. Seventeen features were identified, including a Contact-period hearth with postmolds and associated trade beads, a group of pit features with unburned bird bone in one, and a group of three postmolds in a test pit. The Intensive Survey and Site Examination for Site WW2 recovered a total of 4,569 artifacts and other materials: 2,200 historic materials (including coal by-products), 1,192 chipped lithics, 80 Native American pottery sherds (60 shell-tempered, 5 grit-tempered, 1 sand-tempered, and 14 indeterminate), 17 ground stone/utilized cobbles, 10 Contact-period artifacts, 565 bone fragments, 19 shell fragments, 456 charcoal fragments, 15 unidentified pottery sherds, 12 rocks (possibly cultural), and 3 other specimens of plant remains (historical). The lithics include 21 bifaces (quartz, felsitic rhyolite, chert, and meta-sediment), consisting of four Large Triangle/Levanna points, a Neville-Variant or Atlantic-like point, two other stemmed points, a Small Triangle, two triangular bifaces, and 11 other biface fragments. Other lithics include 1,114 flakes (quartz, felsitic rhyolite, quartzite, chert, hornfels, argillite, granite, slate, meta-sediment, and unidentified), 42 pieces of shatter (quartz, felsitic rhyolite, quartzite, granite), 11 cores (quartz), one uniface (granite), and three chipped cobbles/pebbles (quartz). The ten Contact-period artifacts include eight glass trade beads, one piece of utilized early bottle glass, and one piece of wire-woven white sheet metal. The site is a multicomponent one with Middle and/or Late Archaic, Late Woodland, and Contact-period components. Site integrity is fair, because of plowing and loam removal. Despite this, intact groups of Native American features were identified in the B horizon at three or more locations, including a Contact-period hearth with postmolds containing burned and unburned animal bone and associated glass trade beads. A radiocarbon date of 790 $\pm$ 190 was obtained. The evidence for a Contact-period food and meat processing camp along a tributary stream, the preservation of unburned bone in features from two areas, and the multicomponent aspect of the site all give evidence of this site's significance. The site is eligible for inclusion in the National Register of Historic Places under Criteria A and D.

25-2094 Dudek, Martin and Barbara Donohue

1999 Intensive (Locational) Archaeological Survey, Sesuit Harbor Improvement Project, Dennis, Massachusetts. 115 pages.

This intensive survey involved the investigation of four areas (A-D) in the vicinity of the Shiverick Shipyard site (DEN-HA-2). Dredging fill dating to the 1950s covered nearly all of the project area to the depth of 1-2.5m. A backhoe was used to excavate to the natural strata and systematic test pits (50x50cm) were then excavated. At 15 of 36 locations investigated, it was necessary to use the backhoe to investigate the natural strata, since the fill exceeded 1.8m and the underlying natural strata were too soft or wet to investigate in accordance with OSHA safety standards. No significant cultural resources were identified at Area A. At Areas B, C, and D, potentially significant historic resources related to the Shiverick Shipyard were identified. Shipyard work areas were suggested for Areas B and Area C; this includes stone foundations at TP 17, possibly the calker's shop, and TP 19, possibly a wharf wall or platform used in ship construction. Peat-marsh deposits with wood refuse from the shipyard and possible shoreline features were present at Areas C and D. These included rocks that may have formed a boundary to a wharf, the launch channel, or the shipyard shoreline, and a possible launch channel. Another disturbed marsh deposit may indicate a slip or launch channel at Area B. Wood was present in or on peat deposits from Areas C and D

and consisted primarily of wood scraps and chips with some board, trim, treenails, and worked pieces. It is plausible that wood scraps and wood refuse were dumped in this area. Prehistoric chipping debris consisting of one quartz core, five quartz flakes, and one felsitic rhyolite flake was recovered from Area C. The site pattern suggested by the distribution of prehistoric artifacts in Area C was one of a thin scattering of chipping debris with subsequent historic disturbances (i.e., foundations, mixing and redeposition of soils). It appears that intact but small and discontinuous areas of a site are present. In Area B, a possible flake or quartzite spall, probably redeposited from another context, was recovered. It is considered an isolated and insignificant find. No prehistoric resources were present in Areas A and D. The prehistoric cultural resources identified in Area C are not considered to be significant, due to the low density of the artifacts, the lack of features or diagnostic materials, and the discontinuous nature of intact natural strata associated with the prehistoric artifacts. In all, 350 items were recovered. Of these, 337 were recovered from pre-1950s natural or cultural strata and 13 items were recovered from 1950s fill. The 337 items include 173 pieces of wood (most being worked scraps or chips), 55 coal-related minerals, 59 metal, 19 ceramic, and 11 glass artifacts, 10 stone items (7 prehistoric, 1 historic, 1 unknown, 1 natural), four leather and one textile artifacts, two bones, two shells, and one reed stalk. Of these, the diagnostic artifacts are consistent with a mid-19th-century date for the site (mold-blown bottle glass, whiteware, Albany-slipped stoneware, cut nails). The 13 items from the 1950s fill include six shell fragments, three pieces of plastic, one glass and one metal artifact, one coal product, and one stone spall or flake.

25-2095 Burr, Cornelia, Chris Edens, and Leith Smith

1992 Intensive Survey of the Rowley Elderly Housing Project, Rowley, Massachusetts. 71 pages.

This survey consisted of an intensive survey to identify and evaluate prehistoric and historic archaeological resources, and an architectural survey of standing structures. The intensive survey covered 3.16 acres with 66 50x50cm shovel test pits. Sixty-four test pits were placed at 12m intervals, and two were judgmentally located in proximity to the existing structures and outbuildings. The architectural survey determined that the structures located within the project area were not eligible for listing in the National Register. Prehistoric materials identified during the intensive survey were limited to a possible flake. The majority of historic materials recovered were believed to be associated with 19th- and 20th-century occupation. No further archaeological investigations were recommended.

25-2096 Dalton, Ronald and Deena Duranleau

2000 Report of a Reconnaissance Survey and an Intensive (Locational) Survey for the International Corporate Park in Marlborough, Massachusetts. 39 pages.

The property has been previously disturbed by the construction of radio towers and buildings; therefore testing was restricted to terraces on undisturbed portions of the project area. This testing involved 53 test pits plus 9 bracketing test pits for a total of 62 test pits (all 50x50cm). Four test pits in two areas contained a total of 11 rhyolite secondary flakes and represent two sites: Hager Hill 1 and Hager Hill 2. The flakes are the result of maintenance activities associated with hunting or foraging activities and were not found with features or other evidence for long-term or continuous occupation by Native groups. Given this evidence, no further archaeological investigations are warranted for this 39.69 acre parcel of land.

25-2097 Edens, Chris

1992 Archaeological Site Evaluation at Site 19-MD-702 of the Hamlet at South Natick, Natick, Massachusetts. 30 pages.

An intensive survey was conducted at the Hamlet at South Natick, a 60 unit, approximately 90 acres housing subdivision. Two prehistoric sites were located, and scatters of historic artifacts and

surface remains were identified. One of the prehistoric sites was recommended for a site examination, which identified two distinct occupations. A Late Archaic occupation consisted of a flintknapping site, where bifacial reduction and tool-maintenance was carried out. The other occupation dates to the Late Woodland or Contact Period and evidence of this specialized activity site consisted of pottery, calcined bone, and a charcoal scatter. Given the density of the testing strategy, with 17 test pits and 6 excavation units within a site approximately 20m by 25m, no further archaeological testing is recommended.

25-2098 Edens, Chris and Greg Laden

1993 Site Examination for the Rockwood Estates Development, Canton, Massachusetts. 85 pages.

An intensive survey conducted in 1992 on the 38 acre parcel of land identified an 18th-century cellar hole, associated artifacts, and scatters of chipped stone (see report #25-1350). The parcel lies in or near lands of Ponkapoag Plantation. A subsequent site examination revealed undisturbed soil horizons containing evidence for the prehistoric exploitation of nearby wetlands. The relatively intact foundation and associated refuse and floor deposits date the foundation to the first quarter of the 18th century and indicate English ownership. The historic site is considered significant and potentially eligible for listing on the National Register.

25-2099 Edens, Christopher

1992 Intensive Archaeological Survey, Buttonwood Meadow Development, Acushnet, Massachusetts. 51 pages.

A reconnaissance survey that included this project area was conducted in 1980. For the intensive survey of this 8.1 acre parcel, 116 50x50cm, test pits were excavated in nine transects at 12m intervals. A total of 401 objects (mixed prehistoric and historical) were recovered throughout the parcel with uneven distributions. Prehistoric material was recovered from two separate artifact clusters. These materials included a nondiagnostic quartz scraper, an untyped stemmed projectile point and untyped projectile point stem, a nondiagnostic biface fragment and a variety of chipping waste including quartz, quartzite, felsites, and chert. No additional archaeological investigations were recommended.

25-2100 Decima, Elena

1997 Intensive Archaeological Survey, New Kingston Elementary School, Kingston, Massachusetts. 43 pages.

This survey consisted of documentary research, a walkover of the school land, and the excavation of 38 systematic, 11 judgmental, and 6 bracket test pits. The excavations revealed two small prehistoric sites labeled Kingston School 1 and 2 (KS1 and KS2). KS1 yielded one argillite Small Stemmed projectile point and five felsite flakes. KS2 yielded 27 flakes (felsite, quartz, and chert), five pieces of quartz shatter, a quartz core, and one felsite point tip. Most of the prehistoric artifacts of KS2 were found within mixed (prehistoric/historical) contexts. No features were found. The finds suggest the presence of two small, transient campsites (one belonging to the Late Archaic/Early Woodland period), one on a dry, slightly higher area that overlooks wetlands and probably the headwaters of Second Brook (KS2) and the other (KS1) on a flat expanse of land between First and Second brooks. The artifacts suggest tool maintenance activities and perhaps hunting. Plowing, grading, and landscaping have impacted site KS2; all test pits but one showed mixed chipping debris and historic artifacts and most of them revealed a disturbed stratigraphy. Site KS2 lacks integrity; no additional archaeological work is recommended. Site KS1, which appears to be a small occupation, revealed no apparent disturbance and no mixed contexts. The site could add to the knowledge of Kingston prehistory, which is currently over-represented by sites near the Jones River, Smelt Brook, and Smelt Pond (56% of the sites 2-3 km away from Kingston School), and could shed light on small occupations away from the coast, near the headwaters of small brooks.

Conceivably, the Kingston school area offered adequate hunting and fishing and, being close to the headwaters of two brooks, a supply of possibly year-round water and other dietary resources. Thus, it is recommended that a site examination be conducted, to determine the extent of the site, its integrity, and potential eligibility for inclusion in the National Register of Historic Places.

25-2101 Decima, Elena, Barbara Donohue-Putnam, and Jeff Carovillano

1999 Intensive (Locational) Survey, Wastewater Management Plan, Kingston, Massachusetts. 58 pages.

This survey consisted of historical research, a walkover of areas assessed with archaeological potential, and testing of five areas. The survey identified two prehistoric sites: WW1 and WW2. Site WW1 is located between a main road and a secondary paved road, in the vicinity of the Jones River, and Stony and Tussock brooks. The partially disturbed site yielded prehistoric and historic material. Most of the prehistoric finds came from the topsoil strata, within mixed contexts; the excavated test pits exposed an undisturbed subsoil. Recovered artifacts included 1 point fragment (hornfels), 1 hammerstone (quartz), 1 possible ground stone fragment, 11 flakes (quartz, felsite, and rhyolite), 6 shatter fragments (quartz and unknown material), Rockingham (1) and whiteware (2) sherds, glass (9), and brick (4) fragments. The cultural material is restricted to a 12m linear segment. The site is likely a small Late Woodland hunting camp. The site may extend into a wooded area north of the test pits outside the impact area. A site examination is recommended. Site WW2 is located near the confluence of a minor stream and Stony Brook. This site is somewhat disturbed by plowing and the excavation of topsoil. The finds include 1 quartz edge tool), 3 bifaces (quartz, felsite), two possible hammerstones (1 granite, 1 quartz), 1 quartz core, 109 flakes (quartz, felsite, hornfels, granite, rhyolite), 17 shatter fragments (quartz, felsite, granite), 81 calcined bone fragments, 13 green bone fragments, 1 tooth (possibly deer), 3 shell fragments, 1 glass trade bead; creamware (3), redware (8), and whiteware (3) ceramic sherds, 1 pipe bowl fragment, 11 nails, 6 brick fragments, 20 glass fragments, coal, and aluminum foil. Almost all (97%) of the prehistoric finds come from levels 1-2 and 1-3; all of the historic material comes from 1-2, within mixed contexts. The finds cover an area approximately 120x35sq m. The site is interpreted as a prehistoric and/or Contact Period site, which may be related to (or be part of) site 19-PL-342--a Contact shell heap. The presence of bone, shell, and possibly seeds suggests that a habitation site may have existed in this area; the presence of features strengthens this preliminary interpretation. A site examination is recommended.

25-2102 Duranleau, Deena

2001 Final Report of Intensive Surveys at “The Settlement” and “The Colony” and a Site Examination of “The Bear Site” for the Highlands Development, Holliston, Massachusetts. 62 pages.

Four 30m blocks of 14 test pits each, were placed on terraced areas within 200m of a wetland in “The Settlement” portion of the project. None of the 56 test pits contained cultural material. A small household dump was tested with a judgmental test pit, which revealed a single dumping episode with artifacts dating from 1930s to the mid 1950s. No further archaeological testing was recommended for this 32 acre portion of the project. At “The Colony,” 300 test pits were excavated in the 209 acre parcel of land. Three loci had significant archaeological resources and were recommended for site exams. A site exam at “The Bear Site” revealed a small Early Woodland to the Contact Period encampment. Fifty four test pits and two excavation units were excavated, with felsitic rhyolite secondary flakes, a roasting pit with a C^{14} date of 2880 BP, and a gun flint dating to ca. 1675 identified. No further archaeological excavation is recommended for this site.

25-2103 Smith, J. N. Leith and Barbara Donohue-Putnam

1998 Intensive Archaeological Survey, The Villages at Walker Meadow, Westborough, Massachusetts. 43 pages.

This survey consisted of documentary research, a walkover of the project area, and the excavation of 63 systematic, 21 bracket, and 4 judgmental shovel test pits. Three prehistoric activity loci and a thin scatter of historic refuse were found. Locus 1 was defined by two gray felsite thinning flakes, a green felsite primary flake, and a possible fragment of quartz shatter, all occurring in a plow zone context overlooking a small spring. Locus 2 was identified by a single quartz flake and fragment of shatter, also occurring in the plow zone. Locus 3 was situated on a low terrace overlooking the very western edge of Cedar Swamp. An isolated tan, quartzite Stark-like projectile point base and a dark gray chert, Archaic Notched projectile point base came from this area, as well as a quartz thinning flake and argillite primary flake. All cultural material derived from a plow zone context with the exception of a single calcined bone fragment from the subsoil. Cultural remains from the historic period were limited to a thin scatter of ceramics, glass, and nails, which are likely associated with the occupation of a ca. 1870 Second Empire style farm house. Locus 1 and 2 are judged ineligible for listing in the National Register. An archaeological site examination is recommended for Locus 3 because of its potential for inclusion on the National Register Cedar Swamp Archaeological District. A site examination is also recommended for the yard area of the Second Empire house to determine if an earlier historic occupation occurred in this area, and if associated remains are potentially eligible for listing in the National Register.

25-2104 Macpherson, Jennifer and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey, Dana's Field, Sandwich, Massachusetts. 62 pages.

The intensive survey included background research and field investigations to determine the presence/absence of potentially significant archaeological resources on the 48 acre parcel. Background research did not identify any known prehistoric Native American or historic Euro-American sites in the project area. Subsurface investigations consisted of a walkover of the project area and the excavation of 76 test pits within three blocks and four test pit transects. Subsurface investigations recovered three pieces of quartz chipping debris from three separate test pits. This material, while documenting a Native American presence in the area, does not represent a potentially significant archaeological site and no further archaeological investigation of the project area is warranted.

25-2105 Ingham, Donna, Kristen Heitert, and A. Peter Mair, II

2001 Site Examination of the Santuit River I and Santuit River II Sites within the Cape Club Project Area, Mashpee, Massachusetts. 176 pages.

The site examination of portions of the Santuit River I Site established that it is composed of at least two spatially discrete loci. Each locus contains evidence of prehistoric occupation over a 4,500 to 4,700 year span and contains a diversity of cultural material types situated within intact prehistoric features associated with a variety of past human activities and is of local and regional significance. The Santuit River I Site is considered significant and should be considered eligible for listing in the National and State Registers of Historic Places under criteria A and D. The site examination of the Santuit River II Site established that it is not temporally, structurally, or functionally complex and is of unknown cultural/temporal association and is not considered to be a significant cultural resource.

25-2106 Atwood, Kathleen A.

2001 Historic Properties Management Plan, Hodges Village Dam, Oxford, Massachusetts. 280 pages.

The purpose of the Historic Properties Management Plan (HPMP) is to provide a comprehensive program to direct the historic preservation activities and objectives at the Hodges Village Dam Flood Control Project and to effectively manage and protect each historic property. The Action Plan in Section VII outlines specific tasks, procedures, and priorities that must be accomplished.

Cultural resource management procedures, which must be completed prior to the start of an undertaking, are also explained in this section. To date the follow tasks towards meeting compliance requirements have been accomplished: In 1983, an intensive archaeological survey of a proposed 200 acre low-flow augmentation project was conducted. Portions of the project area below the 476ft elevation were included in the study. In 1994, an intensive archaeological survey was conducted for the disposal of a 3.22 acre excess property tract of vacant land just below the darn. No archaeological resources were identified in either of these two studies. In 1995, an archaeological reconnaissance survey was completed. Background research, a walkover, and limited subsurface testing identified nine prehistoric find spot/site areas and the visual identification of 6 documented historic sites. The report provided recommendations for further inventory of archaeologically sensitive areas and evaluation of identified sites.

25-2107 Ingham, Donna and Alan Leveillee

2001 Intensive (Locational) Archaeological Survey, Cedar Farms Subdivision, Foxborough, Massachusetts. 50 pages.

The 10-acre parcel was stratified according to archaeological sensitivity, and subsurface testing was conducted within portions of the project area judged to possess a moderate or high likelihood of containing sits. A total of 41 test pits was excavated, resulting in the recovery of a low density of historic-period cultural materials and a moderate density of prehistoric cultural materials associated with a previously reported site (19-NF-568). The stratigraphic context for all cultural materials was a well-defined (active) plowzone. The historic and prehistoric cultural resources identified during the survey were not considered potentially significant because of their relative lack of contextual integrity and limited research potential. No additional archaeological investigations were recommended.

25-2108 Binzen, Timothy, Mitchell T. Mullholland, Christopher Donta, Margaret Kelly, and Maureen Manning

2001 Community-Wide Archaeological Reconnaissance Survey of Bolton, Massachusetts. 150 pages.

This project was conducted to identify previously recorded and potential cultural resource areas within the town of Bolton. Data recovered during this survey are part of a management plan that is to be integrated with a local comprehensive plan for future town development. The project included background research into the prehistoric and historic uses of town lands; stratification of town lands into areas of low and high potential to contain cultural resources, based on topography, water sources, soils, and previously recorded sites; a walkover inspection of selected previously recorded sites, and selected areas of high potential; interviews with local informants and town personnel; and integration of this information into a narrative of the town's past, and development of a management plan for identified resource areas. At the start of the project, eight prehistoric sites (including collection areas) and 32 historic archaeological sites in Bolton were on record at the Massachusetts Historical Commission. Many of the historic sites were included in forms for architectural resources or monuments, but had not yet been recorded as archaeological sites. Many of the site forms contained only partial information concerning the history and description, and condition of sites. Historic structures are generally assumed to possess associated archaeological deposits and should be considered sites although site forms may not yet exist for them. During the course of the project, one prehistoric site, one prehistoric locus, and 99 historical sites were added to the record. Temporal and environmental information were added to all the sites. At the end of the survey, there were more than 100 archaeological sites on record in Bolton. During the survey, approximately 46 sites were visited. The project concludes that Bolton contains many areas of high potential for prehistoric and historic archaeological sites. Most of these sites are in areas that have had limited disturbance. They represent a vital part of the town's heritage and have a high potential to contribute information of importance to archaeology. There also are several historic industrial sites and house foundations in town that may be significant. Recommendations are made

for protecting archaeological sites in the town.

25-2109 Dudek, Martin, Neal L. Trubowitz, Ron Dalton, Deena Duranleau, Michael Roberts, and Russell Handsman

2001 Data Recovery Studies at the Old Stony Brook and Crane Swamp Sites, Northborough and Marlborough, Massachusetts, The Massachusetts Water Resources Authority's Walnut Hill Water Treatment Facilities. 2 Volumes, 640 pages.

The Old Stony Brook (19-WR-655) and Crane Swamp (19-MD-790) sites, situated on the north end of Walnut Hill east of Crane Swamp, are Late Archaic short-term camps with evidence of bifacial tool manufacture, expedient tool use, and cooking (calcined bone, reddened earth), but no pit features or prepared hearths. Harris Matrix and quadrant excavation were used for 20sq m at Old Stony Brook (270sq m in size) for a total of 29sq m for all phases, and for 22.5sq m at Crane Swamp (220sq m in size) for a total of 31.5sq m for all phases. Over 1,000 lithics from Old Stony Brook and over 2,300 lithics from Crane Swamp were recovered from all phases, with 20 diagnostic bifaces from the former and three from the latter. Analyses of Phase I, II, and III collections included tool use-wear, debitage, faunal, and botanical analyses, and analysis of pollen cores from Crane Swamp and Cedar Swamp. Review of field methods found that smaller horizontal units aided in identifying activity areas, while the Harris Matrix was not preferred over conventional methods. Old Stony Brook was used, probably repeatedly, ca. 4,500-3,500 B.P., with quartz workshops producing Squibnocket-style and Small Stemmed bifaces, unifaces and flake tools, and activity areas that possibly included processing of game animals for food and hides and working of wood, and possibly bone or antler, for hafting tools. Crane Swamp appears to be a Late to Terminal Archaic (ca. 3,500 B.P.) camp, with two or more contemporary rhyolite workshops producing similar broad-bladed bifaces using two spatially distinct tool-manufacture techniques. Two fine-grained volcanic Genesee/Atlantic-like bifaces were associated. Other possible activity areas included game animal processing (with deer and canid) for food and/or hides, expedient unifacial and flake tool use, and working of wood or possibly bone. Another small, separate activity area may date from the Late Archaic or Early Woodland; it included a quartz drill and a hammer/chopper, a granite grinding stone, and a possible post hole. The differences between Old Stony Brook and Crane Swamp were dramatic. The chronological total-overlap between Squibnocket/Small Stemmed and Broad-Point use in this region challenges a temporal solution. The differences may reflect territoriality or function. A homelands model was examined in light of this area having been within Nipmuc homelands during later times. The likelihood of linking prehistoric homelands to historically documented homelands, without genetic or mortuary data, may be tentative at best. However, limited activity sites such as these are arguably critical in identifying territorial or functional divisions that may be related to prehistoric homelands.

25-2110 Hoffman, Curtiss

2001 Astra-10 Site Archaeological Data Recovery Project, Westborough, Massachusetts, Final Report. In 2 volumes, 638 pages.

From late 1993 through early 1996, students from Bridgewater State College and amateur volunteers from the W. Elmer Ekblaw Chapter of the Massachusetts Archaeological Society excavated a total of 177sq m at the Astra-10 site in Westborough. The data recovery project was designed to address several regional and local research questions, as well as several methodological issues. A total of 144 cultural features, 327 prehistoric lithic and clay artifacts, 3,722 pieces of debitage, 44,995 pieces of organic material, 8,536 pieces of fire-cracked rock, and 25,092 historic period artifacts was recovered from the site. Diagnostic artifacts of the prehistoric period include Vosburg, Brewerton Side-Notched, Brewerton Eared Triangle, Squibnocket Triangle, Merrimack Stemmed, Small Stemmed, Susquehanna Broad, and Fox Creek Stemmed projectile points, a T-base drill, and Middle Woodland pottery. Six radiocarbon dates and 15 oxidizable carbon ration (OCR) dates have been obtained from the site. Some of these are more credible than others. Three definitive prehistoric components are recognized: Late Woodland Laurentian, dated by OCR around 4500

B.P.; Late Woodland Narrow Point, dated by OCR and radiocarbon around 4200 B.P., and Middle Woodland Fox Creek, dated by radiocarbon between 1800 and 1500 B.P. There are possible Paleo-Indian and Transitional Archaic components as well, but the evidence for them is less strong. Historic period components include Federal, Late Industrial, and Modern, on the basis of diagnostic artifacts. There are also possible Colonial and Early Industrial components present. Feature complexity was very great in several areas.

25-2111 Donta, Christopher L., Thomas L. Arcuti, Sharon Swihart, Mitchell Mulholland, and Nancy Muller

2001 Phase 1 Reconnaissance and Intensive (Locational) Archaeological Survey for the Eastern Express Gas Pipeline, Massachusetts. 360 pages.

Archaeological reconnaissance and intensive surveys were conducted for a proposed pipeline project, which included the towns of Sandisfield, Tolland, Granville, Agawam, Longmeadow, East Longmeadow, Hampden, and Charlton. Background research and reconnaissance surveys were conducted of 48km (30mi) of proposed pipeline, 21 proposed access roads, 10 proposed pipeyards, and 1 proposed compressor station. Subsurface testing was conducted in 76 survey units along the proposed pipeline, resulting in the excavation of 1,475 shovel test pits. No subsurface testing was conducted at any of the proposed access roads or pipeyards, although recommendations were made to do so if the project were to be completed. Some testing was previously completed at the compressor station. Thirteen archaeological sites were investigated, eight of which were not previously recorded. The G. Dunham Foundation site (SAN-HA-2) in Sandisfield contains the remnants of a homestead, including a stone foundation, brick chimney remnants, well, stone fences, and a scatter of late 18th- and 19th-century artifacts. Archaeologists collected 562 artifacts and recommended the site for avoidance. A previously undocumented prehistoric site (the Dunham prehistoric site) was found at the same location, yielding a small white quartz triangular projectile point, and was also recommended for avoidance. The Allen House site (SAN-HA-3) in Sandisfield is a homestead site consisting of a stone foundation with central chimney and surrounding scatter of late 18th- and 19th-century artifacts. Archaeologists collected 551 artifacts and recommended avoidance. The Whitney Farmstead site (SAN-HA-1) in Sandisfield is another homestead site consisting of stone fences, a probable paddock, a well, and several stone piles. Excavators recovered a small number of artifacts around the edge of the site and recommended avoidance. The Amos Case Road site in Tolland consists of a stone-lined cellar hole and nearby stone fences. Archaeologists recovered probable early 19th-century artifacts and recommended avoidance. The Riverside site #1 (19-HD-191) in Agawam was a small campsite, which included one quartz biface fragment and one quartz flake. Archaeologists recovered nine pieces of quartz and rhyolite chipping debris, two quartz bifaces, and one ground stone abrader from ten different locations in a plowed field. The site was recommended for avoidance. The Boglisch site #2 in Agawam is a large, previously undocumented site that produced 20 chipped-stone tools, two ground stone, and numerous pieces of debitage and fire-cracked rock, including, diagnostic artifact types of the Late Archaic and Woodland periods. This site was recommended for avoidance. The Brook Bluff site (19-HD-201) in Longmeadow contained Native American ceramics, lithic debitage, ground stone, and fire-cracked rock, and was recommended for avoidance. The Brook Terrace site (19-HD-202) in Longmeadow produced a Jack's Reef projectile point and a small number of other artifacts and was recommended for avoidance. Findspots of isolated prehistoric debitage were also found in two locations in Longmeadow, but were not recommended for further survey. The Watchaug Brook site in East Longmeadow contained debitage but no diagnostics and was recommended for avoidance. One additional findspot was documented in Charlton, but it was not recommended for avoidance. Some survey units along the pipeline and testing at the pipe yards were not completed because the project was cancelled.

25-2112 Davis, Margo Muhl

2000 The Role of Land Trusts in the Protection of Archaeological Sites on Private Land: The

Trustees of Reservations as a Case Study. 231 pages.

Archaeological sites and the information they contain about past ways of life, environmental conditions, and landscapes are disappearing rapidly due to developmental pressures. Although many laws protect sites on public land or those threatened by publicly mandated, licenses or funded projects, sites on private land receive little or no protection. In the Northeast, where the majority of land is privately owned, our archaeological heritage is particularly at risk. One way to curb this threat is to ensure that sites on private land are well cared for and that threatened sites are protected through acquisition or easements by conservation-minded organizations. Private land trusts are uniquely situated for this task since they own thousands of acres of open space and actively encourage private landowners to protect their natural and cultural resources. The Trustees of Reservations (The Trustees), a Massachusetts-based land trust, began exploring archaeological site protection as a conservation option in the early 1990s. This thesis offers and archaeological protection plan for The Trustees to follow that will fulfill site preservation needs and not overburden staff. It also provides a justification for why and how archaeological site protection can enhance visitor and staff appreciation of natural reservations and thus how land trusts in general can benefit from protecting archaeological resources.

25-2113 Donta, Christopher L. and Mitchell T. Mulholland

2001 Archaeological Intensive (Locational) Survey for Harvard Forest Soil Test Plot Locations within Cape Cod National Seashore, Part 2, October 2000. 58 pages.

Subsurface testing was conducted in Provincetown, Truro, Wellfleet, and Eastham as the second part of the Long Term Ecological Research project conducted at Cape Cod National Seashore. Testing was also conducted in 1999 and was described in an earlier report. The purpose of the survey was to ensure that archaeological sites would not be impacted by the vegetation study. Sixty-three areas were selected for analysis, all of which were researched by the archaeological team for cultural resources, with 51 STPs completed in 42 of the soil test plot locations. Five sites or findspots were located in Truro, Wellfleet, and Eastham. One previously unrecorded historic site and four locations within previously recorded prehistoric sites were found. The historic site consists of a cellar hole depression and associated artifact scatter in the vicinity of the Atwood family homestead on Bound Brook Island. The prehistoric sites consist of lithic debitage from two locations on the south side of Salt Meadow in Truro (19-BN-415 and -161) and two locations overlooking Salt Pond Bay in Eastham (19-BN-194/308). No further survey was recommended because the project will have no further subsurface impacts.

25-2114 Cherau, Suzanne G., Kerrylynn Boire, and Mathew Kierstead

1995 Revised Damage Assessment Study and Proposal for Site Restoration, Old Colony Railroad Roundhouse Site (WHI-HA-2), Whitman, Massachusetts. 22 pages.

An archaeological damage assessment study of the National Register eligible Old Colony Railroad Roundhouse Site (WHI-HA-2), located within the new MBTA commuter rail station in Whitman was conducted after the construction contractor did not abide by the archaeological site stipulations as set forth by the MBTA The damage assessment survey consisted of a surface inspection, the careful hand removal of sand and gravel overburden, and the excavation of 10 shovel test pits (50x50cm and 50x100cm) to search for archaeological features that were no longer visible or present in order to assess their condition. PAL collected many of the displaced site elements (i.e., wooden cross tie fragments, iron spikes and tie plates, metal piping, single bricks) that were previously identified in situ as part of the recorded site (see report #25-1279, #25-1495). Other displaced site elements too large for site removal (i.e., foundation stones, brick and mortar sections) were left within the fenced-in site area. It was determined that moderate to severe damage had occurred to many of the ground surface and below-ground site elements including the granite mile marker, wooden crossties, turntable pit foundation stones, water tank foundation supports, and inspection pit structure of the roundhouse foundation. Two plans to repair and restore the damaged

elements of the historic site were recommended. Option A was based solely on repairing the current site damage and restoring site elements to their physical condition prior to contractor activities. Option B consisted of restoring and replacing damaged site elements as well as revealing and adding other site elements as part of an interpretive archaeological park. Interpretive features would include informative plaques describing the site's railroad history and individual site elements. The area of the roundhouse and turntable were also to be developed as an exhibit based on the archaeologically recovered, restored, and revealed ground plans of these structures.

25-2115 Rainey, Mary Lynne and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey Miacomet Golf Course Nine Hole Expansion, Nantucket, Massachusetts. 77 pages.

This investigation was carried out within the proposed location of a 9-hole expansion of the existing Miacomet Golf Course. Background research indicated that the project area was on the perimeter of a core area of Native American settlement. It was expected that the project area could contain prehistoric sites ranging in size from small find spots of isolated cultural material to larger multicomponent sites. The project area was also in close proximity to the documented location of the historic Native American settlement of Miacomet, which was occupied from the mid- to late 18th century. The project area also contained elements of the Joseph Starbuck Farmstead, which was developed in the early/mid 19th century. Historic-period land use in and around the project area was primarily agricultural/pastoral. Field investigations consisted of a walkover survey/surface inspection followed by subsurface testing. The walkover inspection identified zones of high and moderate archaeological sensitivity for prehistoric Native American and historic period cultural resources. Evidence of previous disturbance from unpaved roadways, cart paths, and a former aviation runway was minimal. The majority of the project area was assigned a moderate sensitivity for historic-period cultural resources. The area immediately surrounding a small, modern period cottage, historic/modern period well, and an arrangement of fieldstones and cut granite were in a zone of high sensitivity. The cottage was moved to its present location from another Nantucket location. The main house and two barns within the Joseph Starbuck Farmstead were not included in the golf course expansion project area. This portion of the farmstead was not subjected to subsurface testing. A total of 87 test pits (50x50 cm) was excavated within areas of high and moderate archaeological sensitivity. These test pits were placed in 30x30m sampling blocks and along judgmentally placed transects. Three judgmental test pits investigated the historic/modern period well and one specific topographic feature. No Native American cultural resources were identified during the intensive survey. Test pits within most of the project area yielded historic/modern period cultural material (ceramic sherds, glass, structural materials) from sandy loam plow zone contexts. This material cannot be associated with a specific historic period site, and is not considered a potentially significant cultural resource. A judgmental test pit placed next to the well showed that the upper portion (stone blocks, brick) of the well had been rebuilt in the modern period, while the older, lower portion (brick) remained intact. Two fill deposits within this test pit contained a mix of mid- to late-19th-century and modern period ceramic sherds, glass and structural materials. Test pits placed along a judgmental transect crossing the fieldstone arrangement yielded small amounts of similar material. It is recommended that the sixth fairway be designed to avoid adverse impacts to the historic/modern period well and fieldstone enclosure. A 50ft-wide buffer zone should be placed around these features to protect them during construction of the proposed golf course expansion. For safety purposed, the well should be capped. If avoidance and preservation in place of these features are not possible, additional archaeological investigation at the site examination level is recommended. The Joseph Starbuck Farmstead house and barns will not be affected by the proposed golf course expansion. It is recommended that all construction related activities (stockpiling of materials, heavy equipment, etc.) be carried out away from these structures.

25-2116 Macpherson, Jennifer and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey, Sprint PCS Wireless Telecommunication Facility BS54XC948, Millbury, Massachusetts. 69 pages.

This study included background research, walkover/surface inspection, and hand excavation of test pits. Subsurface investigation consisted of the excavation of 15, 50x50cm test pits placed judgmentally and along two transects. Investigations did not produce any evidence of Native American activity within the project area, and it appears that neither 19-WR-111 nor 19-WR-441 extend into the project area. Historic domestic material (ceramics, etc.) associated with the standing structure on the property was recovered. This material is not representative of any historic middens or other potentially significant archaeological deposits and no further work is recommended.

25-2117 Donta, Chirstopher L.

2001 Archaeological Intensive (Locational) Survey for the Septic System Upgrade on Georges Island, Boston, Massachusetts. 68 pages.

Background research and archaeological reconnaissance and site locational surveys were conducted for a proposed subsurface septic system on Georges Island in Boston Harbor. Four shovel test pits and six machine-assisted trenches were excavated in three possible locations for the septic system. Two areas of excavation focused on the glacis to the west and southwest of Fort Warren, identifying glacis as a combination of a natural hillside and 19th-century fill. Excavation to the northwest of the fort identified fill over a shingle beach horizon. One water worn flake of Saugus "jasper" in the beach level indicated the possible prehistoric use of Georges Island. A gravel pathway and surface remains a 19th-century coal shed and blacksmith shop were also recorded. One hundred and five artifacts were collected, predominantly structural items such as brick, window glass, and nails, although a smaller number of domestic items included ceramics, faunal remains, and one pipe bowl fragment. No specifically military artifacts were recovered. No evidence was found of an activity predating the construction of Fort Warren in the 1830s. Because the soil in all tested areas were considered unsuitable for septic purposes, the project will be redesigned. When new plans are formalized, it is recommended that additional archaeological consultation be completed.

25-2118 Binzen, Timothy and Antonio Medina

2001 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Oak Ridge Estates Residential Development, Leicester, Massachusetts. 41 pages.

In total, 72 shovel test pits were excavated at 7.5m intervals in areas of high archaeological sensitivity. No subsurface features or potentially significant archaeological deposits were identified. Aside from several stone fences, no historical resources are present. Soil profiles indicated a plow zone in a limited northern section of the project area, where a low volume of whiteware fragments was recovered. Elsewhere, the stratigraphy consisted of stony, undisturbed topsoil and subsoil. No further survey is recommended.

25-2119 Buatti, Erika

2001 An Archaeoparasitological Study of Spencer-Peirce-Little Farm, Newbury, Massachusetts. 59 pages.

The aim of the study was to recover and analyze parasitological remains from Feature 6, a privy, at the Spencer-Peirce-Little Farm in Newbury. The results of the study revealed that no nightsoil survived in Locus 21, the lowest level of the privy (a crocking layer) or in the wood samples taken from the planking that lay just above the crocking layer. The study includes an overview of the site's history and of the archaeology performed at the site from 1986 to 1997 as well as a discussion of parasite studies in archaeology and a discussion of methods employed in the analysis. The

only nightsoil that survived in Locus 21 came from soil samples taken from inside intact vessels that were used in the crocking layer. Only one sample produced parasite ova: three parasite eggs of two different species (Trichuris and Ascaris) both common human parasites but also common to farm animals. The results of the study indicate that the fluctuating water table likely leached away any nightsoil that had been present in the deposit. Apart from contributing to an understanding of the formation processes of the privy deposits, this study also examined soil from open yard deposits. The results of this investigation disproved the hypothesis that nightsoil from privy cleanouts had been used in landscaping at the sight. No nightsoil deposits were found in the open yard areas. The author offers several possible interpretations about site formation processes in the privy and offers a reconsideration of the nature and chronology of the feature's stratigraphic sequence. The author's chronological interpretation differs from interpretations of the deposits that are based on artifactual evidence (i.e., terminus post quem for the crocking deposit) and botanical remains.

25-2120 Chartier, Craig S.

2000 Faunal Remains from the Sandy's Point Site: Feature 29 and Feature 1. 228 pages.

A 17th-century Native cornfield was found in 1991 during a cultural resource management survey of a secluded island in Yarmouth. This was an important discovery in New England archaeology because sites are rarely found as untouched and pristine as this one. Excavations revealed that occupation at the site extended from the Lat Archaic to as recently as ca. 1675. Extensive Late Woodland features including hearths, postholes, roasting pits, and a storage pit were found scattered across much of the point. This work focuses on the two features that contained the bulk of the faunal remains. Feature 29 and Feature 1 were respectively situated on the eastern and western edges of the site. Feature 29, a large, shallow deposit of shellfish, pottery, lithics, and vertebrate remains, was dated to approximately 930 years before present. Feature 1, a smaller, discrete deposit of similar remains, was dated to approximately 360 years before present. The similar nature and contents of these two features provide comparative information on the subsistence patterns and environmental conditions of two groups of inhabitants at the site who lived there centuries apart.

25-2121 Chartier, Craig S.

2000 The Aptucxet Trading Post: Fact, Fiction, and a Study in 20th-century Myth Creation. 313 pages.

This work seeks to understand and investigate the significance of the Aptucxet Trading Post Museum Site in Bourne. Specifically, the historical interpretation of the site as a structure built in 1627 by English colonists from Plymouth is being examined. The site was investigated from three historical viewpoints to understand the importance of the trading house in its 1627, 1926, and 1995 cultural systems. First: How was the Aptucxet Trading Post viewed at the time of its construction in 1627? Second: What was the role of the 1920's excavations and subsequent interpretation of the site influenced by the cultural mindset of the time? Third: How, with the archaeological knowledge since the 1920s, can the site be interpreted today?

25-2122 Bradley, James W.

1998 Origins and Ancestors: Investigating New England's Paleo Indians. 32 pages.

This is a popular report on the Paleo Indian heritage of New England and based on a museum exhibition at the Peabody Andover. The catalogue discusses the history of the Paleo Indians of New England by examining three sites: the Bull Brook site in Ipswich, the Neponset site in Canton, and Nicholas site in western Maine. The three sites together present a study of the culture, tool technology, and archaeology of this period of New England history.

25-2123 Public Archaeology Laboratory, Inc.

2000 Archaeological Sensitivity Assessment Site D, Union Park CSO Detention/Treatment Facility, Boston, Massachusetts. 19 pages.

Site D is located on the Massachusetts Water Resource Authority's (MWRA's) Union Park Detention/Treatment Facility in the South End of Boston and is encompassed by the South End Industrial District. The project area's relative proximity to the South End Landmark/National Register District prompted its consideration as a site of moderate sensitivity for archaeological resources. An earlier reconnaissance archaeological survey indicated a potential for industrial period deposits. The site in question, divided into a paved parking area and a playground, is situated adjacent to the Boston Water & Sewer Commission (BWSC) Union Park Pump Station and contains no standing structures. Historic maps, city directories and local histories were reviewed. Staff also contacted staff at the BWSC and the MWRA for relevant information on the former and existing facilities on the property. Boring logs from geotechnical investigations were reviewed to determine the nature and integrity of the subsurface deposits on the site.

25-2124 Roach, Wayna and Kathleen Wheeler

2001 Results of Front Yard Site Examination at the Swett-Ilsley House, Newburyport, Massachusetts. 70 pages.

This survey was conducted to verify the presence or absence of sensitive archaeological resources in the front yard prior to relandscaping. Archaeologists sampled a total of 8sq m across the front yard, excavating three 0.5x2m and 1x2m trenches, which stretched from the front of the house towards High Street. In addition, four 0.5x0.5m shovel test pits (STPs) were excavated near the edge of the street to assess the potential for archaeological deposits along the road. A total of 3,438 artifacts were collected, almost all Euroamerican material related to the historic structure; two Native American artifacts–one quartz flake and one small piece of pottery–were recovered. The earliest historic-period artifacts derived from contexts directly against the house; these materials might have been discarded inadvertently as the result of sweeping out of doorways. For the most part, the front yard was kept clean of household refuse. In the mid 19th century fill, possibly from the back yard, was brought to the front, perhaps to level the lawn area. Archaeological investigations recovered evidence of a small, enclosed portico for the southern front door. The addition was constructed of posts stuck into the ground, and these were recovered against the house and about 2m (6.5ft) from the front of the house. The small enclosure is visible in an 1860s photograph. Planting features all appeared to date to the 20th century, with no evidence of earlier planting holes for trees or small plants. It appears that the quince trees, lilacs, and low-ground vegetation in front of the house all postdate the acquisition of the property by SPNEA in 1911 with the possible exception of a tall bush that is visible in Volume II of the Bulletin of the Society for the Preservation of New England Antiquities. No plantings are visible in the 1860s photo. Artifacts in the uppermost layer of loam suggest that a “formal” front yard was probably created in the mid 19th century. Mary Beaudry notes that in 1802, Isaiah Ilsley sold the house to Stephen Ilsley, Jr., and when Stephen died, the property passed to his son, Stephen Ilsley (see report #25-1380). The house continued in the possession of Ilsley heirs until SPNEA bought the property in 1911. Additional research is necessary to define who owned the house in the mid-1800s and to determine if there was an event (such as marriage or change in economic status) that might have precipitated a reorganization of the front yard into a more formal space along High Road. No sensitive deposits were encountered in the front yard, and no further survey is recommended.

25-2125 Mrozowski, Stephen A. and Brent Handley

1997 Final Report of the Archaeological Data Recovery of the Lawrence Manufacturing Company Overseer’s Block, Lowell, Massachusetts. 144 pages.

This report presents the results of the data recovery program that focused on the former site of Lawrence Manufacturing Company’s Overseers’ Block in Lowell. Extensive archaeological exca-

vation was conducted at the site. Remains of the former Overseers' Block were unearthed as well as substantial deposits of material culture dating to the 19th-century occupation of the site. In addition, prehistoric material was recovered from portions of intact soil horizons discovered beneath the building remains and fills brought to the site during the 19th century to prepare it for construction. Despite extensive development in the area and the demolition of the block in the early 20th century, the cultural resources associated with the Overseers' Block were found to possess a high degree of archaeological integrity. As a result the building remains and associated cultural features provided a rich record of life in the Overseers' Block and the changing character of the urban landscape. As a result of the data recovery program, cultural resources associated with a significant historical site have been unearthed and documented. The data program was successful in meeting the expectations of the research design developed for the project, and we recommend that no further archaeological investigations are needed.

25-2126 Binzen, Timothy L.

2001 Archaeological Intensive (Locational) Survey for the Maple Street Cemetery Preservation Plan, Adams, Massachusetts. 52 pages.

An archaeological intensive (locational) survey was conducted in two sections of the Maple Street Cemetery to determine the presence or absence of unmarked burials. Subsurface testing was conducted in an area adjacent to the Quaker Meetinghouse (built between 1782 and 1784) in the western extreme of the cemetery. Three machine-assisted trenches, each 2ft (60cm) wide and approximately 90ft (27m) long, were excavated to a depth of 30cm below the ground surface. The outlines of 34 grave shafts were identified, demonstrating that unmarked Quaker burials are located throughout this section of the cemetery. Subsurface testing also was conducted in the eastern end of the cemetery, next to a concentration of iron grave markers for Lithuanian and Polish residents dating to the turn of the 20th century. Two trenches, each 1.65ft (50cm) wide and at least 26ft (8m) long, were excavated to a depth of approximately 15cm below the ground surface. The outlines of ten grave shafts were identified. It is likely that additional unmarked burials are located throughout the latter section of the cemetery.

25-2127 Donta, Christopher L.

2001 Archaeological Intensive (Locational) Survey for Changes in the Proposed 5.6-mile Alternative Massachusetts Municipal Wholesale Electric Company, Natural Gas Pipeline, Ludlow, Massachusetts. 46 pages.

Background research and subsurface testing was conducted in four survey units, scattered across Ludlow. One-hundred and twenty (120) shovel test pits were excavated, and evidence of two archaeological sites was found. This consists of three pieces of quartz very close to the previously recorded Camp White prehistoric findspot (19-HD-264), and one piece of lithic debitage from Survey Unit 19, designated the Rood Street findspot (19-HD-266). These two prehistoric sites have each produced only low-density lithic scatters and are considered unlikely to yield substantial deposits of artifacts or intact features. The sites are unlikely to produce information of archaeological significance; no further survey is recommended for this project.

25-2128 Binzen, Timothy and F. Timothy Barker

2001 Archaeological Site Examination for the Proposed installation of an Exterior Drainage System and Re-grading at the John B. Gough Estate ("Hillside"), Boylston, Massachusetts. 78 pages.

This investigation was conducted to locate and identify archaeological resources that could be impacted by construction and to provide information concerning the historic grade around the house, the location of historic landscape features, and the construction sequence of the three sections of the house. The Gough Estate is a National Historic Landmark and is listed in the National Register of Historic Places. A total of 36 test units was excavated, consisting of 14 shovel test pits,

16 excavation units (most measuring 0.5x2m or 0.50x1m), and six machine-assisted trenches. Data were obtained concerning the depth and locations of the historic grade; the location of buried foundations of an outbuilding and addition (not standing); cobble-lined driveway gutters; an underground well vault; and a flagstone pathway leading into the north side of the house. Soil profiles indicated that during the 19th century, the natural slope on the west side of the house was truncated to C-horizon subsoil, and re-graded, while landscaping on the east (front) side of the house resulted in A-horizon topsoil deposits that were deeply buried beneath historic fill. The artifact assemblage was low in density and included whiteware, creamware, porcelain, and pane and bottle glass fragments consistent with domestic occupation of the property between the mid-19th and mid-20th centuries.

25-2129 Cherau, Suzanne G., Kerry Lynne Boire, Paul A. Russo, Kathleen Wheeler, Beth P. Miller, Holly Herbster, and Edna Feighner

1997 Archaeological Inventory Survey of Army Reserve Facilities Throughout new England Under the 94th Regional Support Command (RSC). 638 pages.

An archaeological inventory survey was conducted at 52 Army Reserve facilities located throughout New England located throughout New England under the 94th Regional Support Command (RSC). The archaeological investigations consisted of validation surveys at 31 of the facilities and intensive surveys at the remaining 21 facilities. The intensive archaeological survey at 21 of the Army Reserve facilities included background research and field investigations to classify archaeologically sensitive areas as well as to locate and identify any potentially important prehistoric and historic resources. The scope of the 31 validation surveys included walkovers. Visual inspections and background research as needed to confirm the results of two previous archaeological investigations. The validation surveys resulted in revised prehistoric sensitivity assessments at 4 of the facilities (Middletown and New Haven, CT; Springfield, MA; Bristol, RI), a revised historic sensitivity assessment at one facility (Warwick, RI), and a confirmation of the previous low sensitivity assessments at 26 of the project facilities. The intensive surveys identified low densities of prehistoric, historic, and modern period cultural materials at five facilities (Bangor, ME; Danvers, MA; Belmont, NH; Cranston, RI; and Colchester, VT) and possible deeply buried A-horizon soils between alluvial deposits at the Montpelier, VT facility. The intensive surveys conducted at the remaining 15 project facilities did not identify any archaeologically sensitive areas or yield cultural deposits. Further archaeological research is recommended at the facilities in Middletown and New Haven, CT; Springfield, MA; and Bristol, RI. The scope of work for the validation survey did not include the location and identification of any archaeological sites that may be present within revised sensitivity areas. Portions of these four facilities have been reassigned moderate and high archaeological sensitivity for prehistoric resources. An intensive (Phase I) survey is recommended. The survey would consist of subsurface testing and additional background research as necessary. It is recommended that no future construction activities be planned within the archaeologically sensitive area for unmarked historic graves at the facility in Warwick, RI. Further documentary research, informant interviews, and archaeological testing would be needed to determine the presence and extent of unmarked burials associated with Historic Cemetery #31 in the designated buffer zone where no previous severe disturbances were noted to have occurred. Avoidance or further archaeological research is recommended at the facility in Montpelier, VT. The investigation identified the potential presence of deeply buried A-soil horizons that could have supported prehistoric period occupations. The southwest portion of the facility has been assigned a moderate and high sensitivity for intact prehistoric deposits. Further archaeological research would include a microstratigraphic chemical analysis of soil cores taken from this area to determine the exact nature of the deeply buried soil bands and presence of living surfaces.

25-2130 Luhman, Hope

2000 Cultural Resources Management Plan, Holyoke Hydroelectric Project No. 2004. 208 pages.

This CRMP summarizes information concerning known and potential historic properties within

the area of potential effect; identifies license-mandated operations and enhancements that could affect historic properties; and presents an action plan for the management of historic properties within the APE over the term of the license.

25-2131 Chartier, Craig S.

2001 Intensive (Locational) Survey for Jefferson at Ashland Station, Ashland, Massachusetts. 42 pages.

Sixty-five test pits were excavated within four areas (nine in Transect 1, five in Block 1, nine in Block 2, 16 in Block 3, four bracket test pits, and 22 judgementally placed test pits) that had previously been determined to have archaeological potential in the walkover of the project area. A small concentration of possibly cultural quartz debitage was recovered from Test Pit 4 on Transect 1 (T1-4). Bracket test pits yielded more possibly cultural quartz debitage from one test pit. Because of the concentrated nature and the lack of any temporally diagnostic material from this area, further testing at this site would not lead to a better understanding of the prehistoric occupation there. No additional testing is recommended

25-2132 Hamilton, Christopher E.

1992 Final Report of Archaeological Data Recovery, The Whydah Shipwreck Site. 3 Volumes.

This detailed report summarizes all research conducted on the Whydah project from 1982 through 1992. The first volume summarizes the historical contexts of the research; describes field, laboratory, and conservation activities; provides the results of extensive site formation analyses; and interprets the privately excavated Whydah site within the broad context of the developing global economy of the early 18th century. The Whydah was a slave vessel that sailed from England to West Africa and on to the Bahamas where it was taken by pirates only to later sink off the coast of Cape Cod in 1717. The report includes extensive, illustrated artifact data that can provide useful, tightly dated, comparative data in many artifact classes including arms and armament, coins, Akan gold ornaments, pewter tableware (one piece with a possible Masonic emblem), ship furnishings, and personal effects. The second volume contains a catalog of finds and the third is a lengthy primary source bibliography with transcriptions of many related documents.

25-2133 Ingham**,** Donna and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey: Chelmsford Phase IVD Sewer Project Area, Chelmsford, Massachusetts. 55 pages.

This survey included background research, a walkover of the project area, and subsurface testing. Stratification of the project area into zones of expected archaeological sensitivity was based on the results of background research and a field review. This preliminary evaluation indicated that the project area contained many locations of previous disturbance from residential development as well as locations that contained poorly drained, low-lying areas within flagged wetlands. Subsequent subsurface testing, consisting of 14 test units, sampled those portions of the project area considered to have low to moderate archaeological sensitivity. No Native American or Euro-American archaeological sites were identified during the fieldwork aspect of the survey. No additional archaeological investigation of the Chelmsford Phase IVD Lateral Sewer project area is recommended.

25-2134 Donta, Christopher L., Timothy L. Binzen, and Antonio Medina

2001 Archaeological Intensive (Locational) Survey for the Proposed Lighthouse Beach Shore Protection and Bank Stabilization Project, Nantucket, Massachusetts. 64 pages.

Forty-six shovel test pits were excavated in the northern portion of Siasconset, along the east side

of Baxter Road. The test pits were excavated in locations proposed for the installation of auger holes packed with gravel for dewatering purposes, in an attempt to stabilize the eroding bank on the eastern shore of Nantucket. Three Native American sites were found, consisting of artifacts from seven shovel test pits. The Bounty site (19-NT-208) produced a quartz Small-Stemmed projectile point and a piece of quartz debitage from two test units. The Bluff site (19-NT-210) produced seven quartz and quartzite flakes from three test units. The Eastmost site (19-NT-209) produced a gray chert projectile point tip and two rhyolite flakes from two test units. No further survey was recommended, because the proposed impacts are to be confined to the already-excavated test units.

25-2135 Macpherson, Jennifer and Duncan Ritchie

2000 Intensive (Locational) Archaeological Survey East Brookfield Elementary School. 52 pages.

This 22 acre project area is located along Main Street (Route 9), east of Lake Lashaway. Background research included a review of previous archaeological investigations by both professional and avocational archaeologists within the town of East Brookfield and surrounding sections of the Quaboag River drainage. The project area is within the Seven Mile/Quaboag River drainage, which contains prehistoric sites of varying size and complexity. A known prehistoric site (19-WR-90) was reported to overlap the project area, however its boundaries, contents, and temporal affiliation were unknown. A small core of industrial and commercial activity, which developed through the historic/modern period, was located near the project area at the outlet of Lake Lashaway. A walkover inspection delineated zones of archaeological sensitivity and assessed previous disturbance within the project area. Subsurface testing was conducted in zones of high and moderate archaeological sensitivity. A total of 60 test pits, 50x50cm in size, was excavated during the intensive archaeological survey. No prehistoric cultural material or other evidence of site 19-WR-90 was found during subsurface testing in the project area. A small amount of historic-period cultural material consisting of one redware sherd was found in a plowzone context. This ceramic sherd appears to be an isolated artifact not associated with a specific site and is not considered to be a potentially significant cultural resource. No other evidence of historic/modern period development was found within the project area. No further archaeological investigation is recommended.

25-2136 Macpherson, Jennifer and Duncan Ritchie

2000 Intensive (Locational) Archaeological Survey Attleboro Industrial/Business Park Urban Renewal Project, Attleboro, Massachusetts. 68 pages.

This survey of the 185 acre parcel included the excavation of 148 test pits, resulting in the location and identification of two prehistoric cultural deposits. Findspot 1 yielded high densities of chipping debris and two stone tools within a small, localized area. These deposits are considered to be a potentially significant lithic workshop that could be eligible for listing in the National Register of Historic Places under Criteria A and D. Preservation in place was recommended if prudent and feasible. Findspot 2 consisted of a single, quartz Small Stemmed projectile point. Further testing in the immediate vicinity proved it to be an isolated find, and no further investigation was recommended at the findspot. Historic period land use was reflected in a very low-density scatter of field refuse and stonewall sections. While these resources may be related to a nearby home/farmstead dating from the 18th and 19th centuries, they were not considered to represent significant cultural deposits.

25-2137 Graves, Anna K.

2001 Intensive (Locational) Archaeological Survey, Shaw's Supermarket, Sandwich, Massachusetts. 43 pages.

A total of 50, 50-x-50-centimeter shovel test pits was excavated within the approximately 24-acre project area using a combination of three 30x30m test pit blocks and two test pit transects. The in-

tensive survey included background research, a walkover survey, and subsurface testing to locate and identify potentially significant archaeological resources that may be affected by project construction. The combined results of the intensive survey did not identify any documented prehistoric or historic period resources nor archaeological deposits within the project area. No further archaeological investigations are recommended.

25-2138 Waller, Joseph N. and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey, Phase II Expansion, Pembroke Business Center, Pembroke, Massachusetts. 65 pages.

Based on background research and a preliminary walkover inspection, sections of the project area were considered to have high and low archaeological sensitivity. The majority of the project area had high archaeological sensitivity for both Native American and Euro-American cultural resources based on its locational attributes. The zones of high sensitivity in the project area included the location of Site 19-PL-879 on an elevated knoll of well-drained sand/gravel soils with a fairly level upper surface in close proximity to wetlands along Pudding and Huldah brooks. Subsurface testing within zones of high sensitivity was done with 30x30m sampling blocks each containing 13, 50x50cm test pits and judgmentally placed transects with test pits placed at 10m intervals. This testing resulted in the identification of three prehistoric Native American archaeological sites. Two of these were small, low-density find spots of prehistoric cultural material (quartz, rhyolite chipping debris) designated as Pembroke Business Center Loci 1 and 2. The presence of Site 19-PL-879 was confirmed; prehistoric cultural material was recovered across a fairly large area on the level upper surface of the knoll overlooking Pudding and Huldah brooks. Cultural material recovered from test pits included an Orient Fishtail projectile point; two fragments of untyped projectile points; and pieces of rhyolite, quartz, argillite, and quartzite chipping debris. Two hearth/firepit features were found in what appears to be the central portion of the site. The Orient Fishtail point indicates that the site contains a Terminal Archaic period (ca. 3200–2500 years ago) component. It is also likely that the site has other Archaic or Woodland period components. Pembroke Business Center Locus 1 and Locus 2 are unlikely to yield additional information and are not considered to be potentially significant. Site 19-PL-879 appears to be a large to moderate sized, multicomponent site and is considered to be a potentially significant cultural resource. It is recommended that proposed construction avoid this site, if possible. No further archaeological investigation of Pembroke Business Center Locus 1 and Locus 2 is recommended. If avoidance of Site 19-PL-879 is not possible, additional archaeological investigation at the site examination level is recommended to determine its horizontal boundaries and other characteristics (internal complexity/density of cultural materials and features, temporal affiliation) and evaluate its eligibility for listing in the National Register of Historic Places.

25-2139 Fragola, Patricia and Suzanne Cherau

2001 Archaeological Data Recovery Program Historic Site 20M (HRV-HA-38), Jackson Road Improvement Project, Jackson Technology Park, Devens Commerce Center, Harvard, Massachusetts. 196 pages.

The data recovery program at Historic Site 20M (HRV-HA-38) involved extensive archival research and field investigations that provided for the collection of data, the processing, analysis, and curation of artifacts and samples. The archival research focused on a review of primary land evidence records, town business and tax records, family probates, and family genealogies to reconstruct the documented history of the farmstead and its owners/occupations. The field investigations consisted of the excavation of 63.35sq m of the 3,200sq m site area defined following the intensive survey. The data recovery fieldwork determined that the intact portion of the site is approximately 1,200sq m, of which 54sq m were excavated during the combined archaeological investigations. The subsurface testing units varied in size from single 1m square units to contiguous multiple meter square area. These units were excavated by hand to sterile subsoils or structural remains, in accordance with the Harris-Matrix excavation and recording technique. The documen-

tary and archaeological data are commensurate with house occupation that dates from the early to mid 1700s until the second quarter of the 1800s. The house was owned by three generations of Farwells, but the last (third) generation did not occupy the farm property. Exposed and identified site components consist of the dwelling foundation remains that fronted the historic Shabikin Road. The surrounding yard areas contain evidence of a filled fieldstone well to the north of the dwelling and a remnant cart path to the west and northwest that may have led to the documented barn structure. No archaeological evidence of the barn was identified during the data recovery program. The dwelling remains appear to include the original house built by Caleb Brown in the early 18th century. The full horizontal dimensions are unknown because of the fragmentary nature of the exposed foundation and cellar hole remains. The earlier part of the structure contained a partial cellar and may have been log constructed with a center brick chimney. The dwelling also contained a later 18th-century addition with end chimneys and other improvements made during the ownership of John Farwell. The addition appears to have been 7.5m wide by at least 20m long, with an interior wall sill support, dividing it roughly in half lengthwise. The foundation was constructed of drylaid fieldstones and boulders in part on a bedrock ledge. It was more than one-story high and may have been timber-framed. The house addition had more than one fireplace, one of which was identified at the northwest end in what appears to have been a kitchen and work area. The data recovery program also included a public education component.

25-2140 Doucette, Diana and A. Peter Mair, II

2000 Archaeological Site Examination of Seven Prehistoric Native American Sites, Route 44 Improvement Project, Taunton to Carver, Massachusetts. 275 pages.

The seven investigated sites are located north and south of the existing Route 44, between Route 58 in Carver and the Taunton River in Raynham. The study involved a review of previous archaeological investigations within the project area to develop theoretical and research contexts that guided the site examinations. Over, 323, 50x50cm test pits and 37 1x1m excavation units were excavated among the seven site areas within the Route 44 project area. Of these, 176 test pits and all of the excavation units contained cultural materials associated with prehistoric period land use and settlement. These materials consisted of 3,902 pieces of chipping debris, 83 chipped- and ground-stone tools (projectile points, scrapers, bifacial tools, and ground-stone tools including a gouge and an incised stone that is a possible pendant), and 122 pottery sherds. In addition, 15 cultural features were identified including stone fire hearths, postmolds, and refuse pits. The results of the fieldwork and specialized analysis of recovered data form a core section of the report. Of the seven sites examined, five contained sufficient evidence to be considered significant and potentially eligible for listing in the National Register of Historic Places. Two sites did not yield significant information to warrant further investigations.

25-2141 Heitert, Kristen, Jennifer Macpherson, and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey and Archaeological Site Examinations: Rugg/Dennett Site and Interchange 12 Site, Office/Hotel Development at Mass Pike Interchange 12, Framingham, Massachusetts. 118 pages.

This intensive (locational) survey investigated the presence/absence of potentially significant archaeological sites within three parcels proposed for development. Seventy test pits excavated within areas of high to moderate archaeological sensitivity identified one Native American site, the Interchange 12 Site containing quartz, quartzite, and granitic chipping debris, one quartz biface, and a granitic uniface and biface. The site examination of the Interchange 12 Site consisting of 24 test pits and one EU identified an extremely low density scatter of Native American cultural material, which has a low potential for yielding substantive or new information about prehistoric activity in the area. The Interchange 12 site is not considered significant and no additional research is recommended. The Rugg/Dennett Site, previously determined eligible for listing on the National Register of Historic Places (see report 25-1440), was identified during an intensive archaeological survey in 1994. The site examination included the excavation of 36 test pits and two EUs.

A small number of artifacts generally indicative of the late 18th to early 19th centuries were collected from fill deposits containing late-19th through mid-20th-century materials. Extensive landscaping in the yard area and construction episodes around the original house have disturbed and, in many cases, redeposited original cultural materials within numerous fills. The site examination of the Rugg/Dennett archaeological site did not identify any significant archaeological resources and no additional research is recommended.

25-2142 Heitert, Kristen, Suzanne Cherau, and Stephen Olausen

2001 Intensive (Locational) Archaeological Survey, Fife Brook Put-In Recreation Area, Bear Swamp Development and Zoar Whitewater Take-Out and Put-In Recreation Area, Deerfield River Hydroelectric Project, Florida. 58 pages.

An archaeological site examination was conducted at Fife Brook 5 (19-BK-174) in anticipation of recreation improvements to the area. A total of 38 50x50cm test pits and four 1x1m excavation units was excavated at 5m intervals across the 20x70m terrace overlooking the Deerfield River. This testing strategy, when combined with the intensive survey work (see Reports 25-824, 25-2062), resulted in the recovery of 422 pieces of cultural material. Quartzite chipping debris dominated the assemblage, followed by quartz, rhyolite, and chert. Diagnostic materials included a complete quartzite Atlantic/Snook Kill projectile point and seven fragments of aboriginal pottery, suggesting a Late-Transitional Archaic affiliation. No cultural features were identified. While severely compromised by erosion, the location and artifact profile of Fife Brook 5 is nearly identical to the previously identified Fife Brook Site Cluster (see report 25-824). These similarities form the basis of a predictive site model for the Great Bend section of the Deerfield River emphasizing temporary fishing camps along promising stretches of rapids.

25-2143 Glover, Suzanne, Kerrylynn Boire, and Kevin McBride

2000 Intensive (Locational) Archaeological Survey, Individual Lots Abutting Parcels I, IIA, IIB, and III – Tribal Trust Lands, Gay Head, Massachusetts. 174 pages.

This project surveyed approximately 141 acres of land abutting Tribal Trust Lands in Aquinnah (Gay Head). The acreage comprised 26 individual private lots that abut the north, east, south, and west sides of Parcels I, IIA, IIB, and III of Tribal Trust Lands. These investigations were conducted under contract with the Wampanoag Tribe of Gay Head/Aquinnah for future land acquisition and planning purposes. No previous archaeological investigations had been conducted within these private lots. The survey consisted of documentary research and field investigations that included a thorough surface inspection and subsurface testing. Documentary research consisted of a review of historic maps along with primary and secondary town histories and monographs. Subsurface testing consisted of the placement of 630, 50x50cm test pits within systematic grids around visible historic period structures, 30x30m sampling blocks, linear transects with test pits at 10m intervals, judgemental test pits, and test pit arrays with test pits at 5m intervals. The survey identified 14 prehistoric period Native American sites, the majority of which are designated as find spots of isolated cultural materials. They provide information relating to Middle Archaic through Late Woodland period occupation in the interior portion of the Gay Head peninsula. Only one of the prehistoric sites, in Lot 157, may contain evidence of a more complex occupation area. Additional archaeological investigations may be warranted should future acquisition and development in Lot 157 be planned by the Tribe. Eighteen historic period Native American home sites were located and identified within twelve of the individual parcels (Lots 169, 179, 193, 194, 198, 201, 17, 19, 23, 43, 16-25, and 27). These sites include 12 documented homestead complexes; the remaining six sites were found on the basis of archaeological structural remains and/or material assemblages. The structural remains, artifact assemblages, food remains, and field systems associated with the historic period sites are contributing elements to the complex record of early 18th through late 19th-century Aquinnah Wampanoag occupation and land use in the Old South Road community. Due to their significance in the historic and archaeological record of the island, miti-

gation measures such as avoidance and preservation are recommended should future land acquisition and development undertakings be planned by the Tribe

25-2144 Heitert, Kristen and Suzanne G. Cherau

2001 Intensive (locational) Archaeological Survey, Abington Commons, Abington, Massachusetts. 64 pages.

The 34.5 acre project area currently is a recreational paintball facility and historically encompassed an extensive nursery operation from c. 1880–1980. A walkover survey of the project area identified a high degree of disturbance related to the paintball and nursery operations including the excavation of deep "foxholes"; grading of the ground surface to create level playing surfaces, cleared picnic areas and modular office space; the installation of fencing, bunkers, and spectator bleachers; and large craters created through the removal and rotation of nursery stock. An electric utility easement crosscuts the southern portion of the project area and an active commuter rail line marks the eastern boundary of the parcel. Wetlands dominate the southern and western portion of the project area. A total of 35, 50x50cm test pits was excavated in the Abington Commons project area comprising one 30x30m block, four transects, two judgmental test pits, and one array. A total of 58 pieces of cultural material was recovered during testing including a sample of late-19th- to 20th-century domestic and nursery-related debris and a single, redeposited rhyolite chunk. The rhyolite may be related to the previously recorded Abington Nurseries Site (19-PL-466), which is located south of and adjacent to the current project area and contained materials dating to the Early and Middle Archaic periods. All of the cultural materials from the Abington Commons project area were recovered from heavily disturbed fill contexts. In light of the extensive ground disturbances and lack of any significant cultural deposits, no further archaeological investigations at the Abington Commons project area are recommended.

25-2145 Ingham, Donna and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey: Proposed Meadow Creek Residential Development, Dracut, Massachusetts. 92 pages.

The intensive survey of the 384-acre project area included background research, walkover survey and subsurface investigations including excavation of 177, 50x50cm test pits within zones of high and moderate archaeological sensitivity. Five loci of historic period land use/activity consisting of two small structures and three boulder quarries; the remnants of Proprietor's Way, evidenced by parallel tracks occasionally flanked by stone walls; and three loci of prehistoric period land use/activity, two find spots of chipping debris and one low to moderate density deposit of prehistoric Native American cultural material, consisting of quartz and quartzite chipping debris, broken quartz cobbles, and a quartzite-worked flake, in association with intact soils (Moosewood Site) were identified. No further work is recommended for the historic period loci or the two prehistoric Native American spot finds. It is recommended that Proprietor's Way be incorporated into the overall design of the project, perhaps as a walking trail. The Moosewood Site is considered potentially significant and avoidance was recommended. Through project redesign, Proprietor's Way was incorporated as open space and the Moosewood Site was avoided.

25-2146 Ritchie, Duncan

2001 Archaeological Monitoring Of Landscaping Improvements Bacon Free Library, South Natick, Massachusetts. 73 pages.

The monitored landscape improvements included planting two large trees near the library front entrance, the installation of electrical conduit and lighting fixtures around the exterior of the library building and a patio/terrace with a small garden bed. The Bacon Free Library is within the John Eliot Historic District, which is listed on the National and State Registers of Historic Places. This 71-acre district contains a complex of 18th- and 19th-century structures and the location of

the original 17th-century Christian (Praying) Indian settlement at Natick and a cemetery or burial ground. The Praying Indian Burial Ground is located at the intersection of Route 16 (Eliot Street) Union and Pleasant Streets and includes the grounds of the Bacon Free Library. Following review of the scope of proposed landscaping improvements by the Massachusetts Historical Commission (MHC); the MHC requested that a professional archaeological consultant monitor excavation activities. It was also recommended that limited hand testing be conducted prior to machine excavation of specific areas. Background research conducted as part of the intensive survey indicated that unmarked, historic period Native American burials had been found in the project area during construction of the Bacon Free Library in 1879. On numerous occasions over the last 150 years, unmarked burials had also been found in close proximity to the project area and there was potential for more features of this type to exist within the grounds of the Bacon Free Library. This investigation was carried out in coordination with the Massachusetts Commission on Indian Affairs. During the fieldwork aspect of the survey, Native American representatives from the Nipmuck tribe assisted the archaeologists. Seven judgmentally placed 50x50cm test pits were placed in the proposed tree planting locations, patio/terrace and garden bed. Several of these test pits yielded small amounts of prehistoric cultural material in disturbed soil contexts. This material included a Late Archaic (ca. 5,000—3,000 years ago) period Brewerton Eared projectile point of rhyolite and pieces of rhyolite and quartz chipping debris. During both hand sampling of tree planting locations with test pits and monitoring of machine excavation within the electrical conduit and lighting fixture trench, patio/terrace and garden bed, historic/modern period cultural material was found within landscaped loam, fill deposits and disturbed subsoil horizons. These materials were primarily 19th-century to early modern period ceramic sherds, bottle glass, and structural materials (brick, roofing slate, window glass, nails). Some deposits of sand fill containing brick debris and fieldstone trim spalls are most likely associated with construction of the Bacon Free Library. None of the prehistoric or historic/modern period cultural material found in the Bacon Free Library project area was considered to be potentially significant since it was unlikely to yield more information about past activities in and around the project area. No evidence of any unmarked burial shaft features or graves associated with the Praying Indian Burial Ground was identified in the project area. No further archaeological investigation of the proposed landscaping improvements at the Bacon Free Library was recommended. It was recommended that any future plans to carry out construction or modifications on the Bacon Free Library grounds be reviewed to assess the potential impact or effect it may have on the Praying Indian Burial Ground.

25-2147 Binzen, Timothy and Margaret Kelly

2001 Archaeological Reconnaissance And Intensive (Locational) Survey For The Hampden County Women's Correctional Facility, Chicopee, Massachusetts. 41 pages.

This project area contains approximately 15 wooded acres and is located .25 mile east of the Connecticut River, 1 mile south of its confluence with the Chicopee River. Within the project area, the topography consists of silty, loamy terrace escarpments of glacial outwash plain overlooking the Connecticut River. Subsurface testing was conducted along the crests of steep, linear ridges. A total of 70, 40x40cm shovel test pits (STPs) was excavated at 7.5m intervals. The soil profiles indicated the presence of generally undisturbed soils that had never been plowed. No prehistoric artifacts were recovered. Historic artifacts included bottle glass and a low volume of nails. At the end of a ridge in the northern section of the project area was the remnant of a low, C-shaped wall of cobbles and mortar; sections of the wall have tumbled down the slope. In one test pit to the south, a small stone feature interpreted as a drainage gutter was encountered at a depth of 13cm below the ground surface. No significant cultural resources were identified during the survey.

25-2148 Donta, Christopher and Jennifer Padden

2002 Archaeological Intensive (Locational) Survey And Site Examination Survey For The Proposed Forsman Residential Subdivision, North West Street, Agawam, Massachusetts. 83 pages.

Background research, an archaeological intensive (locational) survey, and a site examination sur-

vey were conducted on a 13-acre parcel of land in the northern part of Agawam, on the eastern side of Provin Mountain. The property lies in the area of one previously reported site (19-MD-92), about which little information is available. A reconnaissance survey defined three survey units with high potential for Native American sites. The subsequent locational survey involved the excavation of 100 shovel test pits, 17 of which contained Native American lithic debitage; Two sites were designated: the Forsman North Locus (19-HD-267) and the Forsman South Locus (19-HD-268). The South Locus site was recommended for site examination, which included 64 shovel test pits, four 50cmx1m trenches, and four 1x1m units. Twenty-eight of the 72 test units contained Native American lithic artifacts, including a Small-Stemmed projectile point, and a tabular anvil stone with a small circular depression in the center, likely utilized as a bracing stone for a pump drill, fire-starter, or spindle shaft. Because the site was of relatively low density and no intact features were found, it is unlikely that additional testing would produce information of importance, and no further survey was recommended.

25-2149 Donta, Christopher L., Margaret Kelly, and Jennifer Padden

2002 Archaeological Site Reconnaissance And Intensive (Locational) Surveys For The Home Depot Construction Project, Wareham, Massachusetts. 57 pages.

Background research on this 15 acre parcel did not identify any known cultural resources within the project area, although Native American sites are known from the immediate vicinity. Following a reconnaissance survey, 105 STPs and one 50cmx2m long trench were excavated. Four of the STPs and the trench contained historical artifacts, all concentrated in a small area adjacent to the junction of Old Plymouth and Old County Roads in the western part of the project area. No intact subsurface features were found in this vicinity, indicating that this cluster of artifacts is probably related to the use of the road in the 18th and 19th centuries. No Native American artifacts were recovered. Because no archaeological sites were found in the project area, no further survey is recommended for this project

25-2150 Anna K. Graves

2002 Intensive (Locational) Archaeological Survey, Mashpee Place, Mashpee, Massachusetts. 50 pages.

This project included background research including informant interviews, a walkover survey, and subsurface testing to locate and identify any potentially significant archaeological resources that may be affected by project construction. A total of 25, 50x50cm shovel test pits was excavated in within the 16.44 acre project area. Testing was comprised of four linear transects with shovel test pits excavated at ten-meter intervals. The combined results of the intensive survey did not identify any documented prehistoric or historic-period resources nor archaeological deposits within the project area. Therefore, the proposed project will not affect any potentially significant cultural resources and no further archaeological investigations are recommended.

25-2151 Binzen, Timothy L., Margaret Kelly, Joannah L. Whitney, and Christopher L. Donta

2001 Archaeological Site Reconnaissance And Intensive (Locational) Survey For Sprint PCS Wireless Communications Facility #Ct33xc564-2, Southwick, Massachusetts. 52 pages.

Following background research and a surface reconnaissance, specific locations within the proposed construction area were tested for prehistoric and historic cultural resources. In all, 26 shovel test pits were excavated at the proposed tower location and along the access road. Stratigraphic profiles in the test pits indicated natural stratigraphy, with the topsoil A-horizon possibly affected by historical timber harvesting and plowing in some locations. No archaeological features or deposits were encountered during testing, and no prehistoric or historic cultural materials were recovered. No further survey is recommended.

25-2152 Wheeler, Kathleen L. and Ellen W. Marlatt

2000 Results of Site Locational Study at the Crown Point Telecommunication Tower, Salisbury (Essex County), Massachusetts. 19 pages.

Archaeologists excavated a total of 26 shovel test pits within the Areas of Potential Effect (APE), which consisted of an access road and a lease area for a cellular tower and associated equipment shelter. No ancient Native American material culture was recovered, but archaeologists encountered a thin distribution of Euro-American artifacts in the plowzone from 21 of the 26 STPs. Artifacts consisted primarily of brick fragments, flat glass, and a few pieces of ceramics with manufacture dates from late 1700s to the first half of the 1800s. In general, artifact density was observed to be very light within the APE with no indication of intact deposits or features. Based on these results, no further archaeological testing was recommended. A final site inspection occurred on September 22, 2000, when project effects were found to conform to the plans provided to IAC, with no additional effect noted outside project boundaries.

25-2153 Donohue, Barbara

2002 Intensive (Locational) Archaeological Survey for the Cherry Street Interceptor in Plymouth, Massachusetts. 62 pages.

Seventy-three 50x50cm test pits (31 systematically placed along two transects, 9 judgmental, and 33 brackets) were excavated in areas of high potential along a 1,372m sewer route located in close proximity to 19-PL-295. While the project area had previously yielded extensive prehistoric materials to avocational collectors, no previous CRM study had been conducted. A total of 977 artifacts (681 prehistoric and 296 historic) were recovered. Diagnostic materials included Native American pottery; a shell midden, lithic activity areas, and a possible habitation/campsite were identified. Six prehistoric sites were identified. Two of the sites contained a low density of material and no further testing is recommended. Four of the sites, however, were determined to have potential to yield information on the Late Archaic through Late Woodland occupation of the area and a site examination is recommended for each of those sites.

25-2154 Chartier, Craig, Martin G. Dudek, and Alan Smith

2002 Report on the Intensive Archaeological Survey for Contract 22 of the Wastewater Program in Dracut, Massachusetts. 49 pages.

An intensive (locational) survey was conducted in the town of Dracut for approximately 500m of cross-country wastewater pipeline routes. This land was tested with 41 systematic test pits across the high-potential areas of three cross-country segments. No prehistoric resources were identified. Fill layers, disturbed stratigraphy, or hydric wetland soils characterized most of the testable routes. 20th-century materials made up the bulk of the recovered materials, most of which represented residential refuse. Several pieces of 19th- to early 20th-century bottle glass and nails were also recovered. No significant cultural resources were identified and no additional archaeological work was recommended.

25-2155 Herbster, Holly and Suzanne G. Cherau

2002 Summary Report, Intensive (Locational) Archaeological Survey, Bologna Property, Aquinnah, Massachusetts. 60 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources. A total of 28, 50x50cm shovel test pits was excavated within the approximately 9250 sq ft proposed project impact area. The intensive survey resulted in the identification of two Native American archaeological deposits. The

prehistoric period deposit consists of 8 pieces of quartz chipping debris collected within a spatially limited (25 sq m) area on the edge of a small knoll. The historic and modern-period cultural materials include domestic and construction-related items, collected in low densities association with several stonewall networks. Documentary records indicate an association with the Wampanoag Cuff family in the mid to late 1800s, who appear to have inhabited a homestead to the east in proximity to the project parcel. No evidence of structural features was identified in the project area, which appears to have been used as open land. While these cultural resources (Lot 209 Findspot; Cuff Site) document the continuity of Native American land use in this section of Aquinnah, they are not considered to represent potentially significant archaeological deposits, and no further testing was recommended.

25-2156 Herbster, Holly and Suzanne G. Cherau

2002 Summary Report, Intensive (Locational) Archaeological Survey, O'Brien Property, Aquinnah, Massachusetts. 54 pages.

The intensive survey included background research, a walkover survey, and subsurface testing. A total of 42, 50x50cm shovel test pits was excavated within proposed project impact areas that cover approximately 22,000 sq ft (2036 sq m). The intensive survey resulted in the identification of one Native American archaeological deposit. The prehistoric period O'Brien Site consists of 7 pieces of chipping debris and one lanceolate projectile point collected in a 100 sq m area on a level, well-drained terrace that is surrounded by wetlands. The recovery of a complete rhyolite projectile in close proximity to quartz chipping debris suggests that more than one period of site use may have occurred, and also suggests that although the area has been plowed, site integrity may be good. Although no cultural features were identified within intensive survey test pits, the presence of sandy, well-drained soils suggests that additional deposits may be located within the project area. In addition, the lanceolate projectile point recovered within the project area is not a type typically recovered at near-interior sites in Aquinnah. The site area is considered to represent a potentially significant archaeological resource and avoidance of the site with a protective buffer was recommended.

25-2157 Herbster, Holly and Suzanne G. Cherau

2001 Technical Report, Data Recovery Program within the Lot 5/6 Site (19-DK-138), Lot 6 Building Envelope, Squibnocket Ridge, Chilmark, Massachusetts. 102 pages.

Archaeological investigations conducted between 1992 and 1999 within portions of the Lot 5/6 Site area have included intensive survey through data recovery-level excavation (See reports 25-1314 25-2057). A total of 13.75 sq m was excavated as 20, 50x50cm test pits and 9, 1x1m EUs within the 420 sq m project area. Two large, deep storage pit features were identified and excavated, along with a shallow hearth feature, located directly below one of the pits. The hearth feature was radiocarbon dated to the Late Archaic Period, although the presence of cord-marked pottery, net sinkers, a burned seed, and other tool fragments in the pit above also connected site use to the Woodland Period. Lithic debitage comprised more than 75% of the 1509 total materials collected. Other artifacts included one Rossville and one Levanna point, several bifaces, stemmed point fragments, and limited shellfish remains. No evidence of human burial features was identified within the data recovery project area. The current data, combined with that collected in other portions of the site area, indicate that the Lot 5/6 Site was part of a large, multi-component occupation area during the Woodland and Contact Periods, and was also used for limited activities as early as the Middle/Late Archaic Periods. The approximately 5660 sq m site includes significant shell midden trash deposits, lithic workshop areas, and at least one human burial. These deposits were identified in sandy, rock-free soils that appear to define the overall site boundaries on a broad, high terrace overlooking Squibnocket Pond and the Atlantic Ocean. The Lot 5/6 Site also appears to be part of an larger settlement area documented at other sites within a one-mile radius on Squibnocket Ridge.

25-2158 Herbster, Holly and Suzanne G. Cherau

2002 Summary Report, Intensive (Locational) Archaeological Survey, Chao and Sand Property, Aquinnah, Massachusetts. 62 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources. A total of 29, 50x50cm test pits was excavated within the proposed well, house, septic, and utility/access corridor impact areas. The intensive survey identified two prehistoric period find spots within the project area. The Harpoon Hollow 1 Find Spot is comprised of a single heavily weathered rhyolite flake recovered in the topsoil horizon in one test pit. The Harpoon Hollow 2 Find Spot was also identified in a single test pit, placed within the northernmost well site. A total of 25 quartz flakes, a biface fragment, and a uniface fragment were collected between 0 and 20 cm below surface in a silty sand A/topsoil deposit. No evidence of cultural features was identified in the project area, indicating the isolated nature of the identified deposits. While these cultural resources document the continuity of Native American land use in this section of Aquinnah, they are not considered to represent potentially significant archaeological deposits, and no further testing was recommended.

25-2159 Herbster, Holly and Suzanne G. Cherau

2001 Summary Report, Intensive (Locational) Archaeological Survey, Zoia Property, Aquinnah, Massachusetts. 46 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources which may be affected by project construction. A total of 18, 50x50cm shovel test pits was excavated within the approximately 4000 sq ft proposed project impact area. The intensive survey resulted in the identification of one Native American archaeological deposit. The prehistoric find spot consists of 4 pieces of lithic chipping debris collected within a spatially limited (5 sq m) area on the edge of a small wetland. No evidence of cultural features was identified in the project area, which currently exists as an open yard area. While these cultural resources (Lot 50 Find Spot) document the continuity of Native American land use in this section of Aquinnah, they are not considered to represent potentially significant archaeological deposits, and no further testing was recommended.

25-2160 Roach, Wayna, Ellen Marlatt, and Kathleen Wheeler

2001 Results of a Partial Phase I Archaeological Survey of the Proposed Kyle’s Court Subdivision at 28 Wiley Street, Wakefield, Middlesex County, Massachusetts. 38 Pages.

This report summarizes a partial Phase IB archaeological survey to verify the presence or absence of archaeological resources within a 24-acre parcel along the Mill River at the site of the ancient Woodville District (19-MD-429). The landholding also contains an 18th-century house that is listed in the National and State Registers of Historic Places. The Woodville District is known from hundreds of ancient artifacts collected from the site by former landowner and resident, Ernest Tyzzer, and the MHC has a catalog (if not exact provenience) of the materials in this collection. The original scope of work called for testing all level areas of the parcel where construction impacts were planned, particularly along the lower terrace and on flat portions of the upper terrace, with a total of 220 shovel test pits. The development project was long in contention with abutters, and in late August 2001, an agreement was made that the Metropolitan District Commission would take the parcel by friendly eminent domain. All aspects of the project, including the archaeological survey were cancelled. The report summarizes the results of the field efforts up to the point that the archaeologists were dismissed. During three days of testing, archaeologists excavated a total of 28 shovel test pits (STPs) along the Mill River, of which 27 were positive for cultural materials. A total of 1,221 artifacts was recovered and included 25 lithic flakes from seven test pits positive for ancient Native American materials, and 1,196 Euro American artifacts. Al-

though the survey was not completed, the parcel was found to contain intact deposits of ancient Native American and Euro American artifacts and is considered sensitive for both types of cultural resources. Should the parcel be considered for any type of development in the future, further testing is strongly recommended.

25-2161 Ritchie, Duncan and Raymond Pasquariello

2001 Archaeological Reconnaissance Survey of Betty's Neck, Lakeville, Massachusetts. 86 pages.

Background research and a walkover survey were used to stratify the 500-acre Betty's Neck property into zones of expected sensitivity for Native American and Euro-American cultural resources. The Betty's Neck Site (19-PL-209) is described in site files as a large area at the head or northern end of Betty's Neck. In a National Register of Historic Places nomination for this site prepared in 1972, 19-PL-209 was described as a section of Betty's Neck with the potential to contain substantial multi-component prehistoric sites and the location of an early historic period Native American settlement that was protected with a wood palisade wall. Site 19-PL-213 is located in the southern half of the property; no information about the type of prehistoric cultural material found on this site or the period of occupation was recorded. This area currently contains sand/gravel pits in active use and Site 19-PL-213 may have been damaged or destroyed. A petroglyph site on the shoreline of Assawompsett Pond along the northern boundary of the property was identified through a local informant. It consisted of two boulders with inscribed dates ranging from the 18th century to modern period, sets of initials and names, as well as images of a human footprint and a wigwam-like structure. This site may be associated with historic-period Native American occupants of Betty's Neck as well as later Euro-American activity. The petroglyph site is considered to be an unusual and potentially significant cultural resource that will require protection. From the 17th century to early modern period a small Native American settlement belonging to the Assawompsett band, a small group within the Wampanoag tribe was located on Betty's Neck. A number of small farmsteads and houses on Betty's Neck were occupied throughout the historic period and the last Native American resident lived there until 1931. Most of the houses in this settlement were outside the southern boundary of the property along Betty's Neck Road in the Indian Shores section of Lakeville, on Assawompsett Pond. Cartographic evidence indicated that several structures occupied by Native Americans in the 19th century were located within the area covered by Site 19-PL-209. The reconnaissance survey identified large zones of high and moderate archaeological sensitivity. These zones have the potential to contain sites related to both prehistoric and historic period Native American activity and historic period use of Betty's Neck by Euro-American residents of the area. They also have the potential to contain undocumented 18th- and 19th-century farmstead or house sites. The property was found to contain a number of standing structures including several that are likely to have been constructed in the late 19th century or early modern period. These structures are located around the perimeter of the cranberry bogs and an open field occupying the central portion of the property. They may be potentially significant for their association with the commercial cranberry industry. It is recommended that an intensive archaeological survey be conducted within the Betty's Neck project area. A resource protection plan should be developed for the petroglyph site on Assawompsett Pond. The historic/modern period standing structures in the project area should be evaluated to assess their potential significance.

25-2162 Pasquariello, Raymond, Joseph N. Waller, and Alan Leveillee

2001 Reconnaissance and Intensive (locational) Archaeological Surveys, Flatley Development Parcels, Southborough and Westborough, Massachusetts. 88 pages.

The 187-acre South Parcel is situated to the immediate northeast of the Cedar Swamp National Register Historic District in Westborough. The 197-acre North Parcel is situated in Southborough, immediately north of the Westborough/Southborough municipal boundary. Following a reconnaissance survey the parcels were divided into zones of archaeological sensitivity. The intensive (locational) survey focused upon projected moderate and high sensitivity to contain prehistoric and/or historic archaeological sites. A total of 191 test pits was excavated across the Flatley parcels dur-

ing the intensive (locational) archaeological survey. No prehistoric artifacts were recovered, and investigation of several potential rockshelter sites failed to provide evidence for their use by Native American peoples. The Flatley parcels are intersected by stone walls, and both documentary and archaeological evidence indicates elements of three clustered 19th-century farmsteads exist. Two of these concentrations of structural remains, landscape features, and archaeological materials, the G.S. & J.A.J. Fay farmstead and the E. Hyde farmstead, are situated in the North Parcel, and one, HS-5, is in the South Parcel. The complex in the South Parcel, HS-5 is represented by a compromised (barn) foundation. The feature, and the surrounding area generally lack contextual integrity and further documentation is not recommended. The G.S. & J.A.J. Fay farmstead, and the E. Hyde farmstead in the North Flatley Parcel both include cellar hole and/or barn foundation features, surrounding stone wall and animal pen features, and archaeological assemblages in good landscape and stratigraphic contexts. Preservation in place of these 19th-century cultural resources is recommended. If preservation in place is not prudent and feasible, further documentation and evaluation at the site examination level would be warranted.

25-2163 Waller, Joseph N.

2001 Intensive (Locational) Archaeological Survey AGT G-System Replacement Workspace Bellingham and Mendon, Massachusetts. 68 pages.

This intensive survey included background research, walkover survey, and subsurface investigation of the G-System temporary and permanent workspace. Archaeologists excavated 50x50cm test pits within zones of high and moderate archaeological sensitivity along the project corridor. Subsurface investigation resulted in the recovery of a single piece of quartz chipping debris from the project corridor. This deposit has been designated as the G-System Find Spot. The quartz flake recovered from the project corridor likely reflects a brief episode of hunting or stone tool maintenance by a single individual who traversed the general project area. This find spot contains limited archaeological information and is considered to have a low potential for yielding substantive or new information about prehistoric activity in the Bellingham and Mendon area. No additional research is recommended for the G-System Find Spot.

25-2164 Chartier, Craig S. and Barbara Donohue

2001 Reconnaissance Survey and Intensive (Locational) Survey for the Plum Island Utility Services Project Newburyport and Newbury Massachusetts. 70 pages.

A synthesis of environmental, historical, and geographical information, accompanied by a walkover survey, identified three areas of archaeological potential that were recommended for intensive-survey testing. As only one of the areas of archaeological potential was going to be impacted by the current project, an intensive (locational) survey was conducted. This area of potential was within or adjacent to the boundaries of 19-ES-03, a site listed merely as a village. Five test pits and four bracket test pits were excavated within an area approximately 30x30ft, and two find spots yielded Native American pottery (shell- and grit-tempered). No further testing was recommended.

25-2165 Ford, Ben and Matthew A. Kierstead

2001 Oliver Mill Park Restoration Project Archaeological Monitoring of Machine Excavation. 60 pages.

During August and September 2001 the mill foundations at Oliver Mill Park, located on the Nemasket River in Middleborough were partially reconstructed. As part of the reconstruction, standing walls were removed and footer trenches for replacement walls were excavated using machinery. A map was created and photographs taken to document the existing conditions at the site prior to the beginning of excavation and archaeological monitoring took place for the duration of the excavation. Oliver Mill, which was an active industrial complex from 1734 to ca. 1855, underwent previous archaeological investigations in 1962 by amateur excavators led by Frederick Eayres Jr.,

and excavations and reconstruction by Roland Wells Robbins in 1967, 1968, 1973, and 1978. Prior to the current investigation it was believed that these excavations and reconstruction destroyed the integrity of the site. However, based on the current investigation it appears that a substantial portion of the Washburn period shovel factory (ca. 1797–1850) archaeological remains are intact. Consequently it is recommended that any future construction at Oliver Mill Park be preceded by an archaeological investigation.

25-2166 Ingham, Donna and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey: Seekonk Water District Brown Avenue Wellfield Replacement and Water Transmission Line Project Areas, Seekonk, Massachusetts. 82 pages.

This survey identified two loci of Native American activity. Background research indicated that no less than 12 archaeological sites are located within one mile of the project area, including the Ledge Road Site (19-BR-349) along the Runnins River. Sixty 50x50cm shovel test pits were excavated. The Seekonk Water District 1 Site and Seekonk Water District Native American Find Spot 1 Site contain low- to moderate-density distributions of prehistoric cultural materials. Cultural material consists of chipping debris as well as a single Attleboro Red Felsite biface, broken during manufacture and a small fragment of a highly finished quartz biface. Neither site is likely to yield new information on Native American activities and no further investigation is warranted. Visual inspection and subsurface testing in the Brown Avenue Wellfield indicate that this area has been altered by previous construction.

25-2167 Herbster, Holly and Suzanne G. Cherau

2001 Summary Report, Intensive (Locational) Archaeological Survey, Taylor Property, Aquinnah, Massachusetts. 34 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources which may be affected by project construction. A total of 25, 50x50cm shovel test pits was excavated within archaeologically sensitive portions of the approximately 2-acre lot. Although a documented historic Native American cemetery and the 18th/19th century Lot 43 Homesite are located in an adjacent lot, no cultural materials or features were identified in the project area. No further testing was recommended.

25-2168 Ives, Timothy H.

2002 Intensive (Locational) Archaeological Survey, Massachusetts Military Reservation, Fuel Spill 1 Wellfield Modification Project Area, Upper Quashnet River and Bogs Area, Mashpee, Massachusetts. 48 pages.

Archaeologists completed an intensive (locational) survey of the Fuel Spill 1 (FS-1) Wellfield Modification project area, located within the upper Quashnet River and Bogs area in Mashpee. The project area is located within a 350-acre parcel that had previously undergone a reconnaissance archaeological survey. Proposed project impacts include the installation of underground utilities, three new extraction wells, concrete vaults, piping, communication lines, and power cable. Subsurface testing was conducted in the FS-1 Wellfield Modification project area in areas of moderate and high archaeological sensitivity, as recommended in the reconnaissance survey. The majority of the project area consists of a 15ft wide corridor. Archaeologists excavated 59, 50x50cm test pits during the intensive archaeological survey, along transects at 10m intervals and in a 10m square block formation. Subsurface testing yielded no evidence of prehistoric period activity. Historic-period materials were recovered from various locales in the project area. These materials date to the late-18th, 19th, and 20th centuries and are likely related to documented 19th-century Mashpee Wampanoag homesteads, transportation corridors, and resource areas. None of these cultural materials are considered to represent potentially significant archaeological resources as they were recovered from disturbed contexts, and were not found in association with any his-

toric features.

25-2169 Herbster, Holly and Suzanne G. Cherau

2001 Summary Report, Intensive (Locational) Archaeological Survey, Mayrand Property, Aquinnah, Massachusetts. 46 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources. A total of 26, 50x50cm shovel test pits was excavated within project impact areas, consisting of a 5000 sq ft (465 sq m) building envelope, and a 200ft (60m) access and utility easement. The intensive survey resulted in the identification of one Native American archaeological deposit, designated the Lot 97 Site. The prehistoric period deposit consists of 28 pieces of quartz chipping debris, a quartz core fragment, and a quartz cobble hammerstone collected in a 225 sq m area. No evidence of cultural features, diagnostic artifacts, or other cultural deposits was identified and the deposit appears to represent a single period of stone tool manufacture or maintenance. The site does not represent a potentially significant resource; no additional testing was recommended.

25-2170 Heitert, Kristen, Jennifer Macpherson, and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey: New Groton Dunstable Regional High School Casella Property, Groton, Massachusetts. 104 pages.

An archaeological survey was conducted for the proposed New Groton Dunstable Regional High School. The project area consists of three parcels of land totaling 179 acres, of which approximately 40 acres are to be developed. The survey included background research, informant interviews, and field investigations. One hundred and forty three, 50x50cm test pits were excavated and 169 pieces of historic cultural material were recovered. No prehistoric cultural material or features were identified in the project area. Three historic period sites were identified. The Smith I Site consists of two large fieldstone foundations and a stone-lined well on two sides of a farm road. The Smith II Site consists of a historic farmhouse and outbuildings. The Smith Saw Mill Site consists of a sparse scattering of materials designating the location of a portable sawmill. The Smith I and II sites relate to a single family's continuous ownership and working of a farm through several generations. The archaeological deposits associated with the Smith I and II sites possess good physical integrity and are potentially significant resources that can contribute information about the history of the family and parcel.

25-2171 Waller, Joseph N. and Alan Leveillee

2001 Intensive (Locational) Archaeological Survey Stonemeadow Community Project Area, Bridgewater, Massachusetts. 58 pages.

The intensive survey included background research, walkover survey, and subsurface investigation of a proposed mobile home elderly community development on approximately 160 acres. Background research indicated that the project area is located north of the concentrated Native American Titicut settlement area. State site files maintained at the Massachusetts Historical Commission note that site Native American Site 19-PL-380 is located on an adjacent property along the margins of the same wetland series that borders the project area. Archaeologists excavated 103, 50x50cm test pits within archaeologically sensitive portions of the Stonemeadow Community project area. Subsurface investigation of the project area recovered Native American and historic-period archaeological resources. Recovered historic period artifacts included coal, brick, nails, ceramic sherds, and glass primarily from plowed stratigraphic contexts. These materials represent incidental inclusions in the A Horizon introduced during historical or recent plowing of the agricultural fields. Native American cultural materials were recovered from three concentrated areas within the project area. These deposits were designated Stonemeadow Find Spots 1, 2, and 3. Stonemeadow Find Spot #1 consisted of a flake of quartz and a flake of rhyolite. Stonemeadow

Find Spot #2 consisted of a single flake of Lynn/Mattapan rhyolite. Stonemeadow Find Spot #3 consisted of two quartz flakes. The composite loci of Native American find spots identified within the Stonemeadow Community project area exhibit poor integrity and contain limited archaeological information. No additional research is recommended.

25-2172 Ingham, Donna and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey, New Lawrence High School, Lawrence, Massachusetts. 70 pages.

Background research conducted as part of the intensive survey indicated that this project area had the potential to contain previously unknown Native and Euro-American cultural resources. One known prehistoric site, the Lawrence Stadium Site (19-ES-200), was reported to be located in the project area. Its current condition was not known, however because extensive modifications to the original landscape have occurred in and around the project area over the last 100 years. The project area is within a core area of urban and industrial development associated with the city of Lawrence. Past land use included agricultural/pastoral activity from the 17th to 19th century, and urban residential development and city parkland in the late 19th century and early modern period. Modern period development in the project area also included buildings such as the former Naval Reserve Training Center, now used by the City of Lawrence as a school. During the intensive archaeological survey of the project area, zones of high and moderate archaeological sensitivity identified in a walkover inspection were subjected to subsurface testing. Subsurface testing resulted in the identification of two loci of prehistoric cultural material in the wooded southeast section of the project area. The Memorial Park 1 Site consists of a low-density deposit of prehistoric cultural material. The five recovered pieces of rhyolite chipping debris indicate a Native American group or individual used the site for the manufacture of chipped-stone tools. While it demonstrates that prehistoric sites have survived in the small patches of relatively intact land along the lower Shawsheen River, the Memorial Park 1 Site is unlikely to yield additional information about Native American settlement or resource use in the lower Shawsheen and Merrimack River drainage. The Memorial Park 2 Site is a small deposit of prehistoric cultural material located south of the existing baseball field. All of this material was recovered from intact soils buried under as much as 77 cm of historic/modern fill soils. Two chipped-stone tools, a triangular projectile point and a graver made on a retouched flake of gray chert were found within buried A_{pz} and B_1 subsoil horizons. One piece of glossy, dark gray chert chipping debris with evidence of thermal alteration or burning (potlid scar) was also found in the buried plow zone. The projectile point is not clearly diagnostic of any temporal period; it is likely, however, to be at least 4,000 years old and may be associated with a Late Archaic Period, Laurentian Tradition component. The graver is similar in terms of lithic material (chert) and morphology to PaleoIndian (ca. 12,000–10,000 years ago) tools. This tool was found at a depth of 120–130 cm below surface in a buried B subsoil horizon. Locus 2 also contains a possible feature consisting of charcoal stained subsoil and a burned (calcined) bone fragment. The temporal affiliation of this anomaly is unclear, however it may be associated with prehistoric activity. The Memorial Park 2 Site could yield more information about Native American activities in the lower Shawsheen and Merrimack drainages and is considered to be a potentially significant cultural resource. The intensive survey identified two small loci of prehistoric cultural material within the southeast portion of the project area. These loci may be associated with the Lawrence Stadium Site (19-ES-200), which is reported to be in close proximity to the project area. Memorial Park 1 is a low-density deposit of chipping debris with limited information content. Memorial Park 2 appears to contain a Late Archaic component. A flake tool/graver recovered from this locus may also indicate a much earlier (PaleoIndian Period) use of this location. Locus 2 is considered to be a potentially significant cultural resource. No further archaeological investigation of Memorial Park Locus 1 is recommended. It is recommended that Memorial Park Locus 2 be avoided and preserved in place. If avoidance is not possible, further archaeological investigation of Locus 2 at the site examination level is recommended.

25-2173 Ritchie, Duncan and Jennifer Macpherson

2001 Reconnaissance and Intensive Archaeological Survey Overlook Ridge Development, Revere and Malden, Massachusetts. 87 pages.

The 100-acre project area is bounded by Route 1 on the west, Salem Street on the south, and on the east by a Boston & Maine Railroad easement. The project area contains the Rowe Quarry, an actively used trap rock quarry. Residential neighborhoods are located both north and south of the Rowe Quarry along a number of side streets. Background research and a walkover survey conducted during the previous reconnaissance survey delineated zones of archaeological sensitivity within the Overlook Ridge project area. Most of the project area contained highly altered land in and around the Rowe Quarry. Small zones of high and moderate archaeological sensitivity were identified around the perimeter of the project area where there were relatively intact wooded areas or vacant lots within residential neighborhoods. A total of 60 test pits was excavated in zones of high and moderate sensitivity during the intensive archaeological survey. Test pits were 50x50cm and arranged along 12 linear transects and one array. Eleven judgmental test pits were placed in specific locations within archaeologically sensitive sections of the project area. Cultural materials were recovered from 26 of these test pits. Subsurface testing conducted during the intensive survey identified one locus of Native American activity (Overlook Ridge Locus 1). Three historic/modern period building foundations (Overlook Ridge Foundations 1–3) identified in a previous reconnaissance survey were investigated with judgmentally placed test pit transects. One small deposit of prehistoric Native American cultural material, designated as Overlook Ridge Locus 1, was discovered in the south-central portion of the project area in Malden. This site is located in a small field along the south side of Ricker Street. A total of 13 pieces of dark red, gray, and black rhyolite chipping debris was recovered from this site. The three foundations for historic/modern period buildings (Overlook Ridge Foundations 1–3) along Breedens Lane are just outside the northeast rim of the Rowe Quarry. A total of 312 pieces of 19th-century and early modern period cultural material was recovered from test pits along two transects placed near these foundations. In summary, Overlook Ridge Locus 1 consists of a small, low density deposit of prehistoric Native American cultural material (bifacial tool blade, chipping debris). Given its limited information content and unknown temporal affiliation, it is unlikely to contribute additional information about Native American settlement and lithic resource use in the Revere/Malden area. Overlook Ridge Locus 1 is not considered to be a potentially significant cultural resource. Based on the material collected from test pits around Overlook Ridge Foundations 1, 2 and 3, these features most likely represent one or two small houses and associated outbuildings (stable/garage, barn) with driveways and landscaping that date from the late 19th century to early modern period. The results of background research indicated that residential development within this section of Revere did not occur until the last few decades of the 19th century. These historic/modern structural remains are not considered to represent potentially significant cultural resources. No further archaeological investigations are recommended for the Overlook Ridge project area.

25-2174 Ingham, Donna and Duncan Ritchie

2001 Intensive Archaeological Survey of the McLean Hospital Redevelopment Water Main. 66 pages.

The proposed project involves the construction of an approximately 1,600ft long water line in the northeastern portion of the McLean campus in Belmont. Based on background research, portions of the project area were considered to be archaeologically sensitive because of their proximity to a recorded historic site (the W.W. Chenery/Highland Stock Farm Site) and to favorable environmental settings for Native American sites such as well-drained, level, elevated ground adjacent to wetlands. A total of 41, 50x50cm test pits were excavated within archaeologically sensitive portions of the project area. These test pits were placed along a single judgmental transect within the proposed water main easement. No Native American cultural materials were recovered from test pits placed within the project area. Subsurface sampling resulted in the recovery of a low density of historic period cultural material. Most of this material was recovered in association with plow zone soils created by past agricultural land use. Ceramic sherds, bottle glass and structural materi-

als (nails, window glass) found in the project area were primarily of mid/late-19th-century and early modern period provenience. These materials are considered to be generally related to the W.W. Chenery/Highland Stock Farm Site, but do not have the potential to yield additional specific information about this 19th-century farm. These materials do not, therefore, represent a potentially significant cultural resource. No additional archaeological investigations are recommended.

25-2175 Dudek, Martin G. and Craig S. Chartier

2002 Report of an Intensive Archaeological Survey for the Tall Pines Development, Clinton, Massachusetts. 100 pages.

An intensive survey was conducted in Clinton, Massachusetts on a parcel of 91 acres bordering on Clamshell Pond. A total of 231 (50x50cm) test pits were excavated, consisting of 170 systematic test pits in six blocks and 13 transects, 17 judgmental test pits, and 44 bracket test pits. Three of four high-potential areas and a medium potential area yielded prehistoric cultural materials. The high potential area closest to Clamshell Pond had three separate loci with prehistoric cultural materials consisting of a localized find of a quartz biface and a quartz edge tool, a small, low-density locus of quartz debitage, and a broad, low-density locus with quartz, quartzite, rhyolite, metasediment and chert debitage. The second high potential area, near wetlands, had six separate loci with prehistoric cultural materials, consisting of an isolated find spot of a broken quartz biface, two localized sites of quartz debitage (one low density, one high density at a boulder with a quarried quartz vein), a localized low-density quartz chipping station with a quartz core and a cobble tool, the Rockshelter Terrace site with a quartz lithic reduction station and a rockshelter yielding a quartz flake and Woodland pottery, and the Hunting-Blind Ridge site, which yielded quartz debitage and a quartz edge tool. A third high potential area had an isolated find spot of quartz debitage, while a medium potential area located at Indian Rock, a large glacial erratic, had an isolated find spot of a quartz edge tool and a piece of quartz debitage. The Rockshelter Terrace site and Hunting-Blind Ridge site are considered to be potentially significant and were recommended for site examinations.

25-2176 Waller, Joseph and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey of the Sherburne Commons Assisted Living Facility, Nantucket, Massachusetts. 62 pages.

Background research indicated that the project area was within the core area of the late-17th- through 18th-century settlement of Miacomet. It was expected that the project area could contain evidence of Native American occupation of the property that ranged from small find spots of isolated prehistoric cultural materials to larger sites and houses associated with the historic Miacomet Native American community. Historic period land use in and around the project area was primarily agricultural/pastoral, serving as an area of sheep pens during the 19th century. Field investigations consisted of a walkover survey/surface inspection followed by subsurface testing. Based on the walkover inspection in conjunction with documentary research, the project area was assessed as exhibiting moderate to high sensitivity for both prehistoric and historic period Native American cultural resources. Evidence of previous disturbance to the project area was minimal. A total of 75 test pits (50x50cm) was excavated across the project area. These test pits were placed in 30x30m sampling blocks and along judgmentally placed transects. A single test pit sampling array was used to supplement testing around a find spot of historic period cultural material. Subsurface testing resulted in the recovery of two sherds of a 17th/mid-18th-century ceramic type (delft), white ball clay tobacco pipe bowl fragments, and pieces of brick and shell from a highly localized area in the western portion of the project area. This deposit has been named the Sherburne Commons Locus 1 Site. It is expected that Sherburne Commons Locus 1 represents a deposit of domestic refuse associated with historic period Native American occupation of the Miacomet settlement, which is designated on state site files as site NAN-HA-2. The Sherburne Commons Locus 1 Site was located within the approximate location of a proposed emergency vehicle access road. It is recommended that the proposed development avoid impacts to the Sherburne Commons Locus 1

Site. If avoidance is not possible, further archaeological investigation of the Sherburne Commons Locus 1 Site should be conducted.

25-2177 Macpherson, Jennifer and Suzanne C. Cherau

2001 Technical Report: Intensive (Locational) Archaeological Survey, Tom's Neck Farm Subdivision and Archaeological Site Examination: Lots 1, 2, 3, 4 and 5 Driveway Sites, Chappaquiddick Island, Edgartown, Massachusetts. 180 pages.

Intensive and site examination investigations were conducted at Tom's Neck Farm in Edgartown, Massachusetts (Chappaquiddick Island). Ninety test pits were excavated within five lots (Lots 1, 2, 3, 4, and 5) and an entrance road and resulted in the identification of six archaeological sites associated with Native American settlement of Chappaquiddick Island (Lots 1, 2, 3, 4, 5 Driveway, Entrance Road sites). All but the last contained potentially significant deposits dating to the Late Archaic and Woodland periods. Eighty-one test pits and eleven 1x1m units were excavated within the site areas during the site examination. The Lots 1, 2, and 3 sites yielded high densities and wide varieties of lithic material and stone tools along with prehistoric pottery and radiocarbon-datable features. These sites have high potential to contain significant new classes of archaeological data. The sites are considered eligible for listing on the National Register of Historic Places under Criteria A and D.

25-2178 Waller Jr., Joseph N. and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey Quail Ridge Country Club, Acton, Massachusetts. 116 pages.

The intensive survey included background research, walkover survey, and the excavation of 184, 50x50cm test pits over the 154.7 acre project area. State site files note that three archaeological sites (19-MD-585, 19-MD-586, and ACT-HA-1) are located on an adjacent property, and it was expected that the project area could contain evidence of Native American habitation of the property or late 18th/19th century cultural resources associated with Acton's granite industry. Subsurface investigation resulted in the recovery of Native American cultural materials from four areas designated as the Quail Ridge Find Spots 1, 2, 3, and 4. The individual find spots consisted of an untyped side-notched projectile point, a flake of banded rhyolite, an isolated quartz biface fragment, and two quartz flakes, respectively. The composite loci of Native American find spots identified within the project area contain limited archaeological information and are not considered potentially significant cultural resources. Historic period cultural resources identified within the project area include the late 18th to early 19th Quail Ridge Farmstead and numerous granite quarry-related locations. The Quail Ridge Farmstead consists of two cellar holes (domicile and possible barn), a possible root cellar, stonewalls, and cart paths. Granite quarry features identified within the project area include boulder and ledge quarry locales, quarry pits, trim piles, and a stone platform. Individually and collectively, the quarry locales and farmstead within the Quail Ridge Country Club project area are considered potentially significant cultural resources. These resources are a reflection of Acton's past and the cottage industries in which the local inhabitants involved themselves.

25-2179 Waller, Joseph N., Jr. and Alan Leveillee

2002 Intensive (Locational) Archaeological Survey The Maples at Little River Subdivision. 58 pages.

The objective of the archaeological survey was to document the presence or absence of potentially significant archaeological resources in the 32-acre project area using a combination of background research and subsurface testing. Background research indicated that the project area is situated in an archaeologically sensitive area. Field investigations included a walkover inspection followed by subsurface testing. Testing included hand excavation of 20, 50x50cm test pits in areas where pro-

ject-related boring logs indicated the potential for undisturbed soils. Test pits were organized within two linear test pit transects and within two sampling cluster arrays. Excavated test pits confirmed that a large portion of The Maples at Little River Subdivision project area has been altered by previous landscaping activity. A former wetland has been filled by cutting and grading portions of a remnant hill, now a terrace, situated within the eastern limits of the project area. Zones of hydrosaturated soils/subsoils exist in the northeastern and southwestern limits of the project area, where wetlands have been filled in the past. Recovered cultural materials were predominantly mixed within disturbed fill deposits that contained variable densities of skeet fragments. A single piece of quartz chipping debris, resulting from stone tool production in the prehistoric period, was also recovered from a fill deposit. Low densities of historic period artifacts, including glass, coal ash, and brick fragments were incorporated within an intact plow zone in the southeastern limits of the parcel. Cultural materials recovered from The Maples at Little River Subdivision represent historic sheet refuse, materials discarded and subsequently mixed with topsoils, in disturbed fill or moderately impacted plow zone deposits. These materials did not represent intact archaeological resources; no further archaeological investigations were recommended.

25-2180 Donta, C.L., F.T. Barker, and Margaret Kelly

2002 Archaeological Intensive (Locational) Survey for the Proposed Town Common Improvement Project, Princeton, Massachusetts. 59 pages.

Background research, a reconnaissance, and subsurface testing were conducted in five survey areas on the Princeton Town Common. Thirty-five shovel test pits were excavated, documenting disturbance around Goodnow Memorial Library, Bagg Hall, and along Town Hall Drive. In the area of a proposed Life-Flight Helicopter Landing Area, several historic features were identified, part of the Clark Historic House site (PRI-HA-5). These include a brick and cut stone foundation, a historic era postmold, a fieldstone foundation, and a filled well. A variety of domestic artifacts were recovered in association with the features, including pane glass, cut nails, brick fragments, stoneware, lead-glazed redware, shell-edged pearlware, flow blue whiteware, and transfer-printed whiteware. The brick and stone foundation is thought to be the remains of the Reverend Samuel Clark house (ca. 1821), and the second foundation may be associated with an outbuilding related to the house, such as a stable or shed, or the 1838 First Congregational Church itself. A recommendation was made to avoid this site, or to further investigate with a site examination survey.

25-2181 Waller, Joseph N., Jr. and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey: Proposed D'Allesandro Farm Irrigation Water Pipeline, Swansea, Massachusetts. 62 pages.

An archaeological survey using a combination of background research and subsurface testing was conducted to document the presence or absence of potentially significant archaeological resources. Background research indicated that several rockshelters, including Margaret's Rock and Devils' Rock as well as a historic grain preparation site at the Swansea/Warren line (King's Rock) are recorded in proximity to the project area. Field investigations associated with the project consisted of a walkover survey/surface inspection followed by the excavation of 31, 50x50cm test pits. Subsurface testing resulted in the recovery of a few historic period artifacts including ceramic sherds, iron fragments, glass, and shell from intensively plowed stratigraphic contexts. No pre-Contact or early historic Native American cultural materials or features were recovered from the project corridor. The cultural materials recovered are not considered potentially significant in terms of future research potential; no further archaeological investigation is warranted.

25-2182 Waller, Joseph N.

2001 Intensive (Locational) Archaeological Survey TGP Beverly-Salem Lateral Replacement, Wilmington and Reading, Massachusetts. 64 pages.

The intensive survey included background research, walkover survey, and subsurface investigation of archaeologically sensitive portions of the project corridor assessed during a site walkover. State site files housed at the Massachusetts Historical Commission indicated the presence of the Foley Site (19-MD-692) in immediate proximity to the pipeline, east of West Street in Wilmington. Archaeologists excavated 23, 50x50cm test pits within the Foley Site, east of West Street in Wilmington, and an additional 15 test pits east of I-93 in Reading. Test pits were organized within linear test pit transects and sampling clusters. Subsurface investigation failed to identify any significant cultural deposits east of I-93 in Reading. Field investigations confirmed the presence of the Foley Site (19-MD-692), east of West Street in Wilmington. Cultural materials recovered from the Foley Site include a projectile point preform and rhyolite debitage. Recovered cultural materials are characterized by raw materials that originate from the Lynn/Mattapan volcanic suite of North shore Massachusetts. The classes of data recovered from the site indicate that a potentially significant pre-Contact Native American site exists within the proposed Beverly-Salem Lateral Replacement project corridor. Avoidance of any ground alteration disturbances to the segment of the project corridor containing the Foley Site (19-MD-692) is recommended. If avoidance is not feasible, a site examination should be conducted at the Foley Site prior to any ground alteration disturbances to evaluate the site's significance relative to National Register of Historic Places criteria.

25-2183 Waller, Joseph N.

2001 Intensive (Locational) Archaeological Survey AGT Mystic River Replacement Workspace, Medford, Massachusetts. 80 pages.

This intensive survey included background research, walkover survey, and subsurface investigation. Archaeologists excavated 12, 50x50cm test pits within the Mystic River Replacement temporary and permanent workspace. Subsurface investigation of the workspace resulted in the recovery of 20th-century cultural materials from disturbed stratigraphic contexts across the project area. These materials do not represent intact archaeological resources. No additional research is recommended.

25-2184 Macpherson, Jennifer

1998 Intensive (Locational) Archaeological Survey Estate at Pride's Crossing Residential Development Area, Beverly, Massachusetts. 72 pages.

The intensive survey included background research, walkover survey, and the excavation of 86, 50x50cm test pits within the 88 acre project parcel. Subsurface investigation resulted in the recovery of low densities of late 19th/early 20th-century cultural materials including whiteware ceramic sherds, machine cut nails, and bottle and window glass shards from project area topsoils. No Native American cultural materials were recovered from the project area. Cultural materials recovered from the project area do not represent intact archaeological deposits and are not considered significant. No additional research is recommended.

25-2185 Leveillee, Alan and Donna Ingham

2001 (Revised 2002) Intensive Archaeological Survey, Interchange Commercial District, Plainville, Massachusetts. 84 pages.

Documentary research, field reconnaissance, and subsurface testing were included in an intensive survey for an approximately 40-acre commercial development. Subsurface testing involved the excavation of a total of 62, 50x50cm test pits, distributed amongst nine linear transects using a 10m interval, two test pit arrays using a 5m interval, and six judgmentally selected locations. Three site locations were identified. A moderate to high density of prehistoric chipping debris was recovered within the Interchange 1 Site. A low density of prehistoric chipping debris and a worked flake, was recovered from within the Interchange 2 Site. Prehistoric cultural materials recovered from both sites are associated with intact soils, and each may meet National Register criteria for

eligibility. The Deep Hole Road Domestic Complex Site consists of a cluster of features including house and barn foundations. Artifacts recovered during subsurface testing around these features indicate that the complex is primarily associated with 20th-century occupation. The Deep Hole Road Domestic Complex Site is unlikely to meet National Register criteria for eligibility.

25-2186 Leveillee, Alan and Donna Ingham

2001 (revised 2002) Intensive Archaeological Survey Warren Street Subdivision, Plainville, Massachusetts. 76 pages.

Documentary research, field reconnaissance, and subsurface testing were included in an intensive survey for an approximately 100 acre residential development. Subsurface testing involved the excavation of a total of 124, 50x50cm test pits, distributed amongst seven 30x30m blocks, five linear transects using a 10m interval, one test pit array utilizing a 5m interval, and three judgmentally selected locations. Three site locations were identified as a result of the survey. A single piece of chipping debris was recovered from the Warren Street Subdivision Prehistoric Find Spot 1 Site. The Warren Street Subdivision Structure 1 Site consists of the remains of a small, low, L-shaped dry-laid fieldstone structure of unknown age and specific function. The Warren Street Subdivision Domestic Complex 1 Site consists of the remains of a cement slab and bermed earth and stone foundation, a stone-lined well, and a depression possibly marking the location of a privy. All three sites are of limited future research potential and are unlikely to meet National Register criteria for eligibility.

25-2187 Macpherson, Jennifer and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey, Rosewood Commons, Raynham, Massachusetts. 54 pages.

Background research indicated that the project area was within a core area of Native American settlement centered around nearby Lake Nippinicket and Titicut Swamp. A known prehistoric period archaeological site, Rozenas II, was located within the I-495 corridor before construction of the highway. The results of background research, a walkover survey and surface inspection indicated that much of the project area had been previously disturbed and had low archaeological sensitivity. The remainder possessed moderate archaeological sensitivity, with some small zones of high sensitivity near a small pond and along the southern edge of the project area. Other sections of the project area had been significantly disturbed by the construction of Interstate 495, and related improvements to North Main Street. A total of 52, 50x50cm test pits was excavated in the project area along nine judgmentally placed transects. Each transect contained between three and ten test pits placed at 10m intervals. No cultural material was recovered from any of the test pits excavated within the project area and no archaeological sites were identified.

25-2188 Donohue, Barbara

2002 Intensive (Locational) Survey Report for the Proposed Erickson Retirement Community, Hingham, Massachusetts. 50 pages.

This survey consisted of documentary research and the excavation of 69 test pits, including 29 in four blocks, 30 in eight transects, and 10 judgmentally placed test pits on a 108 acre parcel that has undergone considerable disturbance from historical and current-day quarrying activities. Three modern artifacts were recovered. Various stonewalls cross the proposed project area and attest to historic land use, no evidence of prehistoric activity was identified. If the area was used by prehistoric peoples, it is most likely that historical and modern activities (such as quarrying, lumbering, and dumping) have severely compromised the likelihood of locating any sites that may have existed. No further field investigation is recommended.

25-2189 Herbster, Holly and Suzanne G. Cherau

2001 Summary Report, Intensive (Locational) Archaeological Survey, Aquinnah Housing Committee, Resident Homesite Parcel 9-158, Aquinnah, Massachusetts. 46 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources that may be affected by project construction. A total of 29, 50x50cm shovel test pits was excavated within archaeologically sensitive portions of the approximately 8500 sq ft impact area. A low density scatter of 19th-century domestic and structural debris was collected within approximately 150m of the previously identified Olive Jerrett Homesite Site (GAY-HA-20), located within the adjacent lot. Cartographic research determined that the current project area boundaries match those of Set-Off Lot 7, assigned to Josiah Jerrett during the 1866/70 division of Indian lands at Gay Head. No evidence of cultural features or structures within the project area was identified through background research or field survey. The deposits identified within the project area do not represent a potentially significant element of the Olive Jerrett Site, therefore no additional testing was recommended.

25-2190 Binzen, Timothy

2002 Archaeological Site Examination Surveys of the Boulder Trail Prehistoric Site and the Stream Prehistoric Site for the Water Treatment Plant Project, Billerica, Massachusetts. 30 pages.

Phase 2 archaeological site examination surveys were conducted at the Boulder Trail Prehistoric Site (19-MD-825) and the Stream Prehistoric Site (19-MD-826), located on a bluff west of the Concord River (See Report 25-2079). In combination with previous intensive (locational) testing, the site examination excavation at the Boulder Trail Site yielded two Brewerton projectile points, two scrapers, and 137 pieces of chipping debris, all made of rhyolite. The site retains a high degree of integrity and represents a single-component, projectile-point manufacturing site of the Laurentian tradition of the Late Archaic Period. In combination with previous intensive (locational) testing, site examination excavation at the Stream Site yielded one small quartz pentagonal projectile point, the tip/midsections of two rhyolite projectile points, contracting stem fragments of one quartzite projectile point and one rhyolite projectile point, one rhyolite scraper, and 117 pieces of chipping debris. More than 90% of the chipping debris at the Stream Site consisted of rhyolite, and the remainder was quartz. The concentration of chipping debris at the Stream Site is low to moderate in density, and no temporally diagnostic artifacts were recovered that allowed the date(s) of site occupation to be defined closely. The Stream Site is interpreted as a hunting station that witnessed multiple re-occupations between the Late Archaic and Early Woodland periods.

25-2191 Binzen, Timothy L., Margaret Kelly, and F. Timothy Barker

2002 Archaeological Reconnaissance and Intensive (Locational) Survey for the Accessible Walk and Drainage Project, Fort Phoenix National Historic Site, Fairhaven, Massachusetts. 28 pages.

Fort Phoenix is listed in the State and National Registers of Historic Places and was in active military service during the Revolutionary War, the War of 1812, and the Civil War. It overlooks the entrance to New Bedford Harbor from the east. A total of 24 shovel test pits was excavated at 25ft intervals along the centerline of a proposed walkway and utility conduit between a parking lot and the fort, in the parade ground, and in the fort interior. No significant features were recorded outside the fort, and no natural soil strata were encountered during the testing. Segments of multiple stone foundations (Features 1 and 2) were identified at two locations on the walkway route within the fort, at depths of 4 inches and 12 inches, respectively, below the existing ground surface. Archaeological and archival evidence suggests that these foundations may represent 19th-century outbuildings. The outlines of the foundation of a barracks or quarters built in the late 18th or early 19th century are faintly visible in the northeast part of the fort. These quarters were burned in the late 19th or early 20th century. Feature 3, an historic refuse pit, was encountered at a depth of 2.3ft below the existing ground surface near the flagpole within the fort. The subsurface testing for this project, while limited in scope, resulted in the discovery of significant cultural resources and addi-

tional unrecorded deposits and features likely exist at the site. Archaeological testing is recommended prior to any future undertakings at the site that could affect the historic landscape there.

25-2192 Binzen, Timothy L., F. Timothy Barker, and Martha Pinello

2002 Results of an Archaeological Site Examination in 2000 for Historic Landscape Restorations at The Mount, Lenox, Massachusetts. 48 pages.

An archaeological site examination excavation was conducted at The Mount, a National Historic Landmark that was the country estate of the American writer Edith Wharton (1862-1937) from 1902 to 1911. The Mount was the first of Wharton's properties to which she applied her European design ideals. The site examination enabled the identification of the landscape design and construction history at the estate. The objective was to identify and document historic landscape features, so that preservation and accuracy could be maximized during restoration. The archaeological work expanded on a previous survey conducted in 1999 (see report 25-1920). Historical photographs guided the placement of excavation units, which mainly consisted of 1m wide strips of various lengths, 0.5x2m exploratory trenches, and 40x40cm shovel test pits. In general, only the sod layer and modern topsoil overburden were removed, in order to expose the stone beds of historic pathways, now obscured by vegetation, that led through the ornamental gardens designed by Wharton. In the southern part of the estate near the mansion, archaeological data allowed the extrapolation of the original layout of the flower garden, bosco terrace, walled garden, and the axial lime walk that connected them. The gardens featured planting beds and rectangular and circular paths, made of a limestone and marble rubble base with a rolled limestone finish. The north lawn paths and evidence of a rock garden wall were identified. Previous disturbance had removed sets of earthen steps that led from the mansion terrace to the north lawn. In the center of the estate, the stone foundation of a springhouse was tested, and a formal pathway was identified linking it to the main drive. A historical drain and the original edges of the main drive were recorded. Throughout the estate, streams and springs had been incorporated into a drainage system featuring ceramic tiles and cobble-lined swales. Testing defined a historic dump next to the stable building. In the northern section of the estate, data were obtained to suggest the historic layout of the extensive kitchen garden and its paths, designed by Wharton's niece Beatrix (Jones) Farrand. An additional formal path led from the kitchen garden to the gatehouse by way of the greenhouse and orchard. Landscaped stratigraphy associated with a maple allée near the entrance was recorded.

25-2193 Binzen, Timothy L. and Margaret Kelly

2002 Archaeological Reconnaissance and Intensive (Locational) Survey for Proposed Construction Activities at the Chatham Municipal Airport, Chatham, Massachusetts. 27 pages.

This project area is located near several freshwater ponds and estuarine wetlands. Subsurface testing was conducted in six locations. A total of ninety 40x40cm shovel test pits was excavated, at 7.5m intervals at each test location. One rhyolite biface fragment was recovered, although it was in a redistributed fill stratigraphic context, and its original provenience could not be determined. Soil profiles indicated the presence of some intact subsoil strata, but also extensive zones of previous mechanical disturbance. No subsurface features or significant archaeological deposits were encountered.

25-2194 Binzen, Timothy, Ann Chapman, and Antonio Medina

2002 Archaeological Reconnaissance and Intensive (Locational) Survey of Two Pump Stations for the Tri-Lakes Sanitary Sewer Extension Project, Belchertown, Massachusetts. 26 pages.

This project area is located to the west and south of Metacomet Lake. A total of twenty-three (23) 40x40cm shovel test pits were excavated. Soil profiles provided evidence of agricultural activity and deposition of fill during road construction, although intact subsoil strata also were recorded. The Bay Road Native American Site was identified at the test location south of the lake. The arti-

fact assemblage consisted of seven rhyolite flakes, three quartz flakes, five quartzite flakes and one piece of quartzite shatter, recovered from a plowzone context. The site likely represents a location where people modified and sharpened stone implements in the ancient past, while preparing for hunting and gathering activities at the Metacomet Lake wetlands. No significant historic resources were recorded at either test location.

25-2195 Mair, A. Peter, II

2001 Archaeological Reconnaissance Survey, Kendall Station Electrical Interconnect, Cambridge, Massachusetts. 68 pages.

The project is located within the Charles River Basin National Register District and the Massachusetts Institute of Technology (MIT) District, both listed in the State and National Registers of Historic Places. A reconnaissance archaeological survey was conducted in compliance with state and federal regulations concerning cultural resources. Background research and field investigations confirmed that the majority of the proposed preferred and alternate routes are located within existing paved streets that rest on deposited fill. Based on the background research and walkover survey of the project area, monitoring of the installation of the underground electrical transmission line in the area of Magazine Beach was recommended. Exposed walls of the utility trench indicate that the project area through the Magazine Beach area is the result of numerous episodes of fill to create the current topography. Based on field monitoring, the proposed 115 kilowatt underground transmission line did not impact any potentially significant archaeological deposits.

25-2196 Waller, Joseph N. and Alan Leveillee

2001 Intensive (Locational) Archaeological Survey American Inn South Village, Southwick, Massachusetts. 60 pages.

State site indicated the Driftwood Site (19-HD-158) was in immediate proximity or perhaps contained within the 8.76 acre, greater project area. Investigations included excavation of 44, 50x50cm test pits. No potentially significant Native American or historic period archaeological sites were identified within the project area. Background research supplemented by project-specific history provided by knowledgeable informants, and subsurface testing results indicate that the project area has been the setting for late-19th- and early-20th-century agriculture, selected logging and associated small-scale processing (sawmill), and a commercial (restaurant) building and parking lot.

25-2197 Donta, Christopher L., Ann Chapman, F. Timothy Barker, and Mitchell Mulholland

2002 Archaeological Intensive (Locational) Survey for the Proposed Combined Sewer Overflow Project in Arnold Arboretum, Boston (Jamaica Plain), Massachusetts. 48 pages.

Two small areas associated with the Boston Combined Sewer Outflow Project were surveyed within Arnold Arboretum. Background research identified two pre-Contact period Native American sites located in or near the two areas that required survey. The sites are the Centre Street Border and Hickory Group site (19–SU-43), and the Spring Brook Village site (19-SU-25). No documentary evidence of historic sites was found. Following background research and visual reconnaissance, 11 shovel test pits were excavated. Both areas surveyed have been disturbed by past construction. The only cultural material recovered was modern bottle glass and styrofoam. No Native American or historic Euro-American materials were encountered. No archaeological features were identified. No further survey is recommended.

25-2198 Herbster, Holly and Deborah C. Cox

2002 Archaeological Reconnaissance Survey, Town of Dartmouth, Dartmouth, Massachusetts.

466 pages.

This town-wide survey was designed to produce a database and comprehensive inventory of known and potential archaeological resources within Dartmouth, to be used by local and state review organizations involved in planning, permitting, and preservation issues. The survey included background research, informant interviews, and drive-over fieldwork and resulted in the documentation of 50 previously unrecorded archaeological sites (20 prehistoric and 30 historic sites). The predictive model developed for the survey indicates that Dartmouth contains a wide diversity of natural resources including extensive wetland networks, limited modern period development, and a documented human presence spanning 10,000 years. These conditions, taken together, give the town a generally high archaeological sensitivity and a determination that the town possesses a generally high sensitivity for additional cultural resources to be present. Data gathered during the survey was used to produce prehistoric and historic archaeological sensitivity maps of the entire town, a user's guide for the maps, a written summary report, and suggested bylaws and management recommendations.

25-2199 Dudek, Martin G. and Craig S. Chartier

2002 Intensive (Locational) Survey for the Chicopee High School, Chicopee, Massachusetts. 79 pages.

An intensive (locational) survey was conducted on a 16-acre parcel where the construction of the new Chicopee High School in Chicopee, Massachusetts is proposed. Substantial areas of fill were identified from boring logs in the northern, western, and southwestern edges of the project area. This limited the area to be tested to a roughly triangular section measuring 134m north to south and 288m east to west in the central and eastern portions of the 16 acre parcel. Fieldwork consisted of 56 test pits (50x50cm) within four blocks, four bracket and 9 judgmentally placed test pits. Extensive 19th- to 20th-century material was recovered, with a few pieces of late 18th-century material. These artifacts represented domestic refuse spread on cultivated fields and material incorporated in fill deposits. Two pieces of prehistoric lithic chipping debris were recovered from a fill deposit and from the first 10cm of excavation. It is not believed that these pieces of chipping debris are in their primary depositional context. No further archaeological testing is recommended.

25-2200 Dalton, Ronald and Barbara Donohue

2002 Intensive (Locational) Archaeological Survey Report for the Proposed Ashland High School Site, Ashland, Massachusetts. 92 pages.

Five 30m blocks of 14 test pits each, one 10m block of 5 test pits, 3 transects, judgmental and bracket test pits, for a total of 176 units, were excavated on a 52 acre parcel as part of a feasibility study. Three sites (two prehistoric and one historical) were identified. Site examinations were recommended for the prehistoric sites, but not for the historical site. As a result of the documentary research, two historical rural landscape features, a section of the 18th-century Mendon Road, and a section of the Connecticut Path were identified.

25-2201 Binzen, Timothy and Ann Chapman

2002 Archaeological Reconnaissance and Intensive (Locational) Survey for the North Central Terminal Alternative at the Barnstable Municipal Airport, Barnstable, Massachusetts. 34 pages.

The project area is mostly wooded and occupies a location in central Cape Cod near several freshwater ponds. Subsurface testing was conducted at locations with high sensitivity for archaeological resources. A total of 237 shovel test pits were excavated at 7.5m intervals. Soil profiles indicated the presence of undisturbed topsoil and subsoil in wooded areas, and some previous disturbance in open areas near the airport. Three pre-Contact Native American sites (the Upper Gate

Pond Site, the Breeds Hill Road Site, and the Nashawake Site) were recorded as a result of the survey. The Upper Gate Pond Site consists of three loci in an area measuring approximately 30m by 90m. A rhyolite Atlantic point of the Late Archaic period was recovered, in addition to 11 rhyolite flakes and 1 chert flake. The Breeds Hill Road Site consists of three large rhyolite flakes recovered from a single test pit. The Nashawake Site consists of a concentration of chipping debris recorded in a test area measuring approximately 7.5m by 40m. The lithic assemblage consists of 21 thinning and sharpening flakes of rhyolite, quartz, and quartzite. The sites provide evidence of Native American subsistence activities near freshwater ponds during the pre-Contact period. No historic Euro-American archaeological resources were encountered during the survey.

25-2202 Graves, Anna K. and Holly Herbster

2002 Technical Report, Intensive (Locational) Archaeological Survey, Riverfront Business Park Project Area, and Archaeological Site Examinations, Evans-Barrett Site, Hathaway Site, and Head of the Cove Site, and Delineation of Four Historic Cemeteries, Freetown, Massachusetts. 288 pages.

An intensive survey, site examinations and cemetery delineations were completed at the 575 acre Riverfront Business Park project area. A total of 154, 50x50cm test pits was excavated within the 10m interval transects and 30x30m blocks. The intensive survey identified four historic period cemeteries, six prehistoric and three historic sites, four of which, the Head of the Cove and Barnaby's Swamp prehistoric sites, and Evans-Barrett (HS-1) and Hathaway (HS-2) historic sites, were determined to represent potentially significant resources. Based on proposed project impacts, site examination investigations were completed at three sites, and the horizontal bounds of all four historic cemeteries were delineated. The Head of the Cove Site covers an area of approximately 8,400sq m. During the site examination, a total of 69 test pits and three 1x1m units was excavated, recovering 404 pieces of cultural material, including two Small Stemmed projectile points, lithic debitage and organic materials in deeply plowed soils. The mid-19th to late 20th-century Evans-Barrett house site covers an area of approximately 4,200 sq m. Thirty three test pits and two 1x1m units were excavated, recovering 1,542 pieces of cultural material, including domestic, structural, and personal items. No historic period cultural features were identified at this site. The mid-18th to mid-20th-century Hathaway house site covers an area of approximately 2,500 sq m. A total of 31 test pits and 3, 1x1m units was excavated, recovering 1,351 pieces of cultural material, including domestic and structural items. Two intact cultural features were identified and investigated; an approximately 1m diameter dry-laid fieldstone well and a possible intact wooden post and partial buried foundation. Machine-assisted testing located the horizontal boundaries of the four 18th and 19th-century family cemeteries within the project area. The Head of the Cove and Evans-Barrett Sites were determined to have poor physical integrity and therefore were not considered significant or eligible for listing to the National Register of Historic Places. Recommendations also included the avoidance of Cemeteries 1–4, the Hathaway Site, and Barnaby Swamp Site. The proposed project, as currently planned, will not impact potentially significant cultural deposits within these areas.

25-2203 Donta, Christopher L, Margaret Kelly, and Kerry J. Lynch

2002 Phase 1 Archaeological Intensive (Locational) Survey for the Benson Farm, Lot A, Concord, Massachusetts. 66 pages.

Two archaeological sites were investigated at the site of the former Benson Farm on Balls Hills Road, which is a parcel of approximately 9 acres being converted to open space as part of a town water supply project. The Benson Farm Native American site (19-MD-70) was previously recorded as having produced diagnostic Late Archaic (6,000-3,000 years ago) and Woodland period (1,600-400 years ago) artifacts, as observed from collections in the area. During this survey, the site location was confirmed by the identification of a light scattering of lithic waste, totaling 11 flakes from 8 excavation units centered on a knoll to the west of the house. No features were identified, nor were any tools found that would aid in better understanding the date or nature of the

site. The site appears to have a low potential to provide information of significance to archaeology. The Benson Farm historic site was tested via trenches along the exterior foundations, and test pits inside the house foundation and around the property adjacent to outbuildings. Excavations produced diagnostic 18th- through 20th-century artifacts, with no indications to support a late 17th-century construction date. It is recommended that the existing foundations of the house, barn, and associated outbuildings not be destroyed but be filled to protect the intact features of this historic property. No further survey is recommended for the Native American site, due to a low density of artifacts, found primarily in plowed soils.

25-2204 Barker, F. Timothy, Christopher L. Donta, Timothy L. Binzen, and Margaret Kelley

2002 Archaeological Intensive (Locational) Survey (Phase 1) of the Proposed Police Driver Training Track, 2001 Testing, New Braintree, Massachusetts. 102 pages.

Background research and subsurface testing was conducted on approximately 300 acres. Documents indicated the presence of one known Native American site (19-WR-299), and an area of high historic potential adjacent to early 19th-century roads that are within the project area boundaries. At least 16 previously recorded Native American sites are located immediately to the north, east, south and west of the project area. Three hundred and forty eight shovel test pits were excavated in clusters, in eight survey units. The known Native American site within the project area boundaries was located and found to contain chipping debris of quartz, quartzite, chert, and rhyolite materials. Five other locations of Native American activity were also found (the Between the Stream site (19-WR-738), the Pumpkin Patch site (19-WR-739), the Boulder Falls site (19-WR-736), the Widow Maker site (19-WR-737), and the Sinkhole site (19-WR-741)), consisting of small areas of lithic debitage. Two historic house sites were found (the Barnes Site (NBR-HA-4) and the Boyden/Hapenay site (NBR-HA-5)), one containing a possible intact foundation feature and each containing artifact concentrations of the late 18th and 19th centuries. It is recommended that three Native American sites and one historic house site be avoided by any construction, as they are potentially eligible for the National Register of Historic Places. The remaining four Native American sites and the one historic site are not considered significant, and no further survey is recommended for these areas.

25-2205 Ingham, Donna and A. Peter Mair, II

2002 Intensive (Locational) Archaeological Survey: East Taunton Industrial Park, Taunton, Massachusetts. 82 pages.

An intensive (locational) archaeological survey of the East Taunton Industrial Part resulted in the identification of two loci of Native American land use and activity. Background research and walkover survey identified areas of high and moderate archaeological sensitivity. A total of 105, 50x50cm shovel test pits was excavated within these areas. The East Taunton Industrial Park 1 Site contains a low-density distribution of quartz and rhyolite lithic debris within approximately 300 sq m. No temporally diagnostic artifacts or features recovered and all materials were recovered from plowed soil. The East Taunton Industrial Park 2 Site contains low- to moderate-density distributions of prehistoric Native American cultural material dating to the Late Archaic and Early Woodland within a 1,950 sq m area. Quartz lithic debris, a quartz biface, and a quartz Small Stemmed projectile point was recovered from disturbed and undisturbed contexts. No subsurface features were encountered. The East Taunton Industrial Park 1 Site does not meet National Register criteria for eligibility. The East Taunton Industrial Park 2 Site contains multiple categories of data, within an undisturbed stratigraphic context and is likely to yield additional data pertaining to use of the area by Native Americans between ca. 5000 and 1500 B.P. The East Taunton Industrial Park 2 Site is considered significant and avoidance or site examination is recommended.

25-2206 Macpherson, Jennifer

2002 Technical Report Intensive (Locational) Archaeological Survey Mashpee Shaws, Mashpee, Massachusetts. 44 pages.

The 24-acre parcel is wooded and bound by SR 151 to the south and Old Barnstable Road to the west. A total of 50, 50x50cm test pits was excavated within project area along three judgementally placed linear test pit transects (A through C) and two 30x30m test pit blocks, each containing 13 test pits. Test pits along transects were excavated at 10m intervals. Testing was conducted in the locations of proposed infiltration basin, the building and two parking lots. Based on the lack of any cultural material, the Mashpee Shaws project area is not considered to yield any potentially significant cultural resources. No further archaeological investigation is recommended.

25-2207 Binzen, Timothy and Christopher Donta

2002 Archaeological Site Examination Survey at the Sachem Rock Native American Site, East Bridgewater, Massachusetts. 32 pages.

An archaeological site examination survey was conducted in part of the Sachem Rock Site (19-PL-63) located within the proposed limit of disturbance for a septic system. A total of twenty-four 50x50cm shovel test pits and two 1x1m excavation units were completed for the site examination, which followed intensive testing. Test pits were excavated at 7.5ft intervals along the proposed septic pipe, and 53 pieces of chipping debris were recovered, in addition to one large utilized flake, one fragment of pottery, and one fragment of fire-cracked rock. An excavation unit placed on the pipe alignment yielded 35 additional pieces of chipping debris, as well as one small triangular projectile point, three pottery fragments, and two pieces of fire-cracked rock. Test pits and one excavation unit also were excavated at intervals within the proposed septic leach field. A total of 50 pieces of chipping debris was recovered from the STPs, as well as one tip/midsection fragment of a rhyolite projectile point and one fragment of fire-cracked rock. The excavation unit yielded 45 additional pieces of chipping debris. Overall, approximately one half (50.3%) of the chipping debris from the Phase 2 testing consisted of quartz debitage, followed by rhyolite and a small amount of chert and felsite. No areas of high artifact concentration were identified and no subsurface features were encountered. The stratigraphy generally consisted of topsoil and fill from house construction overlying gravelly subsoil, or a plowzone deposit overlying undisturbed subsoil. The evidence indicates that the site was occupied during the Woodland period.

25-2208 Hoffman, Curtiss and Adrienne Edwards

2002 The SuAsCo Watershed Archaeological Inventory Project: Exploring The Cultural Resources Of A Suburban Area. 196 pages.

People have lived in the Sudbury/Assabet/Concord (SuAsCo) watershed in eastern Massachusetts for as long as 11,000 years. They left the traces of their existence in the landscape, in the form of stone tools, pottery, and other evidence. Archaeologists have been exploring the watershed's rich past for over a century. Many of the 776 Native American sites now known in the watershed are located in the same kinds of environments, which local environmentalists have identified as valuable open space for wildlife habitat protection, water quality and quantity protection, and open space for passive recreation. Both Federal and state environmental laws afford some protection for these buried cultural resources, if they can be identified. We have gathered data on site locations and contents to produce a GIS-based model for predicting where important cultural resources may be expected to be located. This will help regional and town planners as they generate "smart-growth" proposals for the region. We provide recommendations to various stake-holders in the SuAsCo Watershed and specific recommendations for each town based upon the site distribution model.

25-2209 Herbster, Holly and Suzanne G. Cherau

1999 Fieldwork Completion Report, Archaeological Data Recovery Program within the Herring

Creek Archaeological District, Wampanoag Aquinnah Shellfish Hatchery (WASH), Gay Head, Martha's Vineyard, Massachusetts. 39 pages.

The Tribe is planning the construction of a hatchery building and associated utilities within an 8 acre parcel of Tribal land on Menemsha Pond and the Gay Head Herring Creek, located partially within the Herring Creek Archaeological District. PAL completed an intensive survey of the project area in 1998 (See Report 25-2210). The project methodology called for stripping the topsoils followed by the excavation of any features within of 1500 sq m impact area. Twenty-four cultural features were identified as part of the project, including 12 refuse/storage pits, 7 shell midden pits, 1 hearth, 1 bottle dump, and 2 foundations. Two sacred/ceremonial features were identified but were not excavated. The recovered cultural material assemblage documents repeated, long-term use of the area from the Middle Archaic Period through the early 20th century by Aquinnah Wampanoag peoples for food processing, tool manufacture and maintenance, and habitation as well as ritual activities. The recovered cultural assemblage will be processed and curated by the Tribe at their Cultural Resource Center, currently in development through the Aquinnah Wampanoag Cultural Resource Commission.

25-2210 Herbster, Holly and Suzanne G. Cherau

1998 Summary Report, Intensive (Locational) Archaeological Survey Wampanoag Aquinnah Shellfish Hatchery (WASH), Gay Head, Martha's Vineyard, Massachusetts. 82 pages.

The survey included background research, a walkover survey, and subsurface testing in the form of 35, 50x50cm test pits placed along linear transects. The survey resulted in the identification of four probable prehistoric features, three probable historic period features, and two probable cellar hole depressions associated with a documented 19th-century Aquinnah Wampanoag homestead. The recovered prehistoric assemblage included lithic chipping debris, chipped stone tools and tool fragments, clay pottery sherds, and shell and animal bone fragments. Historic-period artifacts included brick, window and bottle glass, hand and machine-wrought nails, ceramic vessels, and shell and animal bone waste. Based on the recovered data, the site area appears to have been used by Aquinnah's Native peoples from the Late Archaic Period through at least the mid-19th century. The identification of both pre-Contact and historic Native American cultural deposits within close proximity to one another presents an important and unique opportunity to explore and understand the cultural continuity of the Aquinnah population. Potentially significant archaeological deposits were identified within proposed project impact areas. Since avoidance was not deemed feasible by the WTGH/A, it was recommended that the Tribe mitigate the impacts to the archaeological deposits by undertaking additional archaeological investigations in the form of a data recovery program.

25-2211 Public Archaeology Laboratory, Inc.

2001 The Pine Hawk Site: 7000 Years of Prehistory on the Assabet River Acton, MA. VHS cassette.

This video was produced as a part of the public education program on the Pine Hawk Site (19-MD-793) in Acton, MA. (See Reports 25-1876, 25-2061)

25-2212 Baker, Emerson W.

2002 Test Excavations at the Balch House, Beverly, Massachusetts. 67 pages.

Test excavations took place in the front yard of the Balch House (Prehistoric Site 19-ES-714, Historical Site BEV-HA-6 and Historic Structure BEV.185). This initial subsurface testing followed up on documentary research and remote sensing done in 1985 by Edward Bell (See Report 25-621). A total of 27 and a half 2.5x2.5ft pits were excavated within the 40x50ft survey area, with units initially being determined by a random stratified sample. Excavations revealed a range of in-

tact features and artifacts from the 17th though 20th centuries. The site also contains a Ceramic Period component. Despite intensive occupation for over 350 years, this yard contains significant archaeological remains and should not be disturbed without further archaeological excavation.

25-2213 Leveillee, Alan, Amy Barlow, Ben Ford, Gail VanDyke, and Kirk VanDyke

2002 The Whitin Park Mound: An Archaeological Approach. Northbridge, Massachusetts. 10 pages.

Whitin Park is a 7.5 acre property, once an element of the larger estate of John C. Whitin, the 19th-century industrialist after whom the town is named. The park includes the former Whitin house site and several remnant landscape elements including plantings and a small terraced mound, suspected to the buried remains of a former water fountain. Archaeologists were invited to excavate the small mound with the help of community volunteers, in the hope that the results would provide options for planning future park improvements. Archaeologists and public volunteers hand excavated a trench across the mound, exposing a granite polygonal foundation, and recovering a low density of 19th and early 20th-century domestic and structural debris. The investigation provided an opportunity to combine applied archaeology and public education. It confirmed the location of the former water fountain and provided the Whitin Community Center with a number of preservation options.

25-2214 Ingham, Donna

2002 Intensive (Locational) Archaeological Survey, Salt Pond Visitor Center Rehabilitation, Cape Cod National Seashore, Eastham, Massachusetts. 180 pages.

The intensive survey of the approximately 12 acre Salt Pond Visitor Center (SPVC) Rehabilitation project area focused on the proposed locations of project impacts. The project area, situated on elevated ground adjacent to Salt Pond and the Nauset Archaeological District (also a National Historic Landmark), is archaeologically sensitive. Subsurface testing, consisting of a total of 38, 50x50cm hand-excavated test pits placed singly and at 5, 10, and 20m intervals and six split-spoon cores placed within the locations of proposed construction impact, resulted in the identification of two low-density distributions of prehistoric cultural material associated with intact soils. These loci, the SPVC Prehistoric Find Spot 1 and 2 Sites, were identified following the recovery of a total of four pieces of lithic debris of unknown temporal association from two test pits. The spatial extent and information content of both sites is limited and neither site meets National Register criteria for eligibility.

25-2215 Ingham, Donna and A. Peter Mair, II

2002 Intensive (Locational) Archaeological Survey: Silver Lake Middle School, Kingston, Massachusetts. 93 pages.

An intensive (locational) archaeological survey for the Silver Lake Middle School project included background research and field investigations consisting of 44, 50x50cm shovel test pits excavated within areas of high and moderate archaeological sensitivity. Two loci of Native American land use and activity and one locus of Euro-American land use and activity were documented. The Silver Lake Middle School Find Spot 1 and Find Spot 2 sites contain low-density distributions of quartz chipping debris recovered from disturbed contexts. No temporally diagnostic prehistoric or evidence of subsurface features were recovered from either site and neither site is considered potentially significant. The “John Hall’s Mill” Site was identified within the 200ft buffer zone around Halls (Howards) Brook. It contains surviving structural remains and cartographic evidence suggests that additional structural remains or archaeological deposits may exist. Any plans for future development of the area should take into account potential impacts to this resource.

25-2216 Donta, Christopher L. and Margaret Kelly

2002 Archaeological Intensive (Locational) Survey for the Proposed North Raynham Sewerage Project, Raynham, Massachusetts. 70 pages.

Background research, reconnaissance, and subsurface testing were conducted for eight small parcels scattered across North Raynham, part of a proposed sewer expansion. Prior to our fieldwork, there were two recorded Native American archaeological sites in the vicinity of the project parcels. These are the Rozena's Farm Site (19-BR-225) (see report 25-170), in the area of Survey Unit A, and the Zolga Site (19-BR-451), in the area of Survey Unit H. No evidence was found of either of these two sites during the subsurface excavations. The lack of materials was probably due to extensive disturbances in each survey unit, as well as possible distance from the core areas of these two sites. During the field research, two previously unknown Native American sites were identified in the project area. The Hall Street site (19-BR-488) was identified in Survey Unit C, and included 74 quartz artifacts from intact subsoils. The Bridge Street site (19-BR-487) was identified in Survey Unit E, and included five quartz artifacts from plow zone contexts. A cluster of historic artifacts was found in Survey Unit F, but was not found to be in association with any features or standing structures. Avoidance was recommended for the Hall Street site, while the remaining parcels were not recommended for further investigation.

25-2217 Ingham, Donna

2002 A Program of Archaeological Data Recovery, Nourse/Andrews 1, 2, and 3 Sites, Westborough Elementary School Construction Area, Westborough, Massachusetts. 314 pages.

These archaeological sites were identified as three of four potentially significant prehistoric deposits during an intensive survey of the proposed Westborough Elementary School construction area conducted in 1999 (See Reports 25-2025, 25-22026). Following the intensive survey, archaeological site examinations were conducted on the Nourse/Andrews 1, 2, and 3 sites. The Nourse/Andrews 4 Site is located within a wetland buffer area that is intended to be preserved as open space and will not be impacted by the proposed construction. The Nourse/Andrews 1, 2, and 3 sites were well-preserved upland sites dating to the Middle Archaic Period, and all three sites were determined to be significant cultural resources that met National Register eligibility criteria. The data recovery included the excavation of 73 square meters within the three site areas resulting in the identification of seven lithic concentrations, five features, and the recovery of more than 7,000 pieces of prehistoric cultural material including lithic debitage, chipped stone tools and tool fragments, floral remains, faunal remains, and ceramic sherds. The majority of the cultural materials recovered from the three sites are associated with occupation during the Middle Archaic Period. Small, distinctive, assemblages of cultural material associated with occupation during the Early Woodland Period were recovered from the Nourse/Andrews 1 and 3 sites. Detailed analyses of chipped stone tools and lithic debris focused on an assessment of the lithic technologies represented by the assemblages and the relative level of settlement mobility that may be associated with them. These studies yielded evidence that each site contained a Middle Archaic component with a moderate level of settlement mobility. Further, comparison of the Middle Archaic components with the Early Woodland components has highlighted aspects of the Middle Archaic occupations, such as their relative functional and technological complexity, their evidence for the bulk processing of a targeted resource, and their evidence for onsite activities focused on the maintenance of the task group. The contrast between the Early Woodland and Middle Archaic components suggests that settings in the Westborough uplands were used differently during the two periods and that small sites situated in these settings filled differing functional and organizational roles.

25-2218 Graves, Anna K. and Suzanne G. Cherau

2002 Technical Report, Intensive (Locational) Archaeological Survey, Wilcox Hollow Recreational Improvements, Gardners Falls Hydroelectric Project, FERC No. 2334. 52 pages.

Fourteen 50x50cm shovel test pits were excavated within the proposed 1,840 sq ft, eight-car parking area in Shelburne, MA (See Report 25-1205; 25-1991). Testing was conducted using linear

transects with test pits at 5m intervals. The intensive survey included background research, a walkover survey, and subsurface testing. The survey did not identify any documented prehistoric or historic period resources nor archaeological deposits within the project area. No further archaeological investigations are recommended for the proposed Wilcox Hollow Recreational Improvements project area.

25-2219 Cherau, Suzanne G. and Timothy Ives

2002 Intensive Archaeological Survey, 3400 Block Area, Devens Reserve Forces Training Area, Devens (Shirley), Massachusetts. 111 pages.

Field investigations consisted of the excavation of a total of 143 50x50cm test pits divided among the archaeologically sensitive areas targeted for the development within the approximately 45 acre project area. Background research focused on a review of existing documents relating to pre-military and military land use patterns in the project area. Field investigations identified one new prehistoric site (designated the Terrace Site) and one historic site (designated the Boundary Site) and supported a reinterpretation of the previously identified Picnic Area prehistoric site (19-MD-1744). The latter site was not found to contain any identifiable archaeological deposits and no further work was recommended. The Terrace Site contains two loci of debitage activity in proximity to the Nashua River. Further testing might reveal the presence of additional, potentially National Register eligible data classes; avoidance or further subsurface testing is recommended. The Boundary Site contains a cellar hole and a well in an area adjacent to the existing fenceline, which may be on government property. This site could be related to early 20th-century residential occupation. Should future impacts be planned in this area additional research and field testing may be warranted.

25-2220 Cherau, Suzanne G.

2001 Archaeological Site Examinations, Historic Sites 73S, 74S, 75S1, and 75S2 (LAN-HA-40,39, 38 +37) and Prehistoric Sites 19-WR-564 and 19-WR-569, Devens Reserve Forces Training Area, Devens, Massachusetts. 175 pages.

Archaeological site examinations were conducted at four historic sites and two prehistoric sites within the Main Training Area of the Devens reserve Forces Training Area (See Reports 25-1099, 25-1378, 25-1835). The investigations were designed to collect classes of information needed to make determination of the sites' spatial limits, integrity, and eligibility to the National Register of Historic Places. Subsurface testing consisted of a total of 93, 50x50cm test pits and 9, 0.5x1m and 1x1m excavation units at the six archaeological sites. Archival research for the four historic sites was undertaken to outline and clarify the expansion and contraction of each site's boundaries over time, the various owner/occupants, and to identify any references to historic cultural landscape features such as houses or outbuildings. The site examinations of the previously identified prehistoric sites did not recover any additional cultural deposits. Both sites are interpreted to represent short-term use of this portion of the Nashua River drainage. Neither site is considered to be eligible to the National Register of Historic Places. The archaeological investigations identified the presumed locations of dwellings and outbuildings at the three home/farmstead sites (HS 73S, 74S, and 75S1) occupied from the late 18th /early 19th to 20th centuries. These resources are assessed as having poor physical integrity and low research value due to severe military earthmoving disturbances. They are not considered National Register eligible. The fourth historic site, HS 75S2, a cider mill, is assessed as having a good physical integrity and high research value due to its potential to contribute to an understanding of a specialized crop industry in Lancaster and north-central Massachusetts. HS-75S2 is considered eligible to the National Register of Historic Places under Criteria A and D. Avoidance of the roughly 2 acre historic mill parcel abutting the steep embankment of Harvard Road is recommended.

25-2221 Herbster, Holly and Suzanne G. Cherau

2002 Intensive (Locational) Archaeological Survey Aerie Property. Aquinnah, Masachusetts. 58 pages.

A total of 35, 50x50cm shovel test pits was excavated within archaeologically sensitive portions of the approximately 3.14 acre lot. The intensive survey included background research, a walkover survey, and subsurface testing. The intensive survey identified two Native American archaeological deposits. The prehistoric period Aerie Site consists of six pieces of quartz chipping debris and a broken quartz biface collected in a 200 sq m area. The historic Lot 51 Site area consists of two small, rough fieldstone piles adjacent to a partially buried, erect flat granite slab similar in size and shape to burial markers found elsewhere in Aquinnah. No evidence of belowground deposits was noted in association with these stone features. The northern, western, and southern property lines represent historic Lot 51, listed in the 1866/1870 Pease Survey as belonging to Zaccheus Howwasswee, sold to Abram Rodman. The documentary record does not indicate the presence or function of the stone markers. The Aerie and Lot 51 sites are considered potentially significant archaeological resources. Although no cultural features were identified within intensive survey pits, the favorable environmental characteristics and relatively undisturbed soils suggest that additional deposits associated with either the Aerie or Lot 51 sites may be located in proximity to the identified site deposits. It is possible that the stone markers in the southwestern project area represent a burial or ceremonial feature. Avoidance of both site areas with a protective buffer is recommended.

25-2222 Donta, Christopher L. and Ann Chapman

2002 Archaeological Intensive (Locational) Survey and Site Examination Survey for Three Proposed Town Projects: Lakeville Public Library, Tamarack Inn, and Senior Center, Lakeville, Massachusetts. 100 pages.

Archaeologists conducted background research, archaeological reconnaissance surveys, and archaeological intensive (Locational) surveys of three parcels, and a site examination survey of one of the three parcels in the town of Lakeville. The site locational survey included the excavation of 124 test pits in the three parcels, and the identification of Native American sites in all three parcels. The Library parcel contained Native American artifacts in 42 of the 52 STPs excavated, which was designated as the Sargasso Sea site (19-PL-891), totaling 329 artifacts, and including one small-stemmed projectile point and 11 other tools. The Tamarack Inn parcel was found to contain a Native American site, designated the Tamarack Site (19-PL-892), which does not appear to be directly related to the previously defined Pond Cemetery site (19-PL-211). The Tamarack Site included Native American artifacts from 23 of the 32 STPs excavated, totaling 157 artifacts, and including one Small Triangle and one Small Stemmed type projectile points, in addition to three cores. The Senior Center Parcel contained Native American artifacts in 14 of the 40 STPs excavated, which was designated the Ted Williams Site (19-PL-893), totaling 21 artifacts, including one Small Stemmed projectile point and three other tools. Avoidance was recommended for all three sites. Because avoidance was not possible for the Ted Williams Site, a site examination composed of 21 STPs and two 1m X 1m units, documenting a low density lithic scatter, with no additional diagnostic artifacts. No further survey was recommended at the Ted Williams Site.

25-2223 Ritchie, Duncan and Holly Herbster

2001 Intensive Archaeological Survey Comprehensive Wastewater Management Project, Essex and Gloucester, Massachusetts. 68 pages.

The intensive survey evaluated the archaeological sensitivity of seven pump station sites (Pump Stations 1-5, Essex Ave, Lincoln Street Pump Stations) and two cross-country sewer main routes (Pickering to Main St, Brookside Apartments) under consideration as locations for the proposed facilities. One of the pump station sites (Pump Station 5) was reported to contain a known prehistoric period archaeological site (19-ES-221). Another pump station site (Pump Station 2) was adjacent to the site of a 19th-century shipyard on Eben Creek in Essex. Based on background re-

search and a walkover inspection, five of the alternative sites (Pump stations 2,4,5, Essex Ave, Lincoln St Pump Stations) and the two cross-country sewer main routes contained zones of high/moderate archaeological sensitivity with some potential to contain unrecorded prehistoric and historic period sites. Pump Station sites 1 and 3 in Essex were considered to have low archaeological sensitivity because of the extent of previous disturbance. Sources of previous disturbance in these areas of low archaeological sensitivity included filling, grading, and landscaping associated with commercial and residential development. Pump Station 1 was excluded from subsurface testing. Subsurface testing within the proposed Pump Station Sites 2, 3, 4, and 5 in Essex and the Lincoln St. and Essex Ave. sites in Gloucester confirmed previous disturbance and yielded primarily small amounts of historic/modern period cultural material in disturbed/altered soils. None of this material is associated with a specific historic site and is not considered to be a potentially significant cultural resource. No evidence of a previously recorded prehistoric site, 19-ES-221, was found within the proposed location of Pump Station 5 at the intersection of Pond St and Western Ave. The intensive survey indicated that this site is most likely located outside the project area near Alewife Brook. A few pieces of Native American cultural material were found within altered soil strata in the Pickering to Main St. sewer main route. These two pieces of rhyolite chipping debris were not in their original depositional context. This findspot does not represent an intact or potentially significant archaeological site and is unlikely to yield further information about Native American activity in the Essex River estuary area. The intensive survey did not identify any potentially significant prehistoric or historic period cultural resources or archaeological deposits within the Essex-Gloucester Comprehensive Wastewater Management project area.

25-2224 Ingham, Donna

2002 Intensive (Locational) Archaeological Survey, Project PRA-CACO 10(1), Cape Cod National Seashore, Eastham, Massachusetts. 174 pages.

A total of 311, 50x50cm hand excavated test pits and nine machine-assisted cores were placed within the archaeologically sensitive areas where construction impacts will occur. This subsurface testing resulted in the identification of seven archaeological site locations. The Doane Road Site contains a low to moderate density of prehistoric cultural material, partly situated within intact contexts, distributed across an approximately 1,400 sq m area. The presence of prehistoric deposits in association with intact soils across an extended area indicates that the Doane Road site has the potential to address research questions relating to the prehistoric settlement and land use in the Outer Cape and may therefore meet National Register criteria for eligibility. Avoidance of the Doane Road Site is recommended. The Doane Road Prehistoric Find Spot 1 through 5 sites consist of isolated deposits of low densities of prehistoric cultural material. Because of their limited spatial extent, information content, and research potential, none of the five prehistoric find spots will meet National Register criteria for eligibility. Further archaeological investigations are not recommended for the Doane Road Prehistoric Find Spot 1 through 5 sites. The Doane-Brewer House Site is associated with the 18th-century Doane-Brewer House, which is potentially eligible for inclusion in the National Register of Historic Places. The Doane-Brewer House site has the potential to address research questions relating to historic-period settlement and the agrarian economy in Eastham, and may meet National Register criteria for eligibility. Avoidance of the Doane-Brewer House Site is recommended. Buried intact soils were detected at one coring location within the paved shuttle bus turn area at the intersection of Doane Rd with Ocean View Drive. Buried intact soils were not detected within the remaining eight cores extracted within the turning area and the adjacent sidewalk, indicating that much of the area has been disturbed. Further archaeological investigations are not recommended for this area. An intensive (locational) archaeological survey of the proposed Little Creek Path was conducted in addition to the PRA-CACO 10(1) project area. The proposed path, approximately 1800ft long, will be built of wood chips laid over a variety of surfaces, including wooded areas cleared of trees and underbrush, the paved surface of the former Little Creek Road, and on the eroded surfaces of existing “social paths”. Some locations may require filling prior to construction. A total of 39, 50x50cm hand excavated test pits was placed within archaeologically sensitive areas where construction impacts will occur, resulting in the identification of one prehistoric site location and documentation of an historic period roadway.

The Little Creek Road Site contains a low to moderate density of prehistoric cultural material, partly situated within intact contexts, distributed across an approximately 195m long area. The presence of prehistoric deposits in association with intact soils across an extended area indicates that the Little Creek Road Site has the potential to address research questions relating to prehistoric settlement and land use in the Outer Cape and may meet National Register criteria for eligibility. Avoidance of the Little Creek Road Site is recommended. Cartographic evidence for the historic roadway known as Little Creek Road indicates that it had been laid out as early as 1880 and that it remained in use through the middle of the 20th century. A segment of the former Little Creek Road is parallel to and coincident with the proposed Little Creek Path. Overall, the segment of the former Little Creek Road located within the project area is of fair to poor physical integrity and retains little of its 19th-century form or historical associations. Therefore, no additional archaeological investigations of the former Little Creek Road are recommended.

25-2225 Fragola, Patricia, Joanna M. Doherty, and Virginia Adams

2000 Reconnaissance Archaeological Survey and Historic Architecture Assessment New Federal Courthouse, Springfield, Massachusetts. 116 pages.

The project area studied in this survey comprises 6.27 acres and overlaps with the Quadrangle-Mattoon Street Historic District, which is listed in the National Register of Historic Places and is also a City of Springfield Local Historic District. The reconnaissance archaeological survey of the Springfield Federal Courthouse Project encompassed review of the site files and survey forms at the Massachusetts Historic Commission (MHC), a study of secondary histories pertaining to the historical development of Springfield, and preliminary survey of city directories and federal census records. A walkover survey of the project area was carried out to assess the potential for archaeological sites. The historic resources status review examined and assessed existing information concerning the historic properties in the project area. Construction of the U.S. Courthouse in Springfield will involve excavation activities and the relocation of Alexander House, a historically significant structure. Related to this project, but not part of the federal action, is the demolition of the Technical High School additions, part of a historically significant structure. Given the extent of ground disturbance generated by the project, an intensive (locational) survey is recommended to identify potentially significant archaeological sites in the project area.

25-2226 Cherau, Suzanne G., Kristen Heitert, and Stephen Olausen

2001 2000 Baseline Monitoring Program Deerfield River Hydroelectric Power Project, FERC no.2323. 100 pages.

The baseline study was designed to identify through field survey any project-related operations or other activities that are causing damage or have the potential to cause damage to the integrity of cultural resources; record the current condition of each property in order to provide baseline information from which to evaluate subsequent physical changes that occur over time; propose schedules for monitoring the affects of project activities on cultural resources; make recommendations for additional cultural resource investigations that will aid USGenNE in planning ways to avoid, minimize, or mitigate the effects of the project operations on cultural resources; and update the status of proposed educational and public outreach programs. The initial baseline study was conducted to fulfill stipulations in the project's Cultural Resource Management Plan (CRMP See Report 25-1898). The field study identified nine archaeological sites undergoing direct impacts from recreational uses and/or soil erosion. Intensive (identification) surveys were recommended for each of these sites, in order to locate and identify structural and artifactual deposits, and provide an assessment of their physical integrity and National Register eligibility. The remaining 16 previously identified archaeological sites and additional sensitive areas were recommended to be monitored every 5 years for evidence of any impacts. The baseline study also identified two proposed undertakings that would have adverse effects on historic structures for the year 2001.

25-2227 Schley, Thomas

1991 Archaeological Monitoring of a Utility Trench, Bunker Hill Monument, Boston National Historical Park, Boston, Massachusetts. 16 pages.

The excavated trenches ran under the existing sidewalk that skirts the south and east sides of Monument Square around the perimeter of the Bunker Hill Monument, and also within the fence on the grounds itself. No significant archaeological evidence was noted during the project. Most of the telephone trench was dug through fill or areas otherwise previously disturbed by road and sidewalk construction. No evidence of soil change that could possibly indicate the presence of Revolutionary War era earthworks was noted.

25-2228 Kelley, John W.

1998 Burial Practices of the Praying Indians of Natick, Ponkapoag, and Marlboro. MA Thesis. 136 pages.

The relationship between John Elliot and the Praying Indians has been the source of a great deal of scholarly discourse in recent years. Letters fro John Elliot to his benefactors in England and first hand accounts buy Daniel Gookin of the rise and decline of the Praying Indians and their praying towns have been the documentary sources often used to interpret that relationship. This Master's thesis presents an analysis of three Praying Indian burial collections attributed to Christian Indian communities that are part of a long overlooked component of the archaeological record. One collection was recovered by construction workers 120 years ago in South Natick, Massachusetts, while another was recovered in 1951 during the excavation of a sewer trench in Marlboro, Massachusetts. The third was partially excavated in coordination with the Massachusetts Commission on Indian Affairs and the State Archaeologist in 1989 in Canton, Massachusetts. In addition to shedding new light on the Praying Indian experience, this thesis will illustrate the value of museum collections.

25-2229 Dudek, Martin and Karen Michalek

2002 Intensive (Locational) Survey Report for the Augat Self-Storage Facility at Falmouth Road, Mashpee, Massachusetts. 50 pages.

An intensive survey was conducted on a parcel of approximately 7 acres. The project is located within 200m of Falmouth Road and Quaker Run and has near-level topography. The archaeologists excavated 68 test pits: 56 systematic test pits placed in four blocks, plus eight judgmental test pits and four bracket test pits around a find spot. Natural stratigraphy was encountered with hardpan sand and gravel soils. Isolated materials recovered consisted of a minimal amount of modern material and one find spot of a quartz decortification flake. No significant cultural materials were recovered and no additional archaeological work is recommended.

25-2230 Ives, Timothy and Duncan Ritchie

2002 Intensive (Locational) Archaeological Survey Village At Wildflower Green, Raynham, Massachusetts. 90 pages.

The 45-acre project area is located in the eastern portion of Raynham. While background research indicated that the project area contained known ancient Native American archaeological sites and historic/modern period farmsteads, the walkover survey and surface inspection indicated that much of the project area had been disturbed and had low archaeological sensitivity. The remainder possessed moderate archaeological sensitivity, with some small zones of high sensitivity. A total of 58, 50x50cm test pits was excavated in archaeologically sensitive areas during the intensive archaeological survey of the project area. This survey located four prehistoric site areas, designated Wildflower Green I–IV, and one historic period site, designated the Wildflower Green Culvert Site. Wildflower Green I is a site of tool manufacturing or modification using locally available

quartz, probably during a single event. It lacks temporal or cultural affiliation and is contained within topsoil impacted by plowing. Wildflower Green II contains a thin distribution of quartz chipping debris in addition to a highly concentrated locus of hornfels chipping debris, which is indicative of Middle to Late Woodland period (ca. 1,600 to 500 years ago) activity. The small size and high density of this deposit indicates a single episode of stone tool manufacture or modification at a point location. Wildflower Green III consists of the isolated recovery of one quartzite flake. Wildflower Green IV consists of the isolated recovery of a side-notched point similar to the Coburn type, diagnostic of the Terminal Archaic Period (ca. 3,200–2,700 years ago) Susquehanna tradition. The results of close interval sampling indicates that these sites are unlikely to yield any further information. The Wildflower Green Culvert Site consists of a crude culvert constructed of fieldstone, which drains a small wetland into an intermittent stream to the south. This historic-period feature has limited information content. No further archaeological investigation of the Village at Wildflower Green project area is recommended.

25-2231 Ingham, Donna and Duncan Ritchie

2002 Intensive Archaeological Survey, Swan Ridge At Milford. 106 pages.

The intensive archaeological survey was carried out within a 54-acre parcel of land. The project area consisted of upland terrain typical of landscapes along the upper Charles River drainage. Background research and a walkover survey were used to stratify the project area into zones of expected sensitivity and those with high and moderate archaeological sensitivity were tested. The walkover survey/surface inspection identified a complex of features (granite block culvert, foundations, quarry haul road, cutting shed sites) associated with historic granite quarrying. An abandoned granite quarry was also found within designated open space along the northern boundary of the project area. Historic standing structures, consisting of a mid-19th-century house and associated barn foundation were identified along the western edge of the project area. Designated areas of open space in the northern and eastern portion of the project area will be left intact and were not tested. Subsurface testing was conducted with 45, 50x50cm test pits. Subsurface testing identified Swan Ridge Find Spot 1, which yielded a bifacial tool blade fragment and several pieces of quartz and rhyolite chipping debris. This site contributed some information about prehistoric settlement patterns in the upper Charles River drainage, but is unlikely to yield additional information about Native American activity in this area. A granite block culvert crossing the stream and wetland near the center of the project area was documented (photographs, scaled drawing). This feature is unlikely to yield additional information and is not considered a potentially significant cultural resource. The complex of other structural remains and features, including Swan Ridge Structures 1 and 2, the Boston & Albany Quarry haul road, and Boston & Albany Railroad Cutting Shed Site were considered potentially significant. These sites are associated with the operation of a quarry owned by the Boston & Albany Railroad and located just outside the northern boundary of the project area. The mid-19th-century house at 429 East Main Street was considered to be a potentially significant historic standing structure. This house and its associated barn most likely functioned as a farmstead occupied when the project area was used for both granite quarrying activities and agricultural/pastoral land use. No further archaeological investigation of Swan Ridge Find Spot 1 and the granite block culvert is recommended. The abandoned granite quarry will be preserved within proposed open space and no further investigation is recommended. If the complex of features and structural remains associated with the Boston & Albany Railroad Quarry cannot be avoided, additional archaeological investigation at the site examination level, including comprehensive background research, is recommended. Additional background research and documentation should also be conducted on the house and barn foundation.

25-2232 Pasquariello, Raymond and A. Peter Mair, II

2000 Intensive (locational) Archaeological Survey, Tennessee Gas Pipeline Company Dracut Expansion Project, Burlington, Billerica, Tewksbury and Dracut, MA. 154 pages.

Using a combination of background research and walkover survey , the project corridor was as-

signed zones low, moderate, and high archaeological sensitivity. A total of 126 50x50cm test units were excavated in areas of high and moderate sensitivity. Five Native American and two historical archaeological sites were located and investigated. The Shawsheen River, Mead Road, and Saville Road sites produced varying densities of prehistoric Native American cultural material and are considered potentially significant archaeological resources. The Fox Hill and Merrimack River Findspots are isolated artifact finds that are not considered significant. The Webb Brook Road and Nashon Road Well sites provide evidence of historic landuse. The Webb Brook Road Well Site is interpreted as a livestock well and is not considered significant. The Nashon Road Well Site may be part of an historic pump house and is considered significant. The project corridor crosses the National Register listed Middlesex Canal. Avoidance or site examination is recommended for the Shawsheen River, Mead Road, Saville Road, and Nashon Road Well sites. Monitoring is recommended during the crossing of the Middlesex Canal. No further work is recommended for the Fox Hill and Merrimack River Findspots and the Webb Brook Well Site.

25-2233 Mair, A. Peter, II, Jo A. Deaton, and Ben Ford

2002 Phase I Intensive (Locational) Survey: 20 Watertown Street, Watertown, Massachusetts. 76 pages.

An intensive (locational) archaeological survey including background research and subsurface investigations was conducted on approximately 2.42 acres. The project area was the former location of several historic-period structures including the John Cooke House, home to patriot Paul Revere from 1775-1776, the Dorothy Coolidge Tavern, and several factories. It also was sensitive for Native American archaeological deposits. Seven judgmental test pits and five test trenches were excavated in areas of direct project impact. No evidence of the John Cooke House or Coolidge Tavern was identified. The investigations demonstrated that the project area has experienced several episodes of construction, demolition and filling since the 18th century, leaving foundational remains of the Porter & Company factory, but no intact sites. No further testing was recommended.

25-2234 Herbster, Holly and Suzanne G. Cherau

2002 Archaeological Reconnaissance Survey, Town of Aquinnah, Martha's Vineyard, Massachusetts. 196 pages.

The reconnaissance survey included background research, informant interviews, and drive-over field survey. This information was used to compile environmental and cultural contexts for Aquinnah, and to develop predictive models for undocumented archaeological sites. The survey documented 14 previously unrecorded archaeological sites (8 prehistoric and 6 historic). The predictive model developed for the survey indicates that Aquinnah contains a wide diversity of natural resources including extensive wetland networks, limited modern period development, and a documented human presence spanning 10,000 years. These conditions give the town a generally high archaeological sensitivity for Native American resources dating from the prehistoric and historic periods. Management recommendations developed for the survey focus on a number of archaeological resource protection programs that could be considered as well as improvements to the current Historic and Archaeological Resource Protection Bylaw. Recommendations include improved coordination with the Tribe and its designated representatives to ensure that all types of Native American sites including traditional places and ritual/ceremonial sites are considered in the context of new development and construction initiatives.

25-2235 Donohue, Barbara

2002 Data-Recovery Report for the Footprint of the Proposed Hammond Street Building and Construction Impact Zone at the Thwing/Haynes/Slade Site, Chestnut Hill Campus, Boston College, Newton, Massachusetts. 195 pages.

A two-part data recovery was proposed on an 11,000sq ft parcel. Part 1, baseline data collection, included background research, machine-stripping of the topsoil and fill layer, shovel scraping, and identifying, documenting, and sampling features to help define the work to be conducted in Part 2, the final data-recovery plan. As a result of Part 1, 9,366 artifacts and 54 features were identified in the backyard of a former residence that had been occupied from 1806 to ca. 1895 when it was razed. These investigations suggested a site with an intact internal configuration that retained integrity and could provide further information on spatial organization within this house lot as this section of Newton changed from a farming to a suburban community. Additional archaeological investigation and sample analysis was recommended. The MHC did not concur, however, and no final data-recovery plan was pursued.

25-2236 Deaton, Jo A., Matthew Kierstead, and Duncan Ritchie

2002 Intensive Archaeological Survey, Milton Landing, Milton, Massachusetts. 86 pages.

Reconnaissance and intensive (locational) archaeological surveys were conducted at the proposed Milton Landing project area. The survey study area covered approximately 164,678sq ft of development on the former O. S. Godfrey Coal & Lumber Yard/Hood Cold Storage facility along the south shore of the Neponset River. Documentary research and field investigations were used to locate, identify, and assess any visible and below ground archaeological resources. Field investigations consisted of a walkover survey/surface inspection of the study area followed by subsurface testing on the existing cold storage platform. Documented/reported resources included cold storage for ice cream, a coal and lumberyard, a commercial landing for the Triangular Trade, and a general commercial dock for the Town of Milton. The intensive survey fieldwork consisted of 10 machine-excavated trenches in the zones of moderate to high archaeological sensitivity. No significant in situ archaeological deposits were identified. No further archaeological investigations are recommended.

25-2237 Mair, A. Peter, II and Joseph N. Waller, Jr.

2002 Intensive (Locational) Archaeological Survey, Proposed Hampton Inn and Restaurant, Auburn, Massachusetts. 70 pages.

The 11 acre parcel contains two upland areas surrounded by wetlands. Although no surveys have been conducted in the area, the general environmental setting was considered favorable and the project area archaeologically sensitive. A total of 22, 50x50cm test pits was excavated within archaeologically sensitive portions of the project area. No potentially significant archaeological resources were identified. No further investigations are recommended.

25-2238 Wheeler, Kathleen

2002 Results of Archaeological Site Exam for the Proposed Installation of French Drain, West Barn Yard, Cogswells Grant. Essex, Massachusetts. 9 pages.

Subsurface testing included the excavation of three shovel test pits along the 17m length of the proposed French drain. A total of six artifacts was recovered, including one hand-wrought nail, a cut nail, a wire nail, two unidentified nails, and a single piece of ancient Native blocky quartz shatter. All artifacts were retrieved from an upper fill layer that covers clay subsoil. No significant resources were encountered, and no further archaeological survey was recommended.

25-2239 Ingham, Donna and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey The Pinehills – Northern Outparcel Project Area. 78 pages.

The intensive survey incorporated background research, sensitivity rankings, and a review of re-

sults generated by previous archaeological investigations within the larger Pinehills development area (See reports #25-2063) in Plymouth. This information served as a foundation for the archaeological investigations carried out within the 13 acre project area. A total of 43, 50x50cm test pits was excavated within portions of the project area determined to be archaeologically sensitive. The survey identified one locus of prehistoric Native American land use, designated the Pinehills Locus 11 Site, and three modern period structures, designated the Great Island Pond Cottage 1, 2 and 3 sites. Prehistoric cultural material consisting of a single piece of quartz chipping debris was recovered from good (undisturbed) stratigraphic context within the Pinehills Locus 11 Site. This site is located on a level terrace in the eastern portion of the project area overlooking the west shore of Great Island Pond. The deposit of material recovered at the site may have resulted from a brief episode of chipped-stone tool maintenance. Temporally diagnostic tools or materials were not recovered from the site and the temporal association of this episode of prehistoric land use and activity cannot be established. The information content and research potential of this site is limited and it is unlikely to meet National Register of Historic Places criteria for eligibility. Three Modern Period structures located within the project area, the Great Island Pond Cottage 1–3 sites, were documented. Limited background research indicates that Cottage 2 was constructed prior to 1942, Cottage 1 was constructed between 1942 and 1977, and Cottage 3 was constructed after 1977. It is likely that all three cottages were occupied intermittently, perhaps as vacation homes or camps. They represent a type of recreational land use associated with freshwater ponds in Plymouth and other towns within southeastern Massachusetts. Great Island Pond Cottages 1 and 2 appear to be more than 50 years old and Great Island Pond Cottage 3 is likely to be more recent. Great Island Pond Cottage 3 is in poor condition and not considered to be potentially significant. Great Island Pond Cottage 1 and 2 sites are both situated within the 100ft wetland buffer designated around Great Island Pond and may be protected from construction impacts related to future development of The Pinehills-Northern Outparcel project area. The Great Island Pond Cottages 1 and 2 are both situated within the 100-foot wetland buffer zone designated around Great Island Pond. These two structures should be protected from construction impacts.

25-2240 Donta, Christopher L. and Margaret Kelly

2002 Archaeological Intensive (Locational) Survey for the Proposed Vinegar Hill Estates Saugus, Massachusetts. 100 pages.

Background research, reconnaissance, and subsurface testing were conducted for a proposed housing development in the Lynnhurst section of Saugus. The reconnaissance and 113 shovel test pits identified numerous indications of Native American use of the property. Seven previously unknown Native American sites were found in the project area, along with evidence of one previously recorded site in four locations. In total, 288 Native American artifacts were collected. The predominant artifacts are waste flakes of rhyolite. This volcanic stone is visible on the ground surface amongst the numerous rock outcrops that characterize Vinegar Hills, and ranges in color from a dark gray, which is the most common, to black, purple, or more rarely, red. The red color appears to be the same material referred to in the region as “Saugus jasper”, which is known from the quarry site of the same name, located just to the west of the project area. Most of the sites consist of clusters of rhyolite flakes, left from the beginning stages of the manufacture of stone tools. The majority of the flakes are large, and include substantial amounts of cortex, indicating that the people who left them were either quarrying stone at these sites, or completing the first steps of reduction of raw material blanks. The densest deposits of stone lie in Survey Unit 4, at the Swamp Hollow (19-ES-741) and Treehouse Terrace (19-ES-742) sites, which appear to be quarry locations. Other small areas of high density were observed at the Lady Slipper (19-ES-739), Rhyolite Ledge (19-ES-740), Fairmount (19-ES-752), and Dog Day (19-ES-753) sites. Because of the numerous rhyolite outcrops, it is likely that multiple lithic procurement locations were used, and that multiple episodes of lithic reduction took place, some of which have been found by this survey. In addition to the Native American sites, one historic site has been recorded, the Pirates’ Cave site (SAU-HA-9), located in the southeastern most portion of the project area. The site consists of the remains of a cave, which was reportedly used by the pirate Thomas Veale and his associates in the latter part of the 17th century, but has since been partially filled. The Pirates’ Cave site lies outside

any proposed impacts of this project, and no evidence of any pirate activity was found. Five of the sites found during this project have the potential to contain significant deposits of artifacts and features: the Lady Slipper, Rhyolite Ledge, Swamp Hollow, Treehouse Terrace, and the Dog Day site. It is recommended that the project be designed to avoid impacts to all of the Native American sites. If this is not possible, then site examination surveys are recommended. The other sites documented in the project area do not appear to contain intact deposits that would yield significant information.

25-2241 Dudek, Martin G. and Craig S. Chartier

2002 Site Examination at the Tall Pines Development, Clinton, Massachusetts. 138 pages.

A total of 69 test pits were excavated to define the limits of the Hunting Blind (8 test pits; 150sq m) and Rock Shelter Terrace (61 test pits; 4,018sq m) sites at 5m intervals. Two 1x1m units were excavated at the Hunting Blind site and four 1x1m units at the Rock Shelter Terrace site, two within the small chambers of the gneissic schist rockshelter. One unit was extended an additional meter to investigate a terminal Woodland-to-17th-century pottery concentration. An expanded site exam, consisting of seven additional 1x1m units, was conducted within and around the rockshelter, excavating the remainder of the small chambers and areas immediately outside. Materials recovered at the Hunting Blind site consisted of quartz shatter but few flakes and an expedient edge tool. No features, bifacial tools or organic remains were present. At the Rock Shelter Terrace site, a concentration of shattered quartz was investigated, revealing natural weathering and fracturing of quartz combined with evidence of cultural quartz bashing, probably for the acquisition of usable quartz chunks. The double-chambered rockshelter contained quartz shatter with few flakes, and a concentration of pottery from a collared Native American pot in the northern chamber, where wall niches were present. Several pieces of the same pot were present outside of and within the southern chamber. Eighteenth-century artifacts immediately southwest of the rockshelter included burned flint, Scratch-blue stoneware, redware, and wrought iron associated with calcined bone. Thin-sectioning of the Native pot indicates coiling and Algonquian pottery-making techniques. Botanical analysis of plant materials from the rockshelter was also conducted. The Hunting Blind Ridge site is not considered significant. The Rock Shelter Terrace site is not considered significant and is not eligible for inclusion in the National Register of Historic Places. Any significant data were recovered during the extended site examination. No additional work is recommended.

25-2242 Waldbauer, Richard C.

1996 Documentation of Fieldwork and Associated Activities Undertaken at the Dedic Site, Whatley and Deerfield, MA. 18 pages.

This report is a supplement to report #25-2243 and provides a summary of the fieldwork involved in taking soil cores at the Dedic Site (19-FR-157) in Whately.

25-2243 Thorne, Robert M., R. Waldbauer, and Paul Nickens

1999 Archaeological Site Revegetation, Organochloride Based Pesticides, PCB's and their Relationships to Resource Preservation and Protection. Whatley and Deerfield, MA. 46 pages.

Soil cores were taken at eight archaeological sites in the United States in order to examine the effects of agricultural chemicals on artifacts. The Dedic Site (19-FR-157) in Whately was one of the subject sites. The report describes the analytical methodology, brief results and recommendations for further research. See also report #25-2242.

25-2244 Pretola, John P.

2000 Northeastern Ceramic Diversity: An Optical Mineralogy Approach. Dissertation submitted

to the Graduate School of the University of Massachusetts Amherst. 128 pages.

This study uses ceramic petrography to understand the meaning of "Iroquoian" ceramic traits in eastern New York and southern New England. This analysis assumes that style represents non-verbal behavior in both decorative and technological attributes. Style manifests itself as symbolic, iconographic, and technologic communication that can be active or passive. Technologic style is learned behavior that is slow changing, and represented as variation in manufacturing attributes. Because of the enculturative nature of technologic style, it is possible to distinguish social phenomena, especially group affiliation, using ceramic petrography. Ceramic petrography works without resort to typological analysis. Previous attempts to address this question using the typological method have been confounded by the great variability in northeastern ceramic traits. The author's approach combines optical mineralogy with macroscopic examination to study 91 vessel lots from Mohawk, Hudson, Housatnic, and Connecticut river valley sites of Terminal Woodland age. He tests hypotheses about northeastern group affiliation expressed in technologic terms and finds that: 1) the mineral composition of aplastic paste inclusions differentiates the ceramics of each river drainage; 2) analysis of construction techniques shows that Mohawk River Valley ceramics were drawn, while those to the east were coil-built; 3) the surface treatment and collar design application techniques show distinctions between Mohawk River Valley ceramics and those of eastern New York and Southern New England; and 4) the use of slips has a clinal distribution from 76% in the Mohawk River Valley sample to 12% in the Connecticut River Valley sample. Pan-northeastern decorative traits were incorporated and combined into locally distinct stylistic repertoires. This study shows that "Iroquoian" traits in southern New England ceramics were of local Algonquian manufacture. Traditional arguments relying upon unilateral diffusion and trade from New York do not explain ceramic diversity in southern New England. Northeastern archaeologists need to develop a model based upon multi-directional flow of traits integrated with a realistic theory of style and stylistic change. This study shows clear distinctions between the ceramics of the two culturally and linguistically distinct northeastern peoples, who interacted in an open and fluid system that allowed association and mixture of people and ideas.

25-2245 Ingham, Donna and A. Peter Mair, II

2002 Intensive (Locational) Archaeological Survey: Pittsfield Municipal Airport Improvement Projects, Pittsfield, Massachusetts. 70 pages.

An intensive (locational) archaeological survey consisting of background research and field investigations was conducted. Three National Register eligible properties are located within the project area: PIT.292, 293, and 294. A total of 82, 50x50cm test pits was excavated within archaeologically sensitive portions of the project area, resulting in the recovery of low- and moderate-density distributions of historical/modern Euro-American cultural material from plowed soils. This material is interpreted as sheet scatter not representing potentially significant archaeological resources. Areas surrounding the National Register-eligible properties on Cloverdale Road were determined to have been disturbed by 20th-century landscaping and construction activities and are unlikely to contain intact archaeological deposits relating to their 19th-century occupation. No potentially significant archaeological resources were identified and no further archaeological investigations are recommended. Continued consultation with the MHC relative to the disposition of the three National Register eligible properties on Cloverdale Street is recommended.

25-2246 Donohue, Barbara

2002 Intensive (Locational) Survey for the Butter Brook Crossing Golf Course, Westford, Massachusetts. 84 pages.

This survey included documentary research, informant interviews, and the excavation of 84 test pits (69 systematically placed on transects, 4 brackets, and 11 judgmental test pits) on a 180 acre parcel of land, of which approximately 67 acres will be impacted. Seven hundred ninety-three artifacts were recovered (792 historic and 1 biface). The prehistoric site contained a rhyolite biface

and is considered a spot find; no further testing was recommended. A historic residence on the property is documented to have been built in the mid-18th century. Late 18th-to-early 19th-century ceramics were recovered from excavation in the backyard of the house. Stratigraphically, the house lot has been considerably impacted by landscaping and construction-related activities. Given this disturbance, no further testing is recommended.

25-2247 Ritchie, Duncan and Donna Ingham

2002 Intensive (Locational) Archaeological Survey, Scituate Wastewater Collection System Expansion, Phase I, Scituate, Massachusetts. 74 pages.

The Town of Scituate, Massachusetts is presently designing Phase I of the expansion project, which will involve the installation of approximately 1,400 feet of cross-country sewers and two pump stations within four areas. The intensive archaeological survey included background research, a walkover surface inspection of the project area, and subsurface testing. As a result of background studies, a walkover survey/surface inspection, and the application of predictive sensitivity models, it was determined that some portions of the project area demonstrated potential to contain Native American and Euro-American archaeological sites. Subsurface testing within the project area consisted of the placement of 22, 50x50cm test pits in areas identified during the walkover survey/surface inspection as having the potential to contain archaeological resources. Test pits were placed along judgmentally oriented transects within these areas of archaeological sensitivity. Subsurface testing east of the terminus of Sassamon Road resulted in the identification of a small locus of prehistoric Native American activity, designated the Sassamon Road Locus 1 Site. The site consisted of a single piece of rhyolite chipping debris recovered in association with a mixture of disturbed and intact soils. Close interval testing did not result in the recovery of additional Native American cultural material. The Sassamon Road Locus 1 Site lacks temporal or cultural associations, is of limited spatial extent, and will not meet National Register criteria for eligibility. Low- to moderate-density distributions of historic/modern Euro-American cultural material in association with plowed soil in the vicinity of McDonald Terrace and New Driftway broadly reflect 19th-century agricultural use of the area but cannot be associated with a specific farmstead, and therefore does not represent a potentially significant cultural resource. No further archaeological investigation is recommended.

25-2248 Boire, Kerrylynn, Suzanne G. Cherau, and William Begley

1994 Archaeological Reconnaissance Survey for the Greenbush Line of the Old Colony Railroad Rehabilitation Project, Cohasset, Hingham, Hull, Scituate, Weymouth, Massachusetts. 330 pages.

An archaeological reconnaissance survey was conducted for the Greenbush Line corridor of the Old Colony Railroad Rehabilitation Project in the towns of Braintree, Weymouth, Hingham, Hull, Cohasset, and Scituate, Massachusetts. The survey involved background research, walkover/surface inspection of the project areas, and limited auger coring and shovel probes of the 18mi railroad right-of-way, four tunnel alternatives, eight commuter rail stations, one commuter rail layover facility, two commuter boat terminals, and one commuter bus park and ride lot. The survey determined that six of the stations, the layover facility, and the four tunnel alternatives contained areas of moderate and high archaeological sensitivity. Subsurface testing as part of an intensive survey was recommended for these locations. The remaining project areas were found to be highly disturbed and unlikely to contain intact archaeological resources. No further archaeological survey was recommended for the disturbed project locations.

25-2249 Boire, Kerrylynn, Suzanne G. Cherau, and William Begley

1997 Intensive Archaeological Survey and Additional Reconnaissance Survey for Proposed Locations Along the Greenbush Line Old Colony Railroad Rehabilitation Project, Braintree, Cohasset, Hingham, Scituate, Weymouth, Massachusetts. 228 pages.

An intensive (locational) archaeological survey and additional archaeological reconnaissance survey was conducted for the Greenbush Line corridor of the Old Colony Railroad Rehabilitation Project within the towns of Braintree, Weymouth, Hingham, Cohasset, and Scituate, Massachusetts. The Greenbush Line extends approximately 18mi from its junction with the Old Colony Main Line in Braintree to the Greenbush area of Scituate. A previous reconnaissance survey had been conducted for the right-of-way and associated facilities (see report #25-2248). The intensive survey involved additional documentary research and the excavation of 189, 50x50cm test pits at 10m, 15m, and 20m intervals, and 30 machine-assisted trenches. The intensive survey identified three prehistoric sites and one prehistoric find spot. Two of these were assessed as potentially important prehistoric sites: the Woodside Site and the Marshview Site. The Woodside Site yielded a concentration of chipping debris of a wide variety of lithic materials. The Marshview Site yielded a high density of chipping debris, shell fragments, and a possible feature. The sites were recommended as potentially eligible to the National Register of Historic Places; avoidance or site evaluations were recommended. No additional archaeological investigations were recommended for the Kilby Site and Find Spot 1. The intensive survey also identified historic resources in five of the project areas. The Litchfield Homestead Site contained 19th-century structural remains, associated artifact assemblage, and period dump site, and was assessed as potentially eligible to the National Register of Historic Places. Avoidance or site evaluation was recommended. The remaining historic resources consisted of low to moderate density deposits of 19th-century field refuse, 19th-century commercial and homestead remains, and a 19th-century dumpsite. No additional archaeological investigations were recommended for these areas due to limited information content and/or lack of physical integrity. The additional reconnaissance survey involved background research and field investigations (walkover/surface inspection with limited auger coring). The Cohasset Village Station (Alternative 2) project area was determined to have moderate and high sensitivity for prehistoric and historic archaeological resources. Subsurface testing was recommended for any sensitive areas that would be impacted by proposed construction activities at this project location. The Weymouth Landing (Alternatives 2 – 9) locations were assessed as having low archaeological sensitivity. This was primarily due to severe previous disturbances and subsequent loss of subsurface integrity. No additional archaeological investigations were recommended at this project location. The Scituate Route 3A/Driftway Intersection was determined to have moderate sensitivity for prehistoric and historic archaeological resources. Subsurface testing was recommended for any sensitive areas that would be impacted by proposed construction activities at this project location.

25-2250 Cherau, Suzanne G. and Patricia Fragola

2000 Additional Archaeological Reconnaissance and Intensive Surveys and Archaeological Site Examination of the Litchfield Site (HIN-HA-07), Woodside Site (19-NF-416), and Marshview Site (19-PL-823), Greenbush Line Rail Restoration Project, Braintree, Weymouth, Cohasset, Hingham, and Scituate, Massachusetts. 482 pages.

Additional archaeological reconnaissance and intensive surveys and site examination investigations of new and revised project locations were conducted at locations where ground disturbance related to at-grade construction of the Greenbush Line corridor are planned within the Area of Potential Effect (APE). Previous investigations included reconnaissance and intensive surveys of various project locations (see reports #25-2248 and #25-2249). The reconnaissance surveys involved background research, a walkover/surface inspection of each revised/new project area and auger coring as needed to determine the archaeological sensitivity of the current project areas and determine an appropriate subsurface testing strategy. Intensive archaeological surveys were conducted in 12 areas determined to possess moderate and high sensitivity for prehistoric and historic-period resources. Subsurface testing included the excavation of 89, 50x50cm test pits at 10m intervals, one 1x1m excavation unit, and 7 machine-assisted trenches. Seven project locations were found to contain low to moderate densities of 19th and 20th-century cultural materials, but only five could be attributed to an existing historic property. A sixth historic-period deposit could be related to a documented 18th/early 19th-century house site in Hingham, although there was no archaeological evidence of structural remains or features within the project area. Prehistoric finds

were limited to one piece of chipping debris recovered in the South Shore Country Club property in Hingham. Because of limited information content and low research potential, no further archaeological investigations were recommended. The Cohasset Village Municipal Parking Lot project area contained a significant industrial archaeological site. Below-ground structural remains of the 19th-century railroad terminal facility site include the roundhouse's brick inspection pits, the stone walls of the turntable pit, along with associated support mechanisms and artifact assemblage. This railroad roundhouse site was recommended as eligible to the National Register of Historic Places and should be protected from project impacts or further archaeological investigations may be warranted. Archaeological site examinations were conducted at the Litchfield Site (MHC #HIN-HA-07), the Woodside Site (MHC #19-NF-416), and the Marshview Site (MHC Inventory #19-PL-823). The site examination tasks at the Litchfield Site consisted of additional background research and the excavation of seven machine-assisted trenches. The subsurface testing at the Woodside Site consisted of 30, 50x50cm test pits at 2.5m and 5m intervals along with three excavation units. Subsurface testing at the Marshview Site consisted of 74, 50x50cm test pits at 2.5m, 5m and 10m intervals along with six excavation units, each measuring 1x1m. The investigations at all three sites collected sufficient archaeological, and in one case documentary, data to address the research questions and make recommendations concerning significance and National Register eligibility. Each of the sites was found to possess limited information and low research potential. None were considered significant or eligible to the National Register of Historic Places, and no further work was recommended.

25-2251 Marlatt, Ellen and Kathleen Wheeler

2002 Archaeological Reconnaissance Survey Proposed Shaw's Supermarket 134 Water St. Wakefield, MA. 40 pages.

Shaw's Supermarkets proposes to erect a new supermarket facility, which will require the demolition of all buildings presently standing on the lot. These structures are listed as the Wakefield Rattan Company buildings on the National and State Registers of Historic Places as part of the Wakefield Multiple Resource Area. At the conclusion of the reconnaissance survey, we identified five stages of occupation at the site: Native use of Mill River (dating at least to the Early Archaic, 9,000 years ago), Green Mills (small water-powered facility dating from the 18th century to the 1850s), Wakefield Rattan Company 1st Facility (at least 19 buildings, most of which were destroyed in 1881 fire), Wakefield Rattan Company 2nd Facility (rebuilding and expansion, 1882 to 1894), and Heywood-Wakefield Company (ca. 1900–1930). Evidence of each of these time periods may be represented archaeologically within the project area, albeit with some compromised integrity. Native archaeological resources are expected to consist of scatters of lithic debitage and bifaces, recovered from pockets of sediment undisturbed by the Euroamerican mills and large-scale industries. Portions of Green's Mills may be present as stone mill races, the outline of the millponds (reused by Cyrus Wakefield), and stone foundations of woodframe buildings (including the Green dwelling house, along Water Street). Cyrus Wakefield's first rattan-processing facility consisted of 19 structures, nearly all of which were destroyed in an 1881 fire; none of the extant buildings date to this first generation of Wakefield's rattan company. It is presumed that the buildings destroyed in 1881 were woodframe, and nothing is presently known about their size, location, configuration, or spatial relation to one another. Archaeological survey can reveal whether traces of this first Wakefield facility exist within the project area. An intensive site locational survey is recommended within Areas of Potential Effect (APEs). The site is potentially significant because the 19th-century rattan industry is poorly known archaeologically – primarily because Wakefield's monopoly over imported raw materials and successful manufacture of finished products resulted in few competitors. His facility is one of a kind for the second half of the 19th century, and considerable research – both archival and archaeological – is necessary to contribute to our knowledge of how the various components of the Wakefield Rattan Company functioned in concert with one another.

25-2252 Rotman, Deborah, Robert Paynter, Christopher Null, and Kai Heidemann

2001 Report of the 2000 University of Massachusetts, Amherst Field School Study of Lot 33 in Deerfield, Massachusetts. 83 pages.

In the Summer of 2000 the University of Massachusetts, Amherst Summer Field School in Archaeology conducted a third year of training, public interpretation, and intensive survey of the southwest portion of Lot 33 in Deerfield (See report #25-1942). Though this report details the evidence from the excavation of four 1x1m and one .5x1m units in the 2000 field season, the interpretations draw upon stratigraphic studies and artifact inventories described in reports from the excavations of five 1x1m and one .5x1m units in the two previous years. Archaeological and documentary evidence attests to a number of historic period activities on the site, most notably an 18th-century residence and associated tannery, a schoolhouse, a 19th-century fire engine house, a mid-19th to the mid-20th-century store, and a contemporary museum building. Further intensive survey is needed to assess an 18th-century foundation uncovered beneath a deep series (120+cm) of fills.

25-2253 Herbster, Holly

2002 Intensive (Locational) Archaeological Survey, Jack & Jill's Gas Project Area, Truro, Massachusetts. 48 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources within the 0.5 acre National Park Service property in Truro. A total of 15, 50x50cm shovel test pits was excavated at 10m intervals within the level, wooded parcel. The combined results of background research and subsurface testing did not identify any archaeological deposits within the project area.

25-2254 Waller, Joseph N., and A. Peter Mair, II

2002 Intensive (Locational) Archaeological Survey: Chelmsford Phase 4E Sewer Project Area, Chelmsford. 64 pages.

An intensive (locational) archaeological survey was conducted for the Chelmsford Phase 4E Sewer project to document the presence or absence of potentially significant archaeological resources in the project area. Background research indicated that the project area was situated in south of the Merrimack River in an area potentially sensitive to contain Native American cultural resources. A walkover/surface evaluation of the proposed sewer interceptors and pump station confirmed that the majority of the proposed sewer lines would traverse low-lying wetlands. The remainder of the project area, which had low to moderate archaeological sensitivity, was sampled. A total of 34, 50x50cm test pits were organized within five linear test pit transects and one cluster array. No Native American or Euro-American archaeological sites were identified during the fieldwork and no additional archaeological investigations are recommended.

25-2255 McKernan, Rebecca Hatch

2002 Report on Four Revolutionary War Veterans Buried in Old South Burying Ground, Peabody. 126 pages.

This report summarizes a review of the documentary record to determine whether four, unmarked revolutionary War Soldiers' graves are outside the bounds of Old South Burying ground in Peabody. The four soldiers were killed at the Battle of Lexington in 1775, and their bodies were returned to their hometown for burial. Tradition holds that the street next to the cemetery was widened, although when and how much was not known, and the graves off the four soldiers were left outside the current bounds of the cemetery under the sidewalk. To help determine if the street was widened and the possible location of the graves, historical newspapers, historical maps, and secondary sources, including oral traditions, were examined. This report also includes an overview of Massachusetts state regulations concerning burial grounds, burial sites, and the discovery of hu-

man remains, as well as an evaluation of archaeological survey methods. One archaeological survey was previously conducted in the area (see report #25-1656). The Boston St. Site (19-ES-592) is recorded within and contiguous to the cemetery. Although no known maps or other documents conclusively prove this, it is my belief that Main St. was widened at some point to accommodate traffic patterns. A number of second-hand accounts consistently mention the widening of the street. There is no evidence, however, of the precise location of the graves of the four veterans. This lack of conclusive information, in addition to the state regulations preventing the unnecessary disturbance of burials, leads the author to conclude that the four Revolutionary War Veterans should be left in their original resting places. A professional archaeologist should monitor all future utility work adjacent to the cemetery. The MHC should be consulted prior to any excavation or earthmoving activities in the area of the cemetery or roadway to prevent impacting the Native American Site and any unmarked burials.

25-2256 Claesson, Stefan

2002 Rainsford Island Archaeological Reconnaissance and Management Plan. Boston. 359 pages.

Prior to this project, no systematic archaeological surveys of Rainsford Island had been conducted. Rainsford Island is a small, low-elevation drumlin located in Boston Harbor. Approximately 11 acres of uplands and 20 acres of submerged lands were examined. Although no prehistoric sites were located during the survey, 12 historical sites were documented. The survey used low-impact, remote sensing techniques (aerial photography and multi-beam sonar) to map accurately the topography of Rainsford Island and to record the dynamic nature of the island's environment. The survey included topographic mapping and documentation of surface finds as well as the excavation of 4 transects consisting of 5-6, 50x50cm test excavation units (for a total of 23 test units), spaced at 10m intervals, on the eastern half of the island to assess prehistoric and historical sensitivity and site integrity. The prehistory and history of Rainsford Island are summarized in this report. Maps and guides were developed that identify site locations and areas of archaeological sensitivity. Maps were also developed that identify site locations and areas of archaeological sensitivity. Maps were also developed to document changes to the island's coastline over time. The data generated by this study provide spatial and baseline data to assess the current condition of Rainsford Island's cultural resources and identify the natural and man-made factors that impact the island's fragile resources. The recommendations suggested in this report include determining the National Register eligibility of the island's social welfare institutions, such as the Stone Hospital (a Greek-Revival structure built in 1882) and the Rainsford Island Burial Ground. In addition, archaeological research priorities are made for the areas of high prehistoric and historic sensitivity that are under immediate threat of destruction by erosion. The establishment of permitting protocols and rules of conduct of visiting Rainsford Island are also recommended in order to improve preservation of the island's cultural and natural resources, and to manage better public use of the island for recreation, education, and scientific research.

25-2257 Wheeler, Kathleen and Ellen Marlatt

2002 Results of Archaeological Reconnaissance Survey for Milk Row Cemetery, Somerville, MA. 4 pages.

The cemetery was first used as a burying ground as early as 1804, and intensively used (and reused) throughout the 19th century. A number of recommendations are offered including mapping the cemetery, enumerating known graves, and completing a systematic inventory of all features to allow a basic reconstruction of the history of the burying yard. An archaeologist who would recognize edges of burial features should excavate by hand any plantings requiring a hole deeper than 24in. Any trees to be removed (and there is at least one that had grown up against a headstone) should be cut at grade and the root mass allowed to rot.

25-2258 Sheppard, William J.

2001 People of the Coast: Archaeology and Education, Preliminary Report of Multi-Year Reconnaissance and Intensive Archaeological Study, Katherine Nordell Lloyd Center for Environmental Studies. 30 pages.

An archaeological reconnaissance and intensive survey was conducted at the 55acre Katherine Nordell Lloyd Center in Dartmouth, as part of an ongoing summer instructional program titled "People of the Coast," which introduces coastal studies and archaeology to teachers from the Fall River school system. The study includes background research and field testing. At the Sassafrass Midden Site (19-BR-484), a total of sixteen 50x50cm shovel test pits were excavated at 10m intervals along parallel transects with bracket units placed at 5m intervals from units containing artifacts. In addition to the shell midden, a Late Archaic projectile point similar to an Orient Fishtail was recovered. At the Hardscrabble Farm Site, 16 shovel test pits were excavated in random locations on a 5m grid in and around the visible foundation. Features included foundations and a possible privy shaft. Recovered artifacts dated from the 19th and early 20th centuries. Eight additional test units were excavated at a second Native American site at which a quartz Levanna point was recovered. A copy of the course materials for "People of the Coast" accompanies the report.

25-2259 Herbster, Holly

2002 Intensive (Locational) Archaeological Survey Woods Hole Oceanographic Institution Quissett Campus. Falmouth. 70 pages.

A total of 117, 50x50cm shovel test pits was excavated within the approximately 180acre project area. The intensive survey included background research, a walkover survey, and subsurface testing. The survey located and identified one prehistoric site (Oyster Pond Find Spot) consisting of a low-density deposit of quartz chipping debris within the A/Topsoil and B/Subsoil interface. The survey also documented a series of stone walls and stone piles within the project area, but did not locate any associated cultural materials. While the identified cultural resources provide additional data about prehistoric and historic-period land use in the near-interior uplands of Falmouth, they do not represent potentially significant archaeological deposits. No additional archaeological testing was recommended.

25-2260 Ingham, Donna and Duncan Ritchie

2002 Intensive (Locational) Archaeological Survey, The Pinehills – Rye Field and Cornish/Wright Tavern Utilities Project Area, Plymouth, Massachusetts. 77 pages.

The intensive survey incorporated background research, sensitivity rankings, and results generated by previous archaeological investigations (See reports #25-2063 & #25-2239). A walkover survey of the project area confirmed an earlier (1998) assessment that the area possessed moderate prehistoric and a combination of high and moderate historic archaeological sensitivity. A total of 97, 50x50cm test pits was excavated. Moderate- to low-density distributions of historic cultural material consisting mainly of domestic debris with lesser quantities of structural and recreational (ceramic skeet fragments) debris were recovered in association with up to two strata of plowed soils within Rye Field. A low-density distribution of historic cultural material consisting of domestic and structural debris was recovered from plow zone and fill deposits within archaeologically sensitive areas along proposed utility lines at the present location of the Cornish/Wright tavern building. The majority of locations sampled near the tavern were moderately disturbed from the removal, truncation, and alteration of the plow zone. The Pinehills Locus 12 Site was identified following the recovery of a low-density distribution of prehistoric cultural material (1 piece of quartz shatter and half of a split quartz cobble). These materials were recovered in association with plowed soils in the western portion of Rye Field. Additional close-interval testing around the split cobble find spot did not recover any other cultural material. No intact subsurface features were identified during the intensive survey. No further archaeological investigation of The Pinehills Locus 12 Site, Rye Field, and proposed utility lines for the Cornish/Wright Tavern and Nicklaus golf course is recommended.

25-2261 Binzen, Timothy L., Thomas F. Mahlstedt, and F. Timothy Barker

2002 Archaeological Intensive (Locational) Survey for Vegetation Removal and Parking Lot Construction at Greycourt (The Tenney Estate), Methuen, Massachusetts. 67 pages.

An archaeological survey was conducted at Greycourt (the Tenney Estate). Testing investigated the mansion ruins, an area next to a historic gatehouse, and the location of a historic bowling green, pergola, and teahouse. Data was obtained concerning the mansion foundations, historic landscape construction techniques and specifications, and degree of disturbance due to demolition activities in the past. Ten exploratory trenches (0.50x2m and 1x1m) and 30 shovel test pits were excavated. The northern and southern foundations of the mansion were identified. Information was obtained concerning the specifications and construction techniques of the bowling green, pergola and teahouse, which can be used for restoration efforts in the future. The location of a proposed parking lot by the gatehouse was tested and disturbance was recorded. Subsequent monitoring during construction identified functioning historic drainage features at both the proposed parking lot and bowling green. These features were rehabilitated. Elements of a historic water distribution system at the bowling green were observed and recorded, as was the manner in which the hillside location of the pergola and teahouse had been modified and constructed. Remnants of a modern religious shrine adjacent to the bowling green were encountered and removed.

25-2262 Dudek, Martin, Craig Chartier, Deena Duranleau, Jean Marie Johnson, and Leith Smith

2002 Intensive Archaeological Survey of the Andover Wastewater System, Rogers Brook, and Contract Areas 1, 2, 3, and 4, Andover, Massachusetts. 216 pages.

Five hundred fourteen test pits were excavated in 23 transects and one block, across five separate contract areas. A total of 4,229 historic artifacts or other historic materials were recovered, representing primarily modern refuse and building materials, often from fill or disturbed contexts. A small quantity of late 18th- and 19th-century artifacts was recovered from low-density artifact scatters, primarily from former agricultural lands. No potentially significant historic resources were identified. A total of 75 prehistoric artifacts were recovered from nine locales. Two locales contained undated debitage from disturbed or redeposited contexts, and five locales contained undated prehistoric findspots or small, low-density sites of no potential significance. Two sites, the Tilton Lane Site and the South Main Street Site, are potentially significant. The undated Tilton Lane site contained rhyolite and quartz chipping debris from tool maintenance or tool production activities. The South Main Street Site contained rhyolite-chipping debris from tool maintenance or tool production activities and an intact black rhyolite Stark point, diagnostic of the Middle Archaic period (7,500-6,500 BP). These two sites will be avoided because of changes in the location of the pipeline segments; no additional work is recommended. If either site is threatened by subsurface impacts in the future, a site examination is recommended.

25-2263 Ingham, Donna and Duncan Ritchie

2001 Intensive (Locational) Archaeological Survey The Sanctuary Golf Course and Country Club, Hopkinton, Massachusetts. 97 pages.

A significant portion of the project area has been radically altered by sand and gravel mining, portions of it are, however, archaeologically sensitive. Background research and a walkover survey/surface inspection were used to stratify the project area into zones of expected sensitivity for Native American and historic/modern cultural resources. Zones of high and moderate sensitivity were located in proximity to the Whitehall Brook drainage, in elevated terrain in the northern portion of the project area, and near Fruit Street along the western boundary of the project area. A total of 134, 50x50cm test pits was excavated within zones of high and moderate archaeological sensitivity. These test pits were placed in a 30x30m sampling block, 13 judgmentally placed linear transects and five test pit arrays. Fifteen judgmentally placed test pits were used to sample specific

archaeologically sensitive locations. This sampling identified three small loci of prehistoric Native American activity, the Sanctuary Golf Locus 1, 2, and 3 sites, and two historic/modern period cultural resources, the J. Dickman Farmstead Site and Sanctuary Golf Historic Site 1. A low density of prehistoric cultural material consisting of quartz chipping debris was recovered at the Sanctuary Golf Locus 1 Site. Prehistoric cultural material (a single piece of rhyolite chipping debris) was recovered at the Sanctuary Golf Locus 2 Site. Prehistoric cultural material consisting of a small number of quartz chipping debris and a worked quartz flake was recovered at the Sanctuary Golf Locus 3 Site. The J. Dickman Farmstead Site consisted of a dry-laid fieldstone house and barn foundations, a dry-laid stone-lined well, and concrete silo foundation. Limited deed research and cartographic evidence indicated occupation of the farmstead by Jacob Dickman, J. Twitchell, and C. Moore during the period c. 1817 to c. 1903. Cultural material (structural material, ceramic sherds, bottle glass) was associated with fill strata and related primarily to 20th-century, post-abandonment land use and late 19th to early-20th-century occupation. A minor component of the assemblage may relate to the construction or demolition of an older structure on the site in the early/mid-19th century. Sanctuary Golf Historic Site 1 consisted of a cellar hole with an associated earth and stone berm and a stone-lined well. A moderate to high density of domestic debris composed primarily of ceramic and bottle types common during the late 19th and early 20th centuries was sampled from the surface. Recovered cultural material is associated with fill strata, as well as with intact soil, and indicates late-19th- or early-20th-century domestic/agrarian occupation. Cartographic and documentary evidence does not clearly refer to this site. It may be associated with the C. Moore occupation of the nearby J. Dickman Farmstead Site. The Sanctuary Golf Locus 1, 2, and 3 sites have limited information content and are not considered potentially significant. No further archaeological investigation of these sites is recommended. Sanctuary Golf Historic Site 1 has the potential to address research questions such as the changing nature of agrarian life during the Late Industrial Period, and the economic, spatial, and functional reorganization of farmsteads during this time. It may be potentially significant as an element of the nearby J. Dickman Farmstead complex. The J. Dickman Farmstead Site is considered a potentially significant cultural resource. It has the potential to address research questions such as the changing nature of agrarian life in the town of Hopkinton during the Federal, Early Industrial, and Late Industrial periods, and the economic, spatial, and functional reorganization of farmsteads in the mid/late 19th and early 20th centuries. Avoidance of the site is recommended. If avoidance of the Sanctuary Golf Course Historic Site 1 and J. Dickman Farmstead Site is not feasible, additional archaeological investigation at the site examination level is recommended.

25-2264 Heitert, Kristen and Jo A. Deaton

2002 Site Examination E. Hyde/S. Parker Farmstead Site EMC Shamrock Campus, Southborough, Massachusetts. 63 pages.

An intensive (locational) survey of the area previously had identified the remains of dry laid fieldstone house and barn foundations and a series of fieldstone animal pens and farm walls (see report #25-2162). A total of 55, 50x50cm test pits and two 1x1m excavation units (EUs) were excavated at 5m intervals across the site, covering an area of approximately one-third of an acre. The recovered artifact assemblage comprised 1,462 pieces of historic cultural material including redware, creamware, construction debris, and an 1802 penny; analysis of the material and site stratigraphy suggested an early 19th-century construction date for the farmstead complex followed by its complete abandonment in the mid 19th century. Archival research corroborated this assessment by establishing a chain-of-title beginning with Parker and Hyde in 1811 through to the demolition of the complex ca. 1862 and the final conversion of the site area to farmland ca. 1898. The lack of intact, stratified features limits the potential of the site to add data beyond those collected to date or to address significant issues of agrarian, familial, and/or socio-economic change at the town or regional level. The E. Hyde/S. Parker Farmstead Site does not represent a significant cultural resource.

25-2265 Donta, Christopher L., Jennifer Wendt, and Jennifer Padden

2002 Archaeological Intensive (Locational) Survey for the Proposed Pond Street Sewer Project, Ashland, Massachusetts. 56 pages.

This project included background research, reconnaissance, and subsurface testing. Two recorded Native American archaeological sites were known in the vicinity, but no archaeological sites were recorded in the project area. During the field research, 108 test pits were excavated. One Native American site was identified. The Step Rock Site was identified in Survey Unit 1, and included one quartz flake and one rhyolite flake from plow zone contexts. A scattering of historic artifacts was found, but the artifacts were not found to be in association with any features or standing structures, and represent a thin sheet midden within plowed soils. No further survey is recommended.

25-2266 Waller, Jay and A. Peter Mair, II

2002 Intensive (Locational) Archaeological Survey Acorn Estates at Canton Hills/The Highlands at Canton Meadows/The Highlands at Blue Hills. Canton & Randolph Massachusetts. 107 pages

An intensive (locational) archaeological survey was conducted on approximately 103 acres straddling the Canton/Randolph town boundary. The survey consisted of background research, walkover inspection, and subsurface investigations. State site files identified three archaeological sites: 19-NF-509, 19-NF-510, and 19-NF-511 within the project area. A total of 110, 50x50cm test pits were excavated in areas of moderate to high archaeological sensitivity, producing Native American cultural materials from three discreet areas. Subsurface investigations confirmed the presence of site 19-NF-509, a low-density concentration of chipping debris. The Rhododendron Site, produced a dense concentration of rhyolite chipping debris and a tip and mid-section to a rhyolite point. The Roseland Properties Find Spot included an isolated flake. Investigation of site 19-NF-510 did not produce any cultural material. No subsurface testing was conducted at site 19-NF-511 since the proposed development will not threaten the site. Site 19-NF-509 will be preserved within a wetland buffer. The Rhododendron Site and Roseland Properties Find Spot are not considered significant archaeological resources and no further work is recommended.

25-2267 Binzen, Timothy L. and Kimberly Buehrle

2002 Archaeological Intensive (Locational) Survey for the Groundwater Source Exploration Project, Bellingham, Massachusetts. 44 pages.

An archaeological survey was conducted at five proposed groundwater test well locations distributed throughout an area measuring 500ft north-south and 350ft east-west. The project area is located in woodland on the west side of the Charles River. At each test well, one shovel test pit was excavated on the well location itself, and four were excavated 12.5ft away on the cardinal directions. A total of 29, 40x40cm shovel test pits were excavated during the project. Soil profiles indicated that the area had never been plowed or disturbed. Prehistoric artifacts, consisting of chipping debris of quartz, quartzite, rhyolite, and chert, were recovered at all five test well locations. Artifacts were recovered from both topsoil and subsoil strata. No significant historic resources were recorded. The artifacts represent the Charles View prehistoric site (19-NF-584). Given the variety of lithic materials and evidence for multiple short-term occupations, the site is similar to others recently investigated on the opposite side of the river.

25-2268 Binzen, Timothy L. and Jennifer Wendt

2002 Archaeological Reconnaissance Survey of the Mansfield Municipal Airport and Intensive (Locational) Survey of Airport Quadrant 4 and the North Access Road, Mansfield and Norton, Massachusetts. 65 pages.

The airport occupies 252 acres, of which 195 acres are in Mansfield and 57 acres are in Norton. Areas possessing moderate to high archaeological sensitivity were identified. In general these areas consist of upland sections of the airport that are not adjacent to the paved main runaway and its

taxiway. Despite previous grading in some infield locations, many undeveloped sections of the airport contain plowzone and undisturbed subsoil deposits. The property is located north of a concentration of pre-Contact Native American sites recorded along Interstate 495. Native American site 19-BR-1 is located on the north side of the airport but had not been tested prior to the current survey. The property, as a whole possesses moderate to high sensitivity for Native American sites. Intensive (locational) Phase 1b subsurface testing was conducted on 18 acres within Quadrant 4, a level infield area bordered on the south by the main runway, on the west by a turf runway, and on the north and east by a large wetland. Testing also was conducted along a proposed 1200ft access road leading to Quadrant 4. A total of 120 shovel test pits were excavated in clusters of four pits each distributed throughout Quadrant 4 and at intervals along the access road. A variety of Native American artifacts were recovered across a broad area, including one Neville Variant projectile, two Small Stemmed points, one small ulu, two edge tools, and chipping debris of quartz and rhyolite. However, no subsurface features, significant archaeological deposits, or areas of high artifact density were encountered. No additional survey was recommended for the Quadrant 4 improvements. The reconnaissance survey of the airport property and the subsequent testing did indicate that testing is warranted prior to planned improvements at Quadrants 1-3 at the airport. The survey found that site 19-BR-1 is extensive but low in density within the area tested.

25-2269 Binzen, Timothy and Ann Chapman

2002 Archaeological Reconnaissance and Intensive (Locational) Survey for the Woodsom Farm Recreational Fields Project, Amesbury, Massachusetts. 52 pages.

A total of 120 shovel test pits were excavated; the total area of the proposed athletic fields and parking area was nine acres. Test pits were excavated at intervals of 7.5m within clusters containing four test pits each, placed in areas of high archaeological potential. One Native American artifact, a piece of quartz chipping debris, was recovered from a plowzone context. This was designated as the Lion’s Mouth Native American Findspot. It was not considered significant due to the disturbed context in which it was found and the lack of additional Native American artifacts in the project area. A low-density artifact scatter of 19th- and 20th-century domestic refuse was encountered in the plowzone throughout the project area, but no historic sites were recorded. No subsurface features or potentially significant archaeological deposits were identified during the testing. No additional archaeological survey was recommended.

25-2270 Donta, Christopher L. and Margaret Kelly

2003 Archaeological Intensive (Locational) Survey for the Proposed Con-Ed West Springfield Lateral, Agawam and West Springfield, Massachusetts. 80 pages.

Background research and a reconnaissance survey were conducted for a 9.8km pipeline. Subsurface testing was conducted in four survey units in Agawam, totaling 173 shovel test pits and seven 1x1m units. One Native American archaeological site was identified, the Agawam Meadows Site (19-HD-269 formerly referred to as the Frozen Cabbage Site), in the revised corridor in Survey Unit 6 on the terrace overlooking the Westfield River. Native American artifacts were collected from eight test units across an area measuring at least 60x275m (200x900ft). The recovered artifacts include 62 pieces of chert, rhyolite, quartzite, and quartz chipping debris and two biface fragments. The artifacts were found primarily in a buried topsoil horizon between 61-70cm below the ground surface, but extending as deep as 110cm below the ground surface. Soils at the site were found to consist of 30-40cm of plowed topsoil of dark brown silty loam, averaging 10cm thick. The artifacts were clustered in two primary loci; the site was considered to have excellent potential to contain intact features because it is located below the historic plow zone. Avoidance or a site examination survey of the site was recommended. Additional survey is also recommended for Survey Unit 2 if the project, which was discontinued before completion of the survey, be reinstituted.

25-2271 Donohue, Barbara

2003 Intensive (Locational) Survey of the Gardner Zine Subdivision, Gardner, Massachusetts. 57 pages.

This survey included documentary research, interviews, and the excavation of 79 shovel test pits (28 in two 30m blocks, 40 in six transects, and 11 judgmentally placed) and one 0.5x2m trench on a 117 acre parcel of land. A total of 1,083 historic-period artifacts were recovered, but no prehistoric materials were identified. The project area is the location of the Ebenezer Keyes Home Site (GAR-HA-05) whose date of occupation was documented from 1785 to 1812; it has been suggested that a family burial plot associated with Keyes is located within the project area at the location of two stone piles. Documentary research revealed that Keyes owned two properties in Gardner, one from 1784 to 1789 and one from 1790 to 1805. Subsurface testing recovered ceramics associated with Keyes's date of occupation as identified on the site inventory form and also revealed that there were intact soils beneath the stone piles, no bones were recovered and no anomalies were revealed to suggest a grave shaft. No family burial plot is located within the project area. A site examination is recommended to determine the boundaries of the Ebenezer Keyes Home Site (GAR-HA-05) as well as its significance, integrity, and research potential for National Register eligibility. No further research or testing is recommended for the conjectured burial site.

25-2272 Donta, Christopher L. and Timothy Binzen

2000 Archaeological Intensive (Locational) Survey for the Proposed Wastewater Treatment System, Holliston, Massachusetts. 157 pages.

An archaeological survey was conducted of 32 proposed construction site locations for a wastewater treatment system in Holliston. In total, 278 shovel test pits were excavated in these areas, and three previously unrecorded archaeological sites were identified. The Beatrice Lane Native American findspot, consisted of one piece of quartzite, and was not recommended for any further survey. The Cedar Swamp Native American site was identified, overlooking a large wetland, and yielded felsite, quartz, and quartzite chipping debris from four different test units, and a recommendation was made to avoid this site. The Capen Historic Site is a foundation with associated artifact scatter; avoidance was recommended. A single headstone was documented in what appeared to be disturbed contexts of a former gravel quarry. To confirm that human remains do not exist in association with this headstone, additional documentary research and subsurface testing is recommended.

25-2273 Smith, J. N. Leith and David B. Landon

2002 Archaeological Site Examination Orchard House Preservation Project, Concord, Massachusetts. 138 pages.

A preservation program for Orchard House (Con-HA-17), the historic home of the Alcott family including Louisa May Alcott the author of *Little Women* (1868), called for extensive structural repairs, construction of a new foundation under the rear portion of the house, and interior and exterior utility work. A total of 15 shovel tests and 5, 1x1m excavation units were completed around the structure's exterior, while cellar crawl spaces were investigated with 11 additional units. Testing was conducted west of the house to identify the locations of the historic "Path to Town." Exterior investigations revealed that early occupation surfaces had been stripped off by extensive landscaping activities performed by Bronson Alcott in the 1850s–1870s. Two drainage features potentially dating to this period were identified. A sheet midden of domestic refuse was tested on the bank immediately north of the house and associated with tenant occupation during the first half of the 19th century. Cellar investigations revealed a stone-lined well that was mapped by Thoreau in 1857. Because of its significance, the well was incorporated into the house preservation plan. A pit located below the indoor privy revealed a low density of late 19th- and early 20th-century domestic and plumbing related refuse. Potentially significant cultural deposits including a filled ravine identified during intensive survey (see report #25-1948) and a filled cellar may remain intact to the

northeast of Orchard House. The site examination finds represent an important contribution to the overall understanding of landscape use and alteration and aid in the interpretation of 19th-century life at Orchard House.

25-2274 Donta, Christopher L. and Jennifer Wendt

2002 Archaeological Intensive (Locational) Survey for the Proposed Williams Street Bridge Replacement Project, Mansfield, Massachusetts. 58 pages.

A total of 28 test pits were excavated in the proposed impact areas of the Williams Street Bridge Replacement Project area. Twenty-six shovel test pits were excavated in Survey Unit 1, in the vicinity of the Williams Street Industrial Complex (MNF-HA-08), while two were excavated in Survey Unit 2, the proposed wetland replacement area. In Survey Unit 1, two mill building foundations and a partially intact raceway were documented, in addition to a scatter of architectural and domestic artifacts. In total, 517 historic period artifacts were found, all from Survey Unit 1. The archaeological remains identified in the project area correspond to the early 19th-century structures identified in the background research as in operation by 1814, when John Williams was running two mills: a nail factory and a saw and grist mill, which were later converted to cotton production, and a knife factory. The artifacts found at the site include some late 18th- to early 19th-century ceramics (creamware and pearlware), but a larger amount of 19th-century whiteware and evidence of later 19th-century occupation, in the form of coal and wire nails. The proposed construction project avoids most of this site, impacting only a small slice of the stone-lined westerly channel (headrace), immediately adjacent to the existing roadway embankment. The remainder of the westerly raceway, the entire westerly mill foundation (with sluice gate), and the entire easterly mill foundation lie outside the area of project impact. The intensive survey has exhausted the archaeological potential of the impacted portion of the mill site, with additional survey in the impact area unlikely to provide new information. The mill features have been mapped and photographed; no further survey is recommended.

25-2275 Ingham, Donna and Duncan Ritchie

2003 Intensive (Locational) Archaeological Survey, Wamesit Crossing Project Area, Bedford, Massachusetts. 70 pages.

The project area is within a known core area of ancient Native American settlement along the upper Concord River and was a focus of historic period settlement during the 18th and 19th centuries. A walkover survey/surface inspection identified small zones of high to moderate archaeological sensitivity in addition to low sensitivity zones with poorly drained soils. During subsurface testing, 47, 50x50cm test pits were excavated within archaeologically sensitive sections of the project area. The test pits were placed in one 30x30m sampling block and along four judgmentally placed transects. One find spot of ancient Native American cultural material, The Wamesit Crossing 1 Site, contained a low-density distribution of Native American cultural material within an area measuring no more than 10m in diameter (79sq m). A single piece of rhyolite chipping debris, the by-product of the maintenance and/or manufacture of Native American chipped-stone tools, was recovered from a plow zone within this area. No temporally diagnostic Native American artifacts or subsurface features were found. The single piece of chipping debris indicates a brief episode of chipped-stone tool maintenance at an unknown time in the past. It is unlikely that additional subsurface testing of this site would generate new information. The Wamesit Crossing 1 Site will not meet National Register criteria for eligibility. No additional archaeological investigation is recommended.

25-2276 Herbster, Holly and Suzanne G. Cherau

2003 Intensive (Locational) Archaeological Survey, Clay Pit Road Property, Aquinnah, Massachusetts. 39 pages.

The intensive survey included background research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources on the 5.3 acre lot. A total of 26, 50x50cm shovel test pits was excavated. The survey identified the Lot 68 Find Spot—a single quartz projectile point fragment recovered on a small terrace located more than 100m from a current wetland source. The projectile tip and mid-section fragment could not be typed to a specific temporal/cultural period. No evidence of cultural features or additional cultural deposits was identified. The material assemblage recovered in the Clay Pit Road Property project area is likely associated with resource collecting and/or processing in the Aquinnah near interior. The deposit does not represent a potentially significant resource; no additional testing was recommended.

25-2277 Schafer, David K. and Holly Herbster

2003 Intensive (Locational) Archaeological Survey MCI International Site Subdivision and Archaeological Site Examination Mattaquason Purchase (19-BN-12), Chatham, Massachusetts. 175 pages.

The 13.5 acre subdivision project area is located between Lover's Lake and Ryder's Cove in north Chatham. The Massachusetts Archaeological Society completed previous site examination investigations within the Mattaquason Purchase Site in 1974. The intensive survey included excavation of 51, 50x50cm test pits along 15m interval transects and identified four Native American sites (Lover's Lake 1-4). These sites consist of low and moderate densities of chipping debris and shellfish fragments and represent potentially significant activity areas associated with the larger Mattaquason Purchase Site. The site examination delineated the 1.03 acre Mattaquason Purchase Site and investigated the areas surrounding the 1974 excavations. Testing consisted of four, 1x1m excavation units and 49, 50x50cm test pits. The presence of nine intact archaeological features and an undisturbed large shell midden stratum indicates the site's integrity. A total of 1,431 artifacts was recovered including four Levanna and two Small Stemmed projectile points, 438 fragments of animal bone, 125 prehistoric pottery sherds, 451 lithic artifacts, and a single charred kernel of maize. The testing determined that the site is eligible for the National Register of Historic Places under Criterion D.

25-2278 Herbster, Holly and Suzanne Cherau

2003 Archaeological Reconnaissance Survey, Quivet Neck/Crowes Pasture District of Critical Planning Concern, Dennis, Massachusetts. 91 pages.

This reconnaissance survey employed background research, informant interviews, and a walkover survey to compile predictive models and archaeological sensitivity maps for the DCPC. The survey collected additional information on the previously documented Camp Mullen Prehistoric Site (19-BN-742), located within the DCPC boundaries, and recorded two additional areas of prehistoric artifact finds. The survey also identified an historic period foundation and two possible unmarked burial areas. The survey determined that overall, the largely undeveloped DCPC area possesses a moderate to high sensitivity to contain unknown prehistoric and historic archaeological deposits.

25-2279 Robinson, David S. and Joseph N. Waller

2002 Phase I Underwater Archaeological Reconnaissance Survey for Submerged Prehistoric Cultural Resources, Hubline Mainline and Deer Island Lateral Offshore Gas Transmission Pipeline Project, Boston, Massachusetts. 241 pages.

This report presents the results from underwater archaeological reconnaissance and intensive surveys of approximately 16,200 acres of sea floor in Massachusetts Bay within the offshore corporate boundaries of Beverly, Boston, Hull, Lynn, Marblehead, Nahant, Salem, Swampscott, Quincy, Weymouth, and Winthrop. The survey's purpose was to identify potentially significant submerged cultural resources (e.g., shipwrecks) and prepare management recommendations for

them. Survey tasks included background research, reconnaissance marine remote sensing survey, and intensive underwater target inspections by archaeological divers. The 500 documented vessel losses in and around the study area indicated a high potential for archaeological sensitivity. Sixty-seven remote sensing targets inspected by archaeological divers led to the identification of six shipwrecks, one of which is an intact, potentially significant, historic wooden vessel. Archaeological and archival research indicates the vessel was a "limer," probably a schooner, lost in either the late 19th or early 20th century while bound for Boston from the historic lime production center of Thomaston-Rockland, Maine. The undisturbed wreck may be significant under National Register criteria C and/or D.

25-2280 Binzen, Timothy L. and Jennifer Wendt

2003 Archaeological Reconnaissance and Intensive (Locational) Survey for the Boston Golf Club, Hingham, Massachusetts. 76 pages.

The total project area covers approximately 315 acres of rugged, stony terrain punctuated by rock outcrops. Much of the landscape had been disturbed by the quarrying of stone, sand, and gravel during the 20th century. Subsurface testing was conducted in locations possessing high archaeological sensitivity, with effort concentrated on proposed tees, fairways, and other planned construction areas. A total of 224 shovel test pits was excavated. No Native American artifacts were recovered. Three historic archaeological sites, represented by foundations and associated surface features, were recorded (the Clarke House Site, the Hole 10 Site, and the Hole 13 Site). Avoidance of the sites was recommended.

25-2281 Pasquariello, Raymond D. and A. Peter Mair, II

2003 Intensive (Locational) Archaeological Survey, Franklin County Jail and House of Correction. Greenfield, Massachusetts. 49 pages.

The existing jail is included in the Inventory of Historic and Archaeological Assets of the Commonwealth (GRE135) and the general area was intensely occupied by Native American groups during the Woodland and Contact Periods. The intensive level survey included background research and field investigations. Seventy-five, 50x50cm test pits were excavated within four 30x30m blocks and along three linear transects. Subsurface testing yielded a very low density of historic cultural material from a plow zone. No evidence of prehistoric/historic Native American use of the project area was recovered during testing. Based on survey results, the proposed correctional facility will not impact any potentially significant archaeological resources and no further archaeological investigations are recommended.

25-2282 Donta, Christopher L.

2002 Native American Quarrying in the Vinegar Hills of Saugus, Massachusetts. 163 pages.

This site examination of five Native American sites consisted of the excavation of 90 shovel test pits and 9, 1x1m units. A total of 8,376 Native American artifacts were collected (7,593 stone and 783 ceramic). Three of the sites—Lady Slipper (19-ES-739), Rhyolite Ledge (19-ES-740), and Dog Day (19-ES-753)—appear to be discrete locations of lithic reduction associated with local bedrock outcrops. The other two sites—Treehouse Terrace (19-ES-742) and Swamp Hollow (19-ES-741)—are part of a single, larger site that includes a large area of lithic waste left from manufacturing stone tools and evidence of habitation. Four features found at the site and thousands of associated artifacts provide valuable information on the nature, age, and functions of the site. The Vinegar Hills area was well-used by Native Americans as a source for rhyolite. The sites were part of a network of quarries and other site types in the Boston Basin and along the Saugus River. Of particular importance is the identification of an area of habitation associated with the quarrying that contains multiple intact features. Preliminary information indicates the habitation dates to the Woodland period, ca. 1,200—1,300 years ago. Additional excavations would reveal greater detail

about the activities performed at the site, the date ranges of its occupation, the types of tools used, and the ethnic affiliation of the people at the site. This site is an extremely rare find for New England and is in excellent condition. It is recommended that the Treehouse Terrace and Swamp Hollow sites be avoided by any proposed construction because they may be eligible for the National Register of Historic Places. The remaining three sites are not recommended for further survey.

25-2283 Donta, Christopher L. and Mitchell Mulholland

1997 Archaeological Intensive (Locational) Survey of Five Parcels for the Connecticut River Bank Stabilization Project, Gill and Northfield, Massachusetts. 182 pages.

Archaeological testing comprising 312 shovel test pits, 23 1x1m units, and 13 backhoe trenches was completed. The Shearer parcel measured approximately 15m(50ft)x330m(1,082ft). The L'Etoile parcel measured approximately 15m(50ft)x140m(460ft). The Flagg parcel measured approximately 15m(50ft)x565m(1,850ft) and included a portion of the proposed access road northwest of the riverbank. The Crooker parcel measured approximately 20m (65ft) along the riverbank by 210m (690ft). An access road was also tested, as far as 170m (560ft) back from the riverbank. The Wickey parcel, including an access road, measured approximately 745m (2,450ft) in length and is of variable widths. Testing at the Pine Meadow Brook Site (19-FR-346) in Northfield identified two prehistoric loci, including two hearth features. Chert debitage predominates the collection, but there are no diagnostic lithics. Two recovered pottery sherds indicate a Woodland presence. One historic site (NFL-HA-4) was identified adjacent to the prehistoric site, an early 20th-century charcoal kiln remnant on the Shearer property. Measures for avoidance of the prehistoric site were recommended. One previously unknown site, the L'Etoile prehistoric site (19-FR-372) consists of a small scatter of debitage and pottery, again indicating Woodland occupation. Avoidance was recommended. Limited testing was conducted at the Otter Run Field prehistoric site (19-FR-307) in Gill, which had previously been surveyed. Only a low density of artifacts was found, consisting of pottery, fire-cracked rock, faunal remains, and debitage. No further survey was recommended. The area east of the King Philip's Hill Site (19-FR-9) in Northfield was tested, and a prehistoric site was identified (19-FR-373) consisting of two concentrations of artifacts and a feature complex containing a fire hearth and 11 postmolds. Pottery, lithic debitage, and faunal material was collected. Avoidance was recommended. Testing was conducted at the Bottom Brook Confluence site (19-FR-342) in Northfield, where a high density of artifacts was found on the south side of an unnamed drainage, on the terrace below Second Moose Plain. Three fire hearths, and a high-density scatter of lithic waste and tools were found, including diagnostic Late Archaic and Early Woodland projectile points and a wide array of other chipped and ground stone tools. Recommendations were made for avoidance of the high-density portion of the site.

25-2284 Donta, Christopher L. and Jennifer Wendt

2002 Archaeological Intensive (Locational) Survey for the Proposed Massachusetts National Guard Headquarters Fitness Trail, Milford, Massachusetts. 64 pages.

This project included background research, reconnaissance, and subsurface testing with 134 shovel test pits. No Native American or historic archaeological sites were previously recorded in the project area. During the field research, one Native American and one historic site were identified. The Oakfield Site (19-WR-753) includes 15 pieces of quartz chipping debris, recovered from plow zone and subsoil contexts, in an area 7.5x7.5m. The Massachusetts National Guard agreed to reroute the trail to avoid the site. The Fallen Chimney site (MIL-HA-11) consists of an artifact scatter in association with a collapsed field stone chimney. Artifacts, mostly dating from the 19th and 20th centuries, were recovered from seven STPs in an area of approximately 25x40m. Artifacts include bottle glass, two clay pipe stems, wire nails, redware, whiteware, stoneware, brick, and window glass. The proposed trail section in the vicinity of this site was eliminated, thus avoiding any impacts to the site. No further survey is recommended.

25-2285 Donta, Christopher L. and Jennifer Wendt

2002 Archaeological Intensive (Locational) Survey for the Proposed East Main Street (Route 20) Bridges Replacement Project, Westfield, Massachusetts. 57 pages.

Background research indicated a high potential for the presence of Native American resources and a moderate potential for historic resources in undisturbed portions of the project area. The reconnaissance identified multiple sources of disturbance, including a previous road alignment and underground water and gas lines, which lowered the potential of the project area significantly. During the field survey, 42 test pits were excavated in two survey units. Fifteen of the test pits contained historic artifacts, which appear to consist almost entirely of 20th-century refuse. No Native American artifacts or features were found in the project area. No further survey was recommended

25-2286 Mahlstedt, Thomas F.

2003 Archaeological Testing for Deer Barn and New Maintenance Barn, Manuel F. Correllus State Forest, Edgartown, Massachusetts. 14 pages.

This project was performed to assess the potential impacts of constructing a parking lot, kiosk, and bike trail extension at the Deer Barn, and the demolition of the Green Barn and metal shed and construction of a New Maintenance Barn in their place. Five test pits were excavated along a linear transect, through the center and eastern portion of the proposed new parking lot across the road from the Deer Barn. This location was largely undisturbed, though the CCC had planted it as a pine plantation in the 1930s. No significant archaeological materials or deposits were encountered. Five test pits were also excavated along the west edge of the proposed New Maintenance Barn, which will replace the existing derelict 19th-century Green Barn and its associated metal shed. Only one test pit appeared to have been undisturbed, but it contained no significant archaeological materials. The remaining four test pits all showed evidence of varying amounts of fill. It is apparent that when the existing Green Barn was constructed, its southern end was excavated and left open, and accessed down an earthen ramp i.e., the building is a bank barn. To achieve appropriate grades around the rest of the building soil was added around the west, north, and east sides of it. The proposed New Maintenance Barn, which will be a pre-fabricated building on a slab, will be built on fill off the west side of the present Green Barn, and no impacts to significant archaeological resources are anticipated.

25-2287 Mahlstedt, Thomas F.

2002 Archaeological Testing for Water Abatement Structures, Lamson House, Bradley Palmer State Forest, Topsfield, Massachusetts. 9 pages.

This project was undertaken to correct long-standing water drainage problems in the basement of the historic Lamson House. The Lamson House is located adjacent the Ipswich River in the vicinity of numerous recorded prehistoric sites and is considered to have extremely high archaeological potential. Initially five test pits were planned to evaluate possible impacts of the proposed abatement project; only three were excavated. Despite the high archaeological sensitivity of the property for prehistoric archaeological resources the location of the water abatement facilities lay entirely within fill that was more than 1m deep. Although, there were some interesting historic artifacts, such as a clay marble and a variety of ceramic types that could have dated to the late 18th century they lay below more recent materials including, coal, machine cut nails and a plastic comb, thus their provenience was questionable. The fill was brought in to raise the rear yard above the low-lying perennial gardens, and probably also relates to the reconfiguration of the rear of the building into the keeping room and a two-story porch, which occurred as part of Bradley Palmer's transformation of the rural farmstead into an eclectic estate at the turn of the 20th century. Because of the extensive disturbances and the fact that the proposed construction will not go below the fill, no further archaeological evaluation was considered necessary.

25-2288 Mahlstedt, Thomas F.

2002 Archaeological Monitoring for Culvert & Road Repair, New Marlborough Center Cemetery, New Marlborough, Massachusetts. 11 pages.

The Town of New Marlborough, with the assistance of a Department of Environmental Management's Historic Landscape Preservation Grant proposed to replace a failed metal culvert and resurface a portion of the access drive into its Center Cemetery. The Town proposed to replace a failed 6" pipe with a new 15" PVC pipe, which would require between 2’ and 3’ of excavation below the existing dirt road surface, but only a few inches deeper than the smaller 6" pipe was laid. The MHC noted that the Center Cemetery was listed on the State and National Registers of Historic Places as a contributing property to the New Marlborough Center Historic District and could potentially contain unmarked human burials. Accordingly, DEM was authorized to monitor the proposed work under its General Permit #1925. The replacement of the culvert at the New Marlborough Center Cemetery encountered nothing of archaeological significance and the project proceeded as planned. Archaeological monitoring of the project may have provided insight into historic road construction through wet areas. At the bottom of the excavations required for the placement of the new 15in pipe 9 (ca. 28") medium and large sized boulders were encountered. The boulders appear to have been intentionally and tightly set up against one another creating a stone pavement or floor. This stone feature has at least two interpretations. The stones may represent the basal floor for the cemetery access road that had to be elevated above the low wet depression that exists in this portion of the cemetery, the stone floor may have served as a barrier over the wet mucky soils and a firm surface upon which the sandy gravel could be placed. The sides of the filled corridor were armored with stone to contain it and provide outward and side-wall strength. On the other hand, the stone pavement may be the remnant of a former crude stone road that passed through here at perpendicular angles (east/west) to the access road, which it predates by an unknown number of years. Since this former road ran through a wet depression, boulders of varying sizes were tightly packed next to one another to provide a passable surface. Sometime in the late 1700s when a cemetery access road was built workmen may have intersected a segment of this boulder road and incorporated it into the access road as its base.

25-2289 Mahlstedt, Thomas F.

2003 Archaeological Monitoring for Universally Accessible Walkway, Fort Phoenix, Fairhaven, Massachusetts. 15 pages.

In FYI 2001 DEM awarded the Town of Fairhaven a grant to construct a universally accessible walkway, improve drainage improve, and install a utility conduit at Fort Phoenix. Because Fort Phoenix is listed on the State and National Register of Historic Places an archaeological survey (see report #25-2191) was conducted. Three reasonably intact features were discovered and the Massachusetts Historical Commission recommended monitoring of the construction. Three additional features (a portion of a modern brick edged walk, the possible structural remains associated with the 19th-century East Quarters, and a possible trash dump that could have been created sometime around the 1870s, with some modern intrusions) were identified. By adjusting the grade of the walkway and reconfiguring the initial entrance into the fort all three features, as well as those discovered by UMASS, were left in situ. They were covered by geotextile fabric, covered with gravel, and the concrete walkway built over them.

25-2290 Mahlstedt, Thomas F.

2002 Archaeological Testing for Interpretive Signage, Fort Sewall, Marblehead, Massachusetts. 9 pages.

In FYI 2001 DEM awarded the Town of Marblehead a grant to fabricate and install five bronze interpretative plaques within the historic grounds of Fort Sewall. The Massachusetts Historical Commission noted that Ft. Sewall, first constructed in 1644, is listed individually on the State and National Register of Historic Places and is a contributing property to the Marblehead Historic Dis-

trict, and concurred with DEM's proposal to excavate the holes for each plaque as if they were archaeological test pits. Two test pits were excavated on the earthen parapets of the fort, and a third was located just within the fort's entrance at the southern end of the parade ground. Two other plaques replaced existing wall mounted ones and were not evaluated for impacts to archaeological resources. Two highly corroded nails, several redware sherds, a single pearlware fragment, brick and cement fragments, and a portion of a small bone of modern origin were the only artifacts encountered. No artifacts could conclusively be attributed to military use of the fort, although the fact that the parapets appear to be constructed at least partially with sand may reflect Army engineer's preference for that material as opposed to masonry for its coastal defenses. Since there was a one-to-one correspondence between the proposed footing for each sign stanchion and the archaeological test pit, and no significant archaeological resources were observed, the signs were allowed to be placed as proposed.

25-2291 Donta, Christopher L. and Jennifer Wendt

2003 Archaeological Intensive (Locational) Survey for the Great River Bridge Traffic and Bridge Improvement Project, Westfield, Massachusetts. 91 pages.

This archaeological survey was based in part on background research that had been completed at an earlier date. Seventy-six shovel test pits were excavated, distributed amongst seven survey units within the impact limits of the bridge reconstruction project. Large portions of the project area were found to be heavily disturbed by paving, river modification, and various types of previous construction. Subsurface testing indicated that even those areas chosen at the outset to be potentially undisturbed were, in fact, heavily disturbed. One Native American archaeological site was identified in Survey Unit 1, but it has been heavily disturbed and only includes a small pocket of natural soils. The site has little scientific potential, and no further survey is recommended. No historic archaeological sites were found, despite the recovery 1,943 historic artifacts from 63 of the 76 test pits. The historic artifacts all came from disturbed fill soils, and there were no indications of any intact subsurface historic features. No potentially significant sites were found; no further survey is recommended.

25-2292 Ritchie, Duncan and Kirk Van Dyke

2002 Intensive Archaeological Survey, Sutton Wastewater Treatment Facilities, Sutton, Massachusetts. 85 pages.

Background research, a walkover survey, and subsurface testing were used to investigate the approximately 8 acre project area, which appeared likely to contain Native American archaeological sites. Evidence of disturbance from historic/modern period sand/gravel pitting was noted in the western portion of the project area. Sections of the project area were found to have high to moderate archaeological sensitivity and subsurface testing was carried out in these areas (79, 50x50cm test pits). A historic-period dam (Hough Road Dam) was found during the initial walkover survey. Test pits were placed within a single 30x30m sampling block and along judgmentally placed linear transects at 10m intervals. Three arrays containing 12 test pits were used to investigate find spots of Native American cultural material. Thirteen judgmentally placed test pits were excavated to investigate small, archaeologically sensitive sections of the project area and find spots of Native American cultural material. Testing identified four Native American archaeological sites. Three of these sites were small, low-density deposits of cultural material such as an isolated chipped-stone tool or pieces of chipping debris. They likely mark the locations of temporary camps used by individuals or small groups during hunting, trapping, or other resource collection activities in the wetlands and upland forest areas in the area drained by Steamburg, Caswell, and Gilboa brooks. While the White Feather Site yielded a diagnostic Terminal Archaic Period (ca. 3,000—2,500 years ago) Orient Fishtail projectile point, close interval sampling with a test pit array did not yield any other cultural material. The cultural material (rhyolite chipping debris) found in the Grey Squirrel and Yellow Leaf sites lacks temporal or cultural affiliation. These three isolated find spots are very small and the close interval sampling indicated they are unlikely to yield any further in-

formation. They are not considered to be potentially significant cultural resources. The Green Spider Site contains archaeological deposits that appear to be associated with Late Archaic Period, Susquehanna tradition (Atlantic phase) activity about 3,800 to 3,500 years ago. A single Atlantic projectile point of argillite was found there. Susquehanna tradition settlement patterns are not well known in interior upland sections of southern New England like the Blackstone River drainage. The Green Spider Site has the potential to yield information relevant to this cultural tradition. This site may also contain cultural material associated with use of this location by Native Americans during other parts of the Archaic and Woodland periods and is considered to be a potentially significant cultural resource. No further archaeological investigation of the Grey Squirrel, Yellow Leaf, and White Feather sites is recommended. It is recommended that proposed construction avoid the Green Spider Site. The Hough Road Dam Site is within a designated wetland buffer zone and should not be affected by proposed construction activities. No further investigation of this site is recommended.

25-2293 Donohue, Barbara and Leith Smith

2003 A Site Examination at the Sophronia Young House Site in the New Seabury Development. Mashpee, Massachusetts. 141 pages.

A previous intensive survey located the Sophronia Young House site (see report #25-2068). The current survey consisted of background research, excavation of 109 shovel tests (50x50cm) in a 5m grid, four judgmental shovel tests (50x50cm), three excavation units (1x1m), and an intensive walkover in search of burials in a 13 acre parcel. Twelve features (7 surface and 5 subsurface) were revealed, and 5,554 artifacts were recovered, however, no burials were identified. All recovered material was domestic debris. Sophronia Young was a proprietor of the Mashpee tribe. Her property was occupied from 1842 to ca. 1878. The site has retained integrity and is considered eligible for the National Register under Criteria A and D as it has the potential to contribute information concerning issues of continuity and change about subsistence and settlement patterns of the Mashpee Tribe from the mid to late 19th century.

25-2294 Dudek, Martin G.

2003 Intensive (Locational) Archaeological Survey and Site Examination at the Algonquin Regional High School, Northborough, Massachusetts. 88 pages.

The intensive survey consisted of 125 test pits (85 systematic in three blocks and three transects, 20 judgmental, and 20 bracket test pits, all 50x50cm) excavated across the 27.95 acre project area. Historic or modern materials were present but scarce. Two prehistoric find spots (1 quartzite flake and 1 piece of quartz shatter) and two adjacent prehistoric site loci were identified. Locus 1 contained 46 quartz flakes; Locus 2 contained eight rhyolite flakes. A site examination was conducted for both loci, with 120 systematic test pits (50x50cm) at 5m intervals and four excavation units (1x1m). At Locus 1, 73 test pits defined the site boundary as 50m north-south by 35m east-west, or 1,750sq m. Among the 193 lithic artifacts recovered, three bifaces were recovered: a Late Archaic quartz Squibnocket Triangle; a Late Archaic/Early Woodland, quartz Small Stemmed point; and a Middle Archaic, black rhyolite, Stark-like point. Other artifacts included quartz, hornfels, rhyolite, and quartzite chipping debris, as well as a utilized flake. At Locus 2, 47 test pits defined the site boundary as 35m north-south by 20m east-west, or 700sq m. Among the 36 lithics rhyolite, hornfels, and quartzite chipping debris were recovered, but no tools. Both site loci lacked cultural features; artifacts were limited to isolated points or chipping debris, low-density scatters of chipping debris, or discrete chipping stations with low to moderate densities of debitage. Given the limited variety of data and the low density of cultural materials, neither locus was deemed potentially significant and no additional archaeological work was recommended.

25-2295 Dudek, Martin G. and Craig S. Chartier

2002 A Site Examination at Site 19-PL-879 for the Phase II Expansion, Pembroke Business Center, Pembroke, Massachusetts. 141 pages.

Site 19-PL-879, the Pembroke Business Center Site, is located on a relatively broad and level plateau of an unplowed sandbank. Testing consisted of 281 test pits excavated in a 7.5m-interval grid pattern across the site. Steep slopes, in conjunction with two consecutive sterile test pits, defined the site boundaries (13,500sq m). Six 1x1m excavation units focused on features or lithic concentrations. Twelve concentrations of lithics were identified. Two, dense, rhyolite chipping stations and 10 other chipping stations of rhyolite, quartz, or mixed lithics were identified. An extended site examination was conducted at four of these locations, with a 3x3m block excavated at each. These four lithic concentrations were representative of the range of lithic variation across the site. Site-wide, diagnostic points consisted of seven, quartz, Squibnocket triangles. Twelve broken rhyolite bifaces; four intact bifacial preforms; an untyped, quartzite point fragment; and an untyped, quartz, eared triangle were also recovered, along with over 2,000 pieces of chipping debris, mostly of rhyolite or quartz, and four fragments of calcined bone. A rhyolite preform and two bifacial blade base fragments were similar to Middle Woodland Greene-like points, while another preform resembled a Transitional Archaic Orient Fishtail point. An Orient Fishtail point was recovered from the intensive survey (see report #25-2138). One chipping station had over a dozen types of lithic materials, including rhyolites, quartzite, hornfels, chert, and a probable piece of flint. Pottery was absent at the site. Modern tree burns, probable historical charcoal production at one locale, and two recent historical items were present. Quartz was common across the central area of the sandbank, while rhyolite was often concentrated near the edges of the bank, suggesting a different focus. The recovered data indicate a site limited in terms of temporally diagnostic materials and scarce in features or prehistoric organic remains. Given the limited variety of data within the lithic concentrations and the low density of cultural materials elsewhere, Site 19-PL-879 is not considered potentially significant and no additional archaeological work is recommended.

25-2296 Ingham, Donna and Duncan Ritchie

2003 Archaeological Site Examination the Pine Road (19-PL-894) and Triple P (19-PL-895) Sites, The Pinehills Development Area, Plymouth, Massachusetts. 94 pages.

The Pine Road (19-PL-894) and Triple P (19-PL-895) sites are situated in close proximity to the route of a proposed sewer force main and roadway improvements associated with the Phased Review Development IV (PRD IV) of The Pinehills. The site examinations provided information regarding the size, content, internal composition, age, and condition of the Pine Road and Triple P sites. The Pine Road Site occupies the majority of a nearly level to gently sloping terrace overlooking the southeastern portion of an extensive wetland area at the headwaters of the Eel River. Subsurface sampling within the two sites was done with 50x50cm test pits and 1x1m excavation units placed within a coordinate grid system. Cultural materials, the majority of which are Native American lithic artifacts, were recovered within a site area estimated to measure 8,136sq m. Nearly all of the recovered cultural materials were recovered in undisturbed stratigraphic contexts. Although much of the site area contained low-density artifact distributions, numerous small concentrations containing low/moderate or moderate-density distributions were identified. The results of artifact and spatial analyses suggest that these concentrations are the product of numerous episodes of chipped-stone tool maintenance and/or manufacture focusing on highly finished bifaces (particularly projectile points) made primarily from quartz and a variety of rhyolites. Little evidence (one chert scraper-like uniface) suggests that processing of non-lithic raw materials (butchering animal carcasses, hide/leather preparation, plant foods) was an important element of the activities carried out there. Feature 2 may contain categories of data such as plant and animal remains that have the potential to expand our knowledge of activities carried out at the site. The combined assemblage (intensive survey and site examination; see reports #25-2053, #25-2239 & #25-2260) of temporally diagnostic Native American artifact types recovered from the Pine Road Site consists of five Small Stemmed and two Meadowood projectile points, indicating occupation of the site during the Late/Transitional Archaic periods (ca. 5000—2500 B.P.) and into the Early Woodland Period (ca. 3600—1600 B.P.). The majority of the Triple P Site is situated on the sum-

mit and western slope of a small knoll overlooking the southern portion of the extensive wetland at the headwaters of the Eel River. Native American cultural materials were recovered within a site area estimated to measure 3,078sq m. Native American cultural materials are associated with undisturbed contexts and only two small portions of the site area appear to have been plowed. Euro-American cultural materials were recovered in plow zone soils from both of these areas. Although much of the site area contained low-density artifact distributions, a few small concentrations containing low or moderate-density distributions were identified. These small concentrations appear to mark locations where brief episodes of chipped-stone tool maintenance and/or manufacture took place. This activity focused on highly finished bifaces (including projectile points) made primarily from quartz. The combined assemblage (intensive survey and site examination) of temporally diagnostic Native American artifact types recovered from the Triple P Site consists of single examples of Small Stemmed, Squibnocket Triangle, and Levanna projectile points, and two ceramic sherds, indicating occupation of the site during the Late/Transitional Archaic periods (ca. 5000—2500 B.P.) and into the Early Woodland (ca. 3600—1600 B.P.) and Late Woodland periods (ca. 1000—450 B.P.). In addition to confirming the Native American use of the upper Eel River drainage and terminal moraine district during the Late/Transitional Archaic periods and the Woodland Period, these site examinations resulted in the collection of data that can be applied to research questions concerning the nature and patterning of that use. Of particular importance is the additional data relevant to the characteristics of Native American archaeological sites in the Eel River drainage and the inland aspect of Late/Terminal Archaic and Woodland Period settlement and resource use in this part of southeastern Massachusetts. The assemblages of chipped-stone tools and debitage collected from the Pine Road and Triple P sites yielded information about Archaic and Woodland period lithic resource use in the interior pond and moraine district within Plymouth County. The Pine Road and Triple P sites were both considered potentially significant and eligible for listing in the National and State Registers of Historic Places. It was recommended that if development takes place within these areas, a data recovery program should be developed to mitigate any effects on these sites.

25-2297 Waller, Joseph N. and Alan Leveillee

2002 Intensive (Locational) Archaeological Survey, Westborough Office Park 2300 Site, Westborough. 73 pages.

The intensive archaeological survey of the project consisted of background research and field investigations. State site files maintained at the Massachusetts Historical Commission record that the Walkup-Flander Site (19-WR-291) is partially within the project area. Therefore, it was considered likely that Native American archaeological deposits would be encountered within the Westborough Office Park 2300 Site project area. A total of 48, 50x50cm test pits were excavated. Intensive subsurface investigation identified one Native American site. The Washington Lane Site consists of three pieces of Native American chipping debris indicative of stone tool maintenance. This site is spatially limited, with single pieces of debitage from three separate test pits. Historic period cultural materials recovered from the project area include low densities of redware sherds, asphalt shingles, and glass sherds. The materials recovered from the project area do not constitute significant historical or Native American cultural properties. No further archaeological investigation is recommended.

25-2298 Donta, Christopher L. and Timothy L. Binzen

2003 Archaeological Intensive (Locational) Survey for the Proposed Children’s Center, Deerfield, Massachusetts. 68 pages.

Background research and subsurface testing was conducted for the proposed Children’s Center, which includes a main building, two locations for the Whately House, a privy, and a small pavilion on an approximately 8,000sq ft parcel. Eight exploratory trenches (50cmx2m) and 22 shovel test pits were excavated. Historical artifacts were found in all 8 of the trenches, and in 20 of the 22 shovel test pits. The artifacts consist of 602 primarily 19th-century architectural and domestic

items. No features were found related to the historical artifacts. One Native American archaeological site was identified, with 66 artifacts found in 3 of the 8 trenches and 9 of the 22 test pits. No temporally diagnostic artifacts were found at the site, nor were any features identified. The site consists of a concentration of artifacts centered on Trench 3, which represents the remains of lithic reduction and a fire, resulting in a scatter of debitage and fire-cracked rock. The site may have originated from a single episode of lithic working around a fire, becoming scattered by plowing over the last several centuries. No further testing is recommended.

25-2299 Ingham, Donna and Alan Leveillee

2002 Intensive (Locational) Archaeological Survey, Pequit View. Canton, Massachusetts. 70 pages.

A total of 76, 50x50cm test pits was excavated within the proposed residential subdivision. Two loci of Native American activity were identified during the survey. The Pequit View 1 Site is located within the central portion of the development. One rhyolite flake was recovered in association with a mixture of undisturbed A- and B_1-horizon soils. No temporally diagnostic Native American artifact types were recovered, and no subsurface features associated with cultural activities were observed. The Pequit View 2 Site is located within the southwestern portion of the project area and contains a low-density distribution of Native American cultural material within an area measuring approximately 30x10m (300sq m). Two pieces of Native American cultural material (one piece of rhyolite lithic debris and one piece of quartz lithic debris) were recovered in association with undisturbed B_1-horizon soil. No temporally diagnostic Native American artifacts and no evidence of subsurface features associated were identified. The Pequit View 1 and 2 Native American sites are both characterized by limited spatial extent, information content, and research potential. Neither site is likely to yield additional data pertaining to the use of the area by Native Americans. The Pequit View 1 and 2 sites did not meet National Register criteria for eligibility.

25-2300 Deaton, Jo A. and Suzanne G. Cherau

2003 Intensive (Locational) Archaeological Survey, Worcester Vocational High School. Worcester, Massachusetts. 84 pages.

The survey area covered approximately 34 acres of development on the former Belmont Hospital/Home property, WTI property, and Green Hill Park in the northeast part of the city. Documentary research and field investigations were used to locate, identify, and assess archaeological resources. Field investigations consisted of a walkover survey/surface inspection of the entire study area as part of the reconnaissance survey, followed by subsurface testing in approximately eight archaeologically sensitive acres. Documented/reported resources included town and family quarry activities, a blacksmith shop, a homestead farm, a derrick stone, and several quarried stones. The intensive survey fieldwork consisted of the hand excavation of 25, 50x50cm test pits. Test pits were organized along four judgmental transects and as 10 judgmentally placed test pits, assisted by a metal detector at the suspected blacksmith shop site and in proximity to a small quarry. No significant in situ archaeological deposits were identified. No further archaeological investigations are recommended. The few remnant cultural elements identified on the landscape including the derrick stone, millstone, and several representative quarry stones will be integrated into the proposed project landscape close to their historic period locations.

25-2301 da Silva, Janine V. and Kathryn Grover

2002 Historic Resource Study Boston African American National Historic Site. Boston, Massachusetts. 239 pages.

This Historic Resource Study presents detailed descriptions of properties already included within Boston African American National Historic Site (BOAF) and of properties that, on the basis of their historical and architectural significance, we have judged worthy of inclusion in BOAF. These

descriptions are preceded by an examination of how the neighborhood BOAF interprets evolved and a brief discussion of the people who lived within it.

25-2302 Garrow, Patrick H., Toni Goar, and Nathan Morphew

2003 Archaeological Survey of Lots 3 and 4 of the New Bedford Business Park and Testing of the Missio Site (19-BR-338), New Bedford, Massachusetts. 53 pages.

This project involved archaeological testing on a portion of the Missio Site (19-BR-338) and an intensive archaeological survey of 87 acres adjacent to the Missio Site. The testing was undertaken to evaluate the site's potential for listing on the National Register of Historic Places. The site had been identified in 1989 (see report #25-1805) and a portion of it tested in 1998. During the original survey, a Middle Archaic Neville point was found on the site. The test excavations included placement of six 1x1m units in the eastern portion of the site. The testing failed to produce temporally diagnostic artifacts, intact archaeological deposits, or archaeological features, and it was concluded that the Missio Site represents a series of ephemeral prehistoric campsites that lacked intact deposits or features. We concluded that the site is not eligible for listing on the National Register of Historic Places. A total of 74 shovel tests were excavated during that survey. The area surveyed has been extensively disturbed, and no archaeological sites were identified.

25-2303 Hager-Richter Geoscience, Inc.

2001 Geophysical Survey Bunker Hill Monument, Boston National Historical Park, Boston, Massachusetts. 36 pages.

The geophysical survey at the Bunker Hill monument consisted of approximately 14,150 EM31 stations, 68,000 EM61 stations, and 18,125 m of GPR traverse. Based on the combined results of the three geophysical methods, many subsurface features were detected and located including possible utilities, areas with continuous flat reflectors indicative of more compacted soil, areas of disturbed ground (possible fill areas), possible fill areas with dipping reflectors and unidentified buried objects. While the archaeological significance of any of the above features cannot be determined on the basis of the geophysical data alone, future excavations, if conducted, might be warranted in areas of disturbed ground, areas of flat reflectors indicative of more compacted soils, and at the locations of unidentified buried objects.

25-2304 Hoffman, Curtiss

2003 Archaeological Data Recovery Project: Astra-3 Site, Westborough, Massachusetts. Two volumes, 791 pages.

From 1992 through 1994, and again from 1996 through 1997, students from Bridgewater State College and amateur volunteers from the W. Elmer Ekblaw Chapter of the Massachusetts Archaeological Society, working under the supervision of the principal investigator, excavated a total of 180sq m at the Astra-3 Site. A total of 99 cultural features, 909 prehistoric lithic and clay artifacts, 8,404 pieces of debitage, 46,962 pieces of organic material, 11,657 pieces of fire-cracked rock, and 614 historic period artifacts was recovered from the site. Diagnostic artifacts of the prehistoric period include Dalton, Brewerton Side-Notched, Brewerton Eared Triangle, Squibnocket Triangle, Small Stemmed, Atlantic, Rossville, and Levanna projectile points, an eared drill, and Early-Middle Woodland pottery. Nine radiocarbon dates and three oxidizable carbon ratio (OCR) dates have been obtained from the site, with ages ranging from Early Archaic through Late Woodland. Historic period components include Late Industrial and Modern. Feature complexity was great in several areas, possibly due to multiple use of the same areas by different people, possibly due to intentional placement of lenses within features, and possibly due to post-depositional N-transforms such as tree throws and rodent runs.

25-2305 Ritchie, Duncan and Jennifer Macpherson

2002 Intensive (Locational) Archaeological Survey Town of Billerica Sewer Extension River Pines to Middlesex County Jail and House of Correction, Billerica, Massachusetts. 59 pages.

Background research indicated that the project area had the potential to contain both Native American and historic/modern period cultural resources. The approximately 3500ft long sewer easement forming the project area was near a core area of Native American settlement along the Concord River and contained environmental settings similar to those with known prehistoric sites along this drainage. A walkover survey of the project area assessed existing conditions and archaeological sensitivity. Zones of high and moderate sensitivity were investigated through subsurface sampling with judgmentally placed test pit transects. No prehistoric cultural material or other evidence of Native American activity was found during subsurface testing. A small culvert or bridge constructed of local fieldstone was found along the sewer easement (station 7+50) in a wooded area south of the Old Middlesex Turnpike. The culvert was part of an abandoned cart path or roadway associated with historic to early modern period use of the area as farmland. A small amount of historic/modern cultural material (ceramic sherds, bottle glass, brick, nails) was found in test pits along judgmental transects placed in several sections. The low density historic/modern period cultural material found within the project area represents domestic refuse discarded in land under active agricultural use in the 19th to early 20th century. Since this material is not associated with a specific historic/modern period site such as a farmstead or house it is not considered to be potentially significant. The fieldstone culvert found in the project area is evidence of past agricultural/pastoral land use. However, it is not considered to be a potentially significant cultural resource. No further archaeological investigation is recommended.

25-2306 Ford, Ben and A. Peter Mair, II

2002 Intensive (Locational) Archaeological Survey: Silver Lake High School, Kingston, Massachusetts. 55 pages.

This survey included background research and field investigations consisting of 34, 50x50cm shovel test pits excavated within areas of high and moderate archaeological sensitivity. One locus of Native American land use and activity was documented. The Silver Lake High School Find Spot 1 site contains a low-density distribution of quartz chipping debris recovered from the plow zone. No temporally diagnostic prehistoric artifacts or evidence of subsurface features were recovered, and it is not considered significant.

25-2307 Fragola, Patricia and Duncan Ritchie

2001 Intensive Archaeological Survey of the McLean Hospital Development, Belmont, Massachusetts. 80 pages.

This investigation was carried out within four designated areas of proposed development within the McLean Hospital campus. Background research indicated that the project area was on the perimeter of a core area of Native American settlement in the Mystic River drainage and had the potential to contain small prehistoric sites located in proximity to wetlands and streams. Prior to construction of the McLean Hospital complex in the late 19th century, historic period land use was primarily agricultural/pastoral. The project area had the potential to contain evidence of this type of land use. Field investigations consisted of a walkover survey/surface inspection followed by subsurface testing. One prehistoric site, McLean Hospital Locus 4, was identified from cultural material (steatite vessel sherd) found on the graded embankment of a parking lot during the walkover survey of the intensive survey. The walkover survey also identified the structural remains of a barn, gravel-filled cistern, and small outbuilding associated with a 19th-century estate and farm, Highland Stock Farm. This historic site was identified in an area zoned for open space. Since this area was not proposed for development under the current plan, it was not subjected to subsurface testing. A total of 94 test pits (50x50cm) were excavated in areas considered to have high and moderate archaeological sensitivity. These test pits were placed in 30x30m sampling blocks and

along judgmentally placed transects. Subsurface testing identified three prehistoric sites designated as McLean Hospital Loci 1, 2, and 3. These sites are located within 150m of one another and are situated in the vicinity of a former freshwater spring. The stratigraphic distribution of recovered materials suggests that the McLean Hospital Locus 1 Site retains high to moderate degree of integrity, while the McLean Hospital Locus 2 Site retains a high degree of archaeological integrity. The McLean Hospital Locus 3 Site yielded a low density of chipping debris. All of these sites yielded samples of rhyolite and quartz chipping debris. Most of this chipping debris appears to be rhyolite derived from sections of the Lynn volcanic complex in the Middlesex Fells area northeast of the project area. Subsurface testing placed around the steatite vessel sherd find spot on the McLean Hospital Locus 4 Site did not yield any additional prehistoric cultural material. It is likely that the steatite fragment recovered from this site represents an isolated artifact derived from a site damaged or destroyed by construction of the adjacent parking lot. A low density of historic/modern period cultural material (ceramic, glass) was also recovered from Zone 1b. This material cannot be associated with a specific historic period site, and is not considered to represent a potentially significant cultural resource. While their temporal and cultural affiliation is unknown, the McLean Hospital Locus 1 and 2 sites are considered good examples of the type of small to moderate sized temporary camps used by Native Americans while hunting or collecting resources in upland terrain like that in the project area. These two sites represent potentially significant cultural resources. No further archaeological investigations are recommended for the McLean Hospital Locus 3 and 4 Sites or Zone 1b within the McLean Hospital project area. It is recommended that a plan to avoid adverse impacts to the McLean Hospital Locus 1 and 2 sites be developed. If avoidance is not a feasible alternative, additional archaeological investigation at the site examination level is recommended for the McLean Hospital Locus 1 and 2 sites to determine their potential eligibility for listing in the National Register of Historic Places. It is also recommended that an intensive archaeological survey be conducted within the portion of the McLean Hospital campus containing the Highland Stock Farm.

25-2308 Decima, Elena

2003 Report of an Intensive (Locational) Survey of the Stone Cranberry Trust Property, Middleborough, Massachusetts. 30 pages.

A walkover survey of this undeveloped 25.5 acre parcel located several areas of high archaeological potential. Accordingly, 120 test pits of 0.5x0.5m each were excavated in areas designated A-L. The excavations recovered flakes and shatter, as well as five prehistoric tools (four points and a possible scraper) from five archaeological sites. Site 2 was an isolated find, and no further work was recommended. Sites 1, 3, 4, and 5 were all recommended for site examination in the event project plans change in such a way as to impact them. In its present state, the plan will not impact any of the sites, and no further work is recommended.

25-2309 Herbster, Holly and Suzanne G. Cherau

2003 Summary Report, Intensive (Locational) Archaeological Survey, Pancake Hollow Property, Aquinnah, Massachusetts. 33 pages.

The archaeological survey was conducted in compliance with the Town of Aquinnah Historic and Archaeological Resource Protection Bylaw, administered through the Aquinnah Planning Board. The intensive survey included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources that may be affected by proposed residential development. A total of 25, 50x50cm shovel test pits was excavated within the approximately 22,000sq ft (2043sq m) project area. No cultural materials or features were identified within the project area; no further testing was recommended.

25-2310 Herbster, Holly and Suzanne G. Cherau

2003 Summary Report, Intensive (Locational) Archaeological Survey, Sunset Lane Property, Aquinnah, Massachusetts.

The intensive survey included background research, a walkover survey, and subsurface testing. A total of 52, 50x50cm shovel test pits was excavated within the approximately 13 acre project area. The intensive survey identified one Native American archaeological deposit. The Sunset Lane Find Spot consists of two fragments of crystal quartz shatter collected within a spatially limited (10m) area along a gently sloping terrace. A low-density scatter of historic and modern period cultural materials was collected within plowzone soils around a complex of 19th-century standing structures and stone walls. These historic period structures and deposits correspond to the late 19th- and early 20th-century use of the project parcel by the Cooper family. While these cultural resources document the continuity of Native American land use in this section of Aquinnah, they are not considered potentially significant archaeological deposits, and no further testing was recommended.

25-2311 Heitert, Kristen B. and Suzanne Cherau

2003 Intensive (Locational) Survey and Archaeological Site Examination, Stonehurst, The Robert Treat Paine Estate, Waltham, Massachusetts. 63 pages.

Nineteen 50x50cm test pits and two, 1x1m excavation units (EUs) were excavated along 300 linear feet of proposed drainage improvements to the north, south, and west elevations of the house. The test pits were excavated at 5m and 7.5m intervals using three transects and one judgmental test pit. The soils were extremely altered from historical construction and grading activities at the house site. A total of 197 pieces of historic cultural material, primarily construction debris, was collected from fill horizons. Two contiguous EUs were excavated along the west elevation of the house in the location of a capped fieldstone chamber housing a functioning wastewater pipe. Research at the Stonehurst archives provided construction plans produced by the architect, H.H. Richardson, which indicated that the chamber dates to the original construction of the house, circa 1884—1886. The Stonehurst project area contains no potentially significant prehistoric or historic period archaeological deposits. No additional archaeological or documentary work is recommended.

25-2312 Ford, Ben and Holly Herbster

2003 Technical Report, Intensive (Locational) Archaeological Survey, Massachusetts Military Reservation Groundwater Study Areas 1A, 1B, and 8, Bourne, Massachusetts. 80 pages.

A total of 179 test pits were excavated within Areas 1A, 1B, and 8. Test pits were excavated at 10m intervals along transects in the 264 linear feet designated as high sensitivity and at 20m intervals along transects in the 5,493 linear feet designated as low sensitivity. Frank Perkins Road Find Spot 1 consisted of a quartz flake, Frank Perkins Road Find Spot 2 consisted of a quartz flake, Pew Road Find Spot 1 consisted of a quartz biface, and Pew Road Find Spot 2 consisted of a quartz flake. All prehistoric artifacts were associated with disturbed soil. Twentieth-century historic artifacts primarily associated with the military occupation of the area were recovered from eight test pits in the project area. No additional archaeological investigations were recommended.

25-2313 Blancke, Shirley

2003 Archaeological Data Recovery at Sleepy Hollow North Cemetery Expansion: Final Report, Phase 2, Concord, Massachusetts. 2 volumes. 44 pages total.

Over the course of three years, from 1997 to 1999, two archaeological surveys and a data recovery project were conducted by volunteers under Dr. Shirley Blancke in a field in Concord, Massachusetts into which the Sleepy Hollow cemetery was to expand. The general area is southwest of the Great Meadows Wildlife Sanctuary and is named “Cranefields” or “The Great Fields” in some

early maps. Artifacts had been collected from the area in the early 20th century, and the town wished to determine whether any graves of Native people and other possible features might be impacted by the cemetery expansion. A considerable amount of grading was planned to create a rolling landscape out of a flat field. Analysis of the artifacts over the three seasons provided data on the periods in which the field had been occupied, and five radiocarbon dates were derived from features. The artifacts came almost exclusively from the plowzone and could not be definitively associated with the features. Projectile point finds indicated that Middle and Late Archaic components had once existed at the site, and three sherds pointed to a Woodland presence. Edge tools, perforators, gouge fragments, and historical finds such as a part of an 18th-century clay pipe bowl with identifiable molded design were recovered. Of particular interest are two rare types of stone reported from the Concord River drainage area: mylonite and mylonitized rhyolite and amphibolite, a kind of schist. These were identified by lithography at Sleepy Hollow after the 1999 season. The quantity of stone is unusual for Concord sites. Lithic information from the surveys and data recovery, combined with lithics from the Benjamin Smith collection in the Concord Museum, demonstrated that the area must have been an extensive lithic manufacturing location in the pre-contact period.

25-2314 Berkland, Ellen

2003 Results of the Intensive Survey of the Parson Capen House, Topsfield, Massachusetts. 42 pages.

Archaeological testing of the Parson Capen House was completed during the fall of 1993. Plans for the recreation of an 18th-century barn and the installation of additional utilities on the property necessitated an archaeological investigation. Based on the review of materials recovered from the excavated test pits, it appears the site was a temporary or repeated lithic manufacturing/maintenance area. The materials reflect a moderate density site, with questionable integrity given the intermix with historical materials and the proximity to the previous location to an old barn. The majority of flakes were tiny thinning flakes, made from local North Shore volcanics. This is a common site type in the area and deemed not significant. The discovery of a Squibnocket Triangle projectile point could indicate that the site dates to the Late Archaic Period.

25-2315 Donohue, Barbara

2003 Site-Examination Report on the Ebenezer Keyes Site, Gardner, Massachusetts. 70 pages.

A total of 60 shovel test pits measuring 50x50cm and four 1x1m excavation units were dug during a site examination at the Ebenezer Keyes Site (GAR-HA-05; see report #25-2271). Surface features include a dry-laid stone foundation, stone walls, and a dry-laid stone well. Previously, during intensive survey testing, 24, 50x50cm shovel test pits had been excavated in this area. As a result of the above testing, 2,858 artifacts were recovered, dating the site from the late 18th to early 19th century. No primary deposits or intact subsurface features were revealed. Recovered materials were small and considered sheet refuse or secondary deposits. Soil disturbance was evident. While documentary research revealed that Ebenezer Keyes's homestead was located elsewhere in Gardner, the project area was part of his property holdings. Jonathan Eager, who purchased the property from Keyes in 1789, probably developed the site. The historic site is not considered eligible for listing in the National Register of Historic. Given its historic nature, the project proponent plans to maintain a buffer zone around the historic site so that it will not be developed. It is recommended that the reference to "home" be taken out of the site's name, that the foundation and well be protected from vandalism, and that the planned buffer zone be extended to the east to encompass the site's boundaries as determined in the site examination.

25-2316 Cherau, Suzanne G. and Stephen Olausen

2002 Annual Report, Cultural Resource Monitoring, Deerfield River Hydroelectric Project, Conway, Massachusetts. 40 pages.

The 2002 annual report presents the results of investigations carried out as recommended in the 2001 Annual Report action plan, descriptions of cultural-resource-related activities that occurred in 2002, and an action plan for the year 2003. The 2002 annual monitoring program for archaeological sites and sensitive areas consisted of a review of recently conducted cultural resource surveys: archaeological sensitivity assessments of proposed late 2002—2003 recreational enhancements; and Phase IB surveys of three of these projects determined to have archaeological sensitivity for prehistoric and historic period resources. The Phase IB surveys determined that none of these areas contain archaeological resources that are eligible to the NRHP.

25-2317 Thomas F. Mahlstedt

2003 Archaeological Testing & Monitoring For Historic Landscape Preservation Grant, Milton Cemetery, Milton, Massachusetts. 15 pages.

Milton Cemetery has been declared eligible for listing on the State and National Register of Historic Places because it is the result of the designs of several famous American landscape architects, and because it retains many of their design elements in reasonably good condition. Some of the proposed tree replacements were to occur in the earliest portion of the cemetery—the Old Burying Place—which dates to 1672. There was concern that records for this early portion of the cemetery may not be entirely complete and thus unmarked burials may exist here. A combination of traditional subsurface archaeological testing and archaeological monitoring was performed. Six test pits were excavated at the exact location of proposed trees within the Old Burying Place. No cultural material of any kind was encountered by the archaeological testing. Monitoring of 10 machine excavated tree holes and the preparation of a rehabilitated path occurred near the cemetery's main entrance. Two ceramic sherds, cinder, and burlap from the root ball of a former planting were observed during monitoring. Since there were no significant archaeological findings Milton Cemetery was allowed to proceed with their planting plan and complete the Historic Landscape Preservation Grant as proposed.

25-2318 Ingham, Donna and Duncan Ritchie

2003 Archaeological Site Examination: McLean Hospital Locus 2 Site, McLean Hospital Campus Redevelopment Area, Belmont, Massachusetts. 70 pages.

The intensive survey (see report #25-2307) produced rhyolite chipping debris and ceramic sherds suggesting a small temporary camp in upland terrain probably used for hunting and other foraging activities involving forest resources during the Middle to Late Woodland periods, about 1,600 to 450 years ago. The presence of pottery at the McLean Hospital Locus 2 Site indicated that storage and food preparation activities took place at the site. The site may have been oriented to a spring located a short distance to the north. The site examination, consisting of 27, 50x50cm test pits placed within a 5m grid pattern and two, 1x1m excavation units, determined the horizontal and vertical extent, condition, internal structural characteristics, content, and temporal period of the site. Cultural material collected from the site included a Greene-type projectile point of quartzite and chipping debris of rhyolite, quartzite, quartz, and chert. A sample of 29 ceramic sherds was recovered from three, small, concentration areas. Two features found on the site were a dense deposit of burnt rock and charcoal producing a conventional radiocarbon age of 2050±60 years B.P. and a small deposit of lightly oxidized subsoil with charcoal and chipping debris. The McLean Hospital Locus 2 Site is considered potentially significant and may be eligible for listing in the National and State Registers of Historic Places. Analysis of the various categories of archaeological information collected from the site demonstrated that it contains data relevant to research contexts or themes (settlement, lithic resource use, ceramics) related to Middle Woodland Period Native American activity in the northern Boston basin. The northern boundary of the McLean Hospital Site is located outside a designated tree protection zone and a portion of the site will be im-

pacted by proposed construction. The southern half of the McLean Hospital Locus Site lies within the designated tree protection zone and will not be impacted**.** Avoidance of the northern portion of the McLean Hospital Locus 2 Site is not possible and a data recovery program will be developed to mitigate the adverse effects of proposed development.

25-2319 Herbster, Holly

2003 Technical Report, Intensive (Locational) Archaeological Survey, Southeastern BioReserve Visitor Center Project Area, Freetown, Massachusetts. 43 pages

An intensive survey was completed at the 3 acre Southeastern BioReserve Visitor Center project area. A total of 33, 50x50cm test pits was excavated within 2, 30x30m blocks and along 2, 10m interval transects. The combined results of background research and subsurface testing did not identify any archaeological deposits or features within the project area, and no additional testing was recommended.

25-2320 Waller, Joseph N. and A. Peter Mair, II

2003 Intensive (Locational) Archaeological Survey Belmont Office/R&D Building, Belmont, Massachusetts. 71 pages.

An intensive (locational) archaeological survey was completed for the ±15 acre parcel. Background research established that the greater area surrounding Spy and Little ponds, as well as along the margins of Alewife Brook near its confluence with the Mystic River was one of concentrated Native American settlement. Furthermore, inspection of 19th/20th-century historic maps and documentation indicated that the former Heustis Family farmstead with associated agricultural features and properties was established on the subject property during the mid-19th century. This farm operated until 1948 when the property was sold and the buildings razed. Fieldwork for the project commenced with a site visit and walkover that established that areas of extensive 20th-century demolition, filling, and dumping characterize the greater project area. Thirty-two, 50x50cm test pits were excavated in areas assessed as exhibiting low to moderate archaeological sensitivity. Despite the general archaeological sensitivity of the greater Arlington Plain area of the Boston Basin, no Native American cultural resources were identified within the Belmont Office/R&D Building Development project area during the intensive survey. Archaeological testing also failed to locate the buried Heustis house foundation recorded on maps and by local informants. However, subsurface testing did result in the recovery of moderate to high densities of mid- to late-19th- and 20th-century cultural materials including ceramic sherds, glass and brick fragments, butchered animal bones, shells, marbles, a pipe bowl fragment, and kitchen utensils. Historic materials were primarily contained within two possible midden deposits near several large oak trees that date to the Heustis family occupation of the project area. Unfortunately, the integrity of the deposits has been compromised by subsequent fill operations and disturbances. Consequently, additional archaeological investigations are not expected to provide any additional information, and the Heustis family farmstead is not considered a significant archaeological resource. No further archaeological investigations are recommended.

25-2321 Ingham, Donna and Duncan Ritchie

2003 Intensive (Locational) Survey, Strawberry Fields Subdivision, Norton, Massachusetts. 67 pages.

The approximately 35 acre project area was located near a zone of 19th-century and modern residential development along South Worcester Street. Background research indicated that the project area had the potential to contain Native American archaeological sites given its proximity to the Wading River and several other previously recorded sites. The project area was also within a designated historic area (MHC Historic Area #NRT.C). A walkover survey of the project area identified zones of high and moderate archaeological sensitivity as well as low sensitivity areas altered

by a historic/modern period sand/gravel pit operation. Fifty-five, 50x50cm test pits were excavated within areas of high and moderate archaeological sensitivity. Test pits were distributed among two 30x30m sampling blocks, three linear transects, one test pit array, and at five judgmentally selected locations. One locus of Native American activity and two loci of Euro-American activity were identified. The Strawberry Fields Site consisted of a low-density distribution of Native American and Euro-American cultural material within an area measuring approximately 15x5m (75sq m). Three pieces of Native American cultural material, consisting of quartz and rhyolite chipping debris, were recovered, but no temporally diagnostic Native American artifact types or subsurface features were identified. Two of the three pieces of chipping debris are associated with a plowed stratigraphic context. It was unlikely that additional subsurface testing would generate new information and was not considered potentially significant. The Strawberry Fields Stone Retaining Wall is a low, arc-shaped dry-laid wall built of both rounded fieldstone and cut angular stone situated on the bank of the Wading River. The specific function and age of this feature is unknown; it may have been part of a boat landing used by occupants of a nearby farm or homestead during the 19th or 20th centuries. The retaining wall is located in a wetland buffer zone outside of proposed project impacts. The Strawberry Fields Stone Retaining Wall is of unknown specific function and age and was not considered potentially significant. The Strawberry Fields Boulder Quarry extended across an area of approximately 104sq m. It is not clear how the quarrying, which focused on a conglomerate glacial erratic boulder, was carried out. No drill marks were evident on the waste pieces and no tool fragments were recovered during subsurface testing. However, the quarry is similar to the type created by the small-scale extraction of stone for local use during the 19th and 20th centuries. The Strawberry Fields Boulder Quarry has provided evidence that the extraction of local stone for building material was an aspect of the past land use of the project area. None of the three sites will meet National Register of Historic Places criteria for significance. No further archaeological investigations are recommended.

25-2322 Herbster, Holly and Suzanne G. Cherau

2003 Summary Report, Intensive (Locational) Archaeological Survey, Hopkins Property, Aquinnah, Massachusetts. 31 pages.

This project included background research, a walkover survey, and subsurface testing to identify any potentially significant archaeological resources that may be affected by proposed residential development. The circa 1880 Ryan Estate (MHC GAY #22) is partially located within the project area but will not be impacted by the proposed project. A total of 18, 50x50cm test pits was excavated within the approximately 2.26 acre project area. No cultural materials or features were identified within the project area and no further testing was recommended.

25-2323 Herbster, Holly and Suzanne G. Cherau

2003 Intensive (Locational) Archaeological Survey, Holmes Property, Aquinnah, Massachusetts. 42 pages.

This project included background research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by residential development. A total of 30, 50x50cm test pits was excavated within the approximately 3.6 acre proposed project area. The intensive survey identified the Lot 165 Find Spot, consisting of quartz, Small Stemmed point and two pieces of quartz chipping debris collected within a 6.5sq m area above a small brook. While these cultural resources document the continuity of Native American land use in this section of Aquinnah, they are not potentially significant archaeological deposits, and no further testing was recommended.

25-2324 Binzen, Timothy and Jennifer Wendt

2003 Archaeological Reconnaissance and Intensive (Locational) Survey for the Big Alum Pond Sewer Development Project, Sturbridge, Massachusetts. 81 pages.

Twenty-two survey units were identified that possessed high sensitivity for archaeological resources. Although the pond is located to the north of an ancient Native American trail and is within a focal area of historic Nipmuc settlement, no Native American sites had been recorded previously in the vicinity of the pond. A total of 121 shovel test pits were excavated. Two pre-Contact Native American sites, the Mt. Dan Road Findspot and the Morgan Site, were identified on the west and east sides of the pond, respectively. The Mt. Dan Road Findspot consisted of a single piece of chert chipping debris, while the Morgan Site produced an argillite Small Stemmed projectile point and an argillite flake, providing evidence of a Native American occupation that occurred between 2000 and 4000 B.P. Because of the low density of artifacts and absence of subsurface features in the areas tested, no additional survey was recommended.

25-2325 Ingham, Donna and Duncan Ritchie

2002 Intensive (Locational) Archaeological Survey and Historic Resources Inventory, Symington-Talcott Estate, The Pinehills, Plymouth, Massachusetts. 63 pages.

In August 2002, a historic resources inventory and intensive (locational) archaeological survey of the 36-acre core of the Symington-Talcott Estate, currently under consideration for development as part of Phased Review Development (PRD): IV of the Pinehills community was completed. Seventeen resources were identified during the inventory of the estate. These resources include the standing structures on the property as well as features of the estate landscape such as Talcott Pond and the associated dam, causeway, and bridge. All architectural resources associated with the Symington-Talcott Estate within the project area were documented with photographs and field notes and recorded on a Massachusetts Historical Commission (MHC) Area inventory form. Historic resources associated with the Symington-Talcott Estate within the project area are collectively considered to be a potentially significant cultural resource and may be eligible for listing on the National and State Register of Historic Places. The intensive (locational) archaeological survey located one Euro-American archaeological site. A rectilinear depression marking the probable location of an outbuilding was designated the Symington-Talcott Estate Outbuilding Site. It was identified during a systematic walkover survey carried out to locate zones of archaeological sensitivity within the project area. This site was documented with photographs and a measured drawing, and investigated through subsurface testing. This site appears to contain limited information and is not considered to be a potentially significant resource. Subsurface testing within archaeologically sensitive sections of the Talcott Estate was done with a total of 76, 50x50cm test pits. These test pits were placed within two, 30x30m sampling blocks and along eight judgmentally placed transects and two array patterns. Five judgmental test pits were placed in specific locations. The survey located two Native American archaeological sites. A small find spot of Native American cultural material designated The Pinehills Locus 13 Site was identified from two pieces of quartz chipping debris. The Pinehills Locus 13 Site is located near the Eel River north of the Talcott Pond dam in a wooded area a short distance north of a fenced garden area and immediately west of the driveway to the estate. The Pinehills Locus 13 Site is of limited information content and will not meet National Register criteria for eligibility. The Talcott Site was found on the crest of a small knoll located directly south of the caretaker's house. This site was initially identified from 10 pieces of chipping debris (quartz, rhyolite) found in test pits along a judgmentally placed transect. One of the test pits in an array placed on this site yielded more than 43 additional pieces of quartz and rhyolite chipping debris and contained a section of a subsurface feature, designated Feature 1. A broken projectile point recovered nearby may be a basal fragment from a Late Woodland Period (ca. 1,000 to 450 years ago) Levanna projectile point. This tentative temporal association has the potential to be refined by submitting a sample of charred wood collected from Feature 1 for radiocarbon dating. The Talcott Site has the potential to contain additional information about the type and antiquity of Native American activity within the upper Eel River drainage and is considered to be a potentially significant cultural resource that may meet National Register criteria for eligibility. No further archaeological investigations of The Pinehills Locus 13 Site and the Sym-

ington-Talcott Estate Outbuilding Site are recommended. It is recommended that proposed development within the Symington-Talcott Estate avoid the Talcott Site. If avoidance is not possible additional archaeological investigation at the site examination level is recommended.

25-2326 Bechtel, Timothy and Felicia Kegel Bechtel

2001 Archaeological Geophysical Survey, Longfellow National Historic Site, Cambridge, Massachusetts. 20 pages.

The purpose of this survey was to identify colonial and 19th-century outbuilding foundations, fences, and activity areas across the full extent of the property. The property currently encompasses the Longfellow House (with attached Visitor Center), Carriage House/Barn, formal garden, grassy yards with shrubbery, and brick and gravel walkways. In accordance with the NPS RFQ, the geophysical survey employed electromagnetic (EM) terrain conductivity, magnetic (MAG), and ground penetrating radar (GPR) methods. The EM and MAG surveys were completed on November 8, 2001, and the GPR survey was begun on November 8 and completed on November 9, 2001. The EM terrain conductivity data display several extreme anomalies consistent with metallic targets. These include: a metal drain cover, light fixtures, metal curbing, electrical transformer, and utilities. The subtler targets are considered more likely to represent colonial or 19th-century features. These are concentrated northeast of the house (although small areas occur throughout the site). Similar anomalies along the west and north sides of the barn may be historic, but also coincide with areas where equipment and materials (potential sources of interference) are stored. The GPR survey revealed liner anomalies indicative of soil disturbance coinciding primarily with the brick walkways south of the house, walkways along the eastern walls of the house and Visitor Center, and utility trenches along the driveway. A strong anomaly is visible at the location of a reported “sinkhole” immediately adjacent to the northeast corner of the house. This anomaly could represent a filled shallow pit, cistern, or well in which the backfill is subsiding. In addition, scattered anomalies are more common throughout the site. These scattered anomalies could represent historic earth disturbances or features. Correlation of the anomalies from all of the data sets revealed the greatest disturbances to be associated with the Formal Garden, walkways east of the Visitor Center and House, the walkway from the front door of the house to Brattle Street, the driveway, the northwest corner of the house and the west and north sides of the barn. Although none of the anomalies follow simple geometric patterns that would warrant confident interpretation as outbuilding foundation remnants, they could represent outbuilding foundation anomalies overprinted with anomalies from other historical features or anomalies from known sources of interference.

25-2327 Herbster, Holly and Suzanne G. Cherau

2003 Intensive (Locational) Archaeological Survey and Data Recovery Program, Gerhard Site, Aquinnah, Massachusetts. 191 pages.

The archaeological investigations were completed in 1999 and 2000 within a 12,800sq ft (1,190sq m) residential construction impact area. A total of 61.75sq m was excavated within the impact area, resulting in a 5.1% sample of the Gerhard prehistoric archaeological site. Following the subsurface testing, machine-assisted stripping of the topsoil was completed to insure that no human burials were located within the project area. The archaeological investigations identified a high density of primarily quartz chipping debris associated with 21 pit, postmold, and shell midden features. While the shell midden deposits were not the dominant feature type within the site area, they contained large amounts of fish bone and moderate amounts of animal bone, including deer. Together, lithics, shell, and fish/animal bone comprised more than 97% of the 9,640 total artifacts recovered. Radiocarbon dating of two features associated the site with the early portion of the Late Woodland Period and the terminal Late Woodland/Contact Period. The site components, which included a small assemblage of Native American pottery and several historic period artifacts, generally supported the dating of the site. Small Stemmed projectile points dominated the chipped tool assemblage, numbering 34 of the 37 typed points collected at the site. A cluster of 12, Small

Stemmed points was collected in association with the terminal Late Woodland/Contact Period radiocarbon date, supporting interpretations that this point type is associated with later temporal deposits along the up-island coastline. The excavated portion of the Gerhard Site documented the use of both the exposed, rocky knoll and protected western terrace as activity areas within what is presumably a larger occupation area at Menemsha Pond, possibly including the nearby Herring Creek Archaeological District. The identified artifacts and features indicate that lithic tool making occurred, and that shellfish, finfish, mammals, and birds were stored, processed, and discarded onsite. It is also possible that the Gerhard Site, located on a high knoll with broad coastal views, was selected for ritual use within the up-island landscape of Martha's Vineyard.

25-2328 Robinson, David S., Ben Ford, Holly Herbster, and Joseph N. Waller

2003 Marine Archaeological Sensitivity Assessment, Cape Wind Energy Project, Nantucket Sound Massachusetts. 47 pages.

A marine archaeological sensitivity assessment for submerged prehistoric and historic cultural resources was conducted in Nantucket Sound within a 24sq mi area comprising the proposed impact area of the Cape Wind electrical energy generation facility located in both Federal and in Commonwealth waters within the corporate boundaries of Yarmouth and Mashpee, Massachusetts. The sensitivity assessment involved a review of existing project geophysical and geotechnical data, archaeological site files and technical reports, published information on the area's environmental, Native, and Euro-American histories, and shipwreck databases. Source information was synthesized to develop predictive models for prehistoric and historic archaeological resources that may be present within the offshore project area. The sensitivity assessment determined that the Cape Wind offshore study area has potential to contain both submerged prehistoric and historic cultural resources, although most of the study area has a low probability of containing contextually intact prehistoric cultural resources because of extensive post-marine transgression disturbances to the formerly exposed and inhabitable pre-inundation landscape. A marine archaeological reconnaissance survey of the offshore study area to identify targets with potential to be submerged historic cultural resources is recommended. Additional survey to further characterize the origin, nature, and extent of organic sediments observed in vibratory coring samples from the eastern edge of the study area is also recommended to further define the potential for Native American cultural resources to be present.

25-2329 Binzen, Timothy

2003 Archaeological Reconnaissance and Intensive (Locational) Survey For The Richardson Brook Area Sewer Project, Dracut, Massachusetts. 51 pages.

The proposed project consists of construction of approximately 9,140 linear feet of cross-country gravity sewer pipe. A total of 177 shovel test pits were excavated at locations along the cross-country routes that were attributed high sensitivity for archaeological resources. No Native American cultural materials were recovered. The testing produced a very low volume of historic artifacts. Several segments of stonewall were encountered throughout the project area, although plowzone deposits were infrequent. This suggested that the vicinity of upper Richardson Brook was used as woodlot during the historic period, with properties demarcated by stonewalls. Because the low density of artifacts and absence of subsurface features in the areas tested, no additional survey was recommended.

25-2330 Binzen, Timothy, Christopher L. Donta, and Niels Rinehart

2003 Archaeological Intensive (Locational) Survey For The Runway Reconstruction and Extension Project, Turners Falls Airport, Montague, Massachusetts. 82 pages.

A total of 210 shovel test pits (each measuring 50x50cm) were excavated at intervals of 7.5m (25ft) in areas of high sensitivity within the proposed limit of disturbance for the runway recon-

struction and extension project. The archaeological study area included approximately 29 acres of land and was divided into survey units located on the north and south sides of the eastern end of the existing runway, where slopes are to be reduced for safety reasons. Testing was also conducted beyond the eastern end of the runway, where plans call for the runway to be extended and the aircraft glide path improved. No subsurface features or potentially significant archaeological deposits were identified in Survey Units E3, S1, 8, and 9, located to the north, east and south of the east end of the runway. Testing could not be conducted in Survey Unit 7 because lack of landowner permission. In Survey Unit 6, the historic Stevens Site was tested. Located in the glide path beyond the eastern end of the runway, the site consists of a cellar hole with a stone foundation and artifact-bearing deposits dating to the late 19th century. Testing was conducted in Survey Unit 10, located on a long sand dune southeast of the eastern end of the runway. This survey unit was of particular interest because it was said to contain the main portion of the previously recorded Hannemann Paleoindian Site (19-FR-324). The site had not been subject to systematic, intensive testing prior to the present survey. Only the section of the site located within the proposed limit of disturbance for the runway extension project was tested. All excavated soils in Survey Unit 10 were fine-screened through 1/8-inch hardware mesh. In an area measuring 85x210ft (26x64m) atop the dune, four concentrations of jasper chipping debris were encountered during subsurface testing, and a yellow jasper side scraper was recovered. The artifacts appear consistent with the Paleoindian artifact assemblage in the Hannemann Collection, previously collected from the site, and they support the contention that a Paleoindian occupation occurred there. A typical soil profile in Survey Unit 10 consisted of a shallow topsoil stratum (A-1 Horizon) of dark gray-brown silty sand, encountered to a depth of 10cm below the ground surface. This overlay yellow-brown sand subsoil (B-1 Horizon) to a depth of 50cm. The B-1 Horizon soil in the survey unit is thought to have been formed from wind-blown sand during the Terminal Pleistocene. The majority of the jasper artifacts, as well as the side scraper, were recovered from B-1 Horizon soil at depths between 20cm and 50cm below the ground surface. Beneath the B-1 Horizon, yellow sand (C-Horizon) was recorded, which was interpreted as water-deposited Pleistocene sand. The Hannemann Site is considered highly significant and a site examination survey is planned to determine the dimensions of the site and to assist in site avoidance.

25-2331 Barker, F. Timothy, Timothy L. Binzen, and Jennifer Wendt

2003 Archaeological Reconnaissance Survey For The Phase 6 Area Sewer Improvements, Tewksbury, Massachusetts. 39 pages.

The reconnaissance assessed the archaeological sensitivity of seven cross-country sewer lines, totaling approximately 2,185 linear feet, and a pump station in the vicinity of Main Street/Route 38, east of the Shawsheen River between Hill Street and South Street. The proposed sewer lines are located in an area of residential and commercial development built up since the mid-20th century. Although the project area along the Shawsheen River and Main Street may formerly have possessed high potential for both pre-Contact Native American and historic archaeological sites, the degree of development in the project area has greatly reduced this potential. As a result, subsurface testing was not recommended.

25-2332 Mulholland, Mitchell

2003 Archaeological and Damage Assessment, Paxton Inn Parcel – 687 Main Street, Paxton, Massachusetts. 15 pages.

This report discusses the results of an archaeological (and damage) assessment on a historic parcel in Paxton. The parcel is the proposed location of a Country Bank for Savings (CBS) Branch bank. The site is located at 687 Pleasant Street and was once occupied by the former Paxton Inn and Tavern, also known locally as “The Old Inn”. In recent years, the building was a restaurant and lounge with a large modern addition. A fire consumed the entire structure in 2001. The remnants of the buildings were completely removed under order of the State Fire Marshall and the Department of Environmental Protection because of asbestos issues. Recently, construction was begun at

the site, but was interrupted in response to a letter from the Massachusetts Historical Commission requesting that all construction be halted. The MHC requested an archaeological assessment of the property. The parcel has undergone substantial physical damage, in its use as a modern restaurant and lounge complete with septic tanks, a large leach field and parking lots, as well as from recent construction. Much of the site was paved well before the fire. It is assumed that topsoil would have been removed prior to paving. Pavement has been removed from the site. Recent grading the site has removed as much of three feet of overburden and foundation stone. The graded soil has been bulldozed, loaded into dump trucks and re-deposited in the northeast portion of the parcel. The foundation of the inn appears to have been bulldozed. Given the extent of damage from 20th-century operations of the inn, and from recent construction, it is unlikely that intact, significant archaeological features exist. An archaeological survey of the property is not recommended.

25-2333 Binzen, Timothy L. and Jennifer Wendt

2003 Archaeological Reconnaissance and Intensive (Locational) Survey for Portions of the Route 3 South Transportation Improvements Project in Duxbury, Pembroke, and Weymouth, Massachusetts. 84 pages.

Testing was conducted along both the northbound and southbound highways, with archaeological survey units located in Weymouth, Pembroke, and Duxbury. Eight survey units possessing high sensitivity were tested. A total of 172 shovel test pits was excavated. The testing recorded the Rumbling Oak Native American Site in Pembroke and the Sideline Pine Native American Site in Duxbury. Both sites consisted of small concentrations of chipping debris resulting from the modification of stone implements. Because of the low density of artifacts, absence of subsurface features and degree of previous ground disturbance encountered at the sites, no additional survey was recommended. No potentially significant historic resources were encountered in the eight survey units, and no additional survey was recommended for the project as a whole.

25-2334 Whitney, Joannah L. and Jennifer Wendt

2003 Archaeological Site Reconnaissance and Intensive (Locational) Survey for Global Telecommunications Facility #MA216, Southwick, Massachusetts. 64 pages

Following background research and a surface reconnaissance, specific locations within the project area were tested for prehistoric and historic cultural resources. In all, 48 shovel test pits were excavated. Soil profiles in the test pits indicated culturally disturbed stratigraphy, with the top horizon typically a layer of fill or plowzone. One Native American artifact, a rhyolite flake, was recovered. Historic cultural artifacts encountered were consistent with debris associated with sheet composting of agricultural fields. No further survey is recommended.

25-2335 Ford, Ben and Duncan Ritchie

2003 Intensive (Locational) Archaeological Survey, Hill View Estates I & II, Grafton, Massachusetts. 92 pages.

The survey included background research, a walkover survey, archaeological sensitivity assessment, and subsurface testing. Background research indicated that the project area was within a general core area of Native American settlement centered on the Blackstone and Quinsigamond river drainages. During the early historic period, the vicinity of the Hill View Estates project area was part of the Native American community of Hassanamisco. A walkover survey and surface inspection indicated that the project area contained zones of high and moderate sensitivity for both Native American and historic period Euro-American cultural resources. Subsurface testing consisted of the excavation of 52, 50x50cm test pits, in one 30x30m block and along nine, linear, 10m interval transects. Ten judgmentally placed test pits were used to investigate specific locations. Test pits along transects were placed at 10m intervals. Two historic period archaeological sites were identified. The Hill View Estates Site consisted of a fieldstone pier found underneath the

plow zone in a pit or trench excavated into subsoil. The site was likely a field or outbuilding associated with the historic farmhouses located west of the project area. The second site, the Hill View Estates Wells Site, consisted of three fieldstone wells or retention basins in the wetland near the center of the project area. The wells appeared to control the flow of a stream through the wetlands and were likely associated with the use of the property as a dairy during the 19th and 20th centuries. No artifacts were recovered in direct association with any of the features. All of the artifacts recovered during the survey were historic/modern period items (ceramic sherds, glass, structural materials) discarded as "field trash" in the open pasture land within the project area. Neither the Hill View Estates nor Hill View Estates Wells sites would meet National Register of Historic Places criteria for significance. No further archaeological investigation was recommended.

25-2336 Shepley, Bulfinch, Richardson, and Abbot, Architects

1980 Lowell National Historical Park and Preservation District Cultural Resources Inventory, Lowell, Massachusetts. 184 pages.

Lowell is a city of 95,000 in northeastern Massachusetts, 30mi north of Boston and 3mi from the New Hampshire border. The city is built around the confluence of the Merrimack and Concord rivers. At the northern side of the city, the Merrimack traverses long rapids called Pawtucket Falls, before sweeping around a broad bend and receiving the waters of the Concord. Between the head of these rapids and the mouth of the Concord, the waters of the Merrimack drop 32ft. It was this fall of water that drew to Lowell the men, women, money, and technology to this country's first industrial city. Here for the first time agrarian America saw an entire town, and soon a major city spring up that drew its livelihood from large-scale, mechanized, highly organized manufacturing. Within a century after its bold beginnings in the 1820s, Lowell's industrial foundation was crumbling. The major corporations that had founded the city began to relocate or fail. Lowell entered the Great Depression several years before the country as a whole, and the city is still striving to regain full economic health. Within the last decade, however, there has been a renewed awareness of Lowell's significant role in American history, combined with a realization that the city's historical resources might become economic resources as well. The first step in the early 1970s was the development and broad acceptance of the concept that Lowell should establish an urban cultural park. This park would preserve Lowell's unique historic resource, and interpret the city's history to the nation. The city government made a firm commitment to the historic park concept, and since 1975 has spent more than $12 million on activities supportive of park-oriented revitalization. The Commonwealth of Massachusetts authorized the Lowell Heritage State Park in 1974 to help preserve Lowell's historic resources and develop public appreciation and enjoyment of those resources. Several private, public, and joint projects to rehabilitate and reuse historic buildings have been completed or are underway. In 1975 the Lowell Historic Canal District Commission was established by Congress to prepare a plan for the preservation and interpretation of Lowell's historic resources. The report of that commission, together with the cooperative efforts of the National Park Service (NPS), Paul Tsongas (first as a Congressman, then as a Senator), and the Department of the Interior, produced the legislation that was passed by Congress in 1978 and signed into law by President Carter. This law established a two-tiered federal involvement: the Lowell National Historical Park (LNHP or the Park), and the Lowell Historic Preservation District (LHPD or the District). Implementation of the legislative concepts requires a further process of careful planning, based upon a thorough knowledge of the specific historical resources included in the Park and the District. The Lowell Cultural Resources Inventory was commissioned by the National Park Service, North Atlantic Regional Office, Division of Cultural Resources and executed by Shepley Bulfinch Richardson and Abott, Inc. (SBRA) between March 1979 and January 1980. The information produced by the inventory will be used in Park and Preservation District planning, and is also available through local libraries to Lowell's citizens and visitors. This report is a summary and an initial interpretation of the inventory data.

25-2337 Waller, Joseph N. and Duncan Ritchie

2003 Archaeological Site Examination Memorial Park Locus 2 site, New Lawrence High School Project. Lawrence, Massachusetts. 64 pages.

This Native American site is located within the 32 acre project area for the New Lawrence High School in the city of Lawrence. An intensive (locational) archaeological survey of the project area completed in 2001 (see report #25-2172) resulted in the identification of the Memorial Park Locus 2 Site. The cultural material (untyped triangular projectile point, chert graver) found on the site in this survey indicated that it possibly contained late Paleoindian Period (ca. 9,500 years ago) and Late Archaic, Laurentian Tradition (ca. 5,500-4,000 years ago) components. The site was considered a potentially significant cultural resource. The site examination collected information about the size, complexity, condition, and temporal/cultural affiliation(s) of the site. Subsurface sampling during the site examination was done in several stages. Site boundaries and concentrations of cultural material were defined with 22, 50x50cm test pits placed within a 5m coordinate grid system. A backhoe was used to remove modern fill deposits covering intact subsoil horizons containing prehistoric cultural material in the central portion of the site. Two, 1x1m excavation units were opened to collect a larger sample of cultural material from this part of the site. The site examination established that the Memorial Park Locus 2 Site is a small, single component site contained within a 96sq m area. One portion along the southern boundary of the site appears to have been disturbed by modern activity, possibly from the construction of Memorial Park or improvements to Chickering Street. The assemblage of cultural materials retrieved from the site was primarily chert, rhyolite, and jasper chipping debris. Stone tools included utilized flakes, side and end scrapers and unifacial gravers made of chert. Many of these artifacts appear to have been thermally altered or treated. The tool types and lithic materials recovered from the site closely resemble those collected from documented Paleoindian sites in New England. A sample of charcoal collected from undisturbed subsoil in association with the artifacts yielded a radiocarbon date of 7480±40 B.P. (8380-8190 B.P. calibrated) (Beta-173479). This date confirms that the Memorial Park Locus 2 Site contains an early component likely to be associated with late Paleoindian to Early Archaic Period activity. The results of the site examination indicated that the Memorial Park Locus 2 Site was the result of a single occupation and has retained good spatial and stratigraphic integrity. Paleoindian sites in southern New England are extremely rare and limited to a few isolated examples. The Memorial Park Locus 2 Site is considered a potentially significant archaeological property and may be eligible for listing in both the State and National Registers of Historic Places. It is recommended that this important resource be avoided and preserved in place through redesign of proposed development for the New Lawrence High School project. If avoidance of the Memorial Park Locus 2 Site is not feasible, a data recovery program should be developed.

25-2338 Donta, Christopher

2002 Site Examination Archaeological Survey of the Fox Run-2 (19-BN-285) and Fox Run-4 (19-BN-287) Native American Sites and an Intensive (Locational) Survey of an adjacent parcel in Mashpee, Massachusetts. 47 pages.

The Fox Run-2 site was investigated with 44 STPs and two 1x1m units, producing 63 Native American artifacts, including one projectile point fragment, 44 lithic flakes, and 18 pieces of fire-cracked rock. No features were found. What remains is a low-density lithic scatter, with areas of moderate to high density, found in the plow zone and in the upper part of the undisturbed subsoil. Because no temporally diagnostic artifacts were collected, it is not possible to know the site's date. The site may represent the location of occasional seasonal camps, but does not appear to have ever been intensively used. The Fox Run-4 site excavations consisted of 48 STPs, two 50cmx1m units, and three 1x1m units, producing 1,012 Native American artifacts, including Small Stemmed, Rossville, Greene, Orient, and Levanna projectile points, one other bifacial tool, 20 ceramic sherds, 1 rolled copper bead, 204 waste flakes, and 781 pieces of fire-cracked rock. The Fox Run-4 artifacts were distributed in three loci. One possible house foundation feature was found in the northern locus in association with historic and Native American artifacts and a deposit of shell. No features were found in the southern or central loci. The Fox Run-4 site represents the location of multiple activities over a several thousand-year period. Based on the moderate density of artifacts

over several different loci, the site was probably used for seasonal or temporary camps. The Fox Fun-2 and Fox Run-4 sites are part of a cluster of sites known within the Quaker Run drainage. Fox Run-4 is a large site, similar in content to Fox Run-3, which was explored in previous surveys. Fox Run-2 is smaller, and probably peripheral to the central site area. All three of these sites may be, in fact, one large site that was occupied several times over several millennia. Information recovered from the sites have provided substantial information on Native American lifeways of the late pre-Contact period, including data on tool manufacture, settlement patterns, trade, burial practices, and diet. No further survey is recommended for the Fox-Run-2 site. There is no construction proposed for the Fox Run-4 site, Locus 3 (northern locus) area; it should be avoided by any future construction. For Locus 2 and Locus 1, construction methods should avoid any impact to subsurface archaeological resources. For the area west of the Fox Run-4 site that was surveyed at the intensive survey level, no further survey is recommended.

25-2339 Doucette, Dianna Lee

2003 Unraveling Middle Archaic Expressions: A Multidisciplinary Approach Towards Feature and Material Culture Recognition in Southeastern New England. Carver, Massachusetts. 395 pages.

This dissertation focuses on more accurately recognizing the peoples of the Early and Middle Archaic period (9000 to 6000 BP), who have been underrepresented in the archaeological literature, in southeastern Massachusetts. A multidisciplinary approach is used, including the techniques of soil micromorphology and geochemical analysis to examine the nature and function of red pit features, and a reevaluation of stone tool technology to recognize associated components. This research suggests that a more extensive population than originally believed existed in southeastern Massachusetts during the Early and Middle Archaic period is clearly present during the Middle Archaic period. Red ochre burials, quartz technology, and a variety of chipped and ground stone tools that have hitherto been assigned to the Late Archaic period are clearly present during the Middle Archaic period. Although recognition of burial pits is difficult, it is a very important process towards looking at cultural continuity, bringing the past back to life, and recognizing traditional and ceremonial practices that need to be treated with respect. Likewise, a reevaluation of artifact types assigned to this time period is also very important in order to help recognize certain cultural traditions based on tool types that are most often the only surviving evidence of the past. Finally, it is important to make connections with similar sites within a single drainage basin. Data from the Annasnappet Pond Site within the Taunton River drainage basin are used as the basis of this dissertation. Annasnappet Pond has yielded the largest collection of Middle Archaic cultural material in association with radiocarbon-dated features. At this site, a Middle Archaic burial was identified consisting of cremated human bone, red ocher, ground stone atlatl weights, and Neville projectile points in a deep pit feature. The positive identification of this feature as a burial brought to light the fact that many of the red pit features identified on Archaic sites (ca. 9000 to 3,000 years ago) that do not contain human bone or contain very little unidentified burned bone, could be remnants of human burials. Micromorphology and geochemical analysis demonstrate that red ochre can be detected in these pits, which may in turn, suggest a ceremonial function.

25-2340 Dunford, Frederick

2001 Ceramic Style and the Late Woodland Period (1000-400 BP) Sachemships of Cape Cod, Massachusetts. 146 pages.

Ethnohistoric accounts and Plymouth Colony court records support the idea that territorially, socially, and politically distinct communities existed along the shoreline of Cape Cod during the 17th century. The archaeological record of Cape Cod, Massachusetts supports the concept of the development of conditionally sedentary, territorial communities at the major estuaries after 2000 B.P. Following Bragdon (1996) I suggest that a sachemship was an “on-going and organic social grouping” created both by the agency of households and the strategies of sachems. Because a sachemship consisted of both the sachem’s kin and others who actively supported his political ambi-

tion, I argue that the relationship between households and sachems was permeated with he expectations and obligations of kinship. Following Blanton (1995) I propose that within each sachemship households acted to achieve and maintain social status by actively emulating the household practices of a sachem and members of his lineage (related households). In effect, emulation was an active strategy of affiliation. The emulation of household practices would have included forming, shaping, and decorating ceramic vessels in a manner consistent with the women of the sachem's household and lineage. Therefore, I expect that there should be strong concordance of ceramic style within each sachemship and considerable variability between sachemships. In this manner then, the creation of ceramic style within the Late Woodland sachemships of Cape Cod was exceptionally localized and historically contingent. To evaluate this proposal I compared the decorative attributes of 161 Late Woodland vessel lots from two historically recorded sachemships on the outer Cape. The results indicate that two kinds of shell-tempered vessels were created in the sachemships of the Cape during the Late Woodland period. Simply decorated and cord-marked vessels were produced for daily household use. In addition carefully made, elaborately decorated vessels were made for use in the public feasts that deepened the attachment of households and sachems. The latter category of ceramic vessels provides the greatest possibility for examining ceramic design variability as it pertains to the creation of social identity.

25-2341 Cox, J. Lee, Jr.

2001 Documentation of Derelict Vessels at Melville Shipyard, New Bedford Harbor Superfund Site, Bristol County, Massachusetts. 137 pages.

The U.S. Environmental Protection Agency (EPA) has contracted with the U.S. Army Corps of Engineers (USACE) to undertake remediation of the New Bedford Harbor Superfund Site located in Bristol County. As part of that remediation a confined disposal facility (CDF) for contaminated sediments will be constructed at a location that overlaps the site of the former Mellville Shipyard. Previous maritime archaeological investigations for the New Bedford Harbor Superfund project identified a number of derelict and abandoned vessels at the former Melville Shipyard. This report presents supplemental documentation of those vessels and evaluates their significance in terms of National Register of Historic Places eligibility criteria. It concludes that none of the vessels satisfy NRHP criteria.

25-2342 Kellogg, Douglas C. and Joel I. Klein

2001 Stage IB Archeological Survey of "Early Action" Area 2, New Bedford Harbor Superfund Site, New Bedford, Massachusetts. 46 pages.

The objective of the archaeological survey was to determine if cultural resources are present within the area of potential effect associated with Early Action Area 2, encompassing approximately 1.1 acres near the head of New Bedford Harbor. Sediments with high levels of contaminants will be temporarily fenced to limit public access and subsequently removed from the intertidal portion of the survey area, which included the margins of the contaminated zone that may be affected by sediment removal activities. Nineteen shovel test units, approximately 45cm in diameter, were excavated across the dry land portions of the survey area at 8-10m intervals. Three bucket auger holes, 10cm in diameter, were excavated in the intertidal portion of the survey area and the intertidal zone was inspected visually. No potentially significant cultural resources were identified in the survey area. No further archeological investigations are recommended.

25-2343 Cox, J. Lee, Jr.

2001 Supplemental Underwater Archeological Investigations at Two Remote Sensing Targets, New Bedford Harbor Superfund Site, New Bedford, Massachusetts. 25 pages.

This report describes the results of supplemental underwater archaeological investigations at two previously identified remote-sensing targets in New Bedford Harbor. Tasks performed included:

development of a dive safety work plan; target specific magnetometer surveys to re-acquire and refine the boundaries of the two magnetic anomalies; and a diving investigation to identify the nature of the material that generated the magnetic anomalies. The purpose of these investigations was to identify the sources of the two remote sensing signatures and evaluate each according to criteria established for inclusion in the National Register of Historic Places. Divers found modern debris-related objects at each of the target locations. No additional underwater archeological investigation is recommended at either target location.

25-2344 Kellogg, Douglas C. and Joel I. Klein

2001 Stage IB Archeological Pilot Study, New Bedford Harbor Superfund Site, Bristol County, Massachusetts. 56 pages.

A pilot study for archeological survey of the intertidal zone was conducted in three locations within the town of Acushnet. Shovel excavations (60cm diameter) were augmented with bucket auger (10cm) and clamshell-type posthole digger (15cm) excavations spaced from 8–12m. No intact archaeological remains were identified in a proposed cable right-of-way included in the pilot study. No further archaeological investigations of the cable right-of-way are recommended. No archaeological deposits are present on the intertidal shore of the Lawson Site (19-BR-378). Only a reconnaissance of the third area was conducted with no subsurface investigations. Shovel excavations are possible on the upper intertidal shore; however, they are ineffective in peat or water-saturated sediments. Archaeological excavation on the lower portion of the intertidal zone is not feasible. Future archaeological survey in the project area should be targeted at areas where preservation potential is high based on shoreline reconstructions.

25-2345 Kellogg, Douglas C. and Joel I. Klein

2001 Stage IB Archeological Survey of “Early Action” Area 1, New Bedford Harbor Superfund Site, Acushnet, Massachusetts. 36 pages.

The objective of the archaeological survey was to determine if cultural resources are present within the area of potential effect associated with Early Action Area 1, encompassing approximately 0.8 acres near the head of New Bedford Harbor. Sediments with high levels of contaminants will be removed from the intertidal portion of the survey area, which included the margins of the contaminated zone that may be affected by sediment removal activities. Thirty shovel test units, approximately 45cm in diameter, were excavated across the dry land portions of the survey area at 8–10m intervals. Six bucket auger holes, 10cm in diameter, were excavated in the intertidal portion of the survey area and the entire intertidal zone was inspected visually. Supplemental background research was conducted to corroborate information supplied by one of the landowners. No potentially significant cultural resources were identified in the survey area. No further archeological investigations are recommended.

25-2346 Cox, J. Lee, Jr.

2000 (revised 2001) Underwater Archeological Remote Sensing Survey, New Bedford Harbor Superfund Site, New Bedford, Massachusetts. 49 pages.

This report describes the results of an underwater archaeological remote sensing survey carried out for the New Bedford Harbor Superfund Project in the towns of New Bedford, Fairhaven, and Acushnet. Tasks performed included a review of documentary and background research; development of a maritime historical overview of New Bedford Harbor; and magnetic and acoustic remote sensing of portions of the Upper, Lower, and Outer harbors with follow-up target analysis. In addition, seismic (sub-bottom) and bathymetric data were collected during fieldwork activities. The purpose of these investigations was to determine the presence or absence of submerged cultural resources potentially eligible for the National Register of Historic Places that might be affected by dredging to remove contaminated sediments. Analysis of the remote sensing data identi-

fied 60 magnetic and/or acoustic targets. The vast majority of the targets appear to be related to isolated, single source objects, modern debris, or shoreline-related objects. Two of the remote sensing targets are suggestive of submerged cultural resources. If avoidance at these two target locations is not possible, additional underwater archeological investigation is recommended.

25-2347 Fitts, Robert K., Robert G. Kingsley, Douglas C. Kellogg, and Joel I. Klein

2000 Archeological Background Study and Sensitivity Analysis, New Bedford Harbor Superfund Site, New Bedford, Massachusetts. 75 pages.

This report discusses the terrestrial archaeological sensitivity of the project area. Most of the current New Bedford shoreline has been created by landfill in the late-19th and early-20th centuries. As a result, there are only a few portions of the western bank of the Acushnet River within the project area that are likely to contain archaeological resources. Furthermore, most of the western shoreline that was not created by landfill has been heavily developed, making it unlikely that significant archaeological resources have survived except in a few limited areas. Except for the few areas containing wharves and structures built directly on the shoreline, the entire length of the eastern (Acushnet/Fairhaven) shore of the Acushnet River is sensitive for prehistoric archaeological resources. Especially sensitive is the area lying on the coast between Lacuyers Lane (Acushnet) and Veranda Avenue (Fairhaven) where the Archaic-period Lawson Site is known to exist. Two of the five islands (Palmer and Crow) within the project area also have the potential to contain prehistoric archaeological resources.

25-2348 Lackey, Louanna

1984 Landscape Archaeology at the Springfield Armory. Springfield, Massachusetts. 26 pages.

The Springfield Armory National Historic Site, in Springfield, Massachusetts includes a visitors' center, a museum, and administrative offices of the National Park Service. Before utility lines projected for construction in 1987 could be laid, an archaeological and historic survey was required in order to establish the extent of the remaining archaeological resources of the historic site and to assess the impact of the proposed new drainage system on those resources. Archaeological investigations were conducted at the Armory site during July 1984, by a team of six archaeologists working under the cooperative agreement between The American University and the National Park Service. The initial phase of the project was designed to discover as much as possible about the prehistoric, historic, and ethnohistoric background of the site through archival and other historic records in order to determine the most fruitful possible locations for archaeological excavations. Land ownership and land use through time were established in order to discover when and where any house or other structural foundations had been located, in order to optimize both the recovery of artifactual evidence and its interpretation. In addition to this archival research, a ground penetrating radar survey was conducted for both prehistoric and historic archaeological resources. Both approaches proved productive and were used to indicate where the 12, 5x5ft excavation units and 74 shovel test pits should be placed.

25-2349 Mahlstedt, Thomas F. and Lauren Cook

2003 Granite Railway Quarry: Archaeological Inventory Evaluation of Significance, Impacts and Preservation Recommendations. Vol. 1 Phase II Project: Stage I Report; Vol. 2 Phase II Project: Stage I Report, Existing Conditions, Photographic Record; Vol. 3 Phase II: Stage 1 & 2; Vol. 4 Phase II: Stages 1 & 2, Photographic Record of Existing Conditions. Quincy, Massachusetts. 408 pages.

This report is the culmination of a process that began in earnest in 1998 when the Metropolitan District Commission (MDC) was directed through legislation to dewater the Granite Railway Quarry (GRQ), in West Quincy. The MDC undertook an inventory of the quarries of West Quincy and of the Quincy Quarries Historic Site (Appendix C) to provide context and help determine the

relative significance of GRQ. This was followed by an in-house evaluation of the existing conditions and creation of a preliminary management plan that looked at the various options that the Commission faced with an open pit of 275ft. It also looked to the future of GRQ in the broader sense of the Quincy Quarries Historic Site, which combined or otherwise linked the many surviving elements of Quincy's once prominent granite quarrying industry (Appendix D). By mid 2000 the Department of Environmental Protection (DEP) and the Executive Office of Environmental Affairs (EOEA) had ordered the MDC to commence filling GRQ. In its review of the proposed filling the Massachusetts Historical Commission (MHC) noted that it was a contributing element to the Quincy and/or Blue Hills National Register Multiple Resource Areas. In order that the project would not have an adverse affect on GRQ the MHC outlined four conditions that had to be met. This document reports the results of one of those conditions: "archaeological inventory and evaluation of significance" and also offers recommendations for preserving as many of the surviving historic resources as possible during the course of the Quarry's filling. This final report combines data from the west and north sides of GRQ and represents the finished product of the archaeological survey. A total of 123 artifacts and features related to GRQ's 117-year history of quarrying was inventoried. It was found that many of these artifacts and features were inextricably related to one another in time, space, and function: these were classified as feature systems. Fifteen feature systems were identified around the perimeter of the quarry. Each artifact and feature was evaluated for significance based on a series of standard criteria. Of the 123 artifacts/features inventoried, 38 were classified as significant, 62 were considered contributing, 13 were not significant, and 4 were a combination of contributing and not significant. In addition, it is suggested that GRQ is eligible for listing to the National Register of Historic Places based on Criteria A and B. Based on their significance and threat of impacts to the archaeological resources from the filling operations recommendations were made regarding their treatment including preservation in situ, preserve and return to original position, preserve in protection zone and relocate in park, no preservation necessary. A total of 13 historic archaeological features of the Granite Railway Quarry have been impacted by this project or by exposure to the elements. Eight of these were classified as significant: the quarries themselves, a large grout wall, a retaining wall, a portion of the causeway and grout fingers, and a mortared pipe pylon. Five features were impacted that were classified as contributing. Considered within the context of the entire archaeological survey, which inventoried 123 artifacts and features, the loss of 13 artifacts/features (11% of the total inventory), means that 89% of the archaeological resources of Granite Railway Quarry have been preserved and are largely unaffected by the project, or will be otherwise retained as part of the future park. This report is intended to help mitigate the loss of one of the most historically significant granite quarries in New England. The large format photographic record, of HABS/HAER quality, that accompanies this report as Volume 4 preserves how the quarry looked at the time of its filling. While it was not possible to preserve the most significant components of the Granite Railway Quarry i.e., the quarries themselves, the images and the detailed descriptions provided as part of this study, preserve an important body of information. It also documents the ensemble of surviving archaeological features that combine to make a significant industrial landscape.

25-2350 Smith, Leith

2003 Revised Archaeological Reconnaissance Survey, Baker Square Condominium Project, Dorchester Lower Mills, Dorchester, Massachusetts. 14 pages.

A reconnaissance survey was conducted for the entire 7.1 acre parcel, which borders the Neponset River. The project area is located within the Dorchester-Milton Lower Mills Industrial District, listed in the State and National Registers of Historic Places. Documentary research and two site walkovers were conducted. The survey found that the wider, east half of the Baker Square Project area was intensively occupied and utilized from the earliest period of European colonization to the present. Native American groups for many millennia before European arrival may have also inhabited it. The site is especially known for its industrial development because of the availability of easily exploitable waterpower at the upper dam of the Lower Falls. Continued improvement of mills over time resulted in the steady destruction of both early mill and domestic sites. The expansive building effort by the Baker Chocolate Company that began in 1891 and ended in the 1930s is responsible for the

complete removal of, or severe impact to, all archaeological properties that may have been present on the parcel. As a result, the archaeological sensitivity for the project parcel as a whole is low to extremely low. One exception to this finding is a small area of riverbank and narrow flood plain at the west end of the property adjacent to the Central Avenue Bridge. This small portion of the project area appears to maintain physical integrity and has the potential to contain Native American archaeological resources. Due to the steepness of the river bank and the close proximity to the river, however, this area is judged to have moderate to low potential for Native American archaeological remains and low or no potential for historic period remains. This small portion of the project parcel lies outside the construction impact zone and therefore will not be disturbed by the proposed construction and rehabilitation of the Baker Square Project area. Due to the high level of disturbance to the Baker Square Project area, and its lack of integrity no further archaeological investigation is recommended.

25-2351 Griswold, William and William Cooney

2002 Management Summary: Intensive Archaeological Testing at the Chestnut Hill Meeting House, Blackstone River Valley National Heritage Corridor, Millville, Massachusetts. 29 pages.

Archaeological excavations were undertaken at the Chestnut Hill Meeting House (1769) in Millville. These excavations concentrated on the northwest corner of the building. Five square meters of area were exposed during the subsurface archeological testing (3, 1x1m units and 4, 0.5x1m units). Archaeological excavations uncovered parts of the building foundation, the stone fill for a retaining wall along the street, and a posthole and postmold possibly related to a hitching post. Other than nails and window glass fragments, few artifacts were recovered. No human remains were discovered. These excavations demonstrated that the installation of a concrete pier under the northwest corner of the building would not have an adverse impact on the archaeological deposits.

25-2352 Griswold, William

2001 Supplementary Excavations at the Kirk Street Agents' House, Lowell National Historical Park, Lowell, Massachusetts. 113 pages.

This report presents a brief summary of the 2001 archaeological investigations conducted at the Kirk Street Agents' House (KSAH), Lowell National Historical Park (LOWE). The Kirk Street Agent's House had been the subject of previous archaeological investigations (see report #25-818) in 1987. The proposed construction would destroy the archaeological deposits below the ramp. It was also expected to impact areas immediately adjacent to the proposed construction footprint. Excavations revealed the original ground surface of the area, foundation trenches for the construction of the basement walls, part of the wall of the missing ell, granite supports for the porch, an early drain connected with the house, a few mid-late 19th-century deposits, and various post 1920s deposits and features. Only a few deposits were found dating to the period of the mill agents. Discovery of the partially extant foundation wall of the missing ell necessitated redesigning the accessibility ramp and porch. The redesigned ramp will impact only disturbed deposits resulting from the filling of the missing ell in the 1920s.

25-2353 Dudek, Martin, Joyce Clements, Elena Decima, and Chris Edens

2002 Archaeological Site Examination and Data Recovery Project at the Mackin Sand Bank Site. Greenfield, Massachusetts. Four volumes, 958 pages.

The Mackin Sand Bank Site (19-FR-12) is located in the National Register Riverside Archaeological District on a basalt ridge and glacial outwash terrace overlooking the Connecticut River. The site examination consisted of 788 shovel test pits and 14 excavation units distributed in three zones along the basalt ridge (Area A) and across a large outwash plain (Areas B and C). At Area A, which was heavily impacted by pot hunting, testing recovered scatters of chipped stone (1,311 pieces) including a Stark point and 25 Woodland pottery sherds. Area B had minimal disturbance; testing defined 29 distinct clusters of chipped stone (over 3,300 pieces), pottery (over 170 sherds),

and several rough stone artifacts. Diagnostic bifaces include a bifurcate base, several Nevilles and Starks, an Atlantic, an Adena-like blade, a Large Triangle, an untyped lanceolate, and an untyped triangle. Most sherds were assignable to the Middle Woodland. Area C was commercially stripped, but contained a cluster of 13 truncated prehistoric pit features, some over a meter deep, containing dense conifer charcoal and with other botanical remains, but few artifacts (debitage, biface fragments, sherds, a tubular copper bead). Radiocarbon dates of 2040±70 B.P. and 1965±70 B.P. came from two of 13 sampled pit features. A data recovery (1996) was executed for five of 29 clusters in Area B and for the Area C features. Data recovery consisted of 48, 1m units in Area B, with a total recovery of 18,900 pieces chipped stone, 755 pottery sherds, 11 ground or rough stone artifacts (including and adze and a gorget fragment), and 163 calcined bones. Twenty-five features plus more soil anomalies were encountered, including probable postmolds. Radiocarbon dates included 4000±90 B.P. from a deep postmold, 2860±95 B.P. from a large midden pit, 1375±75 B.P. from a small midden pit, and 235±70 B.P. from a small pit. Diagnostic tools included two Nevilles, a Stark, a Vosburg blade, a Susquehanna Broad, a Woodland Stemmed, and an untyped triangle. Most of the pottery was assignable to the Middle Woodland based on fabric and decoration. A total of 51, 2x2m units were cleaned and mapped at Area C, revealing a loss of about 75% of the features uncovered in 1993. Four new features were identified. Five pit features and two anomalies were sampled yielding hundreds of charred seed (94% Rubus), 284 pieces chipped stone, six pottery sherds, a rolled tubular copper bead, one grooved/notched stone, and a calcined bone fragment from features, and a drilled pendant near the features. Four pit features yielded radiocarbon dates of 2255±125 B.P., 2160±90 B.P., 1865±75 B.P., and 1900±80 B.P. One anomalous feature contained a copper bead, charcoal, and unburned wood, with radiocarbon dates on charcoal of 5305±115 B.P. and modern, less than 200 C14 years B.P. Special analyses included faunal, botanical, lithic use wear, quartzite and chert sourcing, and pottery lot analyses. Site interpretation focused on the chronology of the sand bank, with components spanning early Archaic through Late Woodland. The data recovery revealed a Middle Archaic chert workshop camp, two Late Archaic quartzite workshop camps, an early Woodland midden pit with calcined snake, canid, and small mammal bone, four Middle Woodland camps (one recurrent), and a limited Late Woodland and historic Native American presence. Area C, containing numerous pit features dating between 2255 and 1865 B.P. included smoky fires with hundreds of charred Rubus (blackberry/raspberry) seeds. While smoke drying of berries seems represented, ornamental artifacts, a scarcity of typical habitation refuse, and the similar recurrent use of this small area over a 300-year period suggest that this area had communal significance and restricted, if not social and/or ceremonial, use. The research potential for investigating possible two-thousand-year-old Rubus horticulture is advanced.

25-2354 Cherau, Suzanne

2004 Archaeological Reconnaissance, Greenbush Line Rail Restoration Project, 60 and 90 Percent Design Completion, Braintree, Weymouth, Cohasset, Hingham, and Scituate, Massachusetts. 209 pages.

From October 2002 to September 2003 archaeologists conducted an archaeological reconnaissance survey of all new project design elements included in the 60 to 90 percent plans for the Greenbush Line Project Area of Potential Effect. These work areas are situated within and outside of the 18mi railroad right-of-way in the towns of Braintree, Weymouth, Hingham, Cohasset, and Scituate. The design plans include major categories of below-ground project elements that have the potential to impact previously unidentified archaeological resources. The archaeological reconnaissance survey involved a review of the project design package plans and specifications, geotechnical data including soil borings and test pits, literature, maps and previous historic and archaeological studies for the Greenbush Line Project (see reports #25-2248, #25-2249, #25-2250), as well as site visits to verify existing conditions. These tasks resulted in an assessment of the archaeological sensitivity of the current project areas where ground disturbances will occur and an identification of which archaeologically sensitive areas warrant subsurface testing as part of an intensive (locational) survey. Three sections of the railroad ROW in Hingham, Cohasset, and Scituate are assessed as having moderate to high archaeological sensitivity for prehistoric period resources. Two work areas

outside of the railroad ROW are assessed as having moderate to high archaeological sensitivity for prehistoric period resources. A wetland mitigation area in Weymouth may also contain archaeologically sensitive areas for prehistoric and historic period resources. Intensive (locational) archaeological surveys are recommended for each of these work areas to locate and identify any potentially significant archaeological deposits that could be impacted by the project. Sections of the Town Brook Culvert work areas in Hingham are assessed as having the potential to contain deep prehistoric and historic period archaeological features including unmarked burials. Archaeological monitoring of the construction activities below 4-5ft in these work areas is recommended to ensure that the proposed culvert and pump station excavations do not disturb any intact potentially significant archaeological deposits. The current survey does not include several of the new driveways and street intersection project design elements that have not advanced beyond 20 percent. These outstanding project work areas will be reviewed for archaeological sensitivity once each has advanced to 60% design. The current survey also does not include any landscaping on private property in the towns of Weymouth, Hingham, Cohasset, and Scituate. These proposed landscaping areas will be reviewed for archaeological sensitivity once each has been finalized in terms of the landscaping design authorized by the individual property owners. Additionally, in accordance with the PA, Stipulation XIII — Protection of Archaeological Resources, archaeological surveys will be undertaken as needed for any changes to project design elements included in this report as they advance to 90% completion and actual construction.

25-2355 Mahlstedt, Thomas

2002 Archaeological Monitoring for Proposed Dry Well Installation, Administration Building, Walter Baker Chocolate Company, Dorchester, Massachusetts. 14 pages.

The project involved the archaeological monitoring of machine excavated percolation tests at the former Walter Baker Chocolate Company Administration Building. Since there was concern about potential impacts to Native American resources, which were known to exist in close proximity to the falls, DEM worked closely with the design engineers for the drainage system. It was determined that the percolation tests would be excavated to a maximum depth of 6ft below existing grade within that part of the property that exhibits the greatest amount of fill, thereby retaining over 5ft of fill between the bottom of the test and the bedrock. Thus, in theory, a buffer of several feet remains over deeply buried, naturally developed soils that could contain prehistoric archaeological resources. Two machine excavated percolation test trenches were excavated in the southeast corner of the lot and measured approximately 3.5m long by 2.5m wide and a little less than 2m deep. The two trenches revealed a modest array of historic materials throughout the entire 3m depths to which they were excavated. Significantly, all of the materials were contained within various layers of fill, and none of the archaeological materials were in their original position; everything had been brought there or otherwise dumped there as fill. Archaeological monitoring of the percolation trenches determined that significant archaeological resources do not exist in the southeast portion of the yard where the dry wells will be installed.

25-2356 Smith, Leith

2001 Archaeological Contingency Response Summary Report, Contract Area C09C4, Section 19-4, Railroad Depot Loading Dock, Boston, Massachusetts. 15 pages.

On the morning of August 21st, 2001, soil removal activities in Section 19-4 of Contract Area C09C4 revealed architectural archaeological remains that were observed by CA/T staff. In situ architectural remains were observed to extend out of the west embankment between three and four meters below the level of the I-90-I-93 ramp. These included what appeared to be stone and brick foundation walls and cement flooring. An asphalt surface overlying a pavement of Belgian block was present immediately above the walls and was visible in the profile of the soil embankment. After the wall was recorded, a backhoe was used to pierce the concrete floor to explore the sediments below. Additional dark gray brown fill with gravel, architectural debris and round wood timber fragments, some with wooden pegs, were present over a layer of peat. Boston blue clay was

encountered below the peat. The backhoe excavation extended approximately 3m, but due to extremely wet conditions elevations of the peat and blue clay could not be determined. The site consists of several layers of urban fill overlying early 19th-century fill used to create dry land in the South Cove area. The stone- and brick-walled foundations are believed to be associated with an extensive railroad freight depot that was constructed in the second quarter of the 19th century after filling of the South Cove was complete. The project area was backfilled after the site visit.

25-2357 Smith, Leith

2001 Archaeological Contingency Response Summary Report, Contract Area 17A6, Section 23-D, Storage Safe from Kingston Street/Edinborough Street Loop, Boston, Massachusetts, 25 pages.

A large iron storage box or safe was revealed during surface preparation activities of the Central Artery/Tunnel Project in downtown Boston. The safe was constructed of sheet steel with steel angle framing that reinforced edges and panels. Cast iron brackets for casters were bolted to each bottom corner. The safe measured 3ft 3in high, 3ft wide and 2ft deep. The safe was found in a deposit of demolition rubble consisting of brick, mortar, plaster, electrical cable and yellow roadbed sand that was filling the upper portion of a cellar. The cellar formerly belonged to the building at 140-16 Edinborough Street, which was probably demolished at the time the elevated artery was constructed between 1954 and 1959. The safe was determined not to represent a significant archaeological resource due to its early to mid 20th-century date. Opening of the safe revealed the remaining cabinetwork including shelves and draws. No other objects were found. Careful inspection of the safe's exterior as well as all parts of the locking mechanism revealed no marker's marks. As a result, it is not possible to determine the construction date more precisely than the late 19th to first half of the 20th centuries. The safe was discarded upon completion of the examination.

25-2358 Adams, Virginia, Suzanne Cherau, and Matthew Kierstead

Massachusetts Army National Guard Integrated Cultural Resources Management Plan. 2 volumes, 488 pages.

Department of Defense (DoD) Instruction 4715.3 and AR 200-4 require installations to develop an Integrated Cultural Resources Management Plan (ICRMP) as an internal compliance and management tool that integrates the entirety of the cultural resources program with ongoing mission activities. This document presents the Massachusetts Army National Guard (MAARNG) ICRMP and is designed in accordance with (IAW) Army Regulation (AR) 200-4 and Department of the Army (DA) Pamphlet (PAM) 200-4 to support the military mission and meet legal compliance requirements of federal historic preservation laws and regulations in a manner consistent with the sound principles of cultural resources stewardship. This MAARNG ICRMP references 66 facilities statewide that are currently under MAARNG control. The ICRMP enhances readiness capabilities by anticipating impacts to training from cultural resources management activities, and providing reasonable procedures and alternatives. In addition, the ICRMP establishes priorities for the identification and standards for the evaluation of archaeological and historic architectural properties on MAARNG facilities, sets forth Standard Operating Procedures (SOPs) and provides a schedule to accomplish program objectives during a five-year program, from 2002—2007. The plan describes requirements for economic analyses prior to demolition of historic properties, public information and Native American coordination, and the budget process.

25-2359 Mulholland, Mitchell, Timothy Binzen, Christopher Donta, Joan Rockwell, and Heli Meltsner

2002 DEM Cultural Resource Inventory Pilot Project: Five Massachusetts Forests and Parks, Multi-town. 251 pages.

Facilities that were studied included Mohawk Trail State Forest in Charlemont, Florida, Savoy, and Hawley; Bristol Blake State Reservation in Norfolk; Warren Manning State Forest in Biller-

ica; Purgatory Chasm State Reservation and Sutton State Forest in Sutton; and Robinson State Park in Agawam. The project included an archaeological and historical reconnaissance survey that consists of Native American and Euro-American background research, a visual inspection of selected Native American and Euro-American historic sites in each facility, production of site sensitivity maps (and guides) for each facility, completion of Massachusetts Historical Commission site forms, and a report. The purpose of the archaeological portion of the project has been to conduct facility-wide, reconnaissance-level surveys for archaeological resources that will facilitate effective management of these resources. The study also will proved an understanding of the patterns of Native American occupations and activities, as well as historic European-American activity in the facilities, providing facilities management, DEM and the Massachusetts Historical Commission with: a) a planning tool that will allow effective management of sites and areas of high site potential when park construction, maintenance, and other development occurs; b) an inventory of sites with appropriate locational, cultural, and management information that is compatible with the DEM CRI. During the course of the project numerous sites were researched. Temporal and environmental information were added to all the sites as appropriate. The reconnaissance reviewed 46 archaeological sites (38 Euro-American and 8 Native American). The project produced 41 new MHC forms. Twelve sites were added to the inventory.

25-2360 Herbster, Holly and Suzanne G. Cherau

2001 Technical Report, Archaeological Site Examination, Lot 11 Site (19-DK-143), Lot 11 Building Envelope, Squibnocket Ridge, Chilmark, Massachusetts.

The Lot 11 Site was located in 1992 during an intensive survey of buildable lots at Squibnocket Ridge (see report #25-1314). The site examination included hand testing and machine stripping within the 2300sq m building envelope project area. A total of 32, 50x50cm test pits and 2, 1x1m EUs were excavated within a 10m interval grid, followed by machine stripping of topsoils across the entire building envelope. Eleven features were exposed and excavated within this area. The large (1m plus diameter), deep pits were concentrated in a 167sq m area in the northeastern corner of the building envelope, indicating the site extends beyond the tested area in this direction. Dense shellfish and animal/fish bone deposits (including canine teeth and foot bones) in some features indicate food refuse disposal, while a near absence of materials in others suggest use for storage. Maize, pottery sherds, and ground stone tools were also recovered in these features, suggesting a Late Woodland Period site use. One human tooth was recovered within a stratified shell midden pit, in association with a Squibnocket point, net sinkers, and charcoal; it appears to have been deposited post-mortem and suggests a ritual/ceremonial use of the site. All deposits were identified in sandy, rock-free soils that appear to define the overall site boundaries, a trend noted at the adjacent Lot 5/6 (19-DK-138) and Lot 13(19-DK-143) sites on Squibnocket Ridge.

25-2361 McManamon, Francis

1978 Archaeological Investigation of the Impact Area for Sewer Line Connections at Saugus Ironworks NHS, Saugus, Massachusetts. 11 pages.

In March 1978, Saugus Ironworks National Historic Site (SAIR) contacted the Cultural Resource Division, NARO, regarding plans to connect some of its sewerage outfall with the city sewer system. The proposed project requires the excavation of two narrow trenches. The total amount of trenching is approximately 24.75m. The actual depth of the trenches below surface will vary with topography and necessary pitch but is likely to be about 6-7ft. The impact areas are short and narrow; therefore, manual shovel test pits at 5m intervals along the length of the future lines were used. The test pit contents were inspected during hand toweling them to refill the test unit. Screening was not done because a screen was not available. Shovel tests were dug to at least 65cm. The cultural remains were sparse and no stratigraphic or spatial pattern was detected. The ceramic sherds were almost exclusively white with a hard white paste and hard glaze. A single piece of tan paste and blue on white decoration was the exception. There do not appear to be any significant archaeological resources in the areas to be impacted by this project. Since the testing was less than

total, it remains possible that a significant resource does exist.

25-2362 Deaton, Jo and A. Peter Mair, II

2002 Archaeological Reconnaissance Survey: Cottage Farm CSO Storage Project, Cambridge, Massachusetts. 79 pages.

The project area is within the Charles River Basin National Register District, which is listed in the State and National Registers of Historic Places. Background research and field investigations consisting of a walkover and visual inspection were conducted to determine the archaeological sensitivity of the project area and the potential for the project to impact potentially significant sites. The majority of the project area was historically salt marsh separating the uplands of Cambridge and the Charles River. The exception was a small landform known as Captain's Island at the northwestern end of the project. In the late 1800s/early 1900s, the salt marshes were filled to create the existing landform. Through the years the Metropolitan District Commission has made improvements that have resulted in extensive disturbance through excavations and filling. Consequently, the project area is considered to have low potential for intact archaeological resources and no further surveys are recommended.

25-2363 Crane, Pamela, Lelsie Shaw, Peter Morrison, and Anne Wilder

2003 "For the Defense of Salem" Fort Lee and Fort Pickering, Conditions Assessment, Cultural Resource Management Survey, and Maintenance and Restoration Plan Project, Salem, Massachusetts. 317 pages.

Fort Pickering (SAL-HA-11), located on Winter Island in Salem last underwent major construction in 1864. The site may have been fortified as early as 1643. Fort Lee (SAL-HA-8), built in Salem on the height of land near the center of Salem Neck, probably originated in 1776. In 2003, the City of Salem undertook a reconnaissance archaeological survey of these sites in connection to the preparation of a comprehensive management plan. This was the first archaeological testing performed on these forts. The current study included background research, predictive modeling, pedestrian survey, and excavation. At Fort Pickering, the area covered by reconnaissance was 23 acres; at Fort Lee it was 12 acres. Twenty-eight, 50cm square shovel tests and four 1m units were excavated at Fort Pickering and 26 shovel tests and 3 test units were excavated at Fort Lee. Four of the shovel tests at Fort Pickering and three of the shovel tests at Fort Lee were placed for prehistoric sensitivity. A Native American burial (19-ES-383) was discovered at Fort Pickering during construction in 1865, and there is a possibility that other burials are still present. A low density of flakes in the Fort Pickering project area also indicates that the Soccer Field 1 site (19-ES-663), previously discovered on the Plummer School property to the north, extends into the Fort Pickering property. A Native American site (19-ES-382) was previously recorded at Fort Lee based on the discovery of an untyped point in 1886. A small quantity of additional materials found during the current project added to the known assemblage from the site. Both forts were found to possess numerous above-ground features and very well preserved buried features related to the various historical periods of construction and occupation of these sites. Recommendations were made to ensure the preservation of the forts' fabric and below-ground features and artifacts from all periods.

25-2364 Herbster, Holly and Suzanne G. Cherau

2003 Intensive (Locational) Archaeological Survey, East Pasture Property, Aquinnah, Massachusetts. 67 pages.

This survey included archival research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by proposed residential development. A total of 47, 50x50cm test pits was excavated within the approximately 2600sq m building envelope and an approximately 170m road way/utility corridor. The intensive survey identified

the East Pasture Site, consisting of high density deposits of chipping debris, chipped stone tools including Stark, Small Stemmed and Levanna projectile points, pottery, shell, animal bone, two shell middens, a pit feature and a lithic workshop. The East Pasture Site may be associated with the previously investigated Gerhard Site located approximately 100m to the northeast. The identified archaeological deposits constitute a potentially significant prehistoric Native American archaeological site that is eligible for listing on the National Register of Historic Places under Criterion D.

25-2365 Herbster, Holly and A. Peter Mair, II

2003 Intensive (Locational) Archaeological Survey, Proposed New Senior Center, Mashpee, Massachusetts. 72 pages.

The survey included archival research, informant interviews, walkover survey, and subsurface testing to identify potentially significant archaeological resources. A total of 34, 50x50cm test pits was excavated within 30m test pits blocks and along 10m interval transects across the approximately 4acre project area. No cultural materials or features were identified within the project area and no further testing was recommended.

25-2366 Ingham, Donna and Duncan Ritchie

2003 Archaeological Site Examination, Talcott Site, The Pinehills Development Area, Plymouth, Massachusetts. 88 pages.

The Talcott Site is located within the proposed location of a clubhouse for the Old Sandwich Golf Course being planned as part of the Phased Review Development IV (PRD IV) of The Pinehills (see report #25-2325). The Talcott Site occupied the crest and a lower terrace of a small knoll situated within the core of the former Symington-Talcott Estate in an undeveloped area between the caretaker's house and the main residence. Talcott Pond, an artificial impoundment near the headwaters of the Eel River, is located immediately to the west of the site area. Subsurface sampling within the site was done with 29, 50x50cm test pits and 4, 1x1m excavation units placed within a coordinate grid system. Cultural materials, the majority of which are Native American lithic artifacts, were recovered in two discrete areas estimated to measure 852sq m. The majority of the recovered artifacts were within intact stratigraphic contexts, demonstrating that the site's good integrity. A number of small concentrations containing high- and moderate-density distributions of Native American lithic debris and chipped-stone tool fragments were identified within the site area. The results of artifact and spatial analyses suggest that these concentrations are the result of episodes of chipped-stone tool maintenance and production based on quartz and a variety of rhyolites obtained in cobble form from beaches and exposed glacial outwash deposits. This activity appears to have focused on highly finished bifaces (particularly projectile points). The recovery of a unifacially retouched quartzite flake suggests that other chipped-stone tool types, which may be associated with the on-site processing of plant or animal resources, were also a product of site occupants' lithic industry. Direct evidence for the on-site processing of plant and animal resources was recovered from Feature 1, located in the east-central portion of the site. Feature 1 is a cylindrical pit with nearly vertical sides and a flat to shallowly dished bottom, measuring approximately 70cm across and 40cm deep. Flotation of soil samples collected from fill strata in Feature 1 resulted in the recovery of several small fragments of fish bone, unidentified calcined bone, charred and uncharred nut hull fragments, and charred and uncharred seeds. Radiocarbon analysis of charred wood recovered from the lowermost fill stratum of Feature 1 yielded a date of 320 ± 50 years B.P. (Beta 178688). This radiocarbon date indicated that the most recent occupation of the site occurred in the Late Woodland to Contact Period. Less-precise evidence for the antiquity of the occupation(s) of the Talcott Site was obtained through the recovery of three fragmentary projectile points. These fragments, consisting of basal fragments of Wayland Notched-like and Levanna-like projectile points, and a fragment of an unidentified triangular projectile point, indicate occupation of the site during the Late/Transitional Archaic periods (ca. 5000–2500 B.P.) and the Late Woodland Period (ca. 1000–450 B.P.). In addition to confirming the Native American use of the upper Eel

River drainage and interior moraine district during the Late/Transitional Archaic periods and the Late Woodland Period, the site examination of the Talcott Site collected data that can be applied to research questions concerning the nature and patterning of that use. Of particular importance is the potential of the site to yield additional data that can be used to better understand the inland aspect of Late to Terminal Archaic and Late Woodland Period to Contact Period settlement and resource use in southeastern Massachusetts. Because the focus of Native American settlement and resource use shifted during this time to estuarine environments, little of the archaeological data for these time periods has been recovered from inland zones. As a consequence, inland settlement patterns and resource use during these periods are poorly understood. The Talcott Site is considered to be potentially significant and eligible for listing in the National and State Registers of Historic Places. It is recommended that the proposed development activities avoid the Talcott Site. If avoidance is not possible, a data recovery program should be developed.

25-2367 Ford, Ben and Alan Leveillee

2003 Intensive (Locational) Archaeological Survey Patriot Place, Bedford, Massachusetts. 87 pages.

An intensive (locational) archaeological survey was completed for the 1acre Patriot Place project area. A walkover survey, and subsurface testing were conducted. The project area was purported to contain the Israel Putnam Homestead Site a circa 1720–1810 house with associated outbuildings, tavern, and hennery. Subsurface testing consisted of 25, 50x50cm test pits arranged in 1, 30x30m block, 1 linear 8m interval transect, and 2 linear 10m interval transects. No direct physical evidence in the form of foundations, cellar holes, or features for the Israel Putnam Homestead Site was recorded during the survey. Similarly, the cultural materials from the site did not contain the density of architectural or domestic artifacts normally associated with a house site, and no artifacts could be conclusive dated to earlier than the mid-18th century. One quartz flake was recovered from undisturbed B_2 horizon soil. No Native American archaeological features were identified during the survey.

25-2368 Ford, Ben and David Robinson

2003 Intensive (Locational) Archaeological Survey, Tispaquin Farms, Middleborough, Massachusetts. 110 pages.

An intensive (locational) archaeological survey was completed for the 19.9 acre Tispaquin Farms project area. A walkover survey, architectural survey, and subsurface testing were conducted. Subsurface testing consisted of 77, 50x50cm test pits arranged in three 30x30m blocks, one linear 10m interval transect, five judgmentally placed test pits, and three arrays. No Native American cultural materials or archaeological features were identified. All of the artifacts recovered during the survey were Euro-American period items (ceramic sherds, glass, structural materials, cinders) discarded as “field trash” in the open agricultural land within the project area. No further archaeological investigation is recommended.

25-2369 Herbster, Holly

2003 Technical Report, Intensive (Locational) Archaeological Survey, Rising Tide Affordable Housing Project Area, Nantucket, Massachusetts. 58 pages.

An intensive survey was completed at the 10 acre Rising Tide Affordable Housing project area. A total of 30, 50x50cm test pits was excavated along 5, 10m interval transects. The combined results of background research and subsurface testing did not identify any archaeological deposits or features within the project area, and no additional testing was recommended.

25-2370 Heitert, Kristen

2003 Archaeological Reconnaissance Survey, Plymouth Municipal Airport and Intensive (Locational) Archaeological Survey, Plymouth Municipal Airport Roadway, Plymouth and Carver, Massachusetts. 78 pages.

The reconnaissance survey was conducted across the entire 700 acre airport parcel. Moderate prehistoric sensitivity was assigned to the majority of the project area, with small areas of high prehistoric sensitivity identified adjacent to wetland and glacial kettle hole features. Low sensitivity for historical site was assessed over most of the project area with the exception of moderate sensitivity in those areas surrounding the historic cranberry bogs and bog access roads. The intensive (locational) survey was conducted in the proposed location of the Plymouth Municipal Airport Roadway. A total of 156, 50x50cm test pits was excavated at 10m intervals along the alignment using nine judgmental test pit transects (A–I). Testing was conducted on the cross-country portion of the proposed roadway and covered a distance of approximately 1,864 linear meters. No prehistoric or historic cultural materials or features were recovered during the survey. No additional documentary or archaeological work was recommended.

25-2371 Ford, Ben and Suzanne Cherau

Intensive (Locational) Archaeological Survey, Devens MAARNG Facility, Devens, Massachusetts. 75 Pages.

The goal of the survey was to locate and identify any significant prehistoric Native American and historic-period cultural resources that might be impacted by future construction projects within the facility. The survey included background research, walkover survey, and subsurface testing. Background research indicated that the project area was within an area of ancient Native American settlement centered on the Nashua River drainage. During the historic period, the Devens MAARNG facility was vacant until World War II when it was used as a railroad siding and deployment area. The walkover survey identified undisturbed and less disturbed areas of the 40 unpaved acres where subsurface testing would be conducted. The testing consisted of the excavation of 28, 50x50cm test pits, at 10m intervals along five linear transects, and 11 judgmental test pits. The test pits were used to document disturbance in unpaved areas and to investigate unpaved areas along the northern perimeter of the facility near Grove Pond. No prehistoric Native American or historic period cultural deposits were identified within the archaeologically sensitive portions of the facility. A low-density scatter of 20th-century cultural materials was recovered in topsoils and fill/disturbed soil. None of these materials is considered culturally significant. No further archaeological investigation is recommended.

25-2372 Herbster, Holly and Duncan Ritchie

2003 Archaeological Site Examination of the New Education Center, First Church in Roxbury, Roxbury, Massachusetts. 122 pages.

The archaeologists conducted a site examination within the proposed location of a new building adjacent to the First Church of Roxbury,1 a historic property within the John Eliot Square district that is listed in the National and State Registers of Historic Places. The site examination included background research and subsurface testing to identify significant archaeological resources within the 3575sq ft (332sq m) impact area. The results of background research indicated that the project area had the potential to contain both ancient Native American and historic /modern period archaeological deposits. A known Native American archaeological site was located a short distance north of the project area within the yard of the Dillaway-Thomas House, an 18th-century standing structure. The First Church of Roxbury property had also been used for a sequence of meetinghouse and church structures during the 18th and 19th centuries. A total of 17, 50x50cm test pits and four, 1x1m excavation units was excavated within the proposed new building footprint. The Meetinghouse Hill Site was identified as a small, concentrated area of chipping debris found near the existing church building. Most of this chipping debris in this locus of stone tool-making activity was of rhyolite local to the Boston basin area. This site did not yield any diagnostic artifacts

that could be used to associate it with a specific temporal period or cultural tradition. The Meetinghouse Hill Site is not considered a potentially significant cultural resource. The recovered assemblage of historic/modern artifacts were primarily structural materials supporting the written and oral history of building construction and replacement in the First Church/Meetinghouse Hill area from 1630 to the present. No significant historic period archaeological materials or features were identified. No further archaeological investigation is recommended.

25-2373 Chadwick, William J. and Joel I. Klein

2003 Stage IB Archaeological Survey, New Bedford Harbor Superfund Site, New Bedford, Massachusetts. 310 pages.

A Stage IB archaeological survey of portions of the eastern shore of Upper New Bedford Harbor within portions of the New Bedford Harbor Superfund SITE (NBHSS) in the Towns of Fairhaven and Acushnet, Massachusetts was conducted. Prior to the survey a paleoenvironmental reconstruction of the intertidal portion of the survey area was developed and used to divide that area into areas of high, moderate and low/no archaeological sensitivity. The survey area includes both intertidal and supratidal areas that are within the Are of Potential Effect (APE) associated with proposed Superfund remediation activities. A total of approximately 47+ acres were investigated. Following a surface reconnaissance, 1700 auger tests (using 60mm gouge augers and piston samplers) were placed at 8m intervals in intertidal areas classified as having a high or moderate sensitivity and at 8m, 16m intervals, or not at all in areas of low/no sensitivity. A total of 248 shovel test units averaging 45cm in diameter were excavated at 8m intervals in the supratidal portions of the survey area. Eleven new archaeological sites (The Frag Site, Shell/Trash Midden Site, Trust Site, Pear Island Site, Hadley Site, Lacuyers Site, Com Site, Dock Site Beech Site, Harding I Site, and the Harding Site II) were identified. The previously recorded Acushnet Slough Site (19-BR-466), Swift Site (19-BR-212), and Lawson Site (19-BR-378) sites were relocated and/or expanded. Additional testing of the identified archaeological sites that may be impacted by NBHSS remediation activities is recommended.

25-2374 Adams, Virginia H., Suzanne G. Cherau, William Brett, Paul A. Russo, Matthew Kierstead, and Joshua Safdie

1997 Holyoke Project Cultural Resource Reconnaissance Survey, Franklin, Hampshire, and Hampden Counties, Massachusetts. 478 pages.

The Holyoke Project, includes a dam, impoundment, six separate hydroelectric facilities and a three-level canal system. The project area encompasses all of the project facilities including the impoundment, which extends upstream from the dam approximately 25 miles. The cultural resource reconnaissance survey consisted of archaeological and architectural services for the Holyoke Project. The archaeological services included background research, field reconnaissance (boat over of the shoreline, walkover of the adjacent parcels), site and archaeological sensitivity mapping, impact and risk assessment of changes in the shoreline and erosion, and the preparation of MHC archaeological inventory site forms. The architectural services consisted of background research; field survey; preparation of MHC building, structure, and area forms; evaluation of eligibility for listing in the National Register of Historic Places (NRHP); and an impact and risk assessment. The archaeological research and fieldwork resulted in the identification of 38 known prehistoric archaeological sites within the project impoundment, five of which were located in the field due to the presence of lithic cultural materials eroding from river banks. In addition, four newly identified historic archaeological sites were found within the project impoundment. These consist of two transportation-related sites (bridge abutment in South Hadley, ferry landings in Hadley and Northampton), a 19th-century refuse dump in Holyoke, and an historic find in the Hockanum Meadows section of Northampton. Archaeologically sensitive areas were also identified within the project impoundment and adjacent HWP parcels. These sensitivity areas along with the locations of known and newly identified archaeological sites were evaluated for existing and potential future impacts from changes in the shoreline that may occur over the next fifty years.

25-2375 MWH Americas, Inc.

2004 Cultural Resources Management Plan, Otis Air National Guard Base. 3 Volumes.

The Air National Guard (ANG) Readiness Center has authorized the preparation of a Cultural Resource Management Plan (CRMP) for the Otis ANG Base (Otis), located in the Towns of Bourne, Mashpee, and Sandwich. The ANG has contracted to include all facilities under ANG control. Otis and its runways occupy approximately 3,800 acres of the nearly 22,000acre Massachusetts Military Reservation (MMR) on Cape Cod. This document will guide Otis ANGB in the identification, preservation, treatment, and management of historic resources on Base, and will influence future Otis ANGB administration and planning documents and activities. This CRMP will facilitate consultation with Massachusetts Historical Commission (MHC) and with federal and state recognized Native American tribes, such as the Wampanoag Tribe of Gay Head-Aquinnah and the Mashpee Wampanoag, currently having an interest in lands associated with Otis ANGB. This CRMP identifies cultural resources present at Otis ANGB, assesses potential for additional, undocumented resources, and discusses management responsibilities under the mandates of Sections 106 and 110 of the NHPA. It discusses federal and state historic preservation laws and regulations and their influence on daily activities by Otis ANGB personnel. This CRMP establishes standard procedures for compliance with federal and state laws and regulations governing the protection and preservation of historic resources. Some Otis ANGB properties have been determined eligible for the National Register of Historic Places (NRHP) by MHC. Otis ANGB buildings will be assessed and revised through consistent coordination with the SHPO, and formally evaluated every five years during each revision of this CRMP. The 50-year age criterion is dynamic and CRMP revision must address all additional buildings that will cross the 50 year NRHP threshold within the next five year period of implementation.

25-2376 Cherau, Suzanne G.

1995 Intensive Archaeological Survey, Fort Devens, Massachusetts, 2 Volumes. 458 pages.

The intensive survey was performed on property to be transferred from Federal ownership that is situated on the Main and North Posts, as part of the Base Realignment and Closure (BRAC) process. An intensive archaeological survey was also conducted at the proposed location of the relocated Ammunition Supply Point (ASP) on the South Post of Fort Devens. The intensive archaeological survey was designed to locate and identify all prehistoric and historic resources that may be present on sensitive lands within Fort Devens that are to be transferred from Federal ownership. The survey encompassed approximately 600 acres of the Main and North Posts that have a moderate to high historic archaeological potential and approximately 400 acres that possess moderate to high prehistoric archaeological potential. The archaeological study also included defining the spatial limits of all identified prehistoric and historic resources, including those identified in the 1993 survey (see report #25-1378), situated on the property to be transferred from Federal ownership. The intensive archaeological survey of the ASP on the South Post was designed to locate and identify any potentially important historic resources within proposed construction areas. These historic resources would likely be associated with two previously identified historic archaeological sites. The intensive survey identified seven additional prehistoric sites and two additional historic site components on the Main and North Posts. These sites, along with the five prehistoric and eight historic sites identified during the 1993 survey, were subjected to additional field testing and documentary research (i.e., deed and probate records) to make preliminary determinations of site integrity and eligibility for the National Register of Historic Places. One of the prehistoric sites (the Shoppette Site on the Main Post) was determined to be potentially eligible to the National Register. This recommendation is based on the site's potential to contribute new information concerning prehistoric settlement and subsistence systems in the Nashua River drainage. The remaining 11 prehistoric sites on the Main and North Posts were not recommended for further investigation. Of the 10 historic archaeological sites identified on property to be transferred from Federal ownership on the Main and North Posts, four (HS #3N, #8N, #8M, and #20M) were assessed as

potentially eligible to the National Register. This recommendation is based on these sites' potential to address research questions related to frontier settlement and rural landscapes; topics that have been identified by the Massachusetts Historical Commission as important areas of historic period research for the Central Massachusetts study unit. The remaining historic sites (HS #6M, #4N [along with component #1 2N, #6N [along with component #1 3N], and #7N) are not recommended as potentially eligible to the National Register. This recommendation is based on limited information content and/or poor physical integrity.

25-2377 Mahlstedt, John F.

2002 Archaeological Testing for Water Distribution Supply System, Freetown State Forest, Freetown, MA. 11 pages.

This project was undertaken to improve Freetown State Forest's Water Distribution Supply System, which was installed in the 1960s and early 1990s. Most of the 3,000 linear feet of 2in and 1in piping will be placed within existing utility trenches or deeply cut road beds and were considered to satisfy the criteria of a categorical exclusion as defined in the MOA between DEM and the MHC. However, a short spur of about 30.5m that connected a new wellhead was undisturbed and was therefore considered archaeologically sensitive. Due to its distance from water (ca. 300m) and considerable micro-relief it was classified as moderately sensitive for prehistoric archaeological resources. A total five shovel test pits were excavated from the edge of the access road into the tree cover where the wellhead was to be placed. The test pits were completely sterile of any form of cultural material. Although the presence of Native American people is documented by five prehistoric sites within the State Forest, the location tested did not play an important role in their landuse patterns. Since no archaeological resources were encountered further archaeological evaluation was not recommended.

25-2378 Mahlstedt, Thomas F.

2002 Archaeological Testing for Baldpate Pond Parking Lot, Boxford State Forest, Boxford, MA. 8 pages.

This project was undertaken to improve parking along Baldpate Road in Boxford. The location of the proposed parking lot is nearly 300m from Baldpate Pond, close to the maximum distance from a fresh water source, so it was classified with moderate to low archaeological sensitivity. Generally, however, the communities of Boxford, Rowley, Georgetown, and Groveland have high archaeological sensitivity because of the many wetlands present, and the area serves as the headwaters for the Parker River. A total of 14 shovel test pits were excavated in the project area, which measures roughly 64mx37m. No artifacts were recovered in the survey area, suggesting it played a marginal role in local prehistoric and historical landuse patterns. The soil characteristics, with poorly developed topsoil and a shallow glacial till, suggest that the location (a kame terrace) stood barren for a long time after the glacial retreat, and that it was ultimately cleared and kept open in the historical period, probably for pasture as opposed to tillage. No further archaeological evaluation was recommended.

25-2379 Donohue, Barbara

2003 Intensive (Locational) Survey for the Millville Bridges Project, Millville. 102 pages.

The current survey, which included documentary research and the excavation of seven shovel test pits, revealed previously unknown information on the milling history of the town and identified the location of a mid-19th-century house. The areas of impact are small, substantially disturbed, and appear to have revealed as much archaeological information as possible, no further archaeological field investigation is recommended. A sedimentation barrier is recommended to protect the adjacent historic mill remains during construction-related activities.

25-2380 Graves, Anna, and William Brett

2003 Archaeological Reconnaissance Survey, Weaver's Cove LNG Project, On Shore Facilities, Fall River, Freetown, Somerset, Swansea. 59 pages.

There are three facets to this project: a proposed Import Terminal site; two proposed connecting pipeline routes (Western and Northern Routes); and offshore dredging within the Federal Navigation Channel for vessel access. This report is concerned with the onshore facilities (see report #25-2386 for offshore). The survey stratified the Terminal site and each pipeline route into zones of prehistoric and historic archaeological potential. This survey included historic and archival research as well as a driveover/windsheild inspection and walkover survey of areas for which permission was obtained. The report includes environmental and cultural contexts for the Weaver's Cove LNG Project and predictive models for undocumented archaeological sites. The proposed Terminal location in Fall River possesses low archaeological sensitivity; it has been heavily disturbed by decades of industrial and commercial activity. No further archaeological survey is recommended here. The Northern Route is an "in-kind" replacement of an existing but inactive utility pipeline and over 95% will be constructed within the existing utility right-of-way, drastically reducing the potential for impacting intact soils and archaeological deposits. This segment of the Northern Route possesses low archaeological sensitivity. No further archaeological investigations are recommended for most of the segment. The remaining 0.13 miles of the route will require a new right-of-way. Most of this short segment is located within a delineated wetland and sloped terrain. The final 200 feet are largely located within an area disturbed by the construction of a now demolished natural gas processing facility. However, there is one location that is undisturbed and located on a small terrace. This location possesses moderate archaeological sensitivity. The remaining locations possess low archaeological sensitivity. Intensive (locational) archaeological investigations are recommended for the one location of the Northern Route. The Western Route, where it makes landfall in Somerset, is sited in a heavily disturbed area of industrial development and possesses low archaeological sensitivity. Almost all of the remaining length of the route is located along an existing electrical easement but may contain intact soils. This segment possesses moderate archaeological sensitivity and an intensive archaeological survey is recommended. The final 0.3 miles of the Western Route is cross-country and contains undisturbed soils and is relatively near known archaeological deposits and fresh water sources, this segment is assessed as possessing high archaeological sensitivity; intensive archaeological testing is recommended (see report #25-2468).

25-2381 Dudek, Martin G.

2003 An Intensive (Locational) Archaeological Survey at the Wachusett Regional High School, Holden. 67 pages.

The intensive survey consisted of 119 test pits, comprised of 96 systematic in four blocks and four transects, 15 judgmental, and 8 bracket test pits, all 50x50cm, excavated across two areas comprising about 40 acres. Historic or modern materials were present but scarce. Two isolated find spots of prehistoric quartz shatter were identified in Area 1. Isolated find spots of historic artifacts were found within Areas 1 and 2. No significant cultural resources were identified; no additional archaeological work is recommended.

25-2382 Brooke, John L. and Douglas J. Norton

1976 A Preliminary Archaeological Survey of the West, Upper North, and South Families, Hancock Shakers. 20 pages.

A survey of three long-abandoned Shaker settlements located on the property of the Shaker Community, Inc., in Hancock was undertaken in 1976. The purpose of this survey was to locate and map the remains of structures that once comprised the material base of the West, (upper) North,

and South Families of the Hancock Shakers, to describe the condition of these remains, and to make recommendations concerning stabilization and future research.

25-2383 Stull, Scott D.

2004 Phase IB Archeological Reconnaissance Report, Derby Wharf Utility Corridor, Salem Maritime National Historic Site, Salem. 107 pages.

Archeological testing was conducted at Derby Wharf, part of Salem Maritime National Historical Park. The testing area was 420ft (128m) long. A previous survey was conducted an archeological excavation at Derby and Central Wharves (see report #25-1801). Sixteen backhoe trenches were excavated. One trench was 14m (46ft) long, while the rest were between 3.4m (11ft) and 7m (22ft) long with no more than 16ft (5m) between the sampling trenches. One hand-excavated trench, 2.8m (9ft) long, was placed to locate surviving remains of the 1765 Derby Counting House. The main utility corridor did not have any archeological deposits of significance. Architectural remains located in the testing were identified as from the 1765 Derby Counting House and the 1874 Hatch/Very Office. The Counting House remains are outside of the area of potential effect. The Hatch/Very Office is located on an alternate route for the electrical line. Avoidance of potentially significant features was recommended.

25-2384 Herbster, Holly, and A. Peter Mair, II

2002 Intensive (Locational) Archaeological Survey: Truro Town Hall Addition and Relocation, Truro. 45 pages.

The Truro Town Hall is a significant resource listed as Union Hall in the State and National Registers of Historic Places. The survey included background research and field investigations consisting of the excavation of 22 test units within areas exhibiting moderate to high archaeological sensitivity. A single quartzite flake recovered from the disturbed A horizon is considered an isolated find and is not significant. The historic cultural material recovered during field investigations is considered typical of waste from activities that have taken place at the town hall. However, these materials were not recovered in any significant densities, or from any middens or features, and are not considered significant. Based on the results of the subsurface testing, the proposed relocation and expansion of the Truro Town Hall will not impact any archaeological resources; no further investigation is warranted.

25-2385 Macpherson, Jennifer, and A. Peter Mair, II

2000 Intensive (Locational) Archaeological Survey: Falmouth Fire & Rescue Headquarters, Falmouth. 61 pages.

The existing fire headquarters building (Central Fire Station) is listed in the National Register of Historic Places. The intensive survey included background research, a walkover survey, and subsurface testing. Based on the walkover survey, the majority of the project area has low archaeological sensitivity because of extensive disturbance. A total of six, 50x50cm test pits were excavated in moderately sensitive areas. The recovered material assemblage consisted of 79 pieces of historic and modern cultural material collected as field trash, within fill, in the house lot adjacent to the fire station. Based on the significantly disturbed contexts from which the material has been recovered, the assemblage does not represent a potentially significant cultural resource. No further archaeological investigation is recommended.

25-2386 Robinson, David S., Ben Ford, and Jeffrey D. Gardner

2003 Marine Archaeological Reconnaissance Survey, Weaver's Cove LNG Project (Offshore), Fall River and Somerset. 44 pages.

In September 2003, a marine archaeological reconnaissance survey was conducted of the offshore portion of the Weaver's Cove Energy Liquified Natural Gas Terminal and Mill River Pipeline Interconnecting Gas Pipeline Project within the Taunton River (see report #25-2380 for onshore). The goals of the investigation were to assess the archaeological sensitivity of the offshore portion of the project area and determine the presence or absence of submerged historic properties. The survey included background research, geophysical (remote sensing), and geotechnical (vibratory coring) field survey. The project area is within a region of ancient Native American settlement centered on the Taunton River drainage. During the historic period, the banks of the Taunton River closest to the offshore project area were not developed until the early 20th century when a tank farm was established on the Fall River shore and a power station was built on the Somerset shore. Active dredging of the Taunton River also took place during this time, with the northern terminus of the dredged channel coinciding with the tank farm. No vessel losses are documented within the offshore project area. Three areas (i.e., the proposed expanded turning basin area, the proposed gas pipeline, and the alternate pipeline route) comprising 32 track lines spaced 50ft apart were surveyed. Survey coverage for each of the proposed pipeline routes extended 150ft from route's centerline. The total area covered by the survey encompassed approximately 67 acres of riverbed. Analyses of the geophysical and geotechnical survey data produced 54 magnetic, 12 side scan sonar, and 25 sub-bottom profiler anomalies; none were interpreted to be potential submerged historic properties or submerged geological features with archaeological sensitivity. No further archaeological investigation is recommended.

25-2387 Ritchie, Duncan, and Donna Ingham

2004 Intensive (Locational) Archaeological Survey, Lakeville Apartments Project. Lakeville. 59 pages.

The 10.8 acre project area is within a known core area of Native American settlement along the Nemasket River drainage. This core area contains the Riverside Archaeological District, a cluster of nine prehistoric sites listed in the National and State Registers of Historic Places. The project area is located along a primary historic/modern period transportation corridor (Route 105). Based on background research and a walkover inspection, the project area had the potential to contain both ancient Native American and historic/modern period cultural resources. Subsurface sampling of archaeologically sensitive sections of the project area was conducted with 51, 50x50cm test pits, placed within eight linear transects and two 5m array patterns. This testing identified two previously unknown ancient Native American archaeological sites, designated the Lakeville Apartments 1 Site and the Lakeville Apartments 2 Site. The Lakeville Apartments 1 Site is located near the western boundary of the project area and north of a narrow ditch leading to a small wetland. Chipping debris was found within one test pit and further investigated through the excavation of four additional closely spaced test pits in a 5m array pattern. One of these four array test pits yielded a small amount of Native American cultural material. The 12 pieces of Native American material from the Lakeville Apartments 1 Site consisted of a single tip fragment from a bifacial tool blade of chert, a quartz cobble fragment and pieces of quartz and chert chipping debris. The chert tip fragment was most likely from a projectile point or biface of unknown age or cultural affiliation. At the Lakeville Apartments 2, a single piece of Native American cultural material, rhyolite chipping debris, was found within one test pit. This find spot was further investigated through the excavation of four test pits in a 5m array pattern. One of the array test pits yielded a small piece of quartz shatter. Small amounts of historic/modern period artifacts such as ceramic sherds, bottle glass, and brick fragments were also recovered during the intensive survey. This material was primarily found within plowed or disturbed soils in test pits located close to Main Street. The Lakeville Apartments 1 and 2 sites and the historic/modern period artifacts are not considered potentially significant cultural resources. No further archaeological investigation is recommended.

25-2388 Herbster, Holly, and Suzanne G. Cherau

2004 Intensive (Locational) Archaeological Survey, Rose Meadow Lane Property, Aquinnah. 30

pages.

This survey included archival research, a walkover survey, and the excavation of 21, 50x50cm test pits within a 1 acre impact area. No cultural materials or features were identified within the project area and no further testing was recommended.

25-2389 Robinson, David

2003 Marine Archaeological Reconnaissance Survey. Island End River Ram Project – Offshore Area, Chelsea & Everett. 12 pages.

Survey of the offshore area produced 15 magnetic anomalies, 14 side scan sonar anomalies, and no sub-bottom profiler anomalies of note. Based on the relatively small size, duration, and distribution of the magnetic anomalies, and the correlating side scan sonar and sub-bottom profiler data, the source of the detected anomalies is interpreted as modern debris generated by ongoing commercial activities in the river. No further archaeological investigation is recommended.

25-2390 Smith, Leith, and Katherine Howlett

2004 Archaeological Site Examination, North Yard of the Loring-Greenough House, Jamaica Plain, Boston. 68 pages.

A phased program of stabilization and restoration for the Loring-Greenough House called for reconstruction of porches, construction of an entrance walk and new foundations for the carriage house, landscaping, and rehabilitation of garden plantings in the north yard. Archaeological testing was conducted to identify cultural resources that would be impacted by the proposed project and to search for evidence of early garden features. The first phase of research focused on house porches, walkway installation, and foundation work in the carriage house (see report #25-1975). The second phase of work, reported here, focused on the temporal assessment of existing planting beds and identification of historic planting features. Five 1x1m units and four 1mx0.5m units were excavated in the north yard. Investigations revealed an intact buried A horizon in the east and southern portions of the north yard that contains 18th and early 19th-century artifacts. Sand walkways were laid in the early to mid-19th century and may have corresponded with other house improvements made around 1840. Such improvements may have included the creation of a formal garden with beds laid out in a geometric pattern. These garden features were covered over with landscaping fill sometime after 1937, when the Historic American Buildings Survey made a plan of the property. The present parallel garden beds may have been created simultaneously with the geometric garden. The parallel beds have been maintained with slight 20th-century modification. The irregular lilac beds at the north edge of the property appear to date to the late 19th or early 20th centuries; the herb bed was created in the late 20th century. Evidence of 17th- to 18th-century garden features consisting of a series of small planting holes was identified below the south end of the parallel beds and associated walkway. Because of the well-preserved archaeological deposits, recommendations for proposed garden restoration focused on the need to limit the depth of new planting holes to prevent disturbance to the buried A horizon. Because tree planting and erection of posts for arbors require greater depths, it was recommended that the new planting and post locations be archaeologically excavated to mitigate potential adverse impacts. The excavated holes will be used for specific trees and posts. The third phase of archaeological investigation associated with the foundations of the carriage house north wall joists will be reported separately.

25-2391 Bonnner, Jennifer, and Elizabeth Kiniry

2003 Archaeological Reconnaissance Survey, The Robinson Property, Grafton. 72 pages.

This property is part of what was once Hassanamesitt, John Eliot’s third Praying Indian Village. Hassanamesitt was the second Praying Indian Village to achieve church status, after Natick, and this church is reported by local historians to have been located on the Robinson property. The ar-

chaeological reconnaissance survey involved extensive background research, informant interviews, and field investigations. These tasks were used to identify the archaeological sensitivity of the property and assess whether an intensive (locational) archaeological survey was warranted. The field component consisted of a selective walkover/surface inspection of the project area. Based on this research, the Robinson property was determined highly sensitive for prehistoric and historic archaeological resources. In addition, we believe the Robinson Property contains archaeological remnants of Native American habitation sites that are linked to the original Hassanamisett settlement. Several lines of evidence support this assertion including environmental setting, location within the bounds of the original 17th-century Hassanamesitt Praying Indian Village, and the return and continuous occupation of Native families after King Philip's War and into the 19th century. The physical remains noted during the walkover survey, including a terraced cobblestone feature, possible pen, and cellar hole with associated well were all located within the original Muckamaug parcel and could be connected to the Native occupation of the area. The cobblestone feature, although large in size to be only a domestic structure, could have served multiple functions, including use as a public meeting space. It is also in the vicinity of the location for the MHC Site File GRF.HA.01 labeled Site of John Eliot's 2nd Meetinghouse (although the information on this form was taken solely from documentary evidence). This evidence, combined with the physical remains discovered during the walkover survey provides compelling evidence of the property's continuous occupation and connection to the original settlement of Hassanamesitt and John Eliot's "Church." While this evidence alone is insufficient to be entirely certain, archaeological investigations could confirm this connection. An intensive (locational) archaeological survey is recommended.

25-2392 Ingham, Donna, and Duncan Ritchie

2003 Intensive Archaeological Survey Centech Industrial Park Connector Road–Cherry Street Extension, Shrewsbury and Grafton. 93 pages.

This survey included background research, a walkover survey, archaeological sensitivity assessment, and subsurface testing. Background research indicated that the project area was within a general core area of Native American settlement centered on the Blackstone and Quinsigamond river drainages. During the historic period, the vicinity was primarily farmland. From the early modern period until the 1970s, the southern portion of the project area was within the Grafton State Hospital complex. Hillcrest Cemetery, associated with the hospital complex, is located just outside the southern end of the project area. A walkover survey and surface inspection identified zones of high and moderate sensitivity for both ancient Native American and historic period Euro-American cultural resources. A historic period farmstead, the T.H. Knowlton Farmhouse, was located along the southern boundary of the project area near the original route of Cherry Street in Shrewsbury. Subsurface testing included 92, 50x50cm test pits at 10m intervals, along nine linear transects. One test pit array pattern and judgmentally placed test pits were also used to investigate specific locations such as a find spot of prehistoric cultural material and the T.H. Knowlton Farmhouse Site. One previously unknown archaeological resource was identified. The Cherry Street Extension Site contains a very low-density distribution of Native American cultural material within an area measuring approximately 15x5m (75sq m). Three pieces of quartz and quartzite chipping debris were recovered. This small scatter was probably created by one or a few episodes of stone tool making. No temporally diagnostic Native American artifact types were found. No subsurface features associated with past cultural activities were identified. While this site adds some data to the inventory of known prehistoric period archaeological sites in the Blackstone and Quinsigamond river drainages, it is unlikely that additional subsurface testing of this site would generate new information. Subsurface testing on the T.H. Knowlton Farmstead Site yielded a small amount of historic/modern period cultural material indicating it was occupied from the late 18th century to modern period. Recent demolition removed all structures (house, barn, outbuildings) on the farmstead and damaged or altered the below ground archaeological component of this site. No evidence of intact foundations or other structural features was found. Neither of these two archaeological sites meet National Register of Historic Places criteria for significance. No further archaeological investigations are recommended.

25-2393 Ingham, Donna, and Alan Leveillee

2004 Intensive (Locational) Archaeological Survey Proposed Marshfield Commons Residential Development, Marshfield. 60 pages.

Thirty-one, 50x50cm test pits were excavated within areas assessed as high to moderate archaeological sensitivity, and 15 test pits were excavated in areas of low to moderate archaeological sensitivity. Test pits were distributed amongst five linear transects, one test pit array, and at 11 judgmentally selected locations. One locus of ancient Native American land use and activity was identified. The Marshfield Commons Site contains a low-density distribution of ancient Native American lithic debris within an area measuring approximately 5m in diameter (approximately 20sq m). Ten pieces of lithic debris, consisting primarily of rhyolite with one piece of quartz, was recovered from the site. Nine of the ten pieces of lithic debris recovered are associated with a disturbed (plowed) stratigraphic context. No temporally diagnostic ancient Native American artifact types were recovered and no subsurface features associated with past cultural activities were identified. The Marshfield Commons Site contains limited information, is spatially concentrated, is primarily situated within a disturbed stratigraphic context, and is unlikely to yield additional data pertaining to use of the area by Native Americans. The Marshfield Commons Site is not National Register-eligible and is not considered a potentially significant cultural resource. Further archaeological investigation was not recommended.

25-2394 Ingham, Donna, and Alan Leveillee

2002 Reconnaissance Archaeological Survey Wachusett Parkway System, Wachusett Mountain State Reservation, Princeton and Westminster. 124 pages.

The Massachusetts Department of Environmental Management is proposing the rehabilitation of approximately 5mi of roadway in the historic parkway system at Wachusett Mountain State Reservation (WMSR). Zones of low, moderate, and high archaeological sensitivity were identified. Three Euro-American sites were identified during the walkover survey: the WMSR Historic Roadways Site, indicated by the remains of abandoned historic parkway segments and associated features adjacent to Up Summit Road and Down Summit Road; the WMSR Midmountain Structure Site, indicated by the remains of a masonry foundation or retaining wall adjacent to the Midmountain Race Control building on Up Summit Road; and the WMSR Stone Crusher Site, indicated by documentary evidence of an early-20th-century stone crusher located at the intersection of Up Summit Road and Down Summit Road, formerly known as the Ox-Bow. In addition, dry-laid fieldstone walls were noted in the vicinity of segments of Up Summit Road east of the Ox-Bow and Administration Road south of the intersection with Echo Lake Road. Portions of the project area immediately adjacent to or proximate to these various types of structural remains were determined to possess high or moderate Euro-American archaeological sensitivity, respectively. The remainder of the project area, either more distant from surface indicators of archaeological sites or situated in steeply sloping and/or extensively disturbed areas, was determined to possess low Euro-American archaeological sensitivity. Additional archaeological investigation at the intensive (locational) level of zones of moderate and high Native American and Euro-American archaeological sensitivity where project impacts will occur is recommended.

25-2395 Mair, A. Peter, II, and Jennifer Macpherson

2003 Intensive (Locational) Archaeological Survey and Relocation of the First River Terrace Site (19-MD-724), Villages at Danforth Farm. 125 pages.

Background research focused on previous surveys that identified archaeological sites within the 170-acre project area, specifically the First River Terrace Site (19-MD-724) (see report #25-1406). Fieldwork consisted of a walkover inspection of the project site and subsurface investigations. The walkover confirmed that the majority of the project area has experienced extensive disturbance as-

sociated with sand and gravel extraction and past and ongoing construction of the Hultman Aqueduct and MetroWest Tunnel. Subsurface investigations (excavation of 40, 50x50cm test pits placed along eight transects and one 30x30m testing block) confirmed the presence of the First River Terrace Site; the site boundaries have been modified to encompass a greater area than previously established (70,000sq ft (6,360sq m)). The First River Terrace Site was previously determined a significant archaeological resource, eligible for listing in the National Register of Historic Places. The site has the potential to address issues of site function and raw material procurement and manufacture, as well as general questions of local and regional Native American settlement patterns from the Middle Archaic to the Middle Woodland periods. Sites from this time period are especially important as such sites are infrequently identified and poorly understood. Avoidance and preservation of the site is strongly recommended.

25-2396 Ware, Rose

2004 Cultural Resources Management Plan, Otis Air National Guard Base, Bourne, Mashpee, and Sandwich. 204 pages.

The Air National Guard (ANG) Readiness Center has authorized the preparation of a Cultural Resource Management Plan (CRMP) for the Otis ANG Base. Otis ANGB and its runways occupy approximately 3,800 acres of the nearly 22,000 acre Massachusetts Military Reservation (MMR) on Cape Cod. This document will guide Otis ANGB in the identification, preservation, treatment, and management of historic resources, and will influence future Otis ANGB administration and planning documents and activities. This CRMP will facilitate consultation with MHC and with federally and state recognized Native American tribes, such as the Wampanoag Tribe of Gay Head-Aquinnah and the Mashpee Wampanoag, currently having an interest in lands associated with Otis ANGB. This CRMP identifies cultural resources present at Otis ANGB, assesses potential for additional, undocumented resources, and discusses management responsibilities under Sections 106 and 110 of the NHPA.

25-2397 Decima, Elena

1990 Mackin Construction Site Archaeological Reconnaissance Survey Report, Greenfield. 30 pages.

The Mackin Sand Bank site is a well-known archaeological deposit within the Riverside Archaeological District. Two sites, 19-FR-95 (unnamed site) and 19-FR-12 (the Mackin Sand Bank site) are listed in the MHC's site files. The present survey confirmed that large-scale looting has been taking place on the site for decades, investigated the extent of the looting, assessed the property's current archaeological potential, and stratified it in terms of possible future archaeological work (see report #25-2353).

25-2398 Mahlstedt, Thomas F.

2004 Archaeological Monitoring at the Quincy Homestead 34 Butler Street, Quincy. 21 pages.

The Department of Conservation and Recreation (DCR) Division of Urban Parks & Recreation (formerly MDC) installed a new 2" PVC natural gas line at its Quincy Homestead at 34 Butler Rd. Quincy, MA. The DCR's Archaeologist assisted in monitoring. Previous archaeological work at the homestead (see report #25-407,539, 1123, 1643) noted the former existence of a small graveyard (ca. 3-4 headstones) and a well located in the side (south) yard of the house, near the proposed trenching. Since there was an existing 1½" gas line running from Butler Rd. to the house that had been shut off in the 1970s, the project was redesigned to take advantage of the former trench. Archaeological monitoring of the excavations identified three stone features. The first feature appears to have been a stone dry well or French drain. The next feature appears to be the remnants of a roadbed, probably the entry drive from Hancock Street to the 1635 Edmund Quincy I's house. The third feature may relate to the foundation of the 1635 Edmund Quincy I House itself.

This gambrel-roofed house sat a short distance south of the later homestead, which was begun in 1686. Extrapolating from a historic photograph, it appears that a portion of the Edmund Quincy I was in the south yard of the homestead; likely the north elevation and front of the house, while its south and rear elevation would have extended into what is today Butler Rd. Therefore it appears that the gas line trenching intersected a portion of the Edmund Quincy I House's north foundation. If so, we would further predict remnants of the north wall to continue east and/or west an unknown distance parallel to Butler Rd. Conversely, the feature may relate the farmhouse after it had been repositioned to face east in 1888, as opposed to that of its original alignment. In either scenario the 1635 Edmund Quincy I house has been archaeologically verified. Additionally, monitoring noted the existence of a variety of 18th and 19th-century artifacts (no 17th-century specimens were positively identified) scattered more or less uniformly throughout the trench. By restricting excavations to a pre-existing utility trench the project impacts were eliminated; only previously disturbed soils and archaeological deposits were encountered.

25-2399 Ingham, Donna, and Alan Leveillee

2003 Intensive (Locational) Archaeological Survey, Neponset Interceptor Sewer Improvement Project Phase II, Middleborough. 71 pages.

Thirteen 50x50cm test pits were excavated within the property, the only area of high archaeological sensitivity identified within the project area. A total of 30 locations within areas of low archaeological sensitivity were also examined with a 1.5in soil probe for the presence of intact soil horizons and/or the presence of undisturbed archaeological deposits. This fieldwork identified the Norton Site, which contains a moderate-density distribution of Native American and Euro-American cultural materials within an area measuring approximately 48x3m (144sq m). Sixty-two pieces of Native American cultural material, primarily quartz chipping debris, with a small amount of rhyolite chipping debris, and trace amounts of chert, hornfels, and quartzite chipping debris, were recovered from the site area, along with a quartz uniface fragment and two broken quartz cobble fragments. No temporally diagnostic Native American artifact types were recovered and no subsurface features were identified. The Norton Site contains limited information, is primarily situated within a disturbed stratigraphic context, and is unlikely to yield additional data. No further archaeological investigations are recommended.

25-2400 Donta, Christopher L.

2003 Addendum To: Archaeological Intensive (Locational) Survey for the Proposed Massachusetts National Guard Headquarters Fitness Trail, Milford. 12 pages.

Archaeologists completed an additional survey relating to a change in project plans (see report #25-2284). The additional testing is for an approximately 3mx580m area with four trailside fitness locations. The subsurface testing consisted of 32 shovel test pits, of which 12 were excavated along the trail, 18 at the four trailside fitness locations, and two at bridge footings. Seven of the 32 STPs yielded a total of eight historic artifacts, all recovered from plow zone contexts. No features or Native American artifacts or features were found in the project area. No further survey is recommended for this project.

25-2401 Binzen, Timothy, and Jennifer Wendt

2004 Archaeological Intensive (Locational) Survey for the Quadrant 1 Apron, Turf Runway 4/22, Runway Safety Area 14 and the Revised North Access Road, Mansfield Municipal Airport, Mansfield. 55 pages.

A total of 174 shovel test pits were excavated. Although a variety of Native American lithic flakes were recovered during the subsurface testing, no subsurface features, significant archaeological deposits, or areas of high artifact density were encountered. One highly eroded locus of Native American activity, the Back Bay Brook Site, was recorded on the ground surface outside the pro-

posed construction area. A very low-density volume of historic artifacts was recovered from test pits excavated throughout the project area, but no potentially significant historic deposits or features were encountered.

25-2402 Macpherson, Jennifer, and Holly Herbster

2003 Intensive (Locational) Archaeological Survey, Martha's Vineyard Airport Improvement Program, West Tisbury and Edgartown. 65 pages.

The proposed improvement program consists of 13 projects, including upgrades of existing facilities and new construction within the existing one square mile airport boundary. The airport is located in the center of the island of Martha's Vineyard, and was initially given a moderate to high prehistoric archaeological sensitivity and a low historic archaeological sensitivity. It was expected that although no freshwater sources were immediately adjacent, Native Americans could have used the area for short-term habitation and/or resource collection. A total of 110, 50x50cm test pits were excavated along 10m interval transects. No cultural materials were located during the survey.

25-2403 Waller, Joseph N., Jr., and David S. Robinson

2004 Stage II Investigation of a Portion of the Swift III Archaeological Site, New Bedford Harbor Superfund Site, Acushnet. 97 pages.

Stage II archaeological investigation was completed of a small portion of the potentially historically significant Swift III site, comprising approximately 0.03 acres of low-lying uplands within the northwestern limits of the greater 0.22 acre Swift III site and the New Bedford Harbor Superfund Site (NBHSS) project's Area of Potential Effects. The investigation involved archival research, informant interview, and field excavation. Based on results from earlier Stage IB archaeological testing (see report #25-2345), five judgmentally placed 1x1m test units were excavated. The current excavation identified a single pre-Contact Period Native American feature (stone-lined hearth or roasting pit) and recovered 270 pieces of lithic chipping debris, two pottery sherds, and one small quartz scraper, and 90 Euro-American artifacts dating from the late 19th to early 20th centuries. The majority of these materials derived from soil strata that included a well-developed plow zone, thereby limiting the overall contextual integrity of the deposits. No temporally diagnostic pre-Contact Native American artifacts were identified; however, the artifact types, depths of recovery, and the general nature of the lithic debris suggest a brief occupation episode(s) during the Middle to Late Woodland period. The recovered Euro-American cultural materials are interpreted as incidental inclusions, possibly associated with the late-19th- to early-20th-century occupation of the Rodolphus Swift farmstead. The intensity of testing conducted to date effectively mitigates the effects that the NBHSS remediation project will have on this small portion of the Swift III site area; no additional archaeological investigation of this area is recommended. The remainder of the Swift III site appears to be intact and potentially significant. Additional Stage II testing is recommended for any portion of the Swift III site that has not been subjected to Stage II evaluation if future NBHSS remediation activities are planned that may impact those areas.

25-2404 Mulholland, Mitchell T., Joannah L. Whitney, and Jennifer Wendt

2004 Archaeological Reconnaissance and Intensive (Locational) Survey for the Hoosac Wind Project, Florida and Monroe. 70 pages.

A survey was conducted on Bakke Mountain and Crum Hill in the towns of Florida and Monroe. Visual assessment and background research identified three locations within the project area that warranted subsurface testing. Two of these areas are located in Florida at the site of the proposed access road and maintenance building for the Bakke Mountain installation. The third area is located in Monroe at the site of a proposed substation. All other areas were steep or wet and did not

require subsurface testing. The total temporary impact acreage is approximately 48 acres, and the permanent impact area is approximately 10 acres. Twenty-six (26) 50x50cm shovel test pits were excavated at 7.5m intervals in the three areas. A small number of 19th and 20th-century artifacts were recovered from the plowzone, probably included in compost added to fertilize the plowed fields. A stone cairn was located near the top of Crum Hill on the Florida/Monroe town line. Although unsubstantiated, it is possible the Civilian Conservation Corps (CCC) built this in the 1930s. It marks the intersection of the highest point on Crum Hill and the Monroe/Florida town line. This feature will be avoided by construction.

25-2405 Waller, Joseph N., Jr., and David S. Robinson

2004 Stage IB Archaeological Survey, Areas 03-1, 03-2, 03-3, 03-4, and 03-5, New Bedford Harbor Superfund Site, New Bedford. 158 pages.

Stage IB archaeological field survey was completed in five separate areas comprising approximately 6 acres of intertidal marsh and mudflats and low-lying uplands within the New Bedford Harbor Superfund Site (NBHSS) project's Area of Potential Effect (APE). These areas were the remaining portions of the NBHSS APE that had not been surveyed previously for the presence of cultural resources (See reports #25-2345). These investigations included archival research, walkover visual survey, and subsurface testing. Subsurface testing was performed on an 8m grid in the supratidal uplands and intertidal marsh. A total of 104 50cm square shovel test units and 190 60mm gouge auger/piston corer tests were excavated. Two new archaeological sites (the prehistoric Osprey Site and historic Foundation Site) were identified in areas 03-2 and 03-3, respectively, but only the Osprey Site was determined to be potentially significant. Additional testing of the Osprey Site is recommended.

25-2406 Mair, A. Peter, II

2002 Reconnaissance Archaeological Survey: Proposed Route 3 Connector Road, South Weymouth Naval Air Station, Rockland and Hingham. 49 pages.

Background research and field investigations identified small isolated areas of moderate archaeological sensitivity along the proposed corridor. The survey results support the Massachusetts Historical Commission’s request for an intensive (locational) archaeological survey should the WNAS/Route 3 Corridor be advanced as a viable alternative.

25-2407 Heitert, Kristen, Stephen Mrozowski, and O. Don Hermes

2002 Archaeological Data Recovery Program, Osborn-Read-Paige Pottery, Peabody. 77 pages.

A site examination in the project area identified shifts in the structural and labor organization of the pottery throughout its 150-year history, but was unable to locate the remains of the original Amos Osborn kiln (see report #25-1813). During this data recovery 1,758 sq ft were machine-stripped from two portions of the site designated Area 1 and Area 2. The remains of the original Amos Osborn kiln were identified in Area 1 and several waster deposit features were identified in Area 2. A series of four machine trenches and eight column samples were excavated in each stripped area. A machine trench bisected the kiln deposit to establish the vertical extent of the kiln feature and column samples were excavated into the profile walls of the trench to sample the kiln contents. Machine trenches 2–4 were excavated in Area 2 and column samples were placed to sample stratified waster deposits within the trenches. Analysis of the kiln deposit and associated artifacts suggests that the original kiln structure was incorporated within the ever-expanding pottery complex. This deliberate effort to build around the original down-draft kiln indicates that it was valued as efficient and cost-effective equipment even as the pottery grew from a small-scale local industry to a regional powerhouse. Analysis of the stratified waster deposits in Area 2, combined with data from Area 1, noted that vessel loss during firing was largely a consequence of improper clay preparation. This lack of attention to the clay preparation process increased over time

and likely was a cost-cutting response to intense competition from large, midwestern pottery factories. This competitive streamlining with raw materials is corroborated by a streamlining tendency in the finished products of the pottery. As evident from archival and archaeological sources, production shifted from domestic utilitarian wares in the early 19th century to mass-produced flowerpots, field tiles, sewer pipe, and imported retail goods in the late 19th to 20th centuries. Geochemical and petrographic analyses of ceramic and raw clay samples recovered from contexts associated with specific phases of the pottery's history could detect no significant compositional differences among the paste, glaze, or clay produced and used over time. The complementarities of data indicate that the potters were using the same clay beds along the Danvers and Waters river over the entire 150-year-course of redware production at the site. Furthermore, as there were no meaningful geochemical distinctions among the various glazes, the often "proprietary" glaze recipes themselves could not be confidently associated with specific potters.

25-2408 Heitert, Kristen, and Deborah Cox

2003 Intensive (Locational) Archaeological Survey and Archival Research, New Federal Courthouse, Springfield. 117 pages.

The project area comprised 6.27 acres, encompassing the historic Alexander House (ca. 1811) and the Springfield Technical High School (ca. 1909). An earlier reconnaissance archaeological survey of the project area assigned a high sensitivity assessment for Euro-American archaeological sites (see report #25-2225). Eleven trenches and 53sq m were machine excavated across the project area. Nine of the 11 trenches contained unstratified architectural debris and fill deposits associated with the 1870 relocation of the Alexander House and the demolition of the 19th-century, Mansard-style row houses that formerly lined Spring and Elliot streets. Two of the trenches contained features: a complete brick cistern and a brick-lined privy vault. The privy was associated with the early- to mid-19th-century occupation of the Alexander House, and yielded an assemblage of French wine bottle glass and bottle seals, dry-bodied redware, pearlware, buttons, and brick from a series of rapidly deposited fill episodes. The cistern post-dated the relocation of the Alexander House and contained a collection of pharmaceutical and packing bottles, a porcelain teacup, and a thick deposit of coal ash.

25-2409 Rainey, Mary Lynne

2004 Polpis Road Bicycle Path Archaeological Data Recovery Program: Site 19-NT-50, The Roadkill Site (19-NT-166), Site 19-NT-68, and the Folger's Marsh Site (19-NT-180) and Supplemental Site Examination of the Folger's Marsh Site, Nantucket. Volumes I and II. Vol. I, 347 pages; Vol. II, 765 pages.

An archaeological data recovery program, preceded by intensive (1990) and site examination (1993) studies, was completed at four Native American sites adjacent to Polpis Road in Nantucket: the Roadkill Site (19-NT-166) and Site 19-NT-50 near Sesachacha Pond at the eastern end of the island, and the Folger's Marsh Site (19-NT-180) and Site 19-NT-68 in the north-central section of the island, adjacent to Folger's Marsh (See reports #25-1100, 1457). The data recovery sample at each site was 10% of the total site area within the bicycle path easement, regardless of the extent of each site into outlying areas. Total area excavated was: Site 19-NT-50 – 11sq m random units and 48sq m judgmental units; Roadkill Site – 10sq m judgmental units; Site 19-NT-68 – 13sq m random units and 51sq m judgmental units; The Folger's Marsh Site – 30.5sq m judgmental units. A supplemental site examination was also conducted at the Folger's Marsh Site to evaluate the potential significance of an historic component. Thirty-four, 50x50cm test pits and three 1x1m units were completed. At all four sites, the data recovery excavations were followed by 100% machine-assisted removal of topsoil to insure that no unmarked burials were present within the bicycle path easement. To interpret the sites, detailed cultural contexts were developed for two districts of prehistoric activity surrounding Sesachacha Pond and Folger's Marsh. Despite contrasting environmental contexts and distance from one another, each district contained one example of a domestic habitation site (19-NT-50 and 19-NT-68) where evidence of very similar Early to Late Woodland

Period architectural traditions and daily life was preserved in house floor deposits. The excavated house sites are believed to have developed within the context of larger communities consisting of multiple residences. At Site 19-NT-68, initial settlement was established by the Transitional Archaic Period and continued intermittently through the Woodland and Contact periods. The earliest evidence of a domestic settlement at Site 19-NT-50 is during the Early Woodland Period, after which there appears to have been more frequent re-occupation during the Middle and Late Woodland periods. An ephemeral Contact Period component was also discovered. The two smaller sites in each district represent differential use of marginal landscapes in proximity to larger settlement areas. The Roadkill Site contained one discrete refuse feature with evidence of Late Woodland to Contact Period small-scale cultivation and consumption of maize. At the Folger's Marsh Site, short term use of the site began in the Late/Transitional Archaic Period and included stone tool manufacture. One intact feature with food remains (shell and deer bone) dated to the Late Woodland Period. Both sites are low-lying, adjacent to marshy swamp land, and were probably not considered optimal locations for residence. In addition to 18 radiocarbon dates from the four sites, the study provided detailed information about Native American architecture, felsite cobble-based lithic technology, ceramic technology, the introduction and use of maize on Nantucket, foodways, coastal adaptations, Contact Period Native material culture, settlement systems, and general domestic life. In addition to radiocarbon dating and flotation analyses of soils, other analytical techniques included wood species identification, phytolith analyses, floral and faunal analyses, and statistical analyses on ceramic sherds.

25-2410 Donohue, Barbara

2004 Intensive (Locational) Survey for Route 2 Improvements in Fitchburg and Leominster. 69 pages.

Three areas of archaeological potential will be impacted by improvements along Route 2 in Fitchburg and Leominster. The first area, approximately 40x25m (130x82ft), was investigated with eight systematic and two judgmental test pits (0.5x0.5m); 72 artifacts were recovered, representing mixed 19th- and 20th-century roadside refuse. No archaeological sites were identified. A well and a possible stone foundation were identified in the second area, which measures approximately 40x30m (130x98ft). Ten judgmental, seven systematic, and one test pit extended to a 0.5x1m unit were excavated; 1,290 historic artifacts were recovered dating the historic site from the late 18th through at least the mid 19th centuries. In the third area, approximately 20x40m (66x130ft) in size, eight systematic and one judgmental test pits were excavated; the 370 artifacts recovered here reflect 20th-century dumping activities in the area. A site examination survey is recommended only for the historic site in the second area. No further archaeological survey is recommended within the other two areas.

25-2411 Cherau, Suzanne, Alan Leveillee, and Holly Herbster

2001 Archaeological Reconnaissance Survey, New Bedford/Fall River Commuter Rail Extension Project, Canton, Stoughton, Easton, Raynham, Taunton, Berkley, Lakeville, Freetown, Fall River, and New Bedford. 317 pages.

An archaeological reconnaissance survey for new and revised project locations for the Stoughton Alternative of the New Bedford/Fall River Commuter Rail Extension Project was conducted. These project locations are situated along the 66.6mi active and inactive right-of-way. One intensive survey was conducted at the location of the original Parcel 2 of the proposed East Taunton Station. The reconnaissance survey involved background research and field investigations, including a walkover/surface inspection of the right-of-way and each revised and new project work area along with auger coring as needed, to determine the archaeological sensitivity and make recommendations concerning further archaeological survey work. The intensive survey consisted of 22, 50x50cm test pits placed at 10m intervals along judgmental transects. Nine project locations have moderate or high historic and archaeological resource sensitivity: Stoughton Station, Elm Street and Foundry Street along the right-of-way in Easton, North Easton Station, the New Grade Sepa-

ration at Route 138 in Raynham, revised Parcel 1 for the East Taunton Station, the Third Track section outside of the right-of-way near East Taunton Station, the right-of-way at Chipaway Road in East Freetown, and the New Bedford Station/Layover Facility. The sensitivity of two proposed station areas, Dean Street Station in Taunton and the Fall River Station will be assessed when the ongoing historic architectural surveys of the areas, which contain extant 19th- and 20th-century industrial complexes, are completed. The remaining proposed station and layover areas (Canton Center Station, Raynham Station, Freetown Station/Layover Facility, and Battleship Cove Station); proposed Stoughton frontage road; and right-of-way sections have low archaeological sensitivity for intact below-ground cultural deposits. Avoidance of moderately and highly archaeologically sensitive areas is recommended. Otherwise, intensive surveys that include additional background research and subsurface testing may be warranted. Only one project area has been subjected to subsurface testing to date, at the original Parcel 2 of the East Taunton Station. No cultural deposits were recovered during the subsurface testing and no further work is recommended for this area.

25-2412 Heitert, Kristen, and A. Peter Mair, II

2001 Intensive (Locational) Archaeological Survey: Home Depot Cross Dock Facility Project Area, Shrewsbury. 75 pages.

This survey identified two Native American archaeological sites. Background research indicated no previous documentary or archaeological work had been performed within the project boundaries, although three prehistoric sites had been located in proximity to the parcel during an earlier survey (see report #25-125). Fifty-seven, 50x50cm shovel test pits were excavated across the 76-acre project. The Quinsigamond I Site represents a short-term Late Archaic-Early Woodland hunting episode based on a Squibnocket triangle projectile point and a low density of chipping debris. The Quinsigamond II Site contains a dense concentration of chipping debris and two bifaces and likely represents a lithic workshop or longer-term campsite. Given the relative paucity of information regarding settlement and subsistence patterns in the Flint Pond/Lake Quinsigamond area, avoidance of the Quinsigamond I and Quinsigamond II sites is recommended. If avoidance is not possible, a site examination should be undertaken at both sites.

25-2413 Leveillee, Alan

1999 Archaeological Reconnaissance of the Owen District Road Development Area, Westfield. 8 pages.

A reconnaissance archeological walkover assessment of the 216 acre project area was completed. The goal of the survey was to assess the archaeological sensitivity of the project area. The project area is bisected by Pond Brook and its associated wetland margins. The elevated margins to the east and west of Pond Brook, characterized by well-drained sandy soils are highly sensitive. Intermediate areas east and west of the brook are moderately sensitive. The eastern and western margins of the parcel have low sensitivity. Based on the results of the reconnaissance survey, an intensive (locational) survey was recommended.

25-2414 Mair, II, A. Peter

2003 Archaeological Monitoring Services: Downtown Common Redesign, Framingham. 52 pages.

Landscaping activities associated with the improvements to the Downtown Common were monitored to ensure that ground disturbances exceeding 2ft in depth did not impact potentially significant archaeological deposits. The Downtown Common is part of the Concord Square Historic District, listed on the National and State Registers of Historic Places. It is also the site of potentially significant archaeological resources, including unmarked Native American burials recorded in the MHC's Inventory of Archaeological Assets of the Commonwealth (19-MD-359). Fourteen exca-

vations exceeding the 2ft depth were dug by hand and monitored. None resulted in the recovery of cultural material or the exposure of subsurface features. No further monitoring is required.

25-2415 Herbster, Holly, and Suzanne G. Cherau

2001 Intensive (Locational) Archaeological Survey: Canalside Commons, Bourne. 47 pages.

The survey included background research, a walkover survey, and subsurface testing. A total of 87, 50x50cm shovel test pits was excavated within archaeologically sensitive portions of the approximately 63 acres proposed for development. The survey did not identify any documented ancient or historic period resources or archaeological deposits within the project area. No further archaeological investigations were recommended.

25-2416 Graves, Anna K., and Holly Herbster

2003 Technical Report, Intensive (Locational) Archaeological Survey, Cape Wind Terrestrial, Alternative #1, Barnstable and Yarmouth. 97 pages.

The survey included background research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources. A total of 208, 50x50cm test pits were excavated within areas of high and moderate archaeological sensitivity in the 5.9mi proposed utility trench corridor. A low-density prehistoric site, the Pole #20 Site, was identified during the intensive survey, but not recommended for further survey. No historic sites or features were noted during the survey.

25-2417 Heitert, Kristen B., and Suzanne G. Cherau

2002 Phase IB Archaeological Survey, Deerfield River Hydroelectric Project, Stratton, Searsburg, Whitingham, and Wilmington, Vermont, and Charlemont, Massachusetts. 164 pages.

Phase IB/intensive archaeological surveys were completed at nine historic sites and one prehistoric site within the Deerfield River Hydroelectric Project area. The historic sites were located in the towns of Somerset (VT-WD-137, VT-WD-138), Searsburg (VT-BE-213), Wilmington (VT-WD-139, VT-WD-140, VT-WD-141, VT-WD-231), and Whitingham, Vermont (VT-WD-146), and Charlemont, Massachusetts (CHRL-HA-1), and the prehistoric site in Whitingham, Vermont (VT-WD-147). All 10 sites were previously identified as threatened by erosional and/or recreational impacts during a Phase IA/reconnaissance survey conducted in 2000 as part of the Deerfield River Hydroelectric Project Cultural Resources Management Plan (see report #25-1391, 1392, 1898). A total of 76, 50x50cm test pits was excavated using judgmentally placed test pits and linear transects with test pits spaced at 8–10m intervals. The combined assemblage comprised 296 pieces of cultural material including a mix of late-19th-century domestic debris as well as several pieces of chipping debris from disturbed contexts. The subsurface testing, combined with supplemental documentary research for each of the sites, indicated that none of them retained sufficient stratigraphic integrity or significant cultural material to recommend additional archaeological investigations.

25-2418 Heitert, Kristen, and Alan Leveillee

2004 Archaeological Assessment and Monitoring Program, Waters Farmhouse Foundation, West Sutton. 17 pages.

Machine testing consisted of a single 20x2ft trench excavated along the north elevation of the original portion of the house. A buried dry-laid fieldstone foundation wall running perpendicular to the house was identified in the trench. Hand excavation of the feature recovered an assemblage of 2,275 pieces of primarily 18th to early 19th-century cultural material including creamware, pearlware, white salt-glazed stoneware, free-blown green bottle glass, and nails. The foundation is

from a wood/work shed dating to the earliest construction episode of the house, ca. 1757–1762, and razed during a subsequent remodeling of the structure, ca. 1790–1795. The discovery of the foundation illuminates a building campaign unrecognized by either the formal architectural history or oral tradition about the house. Subsequent structural and drainage improvements to the foundation were completed and successfully avoided the foundation feature.

25-2419 Donta, Christopher L., and Thomas L. Arcuti

2004 Archaeological Site Locational Survey for Renovations and Additions to Frontier Regional High School, Deerfield. 63 pages.

The present project area covers 6.84acres. A total of 55 shovel test pits were excavated within five survey units. A thin scattering of historic artifacts was recovered from the topsoil. None of these artifacts appear to predate the late 18th century, and all were recovered from disturbed soil contexts. No further archaeological survey is recommended.

25-2420 Mair, A. Peter, II

2004 Intensive (Locational) Archaeological Survey: Sprint PCS Antenna Site BS33XC690B, Webster. 37 pages.

Background research indicated that the project area was sensitive for Native American archaeological resources. Unfortunately the access road, communication facility, and cell tower were constructed before the intensive archaeological survey could be conducted. Extensive ground disturbance compromised the contextual integrity of soils. Visual inspection of exposed surfaces did not identify any cultural material. Visual inspection of the surrounding area revealed areas that are considered more sensitive for archaeological resources, in particular a large, flat, pine terrace overlooking wetlands northeast of the project area. Because the intensive archaeological survey could not be completed no conclusions regarding impacts to potentially significant archaeological resources could be made.

25-2421 Leveillee, Alan

1996 Reconnaissance Archaeological Survey, Beverly Municipal Airport Vegetation Management Plan, Beverly. 35 pages.

The scope of work included background research and a pedestrian survey to observe existing conditions and assess archaeological sensitivity. Five isolated zones of moderate archaeological sensitivity were identified. They are limited horizontally and all contain evidence of historic alterations and encroachments by the airport and surrounding development. It was not considered likely that potentially significant archaeological sites would be encountered in these patches of moderately disturbed soils, which have a low archaeological sensitivity. It was considered unlikely that archaeological deposits with good vertical and horizontal integrity would be located within the proposed Vegetation Management zones. No further archeological survey is recommended.

25-2422 Donta, Christopher, and Jennifer Wendt

2004 Archaeological Intensive (Locational) and Site Examination Surveys for the Proposed Deerfield Academy Boathouse, Deerfield. 94 pages.

The 12 acre property adjacent to the Connecticut River. The locational survey recovered 49 Native American artifacts from 20 of 60 test pits, including 17 sherds of pottery, and quartz, chert, rhyolite, and quartzite debitage. A subsequent site examination included 121 test pits and five 1x1m units, yielding 290 Native American artifacts from 62 of the test pits and all of the 1x1m units. The artifacts include 108 pottery sherds, five lithic tools including a chert core, lithic debitage, and fire-cracked rock. One feature was documented, a storage/trash pit, containing debitage and a pot-

tery sherd. Diagnostic artifacts are limited to pottery, indicating a Woodland period date for the site, which is interpreted as a seasonal camp location. The site is easily accessed from the river and ideally suited for hunting and fishing as well as planting crops. It contains a low to moderate density of artifacts. Based on the amount of area excavated, the low number of artifacts recovered, and the even smaller number obtained from undisturbed contexts, no further survey was recommended at the Pole Swamp Brook site.

25-2423 Herbster, Holly, and Kristen Heitert

2004 Archaeological Reconnaissance Survey, Town of Westport, Westport. 367 pages.

This survey identified known and potential archaeological sites; developed town-wide archaeological sensitivity maps and an accompanying user's guide; and developed management recommendations for the protection of cultural resources and sensitive areas. The survey included archival research, informant interviews, and field survey and resulted in the documentation of 68 previously unrecorded archaeological sites. The predictive model developed for the survey indicates that Westport contains a wide diversity of natural resources including extensive wetland networks, limited modern period development, and a documented human presence spanning 10,000 years. Management recommendations focus on a coordinated development review through local and regional planning agencies. Partnerships with preservation and conservation advocates, Native American groups, land owners, and the general public are suggested as ways in which Westport can help to document, protect, and preserve important cultural resources.

25-2424 Chartier, Craig

2004 Intensive Archaeological Survey at the Canoe Club Residential Subdivision, Pembroke. 65 pages.

During the Intensive survey, 115, 50x50cm test pits were excavated in high potential areas on the south side of the North River. A total of 303 artifacts were recovered (4 prehistoric, 299 historic). Two prehistoric sites were identified, however no diagnostic prehistoric material was found. One historic site, a recently demolished house and its associated outbuildings and stonewalls, was recorded. Due to deep historic plowing, historic modifications, and the low density of ancient cultural material recovered, these sites are not considered significant. No further testing is recommended.

25-2425 Herbster, Holly, and Suzanne G. Cherau

1998 Intensive (Locational) Archaeological Survey, Meetinghouse Golf Club Project Area. Edgartown. 40 pages.

The 162 acre project area contains two standing structures, one that is 35 years old and the other that dates from the 19th or possibly late 18th century and is the former site of the 17th-century Vincent House, which was relocated and restored as a museum. A total of 182, 50x50cm test pits were excavated within 30x30m blocks and along 10m interval transects. A small area of Native American deposits was designated the Mashacket Cove Site; recovered artifacts included chipping debris, a Late Woodland Levanna projectile point, pottery sherds, calcined bone, and charcoal in association with a large semi-circular pit feature. Because of its potential National Register eligibility, it was recommended that the site be avoided. Historic 19th- and 20th-century archaeological materials, associated with the standing MacKenty House and the previously excavated and relocated Vincent House (see report #25-2067), were collected but the information content from these resources was limited and no further testing was recommended. A possible cellarhole/foundation, with associated 17th and 18th-century domestic and structural artifacts, was designated the Andrews/Vincent Site. It is an historically important archaeological deposit that may be eligible to the National Register of Historic Places under Criteria A and D. Avoidance of this site area is recommended.

25-2426 Erickson, Harley

2004 The Forefathers Burying Ground Tomb Marker Restoration Project, Chelmsford. 24 pages.

The restoration of two tomb markers in the Forefathers Burying Ground was undertaken; the poor physical condition of the structures had compromised their integrity. One marker, a box-type marker with a vaulted tomb underneath, required much structural work and ground disturbance. The other marker, a tablet, required only a small amount of stabilization. A reconnaissance level survey was conducted to ensure that no human remains were impacted during the project. The restoration of these markers was part of the Town of Chelmsford's efforts to preserve this historically significant buying ground.

25-2427 Herbster, Holly, and William Brett

2002 Resource Report 4 – Cultural Resources, Supplemental Report, Archaeological Resources, Maritimes & Northeast Pipeline, L.L.C., Phase III Project, Haverhill, Boxford, North Andover, Middleton, Danvers, Peabody. 96 pages.

Archaeologist conducted a supplemental assessment and survey-level investigation on formerly inaccessible areas as well as on newly proposed facility sites recommended following the submittal of Resource Report 4 – Cultural Resources in October 2000. All currently proposed Phase III Project facilities have been assessed and surveyed, where appropriate. This supplemental report does not include information regarding 16 archaeological site evaluation studies conducted in 2001. Thirteen archaeological sites were identified during supplemental testing including two find spots. These archaeological deposits are low density and/or characterized by a lack of stratigraphic integrity. None of these sites were considered potentially eligible for listing in the National Register of Historic Places. Aboveground resources were also surveyed. Although no aboveground structures or landscapes were identified during investigations, Reroute 4M is located near the Hubbard-Foster House in North Andover, a potentially National Register-eligible property. A valve site along this route change will be installed on an adjacent property, approximately 600ft from the house. The valve site, however, is situated between a stand of trees and an existing Massachusetts Electric power easement. The Hubbard-Foster House property's potential National Register-eligibility will not be affected.

25-2428 Swihart, Sharon, and Mitchell Mulholland

2004 Moore State Park Historic District, Paxton, Massachusetts. 73 pages.

The Moore Memorial State Park has been nominated to the National Register of Historic Places as the Moore State Park Historic District. The park is managed by the Massachusetts Department of Conservation and Recreation. The District is centered upon an historic mill village that operated along the waterfalls of Turkey Hill Brook in the 18th, 19th, and 20th centuries. The District includes saw and grist mills and a trip hammer and a blacksmith shop, along with the homesteads, farmsteads (defined by open pastures and stone fences), forests, waterways, roadways, quarries, and a school, which together defined the mill village as a largely self-sufficient community from the 1740s until 1927. As it stands today, Moore State Park Historic District consists of a centralized mill village complex, through which run the historic stone fence-lined roads which connected the village to nearby farmsteads, and beyond to surrounding town centers. The District contains standing structures, ruins, and archaeological sites.

25-2429 Begley, William R., and Ann K. Davin

1996 Final Report, Data Recovery Program, Riverside 2 (19-PL-703) and 3 (19-PL-702) Sites, Lakeville Corporate Park, Lakeville, Massachusetts. 325 pages.

These two sites are two of the nine sites that form the Riverside Park Archaeological District. Previous site examinations at the Riverside 1-8 sites documented Early Archaic through historic-period land use along the Nemasket River (see report #25-1893). This data recovery confirmed the complexity of the archaeological deposits at the Riverside 2 and 3 sites. The most intense and diverse use of the Riverside 2 and 3 sites occurred during the Transitional Archaic Period. Diagnostic artifacts included Susquehanna Broad, Wayland Notched, and Orient Fishtail projectile points, and several deep storage pits, fire pits, and lithic workshops were recovered as well. Radiocarbon dates obtained from three deep pit features at the Riverside 2 Site ranged from 2600 to 2900 B.P. At the Riverside 3 Site, the recovery of three bifurcate base projectile points revealed a previously unidentified Early Archaic Period occupation. Diagnostic Neville and Stark projectile points document site use during the Middle Archaic Period. The comparatively large assemblage of diagnostic Small Stemmed and Squibnocket Triangle projectile points recovered from both sites, along with a deep pit feature radiocarbon dated to 3870B.P. provide evidence of a Late Archaic Period component. Minor Woodland Period components were also present at both sites (based on radiocarbon dates of 1430 and 950 B.P from feature contexts). The distribution of archaeological deposits associated with the various components suggest that the Riverside 2 and 3 sites reflect the overall pattern within the Riverside Park Archaeological District of planned reoccupation and intensive exploitation of natural resources since at least the Early Archaic Period. The majority of these sites were occupied for relatively brief periods as short-term campsites. The presence of overlapping occupations reveals continuity in the Archaic lifestyle that is sometimes obscured by changes in the stylistic attributes of projectile points and other artifacts and by the structural aspects of sites.

25-2430 Binzen, Timothy L., F. Timothy Barker, and Peggy Kelly

2003 Archaeological Reconnaissance and Intensive (Locational) Survey for the Little Bay Multi-Use Trail on Sconticut Neck, Fairhaven. 97 pages.

The trail route is 1,400m (4,592ft/0.87mi) long and is centered in the northern part of Sconticut Neck. A total of 194 shovel test pits was excavated in 8 survey units and identifying two previously unrecorded pre-Contact Native American sites (the Freitas Native American Findspot and the Little Bay Site). The testing also provided new data from the previously recorded Taber's Brook Site (19-BR-481) and Nasketucket River Site (19-BR-348), Loci A-D. The sites included shell deposits, subsurface features, and lithic assemblages of quartz and rhyolite chipping debris, edge tools and projectile points representing occupations that occurred during the Woodland Period. Site examination surveys are recommended for the potentially significant portions of three sites: the western locus of the Taber's Brook Site; Loci A and B of the Nasketucket River Site; and the Little Bay Site. No additional survey is recommended for the Freitas Native American Findspot. Testing also produced additional data from the previously recorded Freitas House Historic Site (FAI-HA-5), which consists of a house foundation and roadside retaining wall. The survey also identified the Pope-Thompson Historic Site. Both sites were occupied between the mid 19th century and early 20th century. It is recommended that the house foundation at the Freitas House Historic Site be avoided during construction. The retaining wall, a non-integral component of the site, requires no further consideration. No additional survey is recommended for either historic site.

25-2431 Heitert, Kristen

2003 Archaeological Reconnaissance Survey and Archaeological Resources Management Plan, Yankee Nuclear Power Station, Rowe and Monroe. 191 pages.

The approximately 2,200acre project area straddles both banks of the Deerfield River and is composed primarily of undeveloped woodland and steep slope. Fourteen, 19th-century resources were field verified (8 farm complexes and residences; 1 sawmill; 1 cemetery; 1 barn; 2 sugarhouses; and the abandoned Hoot, Toot & Whistle (HT&W) Railroad alignment). Moderate to high historic archaeological sensitivity was assigned to those areas with documented historic period resources

and adjacent lands likely to contain associated structural remains and/or cultural material. Moderate prehistoric sensitivity was assigned to those areas adjacent to wetlands or on isolated upland areas in proximity to small streams or brooks. Environmental constraints such as steep, wet topography, lack of arable land, and previous disturbance resulted in a low historic and prehistoric archaeological sensitivity assessment for the majority of the project area. An Archaeological Resources Management Plan was developed for the project area.

25-2432 Donta, Christopher L., Mitchell T. Mulholland, and Thomas L. Arcuti

1999 Archaeological Field Survey and Assessment for the Cultural Resource Inventory, Analysis, and Preservation Plan, Pilgrim Memorial State Park, Plymouth. 110 pages.

The project area is near four sites occupied between 500 and 6,000 years ago. The area has also been occupied throughout the historic period, beginning in A.D. 1620. Conditions in the study area favor the discovery of sites. Although development has affected much of the vicinity, test excavations identified intact prehistoric resources. A total of 10 shovel test pits, 5 .50x2m hand-excavated trenches, and one backhoe trench were excavated within four survey units. The Coles Hill Site was recorded and produced an assemblage of 423 artifacts. The site was occupied during the Late Archaic and Woodland periods, and possibly during the Contact period. In addition, 6,210 historic period artifacts were recovered. Any construction in the project area should be preceded by additional archaeological survey.

25-2433 Binzen, Timothy L., Peggy Kelly, and Angele Smith

1999 Cultural Landscape Inventory and Analysis for the Cultural Resources Inventory, Analysis and Preservation Plan, Pilgrim Memorial State Park, Plymouth. 83 pages.

A cultural landscape inventory was conducted to document and analyze the historical development of the Plymouth Rock Master Plan study area, and address the historic and current articulation of the Plymouth waterfront with the Plymouth Village Historic District. In keeping with the goal “to maximize the historic interpretive potential of the site” information was compiled from a wide spectrum of documentary and archival sources to trace the evolution of the cultural landscapes within the study area. Five conceptual cultural landscapes emerge (residential, public, commercial, industrial, and commemorative) which together compose the evolving landscape of the study area as it existed at different points in time. A new series of maps was generated that depict these cultural landscapes as they appeared in the Plymouth study area during the Early Colonial Period, the Late Federal Period, the Early Industrial Period, and the Late Industrial Period.

25-2434 Donta, Christopher L., and Timothy L. Binzen

1999 Preservation Approach and Treatment Plan for the Cultural Resources Inventory, Analysis and Preservation Plan, Pilgrim Memorial Park, Plymouth. 41 pages.

This preservation plan for the cultural resources in Pilgrim Memorial Park draws upon archival sources and archaeological excavations conducted within the project area. It discusses possibilities for the future development of the park, including the reconfiguration of existing structures that are within an area of high-density archaeological deposits, and it describes the archaeological sensitivity of different sections of the project area. The North Park and South Park landforms are the remains of historic wharves extending into Plymouth Harbor that were filled and covered. They likely contain deeply buried deposits dating to the 17th century and later. Coles Hill overlooks the harbor and is the location archaeological sites. The Memorial Hall Parking Lot is thought to have a moderate to high archaeological sensitivity.

25-2435 Barker, F. Timothy, Timothy L. Binzen, and Peggy Kelly

2003 Archaeological Reconnaissance Survey of the Fitchburg Municipal Airport, Fitchburg. 42 pages.

The airport is located on a broad level plain north of the North Nashua River, downstream from the confluence with Baker Brook. During the construction of the airport in the 1930s the main channels of the North Nashua River, Baker Brook, and their wetlands were entirely filled and diverted to their present locations. The upland hills and terraces adjacent to the eastern side of the airport were cut and graded during airport construction and have been quarried for gravel. The majority of the airport property has low archaeological sensitivity due to the massive landscape alterations associated with the construction of runways and buildings. During the reconnaissance survey, three relatively undisturbed areas possessing moderate to high archaeological sensitivity were identified. These areas consist of a section of intact river flood plain at the infield area in the southern portion of the airport, hill and terrace remnants located at the southeastern corner of the airport, and the northern infield area. Archaeological testing is recommended prior to any undertakings in these areas.

25-2436 Binzen, Timothy L., F. Timothy Barker, and Peggy Kelly

2004 Archaeological Reconnaissance and Intensive (Locational) Survey for Property Improvements at the Evergreens, Amherst. 74 pages.

Evergreens is the historic home of Emily Dickinson's brother and sister-in-law. The house was built in 1856 on a lot adjacent to the Dickinson Homestead and is a contributing resource in the Dickinson National Register Historic District. The proposed improvements include landscape restoration and walkway repair in front of the house; repair of an existing shed at the rear of the house; installation of an accessible ramp leading into the house; installation of a fence along the sidewalk in front of the house; minor grading and re-gravelling of the drive and turnaround area; and repair of a pathway between the shed and the location historically occupied by a carriage house. Subsurface testing was conducted at all these locations, using 25 shovel test pits, 10 exploratory trenches, and 1 excavation unit. Information was obtained concerning the stratigraphy in the historic landscaping at the site, the method of construction of historic landscape features, and the fabric of features such as pathways and steps. Machine-assisted excavation was subsequently conducted east of the main house, to locate the foundation of a carriage house that once existed there. Footings for the outbuilding were identified. Two small, dense deposits of historic domestic refuse were recorded, which could be investigated during future archaeological research at the property.

25-2437 Ford, Ben, and Suzanne Cherau

2004 Intensive (Locational) Archaeological Survey, Camp Curtis Guild, Lynnfield, Reading, North Reading, and Wakefield. 171 pages.

The facility contains 453 undeveloped wetland acres. A preliminary predictive model was constructed for the facility based on a walkover survey and background research. The model was tested and refined based on the results of 862, 50x50cm test pits excavated within 67, 50x50m testing blocks. A refined predictive model for Camp Curtis Guild was constructed at the completion of the project. The southern portion of the facility was disturbed by the construction of a cantonment and firing ranges, but the remainder of the facility is primarily undisturbed woodland with generally rolling topography and a drumlin located along the east margin of the facility. Cedar Swamp forms the west boundary of the facility and bisects the northern portion of the facility. A light to moderate density of historic period artifacts was recovered from throughout the facility. All of these artifacts appear to be field trash or the results of extremely limited activities. The greatest density of historic period artifacts occurred in the northern portion of the facility, where historic roads are closest. Fifteen Native American sites were identified during this survey; the majority on well-drained soils within 100m of a wetland or water source. Ancient Native American artifacts were recovered from 0–60cm below surface. No features or diagnostic artifacts were

encountered. One untyped projectile point with attributes of a Brewerton Side-Notched type point was recovered.

25-2438 Wallace, Lacey Mayo

2004 Fastening Identities, Dressing for Display: Artifacts of Personal Adornment from the Spencer-Peirce-Little Farm in Newbury, Massachusetts, 1635-1986, Newbury. 110 pages.

This study of the artifacts of personal adornment from the Spencer-Peirce-Little Farm, draws upon the work of Carolyn White, Stephen Hinks, and Grace Ziesing to interpret clothing fasteners and other personal effects recovered from the site during excavations conducted between 1986 and 1996. A total of 206 artifacts recovered from 19 areas at the site are included in the study; these include clothing fasteners (buttons, snaps, collar studs, and buckles), jewelry, and hair ornaments that date from the 17th through 20th centuries. Aided by portraiture, documents, and the work of costume historians, the author offers interpretations of how clothing fasteners assist in the interpretation of articles of dress worn by occupants of the site, and using contemporary social theory, moves towards a contextual analysis of adornment and dress as symbols of social status and personal identity.

25-2439 Robinson, David

2003 Inspection of Magnetic Anomalies Remote Sensing Archaeological Survey, Boston Harbor Deep Draft Navigation Improvement Study, Boston. 67 pages.

A remotely operated vehicle (ROV) survey of three magnetic anomalies within the study area are in the heavily traveled main southern ship channel into Boston Harbor east of Castle Island. The ROV survey included background research, a systematic visual and magnetic ROV survey, and limited subsurface testing. Background research indicated that the study area was in an area of ancient Native American coastal settlement and that the project area was exposed during the prehistoric period. One vessel was documented lost in close proximity to the project area in 1895, and NOAA navigation charts indicate a shipwreck within the project area beginning in 1975. Beginning in the last quarter of the 19th century, dredging to improve and maintain the ship channel lowered the channel bottom 16 feet. The systematic and visual ROV survey consisted of 21 survey lines spaced at 10ft intervals. Visual and magnetic data were collected along the survey lines. Limited excavation using the ROV thruster-wash deflector was also conducted at the three magnetic anomaly locations. No pre-Contact Period cultural materials or archaeological features were identified. The only cultural materials noted were lobster pots and modern debris. Lobster pots and/or magnetic rock outcrops or boulders caused the magnetic anomalies. The proposed activities within the study area will not affect significant archaeological resources; no additional archaeological investigations are recommended.

25-2440 Dudek, Martin G.

2004 Archaeological Reconnaissance Survey for the Red Mill Village, Norton. 72 pages.

This survey determined that over 90% of this 53.1 acre parcel area has been severely impacted by past sand-and-gravel operations and has little or no archaeological potential. Documentary research indicates that there are no known archaeological sites or recorded historic structures within the project area. The White family farmhouse, built in 1797, is located east of the project area, which also borders on the White Cemetery (Norton Form A 801). The cemetery's earliest gravestone is dated 1801. Four discontinuous areas along the property boundaries are relatively undisturbed and may contain archaeological resources. One area will be impacted by the proposed development, while two other areas are in close proximity and will be in danger of secondary impacts. The fourth area is not near the proposed development. An intensive (locational) survey or implementation of a protection plan is recommended for each archaeologically sensitive area.

25-2441 Chan, Alexandra

2003 The Slaves of Colonial New England: Discourses of Colonialism and Identity at the Isaac Royall House, Medford. 2 volumes, 502 pages.

A combination of historical research and three seasons of archaeological excavation at the Isaac Royall House Slave Quarters is revealing that, far from being a collection of simple oppositions, the differences between Caribbean and New England slave systems were more complex and less clearly defined than perhaps imagined. Artifacts and social differentiation in the use of space around the estate do not support the idea of Northern bondage being either systemically gentler or more incorporative in nature than Caribbean forms of slavery. Indeed, research suggests that while Northern slavery was certainly different from Caribbean slavery, it cannot be thought to have been better, for any gains made in the material conditions of life were not without other concessions. The concepts of habitus, praxis, performative social discourse, multi-locality, and implication are used to integrate meaning and agency into the analytical approaches and methods at the Royall House. The study brings an ethnographic approach and analysis to documents, architecture, landscape, and archaeology to focus on the diverse experiences of the many individuals from that site--white and black--and offers possible interpretations of how those different experiences were negotiated through material symbols. In documents, artifacts, landscape, and architecture, the author presents evidence of the contestations between master and slaves as they struggled to define themselves and each other in a world that was violent and shifting and anything but fixed.

25-2442 Putnam, Barbara

1996 Archaeological Intensive Survey for the right of way of the Worcester Commuter Rail Extension, Framingham, Ashland, Southborough, Westborough, Grafton, Millbury, Worcester. 122 pages.

The existing track was first laid in the 1830s at which time there was considerable impact to existing archaeological sites. Since that time, additional historic structures have been built along the rail line. While construction impacts along the rail line are expected to be minimal, the construction of a new double track in Worcester and Westborough and the location of fencing in Grafton and Southborough, do involve potential impacts to cultural resources in the rail corridor. An intensive (locational) survey conducted at these locations showed that the extensive cut-and-fill construction of the original line as well as later maintenance activities has extensively disturbed sections of the track that had to be leveled in order to accommodate changes in elevation. Flat segments along the line, which are not to be impacted by the current project, were not tested during the intensive survey; it is not known whether the entire ROW has been disturbed. (See also reports #25-1480, #25-2075, and #25-2443).

25-2443 Dwyer, Alison

1996 Intensive Archaeological Survey: Proposed Millbury and Grafton Stations of the Worcester Commuter Rail Extension. Millbury and Grafton. 34 pages.

This project entails the construction of five new stations, two of which will be in Grafton and Millbury. An intensive archaeological survey was performed at each proposed station location. Excavation at the proposed Millbury Station location indicated that the area is undisturbed; however, only a limited number of historic artifacts and a single quartz flake were recovered. Excavation at the proposed Grafton Station location indicated that the area is disturbed and that there is a lack of significant archaeological resources. No additional testing is recommended (see also reports #25-1840, 25-2075 & 25-2442).

25-2444 Donohue, Barbara

2004 Typically New England, Cordaville, Southborough's 19th-Century Mill Village. Southborough. 63 pages.

This report, written for the general reader, conveys the history and archaeology of the Mill Site, including labor and management.

25-2445 Timothy L. Binzen, F. Timothy Barker, and Jennifer Wendt

2004 Archaeological Reconnaissance and Intensive (Locational) Survey for the Phase 7 Sewer Improvements, Tewksbury. 91 pages.

The reconnaissance survey assessed the archaeological sensitivity of 8,400 linear feet of proposed sewer lines and eight pumping stations. A total of 128 shovel test pits was excavated in areas exhibiting high sensitivity. Three pre-Contact Native American sites were recorded: the Redgate Site, the Mill Street Bridge Site, and the Regina Site. Each site contained a very low volume of chipping debris and has provided evidence of Native American occupations in the Shawsheen River drainage. Additional testing is not recommended, however, because of previous disturbance, the low volume of artifacts, and the absence of subsurface features. Low volumes of 19th-and 20th-century artifacts were recovered from several of the survey units, but no historic sites or features were recorded. No additional testing is recommended.

25-2446 Herbster, Holly

2004 Intensive (Locational) Archaeological Survey, Castaldi Drive Development Project, Dartmouth, Massachusetts and Archaeological Sensitivity Assessment, Greater New Bedford Business Park Expansion Project, Dartmouth and New Bedford, Massachusetts. 70 pages.

This survey included archival research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by proposed development within the Castaldi Drive parcel. A total of 58, 50x50cm test pits was excavated within the approximately 20 acre parcel. A single quartz flake was located. The three parcels slated for expansion are previously disturbed and no additional testing was recommended.

25-2447 Donta, Christopher L.

1999 Archaeological Intensive (Locational) Survey for the Proposed Perimeter Fencing Project, Turners Falls Municipal Airport, Montague. 81 pages.

A proposed 992m (3,254ft) fencing project includes impacts within close proximity to a Paleoindian site (the Hanneman site, 19-FR-324) that is located on airport property. This study included background research and subsurface testing. A total of 105 shovel test pits was excavated at the property, placed along the proposed fence center line. Artifacts were found in three locations, but all areas were disturbed, and none of the materials recovered were material types used at the Paleoindian site. The present project does not threaten the site. A historic site, the Stevens Site, was identified. This is a middle- to late 19th-century residential site including two buried foundations and an associated scatter of artifacts. No further survey is recommended for this site because the proposed project does not pose a threat to its structural components.

25-2448 Binzen, Timothy L., Christopher L. Donta, and F. Timothy Barker

2004 Archaeological Intensive (Locational) Survey for the Septic System Upgrade Project, George's Island, Boston Harbor. 90 pages.

An archaeological reconnaissance and intensive (locational) survey were conducted for a proposed septic system upgrade near the southwest bastion of Fort Warren on George's Island in Boston Harbor. A total of 13 machine trenches was excavated, in addition to hand-excavation of 16 shovel

test pits and 3 excavation units. On the glacis slope of the fort, deep deposits of stony fill were encountered above a clayey substratum representing the shoal on which the fort was built in the mid-19th century. Testing beyond the foot of the glacis slope encountered fill deposits attributed to landscaping and the demolition of outbuildings. Feature 1, a section of brick foundation encountered, likely represents the foundation of a 19th-century stable. Project plans were modified to avoid the feature. Feature 2 was a concentration of cobbles with animal bone fragments and a low volume of charcoal, visible beneath glacis fill overburden. The feature was contiguous to a deposit of shell that overlay shoal soil. Feature 3 consisted of a shell deposit that overlay shoal soil. The feature soil contained fish vertebrae and dissolved charcoal. It could not be determined whether either feature was cultural in origin. No Native American or Euro-American artifacts were recovered in association with either feature. No further survey is recommended for Feature 2, Feature 3, or the septic system upgrade.

25-2449 Donta, Christopher, and Timothy L. Binzen

2000 Archaeological Site Reconnaissance and Intensive (Locational) Surveys for the Sachem Rock Farm Septic System Installation, East Bridgewater, Massachusetts. 88 pages.

The reconnaissance survey assessed the 31 acre property as a whole, and indicated generally high sensitivity for Native American archaeological resources. The intensive survey involved testing for a proposed septic system (pipe and leach field) to service the main house on the property. The house and outbuildings are adjacent to Sachem Rock (site 19-PL-63), a topographic feature commemorated as the location where Myles Standish and the others from Plymouth acquired Old Bridgewater from the Wampanoag sachem Massasoit in 1649. The reconnaissance reviewed a town history that described Native American artifacts collected in the early 20th century from the fields surrounding Sachem Rock. Four shovel test pits were excavated along the proposed 140ft septic pipe, which begins between the house and Sachem Rock and trends northeast to the leach field. Eight shovel test pits were excavated in the 40x70ft leach field. A total of 34 artifacts was recovered from 11 of the 12 test pits, in intact subsoil, plow zone and fill strata, and included one Meadowood-type rhyolite projectile point, one Native American pottery fragment, one hammerstone, one quartz core, and chipping debris of rhyolite and quartz. Historic-period artifacts consisting of 19th- and 20th-century domestic refuse were recovered from eight test pits, with higher volumes encountered next to the house. Based on the volume of Native American artifacts recovered and the potential for intact cultural deposits associated with Sachem Rock, a site examination is recommended.

25-2450 Whitney, Joannah L., Margaret Kelly, Mitchell T. Mulholland, and Christopher Donta

2004 Archaeological Intensive (Locational) Survey for Proposed Cell Tower – Sage #N11739, of the Fentonville/Langevin Property, Palmer, Massachusetts. 42 pages.

The proposed construction parcel is approximately 2.4 acres with a 360ft long access road extending from the cell tower parcel east to Robinson Street. Following background research and a surface reconnaissance, specific locations within the proposed construction area were tested for cultural resources. Twenty-four, 40x40cm shovel test pits were excavated at 7.5m intervals. No archaeological features or artifacts were recovered during testing. No further survey is recommended.

25-2451 Mair, A. Peter, II

2004 Intensive Archaeological Survey: Concord Sewers Phase I, Concord, Massachusetts. 66 pages.

This survey included background research and field investigations. Phase I of the multiphase/multiyear project included two pump stations (250sq ft per station) and a cross-country lateral (500 linear feet) in locations considered to have moderate to high archaeological sensitivity.

Background research did not identify any archaeological properties within the impact areas. A walkover survey indicated that these areas had been disturbed and the excavation of 7, 50x50cm test units confirmed this observation. No cultural material was recovered. No additional survey is warranted.

25-2452 Donta, Christopher, and Jennifer Wendt

2004 Archaeological Intensive (Locational) and Site Examination Surveys for the Proposed Tewksbury-Andover Lateral Natural Gas Pipeline Project, Tewksbury. 115 pages.

Archaeologists conducted background research, an archaeological reconnaissance survey, an archaeological intensive (locational) survey, and site examination surveys for the proposed 8.2km (5.1mi) pipeline lateral. The research involved the excavation of 245 STPs in 13 survey units, identifying three Native American sites, two of which were recommended for avoidance, and the third was considered too low density to warrant further research. The Great Swamp site yielded 12 lithic flakes, 11 of which are rhyolite. The Meadow Brook Marsh site contained 20 artifacts, including one Small-Stemmed point, one rhyolite point fragment, and 18 rhyolite flakes. The Shawsheen Meadows Site contained six artifacts, all quartz flakes except for a quartz biface fragment. Because avoidance was not possible, site examinations were conducted at the Great Swamp and Meadow Brook Marsh sites. The Great Swamp yielded an additional 42 flakes, all but two of which are rhyolite. The Meadow Brook Marsh site yielded another 78 artifacts, including a rhyolite unfinished triangular point, a whetstone, and 76 flakes of rhyolite. Both sites are interpreted as short-term hunting or camping locations, where a small amount of lithic working took place.

25-2453 Russo, Paul A., and James C. Garman

2000 Intensive (Locational) Archaeological Survey: Boston College Stone House Project, Massachusetts. 60 pages.

A previous reconnaissance survey of the parcel indicated that it had high sensitivity for 18th- and 19th-century EuroAmerican archaeological sites, including a farmstead that may have been established as early as 1730 (see report #25-1463). The intensive survey encompassed excavation of eight machine-assisted trenches, using a backhoe equipped with a flat cutting edge. All trenches were excavated to sterile subsoil. In trenches where natural soil horizons were recorded, field personnel excavated 50x50cm test pits and screened excavated soils through ¼-inch hardware mesh. A total of nine test pits was excavated in this manner. The survey identified different components of land use over time: 19th-century agricultural land use, seen in plow zones and a pit used to bury stones; large-scale turn-of-the-century dumping; and early 20th-century landscaping. None of these components represents a potentially significant archaeological resource. No further archaeological survey is recommended.

25-2454 Mair, A. Peter, II

2004 Reconnaissance Archaeological Survey: Sanctuary at Holden, Holden. 72 pages.

The proposed retirement residential development occupies approximately 30 acres within a gravel quarry on 98 acres. Background research and a walkover survey determined that the majority of the study area has low archaeological sensitivity. Several small areas of high archaeological sensitivity were identified overlooking Poor Farm Brook. The walkover also confirmed the location of the Holden Poor Farm Site (HOL-HA-10), which had experienced some surface disturbance during the placement of erosion control measures. The Sanctuary at Holden development is confined to the disturbed quarry and immediate fringes, which lacks integrity and no additional archaeological investigations are required. It is recommended that no further construction activities take place within the limits of the Holden Poor Farm Site.

25-2455 Donta, Christopher L., and Thomas L. Arcuti

1996 Archaeological Intensive (Locational) and Architectural Survey for the Proposed Williamstown Executive Park, Williamstown. 81 pages.

Background research determined that one Native American archaeological site is adjacent to the project area: the Hoosac Meadow site (19-BK-125). This site is based on a 19th-century historical reference; there are no recent indications of Native American material. Historic information indicates that Europeans settled the area in the mid-18th century. It was mainly agricultural until late in the 19th century when Williams College became the main employer. Several buildings along Simonds Road between the Hoosic River and Sand Spring Road are significant examples of 18th- and 19th-century architectural styles. The project area is currently an industrial zone, with very heavy disturbance caused by a landfill, a wastewater treatment plant, gravel pits, and other activities. The project consisted of two survey units (100 shovel test pits). The units covered the main portion of the proposed development, located west of Simonds Road (Survey Unit 1 – 77 test pits), and a lesser impact area (Suvery Unit 2 – 23 test pits) located along the Hoosic River banks to the east of Simonds Road. One area of Native American activity was identified: seven pieces of dark grayish chert lithic waste recovered from two test pits in the northwestern portion of the project area. Additional close-interval testing revealed no further artifacts, and no features were visible. Areas surrounding this location area heavily disturbed. This site is not likely to yield information of significance to prehistory, and no further survey of the project area is recommended.

25-2456 Binzen, Timothy L.

2004 Archaeological Reconnaissance and Intensive (Locational) Survey for the Richardson Brook Area Sewer Project, Dracut. 55 pages.

The proposed project consists of construction of approximately 9,140 linear feet of cross-country gravity sewer pipe. A total of 177 shovel test pits were excavated at locations along the cross-country routes attributed high sensitivity for archaeological resources. No Native American cultural materials were recovered. The testing produced a very low volume of historic artifacts. Several segments of stone wall were encountered throughout the project area, although plowzone deposits were infrequent. This suggested that the vicinity of upper Richardson Brook was used as woodlot during the historic period, with properties demarcated by stone walls. Because of the low density of artifacts and absence of subsurface features in the areas tested, no additional survey was recommended.

25-2457 Wheeler, Kathleen

2004 Archaeological Reconnaissance Survey of Dennis Village Cemetery, Dennis (Barnstable County), Massachusetts. 18 pages.

An archaeological reconnaissance survey was completed for the 9 acre Dennis Village Cemetery. The survey consisted of site and town file review at the Massachusetts Historical Commission, consultation with members of the Dennis Historical Society, and a site inspection. The purpose of the assessment was to provide recommendations for a general preservation plan to help the town maintain and preserve the municipally-owned burial ground. Recommendations include both “above-ground” and “below-ground” proposals. Above-ground survey includes compiling information related to the study of burial features (e.g., stones, orientation of graves) within the context of 18th- and 19th-century behavior. Above-ground survey would consist of a database that would enumerate graves and would include mapping known graves and matching published inscriptions from archival records. Below-ground archaeology ranges from non-intrusive geophysical studies of underlying features to slightly intrusive probing of soil deposits to reveal the number and alignment of unmarked graves.

25-2458 Dudek, Martin G.

2004 Summary Report for an Intensive (Locational) Archaeological Survey at the Stone Castle Condominiums Methuen, Massachusetts. 139 pages.

The survey consisted of 105 test pits, 82 systematic test pits in 3 blocks and 5 transects, 12 judgmental, and 11 bracket test pits, all 50x50cm, excavated across two areas comprising about 77 acres. The project area has been in use as a farm from the early 1800s until recently. The James Messer House and outbuildings (MHC# MET.519) and the barn located across the street (MHC# MET.525) are within the original parcel. The James Messer Farmhouse and two adjacent outbuildings will not be demolished, however, the farmhouse is not considered significant because of substantial replacement of the original structure circa 1905-1910. The other six standing structures date to the 20th century, four were photo-documented because they will be removed. The 1940s barn is to be removed. It is not considered significant. Another six early-to-mid 20th-century structures are known from old photographs and an interview with the present owner, who has lived at the farm for 84 years. Archaeological testing recovered scattered historic or modern materials. A low-density prehistoric activity zone, the Hovanasian Site, was identified; it yielded 21 quartz artifacts from plowzone contexts, including a Small Stemmed biface, a biface edge fragment, 6 flakes, and 13 pieces of shatter from 11 test pits scattered over a 220m long area. The site is not considered significant because of the diffuse, low-density distribution and the recovery of all artifacts from plowzone contexts. No other significant cultural resources were identified and no additional archaeological work is recommended.

25-2459 Leveillee, Alan, and Donna Ingham

2004 Intensive (Locational) Archaeological Survey and Archaeological Site Examinations MH#2 and MH#4 Sites Fieldstone Landing Residential Subdivision Project Area, Berkley. 100 pages.

The MH#2 northern locus is a highly concentrated and spatially limited stone tool maintenance area occupied during the Late Archaic Period. Its contextual integrity has been compromised by agricultural land use and plowing. The MH#2 southern locus is a stone toolmaking and shellfish processing area occupied during the Late Archaic Period. The site has been impacted and spread by relatively recent episodes of deep agricultural plowing. No evidence of intact portions of truncated cultural features was identified within the site area, including the section predicted to be most sensitive to contain such deposits. Multiple years of collecting has also depleted the artifacts from this site. The contextual integrity of the MH#2 southern locus is poor and is not expected to yield data beyond those collected to date. The spatial integrity of the MH#4 Site is fair to poor. The only in situ context with meaningful vertical and horizontal integrity within MH#4 is the remnants of Feature 1, a low-density trash deposit, reflecting cleaning following food preparation and stone tool maintenance activities. Archaeological deposits within the larger site area have been impacted by recent agricultural land use. The majority of the site assemblage is associated with plowed soils and Feature 1. At one time, materials may have been concentrated in the vicinity of Feature 1, but years of agricultural activity, specifically plowing, have impacted and spread the assemblage across the greater site area and likely destroyed any surface concentrations and shallow features. Multiple years of collecting has also depleted this site. Lacking overall integrity, and with limited promise for data beyond those collected to date, the MH#4 Site is not likely to meet National Register eligibility criteria. No additional archaeological investigations were recommended.

25-2460 Graves, Anna K., and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey, Cingular Wireless Telecommunications Facility, Canton, Massachusetts. 54 pages.

This survey, conducted on the Canton Fish and Game property, included informant interviews, a walkover survey, and subsurface testing of the 40x50ft lease compound to locate and identify potentially significant archaeological resources that may be affected by project construction. A total of ten, 50x50cm test pits was excavated along two, 5m interval transects, and in five judgmentally placed test pits. No archaeological deposits within the project area were found. No further ar-

chaeological investigations are recommended.

25-2461 Herbster, Holly

2004 Technical Report, Archaeological Data Recovery Program, East Pasture Site (19-DK-238), Map 8, Lots 128.1 and 128.2, Aquinnah, Massachusetts. 258 pages.

These archaeological investigations were completed in 2003 and 2004 within an approximately 27,000 sq ft (2,600 sq m) building envelope and approximately 266 linear feet (80m) of an existing grass roadway. An intensive survey completed in 2003 and determined that the East Pasture Site was eligible for listing on the National Register of Historic Places (see report #25-2364). A total of 103 sq m was excavated within the 2,670 sq m impact area, and combined with the intensive survey testing resulted in a 4.3% sample of the site within the project area boundaries. The archaeological investigations identified a high density of quartz chipping debris associated with 24 shell midden, hearth, postmold, and pit features. Lithic debitage and chipped-stone tools comprised the majority of the recovered artifact assemblage, while the shell midden deposits were the dominant feature type within the site area and contained large amounts of mammal bone together with fish, bird and reptile bone. Together, lithics, shell, and animal/fish bone comprised 99% of the 19,679 total artifacts recovered. Radiocarbon dating of three features associated the site with the Late Archaic Period and the Late Woodland Period. Recovered materials also included one complete bifurcate based projectile together with associated chipping debris and a fragmentary bifurcate based point. Other diagnostic projectiles tied the site to the Middle, Late, and Transitional Archaic and Early and Late Woodland periods. A small assemblage of Native American pottery and several historic period artifacts suggested site use through the Late Woodland/Contact and Early Historic periods. Small Stemmed projectile points dominated the chipped tool assemblage, numbering 68 of the 163 typed points collected at the site. The prevalence of quartz Small Stemmed points across the entire site area and in every stratigraphic level suggests this point style was an expedient utilitarian tool fashioned from quartz cobbles that were readily available throughout the Late Archaic through Late Woodland periods. The excavated portion of the East Pasture Site documented the use of numerous activity areas across a broad terrace and within a smaller swale bounded by wetlands. The types and densities of deposits collected at the site are nearly identical to those at the neighboring Gerhard Site (19-DK-237) indicating that these two sites are part of a larger habitation area along the southwestern margin of Menemsha Pond. No evidence of human burial features was identified within the project area portion of the East Pasture Site during the intensive survey or data recovery excavations. No additional archaeological investigations are recommended for the East Pasture Site impact area. Human burial features have, however, been identified at nearby sites and in feature types (including shell middens) such as those investigated at the East pasture Site. Portions of the identified site area, including several of the large shell midden deposits, were not fully excavated during the data recovery program. Therefore, it is possible that unmarked human burials could be present within the site area. Recommendations were made in accordance with the Massachusetts Unmarked Burial Law.

25-2462 Donohue, Barbara

2004 Intensive (Locational) Survey for the Proposed WNSI Taunton Cell Tower Site, No. 912003022A01, Taunton, Massachusetts. 40 pages.

Archaeologists performed a survey of a 100x100ft lease area. Documentary research and the excavation of 58 test pits (14 in one 30m block, 40 along 3 transects, and 4 brackets) were completed for a proposed cell tower site, access roadway, and underground utility line. In all 86 of 87 recovered artifacts ranged from historical (creamware and pearlware) to modern (Styrofoam). A single utilized quartzite flake was also recovered. The historical materials were from plowed soils. No further archaeological testing is recommended.

25-2463 Mahlstedt, Thomas F.

2004 Report Archaeological Testing For Fencing Lake Cochituate State Park Beach, Natick, MA. 17 pages.

A wooden split rail fence is proposed as a goose deterrent adjacent to the swimming beach at Cochituate State Park. The fence will measure between 286ft and 300ft and will employ between 38 and 40 posts (12" diameter) placed at 8-foot intervals. The fence will be sited to prevent flocks of Canada Geese from traversing from their grazing grounds in the day-use playing fields to the shoreline and into shallow water. Five prehistoric sites are recorded within the boundaries of Cochituate State Park (19-MD-216, 548, 549, 555, 576). The well-known ceremonial site Mansion Inn (19-MD-210) is located, just a short distance from the northern end of Lake Cochituate. 19-MD-576 is one of only a few sites within all of southern New England that has yielded the remains of Native American basketry; an avocational archaeologist saw it eroding out of an embankment near the state beach in the late 1960s. Prior to testing, walkover reconnaissance and a 1950s engineering plan revealed that considerable disturbance had occurred along the beach and sampling was meant to identify sections of the proposed fence that had not been previously disturbed. A total of 11 shovel test pits were excavated at the proposed locations of wooden posts. A 12th test was placed randomly near the end of the construction limits. Testing confirmed the presence of past soil disturbances and identified an area that was beyond the limits of disturbance. However, the area that was undisturbed yielded no evidence of Native American activity. The most interesting information that was derived from testing relates to the nature of the landscape and landform that comprises the project area. Unlike glacial till or drift, which varies greatly in its composition, but typically contains quantities of rounded cobbles, pebbles and gravel, the soils in the day-use area were virtually void of stone throughout the column, and as the depth increased the soils became increasingly finer and more silty. These soils are classified as lake or glacial stream deposits and specifically were derived from Glacial Lake Charles. The deposits that were laid down within the Lake Charles are well sorted and thinly stratified fine sand and silt and at the day-use beach ranged from as shallow as 16 cm to as deep as 73 cm below grade. No further archaeological evaluation was performed.

25-2464 Cherau, Suzanne G., Ben Ford, and Timothy Ives

2004 Intensive Archaeological Survey and Site Examinations, LAN-HA-23, LAN-HA-52, HS 91S, 19-WR-565, 19-WR-568, 19-WR-566, and 19-WR-567, Main Training Area, Devens Reserve Forces Training Area, Devens, Massachusetts. 190 pages.

Field investigations were conducted at four previously identified ancient sites and two historic sites where future construction projects are planed. The intensive survey testing consisted of 87, 50x50cm test pits divided among the archaeologically sensitive areas. Background research focused on a review of existing documents relating to premilitary and military land use patterns in the project area. The site examination testing consisted of 8, 50x50cm test pits at each of the four ancient sites and an additional 9 test pits at one of the sites. None of these four sites was determined significant. The site examinations at two historic sites included test pits and 1x1m units. Neither site was determined significant. The survey and site examination field investigations at the one newly identified historic site, HS 91S, determined that this cellar hole and associated material assemblage dates to the 18th and early 19th century. It is recommended eligible to the National Register under Criteria A and D. Avoidance and protection should be maintained in this site area, or mitigation measures including a possible data recovery, may be warranted.

25-2465 Herbster, Holly, and Suzanne G. Cherau

2004 Summary Report, Intensive (Locational) Archaeological Survey, Lot 531 Property, Aquinnah, Massachusetts. 32 pages.

This archaeological survey was conducted in compliance with the Town of Aquinnah Historic and Archaeological Resource Protection Bylaw, administered through the Aquinnah Planning Board. The survey included archival research, a walkover survey, and subsurface testing to identify any

potentially significant archaeological resources that may be affected by proposed residential development. A total of 19, 50x50cm test pits was excavated within the approximately 1.45 acre building envelope. No archaeological deposits were identified.

25-2466 Graves, Anna K., A. Peter Mair, II, and Duncan Ritchie

2004 Intensive (Locational) Archaeological Survey, Red Brook Estates, Southampton, Massachusetts. 92 pages.

The 78 acre project area occupies an elevated terrace at the juncture of Red Brook and the Manhan River. Sections of the project area bordering Red Brook will remain designated open space. The intensive survey included background research, informant interviews, a walkover survey, and subsurface testing to locate and identify any potentially significant archaeological resources. A total of 120, 50x50cm test pits were excavated along four, 30x30m sampling blocks and five linear transects. A few pieces of historic/modern period cultural material (iron, window glass) were the only items recovered from these test pits. No archaeological sites were identified from subsurface testing within the project area. A walkover inspection of the project area during the intensive survey confirmed the reported location of an early 19th-century sawmill site along Red Brook. The Searle and Wolcott Sawmill Site consists of a breached dam, raceway and fieldstone rubble marking a mill foundation and is associated with a sequence of rural industrial activity along Red Brook from the late 18th to mid 19th century. This site is considered potentially significant cultural resource. The current appearance of this mill site was documented with scaled drawings and photographs. Two 19th-century standing structures currently used as single-family residences are located in the northern portion of the project area. These houses will not be affected. Proposed construction of a roadway entering the project area from Gilbert Road will also avoid two modern houses located along the western boundary of the project area. No further archaeological investigation of the Red Brook Estates project area is recommended. The Searle and Wolcott Sawmill Site is located within designated open space and a 100ft riverfront buffer zone and it should be possible for proposed development to avoid this potentially significant cultural resource. The two standing 19th-century structures are also within designated open space and will not be affected by the project as it is currently planned.

25-2467 Waller, Joseph N., and Jennifer Macpherson

2004 Cultural Resources Investigations, Tennessee Gas Pipeline, Massachusetts Rehabilitation Project, Middlesex and Essex Counties, Massachusetts. 76 pages.

Cultural resources services involved a reconnaissance archaeological survey of delivery lines, sensitivity assessment and visual inspection of anomaly sites, and archaeological monitoring at anomaly construction sites. Cultural resources investigations established that TGP delivery lines traverse areas assessed as low, moderate, and high sensitivity for cultural resources. Background research and a walkover survey verified that all of the proposed work sites are n areas of extreme disturbances from previous pipeline construction, landfill operations, roadwork, and natural processes. Consequently, no additional archaeological investigations were recommended for the fourteen Phase 1 work sites. Prior to ground disturbances associated with the project, the archaeologists developed a protocol to include field inspection of anomaly sites and archaeological monitoring in areas of moderate to high archaeological sensitivity. Once identified, staff inspected each anomaly site and re-assessed the site-specific archaeological sensitivity for each site. Anomaly sites associated with the project were typically located in areas of shallow ledge, in wetlands, or in areas of extensive disturbances. No recorded sites are known to exist in the immediate proximity to any of the pipeline anomalies, and neither artifacts nor evidence for structural remains were identified. No additional archaeological studies were necessary. Monitoring was conducted at two anomaly sites along the Gloucester Delivery Line. Excavation proceeded to depths ranging between 4ft and 7ft below ground surface, with soils exposed in the excavated trenches consisting of extensively disturbed fills. No intact land surfaces or archaeological materials were recovered or observed during the excavation of any of the anomaly sites. No additional archaeological monitor-

ing was recommended.

25-2468 Graves, Anna, and William Brett

2004 Intensive (Locational) Archaeological Survey, Weaver's Cove LNG Project, Onshore Facilities, FERC Docket #PF03-04-000, Fall River, Freetown, Somerset, Swansea, Massachusetts. 138 pages.

A total of 157, 50x50cm test pits was excavated along 18, 10m interval transects, one 5m test pit array, and two judgmental test pits. One historic site, the Slade Farmstead and Cemetery (Swansea), was identified during the intensive survey. As currently proposed, the Weaver's Cove LNG Western Lateral will impact the far southern portion of three stone walls and berms that mark what appears to be access routes from the main road to the homestead. The main portion of the site (house, barn, and outbuilding foundations, stone well, and cemetery) is located between 60 and 330 ft outside of the northern edge of the project APE. Three Native American site areas were identified during the intensive survey, including the Wetland 3 Site (Swansea), the Head of the Cove 2 Site (Freetown), and the Barnaby Swamp 2 Site (Freetown). The Head of the Cove 2 and Barnaby Swamp 2 sites are located adjacent to several previously identified sites (see report #25-2202). No further archaeological testing was recommended for the Wetland 3 Site and the Head of the Cove 2 Site. Following the intensive survey, it was considered possible that the Barnaby Swamp 2 Site could yield additional classes of information on settlement patterns within the Weaver's Cove LNG project area. Avoidance and preservation in place are recommended for the Barnaby Swamp 2 Site. If avoidance is not possible, additional archaeological investigations at the site examination level are warranted to define site boundaries and assemble sufficient data to assess site significance.

25-2469 Graves, Anna K., and Duncan Ritchie

2004 Intensive (Locational) Archaeological Survey Wyman Public Water Wellfield, Bridgewater, Massachusetts. 64 pages.

Fieldwork was carried out in two stages. During the first stage of the survey, 49, 50x50cm test pits were excavated along three, 10m interval transects, in one 15m block, and one 5m test pit array. This subsurface testing documented one ancient Native American resource within the project area: the Red Wing Site. A total of 25 pieces of quartz, rhyolite, and felsite chipping debris, one Late Archaic period Atlantic type projectile point, and two hearth/firepit features were identified within the 15x15m area required for the proposed pump station. The Red Wing Site was considered a potentially significant cultural resource that could contribute information about settlement and resource use in the upper Taunton drainage basin. Avoidance was recommended. In the second stage of the intensive survey, supplementary subsurface testing was conducted in an alternative location for the pump station. Twelve, 50x50cm test pits were placed in two, 15m sampling blocks and four judgmentally selected locations. One test pit outside the footprint of the alternative pump station yielded three pieces of rhyolite chipping debris. The Red Wing Site contains a Late Archaic period, Susquehanna tradition component about 4000 to 3700 years old. Cultural materials (Atlantic point, chipping debris) and the two intact hearth/firepit features found in test pits were in the B1 horizon subsoil; the site appears to have good archaeological integrity. The results of supplementary subsurface testing indicated that the Red Wing Site is small (ca 500sq m) and does not extend into the alternative location. The Red Wing Site is a potentially significant cultural resource that could contribute information about settlement and resource use in the upper Taunton drainage basin. It is recommended that proposed construction avoid the Red Wing Site. The results of supplemental testing indicated that avoidance of the site should be possible and no further archaeological investigation of the Red Wing Site is recommended. Measures should be taken to protect the Red Wing Site during construction. If avoidance is not possible, then further archaeological investigation is warranted.

25-2470 Heitert, Kristen, and Suzanne G. Cherau

2004 Archaeological Reconnaissance Survey, MBTA Silver Line Phase III Project for the Boston Common, Boston, Massachusetts. 88 pages.

The goal of the reconnaissance survey was to develop pre- and post-Contact period contexts and predictive statements for archaeological resources within the Boston Common and to provide a comprehensive and proactive planning document for current and future proposed construction activities on the Common. Archival research included a review and synthesis of previous geotechnical and archaeological studies on the Common. A walkover survey to examine existing conditions and identify utility easements was also conducted. The majority of Boston Common was assigned moderate to high archaeological sensitivity at depths ranging from zero to 6ft below ground surface (bgs). The potential for more deeply buried pre- and post-Contact archaeological resources also was identified along the eastern edge of Charles Street at depths ranging from approximately 15–40ft bgs. Potential resources may include Middle Archaic–Late Woodland fishing stations, fishweirs, shell middens, base camps and/or semipermanent settlements; interments associated with the original configuration of the Central Burying Ground; the remains of British Revolutionary War encampments; 18th- and 19th-century landscaping episodes associated with the maintenance of the park such as fence postmolds and vegetative plantings; structural remains and features associated with the 19th-century ropewalks at the base of the Common as well as the workhouse and granary at the northeast corner of the park; 17th- and 18th-century trash deposits and, possibly, execution interments; and, stratigraphic evidence of large-scale land making episodes. Low archaeological sensitivity was assigned to those areas that have been previously tested (see reports #25-735, 1216, 1223, 1269, 1336) and/or heavily disturbed, including the Deer Park Maintenance Facility and the western perimeter along Tremont Street. The northwest portion of the Common containing the Boston Common parking garage also was assigned low archaeological sensitivity. An intensive (locational) archaeological survey is recommended for those areas that have been assigned moderate to high archaeological sensitivity; and that will be subjected to project-related impacts in the sensitive strata. These investigations could involve both hand- and machine-assisted excavations, depending on the nature and location of the proposed impacts.

25-2471 Doucette, Dianna, and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey: Myer's Farm, Greenfield, Massachusetts. 62 pages.

Myer's Farm centers on the 1777 Moses Arms Farmhouse included in the Inventory of Historic and Archaeological Assets of the Commonwealth. Also listed are the adjacent Lower Meadows Cemetery (MHC# GRE.810), and "The Meadows" area further north on Colrain Road. Colrain Road is a Native American trail and a known archaeological site (MHC# 19-FR-370) nearby indicates that archaeological properties associated with Native American use of the area may exist. The survey included background research and field investigations consisting of walkover and subsurface investigations. Sixty, 50x50cm test pits were excavated yielding a low density of historic cultural material, including ceramics, nails, glass, and a clay pipe stem from the plow zone horizon. This material is not considered to represent a significant archaeological resource; the proposed development will not impact any potentially significant archaeological resources. No further archaeological investigations are recommended.

25-2472 Dudek, Martin G.

2004 Intensive (Locational) Archaeological Survey for the Red Mill Village, Norton. 75 pages.

The intensive survey consisted of 50 test pits, with 47 systematic pits in one block and 4 transects and 3 judgmental test pits, all 50x50cm, excavated across three archaeologically sensitive areas within an overall project area comprising 53.1 acres. A fourth area is within the protected wetlands of the Canoe River floodplain and was not tested; a marked no-impact zone is recommended there. Historic property use included 19th- and 20th-century agriculture and mid-to-late 20th-century

gravel excavation. A low density of historic or modern materials was present in all three areas. Area 2 borders on the north wall of the White Family Cemetery (MHC NRT 801), with active use from 1801 to 1991. A 12ft (3.66m) no-impact buffer has been established for the project area abutting the north wall of the cemetery. Block 1 tested the area north of the cemetery wall, with one test pit, B1-8, located within the buffer. A possible grave shaft was identified in the south end of Test Pit B1-8, indicating a potential burial location along the cemetery wall and extending 2.17m north from the wall, within the no-impact buffer. It is recommended that an archaeologist inspect the protective fencing and signs for the no-impact zone prior to construction near the area and that an archaeologist monitor construction near the cemetery no-impact zone. No additional archaeological testing is recommended for Areas 1, 2, or 3.

25-2473 Herbster, Holly, Mary Lynne Rainey, and David Robinson

2003 Technical Report, Archaeological Reconnaissance and Intensive (Locational) Surveys, Nantucket Cable Terrestrial Route, Nantucket and Barnstable, Massachusetts and Archaeological Survey, Nantucket Cable Underwater Route, Nantucket Sound. 222 pages.

Terrestrial and underwater archaeological investigations were completed within the proposed Nantucket Cable project area in Nantucket and Barnstable. The terrestrial portion of the project area on Nantucket passes beneath paved streets in the downtown area. The proximity of existing buried utilities and a lack of previously identified sites in this area limits the archaeological sensitivity of this area and no subsurface testing was recommended. Two sections of the Barnstable route were assessed as having moderate to high archaeological sensitivity. The first is a 6,000ft section at the Kalmus Beach landfall. Archaeological monitoring during the construction phase of the project is recommended for this area. Intensive survey testing was completed along an approximately 2,000ft section of the route through the Barnstable Municipal Airport. Twenty-three, 50x50cm test pits were excavated along 10m interval transects. No cultural materials or features were located.

25-2474 Robinson, David, Michael C. Tuttle, Justin Bailey, Jeffrey Gardner, Warren Riess, Ben Ford, and Ward McIntyre

2002 Phase I Underwater Archaeological Reconnaissance and Intensive Survey for Submerged Historic Cultural Resources and Hubline Mainline and Deer Island Lateral Offshore Gas Transmission Pipeline Project. 242 pages.

An underwater archaeological reconnaissance and intensive survey of approximately 16,200 acres of sea floor in Massachusetts Bay was completed. Algonquin is proposing construction of 29.40mi long high-pressure natural gas pipeline (the HubLine MainLine), and an associated 5.40mi long lateral pipeline (Deer Island Lateral) across the sea floor within the offshore corporate boundaries of Beverly, Boston, Hull, Lynn, Marblehead, Nahant, Salem, Swampscott, Quincy, Weymouth, and Winthrop. The goals of the surveys were to identify submerged historic cultural resources (e.g. shipwrecks) within the offshore project APE and prepare management recommendations based on the surveys' results (submerged prehistoric cultural resources are addressed separately see report #25-2279). Achievement of these goals was accomplished by developing natural and cultural research contexts through background archival research and informant interviews and conducting field reconnaissance survey (marine remote sensing geotechnical survey and underwater video-documentation survey) followed by intensive underwater survey of select remote sensing targets by archaeological divers. Examination of project data established that the offshore project APE had a high archaeological sensitivity for submerged historic cultural resources, with nearly 500 vessel casualties documented in the general vicinity of the study area. Results of the reconnaissance field survey indicated that there were 67 remote sensing targets with potential for representing submerged historic cultural resources. Examination of these targets determined that six of them were shipwrecks, five of which were modern steel-hulled barges with low potential historic significance. One of the six targets, however, was identified as an historic, wooden-hulled sailing vessel with high potential historic significance. This target should be avoided during the pipeline's construction and installation and a no-anchor/no anchor sweep protective buffer zone of not less

than 100ft be maintained around the site in all directions. Algonquin has redesigned the proposed pipeline's alignment to avoid this shipwreck. No further underwater archaeological investigation is recommended.

25-2475 Robinson, David S., Ben Ford, Holly Herbster, and Joseph N. Waller, Jr.

2004 Marine Archaeological Reconnaissance Survey, Cape Wind Energy Project, Nantucket Sound, Massachusetts. 120 pages.

A marine archaeological reconnaissance survey was completed in Nantucket Sound along an approximately 12mi offshore transmission cable route and within an approximately 24sq mi area centered on Horseshoe Shoal comprising the proposed offshore location of a wind-powered electrical energy generation facility. The project area is located in both federal and Commonwealth of Massachusetts waters within the corporate boundaries of Yarmouth and Mashpee. The investigation involved archival research and field investigations consisting of remote sensing and vibratory coring surveys. Several zones with contextually intact paleosols and three remote sensing targets that are considered archaeologically sensitive were identified. The paleosols are buried under 5-10ft of marine sediments 8-10mi offshore, and are interpreted as an upland deciduous forest floor, a freshwater marsh, and a shallow freshwater pond, ranging in radiocarbon date from circa 10,000 to 5500 years B.P. These zones are considered to have moderate to high potential for containing submerged Native American cultural resources, while the targets have moderate potential to represent submerged historic cultural resources, while the targets have moderate potential to represent submerged historic cultural resources.

25-2476 Holmes, Richard, Carolyn Hertz, and Mitchell Mulholland

1994 Archaeological Reconnaissance Survey of the Milton Landfill Project, including a Portion of the "Massachusett" Hill Hornfels/Braintree Slate Quarry (19-NF-105), Milton, Norfolk County, Massachusetts. 67 pages.

A portion of the project area includes the "Massachusett" Hill Hornfels/Braintree Slate Prehistoric Quarry site (19-NF-105), which is listed on the National and State Registers of Historic Places. Much of the original site is now covered by the landfill, which is to be deactivated and capped. The northern boundary of the archaeological site skirts the edge of dumping activity. Recommendations are made to avoid disturbing the remaining intact portions south of the northern boundary of the site, to insure that a previously-surveyed area within the National Register property is protected from construction, and to guide planning for future use of the parcel. If avoidance is not possible, a data recovery project is recommended. A preservation restriction is recommended.

25-2477 Mahlstedt, Thomas F.

2004 Archaeological Monitoring of Relocation of Clivus Multrum Composting Toilet, Peddock's island, Boston Harbor. 17 pages.

The former MDC (now Department of Urban Parks & Recreation) moved a Clivus Multrum self composting toilet from its original location adjacent to Fort Andrew's Chapel to a location behind the New Guardhouse/Visitor Center. The DCR's (then DEM) Archaeologist assisted in monitoring. Peddock's Island is listed on the State and National Registers of Historic Places as part of the Boston Harbor Islands Archaeological District, and Fort Andrews is eligible for listing. The new location for the unit was selected because it had previously been tested for the existing septic system (which has never functioned), as well as for an existing Clivus that was installed in 1996. Archaeological sampling indicated that the entire area was fill to a depth greater than that which was needed for the placement of the Clivus, therefore the likelihood of affecting significant archaeological features or deposits was considered low. The backhoe excavation was monitored by DCR archaeologists. As anticipated from several previous archaeological investigations in the immediate vicinity, the entire excavation, which went to approximately 140cm in depth, was confined to

fill. Artifacts of probable military (Ft. Andrews) association (truck/car suspension spring, electrical wiring, broken urinal) were mixed with more recent, and in some cases very modem artifacts (plastic, paper, soda bottle). A stump dump, presumably of military origin judging from the advanced state of decay of the wood was encountered along the northern portion of the west wall, and extends an unknown distance up slope where surface disturbance is clearly visible adjacent to a stone wall. A MDC pit privy was located at the south end of the west wall of the excavation. The original natural beach or shoreline was not encountered. No artifacts, archaeological features or deposits were encountered. This entire area has conclusively been demonstrated to contain well over 1.5m of fill which the military brought in to build up the former beach thereby extending the island's workable land surface.

25-2478 Ritchie, Duncan

2004 New Neponset Valley Relief Sewer System, Data Recovery Program for Locus D of the Neponset/Wamsutta Site (19-NF-70), Canton, Massachusetts. 316 pages.

The data recovery program was developed to mitigate the impact of proposed improvements to the New Neponset Valley Relief Sewer planned by the MWRA. Locus D contained a Paleoindian period component that had been studied during a previous site examination conducted in 1989 (see report #25-542, 899, 1193). The research design for the data recovery program included problems and questions relevant to several issues such as paleoenvironmental reconstruction and Paleoindian settlement patterns, lithic technology and settlement mobility, scheduling of lithic resource procurement and intra-site structure. The sampling design required the complete excavation of a high-density concentration of cultural material. A 50% sample was excavated in the low-density sections of Locus D. Approximately 81% of the total area within Locus D was excavated during the data recovery program. The data recovery program yielded a large sample of Paleoindian cultural material consisting primarily of debitage and a small assemblage of chipped stone tools. Most of the tools and debitage were of "Neponset rhyolite", a distinctive material from an unknown source area. Chipped stone tools in the PaleoIndian assemblage included bifaces, a probable fluted point preform, unifacial sidescraper, and retouched flakes. The sample of over 3,000 pieces of debitage included 16 channel flakes from fluted point manufacture. The Paleoindian deposition within Locus D covered an area about 14mx8m. The focal point of this deposition was a lithic workshop and hearth feature located next to a cluster of boulders and cobbles. Charcoal from this hearth feature (Feature 3) yielded a radiocarbon date of 10,210±60 B.P. (Beta-75527). An Archaic period deposition covering an area about 10mx5m was identified in the northern end of Locus D. Most of the cultural material in the Archaic deposition consisted of Blue Hill rhyolite debitage recovered from a lithic workshop feature at the northern end of Locus D. A radiocarbon date of 5340±130 B.P. (Beta-75526) obtained from a hearth feature indicated that this later occupation took place during the Middle to Late Archaic Period. Specialized studies carried out as part of the data recovery program included paleoenvironmental reconstruction, geomorphological analysis of soils on Locus D and petrological and geochemical analysis of lithic materials ("Neponset rhyolite", unidentified volcanic rock, chert) to determine their source. These analyses indicated that the "Neponset rhyolite" is non-volcanic and may be an unusual weathered chert or quartzite. Analysis of pollen from a sediment core taken in wetlands near the site revealed that an early forest type containing spruce trees likely existed in the area during the span of the Paleoindian occupation of Locus D. Geomorphological analysis indicated that the terrace containing Locus D consists of fine sand possibly deposited as a lacustrine fan under the water of a post-glacial lake and later reworked by wind action after the lake had drained. The data recovery program on Locus D provided categories of information that will make an important contribution to current knowledge of the Paleoindian Period in southern New England.

25-2479 Mahlstedt, Thomas

2001 Archaeological Monitoring of Hazardous Materials Testing on Gallops, Great & Outer Brewster Islands and Clivus Multrum Installation on Grape Island, Boston Harbor Islands State

Park. 34 pages.

DEM's staff archaeologist monitored the removal of soil samples that were taken to test for hazardous waste on Gallop's, and Outer and Greater Brewster islands. This project represents Phase II of the Clean State Initiative asbestos removal on Gallops Island, commenced in April 1999 and was monitored (see report #25-1774). Significant prehistoric and historic resources are known to exist on these and other Boston Harbor islands and many of them are included on the National Register of Historic Places as part of the Boston Harbor Islands Archaeological District. This project also included the replacement of an outdated Clivus Multrum self-composting toilet. The existence of known prehistoric sites (19-NF-4 and 5) immediately adjacent to the work site made archaeological surveillance mandatory. Sampling on all three islands was performed by a tacked vehicle with a 5" auger drill and a 2" spoon attached to its end for extracting a soil column. On Gallop's Island environmental testing (4 samples) was confined to the building rubble and debris of the former power plant. No intact archaeological deposits or features were observed. On Outer Brewster Island, environmental sampling and drilling were confined to the extensively modified landscape of Battery Jewel and its associated military campus. A standard shovel test pit (ca 50x50cm) supplemented the machine samples. No intact archaeological remains were observed except for the landscape itself. The transformation of the west and southwest ends of Outer Brewster from a rough craggy rock exposure into a military facility has resulted in a significant historic landscape. On Grape Island, the work involving the Clivus Moltrum toilets was completely redesigned. The location for the existing, which was installed in 1995 under the archaeological supervision of an MDC archaeologist was reused with no additional excavation. The small Trailhead Clivus, installed in 1994 was removed from the island with no excavation or associated ground disturbing activities involved.

25-2480 Mahlstedt, Thomas F.

2004 Archaeological Testing for Test Drillings Fort Andrews, Peddock's Island Boston Harbor. 14 pages.

Peddock's Island is included in the Boston Harbor Islands Archaeological District. Fort Andrews has been declared eligible for listing in the National Register of Historic Places. Although several archaeological investigations have been performed at Peddocks there is potential for deeply buried soil horizons below the known fill deposits, and those horizons may contain Native American skeletal remains. Both test pit locations demonstrated the introduction of fill by the military as it initially prepared and later expanded and refurbished the campus of Fort Andrews. Other pipes probably exist in this area as well. It can be concluded that the advancement of the two proposed borings and the subsequent installation of monitoring wells will have no effect to archaeological resources on Peddock's Island, either as they relate to the National Register's Harbor Island Archaeological District or to the National Register-Eligible Fort Andrews. At the same time the archaeological testing was informative about some of the land transformation processes which the military undertook at the turn of the century when it turned East Head into part of the region's coastal defense system.

25-2481 Binzen, Timothy, Jennifer Wendt, Peggy Kelly, Christopher Donta, and Mitchell Mulholland

2004 Community-Wide Archaeological Reconnaissance Survey of Bedford. 127 pages.

A community-wide archaeological reconnaissance was conducted to identify previously recorded and possible archaeological resource areas. Data produced by this survey were integrated into a proposed archaeological site protection plan. The project included background research into Native American occupations that occurred before A.D. 1620 and historic uses of town lands after A.D. 1620; ranking of town lands into zones of low-to-moderate and moderate-to-high sensitivity (or likelihood) for archaeological resources, based on topography, water sources, soils, and previously recorded sites; a walkover inspection of selected archaeological sites and areas of high sensitivity; interviews with local informants and town personnel; and integration of this information

into thematic narratives of the town's past and development of an archaeological site protection plan for sensitive resource areas. When the survey began, 17 Native American sites and 5 historic sites in Bedford were on record at the MHC. During the course of the project, three additional Native American sites and 15 historic sites were added to the state inventory. During the survey, approximately half of the site locations were visited. The study found that Bedford contains multiple areas that possess moderate to high sensitivity for additional, unrecorded Native American and historic archaeological sites. Most of these areas have been subject to minimal disturbance, while some are known by artifact collections from agricultural areas and are partially disturbed. It is generally assumed that historic structures possess associated archaeological deposits and should be considered as sites although site forms do not yet exist for them. It is recommended that the town adopt a bylaw and establish a system of review designed to require archaeological surveys of sensitive areas and to protect archaeological sites.

25-2482 Binzen, Timothy, Peggy Kelly, Jennifer Wendt, and Kathryn Curran

2004 Archaeological Overview and Assessment of the Springfield Armory National Historic Site, Springfield. 120 pages.

An archeological overview and assessment was conducted at the Springfield Armory National Historic Site (SPAR). The national historic site encompasses approximately 55 acres and several buildings of the original armory complex. Designated by George Washington as the first United States arsenal in 1777, the Springfield Armory became a center for the invention, development, and manufacture of small arms. The national historic site contains two sections. The western section includes the Main Arsenal and Museum and is administered by the National Park Service (NPS). The eastern section includes multiple historic buildings and arsenals and is owned by the Commonwealth of Massachusetts, which has leased the property to Springfield Technical Community College (STCC). The overview and assessment entailed extensive background research at archival sources to obtain information concerning the known archeological resources, both Native American and historic, which have been recorded at SPAR. Historic maps and documents were compiled, and summaries of previous archeological research and surveys at SPAR were generated. A walkover reconnaissance and visual inspection obtained locational data for archaeological resources, which was entered into the NPS Archeological Site Management Information System (ASMIS). More than 70 historic archeological sites have been recorded. The result of the survey is an overview that details the archeological heritage of SPAR and summarizes the archeological sensitivity of SPAR to enable the management and protection of cultural resources and enrich the interpretive experience for members of the public. SPAR has high sensitivity for additional, unrecorded historic archeological sites. Systematic subsurface testing, followed by monitoring during the construction phase, is recommended for development actions programmed for SPAR that will involve disturbance or alteration of the ground surface. In currently paved areas, monitoring is recommended for actions that will occur near sites identified from the historic maps.

25-2483 Graves, Anna K., and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey, Deer Crossing Subdivision, Douglas, Massachusetts. 62 pages.

The development consists of 40 single-family homes on 110 acres. The survey included a walkover survey and subsurface testing to locate and identify potentially significant archaeological resources. A total of 121, 50x50cm test pits was excavated along five, 10m interval transects, and in six 30m testing blocks. The intensive survey documented two historic period resources within the project area. The former Douglas Town Farm (MHC #DOU.40), also known as the Aaron Benson Farm, is located in the eastern portion of the project area but will not be affected by the project plans as currently proposed. The remains of a small historic granite quarry were identified during the survey, likely dating to the late 19th or early 20th century. It is unlikely that further investigation of the quarry would yield additional information on turn-of-the-century quarry sites in Douglas. No further archaeological investigations are recommended.

25-2484 Graves, Anna K., and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey: White Brook Meadow, Easthampton, Massachusetts. 68 pages.

This survey was conducted on 46.8 acres. Documentary research indicates that a previously identified prehistoric site (19-HS-49) was reported near or within the project area. The survey included background research, walkover survey and subsurface testing to locate and identify potentially significant archaeological resources. Seventy 50x50cm test pits were excavated in four 30x30m testing blocks, and along three 10m interval transects. Despite extensive testing, no prehistoric cultural material was recovered; leading to the conclusion that 19-HS-49 is not located within the project area. The proposed project will not affect any potentially significant cultural resources; no further archaeological investigations are recommended.

25-2485 Dudek, Martin G.

2004 Summary Report for an Intensive (Locational) Archaeological Survey at the Salisbury Woods Development Salisbury, Massachusetts. 118 pages.

The intensive survey consisted of 50 test pits, with 35 systematic pits in five transects and 15 judgmental test pits, all 50x50cm, excavated across the project impact areas, comprising 17.9 acres. Bedrock exposures and marshland made up the majority of the project area, with localized areas of deeper and dryer soil. No prehistoric resources were identified. Historic property use included 19th and 20th-century quarrying and 20th-century dumping. A mid-19th-century granite foundation with 20th-century concrete elements is present in the project area, as are two brick and mortar wells. Recent landscaping and 20th-century quarrying has impacted much of the project area. Historic materials were concentrated in test pits located near the historic foundation; however, most materials date from the late 19th and 20th centuries and are not potentially significant. Stratigraphic integrity of historic occupations was not evident due to historic mixing or disturbance of deposits. No additional archaeological work is recommended.

25-2486 Ritchie, Duncan, and Anna Graves

2004 Intensive (Locational) Archaeological Survey, Lakewood Estates, Bridgewater, Massachusetts. 88 pages.

Background research revealed that the 17 acre project area was near several known ancient Native American sites located near Lake Nippenicket, and Hockomock and Titicut swamps and therefore had the potential to contain similar cultural resources. The project area contained well-drained soils adjacent to wetlands, often associated with Native American archaeological sites. Background research further indicated that the vicinity of the project area had been used for farmsteads and agricultural/pastoral activity since the late 17th to early 18th century. Portions of the project area had the potential to contain cellar holes, foundations, or other evidence of settlement from the 18th century to early modern period. Subsurface testing during the intensive survey was carried out on two find spots of Native American cultural material found during a walkover survey/surface inspection, in zones of moderate and high archaeological sensitivity and where proposed house lots, a detention basin, and roadway will be located. This subsurface sampling consisted of 70, 50x50cm test pits placed along 12 judgmental transects and within one 30x30m sampling block and three 5m array patterns. Subsurface testing identified four ancient Native American archaeological sites. The Lakewood Lane Site was found at the end of a proposed roadway (Lakewood Lane). Test pits placed within this site yielded Native American cultural material including 24 pieces of quartz and rhyolite chipping debris and a Neville type projectile point of quartzite diagnostic of the Middle Archaic Period (7,800-6,000 years ago). All of this material was found within a sandy loam plow zone. The Lakewood Lane Site was not considered a potentially significant cultural resource. A find spot of quartz chipping debris within the proposed detention

basin in the eastern portion of the project area was designated the Lakewood Estates Locus 1 Site. Subsurface testing of this find spot did not yield any other Native American cultural material. The Lakewood Estates Locus 2 Site consisted of four pieces of quartz and rhyolite chipping debris. Another small scatter of nine pieces of quartz, Attleboro red felsite and rhyolite chipping debris was designated the Lakewood Estates Locus 3 Site. Almost all of this non-diagnostic chipping debris was found in the plow zone horizon. The Lakewood Estates Locus 1, 2, and 3 sites were not considered potentially significant cultural resources. A few historic/modern period artifacts such as structural materials (nails, window glass) and ceramic sherds (redware, whiteware) were found in test pits located primarily in the proposed route of Lakewood Lane. This material represents small amounts of household refuse discarded in former farmland and was not considered to represent a potentially significant cultural resource. In the eastern end of the project area, proposed construction of a cul-de-sac on proposed Lakewood Lane will require the removal of a small, modern wood frame shed formerly used as a dog kennel. This structure was documented with photographs and not considered an important cultural resource. No further archaeological investigation is recommended.

25-2487 Whitney, Joannah, Ann Chapman, and Christopher Donta

2004 Archaeological Intensive (Locational) Survey for Cell Tower – CT43XC851, 454 Russell Street, Hadley, Massachusetts. 47 pages.

Following background research and a surface reconnaissance, specific locations within the proposed construction area were tested. A total of 12, 0.5x0.5m (1.6x1.6ft) shovel test pits were excavated at 7.5m (25ft) intervals. Soil profiles indicated a plowzone underlain by naturally developed B horizons. No archaeological features, deposits, or artifacts were identified. No additional archaeological survey is recommended.

25-2488 Carlson, Claire, and Tonya Largy

1998 Archaeological Site Examination/Data Recovery for the Barn Area of the John Alden House, Duxbury, Massachusetts. 100 pages.

The Alden Kindred of America, Inc., chose the site of the 19th-century barn as the site for a new visitors' center. Archaeologists completed a site examination and data recovery to excavate areas of high artifact density and potential features associated with the 19th-century use of the barn that were identified during an archaeological survey conducted in 1995 (see report #25-1630). Four 50cm×2m test units, one 1×1m test unit, and one 50cm×1m test unit were excavated. All of the units contained artifacts dating from the late 18th to 20th centuries. A total of 9,133 artifacts was recovered at the barn site. A fence post and two trash (midden) deposits were identified in the barn area. The project area was mapped and photographed extensively. All surface rocks were mapped with a transit and a map of the project area was drafted. This map shows the location and orientation of stones that were associated with the 19th-century barn. Excavations determined that the barn was built into the natural slope of the hillside and that the stones were used to support the sill. The Aldens did not dig a foundation and no builder’s trench was located during excavation. The excavation revealed that substantial disturbance from earth-moving has occurred at the site in the past. The integrity of portions of the site is poor. The archaeologists sampled the site adequately and found much of it to be disturbed by grading in the early 20th century. No further survey is recommended.

25-2489 Duranleau, Deena, and Craig S. Chartier

2004 Report of an Intensive (Locational) Archaeological Survey for the Whippoorwill Estates in Raynham, Massachusetts. 53 pages.

A walkover of the project area and background research were conducted, and 104, 50x50cm test pits were excavated in four 30m blocks and five transects. This subdivision is approximately 65

acres and is located near Bassett Brook. All test pits were spaced 10m apart. No prehistoric artifacts were recovered. Possible evidence of charcoal burning was encountered in the southern half of the project area. Archaeologists identified an historic house foundation and two wells that belonged to the Wilbur family from at least as early as 1830 until after 1895 (possibly as early as the late 18th century). The results of the intensive survey indicate that the Wilbur Farm Site, which encompasses the house foundation and the possible charcoal burn area, has the potential to contribute information important to our understanding of the rural farm economy and its interaction with the larger dual agricultural and industrial economy of the town of Raynham in the post-Revolution period (1800-1870). A site examination at both the charcoal burn and house foundation site is recommended.

25-2490 Whitney, Joannah, Karl Bodensiek, Mitchell T. Mulholland, and Christopher Donta

2004 Archaeological Intensive (Locational) Survey for the Proposed Sprint PCS Telecommunication Installation, Sprint #BS43XC830 (Sage #N1785) Pinehaven Cemetery, Burlington, Massachusetts. 64 pages.

The surveyed parcel is adjacent to the Pinehaven Cemetery and once was the location of the Burlington Poor Farm. The project area covers a total of approximately 2.15 acres, including a 12.2x12.2m (40x40ft) lease area, where the telecommunications installation will be constructed, a 3x122m (10x400ft) utility easement, and a 3.7x24m (12x80ft) access road extending from the existing cemetery road to the telecommunications installation. Seventeen, 0.5x0.5m (1.6x1.6ft) shovel test pits (STPs) were excavated, 15 at intervals of (7.3m) 24ft along the utility easement and access road, and two at the site of the proposed cell tower construction. Four, 0.5x3m (1.6x9.8ft) trenches were excavated within the cell tower construction area. Staff archaeologists monitored the subsurface work of the construction process to ensure unmarked burials were not disturbed by any construction related activities. Numerous artifacts were recovered that are associated with the poor farm. They indicate occupants with meager means. No features were encountered. The survey revealed that considerable damage, perhaps by bulldozing has occurred at this location. No archaeologically significant features or deposits were recovered during field-testing and no historic features were observed while monitoring. No further archaeological survey is recommended.

25-2491 Herbster, Holly

2004 Intensive (Locational) Archaeological Survey, MassHighway Assignment #9, Upper Charles Trail Phase I, Milford, Massachusetts. 69 pgs.

Eighty 50x50cm shovel test pits were excavated within the approximately 1mi section of the 3mi project corridor that was considered archaeologically sensitive. The intensive survey included archival research, a walkover survey, and subsurface testing and resulted in the recovery of a low density of late 19th/early 20th-century domestic and structural materials around two dry-laid stone foundations. These materials and features are associated with the Milford Granite Company, a quarry operation active around the turn of the 20th century. The foundations themselves will not be impacted by the proposed construction of the mixed-use trail but are potentially significant resources.

25-2492 Binzen, Timothy, and Jennifer Wendt

2004 Archaeological Reconnaissance and Intensive (Locational) Survey for the Route 2 Safety Improvements, Athol and Phillipston, Massachusetts. 69 pages.

Five survey units were tested. Seventy-one shovel test pits were excavated at intervals of 7.5m in linear transects parallel to the highway. Verification pits were excavated. Two archaeological sites

were recorded in Athol. The pre-Contact Striped Maple Site produced 14 pieces of quartz chipping debris from an area measuring approximately 8x8m. The chipping debris was recovered from subsoil, between 10cm and 70cm below the ground surface. The site is interpreted as a short-term campsite where stone implements were modified prior to hunting and subsistence activities. The Pleasant Street Historic Site consists of a pair of linear stone fences built of large, dry-laid fieldstones. The stone fences are parallel, oriented from east to west, and define a single lane that is 5m wide. Each fence is 1m wide and 0.75m high. The southern fence section is 55m long. The northern fence section is 45m long. Near its midpoint is a gap that would have allowed passage to the north. A small number of fragments of pane glass, bottle glass, brick, and whiteware were recovered from test pits excavated on the north side of the site, which is interpreted as a 19th-century cart path that passed between agricultural fields.

25-2493 Donohue, Barbara, Martin Dudek, and John Lawlor

1998 Archaeological Site Examination, Boston College Site BCLS PS2, Newton, Massachusetts. 82 pages.

A site examination was conducted at Boston College Law School Prehistoric Site, which was previously identified by an intensive survey (see report #25-1629); it consisted of the excavation of 56 systematic 50x50cm test pits and two 1x1m excavation units. The site boundaries were defined with a maximum north-south axis of 45m and a maximum east-west axis of 50m for a total area of 2250sq.m. The site, located on a terrace, is bounded on the south by a slope, on the north and west by disturbance from a previous sand and gravel operation, and on the east and southeast by a path (formerly part of Colby Road). It is located within 40m of a stream and associated wetlands (Edmands Brook), 250m of a Native trail (Center Street) and 225m of a slate outcrop. Three test pits had concentrations of prehistoric materials including a Neville-Variant point (Middle Archaic) within an area that has otherwise witnessed considerable disturbance from about 1950 though the 1970s. The site is a Middle Archaic camp/lithic chipping station. The site exam recovered 112 chipped lithics (26-felsitic rhyolite, argillite-39, slate-23, quartz-4, quartzite-8, granite-2, other-10), 6 bone fragments (4 calcined), 542 historic dump-related artifacts or coal-related minerals, 3 pieces fire-cracked rock, 3 granite spalls, 11 possibly cultural rocks, 14 pieces of charcoal, 2 shell fragments, and 14 pieces of charcoal from the 56 test pits and two excavation units. No tools, no diagnostic artifacts, and no features were found in the site examination. The intensive survey recovered 316 chipped lithics (including 4 bifaces and 1 uniface; felsitic rhyolite-258, slate-38, quartz-9, argillite-6, quartzite-3, granite-1, chert-1, other-3), 13 calcined bone, and 72 historic artifacts or coal-related minerals from the 24 test pits within the site examination area. Because of the extensive degree of disturbance at the site from recent landscaping, the site is considered to have low integrity.

25-2494 Ingham, Donna, and Duncan Ritchie

2004 Intensive (Locational) Archaeological Survey Proposed Woodside Village Residential Subdivision, Sandwich, Massachusetts. 76 pages.

Background research indicated that the project area had the potential to contain ancient Native American archaeological sites because of its proximity to local core areas of settlement at Mashpee and Wakeby ponds. The project area also had potential to contain evidence of historic/modern settlement and agricultural/pastoral land use. During subsurface testing, 46, 50x50cm test pits were excavated within areas of high and moderate archaeological sensitivity. Test pits were distributed within three, 30x30m blocks, one linear transect, and one 5m test pit array. One small locus of Native American activity was identified (the Woodside Village Site) comprising an isolated diagnostic, Late Woodland Period (ca. 1000 to 450 B.P.), Levanna point. This single artifact was likely discarded or lost by ancestral Mashpee Wampanoag. While the site contributes to what is known about Native American land use within the larger Mashpee subsistence territory, it is not likely that additional subsurface testing would generate more information. Therefore, this site does not meet National Register of Historic Places criteria for eligibility and no additional archaeologi-

cal investigations are recommended. An existing, modern period house in Lot 1 of the proposed Woodside Village subdivision will undergo minor repairs and remain in place; it does not meet the National Register minimum age criterion of 50 years and has no characteristics or attributes that would make it a potentially significant cultural resource.

25-2495 Dudek, Martin G.

2004 Intensive (Locational) Archaeological Survey for the Arlington Water Main, Mystic Valley Parkway, Arlington, Massachusetts. 105 pages.

The project corridor spans 640m along the Mystic River, with 488m outside of existing utilities; 420m is continuous open space. This area is within two of three recorded prehistoric sites collectively known as Goat Acre, from which hundreds of prehistoric tools were recovered in the late 1800s. Maps from 1899 to 1920 detail major landscape changes in the project area associated with Mystic Valley Parkway. Systematic testing at 10m intervals was planned; however, five shovel test pits (50x50cm) excavated across the project area indicated that 50 to 60cm or more of hard-packed clayey fill overlay the area. Historical material and several prehistoric flakes were recovered from the fill. The permit was amended to include ten machine-assisted trenches through fill, followed by manual shovel test pits (50x50cm) into natural strata below fill, with deep machine trenching at nine of ten locations. Thin, stony, historically disturbed A and B horizons over glacial till were present in the western 310m of the area, while the eastern 110m had natural wetland stratigraphy, with disturbance in the easternmost 40m. A low density of historic period refuse was recovered, with prehistoric resources limited to a few pieces of chipping debris from historically disturbed contexts in the western area and one quartzite flake tool from an intact, buried A horizon in the eastern area. The cultural resources are not considered to be potentially significant. The principal areas of the Goat Acre site were probably located south of the project area where dense residential development has taken place. Targeted monitoring of the pipe installation was recommended in the area where the flake tool was recovered.

25-2496 Dudek, Martin G.

2004 Intensive (Locational) Archaeological Survey for the Pine Hill Estates, Raynham, Massachusetts. 89 pages.

The survey consisted of 96 test pits, with 28 systematic pits in two blocks, 46 systematic pits in seven transects, ten judgmental test pits, and 12 bracket test pits, all 50x50cm, excavated across archaeologically sensitive areas within an overall project area comprising approximately 70 acres. Historic property use included late 18th- to 20th-century agriculture and, in the late 20th-century, gravel-pit excavation across half of the project area. Low densities of prehistoric and historic materials were present from most areas located within 100m of wetlands or streams. The prehistoric resources consisted of three low-density loci of quartz and/or rhyolite debitage (2 quartz cores, 2 utilized quartz flakes, 1 rhyolite flake tool). No prehistoric features or diagnostic artifacts were located. These loci represent low-density chipping stations and sporadic, short-term, wetland-margin activity areas. No additional archaeological work is recommended.

25-2497 Dudek, Martin G., and Barbara Donohue

2004 Intensive (Locational) Archaeological Survey for Bartlett Road and South Shore Road, Bike Paths, Nantucket, Massachusetts. 96 pages.

Archaeologists excavated two transects of systematic test pits, one for each bike path: 50 test pits at the 0.5km-long Bartlett Road bike path and 69 test pits at the 1.67km South Shore Road bike path. Test pits were all 50x50cm at 10m intervals, except when it was necessary to avoid utilities, filled wetlands, and driveways/roadways. South Shore Road had several utilities impacting all of the southern half of the bike path route; no test pits were excavated within that area. The survey documented filling and disturbances at both bike routes, with a low density of late 18th- to 19th-

century historic materials in fill or disturbed contexts and abundant modern materials from fill contexts. Several stone flakes or shatter pieces were recovered from fill with road gravels at both bike paths. Two small prehistoric pottery crumbs were also recovered in fill at one test pit along South Shore Road. These items were redeposited and are not considered potentially significant. Natural strata at both bike paths, wherever encountered, had no prehistoric and little or no historic cultural materials. No additional archaeological work is recommended.

25-2498 Herbster, Holly

2004 Technical Report, Intensive (Locational) Survey, MMR CS-20/CS-4 Plume Response, Falmouth, Massachusetts. 64 pages.

The proposed project includes the construction of a treatment plant on an approximately 2.8acre parcel and 21 groundwater wells that will be connected to the treatment plant by an approximately 6.6mi long, 20ft wide pipeline network. Two hundred forty three 50x50cm shovel test pits were excavated within the approximately 15,500 linear ft (4,720m) of proposed pipeline/well sites that were assessed with moderate archaeological sensitivity. No archaeological sites were identified during the survey.

25-2499 Dudek, Martin G.

2003 An Archaeological Site Examination at the Fisher-Richardson House, Mansfield, Massachusetts. 110 pages.

This site examination focused on the cellar, where 13 footers with support posts are planned to reinforce the structure. A series of eight excavation trenches covered the locations for all 13 footers. Archaeologists used 1/8th-inch screen and recovered over 4,000 items--principally architecture-related materials with a low density of domestic artifacts or food refuse. Construction of the original house has been dated to the 1740s, with an addition of equal size in 1800. This historical and architectural assessment is supported by the archaeology. Excavation trenches recovered a number of defunct stone footers, two historic disturbances or shallow pits, several shallow builders' trenches, and an earthen floor with associated materials. The earthen floor had residues with small sherds of pottery and glass, and organic remains—wood, plant fiber, seeds, etc.—embedded in it, representing a sealed context circa 1830-1860. Architectural historians judging solely on architectural indicators had previously suggested our conclusion that the earthen floor was the location of a former stair landing.

25-2500 Binzen, Timothy, Jennifer Wendt, and Jaime Moore

2004 Archaeological Reconnaissance and Intensive (Locational) Survey for the Water Main Improvements Project, Holbrook, Massachusetts. 39 pages.

This survey was conducted at the location of a proposed 396m (1,300ft) cross-country water main. Located at an elevation of 38m (125ft), and oriented from east to west, the proposed water main traverses a gradual, wooded, south-facing slope adjacent to the Tumbling Brook wetlands. The route for the water main is directly south of (and parallel to) the Holbrook-Braintree corporate boundary. A total of 47 shovel test pits (each measuring 50x50cm) were excavated at intervals of 7.5m in locations exhibiting high archaeological sensitivity in the eastern and western portions of the project area. No pre-Contact or historical artifacts were recovered. The Town Boundary Site, consisting of a linear ditch flanked by stonewalls, was recorded along the corporate boundary between Holbrook and Braintree in the central and eastern portions of the project area. This historic feature is 198m (650ft) long, and probably dates to ca. 1872, when Holbrook was incorporated. The feature will not be affected by the construction project.

25-2501 Bower, Beth Ann, and Sheila Charles

1982 Report on the 1975 through 1978 Excavations at the African Meeting House, Boston: Artifact Processing and Analysis. 183 pages.

This report describes the 1975-1978 excavations and analysis of artifacts and features, at the African Meeting House on Beacon Hill in Boston. The report begins with a description of the overall stratigraphy of the site and indicates that a burned soil layer, produced by a modern oil fire, covered the entire site, under which lay a 10cm-thick layer of brown loam. The southern portion of the yard had a layer of yellow and brown mottled clay beneath the brown loam. This southern area encompassed Features 5-9a/b, which included brick and rubble deposits and, in Feature 8, a builder's trench. The northern portion of the yard also had a yellow clay layer below the loam and a brown gravelly layer below the clay. This portion included Feature 10, a possible builder's trench for a brick pier. The east side of the Meeting House had dark brown soil on the surface changing to light brown soil, then to rubble, then to clay as the depth increased. Inside the Meeting House, a wooden floor, taken up in 1977, revealed an earthen floor into which one pit was then excavated. This pit was found to contain disturbed soil in which was found ceramics and bones. Below that level was a burned layer coinciding with a 19th-century fire in the Meeting House entryway. Archaeologists recovered many different types of artifacts. A wide range of ceramics came out of the ground including earthenwares, Westerwald stonewares, Jackfield ware, Whieldon ware, luster ware and creamware. Pearlware was the largest component of the ceramic group (approximately 40% of the assemblage). Fragments of Chinese, Japanese, and English porcelain were also found. Many items of glass were recovered including bottle glass, bottle closures, window glass, table glass, lighting glass, and milk glass. Marbles, buttons and jewelry of glass were retrieved as well. Clay pipe fragments, both plain and embellished, were excavated along with games, toys, buttons, and sewing items including fragments of fabric and leather. Coins and tokens were found as well as writing implements among which were slate pencils, lead pencils, and automatic pencils. Architectural materials appeared as well and included nails, screws, bolts, brackets, sash weights, and door hardware. Brick, slate, mortar, ceramic tile, and sewer pipe were found in abundance. Tools, cutlery, and ammunition came out of this excavation also. In the site analysis, it is determined that these materials date to the 1806-1840 period of the Meeting House's use. The artifacts are discussed as they relate to issues of ethnicity, social status and ceramics as economic indicators as well as foodways as revealed through faunal analysis (see reports 25-868, 25-1130).

25-2502 Herbster, Holly, and Suzanne G. Cherau

2004 Intensive (Locational) Archaeological Survey, Slaters Pond Dam Project, Oxford, Massachusetts. 86 pgs.

This survey was completed in two stages and included archival research, walkover/surface inspections, and subsurface testing. The first stage of the survey included the excavation of 25, 50x50cm shovel test pits within the access road and dam repair areas. The subsurface testing recovered a single fragment of rhyolite chipping debris, designated as the Sacarrappa Find Spot. This isolated lithic fragment was collected within a disturbed soil context and considering the absence of additional deposits such as features, this find spot has limited potential. The archaeologists also completed a walkover/surface inspection of exposed shoreline during the temporary drawdown of Slaters Pond to identify archaeological deposits, possibly including those associated with the previously identified pre-contact site 19-WR-431. No significant cultural deposits were identified in the drawdown area and no further archaeological investigations are recommended for either area.

25-2503 Heitert, Kristen

2003 Archaeological Reconnaissance Survey and Archaeological Resources Management Plan, Yankee Nuclear Power Station, Rowe and Monroe, Massachusetts. 64 pages.

The approximately 2,200 acre project area straddles both banks of the Deerfield River and is composed primarily of undeveloped woodland and steep slope. Fourteen historic period resources dat-

ing to the 19th century were field verified during the walkover survey including eight farm complexes and residences; one sawmill; one cemetery; one barn; two sugarhouses; and the abandoned Hoot, Toot & Whistle (HT&W) Railroad alignment. Moderate to high historic archaeological sensitivity was assigned to those areas with documented historic period resources and adjacent lands likely to contain associated structural remains and/or cultural material. The steep topography, lack of arable land, and soil disturbance precipitated by the construction of the HT&W, Sherman Dam, and the nuclear plant resulted in a predominately low historic archaeological sensitivity assessment for the majority of the project area. No prehistoric period resources were identified during the survey. The project area was assessed with predominately low prehistoric archaeological sensitivity for the same reasons cited in the historic sensitivity assessment. Moderate prehistoric sensitivity, however, was assigned to those areas adjacent to wetlands or on isolated upland areas in proximity to small streams or brooks (see report 25-2431).

25-2504 Leveillee, Alan, and Donna Ingham

2004 Intensive Locational Archaeological Survey Campus Community Hebrew Rehabilitation Center Project Area, Dedham, Massachusetts. 69 pages.

Fieldwork on the 163 acre parcel included excavation of 138 test pits amongst nine, 30x30m testing blocks, along two linear transects, and two test pit arrays around find spots. The testing recovered two isolated pieces of rhyolite chipping debris and an assemblage of approximately 100 pieces of 19th- and 20th-century ceramic, glass, metal, and bone fragments within a plow zone stratum. Neither the two rhyolite flakes or the field trash deposits, identified as the Karlstein/Chick Estate Site, represent a potentially significant site, or sites, and would not meet required criteria for National Register consideration. Accordingly, no additional archaeological investigations are recommended.

25-2505 Graves, Anna K., and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey Shrewsbury Edgemere Site Project Area, Shrewsbury, Massachusetts. 94 pages.

The 76-acre project area includes 36 acres previously surveyed in 2001 (see report #25-2412). The previous survey identiifed two pre-contact sites, Quinsigamond I (19-WR-817) and Quinsigamond II (19-WR-818). The current survey was conducted on the remaining 40 acres. Sixty-six, 50x50cm shovel test pits were excavated across the project area, which identified two additional pre-contact Native American sites (Quinsigamond III and Quinsigamond Find Spot) and provided additional information on the Quinsigamond II Site (19-WR-818). The Quinsigamond Find Spot consists of a low artifact density located on a narrow terrace. Additional testing of the Quinsigamond II Site further identified the extent of the site along a narrow terrace above Flint Pond. The cultural material recovered at the Quinsigamond II Site, including a high density of chipping debris, aboriginal pottery, and a Brewerton-eared projectile point, suggests a Late Archaic to Woodland period (5000–450BP) occupation. Site activities most likely included lithic reduction and food processing or storage. The Quinsigamond III Site, on a small peninsula adjacent to Flint Pond, contained a low density of chipping debris. Given the relative paucity of information regarding prehistoric settlement and subsistence patterns in the Flint Pond/Lake Quinsigamond area, avoidance of the Quinsigamond II and III sites is recommended. If avoidance is not possible, an archaeological site examination should be undertaken.

25-2506 Heitert, Kristen, and Matthew Kierstead

2004 Existing Conditions Documentation, 911 Main Street, Wilmington, Massachusetts. 36 pages.

An existing conditions documentation survey was completed for a portion of the Middlesex Canal (ca. 1794–1803) located at 911 Main Street in Wilmington. The documentation consisted of machine-sectioning the exposed southern end of the towpath to record its soil profile and interpret the

construction, materials, and characteristics of the feature; scaled plan and elevation drawings; and, the production of black-and-white archivally-processed 35-mm photographs of the towpath. An important research component of the project was the corroboration of archival sources that discuss the use of "puddling," a technique used to waterproof the canal by applying several layers of clay to its walls and then pounding them to compress the clay further. The section revealed a clear construction sequence for the towpath comprising two mixed fill stratum overlying intact topsoil and subsoil horizons. No evidence of puddling was identified. This lack of puddling—a time, money, and labor—intensive technique—suggests that the technique may have been abandoned along portions of the canal in the face of mounting financial and scheduling pressures after 1798.

25-2507 Donohue, Barbara

2004 Intensive (Locational) Archaeological Survey for the Stratton Hill Subdivision, Ayer, Massachusetts. 41 pages.

Archaeologists excavated 65 test pits (27 in two 30m blocks, 36 in seven transects, and two judgmentally placed) in a planned residential subdivision on a parcel of land approximating 177 acres, 111 of which remain open space. No cultural materials were recovered. No further archaeological testing is recommended.

25-2508 Donohue, Barbara, and Karen Michalec

2002 Site Examination Report for the Cherry Street Interceptor in Plymouth, Massachusetts. 84 pages.

During a prior intensive survey (see report #25-2153), archaeologists identified six prehistoric sites of which three were recommended for a site examination. The excavation of 13 shovel test pits and one excavation unit tested site 1. The site, which was quite small, approximately 10x20m, yielded quartz and rhyolite chipping debris, cores and scrapers typical of a short-term lithic workshop geared towards expedient tool production. No further testing was recommended. The other two sites, adjacent to each other, were tested with 124 shovel test pits and four excavation units. The area, approximately 36x84m, has been combined into one site that was used from the Late Archaic through Late Woodland periods, with a possible Contact period component. While the site contained some discrete disturbed areas, it still has the potential to yield information important to the prehistory of Plymouth. A protection plan for use during construction activities and to be monitored by an archaeologist is recommended because the site lies adjacent to the eastern edge of the project corridor. If the design plans change and the site cannot be avoided, then a program of data recovery is recommended.

25-2509 Donohue, Barbara

2003 Intensive (Locational) Survey Report for the Blackburn Property Cell Tower Site, Lakeville, Massachusetts. 41 pages.

Five test pits were excavated along two staggered transects in 10m intervals within a 13x24m area proposed for a cell tower; three test pits were excavated at 10m intervals along flat, undisturbed sections of an access roadway. No cultural materials were identified. No further testing is recommended.

25-2510 Donohue, Barbara

2002 Intensive (Locational) Survey for the Chubbs Brook Drainage Improvement Project, Beverly, Massachusetts. 35 pages.

Seven test pits were excavated within an approximate 80m long linear segment that had previously been determined to have potential for prehistoric cultural resources in a reconnaissance survey

(see report #25-1998). Only early 20th-century trash, predominantly flower-pot fragments, was recovered. No additional testing is recommended.

25-2511 Donohue, Barbara

2004 Site Examination Report on the East Groton Charcoaling Area (GRO-HA-12) Groton, Massachusetts. 63 pages.

Thirty-five 50x50cm test pits, two 1x1m units, and one 0.5x2m trench were excavated to investigate the East Groton Charcoaling Area (GRO-HA-12). A 0.5x5m trench bisected one of 35 charcoal kilns that had been previously identified (see report #25-1160). A total of 549 artifacts were recovered: 294 (54%) were charcoal, 234 (43%) were historic, 14 (3%) were modern, three (<1%) were prehistoric and four (<1%) were "other" (two possible fire-cracked rocks, one shotgun-shell casing, and one ferrous metal strip). The site, which is approximately 17x25m, dates to the end of the 18th to beginning of the 19th century. Charcoaling activities appear to have been associated with former iron making activities at the historic Forge Village. As the recovered materials may also have been associated with an unrecorded historic structure, no primary deposits or intact features were identified, and the area around the site has witnessed considerable disturbance form environmental testing, it is unlikely that further field investigation would provide more information that has already been revealed. The site is not considered National Register eligible, and no further field investigation or mitigation is recommended. Recovered prehistoric materials consisted of two secondary flakes and one piece of shatter. No further materials were revealed in the surrounding bracket test pits. No further fieldwork is recommended.

25-2512 Wheeler, Kathleen, and Shannon Provost

2004 Results of Phase IB Intensive Archaeological Site Locational Survey, Samuel Morse Homestead, Medfield (Norfolk County), Massachusetts. 24 Pages.

The site is represented by a shallow and rounded depression on a small knoll in a wooded lot south of Main Street, just east of its intersection with Pond Street. Testing took place on four sides of the cellarhole depression and in close proximity to it; the area sampled covers approximately 16x24m. Archaeologists excavated a total of 10 shovel test pits at 4m intervals, and one 1x1m test unit in a single day of fieldwork. The objective of the study was to verify the identification of the site as the 14-year occupation of Samuel Morse between 1663 and 1676, which burned during King Philip's War. A total of 450 artifacts was recovered, with most consisting of wrought nails (n=190) and brick (n=199). All materials can be safely attributed to the 17th and 18th centuries, but none were found to be clearly datable to the third quarter of the 17th century. Two pieces of Native American lithic debitage were recovered, with one flake each of rhyolite and quartzite. The site is potentially significant as the oldest, undisturbed Euroamerican domestic site in Medfield; more work is necessary to confirm this hypothesis.

25-2513 Donta, Christopher

2000 Archaeological Intensive (Locational) Survey for the Proposed Tenneco Pipeyard, Mendon, Massachusetts. 14 pages.

Background research identified several Native American sites along the Mill River drainage to the north and south; however, none were within the three-acre project area. Forty shovel test pits, each measuring approximately 50x50cm, were excavated in an intermittent grid pattern across the proposed impact areas. Two quartzite flakes and three pieces of quartz shatter were recovered; however, they were located within a disturbed context. A stone foundation and cellar hole were identified to the south of the project area, but are not expected to be impacted by the project. No further survey was recommended.

25-2514 Binzen, Timothy L., Timothy Barker, Mitchell T. Mulholland, and Peggy Kelly

2005 Archaeological Site Examination and Data Recovery Surveys of the Shea and Joyce Quarry Parcels, Quincy, Massachusetts. 67 pages.

During the Industrial Revolution, the Quincy quarries were a regional center of granite production and witnessed the employment of immigrant laborers and the development of innovative techniques in the manufacture and transport of quarried stone during a period of rapid architectural development. The surveys documented 30 historic surface features, representing 15 discrete archaeological sites, all related to historic quarry operations. The features included large and small quarry pits, the anchors of derricks that were used to lift stone from the quarry pits, and the bed and spurs of a narrow-gauge railway that transported granite blocks from the area. The project area included the Blue Hill Quarry, McDonnell Quarries Q16 and Q18, and seven small quarry pits that were in production in the 19th and early 20th centuries. Other quarry-related features included seven boulders bearing drill holes and/or iron staples, drills, and rods; four stone blocks bearing iron staples or brackets; two concrete pads; four concrete/retaining walls; five piles of waste trimming stone; one pile of stone blocks; and one tangled metal cable. The main east-west grade of the narrow-gauge railway was 1,420ft long, and the north-south segment was 780ft. Multiple railway spurs and extensive piles of grout or waste stone were recorded. The data recovery program included photographic recordation of features and excavation at work areas at the Blue Hill Quarry (three exploratory trenches), the walls at the Features 27 and 28 Site (six STPs), and a possible early exploratory quarry at the Feature 30 Site (six STPs). Mitigation measures also included curation of moveable quarry features, production of a brochure for popular distribution, and installation of an interpretive sign to educate the public about the historic quarrying activities in the project area.

25-2515 Whitney, Joannah, Ann Chapman, Jennifer Wendt, and Timothy Binzen

2005 Archaeological Intensive (Locational) Survey of the Melone Parcel, for Sprint PCS Wireless Communications Facility #BS13XC620, North Road, Sudbury, Massachusetts. 46 pages.

The project area is located north of North Road and immediately south of the Concord town line. The project includes a 40x40ft construction area, where the cell tower will be placed, and a 240ft long access road that runs to the west. After conducting background research and surface reconnaissance, specific locations within the project area were tested. A total of 14, 40x40cm shovel test pits were excavated. Soil profiles indicated a sandy, gravelly soil with a plow zone or fill layer underlain by a natural B horizon. No prehistoric or historic remains were recovered. No further archaeological testing is recommended.

25-2516 Mulholland, Mitchell T., Joannah L. Whitney, Margaret Kelly, Christopher L. Donta

2005 Archaeological Intensive (Locational) Survey for the Proposed Cell Tower – Sage #N1738, Huntington, Massachusetts. 50 pages.

Following background research and a surface reconnaissance, specific locations within the proposed construction area were tested. In all, 21, 40x40cm shovel test pits were excavated at 7.5m intervals at the proposed tower location and access road. A portion of a stone quarry was determined to be insignificant. No cultural materials associated with the quarry or other activities were recovered. No further archaeological survey is recommended.

25-2517 Doucette, Dianna

2004 Archaeological Site Examination: Hallmark Village I and II Sites, Hallmark Village, Montague, Massachusetts. 87 pages.

Archaeological site examinations were conducted for the Hallmark Village I and Hallmark Village II Native American sites located on a 16 acre parcel. The study involved a review of previous archaeological investigations within the two site areas to develop theoretical and research contexts

to guide the site examination. Thirty-nine 50x50cm test pits and nine excavation units (7, 1x1m and 2, 0.5x1m) were excavated among the two site areas, producing 2,733 pieces of chipping debris, 43 chipped-stone tools (projectile points, bifaces, scrapers, cores, preforms, worked flakes), one piece of calcined (burned) mammal bone, and a few small pieces of charcoal. In addition, one cultural feature identified as a cache of artifacts was exposed at the Hallmark Village II Site. The majority of the cultural material was recovered between 20cm and 50cm below the ground surface in intact, well-drained sandy soils. Although both the Hallmark Village I and II sites produced a dense concentration of cultural material, both sites are extremely small and lack datable features. Based on the results of the site examinations, neither site is expected to produce any new information beyond that already recovered. Therefore, no additional archaeological investigations are warranted.

25-2518 Howlett, Katherine, Stephen Silliman, and Elizabeth Kiniry

2004 Initial Survey and Identification of Archaeological Resources at the Historic Winslow House in Marshfield, Massachusetts. 116 pages.

This property is the remaining portion of the Careswell Winslow estate, originally granted to Edward Winslow, Mayflower Pilgrim and three-time governor of Plymouth Colony. The extant house on the current 20 acre parcel was once believed to have been built by his grandson Isaac Winslow and was continuously occupied until its acquisition and maintenance as an historic house in the early 20th century. A review of identified archaeological sites in Marshfield and associated Winslow historic documentation indicates that the potential for intact cultural resources on the property is very high. Further, local oral tradition has suggested the existence of a tunnel leading from the cellar of the existing 18th-century structure. The current project was initiated to identify pre- and post-Contact archaeological resources on the property, to aid in future management and protection of those resources, and to investigate the possible existence of a tunnel associated with the house. This survey included non-invasive geophysical testing of the majority of the cleared landscape and subsurface testing on a systematic 10m grid for the land immediately surrounding the extant structures. More extensive excavation (2, 1x2m units) was undertaken to define the features associated with the house structure on the south and east sides. The physical testing of the property was complemented by a review of documentation relating to the history of landscape use on this property and in the wider Marshfield area including documentation of archaeological findings, text records, and more recent historiographic syntheses. The results of the geophysical and archaeological survey to date have not identified a tunnel, though the features associated directly with the structure suggest a previously used bulkhead entrance, which was closed and filled, and deposition related to the repair and renovation of the house under its current stewardship. The property retains some archaeological features resulting from earlier activities. Significant features included an undisturbed shell-pit feature containing 18th-century European material; two areas of 19th-century domestic trash deposition immediately adjacent to the house; and an iron pipe within a trench, most likely dating to the early 20th century. The property has been affected by 20th-century landscape and structural preservation work. A small number of fragments of quartz debitage were recovered from widely scattered areas, suggesting that evidence of Native American occupation may have been disturbed by later occupation, and that testing further from the house may identify more intact remains. More intensive testing should be completed prior to any further property alterations. Continued collection and synthesis of house repair and maintenance records is also recommended.

25-2519 Cherau, Suzanne, and Jennifer Bonner

2004 Intensive (Locational) Archaeological Survey Arthur MacArthur USARC Marshfield, Massachusetts. 64 pages.

Subsurface testing of the 6,900 sq m wooded parcel consisted of 25, 50x50cm test pits at 10m intervals along one transect, one block, and seven judgmental test pits. A small assemblage of post-contact period cultural material was recovered and represents redeposited field refuse. No pre-

contact features or cultural material were recovered from the project area. No further archaeological investigations are recommended.

25-2520 Ingham, Donna, and Suzanne G. Cherau

2004 Intensive (Locational) Archaeological Survey, Methuen MAARNG Facility, Methuen, Massachusetts. 80 pages.

The 1913 Methuen Armory building and the 1956 Methuen Armory Garage, along with associated paved areas, occupy the periphery of the 6 acre parcel surveyed. Both buildings have been determined by the Massachusetts Historical Commission to be National Register eligible. Subsurface testing, consisting of 34, 50x50cm test pits arranged in two, 30x30m blocks and two, 5m arrays, was focused on the archaeologically sensitive central portion of the parcel. This testing identified two spatially-limited loci of pre-contact Native American cultural material, designated the Methuen MAARNG 1 and 2 find spots, and a low-density scatter of post-contact/modern period cultural materials. The Methuen MAARNG 1 Find Spot consists of a single piece of quartz chipping debris recovered from plowed soil. The Methuen MAARNG 2 Find Spot consists of a modified cobble recovered from undisturbed subsoil. Additional close-interval testing around both find spots did not yield further pre-contact cultural materials and neither find spot is considered a significant cultural resource. The low-density scatter of post-contact cultural materials recovered is associated with plowed soil and with thin, spatially-limited fill deposits associated with mid-to-late 20th-century use of the parcel by the MAARNG. These cultural materials are not considered to represent a significant cultural resource. No further archaeological investigation is recommended.

25-2521 Hoffman, Curtis

2004 Middleborough Little League Site Data Recovery Operation Final Report. 3 vols. Middleborough, Massachusetts. 890 pages.

The Middleborough Little League site (19-PL-520) was the locus for an intensive survey in 1996, a site examination in 1998, and an extensive data recovery operation from 1999 through 2002. During the data recovery, which is the principal focus of this report, students from Bridgewater State College and volunteers from the Massachusetts Archaeological Society working under the direction of the Principal Investigator excavated a total of 98.25 sq m. All samples were processed at the Bridgewater State College Archaeology Laboratory and are currently curated and displayed at the Robbins Museum of Archaeology in Middleborough. The Little League site is a significant locus for the Middle, Late, and Transitional Archaic phases, on the basis of 6 radiocarbon dates (5770±120B.P. GX-27302; 4770±150B.P. GX-27259; 3790±110B.P. GX-27301; 3640±80B.P. GX-27260; 2990±70B.P. GX-27261; 6250±80B.P. GX-31195 [all corrected]) and numerous diagnostic artifacts. Activities prominent at the site included the retrieval of drift cobbles and their manufacture into stone tools, the disposal of lithic waste in pits, the preparation of animal carcasses into bone tools and hides, and the preparation and storage of objects for use in what is interpreted to be ceremonial activities and trade. Some of the objects (Herkimer diamonds, chert polished pebbles) were obtained from sources a considerable distance from the site, while others (hematite, graphite) were obtained locally. The more mundane tools tended to be fashioned almost exclusively from locally available stone—either the arkose and argillite of the Narragansett Basin, or glacial drift cobbles of quartz, felsite, quartzite, and other materials deposited from distant sources. The local arkose, obtainable from an outcrop close to the site, may have been traded out for both utilitarian and ritual purposes. The site is potentially eligible for the National Register of Historic Places on the basis of Criteria A, C, and D. It contains some relatively undisturbed deposits and an unusually dense concentration of cultural materials. While the portion of the site sampled during the data recovery is cleared for construction, the recommendation is to conserve the remainder of the site in perpetuity via a historic preservation easement.

25-2522 Ingham, Donna, and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey: Green Lodge Interceptor Sewer Replacement, Canton, Massachusetts. 76 pages.

This survey included background research and field investigations. Seventy-four 50x50cm test pits were excavated along six linear transects, three test pit arrays, and at one judgmentally selected location, resulting in the identification of three previously unknown pre-contact Native American archaeological sites. The Milton-Hoosic 1, 2, and 3 Sites each contain low-density distributions of pre-contact Native American cultural material (rhyolite, quartz flakes) representing brief episodes of stone tool making. No subsurface features associated with this past activity were identified within any of the site areas. Glass and plastic fragments, along with an unidentified iron object and several pieces of redware, were also recovered from the Milton-Hoosic 3 site. The pre-contact Native American sites have limited information and are unlikely to yield additional data pertaining to past use of the area. No further archaeological investigations are recommended.

25-2523 Mair, A. Peter, II

2004 Intensive (Locational) Archaeological Survey: MassHighway Assignment #11, Huntsbridge Road Bridge Replacement, North Attleborough, Massachusetts. 81 pages.

This project area lies within the designated site boundaries of the Slaughterhouse Field Site (19-BR-2) and the general area is considered “a single large occupation zone”. This survey included archival research, walkover survey, and subsurface testing. Forty-one 50x50cm shovel test pits and one 1x1m unit were excavated within the proposed area of impact, resulting in the identification of a small pre-contact Native American archaeological site. The Huntsbridge Road Site represents an episode of lithic reduction consisting of a low-density scatter of Attleboro red felsite chipping debris covering approximately 7 sq m. No features or diagnostic artifacts were recovered. The Huntsbridge Road Site does not meet the criteria for listing in the National Register of Historic Places. No additional archaeological survey is recommended for this site.

25-2524 Herbster, Holly

2004 Summary Report, Intensive (Locational) Archaeological Survey, Dnistrian Property, Aquinnah, Massachusetts. 48 pages.

This survey included background research, a walkover survey, and subsurface testing. A total of 15, 50x50cm shovel test pits was excavated within the approximately 1.43 acre proposed project area. The survey identified one Native American archaeological deposit. The Lot 138 Find Spot consists of a single crystal quartz uniface collected at the edge of a slope in rocky and sandy soils. While this material documents Native American land use in this section of Aquinnah, it is not considered to represent a potentially significant archaeological deposit.

25-2525 Ingham, Donna, and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey: Proposed Fairfield Green at Mansfield Residential Development, Mansfield, Massachusetts. 80 pages.

Background research indicated that the project area had the potential to contain pre-contact Native American and post-contact archaeological sites. A walkover survey and archaeological sensitivity assessment identified zones of high and moderate archaeological sensitivity, as well as low sensitivity areas altered by modern period topsoil mining. Fifty-seven 50x50cm test pits were excavated within areas of high and moderate archaeological sensitivity, where project impacts will occur. Two loci of pre-contact Native American activity were identified. The Fairfield Green 1 and 2 sites consist of low-density distributions of pre-contact Native American and post-contact (19th/20th century) cultural material recovered from disturbed (plowed) stratigraphic contexts. No temporally diagnostic artifact types or subsurface features were identified. Neither site is consid-

ered potentially significant and no further archaeological investigations are recommended.

25-2526 Herbster, Holly

2005 Intensive (Locational) Archaeological Survey, Northeast Corner, A-3, A-5 And B-8 Parcels, Camp Edwards, Bourne and Sandwich, Massachusetts. 206 pages.

The 694 acre project area included moderate and high sensitivity portions of four parcels (Northeast Corner, A-3, A-5, and B-8) as determined by a previous base-wide reconnaissance survey (See report #25-929) and updated by the Massachusetts Army National Guard Regional Cultural Resource Manager. A total of 2,784, 50x50cm test pits were excavated within the four parcels and four additional test pits were excavated around an artifact surface find identified on the C Range. The survey identified 25 pre-contact site areas documenting hunting and lithic maintenance activities from the Middle Archaic through Late Woodland Periods. Sixteen of these deposits were classified as isolated find spots and no further testing was recommended. Nine sites, including a cluster around Ox Pond in Sandwich, are considered potentially significant.

25-2527 Mair, A. Peter, II, and Timothy Ives

2004 Intensive (Locational) Archaeological Survey, Chelmsford Phase 4F Sewer Project Area, Chelmsford, Massachusetts. 50 pages.

The survey was conducted to document the presence or absence of potentially significant archaeological resources using a combination of background research and subsurface testing. Background research indicated that the project area was situated in a sensitive area for Native American cultural resources. A walkover/surface evaluation of two proposed pump station locations revealed that both are located in low-lying wet areas, exhibiting low to moderate sensitivity for containing archaeological deposits. Ten, 50x50cm test pits were organized within two clusters, one at each pump station. No Native American or Euro-American archaeological sites were identified during the fieldwork aspect of the survey. No additional archaeological investigations are recommended.

25-2528 Binzen, Timothy L., F. Timothy Barker, and Ann Chapman

2005 Archaeological Reconnaissance and Intensive (Locational) Survey for the Meadowbrook Ventures Subdivision, Amesbury, Massachusetts. 55 pages.

A total of 108 shovel test pits were excavated at intervals of 7.5m in linear transects and in clusters containing four test pits each, placed in areas of high archaeological potential. The White Tail Native American Site, consisting of three test pits with chipping debris and fire cracked rock and the historic Colby Cemetery, dating from 1825 to 1868 were recorded in the northern part of the project area. Avoidance of both sites was recommended for the proposed construction and during ongoing logging and gravel quarrying activities.

25-2529 Binzen, Timothy L.

2005 Archaeological Intensive (Locational) Survey for the Streambank Erosion Remediation Project, South Hadley, Massachusetts. 48 pages.

The survey was conducted along 925 feet of riverbank on the Connecticut River for a streambank stabilization project. A previous archaeological reconnaissance survey for the Holyoke Hydroelectric Project determined that the parcel possessed moderate archaeological sensitivity for Native American resources and high sensitivity for historic resources because a portion of the South Hadley Canal was located nearby during the historic period (see report #25-62, 63, 259). Subsurface testing consisted of a linear transect of 38 shovel test pits at intervals of 25ft along the riverbank. No Native American cultural materials were recovered. A low volume of historic period artifacts was recovered from fill deposits that likely resulted from the filling of the South Hadley Canal

during the second quarter of the 20th century, the construction of an existing sewer line, and the subsequent disposal of low volumes of domestic refuse.

25-2530 Cooney, William

2005 Trip Report for the Emergency Trenching of the Steam Pipe for Building 9 at the Springfield Armory National Historic Site, Springfield, Massachusetts. 8 pages.

On March 28, 2005, a steam pipe leading into Building 9 at the Springfield Armory National Historic Site broke. A 2mx1.7m area around the pipe was exposed by construction workers. This area had been previously disturbed during the original installation of the steam pipe. Three 5-gallon buckets of back dirt were screened revealing a small amount of window glass and brick fragments. Based upon the prior disturbance of the area it was determined that no adverse effect on cultural resources would be caused by the steam pipe repair project and no further archaeological work beyond monitoring was necessary.

25-2531 Doucette, Dianna L.

2004 Intensive (Locational) Survey and Archaeological Site Examination, Franklin County Bikeway Site, Massachusetts Highway Department Assignment No. 10, Deerfield, Massachusetts. 88 pages.

The Massachusetts Highway Department (MHD) is proposing the construction of the Franklin County Bikeway in Deerfield and Montague, Massachusetts. The majority of the proposed route is within existing streets or a former railroad bed. One small section, measuring approximately 700ft (214m) in length, and including a proposed trailhead/parking area, traverses open space between McLellan Farm Road and the rail bed in east Deerfield. The intensive survey identified one previously unknown archaeological site (Franklin County Bikeway Site), which was determined to represent potentially significant resources. After consultation with the MHC and the MHD, a site examination investigation was completed at the Franklin County Bikeway Site. Overall, 52, 50x50cm test pits and four 1x1m excavation units were excavated within the Franklin County Bikeway project area. These materials consist of 54 pieces of chipping debris, one quartzite projectile point tip, and one quartz biface. In addition, one cultural feature, a reddened shallow pit, yielded a Late Archaic radiocarbon date of 3110±80 years before present (B.P.) (3150±80 B.P. Corrected; Beta 195747). The site examination collected sufficient information to answer basic questions about the site's size, age, and internal complexity. Although the Franklin County Bikeway Site produced a moderate amount of cultural material and a Late Archaic feature, it is extremely small and most of its context has been destroyed. Based on the results of the site examination, the site is not expected to produce any new information beyond that already recovered. No additional archaeological investigations are warranted at the Franklin County Bikeway Site.

25-2532 Doucette, Dianna, and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey: Hallmark Village, Montague, Massachusetts. 68 pages.

Background research indicated that the project area is the location of a previously recorded archaeological site (Hallmark Laboratories Site 19-FR-323) associated with the Native American settlement of the Montague area between 7,000 and 3,000 years ago. Field investigations included a walkover and excavation of 65, 50x50cm test pits, and the resulting in the recovery of approximately 207 pieces of chipping debris manufactured of quartz and a sedimentarymaterial, one quartz Small Stemmed projectile point, one sedimentary biface, one quartz core, one quartz scraper, seven pieces of red ochre (one of which is worked), and two pieces of charcoal. In addition, one charcoal stain feature was identified. The majority of the cultural material was recovered from the undisturbed B1 subsoil. The identified feature, chipping debris and Small Stemmed Point

recovered at the Hallmark I Site could be associated with the Hallmark Laboratories Site located along Industrial Drive north of the project area. The various lithic types of chipping debris, quartz cores, and hematite material recovered from the Hallmark II site area likely represent a small workshop, where lithic manufacturing and the extraction of red hematite were taking place. The Hallmark Village I and II sites are considered to be important archaeological resources and additional archaeological investigations at the site examination level to determine site boundaries, internal composition and integrity, and significance and eligibility to the National Register of Historic Places were recommended. (see report #25-2517).

25-2533 Dimmick, Frederica R. with a contribution by John A. Thompson

2005 Archaeological Reconnaissance of Medfield Town Land: A Model for Local Involvement in the Archaeological Process. 38 pages.

Between 1997 and 2001, the Medfield Archaeology Advisory Committee participated in a reconnaissance (Phase 1) investigation of a portion of Medfield town land north of High Street (Route 27). The project centered on three endangered loci within the area and proposed to record any archaeological sites and, at the same time, to train MAAC members in methods of archeological fieldwork. Fieldwork delineated one pre-contact period site on a sand esker, as well as evidence for historic period farming activities on the plain below. An analysis of the patterns of involvement of the committee members and of the positive results of their project, with recommendations for changes in future project planning, may serve as a model for other Massachusetts communities wishing to involve citizens in preservation of local historic resources.

25-2534 Donta, Christopher L., and Jennifer Wendt

2005 Archaeological Intensive (Locational) Survey and Site Examination Surveys for the Proposed Northwoods Retail Development, Taunton, Massachusetts. 172 pages.

The project involved background research and archaeological reconnaissance, intensive, and site examination surveys of a 51.5 acre parcel. The Phase 1 research involved the excavation of 102 test pits in three survey units, within which seven Native American archaeological sites were found: the Butternut, Northwoods, Dead Pine, Snake Bend, Kestrel, Split Oak, and Solstice sites, all but the latter of which were recommended for avoidance or additional survey. The Butternut Site contained a lithic scatter including Small Triangle and Orient Fishtail projectile points. The Northwoods Site contained a probable Small Stemmed point and a burn feature. The Dead Pine Site consisted of a rhyolite and quartz lithic scatter. The Snake Bend Site included a Small Triangle point and a well-preserved hearth feature. The Kestrel Site contained a large volume of quartz debitage, and at least one hearth. The Split Oak Site consisted of a lithic scatter, mostly quartz. The Solstice Site included one test pit with quartz flakes. Site examination of the Northwoods site led to a collection of nearly 1,200 artifacts, consistent with a Late Archaic to Early Woodland occupation, ca. 5,000-2,000 years ago, as well as tools that indicate a probable habitation site. An earlier Middle Archaic component may also be present, as represented by a single Neville point found at the edge of the site. Late Archaic artifacts include eight Small Stemmed points, two Small Triangle points, one Brewerton Corner Notched point, cores, bifaces, edge tools, scrapers, two grooved axes, and ground stone. One burn feature was documented in the northern concentration, and a second truncated burn feature was documented in the southern concentration. The site was undoubtedly once larger, as it continues right up to the edge of existing disturbance on its south and east sides. The Dead Pine Site is a small lithic scatter, mostly rhyolite, consisting of a collection of 235 artifacts, including a single Small Triangle projectile point, and a single post-mold feature. The Kestrel Site is large, with three high density concentrations of lithics associated with multiple features, including hearths and activity areas. Over 1,700 artifacts were recovered during the site examination, including a Small Triangle projectile point. The sites identified and investigated document the extensive use of the Snake River wetlands by Native Americans, most frequently during the Late Archaic to Early Woodland period, with a smaller amount of evidence for a Middle Archaic presence. It is most likely that these multiple site locations were occupied

seasonally over a period of many years, varying slightly based on the conditions and familiarity of the people staying there. Clearly these sites would have been easily accessed by transport along the Snake River, which connects to the Taunton River to the south, as well as the Canoe River to the north. In this respect, the sites in the project area would have been part of a local interaction sphere that would have easily included the areas from Mt. Hope Bay to Assawompset Pond, and north to Hockomock Swamp. It is recommended that the Northwoods and Kestrel sites be avoided by any proposed construction, because both sites contain moderate to high density deposits of artifacts in association with multiple features in intact soils.

25-2535 Heitert, Kristen B.

2004 Archaeological Intensive Testing Program, Frederick Law Olmstead National Historic Site, Brookline, Massachusetts. 110 pages.

This survey was completed in advance of proposed construction impacts associated with the FRLA Upgrade Life Safety Systems and Rehabilitate Historic Structures Line Item Construction project. Ten 50x50cm judgmental test pits and three 1x1m excavation units were excavated within the FRLA project area. The subsurface testing documented substantial soil disturbance associated with late 19th- and 20th-century utility line installations. The location and orientation of these utilities verify the infrastructure information provided on historic and modern maps. Two areas provided data about the presence of previously undocumented infrastructural improvements and the 18th and 19th-century, pre-Olmstead occupation of the property. First, the visitors' parking lot yielded evidence of a redware drainage tile system and the remnants of a possible stone wall base pre-dating the Olmstead occupation of the site. Neither feature is depicted on any existing maps of the property. The lot also contained evidence of a relict landscape associated with the former use of that area as a garden plot during the late 19th century. Second, an excavation unit placed in the service area contained a deeply buried fill deposit containing late 18th and early 19th-century cultural material including English white salt-glazed stoneware, creamware, pearlware, Westerwald stoneware, and lead-glazed redware. This deposit may be part of the wide-scale landscaping and filling effort associated with the Clark occupation of the property, circa 1809. Identification of these deposits augments previous studies of the early landscape history of the property and expands the somewhat meager 18th-century archaeological database for Brookline. Based on the results of the archaeological intensive testing, archaeological monitoring is recommended during the construction phase of the project in the visitors' parking lot and in the service area north of the main house. This strategy will expedite the identification of the potential features described above and the construction schedule. The archaeological monitoring will consist of identifying, recording and photographing any previously unidentified archaeological and/or structural features as they are exposed. It is further recommended that National Park Service personnel monitor construction activity in those areas not included in the archaeological monitoring plan to document any utility/infrastructural configurations that deviate from historic or modern utility plans of the property. Any additions or substantive alterations to the proposed construction plans will require additional archaeological review.

25-2536 Hager GeoScience, Inc.

2004 Archaeological Remote Sensing Services-Frederick Law Olmstead National Historic Site, Brookline, Massachusetts. 20 pages.

The survey areas consisted of the 1.75-acre parcel around "Fairsted," the residence and office of Frederick Law Olmstead, and a 5.46-acre conservation easement to the south. The objective of the investigations was to identify the locations of potential archaeological resources, including former foundations, drainage, roads, etc. within the upper 2m of the subsurface. Data were collected using ground penetrating radar (GPR) and electromagnetic (EM) terrain conductivity profiling. The surveys detected a number of anomalies of possible archaeological interest, including possible former foundations, pathways, and cultivated areas. Modern utilities rather than archaeological features, however, are responsible for most of the linear EM and GPR anomalies. Similarly, a number of

GPR anomalies appear to be caused by natural stratigraphic and shallow bedrock features. Many smaller, regular-to-irregular shaped anomalies of possible archaeological significance were also detected.

25-2537 Donta, Christopher L., and Margaret Kelly

2005 Archaeological Intensive (Locational) Survey for the Bourne Sagamore Rotary Route 3/Route 6 Grade Separation Project, Bourne, Massachusetts. 61 pages.

Background research, a reconnaissance survey and subsurface testing were conducted at three survey units, totaling approximately 18.5 acres, to the west and northeast of the existing Sagamore rotary. The background research did not identify any known cultural resources in the project area, although a Native American settlement was located in close proximity to the west. The field testing included excavation of 165 shovel test pits. One pre-Contact artifact was found, a single flake of white quartz, which was determined to be an isolated occurrence. Additional close interval testing around the findspot did not produce additional pre-Contact artifacts. Two test pits contained historic artifacts that relate to a nearby scatter of brick and glass in a bulldozed area. The artifacts and ground condition indicate that a 20th-century house may have been located at this site. No further survey is recommended.

25-2538 Griswold, William A.

2004 Final Archaeological Assessment Report Cape Cod National Seashore-Herring Cove Beach, Barnstable County, Provincetown, Massachusetts. United States Department of the Interior, National Park Service-Northeast Region. 99 pages.

The purpose of this investigation was to assess the historic or prehistoric archaeological deposits that may be disturbed during construction of vault toilets in the North and South Parking Lots at Herring Cove Beach and the construction of a lift station adjacent to the existing Herring Cove Beach Bathhouse. It included stratigraphic excavation of five 1x1m test units distributed within the proposed impact areas. The test units were, on average, excavated to a depth of 1m below present (asphalt) surfaces. All test excavation units exhibited deposits of prepared or sorted fill consisting of layers of packed, crushed gravel and clay immediately underlying the existing asphalt layer, followed by a deeply stratified layer of beach sand. A small sample of historic period artifacts was collected from the strata of each test excavation unit, including fill deposits (the overall artifact sample [< 25 items total] consists mainly of plastic fragments, iron nails, and bottle glass fragments). The location of an 8-inch diameter cast iron pipe section (possibly part of the original drainage/sewage system dating to the Bath House building's construction) at approximately 1m depth in the test excavation unit for the proposed Lift Station construction site at the Bath House, is not significant. The original construction date for the Bath House at Herring Cove Beach is presently indeterminate and the Bath House has not been evaluated for the National Register of Historic Places eligibility. Construction impacts as proposed at this time will not have an adverse effect on the Bath House structure or viewshed. Further excavations are not warranted, pending a decision regarding the location of the cast iron pipe section. If the Herring Cove Beach Project determines that the Life Station construction site requires repositioning due to the location of the cast iron pipe, a Phase I archaeological investigation will be necessary at the new location.

25-2539 Ingham, Donna, and Duncan Ritchie

2004 Intensive (Locational) Archaeological Survey Clam Pudding Pond Parcel, The Pinehills Development Area, Plymouth, Massachusetts. 115 pages.

Archaeologists completed a survey of the 72-acre Clam Pudding Pond parcel within The Pinehills development area. Preliminary plans include house lots and roadways in two areas to the east, west, and north of Clam Pudding Pond. Designated buffer zones will remain undeveloped around Clam Pudding Pond, wetlands, and the Old Sandwich Road corridor. Archival research indicated

that the Clam Pudding Pond parcel had the potential to contain both pre-contact and post-contact period archaeological sites associated with Native American and Euro-American activity given the presence of the pond, wetlands, and historic roadways. This parcel is near the historic settlement of Thrasherville, which was occupied from the late 18th century to early modern period. Fifty, 50x50cm test pits were excavated within identified zones of high and moderate archaeological sensitivity. Test pits were placed along eight judgmental linear transects, within one test pit array, and at six judgmentally selected locations. Subsurface testing identified of two loci of pre-contact Native American activity, designated the Pinehills Locus 14 Site and the Pinehills Locus 15 Site. The Pinehills Locus 14 site was a findspot of three pieces of chipping debris (rhyolite, quartz, hornfels). The Pinehills Locus 15 Site consisted of an isolated chipped stone tool, a quartz biface that may have been a preform for a Small Stemmed projectile point. Two 19th-century domestic sites, designated the Clam Pudding Pond Farmstead Site and the William S. Leland Summer Home Site were also identified. In addition, two abandoned alignments of Sandwich Road were documented within the site area. The older of the two roadways passes Clam Pudding Pond on its eastern side, while the more recent alignment passes the pond on its western side. Both are situated to the east and north of the present-day alignment of Old Sandwich Road where it passes by the pond. No further archaeological investigations are recommended for the Pinehills Locus 14 and 15 and William S. Leland Summer Home sites and the eastern and western alignments of Sandwich Road. Most of the western alignment is within a 300-foot-wide buffer zone along Old Sandwich Road. Sections of the eastern alignment are within this buffer zone and a 100-foot buffer surrounding Clam Pudding Pond. These buffer zones will allow sections of the eastern and western alignments of Sandwich Road to be preserved. If the Clam Pudding Pond Farmstead Site cannot be avoided, a site examination should be conducted to evaluate its significance.

25-2540 Ritchie, Duncan, and Kirk Van Dyke

2004 Intensive (Locational) Archaeological Survey of the Canton Senior Center, Canton, Massachusetts. 66 pages.

Background research on the approximately 22 acre parcel revealed that the project area was near several known ancient Native American sites located near Reservoir Pond and within the previously reported location of the Eliot School Site (19-NF-72). The project area consists of level terrain with well-drained soils. Background research indicated that in the vicinity of the project area there had been farmsteads and agricultural/pastoral activity since the late 17th to early 18th century. Portions of the project area had the potential to contain cellar holes, foundations, or other evidence of settlement from the 18th century to early modern period. The Lucy D. Downes House (CAN.144), which is included in the MHC's Inventory of Historic and Archaeological Assets of the Commonwealth, is within the southern portion of the project area. Subsurface testing was conducted in zones of moderate and high archaeological sensitivity. A total of 21, 50x50cm test pits were placed along four judgmentally oriented transects within the project impact area. One judgmental test pit was also used to investigate an archaeologically sensitive location. Subsurface testing identified deposits of ancient Native American cultural material that can be associated with the Eliot School Site (19-NF-72) including a Middle Archaic Period semilunar knife preform of Braintree Slate, a Terminal Archaic Period Orient Fishtail projectile point, and a non-diagnostic bifacial tool blade fragment, both made of rhyolite. Chipping debris of rhyolite, hornfels, and quartz were also recovered. The Eliot School Site appears to contain Middle, Late, and Terminal Archaic Period components ranging in age from about 7,500 to 2,500 years ago. The ancient Native American cultural material found in the intensive survey was in both the A horizon/plow zone and the underlying B_1 horizon subsoil. A few historic/modern period artifacts (nails, window glass, and ceramic sherds) were found. This material represented small amounts of household refuse discarded in an open yard and was not considered potentially significant. The portion of the Eliot School Site (19-NF-72) within the wooded northern portion of the project area has good integrity and could yield new information about ancient Native American activity in the Neponset River drainage. It is considered a potentially significant cultural resource. The southern portion of the project area has been modified by historic/modern period landscaping of the open yard associated with the house at 1476 Washington Street. The small amount of ancient Native American and

historic/modern period cultural material found in the open yard area is not considered significant. The Downes House at 1476 Washington Street is listed in the MHC's Inventory of Historic and Archaeological Assets of the Commonwealth. This structure will not be affected by the project as currently planned and is under a demolition delay. It is recommended that the proposed Canton Senior Center be designed to avoid the more intact part of Site 19-NF-72 within the northern portion of the project area. If avoidance is not possible, further archaeological investigation of the Canton Senior Center project area at the site examination level should be conducted.

25-2541 Donta, Christopher L., and Jennifer Wendt

2005 Archaeological Intensive (Locational) Survey for the Stonebridge Commons Adult Retirement Village, Hanson, Massachusetts. 61 pages.

An archaeological reconnaissance and intensive survey was conducted on a 58 acre wooded lot, resulting in the excavation of 98 shovel test pits in four survey units. Lithic artifacts were recovered from 12 different test pits in all four SUs. Sixteen artifacts were recovered: 13 quartz flakes, two rhyolite flakes, and one quartz core. The artifacts found in SUs 1, 3, and 4 were all restricted to one per test pit, while two test pits in SU 2 had two artifacts per pit, and one STP had three artifacts. Only six of the 16 artifacts were found in the undisturbed subsoil. Because of the low density of cultural material, the low number of artifacts recovered in an undisturbed context, and the lack of any features, it is unlikely that additional testing would identify any areas of concentrated cultural materials and artifacts within this project area. No further testing was recommended.

25-2542 Bonner, Jennifer L., and Suzanne G. Cherau

2005 Additional Intensive (Locational) Archaeological Survey, Camp Curtis Guild, Lynnfield, Reading, North Reading, and Wakefield, Massachusetts. 192 pages.

Archaeologists conducted an additional intensive (locational) archaeological survey of areas identified as having high, moderate, and low archaeological sensitivity within the 682-acre Camp Curtis Guild Massachusetts Army National Guard (MAARNG) facility. The additional intensive survey consisted primarily of field testing conducted during two separate mobilizations: one in June 2004 for the Cantonment area, and the other in October/November 2004 for the areas north of Carney Street and in the North Gate area. The two fieldwork mobilizations consisted of the excavation of 722, 50x50cm test pits within 41, 30x30m testing blocks, 16, 10m interval transects, 13 judgmentally placed test pits, and 23 arrays. The random testing in areas of high, moderate, and low sensitivity identified 10 new pre-contact Native American sites, which along with six of the previously identified pre-contact period sites were subjected to close-interval array testing. These sites range from find spots to lithic scatters to large workshop/activity areas. Six of the newly identified (CCG 17, 22, 23, 24, 25, 26) and four of the previously identified (CCG 5, 6, 9, 10) pre-contact Native American sites are recommended for further evaluation. These 10 sites could provide important new information related to habitation and stone tool production of an interior wetland environment in the Ipswich River drainage. These site areas should be avoided or additional archaeological investigations may be warranted in consultation with the MHC. The remaining four newly identified (CCG 18, 19, 20, 21) and two previously identified (CCG 3, 7) sites, while documenting the use of the general project area during the pre-contact period, are not considered to represent National Register eligible archaeological deposits. Their information content and research potential is limited. No further archaeological work is recommended for these six sites. A very low density of late-18th- through 20th-century cultural materials was recovered during the field investigations. These materials are consistent with the documented Euro-American agricultural use and documented military training activities and are not significant.

25-2543 Mulholland, Mitchell T.

2005 Archaeological Assessment of the Worcester Common Restoration Project, Worcester, Mas-

sachusetts. 34 pages.

Following the discovery of three gravestones beneath a sidewalk during permitted construction on Worcester Common, an archaeological assessment was requested by the State Archaeologist. The assessment determined the nature of the discovery and impacts that have occurred; reviewed 100% complete project plans to determine if other impact issues require discussion; and reviewed the precautions taken by the City of Worcester to avoid impacting human burials and gravestones during the Worcester Common Restoration Project. The assessment found that at least three stones beneath the former sidewalk are situated approximately 6 inches below grade (approximately 6 inches higher in elevation than predicted in earlier estimates). No damage occurred to the stones during the 2004 construction, but damage to two stones had occurred when the sidewalk was constructed in the 1970s. It is estimated that at least 24 stones lie below the surface of the proposed sidewalk. In addition, grinding of tree stumps and roots, and excavation of an electrical conduit could impact gravestones within 6 inches of the surface. The City proposes to cover the area with an additional 6 inches of gravel and loam as appropriate, prior to construction, thereby avoiding impact to the gravestones.

2001 Under Quabbin. WGBY Productions. VHS videocassette.

Divers go in search of the remains of four towns (Enfield, Greenwich, Prescott, and Dana) flooded by the construction of the Quabbin Reservoir. Archival photographs and interviews complement the terrestrial and underwater footage.

25-2545 Clements, Joyce M.

2005 “A Winding Sheet for Deborah George,” Searching for the Women of Ponkapoag. PhD Dissertation.

This dissertation is a feminist critical inquiry into ways of reading the archaeological and historical past. It explores the history of 18th-century Native American women from Ponkapoag (Canton), one of 14 Christian Indian reservations, called Praying Towns, established by Puritan missionaries in the 17th century. The work is feminist because it is interdisciplinary in scope, it employs women’s experiences as a source for knowledge, it uses gender as an analytical category, and it prompts social change through its findings. This research addresses two problematics: a method for finding Ponkapoag women in the limited texts that document their lives and a method for speaking about their lives in a way that reduces the appropriation of their voices. Feminist standpoint theories and the conceptual tools “imagination” and “experience” provide ways to address the first problematic, and particular textual strategies address the second. The dissertation blends historian Laurel Thatcher Ulrich’s use of the repetitious dailiness of primary sources to uncover muted histories, with anthropologist Margery Wolf’s use of experimental texts to create appropriate ways to speak for others. The search for Ponkapoag women evokes Roger Simon’s description of being summoned by history and responding to that summons by testifying anew. It accepts that speaking for women is an unavoidable part of historical testimony, and it endorses Linda Alcoff’s position that speaking for others is justifiable when it reveals the injustice of the past and promotes justice for people living today. This research finds ample evidence of Ponkapoag women, and it discloses the gendered touch of colonization. It reveals that colonization disadvantaged Ponkapoag women, and the guardianship system that was created to protect Praying Indians’ interests provided opportunities for some colonists to exploit, bully, and abuse them. This work departs from existing scholarship on 18th-century New England history through its focused attention on Ponkapoag women’s subsistence labor and social reproduction, its examination of colonial-Ponkapoag women’s relationships, and its analysis of physical abuse against Ponkapoag women. This information adds to New England colonial history in general, it offers original insights into Ponkapoag history in particular, and it reveals the value of revisiting history from a feminist perspective, with the compass set to gender.

25-2546 Smith, Leith

2006 Archaeological Intensive Survey, Hanlon Seawall Reconstruction Project, East Sandwich, Massachusetts. 34 pages.

A wood timber seawall located on Scorton Creek is in need of replacement with modern riprap. Construction activities were to impact a narrow terrace adjacent to the seawall and an upper terrace because of the creation of a temporary access road to the construction site. A Native American shoreline burial found 300m north of the site and documented burials and artifact finds on Scorton Neck suggested similar resources could be present in the construction area. Five shovel tests placed in the proposed access road revealed evidence of Native occupation from the Late Archaic or Early Woodland and Contact periods as well as the early Historic period. Cultural material derived from the A- and B-horizons included a low density of quartz and rhyolite flakes, a ballast flint flake, a Small Pentagonal quartz point, fire cracked rock, and a few fragments of brick and window glass. A 30m long, 50cm wide trench excavated adjacent to the seawall on the lower terrace revealed redeposited soils and fill to dominate that area. Minimization of potentially negative impacts to the upper terrace was recommended by covering the access road with temporary timber construction mats during the course of the proposed work.

25-2547 Waller, Jay, and William Brett

2005 Site Examination Archaeological Survey, Barnaby Swamp 2 Site, Weaver's Cove LNG Project, Freetown, Massachusetts. 38 pages.

The Barnaby Swamp 2 Site was identified at the terminus of the Northern Lateral during an archaeological survey in 2004 (see report 25-2468). The deposits were identified within the staked boundary of a proposed meter station site. Thirty-one, 50x50cm test pits and four, 1x1m excavation units were excavated within the Barnaby Swamp 2 Site. Native American cultural materials were recovered from 13 (42%) of the 31 site examination test pits and each of the excavation units excavated at the Barnaby Swamp 2 Site. The subsurface sampling yielded an assemblage of 238 Native American artifacts. The subsurface testing demonstrated that more than 94% of the Barnaby Swamp 2 Site artifact assemblage was recovered from plowed soils and that intensive agricultural plowing has disturbed the horizontal and spatial arrangement of the cultural deposits. While the report suggested that the Barnaby Swamp Site may not be considered eligible for listing in the National Register (See Report 25-2548 and 25-2549), the MHC considered the site to be eligible individually and also possibly as part of a potential archaeological district.

25-2548 Waller, Jay, and William Brett

2005 Summary Report, Supplemental Intensive (Locational) Survey, Weaver's Cove LNG Project, Freetown, Massachusetts. 28 pages.

The intensive survey included research, a walkover inspection, and subsurface testing. A total of 161, 50x50cm shovel test pits were excavated within the approximately 4,385 linear feet of additional areas of potential effects. The intensive survey resulted in the identification of five Native American archaeological deposits. The CSX #1, CSX #2, ISP #1, ISP #2, and the Taunton River Marsh sites each contained low densities of chipping debris, isolated tool fragments, all primarily from plowed topsoils. Intensive agricultural plowing has disturbed the horizontal and spatial arrangement of the cultural deposits at each of these sites, and numerous similar sites reported nearby. While the report suggested that the sites may not be considered to represent potentially significant archaeological deposits, MHC considered the sites to be potentially significant and requested site examination surveys (see reports #25-2468, #25-2547 and #25-2549).

25-2549 Brett, William, and Anna Graves

2005 Site Examination Archaeological Survey, Slade Farmstead, Weaver's Cove LNG Project, Swansea, Massachusetts. 54 Pages.

A site examination archaeological survey of the Slade Farmstead was conducted within the proposed project area. The Slade Farmstead was identified on the Western Lateral during an intensive (locational) survey in 2004 (see report #25-2468). The majority of the site (barn and possible house foundations, outbuildings, a well, and small cemetery) is located between 20m and 100m from the edge of the currently proposed area of potential effect (APE). The project area APE, as currently proposed, crosses three stonewalls located on the southwest and southeast sides of the farmstead. Ten 50x50cm test pits and two 1mx50cm excavation units were excavated within the APE and adjacent to the stonewalls. A very low density of cultural material was recovered during the site examination investigation, and the stone walls within the APE appear to define the boundaries of an access road and a pasture or yard enclosure. According to results from documentary research, the farmstead was owned and operated by members of the Slade family during the 19th century. Although the Slade Farmstead is a partially intact, mid- to late-19th-century farmstead, there are no significant associations that can be made between its former occupants and the history of Swansea or the surrounding area. Nor would there be any information gathered from further investigation of the resource, as the remains of 19th-century farmsteads are a relatively common resource in this region. While the report recommended that the Slade Farmstead is not considered eligible for listing in the National Register, the MHC determined that it was. No further archaeological investigations were recommended (See Reports 25-2547 and 25-2548) however because the significant elements of the site are beyond the APE. An avoidance protection plan was recommended.

25-2550 Conlin, David, and Brett T. Seymour

2004 Predisturbance Clearance Report—Pier One Ferry Landing, Charlestown Naval Yard, Boston National Historical Park. 14 pages.

Survey objectives for the Boston project included conducting precision GPS-positioned side scan sonar survey, subsurface probing for buried cultural materials, magnetometer survey, and recovery of sediment samples for pollutant analysis. Examination of the underside of the pier was an additional task added to the survey at the park's request. The survey was designed to detect magnetic anomalies possibly representing submerged cultural resources, such as historical shipwrecks and materials associated with shore-based land use, and to image the seabed to locate features on or above the sea floor of potential historical interest. Examination of the potential area of effect for the new floating dock did not produce any indications of historical materials. Probing is an indirect method for locating and inferring the nature of materials buried beneath the seafloor and, short of extensive excavation of the potential APE, there is no way to state with certainty what is or is not there. Based upon the limited area of impact of the planned action and direct diver examination, including visual survey, probing and remote sensing with side scan sonar a finding of "no adverse effect" was recommended.

25-2551 Cherau, Suzanne G., Matthew Kierstead, and Virginia H. Adams

2005 Cultural Resources Assessment, MBTA Silver Line Phase III Project Build Alternatives, Boston, Massachusetts. 188 pages.

The cultural resources assessment was undertaken for the Core Tunnel Segment including the proposed Bolyston Silver Line Station and the four alignment alternatives. The assessment consisted of archival research (e.g., cultural contexts, environmental settings, existing conditions) and field survey for aboveground resources. The assessment was designed to provide recommendations regarding the locations of potential sensitivity for archaeological resources and identified historic resources requiring further survey and/or evaluation. Archaeological sensitivity for belowground pre-contact and post-contact period resources was identified in portions of the Core Tunnel Segment and all four of the proposed alternatives along Tremont Street, Charles Street, Stuart Street

and Columbus Avenue. Additional research to determine the precise vertical depth of archaeologically sensitive strata in the project study area is recommended. This research would include a review of soil borings, current underground utility locations, and street widening plans and profiles. Historic aboveground resources dating from the 18th through 20th centuries were identified in the study areas of the Core Tunnel Segment and in the four proposed alternatives for portal options along Tremont Street, Charles Street, Stuart Street, and Columbus Avenue. These resources include National Historic Landmarks (Boston Common, the Public Garden, the Central Burying Ground, and the Tremont Subway Tunnel), one National Register Multiple Resource Area, National Register Historic Districts, individually listed National Register properties, one Local Historic District, and individual Local Landmarks. Also included are district and individual properties that are eligible for the National Register and/or pending Local Landmarks. Additional research, survey, and documentation is recommended in each of the project segments in order to complete evaluation of properties that have been previously inventoried, and to survey and evaluate properties that are 50 years old or older but have not yet been inventoried.

25-2552 Strauss, Alan

2004 Intensive Archaeological Survey of the Sully and Graham Cottages Houselots and Sewage Disposal System, Brewster, Massachusetts. 29 pages.

Background research indicated that no recorded prehistoric sites existed within the project area. Historical resources indicated that the area was the overall site of the Crosby Family Estate and that one bathhouse from that estate, “the Sully Cottage,” existed within the project area. The Cape Cod Museum of Natural History volunteered to excavate 10 shovel test pits as part of an initial archaeological survey. The Museum found that several of the test pits contained prehistoric chipping debris. Field investigations for the Phase I survey consisted of the excavation of 25 shovel test pits. A total of 17 prehistoric flakes and one stone tool fragment were recovered from the site. Soil profiles in the project area exhibited intact horizons that were overlain by windblown dune deposits. Because of the low density of artifacts, the absence of a variety of tool types, the lack of internal site complexity, and the absence of surface features, the project site is considered to have minimal research potential. The site therefore is not eligible for nomination to the National Register of Historic Places. No further archaeological investigations are recommended.

25-2553 Strauss, Alan

2002 Intensive Archaeological Survey of the Proposed New Senior Center at 230 Webster Street in Marshfield, Massachusetts. 34 pages.

An intensive archaeological survey of the proposed new Senior Center in Marshfield, Masachusetts was conducted. Background research indicated that no recorded prehistoric sites were situated within the project area, however known sites were located nearby. No historical sites were reported for the study area although the Webster Estate was located nearby and a gardener’s cottage from that estate was located within the project area according to the Marshfield Historical Society. Field investigations for the project included a surface inspection, followed by the excavation of 50 shovel test pits. A total of 20 pieces of prehistoric debitage was recovered during the subsurface investigations. The chipping debris suggested that stone tools were either made or sharpened on the site. The former gardener’s cottage was moved to Green Harbor village. It is likely that the foundation stones were scavenged and used elsewhere. A light scatter of 19th- and 20th-century historical artifacts were found. These artifacts do not appear to represent a significant historical deposit. It is believed that the prehistoric site is not potentially eligible for the National Register of Historic Places. Therefore, no further archaeological investigations are recommended.

25-2554 Strauss, Alan

2004 Intensive Archaeological Survey for the Proposed New Beach Parking Access Lot 29 Ocean

View Drive in Eastham, Massachusetts. 27 pages.

Background research indicated that no recorded prehistoric or historical sites existed within the project area. Field investigations consisted of the excavation of 40 shovel test pits. Testing was done in the areas of highest archaeological potential. Soil profiles in the project area exhibited intact horizons that were undisturbed. No cultural resources were identified within the project area. No further archaeological investigations are recommended.

25-2555 Bonner, Jennifer, and Duncan Ritchie

2005 Intensive (Locational) Archaeological Survey—Princeton at Bedford, Bedford, Massachusetts. 84 pages.

The proposed project area comprises an approximately 50-acre parcel. The survey included background research, a walkover survey, archaeological sensitivity assessment, and subsurface testing. Background research indicated that the project area was within an area of pre-contact period Native American settlement centered on the Concord and Shawsheen river drainages. During the historic/modern period, the project area was used as agricultural land associated with farmsteads located along Concord Road. The project area contained terraces and knolls of well-drained sandy soil types. Subsurface testing consisted of 50, 50x50cm test pits placed along 12 judgmentally located transects and in two specific places on a historic/modern period site. This testing documented natural A/plow zone and subsoil horizons over the majority of the project area with disturbed soils noted in some of the test pits. A small assemblage of post-contact period cultural material was primarily recovered from the A/plow zone horizon. The majority of the recovered cultural material represents redeposited field refuse ranging in date from the mid/late 19th century to modern period. Because of the sparse nature and relatively undiagnostic characteristic of these materials, they cannot be tied with any certainty to a specific land ownership/occupation of the parcel. One farm-related structure was identified within the project area and designated the Princeton at Bedford 1 Site. Based on the configuration of the structural remains and the associated artifacts recovered, the structure was likely a chicken coop associated with one of the farmsteads located along Concord Road in West Bedford. The structure post-dates 1850, however, the exact date is unknown. While the Princeton at Bedford 1 Site documented the agricultural use of the project area during the post-contact and early modern period, its information content and research potential is limited. No further archaeological investigation was recommended.

25-2556 Strauss, Alan

2002 Intensive Archaeological Survey of Parcels 1 and 2 at the former MCI/RCA Property in Chatham, Massachusetts. 47 pages.

An intensive archaeological survey (Phase I) of Parcels 1 and 2 at the former MCI/RCA property in Chatham was conducted. Background research indicated that there were recorded prehistoric sites within or adjacent to the project area. Historical resources indicated that the area was undeveloped throughout the historical period except for a school building in 1880 and the extensive use of the property as a wireless communications station beginning in the early 1900s. Field investigations consisted of a field reconnaissance followed by the excavation of 50 shovel test pits in Parcel 1 and 70 test pits in Parcel 2. A contingency plan was enacted in the vicinity of TP 8 in Parcel 1 because prehistoric artifacts were found. Four bracket units were excavated around TP 8 in Parcel 1 and a 1m unit was also excavated in this area to determine the nature and integrity of the prehistoric site. The prehistoric site found in the vicinity of TP 8 contained 58 lithic artifacts including a small fragment of a stone tool. This site contained disturbance in the upper levels and was restricted to an area roughly 5x7m in size. The site does not appear to possess archaeological research potential and no further investigations are warranted. Test Pit 34 in parcel 1 contained one quartzite flake. Additional testing in this area failed to locate any more prehistoric artifacts. This site has little research potential and no further investigations are warranted. Test Pit 37 in Parcel 1 contained a single quartz flake in a disturbed context with recent historical remains. The flake does

not represent a significant prehistoric site because of the poor archaeological integrity. No further archaeological investigations are warranted. The prehistoric sites found are likely associated with recorded site 19-BN-590. A prehistoric site consisting of three flakes and a possible sherd of pottery was found in Parcel 2 at Test Pits 22, 23, and 25. These artifacts were found associated with historical cultural remains and in a disturbed context. No further archaeological investigations are warranted for this site because of its poor archaeological integrity. No significant historical cultural resources were recovered during the project. The site does contain buildings and electric towers associated with the MCI/RCA wireless station. These features are outlined in the National Register form.

25-2557 Bonner, Jennifer, and Suzanne G. Cherau

2004 Archaeological Intensive Testing Program, Bunker Hill Rehabilitation Package 106, Boston National Historical Park, Boston, Massachusetts. 109 Pages.

An archaeological intensive testing program was conducted at the Bunker Hill Monument in Charlestown. Four 1x1m excavation units, two 0.5x3m trenches, and one 0.5x4m trench were excavated within the Bunker Hill Monument project area. The subsurface testing documented a substantial level of soil disturbance over the majority of the project area associated with the installation and implementation of a wide range of late-19th- and 20th-century improvements to the property (e.g., irrigation, drainage, grading, landscaping, plaza, and walkway). No significant archeological deposits were identified. The historic significance of the site and slight potential for human burials, including one Native American Revolutionary War combatant presently unaccounted for in the documentary record, however, warrants further consideration during the construction phase of the access ramp realignment and lighting and landscaping improvements near the obelisk. Based on the results of the archeological intensive testing, archeological monitoring of the work areas is recommended during the construction phase of the project. The monitoring would consist of identifying, recording and photographing any previously unidentified archaeological and/or structural features as they are exposed. Should suspected grave shafts be identified during this monitoring effort, then NPS staff will act in accordance with federal and state regulations pertaining to unmarked burials, including the Massachusetts State Unmarked Burial Law and the Native American Graves Protection and Repatriation Act (NAGPRA). Additionally, any substantive ground disturbance modifications to the construction plans would need archaeological review to determine whether an additional testing program is warranted.

25-2558 Ingham, Donna, Mark Lance, and Mary Lynne Rainey

2005 Technical Report, Intensive (Locational) Archaeological Survey, Proposed Surfside Wastewater Treatment Facility Upgrade, Nantucket, Massachusetts. 72 pages.

An intensive (locational) archaeological survey was completed for the eight acres of the existing 20-acre wastewater treatment facility that will be impacted by proposed upgrades. Archival research, a walkover survey, and subsurface testing were conducted as part of the survey. Subsurface testing consisted of 40, 50x50cm test pits arranged in four, linear, 10m interval transects and seven judgmentally placed test pits. No cultural material was recovered and no cultural features were identified. No further archaeological testing is recommended.

25-2559 Cherau, Suzanne G., and Jay Waller

2005 Historic Cemetery Delineation, James Cemetery, The Marina at James Landing Redevelopment/The Residences at Herring Brook, Scituate, Massachusetts. 59 pages.

This cemetery is located in the Greenbush section of the town. The project includes a wooded area adjacent to the historic cemetery, within the designated 50ft buffer zone previously established around the cemetery parcel. Proposed parking lots on the northwest and southeast sides of the cemetery will be located about 10-25ft from the cemetery parcel boundary. The cemetery delinea-

tion was designed to determine the full extent of unmarked graves in the proposed area of impact within the 50ft buffer zone. Archival research including town and family records was used to establish a historical context for the cemetery, which includes three grave markers of late-18th-century smallpox victims. The subsurface testing consisted of auger cores and six, 50x50cm test pits to examine the soil stratigraphy within the project impact areas and determine the depth of the topsoil-subsoil interface where the tops of grave shifts would have been visible. Machine-assisted testing was then used to strip the topsoils, including mostly fills, to the natural subsoils in systematic linear rows within these same project impact areas. The linear rows were oriented to intersect any present shafts, which were expected to be east/west oriented similar to the enclosed cemetery graves. No evidence of intact grave shafts or other burial-related features was identified. No additional archaeological investigations are recommended for the current project impact areas within the designated 50ft buffer zone around the James Cemetery. The remaining 50ft buffer zone around the cemetery should be avoided in future project developments or additional archaeological investigations may be warranted.

25-2560 Herbster, Holly, and Loren Millard

2005 Intensive (Locational) Archaeological Survey, MassHighway Assignment #17, Lower County Road & Swan Pond River Road Reconstruction Project, Dennis, Massachusetts. 55 pages.

The survey included archival research, a walkover survey, and subsurface testing. Thirty-five 50x50cm test pits were excavated along 10m interval transects within archaeologically sensitive portions of the project area, totaling 1,500ft (453m) along Swan Pond River Road. No cultural resources were identified in tested areas, located along the median of the residential roadway. No further archaeological testing was recommended.

25-2561 Chartier, Craig

2005 Final Report on Intensive Archaeological Survey Hummock Pond Road in Nantucket, Massachusetts. 38 pages.

Eight 50x50cm test pits (three systematically placed along a short transect and in one 10m block) were excavated in the project area prior to the installation of a new septic system. The impact to the project area includes the excavation of an approximately 10x12m leaching field bed as well as approximately 30m of pipe extending from the house to the leaching field. A total of 10 artifacts were recovered, all of recent date. No further testing is recommended.

25-2562 Ingham, Donna, and Duncan Ritchie

2004 Archaeological Data Recovery Program Talcott Site (19-PL-977). The Pinehills Development Area, Plymouth, Massachusetts. 291 pages.

The Talcott Site (19-PL-977) was located on a knoll overlooking the headwaters of the Eel River within the proposed location of a clubhouse for the Old Sandwich Golf Club. The Golf Club is within the northern portion of the 3,060-acre Pinehills development area that includes the former Symington-Talcott Estate. The Talcott Site was first identified during an intensive (locational) archaeological survey of the Symington-Talcott Estate conducted in August 2002 (see report #25-2325). Subsurface sampling of the site in this survey indicated that it contained archaeological deposits associated with ancient Native American activity from about 1,000 to 450 years ago (Woodland Period). Subsurface testing during the site examination (see report #25-2366) established the horizontal boundaries of the site and collected information about the integrity, density, and complexity of cultural materials and features, and the temporal range of occupations. The site examination established that the Talcott Site covered an area of 852sq m and contained two primary concentrations (Areas I, II) of cultural material and features. The testing yielded more than 500 pieces of rhyolite, quartz, argillite, hornfels, and chert chipping debris. Four complete and fragmentary chipped-stone tools were recovered. These tools included a basal fragment of a Late Ar-

chaic, Susquehanna Tradition Wayland Notched projectile point, a fragment of an untyped triangular projectile point, a biface fragment and a uniface. A hearth or fire pit within the central portion of the site yielded a radiocarbon date of 320±80 years B.P. (Beta 178688) or from 1,450 to 1,660 years ago when calibrated. The site consisted of a relatively small area with evidence of ancient Native American occupation during at least three temporal periods (Late Archaic, Late Woodland, Contact) from about 3,600 to 300 years ago. It was a well-preserved example of a multicomponent site in an interior environmental setting within the Eel River drainage basin. The Talcott Site was determined to be a significant cultural resource eligible for listing in the National Register of Historic Places. Avoidance of the site area was not feasible. The research design developed for the data recovery program contained a set of research contexts or problems relating to: depositional processes and internal complexity of sites in the interior of Plymouth County and the Eel River basin; cobble-based lithic technologies in the terminal moraine zone of Plymouth County and; late prehistoric and Contact period settlement in the interior of the Plymouth Harbor core area. A data recovery was completed within two artifact concentrations located inside the 852 sq m site area defined by the previous studies. Excavation units placed within Areas I and II yielded a relatively large sample of cultural material and features. Specialized analyses included radiocarbon dating of charcoal samples and petrographic analysis of lithic materials. The few items of possible Late to Terminal Archaic Period age were limited to a single Small Stemmed projectile point, several untyped argillite bifaces and chipping debris of quartzite and argillite. The single Susquehanna Tradition point (Wayland Notched) found in the previous site examination may be an isolated artifact discard and not evidence of an actual occupation event. Two Early Woodland Meadowood points may be the only remains of a single brief occupation sometime between about 2,800 and 2,500 years ago. No clearly diagnostic Middle Woodland items were recovered. A small amount of hornfels chipping debris was interpreted as the result of a single toolmaking event. Evidence was present in the lithic workshop loci on the site for making Levanna projectile points from cobble-derived quartz, rhyolite, and chalcedony-like rock brought there from beach and glacial outwash sources. Six complete and broken Levanna points were collected. Other fragments of small, thin triangular bifaces appeared to be broken, discarded performs for this type of projectile point. Intensive Late Woodland activity probably occurred in at least two separate episodes as suggested by the results of radiocarbon dating of features. The first use would have been about 1,140 to 1,130 years ago (AD 770-1010, AD 770-1020) followed by occupation around 750 years ago (AD 1180 to 1310, AD 1370 to 1380). Native American groups appear to have used the site for the same general purposes during these episodes even though they were separated by several hundred years. Within a larger settlement system including the nearby coastal zone, the location of the Talcott Site seems to have functioned as a temporary camp for groups of people that had a seasonal round extending to locations in the interior terminal moraine and pond zone. These groups probably spent time at other sites near estuarine settings in the coastal zone. The Talcott Site most likely served as a staging point for hunting expeditions where the equipment needed for this activity was manufactured, replaced, and repaired. Ample evidence was present in the lithic workshop loci for making Levanna projectile points from cobble-derived quartz, rhyolite, and chalcedony-like rock brought there from beach and glacial outwash sources. A shallow hearth, hemispherical bowl-shaped and basin-shaped pits in the Late Woodland component could have been facilities for cooking or providing heat/warmth during occupation in cold weather months. Minimal processing of animal carcasses, plant foods or other resources took place here based on the small amounts of faunal and floral remains recovered from the site. If ceramic vessels for cooking and/or processing had been used on the site, it is likely that more sherds from broken or damaged pots would have been left there. The 18 features found within the Talcott Site displayed six distinct morphologies. Pits with varying forms including cylindrical straight sided, hemispherical, basin shaped, and conical morphologies were the most common type. Only one feature with burnt rock fragments was clearly a hearth. The pits could have had multiple functions. They may have been initially used for storage of food or other materials and then served as places to dispose of inorganic (chipping debris) and organic refuse (bone, plant remains) created by various activities such as stone toolmaking, processing of food, or other raw materials. Overlapping ranges of calibrated radiocarbon dates of AD 1420 to 1640, AD 1450 to 1660, and AD 1490 to 1680 indicated episodes of activity in the Contact period. The set of eight similar cylindrical pits made by Contact period groups may have been storage receptacles for some type of foodstuff brought to the

site, possibly in baskets or other (bark?) containers that required flat bottomed, straight-sided pits. No evidence of maize was found in the few floral remains recovered by flotation analysis of soil samples. Fragments of calcined sturgeon and other fish bone may represent food supplies brought to the Talcott Site from a coastal zone base camp. From the evidence collected during the data recovery program, Contact period Native Americans continued to use the Talcott Site as a small encampment while hunting and carrying out other resource collection activities in the Eel River headwaters and terminal moraine zone.

25-2563 Ingham, Donna, and Mary Lynne Rainey

2005 Intensive (Locational) Archaeological Survey Nantucket Post Office, Nantucket, Massachusetts. 78 pages.

An intensive (locational) archaeological survey was completed for the 0.8 acre project area. A walkover survey was followed by subsurface testing, consisting of the excavation of 23, 50x50cm test pits along three linear transects and within one test pit array, located the De Marco Site. The De Marco Site contained six pieces of rhyolite chipping debris recovered within an area measuring approximately 20x2.5m and in association with plowed and fill contexts. This small scatter of lithic waste may have been deposited as a result of a brief episode of chipped-stone tool maintenance. There was not evidence of associated pre-contact subsurface features; it is unlikely that additional subsurface testing would generate new information. Post-contact and modern cultural materials recovered throughout the project area were recovered in association with fill deposits and plowed soils and cannot be demonstrated to be associated with a specific post-contact period occupation. No further archaeological investigation was recommended.

25-2564 Heitert, Kristen

2005 Summary Report, Archaeological Monitoring Program, Nathan and Polly Johnson House, New Bedford, Massachusetts. 25 pages.

The house, which comprises the “original” ca. 1820s Georgian-style structure and a ca. 1857 Greek-Revival-style addition, was the home of Nathan and Polly Johnson, prominent African-American abolitionists. Review of the building footprints and the builders trench material exposed during machine excavation suggest that the original 1820 structure was raised off of its foundation, rotated 90 degrees, and moved to the center of the property onto a new foundation, and that 1857 addition was simply constructed to the same proportions of the existing foundation. This finding contradicts earlier interpretations, which assumed that the original house foundation and the “new” foundation occupied physically distinct footprints on the lot. A waste pipe access chamber was identified at the front of the house. Intact soil profiles also were identified along the south façade of the house. In light of this finding, additional archaeological monitoring and/or excavation was recommended in advance of future impacts to the property.

25-2565 Gary, Jack

2005 Phase I Archaeological Intensive Survey of Hassanamesitt Woods Property, Grafton, Massachusetts. 122 pages.

Documentary evidence has suggested that the property may contain remains of the church for the Praying Indian village of Hassanamisco, established by John Eliot in 1660. Historical deed research has also placed several Nipmuc families on the property in the early 18th century, suggesting that the original inhabitants of Hassanimisco resettled the area in the aftermath of King Philip’s War. In the 18th and 19th centuries portions of the property were used for agriculture. Nipmuc presence on the property endured through the 19th century. During the 20th century the property was used predominantly for orchards before reverting to its current woodland state. The survey of the 203+ acre property on the southern slope of Keith Hill consisted of shovel testing and a GPS survey of above ground features to identify historic and prehistoric resources and make

recommendations for the future management of the property. A total of 386 test pits were excavated on 10m and 20m intervals covering approximately 74 acres and identifying six historic sites and one prehistoric site. The prehistoric site is composed of a well-defined lithic quarry, while the historic sites consist of the remains of 18th, 19th, and 20th-century residential, agricultural, and low level industrial activities. The highest concentration of residential material has been identified as the remains of the 18th and 19th-century Nipmuc settlement. No 17th-century component related to John Eliot's church or meeting house was recovered. Several aboveground features were located including cellar holes, wells, extensive stonewalls, stone retaining walls, and cobbled terraces. Because the property is not slated for large-scale development, no further immediate archaeological testing is needed. The archaeological remains related to 18th and 19th-century Nipmuc settlement offer an opportunity to investigate Native American resettlement after the abandonment of Hassanamisco, however, and future archaeology may help with public interpretation of the property within the context of long-term land use from the Archaic period through the Early Modern period. Data gathered during this survey provides a starting point for the public interpretation of the Hassanamesitt Woods property and allows for the proper management of the property in terms of trail placement and low impact construction.

25-2566 Herbster, Holly

2005 Summary Report, Intensive (Locational) Archaeological Survey, Galbraith Property, Map 9, Lots 44 and 58.1, Aquinnah, Massachusetts. 50 pages.

This archaeological survey was conducted in compliance with the Town of Aquinnah Historic and Archaeological Resource Protection Bylaw, administered through the Aquinnah Planning Board. The survey included archival research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by proposed residential development. A total of 15, 50x50cm test pits was excavated within the approximately 1.45 acre building envelope. The survey recovered a solitary find: a complete, bifacially worked tool designated as the Old South Road-Lot 44 Find Spot. The recovery of the non-diagnostic tool as a solitary find and in the absence of additional deposits such as features limits the information content of the deposit.

25-2567 Waller, Joseph N., and Duncan Ritchie

2004 Archaeological Site Examination Crescent Site, High Oaks Residential Subdivision, Walpole, Massachusetts. 80 pages.

Archaeologists completed an archaeological site examination of the pre-contact Native American Crescent Site, which is within the approximately 70 acre High Oaks residential subdivision project area. The archaeological site examination of the Crescent Site included the excavation of 33, 50x50cm test pits and eight, 1x1m excavation units. Combined intensive (locational) and site examination testing confirmed that the Crescent Site is a potentially significant pre-contact Native American cultural resource within the Neponset River drainage of southeastern Massachusetts. Archaeological site examination established that the Crescent Site was formed during the Late/Transitional Archaic Period, probably during a single occupation episode around 3,600 to 3,400 years ago. Recovered material include primarily lithic debitage and bifacial tool blanks of rhyolite, indicate short-duration, limited activity occupation of the site area by Native Americans affiliated with the Susquehanna tradition. On-site activities appear to have been focused on the reduction of locally available rhyolites during the manufacture of chipped stone hunting and processing tools. A radiocarbon date of 2170+/-50 years B.P. (Beta 196192) obtained on charcoal collected from a suspected firepit found during an earlier intensive survey, falls within the time span of the Early Woodland period and is younger than the Susquehanna tradition component. The nature of this feature was not determined and this date for the site is considered to be suspect. The results of the site examination indicate that further archaeological investigation of the Crescent Site would likely yield redundant information such as more chipping debris and a few bifacial tool blanks. Consequently, no additional archaeological investigation is recommended.

25-2568 Bonner, Jennifer, and Duncan Ritchie

2005 Intensive (Locational) Archaeological Survey of the DYS New Secure Girls Facility, Westborough State Hospital, Westborough, Massachusetts. 6 pages.

The survey of the 5.5 acre project area included archival research, a walkover survey, archaeological sensitivity assessment, and subsurface testing. Archival research indicated that the project area was within an area of pre-contact period Native American settlement centered on the combined upper Sudbury/Assabet river drainages and extensive wetlands in Crane and Cedar swamps. During the 18th and 19th centuries, the project area was agricultural land associated with farmsteads along Lyman Street. The Westborough State Hospital was established in 1884 and continued to expand during the early 20th century. The portion of the state hospital property containing the project area likely remained open farmland during the early modern period. Subsurface testing with 50, 50x50cm test pits documented natural A/plow zone and subsoil horizons over the majority of the project area with disturbed soils noted in some of the test pits. A small assemblage of historic/modern period cultural material such as ceramic sherds (pearlware, whiteware, redware, yellow ware) bottle glass, and structural materials (brick, nails, window glass) was recovered primarily from the A/plow zone horizon. The majority of the recovered cultural material represents redeposited domestic refuse. These artifacts are thinly distributed throughout the plow zone, and they cannot be associated with a specific land ownership/occupation of the land within the project area. One post-contact period structure, a section of fieldstone masonry, was identified and designated the Hospital Road Site. Based on the configuration of the structural remains and the associated artifacts, this fieldstone feature was likely a footing for an outbuilding (shed, barn) associated with the house located to the southwest of the project area on Hospital Road. The structure likely postdates 1850, but the exact date range is unknown. While the Hospital Road Site documents domestic/agricultural use of land in the project area during the post-contact and early modern period, its information content and research potential is limited. The Hospital Road Site is not considered a significant archaeological resource. No further archaeological investigation is recommended.

25-2569 Graves, Anna, and Duncan Ritchie

2005 Intensive (Locational) Archaeological Survey, Bridle Path Subdivision, Sutton, Massachusetts. 112 pages.

The survey included background research, a walkover survey, and subsurface testing to identify any archaeological resources within the 103 acre parcel. Background research indicated that the project area was near a core area of pre-contact period Native American settlement along the Blackstone River drainage. It had the potential to contain small to moderate-sized archaeological sites such as the remains of temporary camps used by Native Americans for hunting and other resource collection tasks. The project area was located between two small, local cores of historic/modern period settlement in South Sutton and Manchaug. From the early 18th century to modern period, the immediate vicinity of the project area remained a rural area with a few roads including New State/Martin Road and farmsteads. Documentary research conducted on two known farmsteads (Burt-Everett, Martin Farmsteads) in the project area indicated they were constructed and occupied from the mid 18th/early 19th centuries to early modern period. Subsurface testing consisted of 85, 50x50cm test pits excavated along 10 linear transects at 10m intervals, and in 14 judgmentally selected locations on one suspected Native American rockshelter and three identified historic/modern period archaeological sites. Historic/modern period cultural material was recovered from 10 of the 14 judgmental test pits. No pre-contact Native American cultural material was recovered from any of the test pits. Five historic/modern period archaeological sites were identified during the intensive survey. The Burt-Everett Farmstead Site consisted of fieldstone and cut granite foundations for a house, barn, and other outbuilding. A filled well is also located in close proximity to the house. The Martin Farmstead Site agricultural complex consists of fieldstone and cut granite foundations for four structures, three of which are located within the project area. The Dorr Site was a small fieldstone foundation or footing marking the remains of a

solitary house or other structure. A stone-lined well is located northeast of a large wetland/vernal pool area in the central portion of the project area. A small sluiceway leads north from the well to a culvert underneath a cart path extending west from the Everett Farmstead. New State/Martin Road defines the northern boundary of the Bridle Path Subdivision project area. This section of the historic roadway has survived intact as an unpaved path partially bounded in some sections by stonewalls. The Burt-Everett and Martin sites consist of intact late-18th- to 19th-century farmsteads with foundations for a house, barn, and other outbuildings that are in good condition. The Dorr Site and the stone-lined well appear to have low information content and are not considered potentially significant. The section of New State/Martin Road within the project area is a well-preserved portion of a historic roadway used from the late 18th to early 20th century. The Everett and Martin farmsteads and New State/Martin Road are considered potentially significant cultural resources. It is recommended that proposed development avoid these sites. The Martin Farmstead and New State/Martin Road will not be impacted by proposed development as currently planned. Placement of a protective, 50ft wide buffer zone around these cultural resources is recommended. If avoidance of the Everett Farmstead is not possible, a site examination should be conducted.

25-2570 Mair, A. Peter, II

2005 Intensive (Locational) Archaeological Survey: MassHighway Assignment #18, Fall River Multi-Use Bicycle Trail, Fall River, Massachusetts. 70 pages.

The survey focused on several short sections: a proposed wetland replacement area, a proposed spur between the railroad bed and a cul-de-sac, and a proposed sidewalk along the Brayton Avenue Extension of the proposed Fall River Multi-Use Bicycle Trail. The intensive survey included archival research, a walkover survey, and subsurface testing. Twenty-four 50x50cm test pits were excavated, revealing a light scatter of post-contact period cultural materials that reflect numerous episodes of dumping along the abandoned railroad bed and the Brayton Avenue Extension. The intermixing of modern with older materials indicates that these deposits have been reworked and do not retain any integrity. Furthermore, the subsurface investigations did not identify any subsurface structural elements to suggest former buildings in the project area. No additional archaeological investigations are warranted.

25-2571 Medina, Antonio, and Timothy Binzen

2005 Archaeological Machine-Assisted Intensive (Locational) Survey for an Underground Fuel Line at Fort Warren, George's Island, Boston Harbor, Massachusetts. 65 pages.

Six machine trenches were excavated at intervals along an archaeologically sensitive portion of the proposed fuel line. Three trenches measured 91cm by 3m (ca. 3 by 10 ft), and three measured 91 cm by 6.1 m (ca. 3 by 20 ft). The depths of the trenches ranged between 70cm and 1m (2.3 and 3.3ft). Archaeologists monitored the excavations and documented soil stratigraphy and features. A low volume of historic artifacts was recovered from backdirt piles. These cultural materials are not useful for dating the period of deposition of the fill layers, because they were recovered from redeposited fills that are not in primary depositional contexts. Multiple layers of historic fill were recorded in the machine trenches, in addition to seven subsurface cultural features, consisting of a concentration of brick and mortar rubble (Feature 1), a concentration of decayed wooden planks (Feature 2), a flat concrete block that may have served as a derrick base (Feature 3), a second concentration of wooden planks (Feature 4), a layer of un-mortared brick that may have served as a pavement (Feature 5), a backfilled utility trench (Feature 6), and an apparent historic grade dating to the construction of the wharf (Feature 7).

25-2572 Medina, Antonio, and Timothy Binzen

2005 Archaeological Machine-Assisted Intensive (Locational) Survey for Pavement and Safety Fence Repairs at Fort Warren, George's Island, Boston Harbor, Massachusetts. 54 pages.

Four machine trenches were excavated in the fort at Bastion C, Bastion D, and Front III. Trench 1 measured 1.8x3.7m (6x12ft). Trench 2 measured 1x1.7m (3.4x5.6ft). Trench 3 measured 1.1x1.9m (3.6x6.2ft). Trench 4 measured 1.2x2.6m (4x8.5ft). Archaeologists monitored the excavations and documented soil stratigraphy and features. Multiple deposits of historic fill were recorded in the machine trenches, in addition to six subsurface cultural features, consisting of a drain (Feature 1), a sand and gravel drainage deposit (Feature 2), a sandy artificial substratum (Feature 3), an additional sand and gravel drainage deposit (Feature 4), an additional drain (Feature 5), and a fieldstone drainage deposit (Feature 6). Four STPs were excavated for safety fence repairs in the demilune of the fort, below Front III. A low volume of historic artifacts including bottle glass, tobacco pipe, and brick fragments, were recovered from two of the STPs.

25-2573 Graves, Anna K., and Suzanne G. Cherau

2005 Intensive (Locational) Archaeological Survey of the MAARNG Facilities in Fall River and Rehoboth, Massachusetts. 66 pages.

The MAARNG is planning ground disturbing activities at both locations and requested an intensive (locational) archaeological survey in the approximately 0.5 unpaved acres of the Fall River facility and in the approximately 4 unpaved acres of the Rehoboth facility. The survey included archival research and field investigations consisting of a walkover and subsurface testing at both facilities. Six 50x50cm test pits were excavated at 10m intervals along one linear judgmental transect in unpaved areas. A low density of modern sheet refuse was encountered in the fill soils; these nondiagnostic materials were not saved. No evidence of intact soils was encountered during the hand testing, which is consistent with the documented former quarry and landfill uses of the property. It is not likely that any intact, natural soils are present, even deeply buried in the unpaved areas. No further archaeological investigations are recommended. Twenty-nine 50x50cm test pits were excavated at 10m intervals along four linear judgmental transects in unpaved, ungraded areas at the Rehoboth MAARNG facility. Natural soil horizons were encountered in the tested areas, but they contain only limited evidence of post-contact/modern period use (i.e., plowing, utility pipes). No additional archaeological investigations are recommended.

25-2574 Graves, Anna K., and Suzanne G. Cherau

2005 Intensive (Locational) Archaeological Survey of the MAARNG Facilities in Pittsfield and Westfield, Massachusetts. 98 pages.

The intensive surveys were focused in the approximately 2.5 unpaved acres of the Pittsfield facility and in the approximately 1.5 unpaved acres of the Westfield facility. The surveys included archival research and field investigations consisting of a walkover and subsurface testing. Twenty-one (21) 50x50cm test pits were excavated at 10m intervals along three linear judgmental transects at the Pittsfield facility. No significant archaeological deposits were identified in the tested, unpaved areas at the Pittsfield facility. No further archaeological investigations at that facility were recommended. Nineteen 50x50cm test pits were excavated at 10m intervals along three linear judgmental transects and as two test pit arrays (5m) excavated at the Westfield facility. This testing located one previously unidentified pre-contact period cultural deposit, designated the Armory Site. The Westfield facility is located on a floodplain of the Westfield River, and subsurface testing revealed the presence of buried A and B soil horizons along with surficial fill and flood deposits. A moderate density of chipping debris was recovered from fill/flood deposits and buried A and B soil horizons in the yard areas east and west of the Armory building. The physical integrity of these deposits is not established. The construction of the present Armory building, and subsequent surrounding yard uses could have disturbed/destroyed significant archaeological components. However, any intact archaeological deposits associated with a short or long-term occupation have the potential to inform about pre-contact/contact period land use and settlement along this section of the Westfield River drainage. It is recommended that ground disturbance activities be avoided in the yard areas at the west and east sides of the Armory. If avoidance of these areas is not feasible, then additional archaeological investigations may be warranted. These investigations would

be needed to determine the site's physical integrity and internal complexity, which contribute to its archaeological significance and eligibility to the National Register of Historic Places.

25-2575 Graves, Anna K., and A. Peter Mair, II

2004 Intensive (Locational) Archaeological Survey: Fall River Executive Park and Route 24 Access Improvements Project Areas, Fall River and Freetown, Massachusetts. 96 pages.

The intensive survey of the 300 acre parcel included background research, field investigations, and laboratory analysis. A total of 180, 50x50cm test pits excavated for the proposed Fall River Executive Park and 120 test pits excavated for the proposed Route 24 Access Improvements identified one pre-contact site (Broken Tree Find Spot) and one post-contact site (Buffinton-Wordell Site). The Broken Tree Find Spot is a solitary find spot and is not considered eligible to the National Register of Historic Places. The 19th-century Buffinton-Wordell Site, covering approximately 20,250 square feet, consists of a house foundation, a possible well, and a large, intact barn and silo foundation. The Buffinton-Wordell Site is potentially eligible to the National Register of Historic Places. Avoidance of the delineated site area and preservation in place are recommended. If avoidance is not possible, additional archaeological investigations at the site examination level are recommended.

25-2576 Herbster, Holly

2004 Intensive (Locational) Archaeological Survey and Archaeological Monitoring, Town Hall New Access Driveway, Mashpee, Massachusetts. 80 pages.

Information provided by the Wampanoag Tribe of Gay Head (Aquinnah) and Mashpee Wampanoag elders suggested that unmarked Native American graves could be present within or in close proximity to the project area. The project included consultation with Mashpee Wampanoag informants and archival research using tribal census and burial data to identify the location and age of the possible burial ground. A total of 37, 50x50cm shovel test pits was excavated within the approximately 50ft wide by 450ft long corridor using two linear test pit transects. Following the subsurface testing, archaeological monitoring was completed during the machine-assisted removal of topsoils and overburden from the entire project corridor. The survey identified mid-19th-century through modern period archaeological deposits within an open lot behind several mid-19th century residential and institutional structures. No evidence of structures or other improvements were identified through the documentary research, informant interviews or subsurface testing. The survey did not identify any unmarked burials or indications of burials within the proposed project impact area. The location(s) of the unmarked burials identified through informant interviews is still unknown.

25-2577 Cherau, Suzanne G.

2005 Intensive (Locational) Archaeological Survey, MAARNG Facilities in Natick and Wellesley, Massachusetts. 57 pages.

The MAARNG is planning ground disturbing activities at both locations in the approximately 1.87 unpaved wooded acres of the Natick facility and in the approximately 2.25 unpaved wooded acres of the Wellesley facility. The survey included archival research and field investigations consisting of a walkover and subsurface testing at both facilities. Ten 50x50cm test pits, excavated at 10m intervals along three judgmental transects and as one judgmental test pit, were placed in unpaved wooded areas. A low density of modern sheet refuse was encountered in the fill soils; these materials were not saved. No evidence of intact soils was encountered during the hand testing, which is consistent with the documented 20th-century industrial and military uses of the property. No further archaeological investigations are recommended for the Natick facility. Fifteen 50x50cm test pits, excavated at 10m intervals along four judgmental transects, were placed in unpaved wooded areas at the Wellesley facility. Natural and disturbed/graded soil horizons were encountered in the

tested areas. Low-density scatters of modern period sheet refuse were encountered in the tested areas along with one milk bottle midden. The bottles all came from a local dairy and date to the first half of the 20th-century. They are likely related to residential occupations along Worcester Street (Route 9). Because of a lack of significant archaeological deposits, no additional archaeological investigations are recommended for the Wellesley facility.

25-2578 Cherau, Suzanne G.

2005 Intensive (Locational) Archaeological Survey, Daly Field East Project Area, New Community Rowing Inc. Boathouse Facility, Boston (Brighton), Massachusetts. 60 pages.

The survey of the 1 acre parcel included archival research and field investigations consisting of a walkover and subsurface testing. Fifteen 50x50cm test pits, excavated at 10m intervals along three judgmental transects and as one judgmental test pit, were placed in testable areas of the project parcel, which has undergone major landmaking and earthmoving activities since the late 19th/early 20th century. Only limited evidence of intact subsoils was encountered during the hand testing, which is consistent with the documented 20th-century recreational uses of the project vicinity related to the Charles River Reservation. No cultural materials were recovered in the intact soils. The parcel is covered by extensive fill materials including asphalt and concrete in the substrata. No further archaeological investigations are recommended.

25-2579 Graves, Anna K., and Suzanne G. Cherau

2005 Intensive (Locational) Archaeological Survey, MAARNG Facilities in Worcester, Massachusetts. 48 pages.

Archaeologists conducted an intensive (locational) archaeological survey in the approximately 0.5 acres of the unpaved grassy facility. The survey included archival research and field investigations consisting of a walkover and subsurface testing. Six judgemental test pits, each 50x50cm in size, were excavated. A low density of modern refuse was encountered in the fill soils. These materials were not saved. Evidence of soil stripping was noted with the presence of remnant B2 subsoils beneath layers of fill and asphalt in several test pits. No evidence of intact A1 or B1 soils was encountered. No further archaeological investigations are recommended.

25-2580 Lance, Mark, and Suzanne G. Cherau

2005 Intensive (Locational) Archaeological Survey, MAARNG Facilities in Brockton, Massachusetts. 66 pages.

Archaeologists conducted an intensive (locational) archaeological survey at the 8.29-acre parcel. The survey included archival research and field investigations consisting of a walkover and subsurface testing at the facility. Thirty-five 50x50cm test pits, excavated at 10m intervals along three judgemental transects and within two blocks, were placed in unpaved wooded areas. A low density of late post-contact/modern period refuse intermixed with pre-contact period lithic debitage was encountered in one area. This area contained bulldozed fill soils, probably associated with the construction of the current facility buildings and parking lots. The lithic debitage has been designated the Brockton Armory Site, but is lacking in physical integrity and is not considered eligible for the National Register of Historic Places. A kaolin pipe bowl was also discovered on the surface in the far northern perimeter of the parcel. Subsurface testing in this area did not recover additional cultural materials or features. This area has eroded, suggesting that the pipe bowl may have been redeposited on the surface at this location. Given the lack of potentially significant archaeological resources within wooded portions of the property, no further investigations are recommended.

25-2581 Donta, Christopher, and Jennifer Wendt

2005 Archaeological Reconnaissance Survey for the Proposed Northstar Natural Gas Pipeline, Northampton, Hatfield, and Hadley, Massachusetts. 72 pages.

The proposed routes within Northampton lie within areas of heavy disturbance and no previously recorded sites were identified. The proposed routes in Hatfield pass through several areas of high archaeological potential, including 10 recorded pre-Contact Native American sites. All of the proposed routes within the town of Hadley lie on level, well-drained landforms, close to sources of freshwater, and six pre-Contact Native American sites are in proximity to portions of the routes. It was recommended that the pipeline avoid unimproved agricultural roads in Hadley and Hatfield and stay within existing roadbeds in Hatfield, in order to avoid impacts to archaeological resources. If this recommendation is followed, then no further survey is recommended.

25-2582 Binzen, Timothy L.

2005 Archaeological Intensive (Locational) Survey for the Excess Material Storage Area, Turners Falls Airport, Montague, Massachusetts. 48 pages.

A reconnaissance and intensive (locational) survey were conducted for an apron improvements project. The survey concerned a location at the southern extremity of the airport that was used for the temporary storage of earthen fill from the apron area. An access road, excess material storage area, and the perimeter of the storage area were tested in order to locate and identify historic or archaeological resources affected by the construction and use of the road and storage area. A total of 64 STPs were excavated at 25ft intervals in clusters of four STPs, distributed throughout areas exhibiting archaeological sensitivity. Single pieces of Native American chipping debris were recovered from two widely spaced test pits. A low volume of historic artifacts was recovered. No Native American or historic subsurface features or artifact deposits were encountered. The soil stratigraphy generally indicated the presence of plowzone topsoil overlying sandy subsoil, and areas of previous erosion. No significant archaeological resources have been affected by the construction and use of the access road and storage area. No additional survey is recommended.

25-2583 Ingham, Donna, and Mary Lynne Rainey

2005 Intensive (Locational) Arcaheological Survey Wannacomet Water Company Improvements, Nantucket, Massachusetts. 86 pages.

A survey, incorporating archival research, subsurface testing, and laboratory processing and analysis, was conducted within an undeveloped 33 acre parcel in north-central Nantucket where improvements are planned by the Wannacomet Water Company. A total of 105, 50x50cm test pits were excavated, identifying two small archaeological sites: the Tank Compound and Tetawkimmo Overlook sites. The pre-contact Tank Compound Site is within the most elevated portion of the project parcel and consists of the basal portion of a rhyolite projectile point similar to the Orient type. This point type is diagnostic of the Transitional Archaic Period (ca. 3800–2600 B.P.) and is common throughout Nantucket's outwash plains. The Tank Compound Site is unlikely to provide new information about the Transitional Archaic Period, however, and is not recommended as potentially significant under National Register criteria. Therefore, no further archaeological investigations are recommended. The Tetawkimmo Overlook Site is a post-contact site located along the western project parcel boundary. The site contains three coarse red-bodied earthenware sherds and two pieces of shell recovered within a buried stratum of anomalous soil. These characteristics are consistent with 18th-century Native American domestic sites recently identified and evaluated for National Register eligibility in the northern portion of the Miacomet valley (see report #25-2115). Relatively little is known about these types of sites because their diagnostic traits and research potential have only recently been recognized. Therefore, the Tetawkimmo Overlook Site is a potentially significant site that could provide new information about Native American life on Nantucket in the 18th century. Should the project design change such that the Tetawkimmo Overlook Site could be impacted, additional archaeological investigations would be recommended.

25-2584 Doucette, Dianna L., and A. Peter Mair, II

2005 Intensive (Locational) Archaeological Survey, A. D. Makepeace Wareham Road Core Parcel 1, Plymouth, Massachusetts. 94 pages.

The 130-acre Parcel 1 represents the first phase of planned development of selected portions of A.D. Makepeace's holdings in Plymouth, Wareham, and Carver. This survey included archival research, a walkover survey, and subsurface testing. A total of 268, 50x50cm test pits were excavated within Parcel 1, identifying a small pre-contact Native American archaeological site. The Deer Pond Site is a low-density scatter of rhyolite chipping debris interpreted as an episode of lithic reduction. No features or diagnostic artifacts were recovered but the majority of cultural material was recovered from undisturbed B horizons suggesting good integrity and the potential for the Deer Pond Site to contain information that might be useful for addressing regional archaeological themes of interest. The site is considered potentially significant. The archaeologists recommend avoiding the Deer Pond Site through project redesign. If avoidance is not possible, additional archaeological investigations is recommended. No other potentially significant archaeological resources were identified.

25-2585 Rainey, Mary Lynne, and Donna Ingham

2005 Intensive (Locational) Archaeological Survey, Proposed Nantucket Human Services Center and Archaeological Site Examinations, Poison Meadow, Valley View, and Wild Rose Pasture Archaeological Sites, Nantucket, Massachusetts. 191 pages.

An intensive (locational) archaeological survey, incorporating archival research, subsurface testing, and laboratory processing and analysis, was conducted within an undeveloped 4.8 acre parcel on the eastern margin of the Miacomet Valley in central Nantucket. A total of 45, 50x50cm test pits were excavated, resulting in the identification of four Native American archaeological sites. The Poison Meadow, Valley View, and Wild Rose Pasture sites all contained 17th-to 18th-century domestic debris and associated soil anomalies or subsurface features. The fourth site, the Workshop Site, is a small lithic workshop of unknown temporal affiliation and is not recommended as potentially significant, and no further archaeological investigations are recommended for the Workshop Site. The Poison Meadow, Valley View, and Wild Rose Pasture sites are all potentially significant archaeological resources that may contain new information about community structure, Native architecture, and daily life for the Christianized Native American community known as Miacomet Village (ca. 1690 – 1764). Site examinations were recommended to evaluate their potential significance. Site examinations, incorporating archival research, subsurface testing, and laboratory processing and analysis, conducted on each of the sites involved the excavation of a total of 100, 50x50cm test pits and 8, 1x1m excavation units. These investigations resulted in the recovery of evidence supporting the initial interpretation of the three sites as 17th to 18th-century Native American residences and contributing to the development of a definition of this site type. The investigations also estimated the boundaries of each site and provided information on the internal configuration and complexity of the sites. As a result, the Poison Meadow, Valley View, and Wild Rose Pasture sites are recommended as significant and eligible for listing on the National Register of Historic Places as elements of a proposed historic archaeological district under criteria A and D. All three sites have the potential to illuminate our understanding of Native American life. In light of the cultural and temporal association of these sites with the adjacent Miacomet burial ground, and the Dwelling Site at the nearby Nantucket High School, the archaeological district should also encompass these important properties.

25-2586 Doucette, Dianna L., and A. Peter Mair, II

2005 Intensive (Locational) Archaeological Survey: Katahdin Hill /Research Building 2 Project Area, Lexington, Massachusetts. 72 pages.

This survey focused on an undisturbed wooded section of a 1-acre parcel. The survey included archival research, a walkover survey, and subsurface testing to locate and identify potentially sig-

nificant archaeological resources that may be affected by project construction. Fourteen, 50x50cm test pits were excavated, revealing relatively undisturbed soils and producing two pieces of post-contact cultural material, a piece of plate glass, and a sherd of whiteware. These artifacts do not represent a potentially significant archaeological resource and no further archaeological investigation is warranted.

25-2587 Smith, J.N. Leith, Jack Gary, Gregory R. Dubell, George Schwartz, and Starla Lane

2005 Archaeological Overview and Assessment of the Salem Maritime National Historic Site, Salem, Massachusetts. 2 Vols. 172 pages.

The Salem Maritime National Historical Site was created in 1937; it was the first park established in the Nation's federal park system administered by the National Park Service. Salem played a primary role in the American international maritime trade from the colonial period to the mid 19th century, and it is this legacy that the park seeks to interpret and preserve. The site encompasses nearly nine acres bordering on the Salem waterfront and contains a variety of historic structures including 17th- through 19th-century domestic dwellings, wharves and warehouses, as well as the federal Custom House and associated Public Stores. Intensive documentary research identified 68 known and potential archaeological sites within the park. Two of these are associated with Native American occupation: a shell deposit under the Narbonne House ell and a lithic scatter adjacent to the Public Stores. Archaeological assets associated with the historic period include a wide array of structures that were constructed and demolished over the course of the 17th through 20th centuries. These subsurface assets compliment those existing resources because of the wide range of domestic, commercial, institutional, civic, and municipal activities with which they were associated. Archaeological investigations within the park have focused on identifying aspects of 17th-century domestic life at the Narbonne House and on identifying evidence of 18th- and 19th-century maritime activities and construction details in the context of Derby and Central Wharves during undertakings associated with installation of utilities and wharf repair and maintenance. These investigations have revealed that some portions of the park maintain a high level of integrity and preservation, while in many other areas resource conditions are unknown. Identification of archaeological resources through intensive (locational) surveys are recommended on a case-by-case basis prior to proposed undertakings, taking into account the present level of knowledge of expected resources and the potential for previous disturbances. In addition, small-scale undertakings should formally document the discovery of cultural resources to aid with the overall knowledge of the park's assets and assist with future management.

25-2588 Dimmick, Frederica

2005 Griffin Island Fencing Project, Cape Cod National Seashore, Wellfleet. 12 Pages.

In summer of 2003, an intensive archaeological survey consisting of 16 shovel test units was carried out at several locations on Griffin Island, Wellfleet, prior to implementation of a protective fencing project. The areas investigated were roadsides of long-used, back roads of the Island, one of them in close proximity to the estuary of the Herring River, an environment known to have been inhabited by Native peoples. It was expected that this location and other areas near to the Cape Cod Bay side would offer archaeological evidence of Native peoples. Results of archaeology along the roads near the Bay and at an upstream location along the Herring River provided meager evidence of historic period use only, while the tested area in the estuarine location showed evidence for both pre-Contact and 18th and 19th-century use.

25-2589 Donta, Christopher, Mitchell Mulholland, and F. Timothy Barker

2005 Archaeological Intensive (Locational) Survey for the Phase 1 and 2 Mile Oak Residential Development, Wilbraham, Massachusetts. 98 pages.

An archaeological reconnaissance and intensive survey were conducted on an 80 acre lot in the

central part of Wilbraham, resulting in the identification of one previously unknown Native American site. The survey included 192 shovel test pits in seven survey units; Native American artifacts were found in three locations. Isolated occurrences of single quartz flakes were reported from Survey Units 1 and 2, while a hearth feature and two scatters of artifacts were found in Survey Unit 7, in the eastern part of the project area, close to Cedar Swamp. It is highly probable that additional subsurface cultural features and diagnostic artifacts are yet to be identified from the Cedar Swamp site loci. More extensive testing of the broad terrace could also identify additional site loci similar to those already identified during the Phase 1 survey. Therefore it was recommended that the site be avoided. Historic house and barn foundations and the remains of a hermit's structure dating to the first half of the 20th century were located just outside of the property's southern boundary.

25-2590 Binzen, Timothy, and Jennifer Wendt

2005 Archaeological Reconnaissance and Intensive (Locational) Survey for the Phase 8 Sewer Improvements, Tewksbury, Massachusetts. 66 pages.

The reconnaissance assessed the archaeological sensitivity of 16 proposed cross-country sewer lines. A total of 104 shovel test pits were excavated within areas exhibiting high sensitivity. Low volumes of historic artifacts were encountered in nine of the survey units and were mainly attributed to the disposal of domestic refuse during the 20th century. No additional testing is recommended.

25-2591 Ives, Timothy H., and Duncan Ritchie

2004 Intensive (Locational) Archaeological Survey North River Village, Marshfield, Massachusetts. 92 pages.

Comprehensive background research, field investigations including a walkover/surface inspection and subsurface testing were used to identify archaeological sites in the 20 acre project area. Background research consisted of a review of historic documents and maps and previous cultural resource management studies conducted in the vicinity of the project area. Extant information about known archaeological sites and other cultural resources in the vicinity of the project area indicated that the North River Village project area contained a known ancient Native American archaeological site (the North River Plano Site 19-PL-348). Based on limited information collected in the 1980s by avocational archaeologists, this site contains evidence of Native American occupation from at least 7,000 years ago, and possibly as early as 9,000 years ago in the late PaleoIndian Period. The portion of the project area along this roadway had the potential to contain cellar holes, foundations, or other evidence of settlement from the 18th century to early modern period. The project area was most likely used as farmland and wood lot and has remained open land. The project area was divided into zones of archaeological sensitivity. Subsurface testing within zones of high and moderate archaeological sensitivity confirmed the presence of the North River Plano Site (19-PL-348) and also identified four small loci of Native American cultural material. These loci yielded a few pieces of rhyolite and quartz chipping debris and were designated the North River Village 1, 2, 4, and 5 sites. The North River Village 1 Site also contained a unifacial tool and core of rhyolite. A previously unknown historic period archaeological site (North River Village 3 Site) near Old Pembroke Road was also found by subsurface testing. Based on the subsurface testing completed for the intensive survey, the North River Plano Site (19-PL-348) is extensive and covers much of the southern half of the project area. A large sample of quartz, rhyolite, hornfels, and argillite chipping debris and three chipped-stone tools were found. The chipped-stone tools include a diagnostic Middle Archaic Period (approximately 7,500 to 6,000 years ago) Stark type projectile point and two bifacial tool blades of rhyolite and quartz. The presence of hornfels chipping debris on the site indicates it also contains a Middle to Late Woodland Period (approximately 1,600–1,000 years ago) component. The North River Village 3 Site yielded a sherd of earthenware with combed slip decoration, white ball clay tobacco pipe fragments, and structural materials such as hand-molded brick, hand-forged and square-cut nails, and window glass. These artifacts indi-

cate the site contains the remains of a mid/late-18th- and 19th-century structure, probably a small house. This house could have been the primary structure within a rural farmstead. The North River Plano (19-PL-348) and North River Village 1 sites are considered potentially significant. The North River Plano Site contains evidence of ancient Native American occupation during the Middle and Late Archaic periods from about 7,500 to 3,000 years ago and Middle to Late Woodland periods about 1,600 to 1,000 years ago. It may have also been used in the Late PaleoIndian Period (approximately 9,000 to 8,500 years ago). The North River Village 1 Site yielded a unifacial tool and rhyolite core similar to those previously found on the North River Plano Site. These artifacts may alternatively be of Middle Archaic Period affiliation. The North River Village 3 Site is also considered potentially significant. This site appears to contain the remains of a late-18th- to early-19th-century house that may have been part of a farmstead. The North River Village 2, 4, and 5 sites are not considered to be potentially significant. No further archaeological investigation of the North River Village 2, 4, and 5 sites is recommended. It is recommended that proposed development within the project area be designed to avoid the North River Plano Site (19-PL-348) and North River Village 1 and 3 sites. If these sites cannot be avoided, they should be studied further at the site examination level.

25-2592 Doucette, Dianna L., and A. Peter Mair, II

2005 Intensive Archaeological Survey, Princeton Wind Farm, Princeton, Massachusetts. 92 pages.

The proposed project consists of the removal of eight existing wind turbines and construction of two new wind turbines, the widening of a portion of Stage Coach Trail, and improvements within the wind farm parcel. Mitigation for the proposed project requires the archaeological survey of an area proposed for a small lot and several post holes for signage on property owned by the Massachusetts Department of Conservation and Recreation. This survey included archival research, a walkover survey, and subsurface testing. Forty, 50x50cm test pits were excavated within the Princeton Wind Farm project area. The test pits revealed a combination of relatively undisturbed soils, shallow soils above rock outcrops, and areas of heavy fill. Eleven sherds of post-contact ceramics (whiteware and redware), two pieces of plate glass, and a nail were recovered. These artifacts do not represent a potentially significant archaeological resource; no further archaeological investigation is warranted.

25-2593 Donta, Christopher L., and Jennifer Wendt

2005 Archaeological Intensive (Locational) Survey for the Willow Street Traffic Improvements Project, Yarmouth, Massachusetts. 77 pages.

Background research, a reconnaissance survey, and subsurface testing were conducted for impacts to portions of Willow Street and its side roads. The total project distance is 1,598 m (5,243 ft). Historic research indicated that a National Register listed, 19th-century Methodist campground was located near the project area. The field testing included the excavation of 101 shovel test pits in three survey units. Although 13 historical artifacts were recovered from 13 test pits in two of the three survey units, no significant cultural materials were found. The artifacts were mostly waste from Willow Street and the nearby railroad (i.e. fragments of plastic, glass, brick, nails, coal, asphalt). No cultural remains were found associated with the campground. No further survey is recommended.

25-2594 Herbster, Holly

2005 Technical Report, Intensive (Locational) Archaeological Survey, Olde Harbor Estates, Sandwich, Massachusetts. 55 pages.

Eighty one 50x50cm test pits were excavated within archaeologically sensitive portions of the 7 acre proposed project area. The subsurface testing recovered 25 pieces of cultural material includ-

ing a low density of post-contact/modern materials and six pieces of lithic chipping debris collected in three isolated deposits (Olde Harbor Estates Find Spot 1, 2, and 3). All of the cultural materials were collected between 0 and 40cm below the ground surface in plow zone soils, disturbed topsoils, and natural B_1 subsoils. No single test pit contained more than one piece of lithic material. Close-interval testing did not recover any additional cultural materials or any evidence of cultural features. The recovered lithic fragments represent isolated finds. No additional archaeological investigations were recommended.

25-2595 Donta, Christopher, and F. Timothy Barker

2005 Archaeological Intensive (Locational) Survey for the Proposed Roadway and Drainage Improvements at Route 20 and the Post Office Park Drives Wilbraham, Massachusetts. 25 pages.

Twenty STPs were excavated to test the impacts of a proposed access road ramp and a storm water drain on a small (<1 acre) lot. A small trash dump dating from the late 19th century to the first quarter of the 20th century was identified in STP 3. Artifacts from the dumping episode were contained within a dark gray-brown silty sand fill, from 0 to 22cm below the ground surface. Artifacts from the dump episode included transfer print whiteware, plain whiteware, ironstone, clear bottle glass, window pane glass, cut nails, coal, and oyster shell. No further survey was recommended.

25-2596 Binzen, Timothy L.

2005 Archaeological Reconnaissance and Intensive (Locational) Survey for the Mount Holyoke College Boathouse, South Hadley, Massachusetts. 56 pages.

The project area is located between the tributaries of Bachelors Brook and Stony Brook. Pre-Contact Native American artifacts were reportedly surface collected from this site in the past, but systematic testing had not been conducted prior to the present survey. Forty-eight shovel test pits were excavated in an approximately two acre area. A concentration of pre-Contact Native American cultural materials (chipping debris and fire-cracked rock) was identified. The dimensions of the artifact concentration are at least 61m (200ft) north to south and 15m (50ft) east to west, and is designated as the Southern Locus of the previously recorded site 19-HS-75. The predominant raw material in the lithic assemblage (76.7%) is a fine-grained black chert, while rhyolite makes up 13.7%. Quartzite makes up 6.8% of the assemblage, while other materials (including brown jasper) make up 2.7%. The likelihood for intact unrecorded deposits and features in untested areas is high. The variety of lithic raw materials present offers evidence that the trade or transport of these materials occurred via the river. To determine the National Register eligibility for the Southern Locus of Site 19-HS-75 and evaluate avoidance options, a site examination survey is recommended.

25-2597 Savulis, Ellen-Rose

1998 Vision and Practice: Resistance and Dissent in Shaker Communities. 158 pages.

This dissertation presents a study of the United Society of Believers in Christ's Second Appearing, popularly known as the Shakers. If offers an interdisciplinary analysis that integrates anthropology, social and religious history, and biography in an exploration of the dynamics of material culture in the maintenance of, and challenges to, relations of gender and social power in a sectarian communal society. This dissertation explores how the United Society manipulated spaces, symbols, and rituals during three crisis periods in order to reproduce their communities and specific social relations through time, as well as the various roles members played in supporting or resisting such efforts. This dissertation also explores how the Shakers represented their distinctive landscapes to each other through their art work, prayers, and poetry. These "imagined landscapes" reflect the circumscribed worlds determined by gender, celibacy, and spiritual hierarchy. Such alternative media identify domains within the Shaker material and spiritual worlds that were contested at different times by men and women, and leaders and common members.

25-2598 Blades, Brooke S.

1979 Archaeological Excavations at Frary House, 1978. 93 pages.

The excavations in Deerfield exposed a stone-lined well associated with the occupation of Salah Barnard in the second half of the 18th century. A stratigraphic progression of soil from the earliest years of European occupation (1670s) to the recent preservation efforts by Mr. And Mrs. Henry N. Flynt and Historic Deerfield, Inc., was revealed on the site. Thousands of objects relating to three centuries of domestic occupation on the property were recovered.

25-2599 Donta, Christopher L., Margaret Kelly, and Jennifer Wendt

2005 Archaeological Intensive (Locational) and Site Examination Surveys for the Proposed Bike Path, Southwick, Massachusetts. 68 pages.

Background research, and a site intensive (locational) survey were conducted along a 400m segment of a proposed bike path. The intensive survey identified a single Native American site in three of 54 shovel test pits, which yielded 27 flakes of chert and a burn feature from one area of concentration. A site examination was recommended and completed, consisting of an additional 10 shovel test pits and two 1x1m units. The site boundaries were identified, and the burn feature was examined, producing evidence that a single occupation occurred approximately 1,200-1,300 years ago. An additional 214 artifacts were collected during the site examination, all were chert flakes except for a single untyped chert point fragment. The Gillette Street site (19-HD-277) is a small, single occupation locus of lithic tool production around a hearth. The site was probably occupied for a single day or night, and was used briefly to finish or rework a small number of chert tools. The data gathered indicates the site is comprised of a low-density flake concentration associated with a hearth feature. No further survey is recommended.

25-2600 Donta, Christopher L., Richard D. Holmes, Carolyn D. Hertz, and Mitchell T. Mulholland

1994 Archaeological Site Locational Survey for the Municipal Water Supply, Wannacomet Water Company, Nantucket, Massachusetts. 51 pages.

The project area consists of an impact area of approximately two acres on the top of a knoll next to the existing water tank. Thirty-two shovel test pits were excavated. No prehistoric materials were recovered within the project impact area. A small number of historic artifacts was recovered from disturbed contexts in the project area, all related to 19th- and 20th-century activity associated with previous use of this location for water supply. Two brick foundations were noted in the vicinity of the impact area. The first consists of a small square structure that appears to have been a utility building. The second is the foundation of a 19th-century house inhabited by the water company engineer and his family. The latter building is outside of the Wannacomet Water Company property and will not be impacted. No further archaeological survey is recommended.

25-2601 Graves, Anna K., and A. Peter Mair II

2005 Intensive (Locational) Archaeological Survey: Middleboro Subdivision, Middleborough, Massachusetts. 84 pages.

The survey consisted of research and field investigations to determine the presence/absence of potentially significant archaeological resources. Thirty-nine test pits were excavated within the 14 acres of upland, resulting in the identification of two Native American sites. The Blueberry Hill Find Spot yielded a single piece of pre-contact cultural material and is not considered significant. The Caterpillar Site produced 13 pieces of chipping debris from undisturbed soils. The small lithic production/maintenance site is considered potentially significant. Avoidance of the Caterpillar Site and a 30ft buffer is recommended. If the Caterpillar Site cannot be avoided, a site examination is

recommended.

25-2602 Lance, Mark, Kirk Van Dyke, and Alan Leveillee

2005 Intensive (Locational) Archaeological Survey Vitale Fly Ash Consolidation and Wetlands Restoration, Wenham, Massachusetts. 43 pages.

The survey included background research, the excavation of eleven 50x50cm test pits, and the processing and analyses of collected data. Ten pieces of rhyolite debitage were collected from within (nine pieces) and just below (one piece of shatter) a well-defined plow zone stratum. This material is associated with Native American activity within or in close proximity to the planned clearing and chipping areas. The recovered materials are associated with the Phillips Site, which extends from the fields to the north, to the brook to the immediate south, and possibly beyond. No features and no temporally diagnostic artifacts have been recovered from the Phillips Site (19-ES-451), but it likely results from occupation of the area between 6,000 and 500 years ago, during the Archaic and Woodland periods. Lacking definitive diagnostic tool types or samples suitable for radiocarbon dating, assigning the occupation to this time span is tentative. It was determined unlikely that the recovered materials within the limited easement represented a potentially significant site, and that further testing in the project area would not be expected to result in data beyond those collected to date. Accordingly, it was recommend that no further archaeological investigations be required. If the scope of the planned work extends beyond those areas investigated to date, and/or includes removal of topsoils in other (non-surveyed) areas north of the brook, additional testing may be warranted.

25-2603 Donta, Christopher L.

2005 Archaeological Research on Gallops Island, Boston, Massachusetts. 67 pages.

The study included background research, some detailed mapping of existing resources, collection and analysis of artifacts recovered during the removal of asbestos siding fragments, and recommendations for protection of the cultural resources present. Archaeological research to date has identified one prehistoric midden site, a single isolated flake, and a large number of building foundations most of which date to the 20th century. However, several structural remains date to the 19th century, and may be related to barracks of the Civil War or earlier. An unmarked graveyard of quarantine patients is also present on the island. Little appears to remain from the 17th- and 18th-century occupation, although the potential exists to find evidence of activity from this time. Asbestos removal resulted in only very minor impacts to the ground surface, all of which were closely monitored by archaeologists.

25-2604 Atwood, Kathleen A.

2005 Final Historic Properties Management Plan, Tully Lake, Royalston, Massachusetts. 224 pages.

The purpose of the Historic Properties Management Plan (HPMP) is to provide a comprehensive program to direct the historic preservation activities and objectives at the Tully Lake Flood Control Project and to effectively manage and protect each historic property. The Overview, found in Section V, provides a project description, historic contexts, and results of archaeological investigations. The Landuse Guide is located in Section IV and details the types of agency activities that should have no effect on cultural resources and those that may impact historic properties. This section describes routine operation and maintenance activities, as well as possible future activities and/or improvements. The Action Plan in Section VII outlines specific tasks, procedures, and priorities that must be accomplished to satisfy Section 110 requirements. Cultural resource management procedures, which must be completed prior to the start of an undertaking, are also explained in this section. To date the following tasks contributing tos meeting compliance requirements have been accomplished. In 1995, an archaeological reconnaissance survey was completed (see report

#25-1507). Background research, a walkover, and limited subsurface testing identified 17 prehistoric sites and six documented historic period sites within the project area. The report provided recommendations for further inventory of archaeologically sensitive areas, and evaluation of identified sites. In 1999, proposed gatehouse repairs led to an historic inventory of the Tully Lake project area. The Tully Lake gatehouse and appurtenant structures have been determined eligible for the National Register of Historic Places (NR). In 2000, an intensive archaeological survey of the existing recreation and campground project was completed (see report #25-1969). The investigations identified and examined one prehistoric and two historic sites. The prehistoric site, designated the Short Site, is considered a potentially significant archaeological resource that may be NR eligible. The two historic sites HS 1, the E.W. Dexter Farmstead, and HS 8, the J.W. Bosworth Farmstead are 19th-century farmsteads. HS 1 possessed poor physical integrity and low research value; no further archaeological investigations were recommended. HS 8, the J.W. Bosworth Farmstead, is situated in the campground area west of Tully Lake. This site represents a potentially significant archaeological resource and may be NR-eligible. Avoidance or further research is recommended for HS 8.

25-2605 Dudek, Martin G., and Barbara Donohue

2005 Archaeological Site Examination at the Mt. Elam/Route 2 Historic Site for Route 2 Improvements, City of Fitchburg, Worcester County, Massachusetts. 137 pages.

The site examination at the Mt. Elam/Route 2 site involved the excavation of 62 systematic test pits (50x50cm), five judgmental test pits (three extended into 1mx0.5m units), three trenches (two 2mx0.5m and one 2mx1m) and one excavation unit (1mx1m). Three loci were defined, numbered west to east. Locus 1 consists of a demolished dwelling foundation, cellar hole and an intact well, with associated refuse circa 1800-1840s. Locus 2 consists of a property divide with an artificial earthen berm and line of boulders; to the north of the right-of-way this line continues as a stonewall. Locus 3 consists of a stone slab feature with associated refuse (c. 1830s-1900s); a boulder field is nearby with drilled quarrying holes in most boulders. The principal site component, Locus 1, is associated with the Battles occupation (1803-1848) along the north side of the Fifth Massachusetts Turnpike. Locus 3 is associated with the Perkins (1831-1869) and Cowdry (1869-1874) ownership. Both the Battles and the Perkins/Cowdry sites originally included dwellings. Construction of Route 2 in the 1950s covered the Fifth Massachusetts Turnpike and much of these parcels, impacting the dwelling foundations and leaving only portions of the back-lots intact. No additional archeological work is recommended.

25-2606 Hoffman, Curtiss

2005 South Brook Archaeological Survey, Bridgewater State College. 336 pages.

This report is of a locational survey of the South Brook project area on the campus of Bridgewater State College. Preliminary archaeological investigation of the project area has been productive. Fourteen pre-Contact sites, five pre-Contact findspots, eight post-Contact period sites, and five post-Contact period findspots have been identified. A total of 12 features, 484 pre-Contact artifacts, 681 flakes, 2,617 fire-cracked rocks, 6,912 organic materials, and 943 post-Contact artifacts were recovered. Diagnostic artifacts suggest that pre-Contact occupations were primarily from the late Archaic and/or Transitional Archaic period, while post-Contact occupations appear mostly to relate to 20th-century dumping activities from an adjacent piggery. Several functions were proposed at the site, including the production of what are interpreted as ceremonial objects, toolmaking, pit construction, food preparation, hunting, and astronomical observation. A limited number of site areas were recommended for a site examination should Bridgewater State College propose construction in this area.

25-2607 Holmes, Richard D., and Carolyn D. Hertz

1994 Limited Archaeological Site Locational Survey of the Electric Distribution Line, Podick Substation to UMass, Amherst, Massachusetts. 43 pages.

The project area passes through a portion of Hadley. Historic material included recent and temporally non-diagnostic artifacts. No further survey is recommended.

25-2608 Doucette, Dianna L., and A. Peter Mair, II

2005 Intensive (Locational) Archaeological Survey, Oakridge Avenue Sewer Project, North Attleborough, Massachusetts. 75 pages.

The intensive survey included archival research, a walkover survey, and subsurface testing. Thirty-eight, 50x50cm test pits were excavated, revealing a combination of relatively undisturbed soils, wetland soils, and areas of heavy fill. Cultural material recovered consisted of modern field trash, the majority of which was recovered from around the modern foundation of a garage. No further archaeological investigation is warranted.

25-2609 F. Timothy Barker, Timothy L. Binzen, Jennifer Wendt

2006 Archaeological Reconnaissance and Intensive (Locational) Survey for the Riverwalk Residential Community, Palmer, Massachusetts. 42 pages.

Within an area of approximately 19 acres on the north side of the Chicopee River, 124 shovel test pits were excavated. No cultural deposits or features were encountered. No additional survey is recommended. While the topographic landform and proximity to the river were predictive factors that strongly suggested that the survey area would contain pre-Contact Native American archaeological resources, the high stone content of the surface soils apparently made nearby floodplains and terraces more attractive for settlement.

25-2610 Cherau, Suzanne

2005 Archaeological Reconnaissance Survey, Arnold Arboretum, Boston, Massachusetts. 192 pages.

Archival research for the project in the Jamaica Plain neighborhood included a review and synthesis of all previous archaeological studies within the Arboretum as well as written histories and cartographic and photographic records on file at the Arnold Arboretum Archives. Previous archaeological studies included a 1992 reconnaissance archaeological survey that resulted in the development of an archaeological resources inventory map for known and expected resource areas (see report #25-1408). Other sources of information included all currently available plant reference maps, infrastructure (underground utility) maps, and site-specific soils mapping, provided by the Arboretum manager of plant records. Based on the current archival research and walkover survey, the majority of the Arnold Arboretum grounds were determined to have low/no archaeological sensitivity for intact belowground resources, including nine of the previously recorded sites. This assessment is based on the well-documented earthmoving activities. Moderate and high sensitivity is assigned to portions of the remaining nine previously recorded archaeological sites and about two acres in Weld Hill. These sensitive areas are documented to have been spared substantial earthmoving and planting activities, and in fact, are mostly contained in what the Arboretum has designated as “natural woods”, including the much reduced “North Woods” and “Central Woods”. Management recommendations for the archaeologically sensitive areas identified within the Arboretum study area include outlining the steps that will be taken to avoid, minimize, or mitigate future impacts to significant archaeological resources by avoiding ground disturbances in these areas or, where ground disturbance cannot be avoided, conducting further archaeological investigation to determine the presence or absence of intact archaeological resources. It is also recommended that the Arboretum address the National Register eligibility of the Spring Brook Site (19-SU-25) in consultation with the MHC and Boston Landmarks Commission, since it was previously rec-

ommended as an archaeologically significant site. Additional recommendations include developing an unanticipated discoveries and casual finds protocol along with staff training in cultural material identification, providing for the transfer and permanent curation of all artifacts and study materials generated during previous and future archaeological investigations to the Arboretum Archives as well as future public interpretative and educational initiatives. Archaeological site forms have been updated. Management recommendations will be addressed in a forthcoming Cultural Resources Management Plan.

25-2611 Ritchie, Duncan, and Kirk Van Dyke

2005 Intensive (Locational) Archaeological Survey, Brookmeadow Subdivision, Grafton, Massachusetts. 130 pages.

Research completed as part of the sensitivity assessment and intensive survey indicated that the project area was near a general core area of pre-contact Native American settlement along the upper Blackstone River drainage. Two known pre-contact period Native American archaeological sites, the Milford Road Quartz Quarry (19-WR-515) and Milford Road Rockshelter (19-WR-516), were located in the project area. During a walkover survey of the project area, seven previously unknown archaeological sites were identified. These sites were a Native American rockshelter and petroglyph site (Brookmeadow Rockshelter), two post-contact period cellar holes/foundations (Brookmeadow Foundations 1 and 2), two small granite quarries (Brookmeadow Granite Quarries 1 and 2), a fieldstone dam (Brookmeadow Dam) and well (Brookmeadow Well). A modern period house located at 373 Providence Road was also documented. Subsurface testing in zones of high and moderate archaeological sensitivity was conducted with 55, 50x50cm test pits placed along judgmentally oriented transects and in specific locations at known or suspected archaeological sites. Judgmental test pits were used to investigate Native American rockshelters, the two post-contact period cellar holes/foundations and one granite quarry. Small amounts of quartz chipping debris were found within the Milford Road and Brookmeadow Rockshelter sites. Test pits placed next to the two cellar hole/foundation sites (Brookmeadow Foundation 1 and 2 sites) yielded a few sherds of redware. The locations of the Milford Road Quartz Quarry and Milford Road Rockshelter sites in the southern part of the project area were confirmed. The extent and type of recent damage to the Milford Road Quartz Quarry Site by avocational mineral or artifact collectors was documented. Samples of quartz debitage and quarry debris likely to be of pre-contact period Native American origin were collected. A sample of artifacts (ceramic sherds, bottle glass) was also collected from a late 19th-century to early modern period deposit of domestic refuse exposed in a test pit dug for site engineering studies at 373 Providence Road. No further archaeological investigation was recommended for this includes the modern period house located at 373 Providence Road and associated post-contact period trash deposit, Brookmeadow Well, Brookmeadow Dam, and the Brookmeadow 1 and 2 Granite Quarries. Five sites were considered potentially significant. The Milford Road Rockshelter (19-WR-515), Milford Road Quartz Quarry (19-WR-516), Brookmeadow Foundation 1 and 2 sites, and the Brookmeadow Rockshelter with associated petroglyph site contain evidence of pre-contact and post-contact period Native American or Euro-American settlement and resource use. While the central portion of the Milford Road Quartz Quarry has been badly damaged by uncontrolled digging, peripheral sections of it appear to remain somewhat intact. The Brookmeadow Foundation 1 and 2 sites may be associated with either the post-contact Native American community of Hassanamisco or early Euro-American settlement. The Milford Road Rockshelter is outside the proposed impact area. The Milford Road Quartz Quarry and Brookmeadow Foundation 1 and 2 sites are within designated wetland areas. A long-term protection plan should be developed for these potentially significant cultural resources. Proposed development should avoid the Brookmeadow Rockshelter Site.

25-2612 Cherau, Suzanne, and Donna Ingham

2006 Intensive (Locational) Archaeological Survey, GE-Pittsfield/Housatonic Superfund Site, 1.5 Mile Removal Action, Phase 3C (Pomeroy Avenue Bridge to the Confluence), Pittsfield, Massa-

chusetts. 54 pages.

The 1.5 Mile Removal Action consists of remediation of the East Branch of the Housatonic River and its riverbanks from Lyman Street to the confluence with the West Branch of the Housatonic River in Pittsfield. Phase 3C of the undertaking addresses properties located along the East Branch of the river between Pomeroy Avenue and the confluence with the West Branch. A portion of the properties located in Phase 3 were determined to be archaeologically sensitive. Ground disturbances in these sensitive areas included the construction of access roads, and the preparation of crane mats and staging areas, within the river floodplain on both sides of the river. The intensive survey consisted of archival research and field investigations (walkover survey, subsurface testing). The subsurface testing consisted of the excavation of 62, 50x50cm test pits at 10m intervals along both sides of the river floodplain. The post-contact cultural materials noted in excavated soils and sediments during subsurface testing were situated predominantly within alluvial deposits. Modern cultural materials (e.g., tin foil, 8-track tape, plastic, Styrofoam) were also noted within recently developed A-horizon soils formed in the alluvial sediments and within fill deposits. No further testing of the floodplain areas was recommended. Planned archaeological monitoring for the riverbed and riverbanks that will be excavated during the removal action was recommended.

25-2613 Chartier, Craig S.

2006 Report on the Intensive Survey Fieldwork at Wickets Island, in Onset Village, Wareham, Massachusetts. 57 pages.

Forty-two, 50x50cm test pits were excavated in a 5m grid covering an area measuring 60m north to south by 30m east to west. A total of 1,035 artifacts was recovered, all of historic date. Nine features were identified during the survey, eight of which related either to the late 19th to late 20th-century occupation of the island. One feature consisted of a thin shell midden layer containing deer and turtle bone as well as oyster and quahog shells. No temporally diagnostic artifacts were recovered in association with this feature. Its position just below a buried A horizon may indicate a late 18th to early 19th-century date for this feature. No further testing is recommended.

25-2614 Chartier, Craig S.

2006 Report on the Intensive Survey Fieldwork at the Village of Hanover in Hanover, Massachusetts. 50 pages.

One hundred and four, 50x50cm test pits (88 systematically placed along eight transects and 16 in four array brackets) were excavated in high potential areas in close proximity to swamp land on the property. A total of 37 artifacts were recovered (29 prehistoric, 8 historic). Three prehistoric sites were identified with diagnostic material being found at only one. Artifacts recovered included 19 pieces of chipping debris, two core fragments, five shatter fragments, one piece of fire-cracked rock, and two Late Archaic (6000-3000 years BP) projectile points. Historic material was limited to redware, possible brick and one hand-wrought nail fragment. Due to deep historic plowing and the low density of prehistoric cultural material recovered none of the sites identified is considered significant. No further testing is recommended.

25-2615 Grossman-Bailey, Ilene

2005 Summary Report, Phase II Site Examinations for Loci 2 to 6, Proposed Water Treatment Plant and Appurtenant Work, Norwell, Plymouth County, Massachusetts. 140 pages.

A site examination was conducted of five sites (Loci 2 through 6) identified during intensive survey in the vicinity of Old Pond Meadow. The sites varied in size, but the areas tested totaled 490sq m (approximately 0.1 acre). As the impacts consisted principally of linear pipeline corridor, it is likely that each site is larger than the tested area. Activities performed included background research, subsurface testing (50cmx50cm shovel test units and 1mx1m excavation units), off-site

flotation, artifact analysis, radiocarbon dating, and archaeobotanical analysis. Locus 2 was identified as a limited-use resource procurement station. A total of 88 lithic artifacts, none diagnostic, were recovered from 6 test pits and 2 excavation units. Locus 3 was a seasonal resource procurement and processing site, dated to the Late Archaic Period by the presence of a Squibnocket and a Merrimack projectile point (found during the intensive survey). The site examination recovered 135 lithic artifacts, none diagnostic, from 5 test pits and 2 excavation units. Locus 6 consisted of several short-term activity areas or occupation zones where hunting, cooking, lithic manufacture, and other activities occurred. 172 lithic artifacts, none of them diagnostic, were recovered from 12 test pits and 3 excavation units. Loci 2, 3, and 6 were determined ineligible for the National Register of Historic Places. Locus 4 was a Late Archaic extended family/small group micro-social seasonal camp, occupied during at least the summer and fall. In all, 1,425 lithic artifacts, including a quartz triangle and Rossville points, were recovered from 3 test pits and 2 excavation units. A hearth of cooking feature was excavated and radiocarbon dated to 4320+/-40 B.P., calibrated to 4907 to 4830 B.P. (Beta 197615). Botanical materials included hazelnut, hickory, grape seeds, and birch, beech, and coniferous wood. Locus 4 was determined eligible for the National Register of Historic Places under Critera A and D. Locus 5 was a Late Archaic small group temporary procurement or hunting station. A total of 55 lithic artifacts, including quartz triangle and Small Stemmed points, were recovered from 5 test pits and 2 excavation units. A hearth or cooking feature was tested and radiocarbon dated to 4010+/-40 B.P. calibrated to 4560 to 4410 B.P. (Beta 197616). Botanical materials included carbonized acorn and oak wood. Locus 5 was determined eligible for the National Register of Historic Places under Critera A and D.

25-2616 Mair, A. Peter, II

2005 Intensive (Locational) Archaeological Survey, Village Green Project Area, Tewksbury, Massachusetts. 78 pages.

An intensive (locational) archaeological survey was conducted for the approximately 7.41-acre project area. Archival research indicated that the project area was potentially sensitive for Native American cultural resources based on the presence of a recorded site (19-MD-19) and favorable environmental conditions. Fieldwork consisted of a walkover/surface evaluation and subsurface testing. Forty 50x50cm test pits were excavated, producing a light scatter of post-contact ceramic material. No evidence of Site 19-MD-19 was recovered during field investigations. The ceramic materials represent a field scatter of trash and are not considered significant. No additional archaeological investigations are recommended.

25-2617 Ingham, Donna

2004 Intensive (Locational) Archaeological Survey Project PRA-CACO 202(1), Cape Cod National Seashore, Eastham, Massachusetts. 76 pages.

Subsurface testing was placed within each of the three roadway reconstruction areas. Thirty-one 50x50cm test pits were excavated within the three work areas. This subsurface testing resulted in the identification of pre-contact Native American archaeological resources within two of the three areas. Lithic artifacts were recovered from a number of testing locations adjacent to the cul-de-sac section of Tomahawk Trail. All of this material was from the plow zone. Plowed soil within and around the cul-de-sac was found to range between 26 and 47cmbs. Native American cultural material, including a temporally diagnostic ceramic sherd, was recovered from test pit TA-4 in association with a soil anomaly at 38cmbs--just below the plow zone. The assemblage of recovered cultural material indicates the presence of archaeological resources that may be eligible for listing in the National Register of Historic Places. No additional subsurface investigations are necessary in the cul-de-sac section of the Tomahawk Trail provided that project impacts are confined to within 2ft of the existing edge of pavement and to more than 10in below existing grade. Protective fencing on the inside and outside of the cul-de-sac and monitoring during construction are recommended. Lithic artifacts recovered from the section of the Tomahawk Trail (west side) between stations 25+60 and 27+15, although of low density, are of diverse material types, and partially

situated within undisturbed stratigraphic contexts. These materials may indicate the presence within the proposed work area of a cultural resource that may be eligible for listing in the National Register of Historic Places. No additional subsurface investigations are necessary on the west side of Tomahawk Trail between stations 25+60 and 27+15 provided that protective fencing is erected and monitoring occurs during construction. Lithic artifacts recovered from the east side of the roadway within this work area are of low density and exist within disturbed stratigraphic contexts. No further archaeological investigations are recommended within this work area on the east side of the roadway. A low density of post-contact cultural materials recovered from the section of Tomahawk Trail between stations 17+10 and 18+10 are of limited diversity, are situated within a disturbed stratigraphic context. No further subsurface investigations are recommended.

25-2618 Pasquariello, Raymond D., and Gregory R. Dubell

2006 Reconnaissance Archaeological Survey for the Jackson Appleton Middlesex Urban Revitalization and Development Project Parking Structure, Lowell, Massachusetts. 40 pages.

This project included documentary research, consultation, a walkover survey, and monitoring of geotechnical and geophysical investigations to identify limited locations within the project impact area with the potential to contain intact historical and archaeological features associated with the 19th-century boardinghouse residents of Hamilton Mills. A site examination archaeological survey was recommended for three specific locations to determine the absence/presence of these features and evaluate their potential significance: housing blocks 12-14 and associated yard and shed areas, the yard and shed areas associated with housing blocks 20-24, and housing blocks 31-34 and associated yard and shed areas.

25-2619 Binzen, Timothy

2006 Archaeological Reconnaissance and Intensive (Locational) Survey for the MassHighway Research and Materials Laboratory, Worcester, Massachusetts. 45 pages.

Two survey units were tested in the 6.48-acre parcel. Thirty-four shovel test pits (STPs) were excavated at intervals of 7.5m (25ft) in clusters of four STPs apiece in locations exhibiting high archaeological sensitivity. A high degree of previous ground disturbance, soil dumping, and grading was encountered in the majority of the survey area. No cultural deposits were encountered. The proposed construction will not affect potentially significant cultural resources.

25-2620 Ritchie, Duncan

2005 Intensive (Locational) Archaeological Survey Valley Street Subdivision, Pembroke, Massachusetts**.** 80 pages.

Background research completed as part of the intensive survey indicated that the project area was near a general core area of pre-contact Native American settlement along the upper North River drainage. A known pre-contact period Native American archaeological site, 19-PL-456, was reported to be in the project area. It consisted of a find spot of a single Terminal Archaic Period (3,600–2,500 years ago) Orient Fishtail type projectile point. Subsurface testing in zones of high and moderate archaeological sensitivity was done with 101, 50x50cm test pits placed along judgmentally oriented transects and in specific locations near find spots of cultural material. Two pre-contact period archaeological sites were identified. Valley Street Locus 1 and 2 are isolated find spots of pre-contact period Native American cultural material. They consist of small, low-density deposits with a few pieces of quartz and rhyolite chipping debris. Valley Street Locus 1 also yielded a single bifacial tool blade of quartz. These two sites have low information content, poor integrity, and cannot be associated with a specific time period or cultural tradition. The Valley Street Locus 1 and 2 Sites are not considered potentially significant. Site 19-PL-456, a recorded pre-contact Native American archaeological site in the southern part of the project area, could not be confirmed. Subsurface testing in the recorded location of this site did not yield any cultural ma-

terial. A post-contact period archaeological site, the Upper Chandler Pond Dam Site, is partially located within the project area. It was a small rural sawmill from the early to late 19th century. The dam also appears to have served as a crossing over Pine Brook for a roadway extending from the town of Kingston through the southeastern corner of Pembroke to Duxbury. Some modification or repair of the dam structure was made in the modern period. This historic dam is considered a potentially significant cultural resource. A modern sheet metal shed in the project area appears to be associated with recent commercial cranberry growing. It is not considered potentially significant. The location of Site 19-PL-456 will not be affected by proposed development. This section of the project area will remain undeveloped woodland. The Upper Chandler Pond Dam Site is within a designated wetlands area and will not be impacted. However, it is recommended that a protective buffer zone be placed around the southern end of the dam. No further archaeological investigation is recommended.

25-2621 Herbster, Holly

2005 Technical Report, Archaeological Reconnaissance Survey, Keyspan Sagamore Reinforcement Project, Sandwich, Barnstable, Yarmouth, Dennis, and Harwich, Massachusetts. 78 pages.

The proposed Preferred Route involves the construction of three pipeline segments (Western, Middle and Eastern) totaling approximately 13.1 miles. The study area also includes a "Noticed Alternative" for each segment. The survey determined that the Western and Eastern Preferred Route have a low archaeological sensitivity. The Middle Preferred Route contains areas high, moderate, and low archaeological sensitivity. The Western, Middle, and Eastern Noticed Alternative segments each contain areas of high, moderate, and low archaeological sensitivity. An intensive (locational) survey was recommended for impact areas within the Middle Segment Preferred Route that were assessed as having moderate and high archaeological sensitivity.

25-2622 Lance, Mark, and A. Peter Mair, II

2005 Intensive (Locational) Archaeological Survey: Lowe's of Hadley, Hadley, Massachsuetts. 70 pages.

The survey included archival research and field investigations of the 18 acre parcel. The project area was considered archaeologically sensitive based on the presence of favorable environmental factors and six previously recorded archaeological sites (19-HS-142, 151–154, 254) located south of the project area. Sixty, 50x50cm test pits arranged in four, 30x30m test pit blocks, one test pit transect, and one judgmental test pit were excavated. Subsurface testing produced one piece of chipping debris from a disturbed road context and light density scatter of post-contact cultural material, including a buried box of wire nails. No further archaeological investigations are recommended.

25-2623 Graves, Anna K., and Duncan Ritchie

2005 Intensive (Locational) Archaeological Survey, Old English Square, Holbrook, Massachusetts. 70 pages.

The project area is located in an area of intensive pre-contact period Native American activity along the upper Cochato River drainage. Archival research on settlement/land use in the towns of Holbrook and Randolph surrounding the project area suggested that Native American groups inhabited the area continuously from the Early Archaic to Late Woodland periods (8,500 to 450 years ago). The Cochato River served as a transportation corridor between the interior and coastal/estuarine zone around the southern margin of Boston Harbor. The cluster of known Native American sites along the Cochato River wetlands and various tributary streams demonstrates that upland areas with well-drained soils adjacent to these streams and wetlands were an integral part of pre-contact period settlement patterns. The project area contains six (19-NF-103, 139, 449 to 452) of the 17 previously identified pre-contact period Native American archaeological sites in the

vicinity of the project area. All six of the sites within the project area were documented from the Frederick Carty artifact collection and are known by their approximate location. These sites most likely contained evidence of settlement over a 7,000 year span from the Middle Archaic to Late Woodland periods. Post-contact period land use in the project area was primarily agrarian/pastoral in nature from the mid-17th through mid 20th centuries. In the 20th century a dairy farm operated here. Some industrial development including an icehouse and weighing station occurred in the 20th century along a railroad spur that passed through the western and southern portion of the project area. The operation of sand/gravel pits in the project area during the last 50 years removed much of the original land surface leaving a few wooded and open field areas with intact soils. Approximately 28 acres of the 79 proposed for the project were undisturbed and retained intact topography and soil horizons. Of the 28 undisturbed acres, approximately 16 are in a proposed conservation zone. Thirty-eight, 50x50cm test pits were excavated within the 12 acres of upland considered to have high or moderate archaeological sensitivity. This subsurface testing confirmed archaeological deposits within the location of two previously identified Native American sites. The Lake Holbrook Site (19-NF-139) yielded 88 pieces of pre-contact Native American cultural material from the surface and intact soils. Two chipped-stone tools found on the site were a triangular projectile point fragment and a quartz bifacial tool blade. The broken triangular projectile point resembles the Levanna type, which is diagnostic of the Late Woodland (1000 to 450 years ago) to Contact (AD 1500 to1620) periods. The Lost Site represents a locus of a larger unnamed site (19-NF-450) that was identified by avocational archaeologists and recorded in 1999. Intensive testing at the Lost Site produced 18 pieces of quartz chipping debris from the plow zone and B_1 subsoils. Post-contact period cultural material found in test pits on the Lost Site were primarily ceramic sherds (whiteware, ironstone, porcelain). These artifacts likely represent domestic or farm-related refuse discarded in open fields during the late 19th century to modern period. The survey confirmed two previously identified pre-contact period Native American archaeological sites. The Lake Holbrook (19-NF-139) and Lost (19-NF-450) sites both consist mostly of deposits of quartz chipping debris created by the manufacture of chipped-stone tools during brief occupations. The Lost Site cannot be placed within a specific time period or cultural context, has low information content and is not considered potentially significant. No further archaeological investigation was recommended for the Lost Site. The Lake Holbrook Site is in good condition within a wooded section of the project area. It could provide additional information about Late Woodland Period settlement patterns within the general Cochato River drainage and is considered to be potentially significant. Current plans for the project indicated that the Lake Holbrook Site was located outside the approximate limit of proposed development. No further archaeological investigation was recommended. It was recommended that a suitable buffer zone be placed around the Lake Holbrook Site.

25-2624 Herbster, Holly, and Loren Millard

2005 Technical Report, Intensive (Locational) Archaeological Survey, Canal Place, Bourne, Massachusetts. 74 pages.

Eighty, 50x50cm test pits were excavated within archaeologically sensitive portions of the 12 acre proposed project area. The subsurface testing recovered 33 pieces of cultural material including 20 pieces of chipping debris, one complete Levanna projectile point, and a low density of post-contact/modern materials in two isolated deposits, designated as the Canal Place 1 and 2 sites. All of the cultural materials were collected between 0 and 90cm below the ground surface in plow zone and natural B_1 subsoils. No single test pit contained more than four pieces of lithic material, and no indications of cultural features or soils anomalies were identified in association with these materials. Close-interval testing did not recover any additional cultural materials or any evidence of cultural features. The recovered lithic fragments and projectile represent isolated finds, and the absence of additional deposits such as features, limits their information content. No additional archaeological investigations were recommended.

25-2625 Graves, Anna K., and William Brett

2005 Intensive (Locational) Archaeological Survey, Newland Avenue Ground Bed, Bellingham, Massachusetts. 52 pages.

The project area measures approximately 770 linear feet. A preliminary walkover inspection determined that archaeological survey was required for 350ft of the proposed cable path. Eight 50x50cm test pits were excavated at 10m intervals within the proposed impact area, yielding modern cultural material (glass, unglazed redware) that was not saved for cataloging. No potentially significant cultural resources were identified and no further survey is recommended.

25-2626 Herbster, Holly, and Michael P. Duffin

2006 Intensive (Locational) Archaeological Survey, B-9 and C-14 Parcels, Camp Edwards, Bourne and Sandwich, Massachusetts. 198 pages.

A survey was completed of 682 acres of Camp Edwards at the Massachusetts Military Reservation. The project area included moderate and high sensitivity portions of two parcels (B-9 and C-14 Training Areas) as determined by a previous base-wide reconnaissance survey (see report #25-929) and updated by the Massachusetts Army National Guard Regional Cultural Resource Manager. A total of 2,096, 50x50cm test pits were excavated within the two parcels and along two short well routes located in the Demo 1 Area. The survey identified 17 pre-contact site areas documenting hunting and lithic maintenance activities, although no temporally diagnostic materials were recovered. Thirteen of these deposits were classified as isolated find spots and no further testing was recommended. Four sites in the B-9 and C-14 parcels are considered potentially significant based on the recovery of a higher density of cultural materials and/or the identification of possible features.

25-2627 Donta, Christopher L.

2005 Connecticut River 2000: Archaeological Intensive (Locational) Survey of Eight Parcels for the Connecticut River Bank Stabilization Project, Montague, Gill, and Northfield, Massachusetts. 137 pages.

Eight parcels under consideration for erosion control were the subject of subsurface testing, using 477 shovel test pits, 27 1x1m units, and 24 backhoe trenches. Based on the documentary background review, six of the eight parcels included portions of known Native American archaeological sites. The data recovered during the subsurface testing documented two previously known sites and identified eight new Native American sites. The Durkee's Landing Ravine site (19-FR-347) was documented in two parcels. The Durkee Downstream parcel contained Native American artifacts across the entire length of the area tested, with concentrations in three places, including 17 rhyolite bifaces within an intact cache feature. Artifacts were also found eroding on the beach, including a grooved maul and a long ground stone pestle. The Durkee Upstream parcel contained a light scattering of Native American artifacts, with no definite concentrations. Artifacts were also found on the beach in this location. In total, 204 artifacts were collected from this site in the two parcels. The Four Star Site (19-FR-375) was identified in six test units near the western end of the Skalski parcel, from which 18 artifacts were collected, including ceramic sherds and lithic flakes. The Burning Terrace Site (19-FR-374) was documented in five test units located on a small lower terrace in the southern portion of the Skalski parcel. The five test units identified a black, burned soil feature, and one test pit contained a single ceramic sherd that was also burned. The Pumpkin Field Site (19-FR-376), also in the Skalski parcel, contained the largest and most dense concentration of material in this parcel. The artifacts included 20 sherds of pottery, 20 pieces of lithic debitage, one piece of fire-cracked rock, one clay bead, and one fragment of a decorated pipe bowl. The Kidds Island Overlook Site (19-FR-377) is located in the central part of the Skalski Parcel, where seven artifacts were collected from six different excavation units, consisting of six lithic flakes and one ceramic sherd. The Pear Orchard Site (19-FR-378) in the eastern part of the Skalski Parcel contained six excavation units with artifacts. Nine flakes of shale, and hornfels or chert were recovered from 1 to 50cm below the ground surface, in addition to a single faunal bone. Evi-

dence of the Northfield-Mt. Hermon Lagoon site (19-FR-351) was found in the Urgiel Downstream and Urgiel Upstream parcels. The Urgiel Downstream parcel contained Native American artifacts in five test pits, situated in two small concentrations. One area, with two test pits yielding nine pieces of quartz shatter from fill contexts, is considered disturbed. The second area yielded 14 lithic flakes and two pieces of fire-cracked rock from undisturbed soils. The Urgiel Upstream parcel contained four ceramic sherds from a single test pit, with no other artifacts found in the surrounding area. The Coassock Site (19-FR-119) in the Country Road parcel, yielded 32 artifacts from four test units, consisting of 26 sherds of pottery, one quartz flake, one quartzite flake, three rhyolite flakes, and one flake of a heavily patinated, uncertain material. The Effluence Pipe Site (19-FR-379) in the Country Road parcel, produced one quartz flake and two ceramic sherds from two test pits. The Windy Ridge Site (19-FR-380) in the Country Road parcel contained five test units that yielded twelve pieces of lithic debitage. Project construction was designed to avoid any impacts to the defined archaeological sites.

25-2628 Cook, Lauren J., John P. McCarthy, and Stephen A Brighton

2005 Intensive (Locational) Archaeological Survey, Massachusetts Water Resources Authority, Section 530 Sewer Replacement, Upper Neponset Valley Relief Sewer Project, West Roxbury, Massachusetts. 44 pages.

The project consisted of documentary research and field investigation of a 1.75mi (2.81km) pipeline route running between the VFW Parkway and the Brookline town line. Documentary research and pedestrian survey indicated that while much of the route was originally of low or moderate sensitivity for archaeological resources, installation of the original Section 530 sewer significantly disturbed most locations that retained sensitivity. An exception appeared in one area, which was in the vicinity of a sawmill built in the 17th century by Erasmus Drew on Saw Mill Brook. A second location that had been part of St. Joseph's Cemetery was paved, and its degree of disturbance could not be assessed. Archaeologists recommended testing and monitoring. Subsurface testing indicated that impacts from the original construction of the sewer were greater than originally thought. No further archaeological work is recommended.

25-2629 Cherau, Suzanne G., and Jennifer B. Bonner
2006 Archaeological Investigations, Chadwick Lead Mill Site, Salem and Marblehead, Massachusetts. 158 pages.

The investigations at the Chadwick Lead Mill Site were conducted in two phases, a reconnaissance survey/sensitivity assessment in 2002 and a subsurface testing program as part of an intensive survey and site examination in 2005. The reconnaissance survey involved extensive archival research and a walkover survey; the subsurface testing focused on the worker housing portion of the site because the industrial mill complex itself had been largely compromised. The testing strategy was developed to collect archaeological data relating to the site's physical layout and integrity, content and complexity, and date(s) of occupation. Additional research focused on the use of space and material culture of the Chadwick Lead Mill tenement community and comparisons of the socioeconomic condition of the Chadwick Lead Mill workers to other historically and archaeologically investigated industrial worker communities in the region. The excavation consisted of 49, 50x50cm test pits and 7 larger excavation units. The test pits were placed at 10m intervals along 10 judgmental transects, and included six judgmental test pits. The larger units, used to further investigate cultural features and artifact deposits, varied in size (three 50x100cm and four 1x1m). The archaeological investigations identified extensive post-lead mill 20th-century disturbances; the site is not recommended as eligible to the National Register of Historic Places. A low density of lithic debitage was recovered during the subsurface investigations. These materials are probably associated with the recorded pre-contact/contact period Lead Mills Site (19-ES-414) and further confirm that Native Americans used the outwash terraces on the southeast side of Salem

Harbor/mud flats prior to the establishment of the Euro-American milling activities. The physical integrity of the Native American cultural deposits has been severely compromised by the industrial use of the parcel however, and they do not constitute a potentially significant archaeological resource. No further work is recommended.

25-2630 Bonner, Jennifer L., and Suzanne G. Cherau
2005 Intensive (Locational) Archaeological Survey, Shaw's Supermarket at Wakefield, Massachusetts. 122 pages.

The proposed undertaking requires the demolition of the four remaining structures of the historic Wakefield Rattan Company, which operated from the mid-19th century to about 1930. The expanded archaeological assessment of the project parcel, conducted prior to fieldwork, determined that the majority of the redevelopment area was heavily disturbed by late 19th- thru 20th-century industrial and commercial businesses, associated underground utilities, and recent demolition and exploratory soil testing. These collective earthmoving disturbances compromised the physical integrity and research value of the documented structures and features of the majority of the early mill and later rattan company industrial occupations. Initially two areas of intact ground surfaces associated with a mid-19th-century mill-related shop, possibly re-used as a wagon shed, were identified in the southwest section of the parcel. Machine-assisted subsurface testing of three trenches of varying sizes and depths confirmed that this section was also heavily disturbed. One structural feature, a large, buried concrete culvert/pipe roughly aligned with the location of the underground southern raceway, was located. No pre-contact period cultural resources were identified. No further archaeological investigations are recommended.

25-2631 Doucette, Dianna L., and Holly Herbster
2005 Intensive (Locational) Archaeological Survey of the Norfolk Landing Subdivision, Norfolk, Massachusetts. 69 pages.

The survey of a 15-acre parcel, near the confluence of the Charles and Mill rivers and adjacent to the existing Norfolk Airport included archival research, a walkover survey, and subsurface testing. A total of 54, 50x50cm test pits, were excavated at 10m intervals along six, judgmentally placed, test pit transects and in two arrays. The excavations identified the previously recorded Populatic Pond Site (19-NF-183), which prior to this survey had not been investigated by professional archaeologists, and its physical boundaries were unknown. Archaeologists recovered 144 Native American artifacts consisting of 137 pieces of chipping debris, 5 stone projectile points, and 2 pieces of calcined mammal bone. This assemblage includes a diagnostic rhyolite Neville point and an argillite Stark projectile point preform dating to the Middle Archaic Period (ca. 8000–6000 B.P.) and a quartz Small Stemmed point, diagnostic of the Late Archaic Period (ca. 6000–3000 B.P.). The Populatic Pond Site may cover a fairly large horizontal area and appears to contain moderate density cultural deposits including diagnostic artifacts and cultural features; the horizontal boundaries of this site have not been defined. The Populatic Pond Site is considered a potentially significant cultural resource that could contribute additional information to the archaeological record of the Charles River area and is potentially eligible for the National Register of Historic Places. Avoidance is recommended; if that is not possible a site examination is recommended.

25-2632 Graves, Anna, and A. Peter Mair, II
2005 Intensive (Locational) Archaeological Survey, Southend Farm Definitive Subdivision, Millis, Massachusetts. 97 pages.

This survey included research, a walkover survey, and subsurface testing. The Millis Earthworks (MLS.HA.7), a stone garrison house (MLS.HA.6), and the South End Pond Site (#19-NF-65) are within or near the project area. A total of 114, 50x50cm test pits was excavated, identifying one previously unknown pre-Contact Native American archaeological site and a portion of the previ-

ously recorded Millis Earthworks within the project area. The Bogastow Brook Site contains a low-density distribution of pre-Contact Native American artifacts representing a small, limited activity site focusing on lithic manufacture. The absence of diagnostic materials or features limits the potential of this site to provide new information beyond that recovered during this project. The remnant of the Millis Earthwork within the project area is located within a wetland and protected by a wetland buffer. No additional work is recommended at either site.

25-2633 Cherau, Suzanne G., and Jennifer B. Banister
2006 Intensive (Locational) Archaeological Survey for the Proposed Carriage Way Extension Project in Hancock Shaker Village, Hancock and Pittsfield, Massachusetts. 108 pages.

No previous archaeological investigations had been conducted for this specific project area, although a number of archaeological investigations have been conducted elsewhere on Hancock Shaker Village (HSV) lands (see reports #25-1025 and 25-2004). The current survey included archival research and field investigations. Archival research assisted the identification and assessment of archaeological deposits. Field investigations consisted of the hand excavation of 163, 50x50cm test pits placed at varying intervals (2.5, 3, 7.5, and 10m) in the impact areas. A total of 96 post-Contact Period artifacts was recovered from 0cm to 50cm below surface in A_{pz} and A soil horizons and in one post-Contact Period soil anomaly/cultural feature. No pre-Contact Period features or artifacts were recovered. The majority of the recovered cultural materials consist of redeposited domestic and architectural (mostly fence) items in the plow zone soil horizons in the North Pasture and South Pasture segments of the proposed carriageway extension. These low-density scatters of field refuse have limited research value and are not considered significant archaeological deposits. Likewise, no significant cultural deposits were identified in direct impact areas in the far southern part of the carriageway extension in the area designated as the Quarry Woods, which contains visible ledge quarries that date to the Shaker Period of occupation. The quarries will not be impacted by the current project design. The soil anomaly/cultural feature identified in the South Pasture, named the Lime Kiln Site, dates to the Shaker period of occupation and perhaps earlier. It is a significant archaeological resource potentially eligible for the National Register of Historic Places as a contributing element of the Hancock Shaker Village National Register District. The proponents agreed to re-route the proposed carriage way and protect the site area during construction activities. The project also includes the removal of 11 intrusive spruce trees from three locations near Route 20 within Hancock Shaker Village. Archival research determined that documented and under-documented Shaker period buildings and features could be present in all of the proposed tree removal areas; the removal will be monitored by an archaeologist.

25-2634 Graves, Anna K., and Duncan Ritchie
2005 Intensive (Locational) Archaeological Survey and Site Examination, Webster Point Village, Marshfield and Duxbury, Massachusetts. 119 pages.

The proposed residential development measures approximately 44 acres; the proponent will develop 28 acres and leave the remaining 16 acres as a conservation zone. Thirty-nine, 50x50cm judgmentally-placed test pits were excavated during the intensive survey during which two Native American sites, the Area 2 Find Spot and Rocky Swale Site were identified. The Area 2 Find Spot consists of a single piece of rhyolite chipping debris. Subsurface testing at close intervals (5m) around this findspot did not yield additional cultural material. The Area 2 Find Spot is not considered a potentially significant cultural resource; no further testing is recommended. Over 100 pieces of chipping debris were recovered at the Rocky Swale Site during the intensive survey. A subsequent site examination of the site included 44 additional test pits within a 10m grid and 4, 1x1m excavation units. Excavation yielded four rhyolite Levanna projectile points; one piece of pottery, suggesting a Middle to Late Woodland period occupation; nearly 4,000 pieces of chipping debris; 30 bifacially flaked tools; and three cultural features. The Rocky Swale Site is a significant cultural resource and is potentially eligible for listing in the National Register of Historic Places under Criteria A and D. Avoidance of the delineated site area and preservation in place is recom-

mended.

25-2635 Graves, Anna K., and William Brett
2005 Archaeological Site Examinations, CSX #1, CSX #2, and Taunton River Marsh Sites, Weaver's Cove LNG and Mill River Pipelines Project, Fall River and Freetown, Massachusetts. 108 pages.

Site examinations have been completed at the CSX #1, CSX #2, and Taunton River Marsh sites (see report #25-2548). The CSX #1 Site covers approximately 1,050sq m measuring approximately 30m east/west by 35m north/south. Intensive survey and site examination testing recovered two projectile points (Small Stem, untyped broad), ten bifacially-flaked tools, two lithic cores, a hammerstone, and a scraper as well as a high density of chipping debris and organic materials (shell, bone). The CSX #2 Site covers an area of approximately 1,050sq m measuring approximately 70m east/west by 15m north/south. The intensive survey and site examination recovered a low density of chipping debris and scattered post-contact period materials. The Taunton River Marsh Site covers an area of approximately 3,200sq m measuring approximately 40m east/west by 80m north/south. Intensive survey and site examination testing recovered two projectile points (Levanna, unidentified), a bifacially flaked tool, a lanceolate blade fragment, a lithic preform, a utilized flake, and a moderate density of chipping debris and organic materials (shell, bone). The CSX #2 Site is not considered significant. The CSX #1 and the Taunton River Marsh sites each contain high densities of cultural material and temporally diagnostic materials, and have potential to contain cultural features. Both the CSX #1 and Taunton River Marsh Sites are significant cultural resources eligible for listing on the National Register of Historic Places under Criteria A and D.

25-2636 Leveillee, Alan
2006 Wellesley Congregational Church Cemetery, Wellesley, Massachusetts. 12 pages.

The Wellesley Congregational Church is preparing a preservation and future interment space plan within its cemetery. One area under consideration includes a former 19th-century roadway. Previous research included compiling archival materials, assessing the condition of existing monuments, and a ground penetrating radar survey of the former roadway to determine whether the location of the former roadway contains burials. The goal of the current archaeological investigation was to definitively determine whether unmarked graves exist within the former roadway. The staged approach to the investigation included review of existing documentation and historical records research followed by field investigations. Hand excavations documented the stratigraphic characteristics of subsoils, and machine-assisted topsoil removal and hand/shovel scraping exposed subsoils below the topsoil/subsoil interface for inspection for potential grave shaft features. The archaeological investigation indicated that graves do not exist within the tested section of the former roadway.

25-2637 Doucette, Dianna L., and Holly Herbster
2006 Intensive (Locational) Archaeological Survey of the New Marlborough Hill Road Development, New Marlborough, Massachusetts. 72 pages.

The survey included archival research, a walkover survey, and subsurface testing to locate and identify potentially significant archaeological resources that may be affected by project construction. Approximately 28 acres of the 107 acre site will be developed. A total of 101, 50x50cm test pits was excavated within the archaeologically sensitive portions of the project area; a stone foundation and barn was identified in one of the proposed house lots. Forty-seven pieces of post-contact cultural material were recovered from six of the 101 test pits excavated within the project area, including pieces of bottle and beverage glass, ceramic sherds, machine-cut nails, and brick fragments. The material was recovered between 0cm and 40cm below surface in disturbed topsoil

and fill deposits in the area immediately surrounding the barn. The archival research and field survey indicate that the stone foundation and associated belowground deposits comprise a potentially significant archaeological site, designated as the J. Hayes Site. Archival research identified a structure on the 1876 (Beers) Map of New Marlborough labeled as "J. Hayes," in the same approximate location as the dry-laid fieldstone foundation that currently serves as the footing for a wooden barn. The age, period of use, and internal configuration of the site have not been determined, but the site appears to date to at least 1876 and probably served as a home and farmstead. Avoidance is recommended, but if that is not feasible an archaeological evaluation to determine the site's significance and eligibility to the National Register of Historic Places is recommended.

25-2638 Herbster, Holly, and Dianna Doucette
2006 Summary Report, Intensive (Locational) Archaeological Survey, Brown Property, Aquinnah, Massachusetts. 50 pages.

The survey included archival research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources. A total of 23, 50x50cm test pits was excavated within the approximately three acre building envelope. The intensive survey identified the Brown Site, a low density deposit of chipping debris and a chipped stone scraper. The Brown Site may be associated with the previously investigated Gerhard and East Pasture sites located adjacent to the project area, and appears to have functioned as a short-term activity area within the Menemsha Pond coastal zone in the pre-Contact period and as part of a large field system in the post-Contact period. Although the recovered materials contribute to the overall understanding of Native American land use in Aquinnah, the lack of temporally diagnostic artifacts, features, or artifact concentrations limits the information content of the Brown Site. The recovered cultural materials do not represent potentially significant resources.

25-2639 Herbster, Holly, and Dianna Doucette
2006 Summary Report, Intensive (Locational) Archaeological Survey, Taylor Property, Aquinnah, Massachusetts. 42 pages.

This survey included archival research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources. A total of 25, 50x50cm test pits was excavated within the approximately 6,804 sq ft project parcel. No cultural materials or features were identified within the project area and no further testing was recommended.

25-2640 Herbster, Holly
2005 Archaeological Reconnaissance Survey, Destruction Brook Woods Reserve, Dartmouth, Massachusetts. 78 pages.

Archaeologists completed an archaeological reconnaissance survey of the approximately 284 acre project area that included archival research, a walkover survey, and archaeological sensitivity assessment. The survey documented two 19th-century residential complexes, collected information about nearly 200 years of mill operation, and delineated areas of low, moderate, and high pre-and post-contact archaeological sensitivity. The two foundation complexes represent potentially significant archaeological resources. Avoidance is recommended, however if that is not possible an intensive site survey is recommended. It is also recommended that any cultural resources exposed during future clearing be recorded and left in place, and MHC archaeological site forms be completed.

25-2641 Donta, Christopher L., and Jennifer Wendt
2006 Archaeological Intensive (Locational) Survey for the Proposed Telecommunications Facility Sage N1889, Norton, Massachusetts. 59 pages.

Archaeologists conducted background research and a reconnaissance survey that indicated the proposed 30x30m (approximately 100x100ft) compound and 43m (140ft) long access road, totaling 0.25 acres, had high potential to contain Native American archaeological sites. The field testing included the excavation of 13 shovel test pits (STP) in the two defined survey units. Two of the STPs situated along the proposed access road contained artifacts, resulting in the designation of the Newland Street Native American archaeological site. The artifacts were found primarily in a single test pit and consisted only of waste from stone tool working. Two verification test pits placed adjacent to STPs 10 and 11 did not contain additional Native American artifacts. No features were found associated with the artifacts. Because the Newland Street Native American Site contains a low density of artifacts, has been disturbed by plowing, and only one test pit contained artifacts in undisturbed soils, it is considered unlikely that the project will impact significant archaeological resources. No further archaeological survey is recommended.

25-2642 Dudek, Martin G.
2006 Archaeological Intensive (Locational) Survey for the MCF Monopole Facility off of Jordan Drive, Town of Stoughton, Norfolk County, Massachusetts. 44 pages.

The project area is located near a Contact Period trail, a colonial road, and wetland resources. The intensive survey consisted of 17 systematic test pits (50x50cm), including 5 test pits at the monopole facility and one transect of 12 at an access road, excavated across archaeologically sensitive areas within an overall project area comprising approximately 1 acre. Several fragments of coal and slag were recovered from one test pit. No other artifacts were recovered; no additional archaeological work is recommended.

25-2643 Chartier, Craig S.
2006 Site Examination Fieldwork at 81 North Pamet Road in Truro, Massachusetts. 75 pages.

A site examination was conducted around the foundation of the Lot Harding House pursuant to repair work on the foundation of the house. The Lot Harding House (TRU.1) is listed in the Inventory of Historic and Archaeological Assets of the Commonwealth and is within the Pamet historical area and the Cape Cod National Seashore. The area around the house consists of grass, a crushed surf clam shell driveway, cedar and maple trees, and ornamental plantings adjacent to the house sill. Testing included the excavation of 3, 1x0.5m and 1, 1.5x0.5m hand-excavated trenches adjacent to the sills of the house. A total of 2,852 artifacts were recovered. Three 20th-century features were also identified. This testing bolstered support for a mid to late 18th-century construction date for the house and identified evidence of building alteration in the 18th century. Late 17th- to early 18th-century architectural elements were recovered (turned lead, wide bricks), possibly pointing to either an earlier construction date or a reuse of older materials. Artifact classes recovered included faunal remains, indicating that the occupants likely raised and butchered their own livestock, and used imported and domestically produced ceramics and personal items such as clay tobacco pipes, buttons, and shoe buckles. No original foundation was uncovered and no builders' trench associated with the construction of the house was identified. The area immediately adjacent to the Lot Harding House was found to be rich in artifacts, but many portions were impacted in the 20th century by utility, bulkhead, and sill shoring construction. The lack of a builders' trench and the extensive disturbance located adjacent to the house limits the archaeological research value of this area. It is recommended that the proposed sill shoring be allowed to proceed without further archaeological testing adjacent to the house. Analysis of the artifacts and faunal remains provided important insights about the local economy and the frugality and gentility of the residents.

25-2644 Doucette, Dianna L.
2006 Intensive (Locational) Archaeological Survey for the Bridge No. D-05-004 Rehabilitation

Project, Dedham, Massachusetts. 50 pages.

The current survey included archival research and field investigations to locate and identify significant archaeological resources. Field investigations consisted of the hand excavation of 10, 50x50cm test pits placed 10m apart along two parallel transects (Transect A and B) placed 5m apart. Test pit profiles documented previous below ground disturbance in each of the test pits, with layers of fill most likely from road construction, and disturbed A-horizons. Some test pits contained a dark olive brown silty sand fill and/or overburden deposits to an average depth of 25cmbs, overlying natural dark yellow brown silty sand B1 and yellow brown coarse sand B2 subsoils. Test pits placed closer to the river contained disturbed A horizon soils to approximately 38cmbs. No cultural resources were identified during the intensive survey; no further archaeological testing is recommended.

25-2645 Banister, Jennifer Bonner, and Holly Herbster
2006 Archaeological Survey, the Whittemore House Rehabilitation Project, Minute Man National Historical Park, Lexington, Massachusetts. 90 pages.

The survey included the excavation of 15, 50x50cm test pits and 2, 1x1m excavation units within the proposed utility trench, water line, and sonotube piling impact areas associated with the project. Subsurface testing documented previous disturbance across the project area and did not recover any significant archaeological deposits or features. A low density of 18th-century materials was recovered from disturbed contexts across the site. While the presence of these artifacts help support the 18th-century construction date of the house, they are not sufficient to provide the exact year of construction. Without the presence of a builders' trench or significant archaeological deposits or features it is unlikely that further archaeological excavation within the project impact areas would yield further information.

25-2646 Herbster, Holly
2006 Archeological Overview and Assessment, Minute Man National Historical Park, Concord, Lincoln, and Lexington, Massachusetts. 180 pages.

The National Park Service requires the periodic completion of an Archeological Overview and Assessment (AOA) as an archaeological planning document that describes and assesses the known and potential archaeological resources of a park. The last AOA for the park was completed in 1980 (see report #25-322). Minute Man NHP contains documented archaeological resources that date from approximately 9,000 B.P. to the early 20th century. More than 100 prehistoric and historic period archaeological sites have been identified within the park through more than 40 years of professional and avocational excavation and collections research. The AOA included consultation with park archaeologists and curators, archival and collections research, the development of natural and cultural contexts, the evaluation of previous archaeological studies, and the production of archaeological sensitivity maps. Although the AOA covered the entire park, an emphasis was placed on the Battle Road Unit, the largest of three subunits that comprise the park. The development of historic contexts and evaluation of potential resources focused on four research themes: prehistory; April 19, 1775; the colonial period; and 19th-century agriculture and daily life.

25-2647 Heitert, Kristen
2006 Intensive (Locational) Archaeological Survey, Harlow Old Fort House, Plymouth, Massachusetts. 130 pages.

Nineteen, 50x50cm test pits were excavated within the project area including nine test pits excavated at 5m intervals along one judgmental linear transect (Transect A) adjacent to the house foundation, and 10 judgmental test pits (JTP) inside the house and along a proposed trench corridor leading from the corner of the house to the street. In addition, two, 50x100cm excavation units

(EU 1 and EU 2) were excavated to explore a suspected fieldstone foundation feature (Feature 4) inside the rear entrance of the house. No discrete concentrations of 17th- or 18th-century cultural material or any evidence of a builders' trench associated with the original construction of the house, ca. 1677, was identified during the survey. The post-contact period assemblage comprised a mix of 18th- through 20th-century domestic and architectural debris recovered primarily from fill contexts post-dating 1921. A linear concentration of fieldstones, initially believed to be part of an undocumented building campaign, was uncovered immediately inside the west entrance of the house. Stratigraphic analysis of the feature, however, suggested that it most likely dates to the restoration of the house in the 1920s, and may have been a prop for a small section of sleeper running beneath the reconstructed doorframe in that location. The observed and inferred soil disturbance, while disappointing in regards to the earliest occupation of the property, did provide information about the relatively undocumented impacts associated with a 1920s restoration of the house. More significantly, pre-contact component was identified and included a portion of a potentially Late Woodland Period hearth immediately inside the west entrance to the house, and a total of 22 pieces of lithic cultural material including Neponset rhyolite, quartz, and quartzite chipping debris, a rhyolite drill, and two rhyolite bifaces. During James Deetz's excavation on the property in 1960, he reported the recovery of a similar pre-contact assemblage including a rhyolite Levanna point, suggesting the current assemblage may be part of the same occupation. While the level of soil disturbance across the majority of the impact area limits substantive interpretation of the pre-contact component it presence is a rare survival, and demonstrates the Colonial Period reuse of the Native habitation areas.

25-2648 Cherau, Suzanne G., and Jennifer L. Bonner
2006 Intensive (Locational) Archaeological Survey and Historic Landscape Documentation, Brewster Gardens Park, Plymouth, Massachusetts. 150 pages.

These investigations were undertaken in advance of town-planned improvements to approximately 2.88 acres of the 4 acre park along both sides of Town Brook from Water Street to just west of Market Street. Brewster Gardens (MHC #PLY.943) is a contributing element of two National Register districts: the Plymouth Village Historic District and the Town Brook Historic and Archaeological District. The historic landscape documentation includes black-and-white photo documentation of the entire park landscape, keyed to the project plans. The research identified a granite retaining wall section that reflects the linear orientation of the 19th-century industrial businesses that once occupied the seventh water privilege of Town Brook. Avoidance of this feature during park improvements was recommended. The intensive survey consisted of archival research and field investigations. The archival research reviewed 18th- through 20th-century maps of Plymouth and secondary historical sources, with a specific focus on the Town Brook drainage. Field investigations consisted of a walkover and subsurface testing, which consisted of 58, 50x50cm test pits placed at 5 and 10m intervals along four judgmental transects and 12 judgmental test pits. The archaeological investigations identified buried structural and artifactual resources related to historic period domestic, commercial, and industrial land uses. The south bank of the brook between Market and Main streets contained the buried fieldstone/timber remains of two documented late-19th-/early-20th-century privy features associated with dwellings and stores that once fronted on Sandwich Street to the southwest. These remains are not considered significant archaeological resources, and no further archaeological survey is recommended here. The north side of the brook between Main and Water streets contains several buried structural features, associated fill strata, and artifact assemblages dating to the occupation/demolition of documented 18th- and 19th-century ropewalk and barrel factory buildings. Two brick and mortar piers, two cut granite footings, a probable compact work surface, and a trash midden (possibly related to residences fronting Leyden Street) were identified in this area. The identified structural features and artifacts are situated below the 1.5–2ft of park fill and extend to depths of at least 3ft, within the current water table. This area is designated the Robbins Cordage/Barnes Barrel Factory Site. These remains are considered significant contributing archaeological elements within the Town Brook Historic and Archaeological District. Avoidance and preservation/protection of the site is recommended.

25-2649 Doucette, Dianna L.
2006 Intensive (Locational) Survey of the J. T. Berry Rehabilitation Center, North Reading and Wilmington, Massachusetts. 78 pages.

The 87 acre parcel currently contains 16 structures that will be razed and replaced with a mixed business/residential development. The intensive survey included archival research, a walkover survey, and subsurface testing to locate and identify significant archaeological resources. Archival research identified three ancient sites recorded by Ripley Bullen (19-MD-12 to 14) in the project area, which, combined with favorable environmental conditions, suggests a high archaeological sensitivity. A total of 118, 50x50cm test pits was excavated along 14 judgmentally placed transects, two 30x30m blocks, eight test pit arrays, and four judgmental test pits within the archaeologically sensitive portions of the project area. Ten areas of pre-contact Native American activity were identified. These areas have been designated Loci 1 through 9 and Find Spot 1. The recovered pre-contact Native American materials include 158 pieces of chipping debris, 4 bifaces (including one Neville projectile point), two scrapers, and one piece of pottery. Also, two features consisting of reddened soils, fire cracked rock, and charcoal were identified. The majority of cultural material was recovered from undisturbed B horizons suggesting good integrity and the potential to contain information that addresses regional archaeological themes; the site is potentially significant according to National Register of Historic Places eligibility criteria. Avoidance through project redesign was not possible and archaeological site examination and data recovery were conducted subsequently (see reports #25-2678 and 25-2864).

25-2650 Herbster, Holly
2006 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, Cape Cod Pipeline Project, Sandwich and Bourne, Massachusetts. 92 pages.

A total of 473, 50x50cm test pits were excavated within archaeologically sensitive portions of the 3.5-mile-long project area. Test pits were spaced 10m apart within 41 transects, and where the width of the study corridor exceeded 100ft, parallel transects were employed. Subsurface testing recovered 161 pieces of cultural material; 24 were pre-contact period cultural materials recovered from within nine designated find spots. All cultural materials were collected between 0 and 60cmbs in plowzone soils, natural and disturbed topsoils, and natural B subsoils. Close-interval testing around each deposit did not yield additional cultural material or evidence of features. No new potentially significant aboveground properties were identified within or adjacent to the project. The project does, however, pass through portions the historically significant Old King's Highway Regional Historic District and Camp Edwards properties. None of the individual historic properties that together compose the Old King's Highway Regional Historic District or that contribute to Camp Edwards' local and state significance will be affected. No further study was recommended.

25-2651 Luhman, Hope E.
2006 Intensive Archaeological Survey, Proposed Carlisle Cell Tower Location, Carlisle, Middlesex County, Massachusetts. 37 pages.

The project area comprises 5,120sq ft (0.12 acres, 0.04 hectares) for the placement of the cell tower (80x64ft [24.4x19.5m]) with an additional 2,260sq ft (210sq m) for a 12ft-wide (3.6m) access road. The fieldwork consisted of pedestrian surface survey and the excavation of 37 shovel test pits. The shovel tests pits measured 50x50cm and were placed at 15m intervals along two transects and also within the footprint of the monopole location. No cultural material or resources were identified within the portion of the project area associated with the plans to construct the cell tower. No further work is required.

25-2652 Mair, A. Peter II
2006 Intensive (Locational) Archaeological Survey, Chelmsford Phase 4G Sewer Project Area, Chelmsford, Massachusetts. 65 pages.

Archival research indicated that the project area, south of the Merrimack River, is a sensitive area for potential Native American cultural resources. Fieldwork included a walkover/surface evaluation of the three proposed pump stations, followed by subsurface investigations. A total of 11, 50x50cm test pits, distributed among the three proposed pump stations, produced no evidence of archaeological sites. Consequently, no additional archaeological investigations are warranted.

25-2653 Doucette, Dianna L.
2006 Intensive (Locational) Archaeological Survey of Plymouth Piney Woods Project Area, Plymouth, Massachusetts. 57 pages.

The proposed project involves the construction of a 150ft high aboveground monopole tower and associated equipment for wireless communications, on an approximately 100sq ft (9sq m) wooded area around cranberry bogs. This survey included archival research and field investigations. Field investigations consisted of the hand excavation of 13, 50x50cm test pits placed within a 30x30m block. Soil profiles within the wooded project area were undisturbed and consisted of an Ao/duff horizon overlying a grayish brown silty sand Ae, and a brown silty sand A1, dark yellow-brown silty sand B1, and yellow-brown B2 subsoils. In most cases, the glacial C horizon was encountered consisting of yellow-brown sand with rocks and gravel. No cultural resources were identified. No further archaeological testing is recommended.

25-2654 Waller, Joseph N., Jr.
2006 Stage II Site Evaluation Southern Portion of the Swift III Site, New Bedford Harbor Superfund Site, Acushnet, Massachusetts. 100 pages.

Archaeological investigations within the 230sq m southern portion of the Swift III Site (see report #25-2403) yielded quartz, rhyolite, and jasper chipping debris, a Susquehanna Broad and an untyped stemmed projectile point, few bifacial tool fragments, a pottery sherd, and a soapstone vessel sherd from six, 50x50cm test pits and 11, 1x1m excavation units. The artifact assemblage indicates that various activities including stone tool manufacture, hunting and/or processing of game, as well as food processing for consumption occurred on site. Cultural materials were primarily contained within a well-developed plowzone limiting the contextual integrity of the deposits.

25-2655 Binzen, Timothy, Jennifer Wendt, F. Timothy Barker, Mitchell T. Mulholland, and Christopher Donta
2006 Cultural Resources Inventory Report, Mt. Tom State Reservation, Easthampton and Holyoke, Massachusetts. 102 pages.

The Mt. Tom State Reservation was established in 1903 and is among the earliest recreational public parks in Massachusetts. Currently occupying approximately 1,900 wooded acres in Holyoke and Easthampton, the Reservation is administered by the Massachusetts Department of Conservation and Recreation. Cultural resources include 24 archaeological sites, 7 architectural resources, and 4 scenic overlooks. These resources are related to 19th-century tourism and the activities of the Civilian Conservation Corps. An archaeological reconnaissance and intensive (locational) survey with subsurface testing of selected areas was conducted to produce a comprehensive inventory of resources on the reservation and to identify areas of high archaeological sensitivity for future planning and management purposes. Three pre-Contact Native American sites and 20 historic sites related to quarrying, logging, agriculture and settlement, tourism and recreation, and the Civilian Conservation Corps were identified. Four survey units (Free Orchard, Eyrie House, Lake Bray North, and Lake Bray West) were tested using a total of 50 shovel test pits. The Beau

Bridge Trail Native American Site, consisting of a small concentration of chipping debris, was identified on the mountaintop in the eastern section of the Free Orchard.

25-2656 Ingham, Donna, and Duncan Ritchie
2005 Intensive (Locational) Archaeological Survey, Proposed Rising Tide Development, Sherborn, Massachusetts. 92 pages.

The approximately 28 acre project area occupies former agricultural land in the southwestern corner of the town. This development is planned within the former Whitney Farm, which is listed in the Inventory of Historic and Archaeological Assets of the Commonwealth and is potentially eligible for listing in the National Register of Historic Places. This farmstead was established by the Whitney family in the mid-18th century and continuously occupied by members of the family until the 1930s. The Shiari family carried out agricultural activities on the farmstead until the late 20th century. The 1907 farmhouse will be rehabilitated; demolition of the main barn, a silo, hay barn, and shed is proposed. Research indicated that pre-contact period Native American settlement was concentrated along the Charles River and Lake Winthrop east and south of the project area with smaller zones of intensive Native American land use along the numerous tributary streams to the Charles River such as Dopping, Boggastow, and Chicken Brooks. The project area is at the headwaters of Dopping Brook and had the potential to contain pre-contact period Native American archaeological sites. Post-contact period settlement and land use in and around the project area was primarily agricultural/pastoral. During the subsurface testing, 51, 50x50cm test pits were excavated within areas of high and moderate archaeological sensitivity. Test pits were placed along seven linear transects, within three test pit arrays, and at two judgmentally selected locations. This sampling identified three pre-contact period Native American archaeological sites: the Ant Hill Site, the Whitney Farm Locus 1 Site, and the Whitney Farm Locus 2 Site. The Ant Hill Site has been artificially divided into two sections by an existing natural gas pipeline easement. Subsurface testing around the Whitney farmhouse did not yield any evidence of a recognizable archaeological component associated with the structure. The Ant Hill Site (East) appears to contain both Archaic and Middle Woodland Period components and other evidence of pre-contact period Native American settlement and resource use in the upper Charles River drainage. Chipped-stone tools found on the surface of this site consisted of a mostly complete, Middle Woodland Period (1,600 to 1,000 years ago) Fox Creek lanceolate projectile point of rhyolite and a basal fragment of a stemmed projectile point of rhyolite likely to be of Late to Terminal Archaic Period (3,000 to 2,500 years ago) affiliation. An untyped biface or projectile point of argillite and pieces of quartz and rhyolite chipping debris were also found. A subsurface hearth/firepit feature identified at the Ant Hill Site (East) demonstrates that it has the potential to contain additional information in undisturbed stratigraphic contexts; it is a potentially significant cultural resource that may meet National Register of Historic Places criteria for eligibility. The Whitney Farm Locus 1 and Whitney Farm Locus 2 sites consisted of low-density deposits of pre-contact Native American cultural material. The Whitney Farm Locus 1 Site yielded a quartz scraper. Whitney Farm Locus 2 produced three pieces of quartz chipping debris. The Whitney Farm Locus 1 and 2 sites have low information content and are not considered to be potentially significant cultural resources. No further archaeological investigation was recommended for the Whitney Farm Locus 1 or Whitney Farm Locus 2 sites. Based on current plans of the project area, the Ant Hill Site (East) is within the proposed locations of recreational facilities; a site examination is recommended.

25-2657 Waller, Joseph N., Jr., and Duncan Ritchie
2006 Archaeological Site Examination, Ant Hill Site East, Rising Tide Residential Development, Sherborn, Massachusetts. 52 pages.

The Ant Hill Site East was identified during a previous intensive archaeological survey of a proposed 28-acre development (see report #25-2656). The site examination involved the excavation of 36, 50x50cm test pits and five, 1x1m excavation units placed within a 10m interval coordinate grid system. Combined intensive (locational) and site examination archaeological testing demon-

strated that the site consisted of a low-density deposit of Native American cultural materials distributed over approximately 900 sq m. Cultural material recovered during the site examination consisted exclusively of quartz and rhyolite lithic debitage (41 pieces). Many pieces of rhyolite chipping debris had been burned, obscuring visual characteristics that could be used to determine the source of this lithic material. The recovered cultural materials were found within plow zone soils and previously altered fill contexts that have limited integrity. The low density of artifacts and lack of identified Native American features suggest that a few individuals occupied the site for a short period of time. The site examination of the Ant Hill Site East did not produce any temporally diagnostic Native American cultural materials or sufficient charcoal from features for radiocarbon dating analyses. Information about the age and cultural affiliation(s) of the Ant Hill Site East was limited to the basal fragment of a Transitional Archaic Orient Fishtail (3000 to 2600 years ago) and broken Middle Woodland (1600 to 1000 years ago) Fox Creek type projectile points recovered during the previous intensive archaeological survey. The absence of other stone tools and the relatively small size of the site indicated that the Ant Hill East Site was unlikely to contain any other Native American components. Because of the poor contextual integrity and limited classes of information, the Ant Hill Site East site does not meet National Register of Historic Places eligibility criteria. No additional archaeological investigation was recommended.

25-2658 Bradley, James W.
2005 Archaeological Investigations at the Carns Site, Coast Guard Beach, Cape Cod National Seashore, Massachusetts. 149 pages.

In 1990 a collector discovered a prehistoric pit feature eroding from the scarp of Coast Guard Beach in Eastham. An emergency archaeological data recovery project excavated over 300sq m of the Carns site (19-BN-646). Goals for this salvage included determining the size and age of the site, and excavating all areas immediately threatened by natural erosion. The site consists of 1 to 2 meters of dune deposits with buried soil beneath. Researchers used ground-penetrating radar, soil resistivity, magnetometry, and coring to determine the horizontal limits of the site, but only coring produced meaningful results. Excavators constructed berms around excavation areas to protect the site from storms and high tides, but a 1991 winter storm destroyed two loci. The Carns Site dates to the Woodland Period (3,000–450 B.P.) with significant occupations in the Early and Middle Woodland (3,000–2,000 B.P. and 2,000–1,500 B.P.). Artifacts from the Early Woodland include Lagoon and Rossville-like points. Middle Woodland artifacts include Greene-like and Fox Creek points with rocker dentate and thumbnail impressed ceramics. Late Woodland artifacts are fewer in number but include Large Triangular points with cord-wrapped stick and exterior fabric-impressed ceramics. Most of the 230 identified features date to the Early and Middle Woodland periods with some from the Late Woodland. The Carns Site appears to be one of the very few sites in the area occupied during the Early and Middle Woodland periods. The large number of artifacts, numerous datable features, and large size of the site are notable. The large number of Late Woodland sites in the surrounding area suggests a shift in settlement patterns during the Late Woodland. The project received nation-wide publicity and a video is included documenting the site and the excavations (see #25-2659).

25-2659 Weisler, Emero
1991 Of Time and Tides: An interpretive video documenting the archaeological discovery at Coast Guard Beach. VHS Cassette.

This video documents the excavations that took place between 1990 and 1992 at the Carns Site (19-BN-646) in Eastham, MA (see report #25-2658).

25-2660 Bradley, James W.
2006 Woburn First Burial Ground Project Archaeological Monitoring. 8 pages.

Archaeological monitoring was conducted at the oldest public burying ground in Woburn, dating from 1642 to 1794, during repairs to the burial grounds. While human remains were encountered in recently redeposited soils from elsewhere in the cemetery, no intact burials were found during the monitoring; all proposed areas of disturbance were previously impacted by filling or construction. A neighbor reported burials in their yard indicating the possible presence of the burial ground outside the present boundaries.

25-2661 Bonner, Jennifer L., and Holly Herbster
2005 Intensive Archaeological Testing, Wayside Drainage Project, Minute Man National Historical Park. 81 pages.

The National Park Service is proposing a series of improvements to enhance site drainage and to stabilize and rehabilitate the landscape immediately north of the Wayside. Slumping and erosion have obscured the original toe of a steep slope located directly behind the house and the deposition of fine silt in this area has impacted drainage. This survey included the excavation of three 0.5x2.0–3.0m trenches within the area of potential effect. Trench 3 exposed the lowest granite step, which had been covered by eroding soil. The exposed soil profile clearly identified a layer of slope wash overlying a compact surface that is likely a historic ground surface. This ground surface is cut by fill associated with a concrete support for a post supporting the building's rear eave. Feature 1, located in TR 4, documents previous efforts to divert run-off from the area upslope of the granite stairs and buildings. Portions of this loosely fashioned stone and brick culvert were visible on the ground surface north of the trenches. The excavation of the northern portion of TR 5 also clearly defined the extent of slope wash overlying the original subsoil to the edge of previous archaeological testing between the Wayside house and barn (see report #25-704). An examination of a photograph taken at the time of those 1969 excavations shows the edge of the same area exposed in TR 5. The photograph clearly shows excavation soil piled upslope. This may explain why no original topsoil/A stratum was noted in TR 5 and why Context 15 (back dirt) contained a moderate density of artifacts (n=36). It is likely that the original slope surface (slope wash and topsoil) was removed with the spoil pile when the 1969 trench was backfilled. The single piece of chipping debris collected in the slope wash does not represent an in situ deposit. The post-contact period materials collected primarily in the slope wash indicate the general use of the property over the late 18th, 19th, and 20th centuries and primarily consist of structural materials and domestic refuse. None of the recovered materials were collected in association with intact cultural features and they do not represent potentially significant archaeological deposits. The proposed removal of accumulated slope wash soils and the re-exposure of buried structural and landscape/drainage elements at the base of the slope will not impact potentially significant archaeological resources provided the project impacts are limited to these overburden strata. Excavation in the area between the Wayside building and barn is unlikely to affect potentially significant cultural resources if the proposed improvements are limited to the delineated area of previous archaeological testing. Archaeological monitoring is recommended during the construction phase of the project. An intensive survey is recommended if any belowground impacts are proposed that extend beyond the defined areas of overburden/slope wash and previous excavation (including the trenches excavated as part of the current project).

25-2662 Binzen, Timothy, Antonio Medina, F. Timothy Barker, and Jennifer Wendt
2006 Archaeological Investigations for the Phase II Sewer Extension Project, Kingston, Massachusetts. Reconnaissance and Intensive (Locational) Survey for Cross-Country Lines and Pump Stations and Site Examination for Design Alternatives at the Spring Street Native American Site (19-PL-118). 144 pages.

Archaeological reconnaissance, intensive (locational) testing, and site examination surveys were conducted for the "Phase II" sewer extension project. The intensive survey tested seven survey units, including two proposed cross-country gravity sewer easements and five pump stations. Test pits were excavated, at intervals of 7.5m (25ft) in areas exhibiting high sensitivity. No archaeo-

logical resources were identified at any of the five pump station locations. Testing for cross-country lines between Bradford Avenue and Spring Street and between Spring Street and Lee Circle identified four concentrations of Native American artifacts, as well as features, representing southern portions of the Spring Street Site (19-PL-118), previously recorded on the basis of artifacts found in the vicinity. The reconnaissance survey recorded the Isaac Allerton Site east of Spring Street and north of one survey unit. Allerton was a *Mayflower* passenger, prominent in the history of Plymouth County, who owned the property after 1628 but it may have been occupied by his relatives at least to 1690. The earth-fast and fieldstone foundation of the Allerton house was excavated in 1972 during a survey by Plimoth Plantation archaeologists James Deetz and Eric Ekholm. The 19th-century Bradford Avenue Barn Foundation Historic Site was recorded east of Bradford Avenue. Site examination survey was recommended for the four artifact concentrations in the southern part of Site 19-PL-118. Additional test pits and 0.5x2m trenches were excavated. One high-density concentration of features and artifacts was identified in the proposed easement west of Spring Street, apparently representing a Woodland-period occupation surface. Soil stains possibly representing the foundation sill of a 17th-century earthfast outbuilding associated with the Isaac Allerton Site were identified north of Spring Street. An alternative sewer line easement was designed to avoid these concentrations of highly significant archaeological resources. The alternative was tested with test pits and trenches with comparable findings. Site avoidance measures and the need for additional survey were evaluated on the basis of the archaeological data. Ultimately the two cross-country lines were eliminated from the project design, and thus the sites were not impacted. MHC recommended acquisition and preservation of the site by the town.

25-2663 Herbster, Holly
2006 Technical Report, Intensive (Locational) Archaeological Survey, MMR CS-23/LF-1 Plume Response, Falmouth, Massachusetts. 56 pages.

This project included archival research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources. A total of 49, 50x50cm shovel test pits was excavated along linear transects at 10m intervals within the proposed pipeline/well sites assessed with moderate archaeological sensitivity. No cultural materials or features were identified; no further testing was recommended.

25-2664 Sutherland, Frederick
2006 Use, Reuse, and Desecration: Analysis and Interpretation of the Lucy Kimball Mead Tomb, Littleton, Massachusetts. 82 pages.

The Lucy Kimball Mead Tomb, built in 1821, was excavated from 2000 to 2003 as part of a restoration and preservation project. The structure is the only known tomb in the Old King Street Burying Ground in Littleton, Massachusetts, at the western end of Middlesex County. An osteological report on the remains returned results that contradicted the expectations of researchers. The carved doorway indicated only one woman buried, but the bones recovered were from an older man and possibly a child. The primary focus of the thesis is on mortuary hardware and coffin trimmings; including coffin tacks, nails, screws, and wood. Dates of manufacture are compared with mortuary records to learn about those interred. Town, probate, and tax records are studied on the Kimball and Mead families who built the tomb. The conclusion includes a history of the tomb from construction, through multiple interments, removal of bodies, neglect, desecration, and to eventual excavation, reinterment, and restoration of the tomb.

25-2665 Cherau, Suzanne G., Kristen Heitert, and Jennifer Bonner Banister
2006 Intensive (Locational) Archaeological Survey, Acushnet River Restoration Project, Sawmill Dam and Hamlin Street Dam, Acushnet, Massachusetts. 138 pages.

This survey was conducted in advance of the removal of portions of the dams/culverts/spillways

as a means to restore fish passage along the Acushnet River. An historic resources survey was also completed for the Sawmill Dam property because of the proposed removal of an early 20th-century building and modifications to several of the historic waterpower structures on the approximately 11-acre property. The cultural resource surveys included archival research and field investigations. The river channels and dams/culverts/spillways at both sites where work will occur for the construction of the fish passage structures were assigned a low archaeological sensitivity because of post-contact period alterations to natural soil strata and historic landscape configurations. No subsurface testing was conducted for these work areas. Moderate sensitivity for early historic mill resources was assigned to proposed construction staging/stockpiling/access areas at both project locations. At Hamlin Street 19 test pits were placed in proposed staging areas: 10 at 10m intervals along 2 linear transects and an additional 9 judgmental test pits. At Sawmill Dam 16 test pits were placed at 10m intervals along 3 linear transects and one 15m block containing 5 test pits in proposed staging areas. At Sawmill Dam, low densities of pre-contact chipping debris and post-contact mill-related debris were recovered in fill deposits. It is not possible to know whether these materials represent in situ occupations or if they were brought in from off-site, perhaps as part of documented 20th-century filling activities for the mill expansions. The cultural materials found in fill deposits throughout the Sawmill Dam project property lack meaningful interpretive archaeological context. The historic survey determined that the Acushnet Saw Mill Company Area (including extant buildings and waterpower structures and landscape) lacks integrity. Likewise at Hamlin Street low to moderate densities of post-contact cultural materials were recovered in fill deposits along the eastern bank of the culverted river channel. The varying densities of post-contact cultural materials recovered in the fill (and possibly flood) episodes were likely dumped and/or simply accumulated as general field trash during documented mid-18th through 19th century to present-day small-scale industrial and residential land uses. No intact structural remains of documented mill or other structures were identified at either of the project work areas. No potentially significant archaeological deposits, structures, or landscape or water-control features were identified at either the Hamlin Street or Sawmill Dam project areas. No additional investigations are recommended.

25-2666 Cooney, William A.
2006 A Compendium of Small Section 106 and Line Item Construction Project Reports for Minute Man National Historic Park, in the Towns of Lincoln, Lexington, and Concord, Massachusetts. 38 pages.

This report is a compendium of archaeological testing conducted at Minute Man National Historic Park between July 23 and November 21, 2005. Minute Man National Historic Park (MIMA) is proposing to build a temporary cattle fence to enclose a section of the Noah Brooks historic property. In addition the park also proposes to install an interpretive sign at the Monument Street parking lot, Noah and Samuel Brooks' house sites, restoring the drainage pattern at a portion along Sunny Side Lane, and removing a concrete apron around the Major John Buttrick House. As a result of these plans and the high archaeological sensitivity identified by previous archaeological work (See reports #25-1494, 25-2646) of these areas, the National Park Service conducted Phase 1 shovel testing in the proposed project areas. All collected artifacts and associated documents for the projects have been cataloged into the National Park Service's Automated National Cataloging System+ (ANCS+). All artifacts and associated documents will be stored at Minute Man National Historic Park. Because of the small number of recovered artifacts and the disturbed soil profile it was concluded that the proposed projects would not have a negative impact on cultural resources within the project areas. Any work proposed for areas outside the tested areas would require further archaeological testing.

25-2667 Parson, Kimberly

2006 Archeological Investigations for the Accessibility Project Saugus Iron Works National Historic Site, Saugus, Massachusetts. 182 pages.

This study was conducted in advance of proposed ground-disturbing modifications related to making the site accessible and upgrading the collections area at two existing non-historic buildings in the northwest corner of the property. Archaeological investigations did not document any remains associated with the 17th-century iron works. While pockets of intact 17th-century deposits may be scattered throughout the property, these investigations indicate that 20th-century construction and archaeological activities have significantly altered the majority of the impact areas. The investigations defined two prehistoric occupation areas encompassing portions of the upper terrace (Areas 1 and 7). Investigations at Area 1 documented a multi-component site comprised of high numbers of prehistoric (n=273) and historic (n=2,465) materials. All of the prehistoric artifacts are nondiagnostic lithics recovered from disturbed or possibly intrusive contexts. One prehistoric feature (Feature 6) was identified at the buried plowzone/subsoil interface. Excavation of Feature 6 did not produce any artifacts and pollen analysis indicated poor preservation. Although the feature is tentatively interpreted as a hearth, the lack of any association renders clear interpretation difficult. The prehistoric component at Area 1 is considered to have poor integrity and limited information potential. Excavations of the historic component at Area 1 revealed a 19th-century scatter at the site that possibly coincides with the tenement occupation of the Iron Masters House. Diagnostic artifacts indicate manufacturing date ranges from the mid-18th through early-21st centuries; the vertical distribution of materials by context suggests a chronological separation of the deposits. As expected, the upper fill deposits comprise a mix of datable materials redeposited during construction/maintenance and utility installation at the property. However, the buried plowzone (A^{pb} horizon) and interface between plowzone and subsoil (BE horizon) yielded earlier artifacts dating from the late-18th century to the first quarter of the 20th century. The terminus post quem for these deposits, provided by wire nails and hand painted whitewares, indicate dates of 1860 (A^{pb} horizon) and 1840 (BE horizon). In addition, most datable ceramics from these contexts have end-manufacturing dates prior to 1880, suggesting that the historic component at Area 1 may date roughly to the mid-19th century. A stone-lined well (Feature 8) was encountered in fill and underlying A^{pb} horizon contexts, however no artifacts were recovered. Considering the large amount of diagnostic materials associated with mid-19th-century occupation, the historic component at Area 1 is considered to possess integrity. Systematic testing in area 7 revealed partially preserved Archaic and Woodland occupation areas at the interface between the buried plowzone (A^{pb} Horizon) and subsoil (BE horizon) deposits. Considerable amounts of fill buried these components and shielded them from modern disturbances such as grading and landscaping activities; the upper portions of these areas have been truncated by historic plowing. Excavation recovered 4,558 prehistoric artifacts from nine test units. All but six of these artifacts represent nondiagnostic materials, mostly recovered from fill and plowed deposits. A single prehistoric ceramic and untyped triangle projectile point was recovered documenting an unspecified Woodland occupation at the site. Support for Late Archaic, Late Archaic to Transitional, Middle Woodland, and Late Woodland age occupations are documented, respectively, by the recovery of Squibnocket, Vosberg, Fox Creek, and Levanna points. The Fox Creek projectile point was found in association with Feature 3, demonstrating the Middle Woodland age of this feature, while the recovery of the Vosberg point from Feature 7 supported a Late Archaic to Transitional Archaic date. A radiocarbon date (4250 B.P.) from charcoal from Feature 5, located near Feature 7, dates this Late Archaic occupation. The prehistoric component at Area 7 is considered to possess integrity. Archaeological investigations of the historic component at Area 7 revealed a 19th-century scatter at the site composed of almost equal amounts of ceramics and metal, but also includes lesser amounts of glass and very low numbers of datable synthetic materials. Plain whitewares, creamwares, and pearlwares dominate the ceramic sample; extremely low numbers of painted and printed wares were also recovered. Most of the artifacts were recovered from the buried plowzone (Apb horizon), though high numbers were also recovered from overlying redeposited A/fill contexts. Diagnostic artifacts indicate manufacturing date ranges from the early-18th century through the late-19th to early-21st century. For the most part, the beginning dates of manufacture (TPQs) for the ceramics fall before 1840. TPQs for the Apb and BE horizons, provided by machine-made glass and a machine-cut nail indicate dates of 1890 (Apb horizon) and 1820 (BE horizon), suggesting that the historic ground surface may date roughly between the first quarter and last quarter of the 19th century.

25-2668 Graves, Anna K., and Alan Leveillee
2006 Intensive (Locational) Archaeological Survey, Mirimichi Estates, Plainville, Massachusetts. 52 pages.

The project parcel consists of 66 lots on approximately 78 acres. Access to the partially developed wooded site will be via the existing Gateway and Coach road easements. Currently, a water line runs beneath these unpaved roadways. The majority of the soils in the central portion of the project area have been stripped to create these access roads for the proposed subdivision. The remaining portions of the project area were archaeologically sensitive because of their location in level, well-drained areas in proximity to wetlands. Seventy-five test pits were excavated within the intact portions of the project area. These 50x50cm test pits were excavated within two 30x30m blocks and along seven judgmental linear transects. The subsurface testing recovered no cultural material; no further archaeological investigation is recommended. Interpretations were offered to consider the area as a social buffer zone between Native territories.

25-2669 Flynn, Erin, and Dianna L. Doucette
2006 Intensive (Locational) Archaeological Survey of the Labor-in-Vain Interceptor Sewer Replacement, Somerset, Massachusetts. 50 pages.

The current survey included archival research and field investigations. Field investigations consisted of the hand excavation of 45, 50x50cm test pits. These test pits were placed along five linear transects at 10m intervals following the center of the proposed sewer route. Three judgmental test pits were also excavated to confirm disturbance along the proposed sewer route. Soil profiles within the wooded areas and open agricultural fields within the project area were relatively undisturbed and consisted of a plow zone horizon overlying B1 and B2 subsoils. A high water table disrupted many of the test pits closest to the southern marsh area along the proposed sewer route. In test pits to the north, a gradual uprising slope resulted in better drainage and permeable soils. No cultural resources were identified during the intensive survey.

25-2670 Cherau, Suzanne
2006 Archaeological Monitoring, GE-Pittsfield/Housatonic Superfund Site, 1.5 Removal Action, Phase 3C (Pomeroy Avenue Bridge to the Confluence), Pittsfield, Massachusetts. 40 pages.

The archaeological monitoring was conducted during sediment excavation and removal within the river and on the riverbanks. No significant archaeological deposits were identified during the archaeological monitoring. No further action was taken in accordance with the project's Archaeological Monitoring Plan (see report #25-2612).

25-2671 Bagley, Joseph
2006 Life on the Frog Pond: A Prehistory of Boston Common. 80 pages.

A study of a curated artifact collection from the 1986 excavations (see report #25-1216) at the Frog Pond and the Block 79 sites (19-SU-60 and 19-SU-61) was undertaken as an undergraduate thesis. An overview of geological and topographic history is followed by analysis. The study chiefly focused on ancient lithics and pottery. Diagnostic tools included Neville-like and Levanna points. Other bifaces and debitage are described. Lithic materials include quartz, quartzite, jasper, what appears to be rhyolite, hornfels, and argillite, and what is described as a white chert with a black vein and small specs of black inclusions. Notable lithic specimens include a tabular stone, possibly basalt, evidently scored or incised; a flat tabular piece of sandstone with an area of linear scratches interpreted to be an abrading stone used by a flintknapper; a spokeshave; and a possible geode with quartz crystals. The results of a descriptive and formal ceramic analysis was included, with plasticine casts used to illustrate ancient textile characteristics from decorative impressions preserved in the fired clay. Carbonized residue was noted on the interior of some sherds; other

sherds without such residue might indicate the use of clay vessels for storage rather than for cooking. The potential for analysis of faunal materials is discussed, including the observation of possible human remains from the Frog Pond Site, although this identification is not certain, and recommendation is made to have these materials identified by an expert. Interpretation of the collection indicates that lithic reduction occurred, as did cooking, possibly textile production, and gathering clam and other animal species. The potential for site preservation in urban parks, the potential of curated collections, and the utility of completing initial analyses and preserving documentation are discussed. Appendices include artifact catalogues with separate catalogues of flakes, bifaces, and pottery from the Frog Pond Site.

25-2672 Miller, Aaron F.
2006 Archaeological Reconnaissance Survey at the Taylor's Fort Site (CRL.HA.19 And 19-FR-407), Charlemont, Massachusetts. 43 pages.

The reconnaissance survey of the Taylor's Fort Site at Hall Tavern Farm in Charlemont was conducted as part of the Taylor's Fort Archaeological Project, a public educational venture. This investigation revealed two archaeological sites at the location: a Native American site (19-FR-407) and an 18th- and 19th-century historic site (CRL.HA.19). The project is a community-funded program that seeks to educate and involve the surrounding communities in their historic and archaeological heritage. The excavation was the first stage in a larger multi-phase investigation at the site of one of the original European settlements in the area in the mid 18th-century. The survey was designed to locate the site and assess its potential. The survey consisted of six, 50x50cm test units placed according to a visible structural depression at the site. These units revealed artifacts dating from the prehistoric period up to the present. In addition, artifacts were recovered that date to period contexts of the fort, which is the primary area of interest to the project. This survey has proven the location of the 18th-century fort and shows the rich potential for future fieldwork (see report #25-2759).

25-2673 Leveillee, Alan
2006 Intensive (Locational) Archaeological Survey Moran Property, Sterling, Massachusetts. 68 pages.

Subsurface testing included the excavation of 39 shovel test pits in three testing blocks in the 2.5 acre area, followed by the excavation of 11 hand trenches to investigate specific areas where remote sensing survey provided data that contributed to formulation of a burial hypothesis. Cultural materials recovered during the systematic testing include one quartz projectile point fragment, one small quartz fragment of a bifacially flaked tool, one small quartz core fragment, seven pieces of quartz chipping debris, and one piece of quartzite chipping debris. This assemblage is collectively referred to as the South Meadow Brook Site. The South Meadow Brook Site is characterized as a low-density lithic deposit. Horizontally the site is small and dispersed, and vertically the deposits are primarily in the topsoil strata. The range of data on the site is limited, and no features or concentrated activity areas were identified. Examination of 11 of the 19 specific locations of anomalies that were hypothesized in 1994, (see reports #25-1330, 25-1338) to have resulted from ground disturbances during and following human burial did not result in any evidence that would support the burial hypothesis. There was no evidence of any kind of features resulting from human activity at 11 of the specific locations identified during the earlier remote sensing survey. Stone markets identified during earlier survey were confirmed as property boundary markers. No further archaeological investigations are recommended.

25-2674 Hodge, Christina J.
1998 Out of the Silence: An Investigation of Mortuary Practices and Cultural Relationships at the Waldo Farm Site in Dartmouth, Massachusetts. 145 pages.

This undergraduate thesis addresses interaction between Quaker colonists and Wampanoags in the post-King Philip's War period through an examination of the Waldo Farm burying ground, an early 18th-century cemetery in Dartmouth. The Waldo Farm cemetery (DAR-HA-05) had been excavated in 1924 by H.L. Shapiro, and this thesis is an analysis of the field notes, excavation correspondence, and materials from that excavations, as well as descriptions of remains compiled in compliance with NAGPRA. Analyzed materials include human skeletal remains, and a small sample of finely woven linen, possibly from a burial wrapping. No other grave goods were associated with the remains. Copper stains consistent with the use of shroud pins were found on 12 of the 35 individuals. The materials are compared to other post-contact burial sites in southern New England (Palmer, Bark Wigwams, Springfield Fort Hill, RI-1000, Burr's Hill, Titicut, Winthrop, Natick, and Ponkapoag) to illustrate the differences between Native burials in Puritan dominated communities and Quaker dominated communities. The Waldo Farm burials appear to be indistinguishable from Anglo-American Quaker burial practices. A post-colonial theoretical structure addressing faults in the resistance model of European-Native American interaction in the 17th and 18th centuries is used to frame the data by considering the effect of Quaker mortuary practices on Wampanoag mortuary practices and the masking of inequality through funerary practices.

25-2675 Mair, A. Peter, II, and Anna K. Graves
2005 Intensive (Locational) Archaeological Survey: Sunset Point Subdivision, Hanover, Massachusetts. 70 pages.

The 16 acre project area is located near the Indian Head River and several Native American sites are recorded in the near vicinity. The intensive survey included archival research, a walkover survey, and subsurface testing. Fifty-one, 50x50cm test pits were excavated within the moderately sensitive wooded upland section. The test pits revealed relatively undisturbed soils; no cultural material was recovered and no further archaeological investigation is warranted.

25-2676 Donta, Christopher L., and Jennifer Wendt
2006 Archaeological Intensive (Locational) Survey for the Iyannough Road (Route 132) Traffic Improvements Project, Barnstable, Massachusetts. 86 pages.

This survey included the excavation of 230 shovel test pits (STP) in three survey units. Three STPs in Survey Units 1 and 2 contained pre-Contact Native American artifacts. STP 42 contained one quartz flake, and was labeled the Iyannough Road findspot, and STP 57 contained one rhyolite projectile point tip and a quartz flake, designated the Old Neck Road findspot. The Hadaway Road findspot (STP 136) consisted of a quartz projectile point. These artifacts represent scattered isolated finds probably related to hunting activities in the area during the pre-Contact period. Historic artifacts were recovered from seven STPs in Survey Unit 2, Area 8, all recovered from the plow zone and fill. These artifacts include sherds of plain pearlware, plain whiteware, transfer print whiteware, flow-blue whiteware, glazed and unglazed redware, kaolin pipe stem fragments, brick fragments, and shell and bone fragments. The ceramics date mainly to the second half of the 19th century. No subsurface or surface historical features were identified. The concentration of 19th-century historic artifacts at this location may be a dumping episode or evidence of a nearby historic site beyond the project area. Because the Native American artifacts recovered during the survey represent isolated finds, no further survey is recommended.

25-2677 Carovillano, Jeffrey R.
2002 Adaptation and Resistance: An Analysis of Native American Activity at Den Rock During the Contact Period, ca. 1625–1675. 98 pages.

Den Rock, a multi-component Native American archaeological site in Lawrence, Massachusetts, has provided new information about the lives of the region's original inhabitants. Den Rock is a massive rock formation used by Native Americans during the Woodland (2700–400 B.P.) and

Contact (1500–1700 AD) periods. In addition to more conventional activities such as hunting, food preparation, and lithic tool maintenance, archaeological investigation has shown evidence that the site was also used by indigenous inhabitants as a mineral quarry and a workshop area for the production of ceramic vessels. This Master's thesis focuses on the Contact Period activity at the site, represented by numerous Contact Period artifacts including European ballast flint debitage, tools, and gunflints, and part from an early English snaphaunce firearm. These artifacts add to our understanding of the changes in Native American warfare, weapons, and trade that occurred during that turbulent time period. Although these changes are well represented in numerous documentary sources, the analysis of the archaeological record from Den Rock contributes to our understanding of these changes. When combined with other Contact Period artifacts found at the site, these artifacts serve to create a more precise temporal range for the Contact Period component at the site (1625–1675 AD). Finally, I suggest that the Contact Period component at Den Rock represents a specific class of New England archaeological sites – a temporary natural refuge for Native people during times of war (see report #25-1607).

25-2678 Doucette, Dianna L.
2006 Archaeological Site Examination of Locus 1, Locus 2, Locus 3, Locus 4, Locus 5, Locus 6, Locus 7, and Locus 9, J.T. Berry Rehabilitation Center, North Reading and Wilmington, Massachusetts. 182 pages.

A total of 231, 50x50cm test pits and 15, 1x1m excavation units were excavated among the eight site areas (see report #25-2649). Recovered cultural materials associated with pre-contact land use and settlement of the area consist of 1,746 pieces of chipping debris, 28 chipped-stone tools (six projectile points, 13 bifaces, 5 scrapers, 1 core, 3 worked flakes), 1 ground-stone gouge, 42 pottery sherds, 3 pieces of calcined mammal bone, and charcoal. Four cultural features were also identified, two of which yielded Late Archaic radiocarbon dates. The majority of the cultural material was recovered between 20 and 50 centimeters below the ground surface in intact, well-drained sandy soils. These sites' importance lies in their potential to yield information about cultural continuity, settlement patterns, and subsistence practices spanning the Middle Archaic to Woodland time periods. The nature of activities represented by the cultural materials recovered includes lithic manufacturing, which appears to be the predominant activity based on the amount of chipping debris recovered, but bifaces and worked tools suggest support activities as well. Evidence of features consisting of charcoal and reddened soils that are possibly fire-hearths and/or small storage pits, further suggests a more intensive use of the site beyond stone tool production. Of the eight sites examined, five (Loci 1, 3, 4, 6, and 9) contained significant evidence for eligibility and are being recommended for data recovery. The remaining three sites, Loci 2, 5, and 7, did not yield significant information to warrant further investigations. (see reports #25-2649 and 25-2864).

25-2679 Herbster, Holly
2006 Technical Report, Intensive (Locational) Archaeological Survey, Pennywise Path Affordable Housing Project, Edgartown, Massachusetts. 70 pages.

The survey included archival research, a walkover survey, and subsurface testing to identify potentially significant archaeological resources that may be affected by the project. A total of 73, 50x50cm shovel test pits was excavated along linear transects at 10m intervals within the approximately 12 acre project area. The survey recovered a solitary find: a complete Late/Transitional Archaic Orient Stemmed quartz projectile point. No other cultural materials or features were identified; no further testing was recommended.

25-2680 Brett, William
2006 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, Needham Meter Station Replacement Project, Needham, Massachusetts. 36 pages.

Archival research indicated four previously identified pre-contact period archaeological sites located within one mile of the project area. The project was limited to a square-shaped parcel, characterized by a gentle slope within an open meadow, measuring approximately 1.2 acres. Thirteen, 50x50cm test pits were excavated in a 30x30m testing block. Soil profiles within the project area consisted of a thick plow zone horizon over intact B1 and B2 subsoils. No cultural materials, features, or soil anomalies were identified or collected within the proposed project area. No further archaeological investigations are recommended.

25-2681 Dimmick, Frederica R.
2006 Archaeological Investigations at the Bog House, Truro, Massachusetts. 24 pages.

The Pamet Valley Bog House was the home of a successful cranberry picking and packing industry at the end of the 19th and into the first half of the 20th centuries on the outer Cape. The house, reputedly brought to this location in 1889, and its surrounding property are located near former bogs, the Pamet River, and a fresh water pond, within a swale formed by glacial headlands and sand hills a short distance from the Atlantic Ocean. This physical setting was attractive to Native peoples, who found the swale a safe place offering resources of small marine and terrestrial foods as well as fresh water. Archaeological investigations along the causeway road to the Bog House provided evidence for use of the area by Late Industrial and Early Modern period Americans as well as by Native Americans in the Pre-Contact period. Historic period artifacts included 18th- through 20th-century ceramics, glazed drain tile, window and bottle glass, coal, mortar and brick, machine cut and wire nails, caulking and asphalt roofing. Artifacts of the Pre-Contact period included 2 hammerstones with use-wear, a quartz bifacial preform, quartz shatter, and possible wooden weir stake fragments. The Bog House ceased its cranberry operation in the mid-20th century. Since its acquisition by the National Park Service, it is a place for visitor interpretation at the Cape Cod National Seashore.

25-2682 Ritchie, Duncan, and Anna Graves
2006 Archaeological Site Examination, Keith Farm Site, Lakeside Estates, Bridgewater, Massachusetts. 70 pages.

The proposed 10-lot residential subdivision is located within the Hockomock Swamp Area of Critical Environmental Concern; the proponent has confined the development to an approximately 13-acre parcel of uplands within a larger 95-acre tract. This study was conducted to delineate the boundaries of the Keith Farm Site and evaluate its significance. During the site examination, 50x50cm test pits placed at 10m intervals within a coordinate grid system were used to delineate site boundaries and collect information about internal complexity and the distribution of cultural materials and features within the site. Identified concentrations of cultural material and features were investigated with four, 1x1m excavation units (EUs). Twenty-one test pits from both the previous intensive survey and this site examination contained Native American cultural material in intact subsoil horizons. EUs 2, 3, and 4 from the site examination also contained Native American cultural material within intact subsoils. The densest deposits of Native American cultural material are contained within two artifact concentrations (Areas I, II) in the northern and southern ends of the delineated site area. Pre-contact period Native American cultural material found during the site examination included projectile points, a core, cobble fragment, and 98 pieces of quartz, quartzite, arkose, unidentified volcanic material, and rhyolite chipping debris. EUs 1–4 were placed in two concentrations (Areas I, II) of pre-contact Native American cultural material (projectile point, bifacial tool blades, chipping debris) previously identified in the intensive archaeological survey of the project area and further defined in the site examination. Two projectile points were recovered from Area II in the southern portion of the Keith Farm Site during the site examination. A small stemmed point of argillite found in EU1 is most likely a Late to Terminal Archaic Period artifact about 4,500 to 3,000 years old. An untyped lanceolate point with a slightly flared base made of grainy argillite or arkose-like material resembles some Middle Woodland Period point types, but is of uncertain age. A large, deep Native American fire pit feature (Feature 1) consisting of

burned/oxidized soils with some charcoal concentrations was located in EU2 in Area II. Further exposure of the feature in EU3 indicated that it extends from the bottom of the loam topsoil (plow zone) to a depth of 75cm in a lower subsoil horizon and likely represents the remains of a large fire pit. Charcoal samples collected from different parts of this pit feature yielded radiocarbon dates of 3840 ± 40 B.P. (Beta 215826) and 1190 ± 40 B.P. (Beta 215827). They indicate Feature 1 could have been used in two different episodes of Native American activity during the Late Archaic and Middle to Late Woodland periods. Boundaries for the Keith Farm Site were delineated only around those test pits and EUs that contained Native American material in intact subsoil horizons below the plow zone. A few post-contact period artifacts, such as structural materials (nails, window glass) and ceramic sherds (redware, whiteware), were found in test pits located in wooded and open field sections of the project area. This material represents small amounts of household refuse discarded in former farmland and is not considered a potentially significant cultural resource. The results of the site examination indicate that the Keith Farm Site contains evidence of occupation during the Middle and Late Archaic periods from about 7,500 to 3,000 years ago. A Middle to Late Woodland Period (1,600 to 1,000 years ago) component also appears to be present on this site. This archaeological site could yield additional information about various aspects of pre-contact period Native American settlement along the margins of Lake Nippenicket and the Hockomock Swamp district. The Keith Farm Site is considered to be significant and potentially eligible for listing in the National Register of Historic Places under criteria A and D. The Keith Farm Site is within the proposed location of house; avoidance was not feasible and a data recovery program to mitigate the adverse effects of proposed development was recommended and subsequently conducted.

25-2683 Brett, William
2005 Addendum Report, Intensive (Locational) Archaeological Survey, Riverside Reroute, Weaver's Cove LNG/Mill River Pipeline Project, Freetown, Massachusetts. 11 pages.

The linear project area measured 360ftx50ft and is located near the Taunton River Marsh, Head of the Cove (19-BR-497), and Head of the Cove 2 (19-BR-498) prehistoric archaeological sites. Testing for this rerouted plan consisted of 22 test pits placed at 10m intervals within a linear transect and a 5m test pit array. Five pieces of quartz chipping debris, designated the Riverfront Reroute Find Spot, were recovered from a solitary test pit. The cultural material was recovered from within plowzone and intact subsoils from depths of 10 to 50cm below surface. Although the findings indicate that Native Americans were active at some time at this location, the data suggest that it may have been used only temporarily or perhaps on a single occasion for tool manufacture and/or maintenance. Further, the absence of temporally diagnostic artifacts and features indicate that its information content is likely to be low. No further archaeological investigations were recommended for the find spot.

25-2684 Graves, Anna, and William Brett
2005 Intensive (Locational) Archaeological Survey, Hopedale Street Ground Bed, Mendon, Massachusetts. 50 pages.

The linear project area measured 1,440ft. A preliminary walkover inspection determined that an intensive survey was not required for the first 600ft of the proposed project length because it is located entirely within an existing pipeline right-of-way. Subsurface testing was conducted for the remaining 840 linear feet of the project area. The project area is located within one mile of Upton State Forest Find Spot (19-WR-798). The dimensions of the surveyed area are 840x 20ft (0.4 acres). Thirteen, 50x50cm test pits were excavated at 10m intervals within the proposed impact area, yielding no cultural material. A fieldstone wall was documented adjacent to the project area running parallel to the excavated test pits. The stonewall, however, is located outside of the area of potential effect and will not be impacted. No cultural resources were identified during the survey and no further survey was recommended.

25-2685 Medina, Anthony, Timothy Binzen, F. Timothy Barker, Jennifer Wendt, and Mitchell T. Mulholland
2006 Archaeological Data Recovery for the Greenbush Line Restoration Project, Mill Pond Wall Historic Site, Hingham, Massachusetts. 74 pages.

Archaeological monitoring was conducted during construction of the Town Brook Culvert within the Lincoln National Register Historic District. Monitoring of the machine trenching identified the Mill Pond Wall Site, a deeply buried 1.8m segment of stone wall. Preliminary investigations indicated that the wall was located on the historic shoreline of the tidal Mill Pond, which was filled in 1949 (see report #25-2248, 2249, 2250, and 2354). A data recovery program was recommended for the Mill Pond Wall Site, and the segment of wall within the trench box for the culvert was completely exposed and documented. Excavation units were placed on the north and south sides of the wall. Artifacts associated with the historic fill deposits dated between the late 17th century and mid-19th centuries and were interpreted as locally derived fill containing domestic refuse. This refuse was brought in during land-making activities in the early to mid-19th century that included construction of this retaining wall.

25-2686 Medina, Anthony, Timothy Binzen, F. Timothy Barker, Jennifer Wendt, and Mitchell T. Mulholland
2006 Archaeological Survey for Additional Work Areas and Monitoring for the Town Brook Culvert, Greenbush Line Restoration Project, Braintree, Cohasset, Hingham, Scituate, and Weymouth, Massachusetts (Report 2/3). 210 pages.

Intensive surveys were conducted in Braintree, Cohasset, Hingham, Scituate, and Weymouth for areas within and adjacent to the railroad right-of-way (ROW), that exhibited sensitivity for Native American and/or historic resources. Survey often entailed backhoe excavation to remove railroad fill to reveal buried topsoil or historic fill layers followed by hand excavated shovel test pits into exposed strata. At the work area in Hingham, 15 STPs were excavated. The Foundry Pond Native American Site, a possible seasonal encampment dating to the Late Archaic period, was identified and a site examination was recommended. At the work area in Cohasset, 8 STPs were excavated. No significant archaeological resources were encountered. At the work area in Scituate, 27 STPs were excavated. No cultural materials or features were identified. At the work area outside the ROW at the Liberty Street Relocation in Braintree, 18 STPs were excavated. A segment of stone foundation was identified and designated the Rev. Jonas Perkins Historic Site. Site examination was recommended. At the work area outside the ROW at the Rocky Lane Bridge in Cohasset, 19 STPs were excavated. The North Main Street Historic Site, including foundation walls, was recorded but was determined not significant and no additional survey was recommended. For the Durante Wetland Mitigation Area located in Weymouth, a reconnaissance was completed. The Weymouth Iron Company Historic Site was recorded in this parcel which had been extensively developed in the 19th and 20th centuries. The history of the site was traced through maps indicating the facilities that had existed. Because of disturbance, however, the sensitivity of the parcel was low and testing was not recommended. Monitoring was conducted for the 1,800ft Town Brook Culvert within the Lincoln National Register Historic District in Hingham. The Mill Pond Wall Historic Site was recorded near the historic shoreline of Mill Pond and data recovery was recommended. The monitoring identified the Lincoln Historic Site and recorded the Town Brook Native American Site, a locus occupied during the Late Archaic, Woodland, and Contact periods. Data recovery was recommended for both of these sites. During construction of a utility trench on North Street in Hingham, the Moriarty Foundation Historic Site was discovered. Archival research suggested the site possessed low research value and no additional survey was recommended.

25-2687 Binzen, Timothy, and Jennifer Wendt

2004 Archaeological Reconnaissance and Intensive (Locational) Survey for the Route 2 Realignment Project, Erving, Massachusetts. 100 pages.

A total of 84 shovel test pits was excavated in five survey units located on the north side of the millers river. Test pits were placed at intervals of 7.5m in locations exhibiting high archaeological sensitivity. The testing recorded two pre-contact Native American sites. The Route 2 Findspot consisted of one piece of quartz chipping debris, and the Bowed Birch site consisted of a concentration of black, brown and gray chert and quartz chipping debris with edge tools, abrading stones and fire-cracked rock. Two historic sites were recorded. The J. E. Stone site is a heavily disturbed complex of historic landscape features from a 19th-century residence. The River Terrace site is a small stone foundation with a hearth base, accompanied by an artifact assemblage that suggests a period of site occupation that began in the late 18th century, making it one of the first colonial dwellings in the town. avoidance is recommended for the Bowed Birch Native American site and the River Terrace historic site, with site examinations to be conducted if avoidance is not feasible.

25-2688 Leveillee, Alan, and Joseph N. Waller, Jr.
2005 Intensive (Locational) Archaeological Survey Benfield Parcel A Project Area, Carlisle, Massachusetts. 80 pages.

Ninety-one, 50x50cm shovel test pits were excavated within “Design Alternative A” proposed for the project. Test pits were organized in five, 30x30m sampling blocks, four linear test pit transects, and two 5m sampling arrays. Archaeological testing recovered three pre-contact Native American flakes from two distinct sections of the project area. The collected Native American cultural materials are interpreted as the result of small, limited-duration occupations by Native Americans. Subsurface archaeological testing also recovered low densities of 19th- and 20th-century cultural materials from across the survey area. These materials represent incidental discard of cultural materials into the plowzone by farmers. The cultural material record from Design Alternative A at the Benfield Parcel A project area lacks meaningful contexts and is not considered a potentially significant cultural resource. Stone piles on the property continue to be the subject of debate. These remains are remnants of 18th- through 20th-century agricultural activities; some modern Wampanoag and Narragansett Indians maintain the stone features are part of an extensive ceremonial place and landscape. Throughout the process of the archaeological survey, the Tribal Historic Preservation Officers of the Wampanoag Tribe of Gay Head-Aquinnah and Narragansett Tribe have expressed a desire to work with the Town of Carlisle as the plans for the development of the parcel move forward. The authors encouraged this continued consultation. A productive dialogue might result in preservation of as much of the perceived sacred landscape as is reasonably possible, while developing the property to suit the needs of the town. Preserving the characteristics of the remnant landscape will set an important example for future similar endeavours.

25-2689 Donta, Christopher L., and Mitchell T. Mulholland
2001 Archaeological Data Recovery at the Vine Brook Terrace Site (19-MD-600), Bedford, Massachusetts, 115 pages.

Data recovery excavations were conducted at the Vine Brook Terrace Site; 24.5sq m were excavated at the site, in addition to the 5.75 sq m excavated during the Phase I and II projects (see reports #25-795, 854). The size of the site is estimated at 84.5 sq m, and thus, 36% of the site has been excavated. The site is a short-term occupation, seasonal camp, occupied twice, some 2,700 years apart. The large wetland associated with Vine Brook to the east, which is a tributary of the Shawsheen River likely attracted the inhabitants. The first occupation occurred during the Late Archaic (5,200 years ago) and the second during the Terminal Archaic/Early Woodland period (2,500 years ago). Two fire hearths, a burn feature, and a stone concentration were identified and

excavated. Radiocarbon dates of 5180±90 and 2470±110 years B.P. obtained from feature contexts along with an Atlantic projectile point and two grit-tempered ceramic sherds confirmed the two occupations at the site. The earlier occupation consisted of a burn feature associated with a scatter of chert debitage. More information was obtained about the second occupation, which included three bifaces, two fire hearths, Vinette I-like ceramics, a primarily rhyolite lithic scatter, and a stone concentration all within the same stratum. The association of a Susquehanna tradition artifact type with ceramics is not a common occurrence, although the date ranges of the point style and the ceramics overlap. The limited number of tools present at the site suggests two short-term occupations. It is possible that additional portions of the camp site lay to the west, now buried underneath the fill deposited in the construction of Route 3. A short pollen core in the wetland adjacent to the site indicates that the forest was predominantly oak and was more open than would be expected for interior forests. Pine pollen percentages were unusually low. This, coupled with the high frequency of bracken-like ferns and large amounts of charcoal, suggests that burning was common. The authors interpret this as a result of human occupation of the area. Fire was an important forest-management technique, and a pollen core from the small stream at the site shows that fire was common at the time of the second occupation. Fire may have been used to remove pines that were competing with the nutritionally important oaks.

25-2690 Banister, Jennifer, and Kristen Heitert
2006 Intensive (Locational) Archaeological Survey and Site Examination, Old Ordinary House, Hingham, Massachusetts. 93 pages.

Twelve, 50x50cm test pits spaced at 5m intervals and two 1x1m excavation units were excavated adjacent to the north side of the house within a roughly 60ft-long and 15ft-wide impact area. The survey recovered 1,883 pieces of post-contact period cultural material including architectural debris (nails, brick, plaster, mortar, and window glass) and domestic debris: ceramics (Staffordshire slipware, creamware, redware, pearlware, whiteware, porcelain, ironstone), bottle glass, ball clay pipe stems, and a bone button. Three features were identified including the remnant fieldstone foundation of a small shed (circa 1760) formerly attached to the northeast corner of the house, a postmold associated with a trellis built against the shed, and a 19th-century shallow brick vault located inside the shed that likely was used for coal or wood ash storage. The features are previously undocumented structural features associated with the late-18th- and 19th-century occupation of the house.

25-2691 Dudek, Martin G.
2006 Archaeological Intensive Survey for the Nelson Point Residential Development, Town of Shrewsbury, Worcester County, Massachusetts. 66 pages.

The proposed Nelson Point subdivision was tested with 35 shovel test pits (50x50cm), consisting of 26 systematic, five judgmental, and four bracket test pits. Natural undisturbed stratigraphy was common; the project area was very rocky, however, which may have had a negative effect for land use in pre-Contact and historic periods. Natural quartz veins with naturally weathered shatter were present in outcrops near Nelson Point Road. Pieces of fractured quartz were recovered from two adjacent test pits near exposed veins of natural quartz; however, the fracture patterns lacked evidence of a cultural origin. Bracket test pits around the location also failed to recover cultural materials. No further investigation is recommended.

25-2692 McCarthy, John P.
2006 Cultural Resources Report, Cummingsville Branch Replacement Sewer: Archaeological Monitoring, MWRA Contract No. 6186, Winchester, Massachusetts. 57 pages.

Portions of two features associated with the Middlesex Canal (constructed 1795–1803 and operated until 1852) were documented, and specifically associated with the Stone, or Hollis, Lock (constructed in 1825). Evidence of the large passing basin below (south) of the lock was observed

and soil deposited in the basin during or shortly after its use was sampled. No artifacts were recovered from this area. In addition, and more significantly, an east-west oriented split granite retaining wall or abutment, facing downstream (south), was encountered. This find documented the precise location of the southern end of the lock structure and confirmed the alignment of the canal beneath current Sylvester Avenue as documented in 1998 rather than, at least in part, well to the east of Sylvester Avenue as had been suggested (see reports #25-1786, 1787). A soil sample associated with this feature was also examined. No artifacts were recovered. While these features are associated with the Middlesex Canal, no further archaeological investigation associated with the construction of Segment J of the Cummingsville Branch Replacement Sewer is recommended. These finds do suggest that similar resources many survive in other urban areas. Specifically, other canal-related features may survive nearby, especially in the area to the west and north of the stone wall remnant, where the main lock structure would have stood. Future construction activity in that area should be carefully monitored to identify and record other canal-related remains.

25-2693 Cherau, Suzanne G., and Jennifer B. Banister
2006 Archaeological Reconnaissance Survey of Water-Powered Industrial Resources, Falmouth, Massachusetts. 238 pages.

This survey included archival research, informant interviews, and field survey to collect information about known and potential water-powered industrial sites. This information was used to compile environmental and cultural (including water-powered industrial) contexts for Falmouth and to provide for a reliable predictive model for locating and identifying these types of historic archaeological resources within the town. The survey identified eight previously unrecorded water-powered industrial archaeological (mill) sites on the town's major river drainages and in the coastal zone of Woods Hole. Of the eight sites, six are potentially eligible to the National Register of Historic Places under Criterion A for their associations with the historical, social, and economic development of Falmouth, in particular the villages of East Falmouth and Waquoit, during the 18th and 19th centuries. These sites are also potentially significant under Criterion C because they could yield information about distinctive method(s) of construction related to small-scale, rural, water-powered industrial sites. They are also potentially significant under Criterion D because they could yield information about the function of small 18th- and 19th-century water-powered industrial sites and adaptive agricultural (cranberry bogs) reuse in the early to mid-20th century. Management recommendations for the protection of the potentially significant mill sites are grouped by their ownership status, which affects the type of land use controls that can be applied. The recommended site protection measures could be formalized into a town-wide archaeological site protection program. Interpretive structures and text are recommended for the mill sites identified on town-owned agricultural lands on the Coonamessett River.

25-2694 Barker, F. Timothy, Timothy Binzen, Jennifer Wendt, and Mitchell T. Mulholland
2006 Archaeological Data Recovery at the Lincoln Historic Site for the Greenbush Line Restoration Project, Hingham, Massachusetts. 110 pages.

The Lincoln Historic Site was initially identified during monitoring of machine trenching for the Town Brook Culvert within the Lincoln National Register Historic District (see reports #25-2248, 2249). Documentary research found that the site was located within the original 1635 5-acre lot sold by William Arnell in 1644 to Cornelius Cantleberry, who built a house on the property in 1645. In 1649, Samuel Lincoln purchased the lot and house. His descendant Enoch Lincoln built a new house in 1784. Descendants of the Lincoln family occupied the property until 1852, when it was sold to the Soule family. A data recovery program was recommended for the Lincoln Site, and the portion of the site affected by the culvert construction was investigated. The Lincoln Site is a complex of features and deposits. Earlier deposits had been penetrated during successive episodes of construction and renovation on the property, and in some instances artifacts had been redistributed from their primary depositional contexts. Major classes of artifacts included ceramics, glass, clay pipes, and architectural materials. Major features included a 19th-century, stone-lined well

that had been retrofitted with a sewer drainage outfall pipe and manhole cover in the early 20th century; stone foundation blocks and brick masonry piers for a 19th-century barn associated with the Enoch Lincoln House; a fill deposit outlining the footprint of an outbuilding that dated to the Lincoln family period of ownership; a privy dating to the second half of the 19th century; evidence for a late 19th-century barn that likely was built by the Soule family; and a widespread fill deposit apparently related to late 19th-century construction and renovation episodes. Historic maps and site stratigraphy were analyzed to interpret the sequence of overlapping land modification and construction events that resulted in the current archaeological record. It was found that while the site included archaeological deposits dating to the 17th century, the well and barn-related features that were investigated dated to the late 19th century.

25-2695 Donta, Christopher L.

2006 Archaeology of the Nemasket River: Data Recovery Surveys at Riverside Park. 502 pages.

Data recovery excavations were conducted at seven sites in the Riverside Archaeological District in Lakeville, including Riverside 1 (19-PL-704), Bridge Street II (19-PL-192), Riverside 4 (19-PL-701), Riverside 5 (19-PL-700), Riverside 6 (19-PL-699), Riverside 7 (19-PL-697), and Riverside 8 (19-PL-698). The report provides an interpretation of the ancient settlement patterns of the Nemasket River drainage. Several technical appendices (Faunal, floral, etc.) provide important comparative information, especially for the identification of non-human mammal bone by analysis of osteons. The sampling design explored and documented features that had been previously identified (see reports #25-1039, 2429). The completed excavations amounted to a total of 110.25 sq m and included 137 shovel test pits; 62, 1x1m units; 1 2x2m unit; 3, 2x1m units; 2, 1mx50cm units; and 2, 4mx50cm trenches. The data recovery excavations documented a dense array of features and scatters of artifacts at seven different sites. The findings relate to Late Archaic and Woodland period occupations, dating from ca. 5,000 to 500 years ago. Highlights of the project include the documentation of several very large pit features at the Riverside 1 Site and scatters of rhyolite lithic working, and the Riverside 4 Site which contained a high density of features including hearths and pits, along with pottery from the Middle and Late Woodland periods. The project documented the co-occurrence of Small Stemmed and Susquehanna tradition artifacts in an interior riverine location, but with marked differences in raw material use between the two traditions: Small Stemmed traditions favored local materials, particularly quartz, and Susquehanna used no quartz, but more regionally available volcanic stone. At Riverside 1, 4,328 artifacts were collected, mainly rhyolite debitage, but also a substantial number of quartz, chert, and debitage of other raw materials, as well as lithic tools and tool fragments, a small number of steatite and pottery sherds, along with fire-cracked rock and faunal material. Temporally diagnostic artifacts point to a single occupation during the Early Woodland Period, but possibly including more than one occupation, including the Late Archaic (ca. 4,100–3,500 B.P.), and perhaps others. At least five different activity areas were identified, indicating a range of uses for the site. A radiocarbon date from the large pit features at the site points to the Late Woodland period, which may be problematic, since the features contained material that indicates a Late Archaic to Early Woodland occupation. At Bridge Street II, 809 artifacts were collected. The largest number is quartz debitage from stone tool making, but there was also a substantial amount of rhyolite debitage, a large amount of fire-cracked rock, a few stone tools and tool fragments, and two pieces of faunal bone. Temporally diagnostic artifacts and radiocarbon dates from features at the site point to some minimal presence during the Early Archaic Period, ca. 9,000–7,500 years ago, as well as possibly two Late Archaic components: one ca. 5,000–4,100 years ago that is supported by two radiocarbon dates from hearth Feature 2-9, and the second ca. 3,200–3,000 years ago, on the basis of two point fragments. The Riverside 4 Site yielded 3,804 artifacts, the majority of which are quartz lithic waste from stone tool making, but also include a substantial amount of rhyolite waste, as well as quartz, rhyolite, and other lithic tools and tool fragments; a small number of pottery sherds; and fire-cracked rock and faunal material. Temporally diagnostic artifacts indicate multiple occupations at the site: a very small amount of Early Archaic material (ca. 9,000–7,500 B.P.), which are probably outliers from the adjacent Riverside 3 Site; a Late Archaic occupation (ca. 4,500–4,100 B.P.); an Early Wood-

land occupation (ca. 3,000–2,700 B.P.); and a Late Woodland occupation (ca. 1,500–500 B.P.). Four radiocarbon dates from features at the site date to the Late Woodland Period. Numerous features were found at the site, which included several large pit features, some of which were used for burning and others for storage and later waste. Most of the features seem to date to the Woodland occupations, which cut through earlier deposits at the site. The features document the processing of food, use of fire for heat and cooking, firing of pottery, and postmolds from temporary structures. At Riverside 5, 106 artifacts were collected, primarily quartz lithic debitage resulting from stone tool making, but a small variety of other lithics, tools, fire-cracked rock, and faunal material were also found. Temporally diagnostic artifacts indicate a Late Archaic to Early Woodland period occupation, ca. 5,000–2,300 years ago. The low number of artifacts and limited vertical distribution argue for a single component site. The single feature found at the site may be the result of a cooking station, in which the remains of deer, bird, beaver, turtle, and possible other animals were prepared. The central part of the site contained a high percentage of tools that represent either manufacture of a quartz toolkit or perhaps hide-working. The Riverside 6 Site yielded 362 artifacts, the majority of which is quartz debitage from stone tool making, but there was also a small number of ceramic sherds and faunal material. Temporally diagnostic artifacts point to a Woodland Period occupation, probably during the Middle Woodland, ca. 1,500–1,400 years ago. The single area of artifact concentration and limited vertical distribution argues for a single component site. No features were found at the site. At Riverside 7, 420 artifacts were collected, primarily quartz lithic waste from stone tool making, but also a substantial amount of fire-cracked rock, a few quartz stone tools, a few ceramic sherds, and a small amount of faunal material. Temporally diagnostic artifacts and radiocarbon dates from features at the site point to two components: one ca. 4,500 years old in the Late Archaic Period, and the second ca. 1,000 years old in the Middle to Late Woodland period. The Riverside 8 Site produced 2,873 artifacts, most of which were quartz debitage from stone tool making, but there was also a substantial amount of fire-cracked rock, a number of quartz stone tools, a few non-quartz tools, and a small amount of faunal material. Temporally diagnostic artifacts and a radiocarbon date from one of the features at the site point to two possible components: one a ca. 4,500 years old Small Stemmed occupation of the Late Archaic period, and the second ca. 2,000 years old during the Early to Middle Woodland period. A total sample of 12,702 artifacts from seven sites was obtained from the Riverside District, primarily dating between 5,000 and 500 years ago. In addition to artifacts, numerous features were investigated documenting an array of Native American activities. Although Early and Middle Archaic components have been found within the district, no evidence of these occupations was found during this data recovery. The main evidence of Early and Middle Archaic activity lies at Riverside 3. It is not clear what resource was found at Riverside 3 that attracted these early inhabitants, rather than to other parts of the District. The Late Archaic and Early Woodland time periods are well represented, particularly at Riverside 1, Bridge Street II, Riverside 4, Riverside 5, Riverside 7, and Riverside 8. Evidence of these occupations is plentiful, in the form of lithic artifacts, features such as hearths, pits, and other burn features, and in faunal remains. Small Stemmed tradition artifacts are the most common, occurring at six of the seven sites, in contrast to lower numbers of Susquehanna and Laurentian related materials. Small Stemmed artifacts were most commonly made of quartz and other locally available materials, in contrast to higher percentages of non-local artifacts in the Susquehanna and Laurentian assemblages. Late Archaic to Early Woodland occupations were the most common in the District, occupying the widest area and comprising the most locations of activity. A large Middle Woodland presence is evident at Riverside 4, but is the only such location in the areas investigated. Late occupation of the District appears to have been more concentrated, and of a longer duration, resulting in the highest density of features, all at Riverside 4. A boulder with petroglyphs was also documented.

25-2696 Donohue, Barbara
2006 Intensive (Locational) Survey at the Site of the Proposed Wyndbrook at Tyngsboro, Town of Tyngsborough, Middlesex County, Massachusetts. 86 pages.

In total, 79 test pits (28 in two 30m blocks, 41 in 6 transects of varying lengths, and 10 judgmentally placed) were excavated on a 42 acre parcel. The Eben Swan House (MHC#TYN.38), which

was continuously occupied by the Swan family from circa 1797 through the end of the 19th century, is in the project area. A total of 620 historical artifacts was recovered. While the majority of datable materials was associated with the early 19th century, it was mainly recovered from redeposited and fill soils; no subsurface historic features were identified. No further archaeological investigation is recommended.

25-2697 Binzen, Timothy, and Jennifer Wendt
2006 Archaeological Reconnaissance and Intensive (Locational) Survey of the Mariamante Parcel, Gill, Massachusetts. 84 pages.

This survey was conducted in the northern part of the Riverside National Register Archaeological District. Site 19-FR-268 was previously recorded on the property, on the basis of the Rodimon Collection. One hundred and sixty, 50x50cm shovel test pits were excavated on a survey grid established in the central part of the property, a former agricultural field where future development is anticipated. Background research and testing found that Site 19-FR-268 contains evidence of multiple episodes of Native American occupation that began at least as early as the Middle Archaic Period (7,000 years ago) and continued, possibly with greater frequency, during the Late Archaic and greater Woodland periods (500 to 5,000 years ago). The archaeological record within this parcel has undergone considerable disturbance since European settlement began. Repeated plowing of the land for agricultural use disturbed the topsoil, which probably once contained widespread archaeological deposits that were removed by artifact collectors. Testing identified multiple concentrations of Native American artifacts, but mainly only chipping debris. Chert in several varieties is the predominant lithic material, followed in frequency by rhyolite, quartzite, and quartz. The assemblage also includes fragments of pottery, a scraper, and small triangular projectile point. While the majority of the artifacts were recovered from the plowzone, artifacts were found in undisturbed subsoil in several locations, and multiple subsurface features of Native American origin were recorded. The report demonstrates the impact of surface collecting on surviving artifact deposits.

25-2698 Olausen, Stephen, and Suzanne G. Cherau
2004 2003–2004 Annual Report, Cultural Resource Monitoring, Deerfield Hydroelectric Project, FERC No. 2323. 82 pages.

The 2003–2004 Annual Report summarizes cultural resource-related activities undertaken from January 1, 2003 to May 31, 2004 including the results of investigations carried out as recommended in the 2002 Annual Report action plan, descriptions of cultural resource management activities that occurred in 2003, and an action plan for the year 2004. One new recreational enhancement project, the East Branch Trail in the Searsburg Development in Vermont, was completed in 2003–2004. One new project that involved historic buildings and structures was initiated in 2003–2004: the proposed installation of a cooling fan in an existing window at Development No. 2 Powerhouse where existing condition photo documentation was completed. As of the completion of this annual report the installation of the cooling fan had not been performed so the "after" photo documentation is on hold.

25-2699 Olausen, Stephen, and Kristen Heitert
2006 2004–2005 Annual Report, Cultural Resource Monitoring, Deerfield Hydroelectric Project, FERC No. 2323. 66 pages.

The 2004–2005 Annual Report summarizes cultural-resource-related activities undertaken from June 1, 2004 to December 31, 2005 including the results of investigations carried out as recommended in the 2003–2004 Annual Report action plan, descriptions of cultural resource management activities that occurred in 2004–2005, and an action plan for the year 2006. No archaeological work was completed for previously listed or new recreational enhancement projects during the period covered in this annual report. As part of the Action Plan for 2006 archaeological sensitivity

assessments will be conducted for recreational enhancement projects as design plans become available. Two new projects that involved historic buildings and structures were advanced during this period: the replacement of the roof surfacing of the No. 4 Development Garage/Maintenance Building and the repair or replacement of the Sherman Development Powerhouse Roof. Information about these projects will be forwarded to the MHC when available to consult on ways to avoid, minimize, or mitigate impacts to these structures.

25-2700 Donta, Christopher, and Jennifer Wendt
2006 Archaeological Intensive (Locational) and Site Examination Surveys for the Proposed Route 20 (Boston Post Road) Bridge Replacement Project, Wayland, Massachusetts. 98 pages.

The project area is situated along Route 20, with proposed impacts on the northeast side of the existing bridge over the Sudbury River, measuring approximately 120m in length and 17m in width, totaling 0.5 acres. Several previously recorded Native American sites were identified in the immediate area, but none within the proposed impacts. The Phase 1 survey included 20 shovel test pits (STPs), seven of which contained a total of 15 artifacts. Site examination testing at the site, designated the Post Road Launch Native American Site, included another 12 STPs and two 1x1m (3.3x3.3ft) units, resulting in the collection of 70 Native American artifacts and the identification of one possible postmold. A quartz biface and a quartz scraper were found. No temporally diagnostic artifacts were found. The Post Road Launch Native American Site is a remnant of a larger site previously impacted by road and railroad construction. Because of the small size and poor condition of the remaining portion of the site and low density of cultural materials collected from the two surveys, no further testing was recommended.

25-2701 Donta, Christopher L., and Jennifer Wendt
2006 Archaeological Intensive (Locational) Survey for the Proposed South Road Reconstruction Project, Westhampton, Massachusetts. 68 pages.

The proposed reconstruction of South Road led to reconnaissance and site locational surveys along a 2.1km section of South Road. Six survey units were tested with 57 shovel test pits. No evidence of Native American activity was found. Two test pits contained a total of three historic period artifacts. The visible remains of the Loud Family Mill were found near the northern end of the project area, closest to Westhampton town center. All of the visible mill remains are located outside of the project area. Subsurface testing of the impact area near the mill remains recovered no artifacts or features. No further archaeological survey was recommended.

25-2702 Mulholland, Mitchell T., Antonio Medina, Timothy Binzen, Christopher Donta, and Jennifer Wendt
2006 Archaeological Intensive (Locational) Survey for the Council Oak 2 Development, Dighton, Massachusetts. 90 pages.

The project area is located immediately northwest of a large oak tree, known locally as the Council Oak and which has historical significance. The archaeological survey identified a thin scatter of historic European-American and Native American artifacts. Nineteen Native American artifacts and fourteen historic artifacts were recovered from the 65 shovel test pits excavated. No subsurface features were encountered. Soils were extremely stony, increasing dramatically with depth. All of the recovered artifacts were contained within the well-developed plow zone. Background research and local tradition indicates that the area within a mile of the project area was used extensively by Native Americans for at least 8,000 years and by European farmers for at least the past 200 years. Field survey suggests that the project area was farmed by a local nursery business since the 1860s. Historical documents and local tradition suggest that a Native American village with a cemetery and numerous associated artifacts were located at an undisclosed distance north of the Council Oak Tree. The small number of artifacts does not suggest intensive occupation of the pro-

ject area, as would have been associated with a village. The site is a low-density continuation of site 19-BR-92, which extends east and northeast from the project area to Elm Street. One small area in the vicinity of the historic Council Oak tree was recommended for avoidance. While no evidence of a cemetery was encountered, the issue was not resolved. Therefore, monitoring by archaeologists during the removal of the topsoil was recommended.

25-2703 Thibodeau, Lillian, Helene Lisy, and Curtiss Hoffman
1978 In Retrospect: An Archaeological Excavation of the Amos Wyman Site, Billerica, Massachusetts. 126 pages.

Excavations occurred at the Amos Wyman Site (BIL-HA-4) as an archaeological field education program for middle school students and adult residents, as part of the U.S. Bicentennial observations. The property is owned by the Billerica Historical Society. The report includes an overview of the property's history; field, laboratory, and educational methods and goals including examples of classroom lessons and projects; and a description and interpretations (with photographs) of the cellar hole excavation results including descriptions and photographs of the predominantly 18th and 19th-century household and farm artifacts (an ancient slate gorget fragment is also illustrated). The report concludes with an interpretation of the site history and an evaluation of the educational program with recommendations for similar projects involving students.

25-2704 Robinson, David S. (with contributions by John D. Sullivan)
2006 Remote Sensing Archaeological Survey, Annisquam River Dredged Materials Disposal Site for Annisquam River Maintenance Dredging, Gloucester, Massachusetts. 76 pages.

Archaeologists completed a remote sensing archaeological survey of the proposed 110-acre Annisquam River Dredged Materials Disposal Site (AR-DMDS) located approximately 1 mile from shore, north of the mouth of the Annisquam River and Coffin's Beach in Ipswich Bay. The archaeological work was conducted to identify and document remote sensing target areas with potential to be significant archaeological deposits (i.e., shipwrecks) or intact paleosols with archaeological sensitivity for containing pre-contact archaeological deposits that could be present within the previously defined Area of Potential Effect (APE). The remote sensing survey consisted of archival research and field investigation using differential GPS, high-frequency side scan sonar, a cesium-vapor marine magnetometer, and a CHIRP sub-bottom profiler to acquire 100% coverage within the proposed AR-DMDS along a series of 33 parallel track lines spaced 50 feet apart. Although archival research indicated a moderate potential for pre-contact archaeological deposits dating from ca. 12,000 to 5000 B.P. and high potential for post-contact archaeological deposits, no targets/anomalies or buried geological features suggestive of archaeological deposits or potential paleosols were identified by the survey. No additional archaeological investigation was recommended.

25-2705 Mair, A. Peter, II, and Anna Graves
2006 Intensive (Locational) Archaeological Survey, Highland Commons, Hudson and Berlin, Massachusetts. 106 pages.

Eighty-nine, 50x50cm test pits were excavated in the project area. Three archaeological sites were identified: the Tin Pot Site; the Potash Hill Terraces Site (HUD-HA-3), a previously recorded historic period site; and the Mary Cate Road Site. The Tin Pot Site contains a low density distribution of cultural material resulting from lithic tool production and maintenance. No cultural features, stone tool fragments, or other diagnostic materials were recovered during the intensive survey. Subsurface investigations of the Potash Hill Terraces Site did not produce any evidence of its reported function as a potash kiln and/or orchard. The Mary Cate Road Site consists of two fieldstone foundations, a deep hole that is potentially a borrow pit, and an existing concrete block structure. Neither research nor subsurface investigations at the Mary Cate Road Site produced any

information about the site. The Tin Pot Site and Mary Cate Road sites are within wetland buffer areas that will not be developed. Current project plans indicate that the Potash Hill Terraces Site will not be impacted. Although the Potash Hill Terraces Site is not considered a significant archaeological resource, the incorporation of the terrace feature into the landscape design of the development would provide an interesting visual reminder of the past use of the area.

25-2706 Donta, Christopher, and Jennifer Wendt
2006 Archaeological Intensive (Locational) Survey for the Proposed Water Treatment Facility Improvements for Callahan Wells, Hadley, Massachusetts. 48 pages.

Background testing indicated that the vicinity of the 1 acre project area has produced evidence of numerous Native American archaeological sites. Two of these sites are located in close proximity to the project area. A low number of historic artifacts, consisting of glass and whiteware, were recovered from the plow zone in four of the 16 excavated shovel test pits. No Native American artifacts, subsurface cultural features, or architectural remains were encountered. No further survey is recommended.

25-2707 Dudek, Martin G.
2006 Archaeological Intensive (Locational) Survey for the Pappas-Evergreen Enterprises, Inc. Monopole Facility, Apremont Way, Town of Holyoke, Hampden County, Massachusetts. 58 pages.

The project area is located near a historic road and wetland resources. The intensive survey consisted of 11 systematic test pits and 1 judgmental test pit (all 50x50cm), including 6 test pits at the monopole facility and 1 transect of 6 test pits at the access road, excavated within an overall project area comprising approximately 0.2 acres. Modern/historic artifacts were recovered from fill or disturbed A-horizon soils in test pits near an existing access drive and fence for an adjacent water tank. No potentially significant archaeological resources were identified; no additional archaeological work is recommended.

25-2708 Dunford, Frederick J.
1995 The Sandy Neck Cultural Resources District, Barnstable, Massachusetts: An Archaeological Reconnaissance Survey with Suggestions for Cultural Resource Management. 46 pages.

The first phase of the project consisted of an intensive background study. More than 50 primary and secondary sources were consulted to develop an environmental and historical context for the archaeological record of Sandy Neck. Phase two, a surface survey, was conducted in the spring of 1992. During the course of this survey, 7 archaeological loci were identified, recorded, and photographed. After the survey, a series of aerial photographs were taken to compare future changes in the surface topography of the neck. This report provides an environmental and historical context for the archaeological resources on Sandy Neck and makes recommendations for cultural resource management.

25-2709 Rainey, Mary Lynne, and Joyce Clements
2006 Technical Report: Intensive (Locational) Archaeological Survey, Route 24 and Pleasant Street Development, Bridgewater, Plymouth County, Massachusetts. 57 pages.

Known prehistoric site 19-PL-169 is documented as a collecting territory that encompasses an unknown portion of the 56 acre project area. Archaeologists excavated 98, 50x50cm test pits within 16 acres of the larger parcel that were deemed archaeologically sensitive. Testing recovered prehistoric cultural material dominated by chipping debris across much of the tested area, including three isolated loci, suggestive of Transitional Archaic and Late Woodland cultural compo-

nents. Edge tools associated with food processing and other domestic activity were also recovered, along with a small collection of calcined bone and fire cracked rock; no features were found. Named the Pleasant Street Site, the recovered materials are considered part of the larger area of site 19-PL-169. The Pleasant Street Site was recommended as potentially significant and site examination was recommended (see report #25-2763).

25-2710 Pendery, Stephen R., and Leslie A. Mead
2006 Archaeological Investigations at the Boston African American National Historic Site, Boston, Massachusetts. 309 pages.

This report presents and interprets the results of an archaeological data recovery conducted by National Park Service staff between 1995 and 1997 in conjunction with a construction project to improve access and drainage at the 1835 Smith School House and the 1806 African Meeting House. Excavations occurred in four areas within these two properties and included a block of 34 contiguous meter excavations in the courtyard immediately west of the Smith School, two trenches in the easement between the Smith School and African Meeting House, two trenches in the alley on the eastern side of the African Meeting House, and one unit in the sidewalk in Smith Court. Archaeology at the Smith School House site included the discovery of a brick pavement covering several 19th-century features in the courtyard. These included a system of brick cesspits for a centrally-located privy, linked with the school's mid-19th-century roof drainage system and designed to flush the privy into drains leading to Smith Court. This area was considered to be significant, however, project-related construction impacts could not be avoided. The privy and its components were documented and extensively sampled. Testing in the Easement and East Alley of the African Meeting House revealed modern disturbance in the upper surfaces, however several truncated features, including drains, were exposed immediately beneath. The recommendation was made to limit impacts to these features by limiting construction depth in this area. Monitoring of construction was recommended for two areas inaccessible to manual excavation: under the Smith Court sidewalk, and beneath the concrete cellar slab of the Smith School House. Monitoring documented additional brick and slate drains.

25-2711 Strauss, Alan E.
2003 Intensive Archaeological Survey of Parcel 22 at 40 Skaket Way, Brewster, Massachusetts. 38 pages.

Background research indicated that no recorded prehistoric sites existed within the project area. Historical resources indicated that the area remained wooded and uninhabited throughout the historic period. Six of the 24 test pits excavated contained prehistoric artifacts. A total of 19 lithic flakes and 2 stone tool fragments were recovered from the site. A Middle Woodland Lanceolate projectile point base was recovered from one of the test pits. The site appears to be a small Woodland Period activity area. Because of the low density of artifacts, the lack of internal site complexity, and the absence of subsurface features, the site is considered to have minimal research potential. No further archaeological investigation is recommended.

25-2712 Cherau, Suzanne G.
2006 Longfellow Bridge, Rehabilitation and Restoration Project, Archaeological Assessment, Boston and Cambridge, Massachusetts. 69 pages.

The purpose of the archaeological assessment was to provide a historic shoreline reconstruction and land use history of the Boston and Cambridge shorelines adjacent to the bridge abutments/approaches and determine the potential for significant submerged and/or terrestrial archaeological resources in project work areas. The project's impact area for archaeological resources has not been definitely determined, but is estimated to include the river channel within and surrounding the bridge span and the two bridge approach areas extending approximately 250ft from each

shoreline. The archaeological assessment consisted primarily of an archival review, synthesis, and analysis of existing primary and secondary documentary and cartographic sources. A site visit to the bridge and approaches project study area was conducted to familiarize the archaeological project staff with the bridge, road, and park infrastructure and layout of the area. The historic shoreline reconstruction and detailed bridge component historical assessment indicate that there is no potential for significant pre-contact/contact or post-contact period archaeological resources within the river channel and bridge approaches in Cambridge and Boston. The documented late18th- through early to mid-20th-century trenching/draining of the marshes, dredging in the river channel, and shoreline reconfigurations, all occurring on made land, have likely obliterated any intact Native American and earlier historic period land surfaces that may have been present below the fill. The historical identification and assessment for the project confirmed only two surviving pre-1950s structural elements (1805 Broad Canal fragment; section of 1883–1890/1900–1907 Memorial Drive Esplanade seawall) in the areas adjacent to the Cambridge side of the Longfellow Bridge, but no associated landscapes that pre-date the 1950s Storrow and Memorial Drives reconfigurations. Given the original shoreline locations well inland of both the Cambridge and Boston sides of the modern Longfellow Bridge approaches, the river channel dredging, and the severity of 20th-century reconfigurations of the bridge approaches/highways/rapid transit infrastructure, it is not expected that any significant archaeological resources are present within at least a 500ft radius of the Longfellow Bridge substructure. No archaeological investigations or monitoring of the proposed geotechnical test pit program are recommended for the Longfellow Bridge rehabilitation and restoration project.

25-2713 Donta, Christopher
2006 The Neponset Paleoindian Site (19-NF-70) in Canton, Massachusetts: Archaeological Data Recovery Surveys 2002–2003. 91 pages.

Archaeological data recovery was conducted at a portion of the Neponset Site (19-NF-70) to be impacted by a proposed office building. Numerous previous surveys have been conducted at the site, documenting a wide range of occupations, from the Paleoindian through Woodland periods, representing one of the few Paleoindian sites scientifically explored in the state. The present project consisted of literature review and new excavations. While extensive disturbances were found in most of the proposed impact areas, the western portion of the proposed building site was scheduled to impact a previously undocumented Paleoindian locus. This Paleoindian locus (previously identified as Locus 4, containing Archaic and Woodland components, see reports #25-1001, 1193, 1584, 1877, 1911, 2478) contained a scatter of mostly quartz and Mt. Jasper rhyolite, with smaller amounts of other rhyolites, argillite, quartzite, jasper, and chert. Interestingly, in contrast to other Paleoindian loci ant the site, no Attleboro red felsite was reported. Artifacts from the Paleoindian component include three fluted point fragments, eight unifacial sidescrapers, two bifaces, and a large amount of debitage. The artifacts were similar in form and materials to those previously documented at Neponset Site Loci A–D. The artifact types and raw materials from the Neponset Site point toward a connection with the Israel River complex of northern New Hampshire, dating from the middle portion of the Paleoindian period, ca. 12,000 years ago. Multiple loci of the Michaud-Neponset phase of the Paleoindian Period have been documented across the southeastern portion of the site that provide information on contacts between Paleoindians of southern and northern New England.

25-2714 Binzen, Timothy, F. Timothy Barker, Mitchell Mulholland, Jennifer Wendt, and Jennifer Fairlie
2003 Archaeological Intensive (Locational) Survey for the Hingham Square Underpass, Greenbush Line Commuter Rail Restoration Project, Old Colony Railroad, Hingham, Massachusetts. 106 pages.

The proposed construction consists of a new tunnel 823m long within the right-of-way of the Greenbush Line that runs through the Lincoln National Register District. Soil borings for the underpass project revealed the presence of intact topsoil and subsoil strata buried beneath 1m to 2.4m

of artificial fill that forms the existing railroad bed. The survey involved 17 backhoe-excavated machine trenches extending across the railroad bed at multiple locations to reveal buried topsoil or cultural deposits. Shovel test pits were hand-excavated in the bottom of the machine trenches to identify archaeological deposits and features. Priority was given to locations near watercourses and wetlands, and where soil borings had indicated the presence of buried organic strata. The machine trenches were typically 1.2 to 1.5m wide, and ranged in length from 6m to 15m. Typically, three test pits were excavated in each machine trench. In 12 of the machine trenches, no potentially significant archaeological deposits or features were identified beneath the railroad bed fill. In three of the trenches, early 20th-century supports for a railroad trestle were encountered within the railroad bed fill. The 20th-century timbers replaced the 19th-century timbers. Potentially significant archaeological resources were identified in two trenches. The Hingham Underpass 1 Site consists of a deposit containing Euro-American artifacts dating to the 17th and 18th centuries and a thick mat of branches beneath the cultural deposit. The feature is tentatively interpreted as part of a cart path that led across a marshy area. The Hingham Underpass 2 Site contains a buried topsoil stratum containing a low volume of historic artifacts. A concentration of large cobbles was encountered, abutting wooden planks supported by an upright, hand-hewn wooden post. Capped by clay and a deposit containing late 18th-century artifacts, the feature may represent part of a shoring for a retaining wall or cribwork. Site examinations are recommended for the two historic archaeological sites. The Mill Pond Trestle Site was recorded in the eastern section of the project area. The site consists of 20th-century wooden supports for a trestle. These supports had been preserved when the trestle was encased in railroad bed fill in ca. 1949. The supports were documented. The archaeological investigations at the Hingham Underpass 1 and 2 sites will take place after construction stabilizes the area around the building foundations and the installation of the GeoJet walls is complete. Two areas could not be tested during the survey. The ancient Broad Bridge is in the current location of Central Street. This area is now a paved roadway and cannot be disturbed until the pavement is removed, the road closed for construction, and construction stabilizes the area around the building foundations. A second area is located in a narrow railroad corridor between several buildings. Machine trenching in this location could undermine the foundations. If these areas contain potentially significant archaeological resources a site examination and data recovery will be completed.

25-2715 Cherau, Suzanne
2006 Archaeological Monitoring and Documentation, Muddy River Flood Damage Reduction and Ecosystem Restoration Project – Geotechnical Test Pits, Boston, Massachusetts. 113 pages.

The project area lies within the Back Bay Fens and Muddy River/Riverway sections of the Olmsted Park System, also known as the Emerald Necklace. The Olmsted Park System is a National Register Historic District and Boston City Landmark. The archaeological work was conducted to identify and document potentially significant park-related, water-management, and other engineering features exposed in the geotechnical test pits. The archival documentation and geotechnical test pit monitoring determined that the historic park pond shoreline and pathways are likely present and identifiable beneath the modern fill deposits in a majority of the project work areas. The 20th-century fill in most areas covered the significant Olmsted and Shurtleff period landscapes along with any structures and features that were not completely dismantled in the process. The fill across the majority of the park work areas seems to generally average between 6 and 8ft below surface. Modern utilities are not likely to have been excavated into the historic landscape strata. The archaeological sensitivity of the work areas is generally assessed as moderate to high for both Olmsted Period (1880–1895) and Shurtleff Period (1910–1933) park landscape and water-control resources and cultural strata. The identification and documentation of such resources prior to construction would enhance the historically sensitive restoration of this portion of the Back Bay Fens as part of the Muddy River project. Identified historic resources consist of the northwest and southwest wingwalls of the 1891 Fens Bridge at Avenue Louis Pasteur and a section of pond shoreline on the southeast side of Upper Fens Pond. The intact west wingwalls are together recommended as a contributing element of the 1891 bridge placing it within the Olmsted period of significance (1880–1895) for the Back Bay Fens. Olmsted period documented resources that may

be present in other parts of the project work areas include the circa 1883 Muddy River gatehouse substructure foundation and support remains near Brookline Avenue; an 1880s/1890s boat landing and shed near the former gatehouse; an 1891 culvert and retaining/headwall opposite the gatehouse at Brookline Avenue; and a ca. 1891 Bridle Path Bridge across the former pond and footpaths in the Riverway. The geotechnical investigations were not focused on and therefore did not determine whether any intact remains associated with these resources are present beneath modern fill deposits. Archaeological survey and documentation would be needed to identify the presence and evaluate the integrity of any such water and park-related features including the historic pond shoreline and footpaths prior to the proposed day lighting and park restoration work. Additional historic archival research could also be conducted as part of an archaeological survey.

25-2716 Mahlstedt, Thomas F.
2006 Archaeological Testing, 1790 House, Arrowhead Farm, Newburyport, MA. 8 pages.

This archaeological survey was undertaken prior to the implementation of a number of physical modifications to the grounds and building of the so-called 1790 House located at 133 Old Ferry Road, Newburyport. Two locations were tested: a proposed driveway and garage of approximately 110 linear feet, and directly behind the 1790 House where an addition of 17 feet is proposed. Although historic artifacts were observed in all eight of the test pits, many of them were of modern or recent provenience. Along the driveway alignment disturbances from fill and/or compaction from vehicular traffic over a former access road was observed, and the historic artifacts were all confined to the fill or the naturally occurring topsoil layer. There were no artifacts that were considered to be quantitatively or qualitatively significant. Testing behind the house yielded evidence of a low density scatter of domestic refuse and building debris, which appears to have resulted from casual broadcast disposal through a back door in the kitchen. A true kitchen midden appears to have developed through a side door off the kitchen to the west and will not be affected by the extension. The presence of two Jackfield sherds are the only diagnostic artifacts recovered and they place at least some of the sheet refuse behind the house to between 1740 – 1850. No prehistoric materials or features were observed while testing around the 1790 House. The lone site in the vicinity (19-ES-273) is located immediately adjacent the river on its alluvial flood plain. The archaeological survey of the 1790 House did not locate any significant archaeological resources. Historic artifacts, primarily of recent origin, are scattered across the landscape around the house. 18th- and 19th-century artifacts were observed but they were either within fill or mixed with non-historic materials i.e., not in an intact context. It can be concluded that the construction of the driveway and garage and the extension off the rear elevation of the 1790 House will have no effect to archaeological resources of the 1790 House.

25-2717 Smith, J. N. Leith, and Gregory R. Dubell
2006 Report on the Archaeological Site Examination of the Entrance Drive, Carriage House, Greenhouse, Vegetable Garden, Flower Garden, and Grapery at Gore Place, Waltham, Massachusetts. 123 pages.

A landscape restoration plan for the 45 acre Gore Place calls for restoration of grounds, gardens, and structures to depict and interpret the late 18th- and early 19th-century occupation of Massachusetts governor and United State senator, Christopher Gore, his wife Rebecca and their staff. The restoration plan includes archaeological investigation to help identify the location and integrity of six historically documented features on the Gore Place grounds. Blocks and transects of shovel test pits at 5, 10, and 20m intervals along with 1x1m excavation units and trenching were employed in the archaeological site examination of these areas. Testing in the area of the present entrance drive revealed evidence of landscape alteration characterized by a process of topsoil removal followed by filling first with a layer of stone, then loamy sand and gravel, and finally replacement of topsoil, all to create flat and well-drained yard space. The existing entrance drive is hypothesized to have been constructed during the Gore occupation, as was a separate service drive. Work at the site of the 1793 carriage house pinpointed the location of the original foundation. The site of the Gore-period greenhouse was also identified by architectural remains that in-

clude fragments of marble tile flooring identical to that in the Gore Mansion. A stone-lined drain, glass bell jar fragments, and a soapstone brick possibly associated with the greenhouse heating system were also found. Investigations in the vegetable and flower gardens revealed intact soils and late 18th- / early 19th-century artifacts suggesting Gore-period garden features may be preserved and are potentially archaeologically identifiable. Work in the area of the grapery/fruitwall revealed remains of the large greenhouse that occupied the site from the second quarter of the 19th century until ca. 1921. Intact greenhouse soils and foundations suggest that the original fruitwall footing is preserved within the later greenhouse foundation. Areas of the property not tested during the survey may be archaeologically sensitive and may require testing in advance of future proposed impacts. Recommendations specific to each area include options for grounds restoration and interpretation as well as additional archaeological investigations to proceed in tandem with proposed landscape changes. The report also includes a summary of scholarly research associated with designed landscape archaeology with reference to Massachusetts.

25-2718 Dudek, Martin G., and Barbara Donohue
2005 Archaeological Intensive (Locational) Survey for the Summer Village, Town of Westford, Middlesex County, Massachusetts.

The survey consisted of 90 test pits, with 77 systematic pits in seven transects, 10 judgmental test pits, and three bracket test pits, all 50x50cm, excavated across archaeologically sensitive areas within an overall project area comprising approximately 146 acres. A total of 844 artifacts were recovered, with 841 historic or modern artifacts, two quartz shatter and one prehistoric flake of a fine-grained, unidentified stone. One prehistoric find spot and four historic archaeological sites were identified. The latter sites include two unrecorded standing late 18th- to early 19th-century dwellings with additions, a third site consisting of a possible foundation remnant from the mid-19th-century, and a fourth site consisting of a granite-lined cellar hole with associated late 18th- to early 19th-century artifacts. In addition, the Wyman Campground contains cottages and other campground buildings dating prior to the 1930s. Other historic elements on the property include two granite markers, two quarry areas, two granite-lined road culverts and a historic earthen road that was discontinued by the mid-19th century. No additional archaeological work is recommended for the prehistoric find spot, the mid-19th-century historic site, or around the standing historic structures because of extensive ground disturbance. The historic road and granite-lined cellar hole are outside of project impacts. Documentary research for the road and a site examination for the cellar hole are recommended if future development will adversely affect these two historic sites. Documentation of the standing historic structures and other historic elements, is recommended.

25-2719 Timms, Peter, Joyce Clements, Hadley Kruczek-Aaron
2006 Archaeological Investigations of the Shaker Farm, Ashburnham, Massachusetts. 143 pages.

This report is the final product of a field school sponsored by the Ashburnham Historical Society between 1992 and 1998. The Shaker Farm was owned, but not occupied by the Harvard community of Shakers from 1822 through 1882. The Shakers hired non-Shaker managers to look after their interests. The archaeological research provided information on the commercial and economic activities of the Harvard Shaker community. The farm was used as a wood and timber lot, tannery, and as summer pasture for sheep and cattle. Despite regular use of the land and visits to the property, the archaeologists concluded that there are not Shaker subassemblages or features discernable in the archaeological record of Shaker Farm. This does not, however, distract from the additional information gained regarding Shaker practices and the Harvard Shaker community.

25-2720 Donta, Christopher, Jennifer Wendt, and F. Timothy Barker
2006 Archaeological Intensive (Locational) Survey for the Proposed Turf Grass Experiments Building, Deerfield, Massachusetts. 74 pages.

An archaeological reconnaissance and intensive survey were conducted on an approximately 20-acre portion of a terrace adjacent to the Connecticut River in the southeastern portion of the town of Deerfield. Background research indicated that the proposed impacts lie within the boundaries of the Native American site 19-FR-77, recorded by William Fowler in 1940. Subsurface testing consisted of the excavation of 24 shovel test pits in three survey units, as well as shovel shaving and inspection of 144 sq m (1,550 sq ft) of subsoil in an area that had already been partially bulldozed. A total of 36 flakes of quartz, chert, and quartzite were found in 15 of the 24 shovel test pits, as well as on the ground surface. No lithic tools or pottery were found. In addition, a pit feature was identified, indicating the presence of intact features at the site. Recommendations were made for avoidance of the intact portions of the site.

25-2721 Mulholland, Mitchell T, Jennifer Wendt, and Christopher Donta
2006 Archaeological Intensive (Locational) Survey (Phase 1) for Two T-Mobile Cell Towers Sites in Southwick and Westfield, Massachusetts. 76 pages.

Following background research and a surface reconnaissance, specific locations within the proposed construction areas were tested for Native American and European American historic cultural resources. Most of the Southwick area has been severely damaged by a gravel pit and a municipal transfer station. Only the tower lease area was testable. Six, 50x50cm test pits were excavated at the Southwick location. No artifacts or features were found. In Westfield, all of the tower lease area and portions of the access road were tested. Fifteen shovel test pits were excavated. One sherd of bottle glass was found. No features were encountered. In all, 21 shovel test pits were excavated in the location of the cell towers and access roads. No further archaeological survey is recommended for either parcel.

25-2722 Pretola, John P., and Ellen-Rose Savulis
2007 Intensive Archaeological Survey of the Texas Road Telecommunications Tower, Westford, Massachusetts. 40 pages.

This study sought to assess impacts to potential archaeological resources by a proposed 10x550ft access road and 40x40ft equipment compound. The project area was stratified, and at total of 21, 50x50cm shovel test pits were excavated: including 19 shovel test pits spaced 8m apart on three transects, and two judgmental 50x50cm shovel test pits. No historic or prehistoric artifacts, ecofacts, or features were found even though the study area's southward facing aspect and proximity to water made the potential for a small upland site possible. The parcel appeared to have never been plowed, and its shallow stony soil appears to have been used primarily for grazing and pasturage.

25-2723 Doucette, Dianna
2007 Intensive (Locational) Archaeological Survey, Cape Cod National Seashore (CACO) Province Lands Bike Path, Provincetown, Massachusetts. 64 pages.

The National Park Service is proposing to rehabilitate a 3-mile section of the 7.5 mile Province Lands Bike Trail. The intensive survey included archival research, a walkover survey, and subsurface testing to locate and identify potentially significant archaeological resources that may be affected by project construction. A total of 285 test pits was excavated. These test pits (50x50cm) were excavated along 41 judgmental linear transects, with test pits located at 8m intervals. The test pits revealed relatively undisturbed dune sands and some intact and disturbed soils. This testing yielded a very low density of post-contact cultural material (one piece of bottle glass, five stoneware sherds, two nails, and one metal fishhook fragment) from disturbed soils, none of which is considered to represent a significant archaeological resource. Based on the results of this survey, the proposed widening and realigning work will not impact any potentially significant archaeo-

logical resources. No further archaeological investigations are recommended.

25-2724 Doucette, Dianna
2007 Archaeological Intensive (Locational) Survey and Site Examination of the Christina Estates Subdivision, Cushman I and II Sites, North Attleborough, Massachusetts. 94 pages.

Archaeologists identified two sites (Cushman I and Cushman II) and three find spots of Native American pre-contact cultural material. The Cushman I Site consists is a small campsite repeatedly occupied, and the Cushman II Site is a large (ca. 15 acre) Attleboro red felsite quarry, where evidence of lithic procurement and reduction is clearly evident. A site examination was recommended and conducted. Overall, 175, 50x50cm test pits and three 1x1m excavation units were excavated. Of these, 28 of the 175 test pits and all of the EUs contained cultural materials associated with Native American pre-contact land use and settlement of the area. In addition, numerous artifacts were found on the surface of a path in the project area. Artifacts recovered include 4,682 pieces of chipping debris (Attleboro Red felsite, hornfels, rhyolite, chert, jasper, quartz, quartzite), one Attleboro Red felsite bifurcate-base preform, one quartz Squibnocket Triangle projectile point, one argillite Susquehanna projectile point, seven Attleboro Red felsite Susquehanna-type performs, one hornfels Jack's Reef projectile point, 17 Attleboro Red felsite bifaces, seven cores, seven hammerstones, 11 worked flakes, two utilized flakes, and one quarrying wedge tool. The projectile points are diagnostic of the Early Archaic (ca. 10,000–8,000 B.P.), Late Archaic (ca. 5,000–3,000 years ago), Transitional Archaic (ca. 3,500–2,500 B.P.), and Middle Woodland (ca. 2,000–1,000 B.P.) periods. The majority of the material was recovered from the two site areas 20 and 50 centimeters below the ground surface in intact, well-drained sandy soils. The abundance of cultural material and diagnostic tools in undisturbed contexts in proximity to, and within, a pre-contact quarry site indicates a high potential for the sites to contain significant new classes of data about lithic procurement and production including apprenticeship and specialized craft production and exchange. Cushman II is a rare, intact ancient Native American quarry with exceptional historic, scientific, and cultural importance. Attleboro red felsite is a distinctive lithic material exchange throughout New England, and which was first utilized during the Paleoindian period. The presence of material from more distant sources (eg. hornfels, chert, and jasper) demonstrate regional and extraregional contacts and exchange among ancient groups. Therefore, the Cushman I and II sites within the Christina Estates project area are considered eligible for listing on the National Register of Historic Places and avoidance and preservation are recommended.

25-2725 Barker, F. Timothy, and Timothy Binzen
2007 Archaeological Reconnaissance and Intensive (Locational) Survey for the Relocation of Lower Valley Road Bridge #W-09-012, Washington, Massachusetts. 40 pages.

Four survey units were tested during this survey. Twenty-nine shovel test pits were excavated at intervals of 7.5m in locations exhibiting high archaeological sensitivity. No Native American cultural materials were recovered. No significant historic features or deposits were encountered. A small 20th-century bottle dump was recorded. The proposed construction will not affect any significant cultural resources. No additional survey is recommended.

25-2726 Donohue, Barbara, and Martin G. Dudek
2007 Archaeological Intensive (Locational) Survey for the Northampton Water Treatment Plant and Site Examination for the Mountain Street Historic Site in the Town of Williamsburg, Hampshire County, Massachusetts. 120 pages.

The survey consisted of 89 test pits, with 28 systematic pits in two blocks, 50 systematic pits in three transects, seven judgmental test pits, and four bracket test pits, all 50x50cm, excavated across archaeologically sensitive areas within an overall project area comprising approximately 20 acres. A 19th- to early 20th-century farm site (the Mountain Street Site) was identified. A total of

149 artifacts were recovered; most including a piece of quartz shatter were recovered from the house and barn location. No other prehistoric artifacts and only trace amounts of historic and modern artifacts were recovered from other test areas. A site examination was recommended for the historic farm site. The site examination consisted of 78 STPs excavated in a 5m grid around the historic site, one judgmental test pit, four 1x1m excavation units, and one 0.5x1m trench. A total of 2,020 artifacts were recovered. The site examination revealed archaeological deposits with limited spatial patterning. The deposits were not associated with intact features or primary deposits, but were more typical of sheet refuse. Even though the location of a former residence and barn were identified, the locations were consistent with a 20th-century plan, which provided more information about intra-site pattering than was revealed in the field investigation. Further field investigation of the site, which measures approximately 55 to 60m east-west by 25m north-south, is not likely to provide further information on the research questions identified in the survey's research design. The site is not considered significant.

25-2727 Herbster, Holly, and Michael Duffin
2007 Intensive (Locational) Archaeological Survey, Sunset Ridge Subdivision, Bolton, Massachusetts. 60 pages.

Archaeologists completed an intensive survey of the proposed 19.67 acre subdivision. The survey included archival research, a walkover survey, and the excavation of 40, 50x50cm test pits within areas of moderate and/or high archaeologically sensitivity. The survey identified the D.L. Wheeler Site, a low density deposit of domestic and structural material associated with a probable late-19th- or early-20th-century field enclosure or barn foundation. No additional features or artifacts were found within the project area, and no additional testing was recommended.

25-2728 Dudek, Martin G.
2007 Archaeological Reconnaissance Survey for the Berkshire Gas Company Sediment Remediation Project, Green River, Greenfield, Franklin County, Massachusetts. 94 pages.

The survey encompassed an area of approximately 1.8 acres consisting of riverfront area, inland bank, land under water, and proposed work areas within a fenced compound. The project vicinity includes a succession of historic mills and industries on the north side of the river. The south side of the river is adjacent to the Green River Cemetery. Based on documentary research, no historic structures appear to have been located within the proposed current remediation project work zones. Industrial landscaping within the fenced compound on Mead Street appears to have modified, truncated, and leveled the natural topography. Project-related disturbance within these areas will be shallow and unlikely to encounter undisturbed deposits. No further archaeological investigation is recommended.

25-2729 Rainey, Mary Lynne, Joyce M. Clements, and Richard Petyk
2007 Final Report: Results of Phase I Intensive Archaeological Survey for the Proposed Sankaty Head Lighthouse Relocation Project, Nantucket, Massachusetts. 63 pages.

Archaeologists excavated 32, 50x50cm shovel test pits around the base of the extant Sankaty Head Lighthouse, at 10m intervals in two transects for the proposed lighthouse relocation project. Fifteen of the 32 test pits contained historical artifacts in the context of demolition fill, and one test pit revealed a brick foundation, probably dating to the 1887 Victorian wood frame keepers' dwelling. Because the history of Sankaty Head lighthouse keepers and their families is well reported, and the function and location of historical structures and outbuildings appear on numerous maps, plans, and photographs, further testing is unlikely to produce significant new information about lighthouse keeping. No further archaeological investigations are recommended.

25-2730 Elquest, Ora, and Dianna Doucette

2007 Intensive (Locational) Archaeological Survey, Osborne Hills, Salem, Massachusetts. 56 pages.

The survey on this 162 acre site included archival research and the excavation of 99, 50x50cm test pits. These test pits were placed within 2, 30x30m blocks, along 16 judgmentally placed transects, and as 8 judgmentally placed test pits in the approximately 69 acre project impact area. Post-contact materials include a bottle and glass scatter and two abandoned cars. A small, 19th-century quarry site consisting of two drilled and split granite boulders was identified. The bottle scatter and abandoned cars represent dumping, while the quarry feature represents a single event of opportunistic quarrying. Further investigation of the quarrying site was not considered likely to produce any additional information. No further archaeological testing was recommended.

27-2731 Rotenstein, David, S., Janet Friedman, and Kristen Heitert
2000 Phase II Archaeological Investigations of the Cato Freeman Site, North Andover, Essex County, Massachusetts. 83 pages.

Archaeologists completed Phase II investigations at the Cato Freeman Site, initially identified as the homesite of an African American family in a 1982 Phase I survey for a proposed technical park (see report #25-405). The intent of the current investigations was to define the site's horizontal and vertical limits, identify and sample artifacts and cultural features, and evaluate the site's integrity and eligibility for listing in the National Register of Historic Places. Investigations included documentary and cartographic research and archaeological fieldwork consisting of the excavation of 51 shovel tests (50x50cm) and 6, 1x1m test units. Little direct archaeological evidence was recovered during testing. An assemblage of artifacts dating to the late 18th and early 19th centuries was recovered and there appears to be some patterning in the differential distribution across the site of functional artifact types. Despite extensive field testing, no architectural features were identified and all of the artifacts were confined to sheet midden/plowzone deposits. The site does not appear to be eligible for listing in the National Register. No additional archaeological work is recommended.

25-2732 Elquist, Ora, and Suzanne G. Cherau
2007 Phase I Archaeological Identification Survey, Assabet River National Wildlife Refuge Visitor Facility, Sudbury, Middlesex County, Massachusetts. 103 pages.

The survey area consists of an approximately 100x70m area for the proposed visitor facility, a 30x40m parking area, and an approximately 800m water line. The survey consisted of archival research and the excavation of 170, 50x50cm test pits excavated at 8m to 16m intervals along linear transects. Post-contact period cultural materials recovered in the test pits included brick fragments, ceramic sherds, coal, electrical insulator fragments, iron hardware, glass, plastic, and a nail. Most of the 42 recovered items consist of low-density late-19th-and 20th-century field debris. The electric insulator fragments along with coal, plastic, and brick were collected from a demolition layer possibly related to a demolished outbuilding associated with a 19th-to early-20th-century farmstead. The farmstead buildings were used for housing and storage following military acquisition of the property after 1942. The cultural materials in the project impact area are not considered a significant archaeological resource. No further archaeological investigations are recommended.

25-2733 Graves, Anna K.
2007 Intensive (Locational) Archaeological Survey, Industrial Tower & Wireless – Barre Cell Tower, Old Town Road, Barre, Massachusetts. 44 pages.

Fieldwork included a sensitivity assessment, including the walkover survey and subsurface testing.

Seventeen 50x50cm test pits were excavated within archaeologically sensitive portions of the proposed project area. These test pits were arranged in four linear test pit transects, with testing at 10m intervals. The survey recovered no cultural material and did not identify any potentially significant cultural resources. No further archaeological testing is recommended.

25-2734 Leveillee, Alan
2007 Intensive (Locational) Archaeological Survey, Sugarloaf Hill Estates, Webster, Massachusetts. 34 pages.

The 138-acre property is divided into four parcels, one of which (Parcel 3, 102 acres) is being donated to the Massachusetts Department of Fish and Wildlife and will not be developed. Approximately 10 acres in the developed parcels will remain permanent open space. Sixty-four 50x50cm test pits were excavated in three 30x30m blocks and along judgmental linear transects. The subsurface testing recovered no cultural material; no further archaeological investigation was recommended.

25-2735 Leveillee, Alan
2007 Intensive (Locational) Archaeological Survey, Hillside at 495 Commercial Complex, Northborough, Massachusetts. 51 pages.

The closest known cultural resources to the 170 acre area include the ancient Native American Crane and Old Stony Brook sites; well-documented lithic workshops and food and resource processing locations occupied repeatedly during the Late and Transitional Archaic periods. These sites were situated to maximize the collection and processing of foods and possibly reeds and rushes collected from, or immediate to, water sources. Far fewer sites are situated away from wetland margins, in the hilly uplands. The Hillside at 495 project area was within the territorial and resource collection catchments of the Native occupants who created the Crane and Old Stony sites, and others in the surrounding dendritic network of the Assabet drainage and related wetlands. It is likely that the rocky upland landscapes like Rock Hill were not occupied for habitation or resource-specific activities that would have required anything but short-duration stays, likely measured in hours. The Native use of this kind of landscape is transitional and of very low archaeological visibility. Any sites in this terrain utilized for more than a few hours would likely be focused in or around a potential lithic source, a rockshelter and/or one affording a strategic observational perspective. These characteristics are not prominent within the planned Hillside at 495 Complex. Similarly, land use in the post-contact period was limited to lumbering and/or grazing. Two hundred and seven test pits were excavated within the Hillside at 495 project area. These test pits, 50x50cm in size, were excavated within 14, 30x30m blocks and along judgmental linear transects. Subsurface testing of the project area recovered no cultural material and no further archaeological investigation was recommended.

25-2736 Doucette, Dianna L., and A. Peter Mair, II
2007 Intensive (Locational) Archaeological Survey A.D. Makepeace: Santos Property & Hotel Lot, Wareham, Massachusetts. 82 pages.

The environmental conditions in the project area suggested it was a sensitive area for Native American cultural resources, and historical maps identified an ironworks in close proximity to the Santos Property. The survey included archival research, a walkover survey, and subsurface testing. Seventy-five test pits were excavated within the two parcels. Three pieces of quartz chipping debris were recovered from the Santos Property and two pieces of rhyolite chipping debris was recovered from the Hotel Lot. Although these isolated pieces of chipping debris attest to a Native American presence in the general area, they are not considered significant archaeological resources. No evidence of an ironworks was noted. No further archaeological investigations are warranted.

25-2737 Heitert, Kristen B., and Jennifer Banister
2007 Intensive Archaeological Testing, Sewer Connector, Adams National Historic Site, Quincy, Massachusetts. 120 pages

The proposed sewer connection corridor extends between the Old House and a pond located to the north that was developed by John Adams in 1821. A total of 26, 50x50cm test pits were excavated along the proposed construction corridor including 23 test pits excavated at 5m intervals and three judgmental test pits. The survey recovered 335 pieces of pre- and post-contact cultural material from filled soil contexts including a mix of 18th- and 19th-century domestic and architectural debris and a small assemblage of pre-contact cultural material including a quartz Small Stemmed point, rhyolite biface, and assorted chipping debris. The soil profiles and artifact assemblage indicate that the majority of the project area is covered with a mix of topsoil and colluvium from the surrounding slopes overlying poorly drained subsoil strata. The western slope of the property dividing the Beale and Adams estates appears to be a mid-19th-century fill deposit, while the fill along the east edge of the property is likely the result of the various 19th-century transportation improvements that have occurred in that location (e.g., Old Colony Railroad Line, Newport Avenue). The remains of a relict stream bed, depicted on 18th-century historic maps, also were identified in the center of the transect.

25-2738 Ritchie, Duncan
2007 Intensive (Locational) Archaeological Survey, Fountain Well Water Supply and Treatment Plant, Raynham, Massachusetts. 80 pages.

The project area was characterized by sandy well-drained soils and wooded wetlands, attributes frequently associated with the presence of pre-contact period Native American archaeological sites. It is also near two pre-contact Native American sites, Rozenas I and II, which extended across a large area from the southern shoreline of Nippenicket Pond to the western edge of Titicut Swamp on both the east and west sides of North Main Street. Post-contact period maps showed that the area around Titicut Swamp and North Main Street was the location of a few homesteads during the early 19th century, and by the mid- to late 19th century there were several farms and houses dispersed along North Main Street (Route 104) near the project area. The project area remained a rural landscape until the modern period. Zones of high and moderate archaeological sensitivity were investigated by excavating 50x50cm test pits at 10m intervals along linear transects. Three array patterns with test pits placed at 5m intervals were used to investigate find spots of pre-contact period Native American cultural material. Fifty-seven test pits were excavated in the project area during the intensive survey. Three small find spots of pre-contact period Native American cultural material (quartzite, rhyolite, hornfels chipping debris) were found in the project area. The Fountain Well 1, 2, and 3 sites have limited information content and are not considered significant. No further archaeological investigation is recommended.

25-2739 Binzen, Timothy, and Jennifer Wendt
2007 Archaeological Reconnaissance and Intensive (Locational) Survey for the Phase 9 Sewer Improvement, Tewksbury, Massachusetts. 70 pages.

The reconnaissance survey assessed the archaeological sensitivity of 13 cross-country sewer lines and three pump stations. Ten cross-country lines and one pump station were tested. A total of 155 shovel test pits were excavated at intervals of 7.5m in locations exhibiting high sensitivity. Native American artifacts were recovered from one location, designated as the Babicz Road Site. An assemblage consisting of nine pieces of gray rhyolite chipping debris was recovered from two of the 14 shovel test pits. No temporally diagnostic artifacts were recovered. This small site appears to be the result of a brief episode of stone tool maintenance that occurred at an undetermined time in the ancient past. Low volumes of historic artifacts were encountered in eight of the survey units, typi-

cally in landscaping fill deposits and in association with modern trash, and were mainly attributed to the disposal of household refuse during the 20th century. The Phase 9 sewer project will not affect any significant archaeological resources. No additional testing is recommended.

25-2740 Binzen, Timothy, Christopher Donta, and Jennifer Wendt
2007 Archaeological Reconnaissance and Intensive (Locational) Survey for the Walnut Grove Estates Project, Hadley, Massachusetts. 52 pages.

An estimated 80 acres were subject to archaeological testing. Locations exhibiting high sensitivity were tested. A total of 150 were excavated. While the local topography (gentle ridges and terraces in proximity to the Fort River floodplain), the availability of freshwater sources (the Fort River and its tributary streams), and the presence of previously recorded pre-Contact sites in nearby agricultural fields suggest the present survey area would have been favorable for settlement during the pre-Contact Native American period, the soils in the survey area were high in silt content and contained clay. Low volumes of historic artifacts were encountered. There were no locations where historic artifacts were encountered in high concentration or in association with historic features. No additional archaeological survey or testing is recommended for the Walnut Grove Estates project

25-2741 Brett, William, and Anna K. Graves
2007 Intensive (Locational) Survey, Algonquin Gas Transmission, LLC, 2007 Integrity Project, Rehoboth and Berkley, Massachusetts. 62 pages.

The Rehoboth project area is located near the Palmer River in an active crop field. The workspace measures 25 feet wide by 150 feet long (approximately 3,750 square feet, or 0.08 acres). The Berkley project area is situated above the Taunton River and a local marsh. The workspace is shaped as a right triangle measuring approximately 67 feet by 75 feet by 102 feet (approximately 2,500 square feet, or 0.06 acres). The intensive survey included a sensitivity assessment, including archival research and a walkover survey, and subsurface testing. At the Rehoboth site, four 50x50cm test pits were excavated within a linear transect at 10m intervals. Fifteen 19th-/20th-century artifacts were recovered in three of the four test pits (four pieces of shell, four sherds of bottle glass, and seven pieces of whiteware), all from within the plow zone. The project area possesses no stratified deposits, intact soil features, or historic features below the surface. Subsurface deposits lie entirely within the soil horizon that has been disturbed by previous plowing, and no further survey was recommended. At the Berkley project area, three 50x50cm test pits were excavated within a linear transect at 10m intervals. Water was encountered in all four test pits. No cultural material was recovered. No further survey was recommended.

25-2742 Herbster, Holly
2007 Intensive (Locational) Archaeological Survey, Schiavone Property, 18 State Road, Tisbury, Massachusetts. 70 pages.

The previously recorded Vincent Site (19-DK-21) is partially located within the Schiavone parcel. The Vincent Site was partially excavated by William Ritchie in 1966 and contains Late Archaic through Late Woodland deposits indicative of a seasonal habitation site. Eleven 50x50cm test pits were excavated within an approximately 4,800 square foot area where new construction is proposed. The intensive survey encompassed a portion of Ritchie's excavation area to confirm and document the extent of previous disturbance. Subsurface testing recovered a highly fragmented Native American cultural material assemblage collected almost exclusively from previously disturbed soil contexts. The intensive survey indicated that the southern and/or southwestern portions of the property could contain intact soils and cultural deposits associated with the Vincent Site. In addition to a relocation of the impact area to avoid sensitive areas, the property owner will consult with the Wampanoag Tribe of Gay Head/Aquinnah Tribal Historic Preservation Office to insure

monitoring during construction activities. No further archaeological testing was recommended.

25-2743 Dudek, Martin G.
2007 Archaeological Intensive (Locational) Survey and Site Examination at the Dugans Brook Knoll Site (19-MD-151) for the Deaconess Water Treatment Facility Town of Concord, Middlesex County, Massachusetts. 172 pages.

The survey consisted of 41 test pits (50x50cm): 33 systematic pits in two blocks and a transect, and three judgmentally-placed and five bracket test pits, excavated across archaeologically sensitive areas comprising approximately four acres. Thirteen Native American lithic artifacts and five calcined bone fragments were recovered from six adjacent test pits, confirming the location of the Dugans Brook Knoll Site (19-MD-151). Benjamin Smith collected 29 stone artifacts from a broader area in the 1940s, including Archaic and Woodland period points. The site examination for Site 19-MD-151 consisted of 62 systematic test pits defining a site area 45mx40m. Eight 1x1m excavation units investigated artifact concentrations. A hearth, calcined bone concentration, and tool maintenance areas were identified. A radiocarbon date of 2430 $\pm$ 60 years B.P. was obtained on a charcoal deposit within the hearth. Another 612 calcined bone and 498 Native American chipped lithic artifacts were recovered from the site examination, including three Brewerton/Broad Eared points and one Small Stemmed point. The site is interpreted as short-term Laurentian Late Archaic and Early Woodland campsites associated with tools of rhyolite, hornfels, and quartzite. Excavations recovered a sufficient sample from the site area, and review of the curated and recently excavated collections provided interpretations of ancient settlements and land use in the area.

25-2744 Duncan Ritchie
2007 Archaeological Reconnaissance Survey, Afra Terrace, West Boylston, Massachusetts. 59 pages.

During archival research, available information about known archaeological sites within the Afra Terrace project area and vicinity was reviewed. A land management plan for the Wachusett Reservoir watershed identified 27 known and recorded pre-contact period Native American sites within or near the project area. The South Bay Quartzite Quarry Site (19-WR-185) and a rockshelter used from the Late/Terminal Archaic to Middle or Late Woodland periods appeared to be within the project area. Limited excavation by an avocational archaeologist in 1972 at the quarry site recovered a deposit of quartzite fragments and chipping debris along with an assemblage of quarry tools; the rockshelter produced a soapstone smoking pipe and Small Stemmed projectile point. The project area contained environmental settings such as level terraces near wetlands or streams with potential to contain unidentified Native American archaeological sites. Archival research indicated that the project area was used primarily as farmland during the post-contact period and had the potential to contain the remains of farmsteads or house sites. A walkover survey was conducted to assess the extent of previous disturbance within a defined development parcel and confirm the location of the South Bay Quartzite Quarry Site (19-WR-185) and associated rockshelter. The development parcel along Afra and Jasmine drives was considered to have low archaeological sensitivity because of extensive modification. The locations of the South Bay Quartzite Quarry Site and a rockshelter were confirmed and they remain intact on the crest and upper western slope of a wooded hill in the northeast portion of the project area. These sites are within the project area but outside the defined development parcel. No further archaeological investigation of the development parcel is recommended. A proposed stone-lined drainage swale on the west slope of the hill above Afra Drive and along the margin of the development parcel is not likely to disturb the South Bay Quartzite Quarry Site. However, an effort should be made to minimize the amount of alteration of soils and vegetation during construction of the swale. After construction of the swale, any exposed soil should be covered to stabilize the slope and avoid future erosion. The South Bay Quartzite Quarry Site and associated rockshelter are considered potentially significant cultural resources that contain evidence of pre-contact period Native American

quarrying of lithic material and habitation. It is recommended that development avoid the South Bay Quartzite Quarry and associated rockshelter site. If avoidance is not possible, then archaeological evaluation to determine the site's significance is recommended.

25-2745 Ritchie, Duncan
2007 Intensive (Locational) Archaeological Survey, Beaver Pond Commons, Milford, Massachusetts. 105 pages.

Research indicated that several pre-contact Native American sites are located in the vicinity of the project area. Post-contact period cultural resources were expected to reflect past agricultural/pastoral activities. Most of the project area was considered to have high and moderate sensitivity for both pre- and post-contact period cultural resources. Remains of a post-contact period farmstead were found. Fifty-six, 50x50cm test pits were excavated along judgmentally placed transects in areas of high and moderate archaeological sensitivity. Subsurface testing identified four pre-contact period Native American archaeological sites (Beaver Pond Site, Chipmunk Site, Kitchen Sink Site, and Oak Knoll Site) and sampled the post-contact period farm complex (Read-Davis Farmstead Site). The Chipmunk, Kitchen Sink, and Oak Knoll sites contained low densities of quartz and rhyolite chipping debris. A single non-diagnostic quartz scraper was found on the Oak Knoll Site. These three sites are not considered potentially significant. No further archaeological investigation of these three sites is recommended. The Beaver Pond Site contains activity areas where stone tools were made from several different lithic materials such as quartz, rhyolite, and hornfels. A bifacial tool blade of quartz was also found on this site. The site contains Native American cultural material in both topsoil and intact subsoil horizons. The hornfels chipping debris indicates that the site contains a Middle Woodland Period (1,600 to 1,000 years ago) component. The Beaver Pond Site is considered a potentially significant cultural resource. Avoidance of the site is recommended, otherwise further archaeological evaluation is recommended. Research using post-contact period maps of the towns of Milford and Bellingham indicated that some parts of the Read-Davis Farmstead Site may have been constructed by around 1870. The farmstead is not shown on the 1940 or 1946 USGS topographic maps of the area suggesting that buildings had been demolished prior to about 1940. The archaeological deposits on the Read-Davis Farmstead Site contain only late-19th-century to early modern period artifacts. The structural remains on the site have been well documented with scaled drawings and digital photographs. Additional archaeological investigation of the Read-Davis Farmstead Site would be unlikely to yield significant information. No further archaeological investigation of this site is recommended (See Report 25-2812).

25-2746 Graves, Anna, and Holly Herbster
2007 Intensive (Locational) Archaeological Survey, Westport Lakes Subdivision, Westport, Massachusetts. 44 pages.

The proposed project involves the development of a residential subdivision on 44.7 acres of an approximately 220 acre parcel of land near the intersection of Routes 88 and 177. A total of 52, 50x50cm test pits were excavated along 10m interval transects and as judgmental test pits. No cultural resources were identified and no further archaeological testing was recommended.

25-2747 Pasquariello, Raymond D., Richard Petyk, Joyce M. Clements, and Gregory Dubell
2007 Intensive (Locational) Archaeological Survey for the NSTAR Electric Relocation of 115 kV Line 433-507 Project; NStar Electric Row 8-1 Framingham, Natick, and Sherborn, Massachusetts. 84 pages.

Archaeologists conducted historical and environmental research and excavated 83, 50x50cm shovel test pits during this survey. The project right-of-way is 76.2m (250ft) wide and extends 4.82km (3mi) through commercial, light industrial, and residential areas in the southeastern por-

tion of the Concord River Watershed. One previously identified site (19-MD-598, see report #25-607) was determined to be beyond the impact area. Archaeologists excavated shovel test pits in the exact location of 33 pole replacements and at 7.5m (24.6ft) intervals in each of the cardinal directions around the primary shovel test pits. Archaeologists recovered no cultural materials and recommended that the project continue without further investigation.

25-2748 Cherau, Suzanne, Stephen Olausen, and Tim Wallace
2006 Annual Report, Cultural Resource Monitoring, Deerfield River Hydroelectric Project, FERC No. 2323. 24 pages.

The 2006 annual report presents the results of investigations carried out as recommended in the 2004-2005 Annual Report action plan (see report #25-2699), descriptions of cultural-resource-related activities that occurred in 2006, and an action plan for the year 2007. Archaeologists conducted Phase IB survey investigations for proposed improvements in the Whitingham Carry-In Recreation Area. Subsurface testing consisting of 8, 50x50cm test pits did not identify any below-ground cultural deposits. No further archaeological investigations are recommended for the project area. No projects relating to historic buildings at the Deerfield Project were undertaken during this reporting period, and no new educational/public outreach program activities were conducted. As part of the Action Plan archaeological sensitivity assessments for new recreational enhancement projects will be conducted as design plans become available. Cultural resource management geographic information systems layers are to be created.

25-2749 Leveillee, Alan
2007 Area-Specific Intensive (Locational) Archaeological Survey, Proposed Driscoll Development, Bridgewater, Massachusetts. 41 pages.

Archaeologists completed an area-specific survey within sections of a proposed six-lot residential development with a roadway access off Broad Street in Bridgewater to provide information about the nature and extent of the Old Trinity Church Burial Ground and its relationship to the planned development. Four gravestones were identified within the planned roadway. The gravestones include three carved headstones and a base for one headstone. The four stones are spaced 2 to 3 meters from one another, in an apparent cluster. The three headstones include those of Lucy Ann Carr, 1827-1899 (granite stone and base, machine cut and polished; apparently a 20th-century replacement stone), Florence W. Sandridge, 1877-1895 (also a machined granite stone polished; also a 20th-century replacement), and Matilda Marshall, died 189(?) (marble). Hand testing in immediate proximity to the headstones identified associated features that conformed to grave shafts. Archaeological investigation for unmarked interments associated with the Old Trinity Church burial ground also included excavation of seven machine trenches along and to either side of the proposed access roadway's centerline. Machine trenches were excavated to depths exceeding 1ft (30cm) below the ground surface and ranged in width between 1.75m and 3m and 5-15m in length. Machine-assisted archaeological investigations within the Driscoll property in exposed 136.5sq m of subsoil along the staked easement of the proposed access road. No grave shafts or other soil anomalies were observed in any of these trenches. The Marshall, Sandridge, and Carr stones are not displaced from the 19th-century sections of the Old Trinity Church to the east, but are in situ extensions of it. The existence of these graves suggested other graves may be present and further testing was recommended.

25-2750 Binzen, Timothy, and William Thompson
2007 Archaeological Reconnaissance and Intensive (Locational) Survey for the Lowe's Home Center, East Longmeadow, Massachusetts. 51 pages.

Fifty one shovel test pits were excavated in areas exhibiting high sensitivity. No significant historic resources were encountered. Three neighboring test pits on a natural terrace overlooking Pe-

cousic Brook recovered pieces of chipping debris from the historic plowzone and from the intact, sandy subsoil stratum. The assemblage from the test pits consisted of one flake of red rhyolite, five flakes of chert, and possible fire-cracked rock fragments. The resource was designated the Pecousic Brook Site. No subsurface features were encountered at the site, which appears to be contained within an area that has preliminary maximum dimensions of 30ft (9m) from north to south, and 40ft (12m) from east to west. Avoidance of the site was recommended.

25-2751 Heitert, Kristen
2007 Intensive (Locational) Archaeological Survey, Eliot Montessori School, South Natick, Massachusetts. 109 pages.

The 4.78-acre project parcel, located in the John Eliot Historic District, contains several existing structures including the Peletiah Morse Tavern, ca. 1748, the only known historic resource within the project parcel; a detached outbuilding; and a 19th-century barn foundation. Fifty-six, 50x50cm test pits were excavated across the project area using three 30x30m blocks, one judgmentally placed transect, and 13 judgmentally placed test pits. The test pits documented a range of plowed and deeply filled soil profiles containing a mix of 19th- through 20th-century domestic (whiteware, ironstone, pearlware, American stoneware, and molded bottle glass) and architectural (machine-cut and wire nails, brick, mortar, and window glass) debris. A small assemblage of 18th-century materials (English white salt-glazed stoneware, English yellow slipware, creamware, and Jackfield) was recovered from fill soils adjacent to the house foundation, but no builder's trench, intact post-contact period landscape features, or relict ground surfaces were identified. Six pieces of pre-contact cultural material were recovered from plowed/fill soils including an argillite scraper, rhyolite chipping debris, and a quartz flake. No evidence of a 17th- or early-18th-century occupation of the property by the "Praying Indian" community of Natick was identified during the survey. This lack of data seems to corroborate recent scholarship suggesting that the center of South Natick was never a locus of residential native settlement during the plantation or proprietorship periods. No evidence of a builder's trench or landscape features associated with the original construction or subsequent Euro-American occupation of the Peletiah Morse Tavern was identified during the survey.

25-2752 Elquist, Ora, and Dianna Doucette
2007 Technical Report, Intensive (Locational) Archaeological Survey, 2 Fairgrounds Road, Nantucket, Massachusetts. 78 pages.

Archival research and a walkover survey of the 20 acre site concluded that most of the project area was archaeologically sensitive for pre- and post-contact cultural resources. Seventy-nine 50x50cm test pits, distributed among five 30x30m blocks, along one linear transect, and within one test pit array were excavated in portions of the project area free of surface indications of disturbance. One previously unidentified archaeological site, designated Find Spot 1, consists of a single, quartzite projectile point tip. The projectile point tip is not diagnostic of any specific chronological period and was derived from a disturbed context. No other pre-contact cultural materials or features were identified. Historical period ceramics were found with the projectile point tip, and scatters of ceramics and glass were found to the west and southwest of Find Spot 1. The post-contact materials are typical of debris associated with plowed agricultural fields. Find Spot 1 is not as a significant site. No further archaeological investigations are recommended.

25-2753 Lance, Mark, and Alan Leveillee
2007 Intensive (Locational) Archaeological Survey, Westfield Pavilion, Westfield, Massachusetts. 63 pages.

The planned complex will include buildings, and associated roadways and parking lots on a 217-acre parcel in the north-central section of the town. A total of 190, 50x50cm test pits were exca-

vated within 10, 30x30m blocks, and along judgmental linear transects. Test pits demonstrated that the soils are relatively undisturbed and well-stratified Hinckley and Windsor series loamy sands. Subsurface testing within the project area recovered cultural material in one test pit. Four pieces of chipping debris were recovered; two rhyolite flakes from B_1 soil, and two chert flakes from the top 10cm in the duff. An array was excavated around this test pit at a 5m interval, but no other cultural material was recovered. This small site has been designated the Vista Pond Site. The Vista Pond Site is on a high terrace overlooking Pond Brook. It is most likely a single-use site, likely for resource extraction or hunting-gathering activities. The chronology of the site is difficult to determine, but the non-local lithic material is suggestive of the Woodland Period. Being concentrated in a single test pit, this limited deposit is not considered a potentially significant archaeological resource. No further archaeological investigations are recommended.

25-2754 Graves, Anna
2007 Intensive (Locational) Archaeological Survey, Industrial Tower & Wireless- Duxbury Cell Tower, Temple Road, Duxbury, Massachusetts. 43 pages.

The proposed project involves the construction of a new 100-foot monopine wireless communications tower enclosed within a 10,000sq ft fenced compound and the improvement of an approximately 1,000ft access road between the fenced compound and Temple Street. Fifteen, 50x50cm test pits were excavated within the tower and compound area and the access road. No cultural materials were identified, and no further archaeological testing was recommended.

25-2755 Strauss, Alan E.
2003 Intensive Archaeological Survey of Lot 43 Turning Mill Road, Brewster, MA. 36 pages.

Background research indicated that no recorded prehistoric sites existed within the project area. Historical sources indicated that the area remained wooded and uninhabited throughout the historic period. Twelve of the 25 test pits excavated contained prehistoric artifacts. A total of 62 flakes and three stone tool fragments were recovered from the site. None of the tool fragments were diagnostic. Seven sherds of Early to Middle Woodland pottery were recovered. The site appears to be a small Woodland Period activity area. Because of the low density of artifacts, the lack of internal site complexity, and the absence of subsurface features, the site has minimal research potential. No further archaeological investigation is recommended.

25-2756 Leveillee, Alan
2007 Intensive (Locational) Archaeological Survey, Mitchell Farm Irrigation Line, Westborough, Massachusetts. 12 pages.

This project included historical research, field reconnaissance, and subsurface investigations. An initial walkover of the site recovered pre-contact Native American and post-contact Euro-American cultural materials from the surface. Twenty test pits were excavated along the 1,350ft length of the project area. Subsurface testing yielded cultural materials in 8 test pits including low densities of post-contact and Native American artifacts, including a small projectile point tentatively identified to the Woodland Period. No evidence of features was recovered in any of the test pits. The archaeological deposits in the Mitchell Farm Field are designated the Mitchell Farm Site. It is recommended that the planned irrigation line construction be either surface based or confined vertically within the existing plow zone stratum, with the construction trench not exceeding vertical depths of 30 cm. If implementation of these recommendations is not prudent or feasible, further archaeological investigation is necessary.

25-2757 Tritsch, Electa Kane
2007 Documenting Hassanamesit Woods, Its History and Cultural Resources. 187 pages.

This report documents the prehistory and history of Hassanamesit Woods in Grafton and is intended to be used, together with a companion natural resources inventory, as a briefing document to inform the planning of future investigations. Archaeological investigations have been conducted here in 2003 and 2005 and subsequently (see reports #25-2565 and 25-2391). The report discusses Grafton in the Precontact Era, the development of the "Praying Town" of Hassanamesit, and its evolution in relation to the town of Grafton. The turnover of land proprietorship in Grafton in the 18th and early 19th centuries is covered, as well as Grafton's "Golden Age" in the early 19th century. The report addresses the development of the Keith Hill area and the Fiske Farms. Historical sources are included in an appendix.

25-2758 Towle, Linda, Duncan Ritchie, and Barbara Robinson
1981 Wayland Prehistoric Site Survey. 123 pages.

This project is Phase I of a systematic study of the town of Wayland's prehistory (See Report # 25-613). This survey consolidated and upgraded the recorded data on known sites and identified new sites through the inventory of private collections. Twenty three sites were inventoried during this survey, 9 new and 14 previously known. The survey identified 22 locations of possible significance in need of more data, and general areas worthy of field investigation. In addition to the site surveys, 15 private archaeological collections containing artifacts from Wayland archaeological sites were inventoried. Results of this survey showed evidence of occupation along the Sudbury River throughout prehistory; a systematic survey of the interior of Wayland is recommended. The report identifies nine sites surrounding Heard Pond that are potentially eligible for National Register nomination. Archaeological testing is recommended for any construction projects on land more than ½ mile from the Sudbury River.

25-2759 Miller, Aaron F.
2007 Archaeological Site Examination Survey at the Taylor's Fort Site (CRL.HA.19 and 19-FR-407), Charlemont, Massachusetts. 145 pages.

The archaeological site examination survey of the Taylor's Fort Site at Hall Tavern Farm in Charlemont was conducted as part of the Taylor's Fort Archaeological Project, a public educational venture. The project consisted of two phases of excavation: a reconnaissance survey, carried out in the spring of 2006 (see report # 25-2672), and an archaeological site examination survey that took place in the summer/fall of the same year. The initial reconnaissance survey revealed two archaeological sites at the location, a Native American site (19-FR-407) containing steatite bowl fragments and a Late Archaic Orient Fishtail projectile point and an 18th- and 19th-century historic site (CRL.HA.19). The initial survey was designed to locate the site of a circa 1754 fortified farmstead and assess the archaeological potential. The site examination was intended to locate the structures comprising the fortification. Excavation revealed the two foundations from the fortified farmstead and a third foundation built in the last quarter of the 18th century. More than 3,000 artifacts were unearthed from various periods of occupation at the site, with more than 1,000 items dating to the fort-period occupation of the setting. The project was a community-funded program that educated and involved the surrounding communities in their historical and archaeological heritage.

25-2760 Mair, A. Peter, II.
2007 Intensive (Locational) Archaeological Survey, Lowell/Morton Street Bridge (L-15-004) Replacement Project, Lowell, Massachusetts. 53 pages.

The survey of a proposed 650ft-long access road was conducted to identify potentially significant archaeological resources in the project area using a combination of archival research and subsurface testing. Archival research indicated that the project area was potentially sensitive to contain

Native American cultural resources because there are two recorded sites (19-MD-52 and -896) located to the northwest of the project area and environmental conditions are favorable. Fieldwork consisted of a walkover/surface evaluation and subsurface testing. Thirteen, 50x50cm test pits were excavated along two transects. No cultural material was recovered. No additional archaeological investigations were recommended for the Morton Street Bridge Replacement Project.

25-2761 Graves, Anna K., and Holly Herbster
2007 Intensive (Locational) Archaeological Survey, Route 6 Median Installation & Safety Improvements at Edgehill Road, Massachusetts Highway Department Assignment No. 32-B, Bourne, Massachusetts. 53 pages.

The project area extends along Route 6 approximately 2,000 feet west of and 1,600 feet east of the Route 6/Edgehill Road intersection and involves road widening along the northerly side of Route 6. Twenty, 50x50cm shovel test pits were excavated along three linear transects within the project area. No cultural materials or features were identified, and no additional archaeological investigations were recommended.

25-2762 Ingham, Donna, and Alan Leveillee
2007 Intensive Archaeological Survey, Blackstone Municipal Water and Sewer Improvements, Blackstone, Massachusetts. 125 pages.

Subsurface testing was conducted for the portions of two cross-country water main alignments considered to be archaeologically sensitive. Subsurface testing of a proposed cross-country alignment recovered prehistoric and historic cultural material, and identified a below-ground historic feature and the remains of three nearby structures including associated elements of stream channel modification for the delivery of water power. The historical cultural resources, including the structural and engineering remains, are associated with site BLK-HA-03, a domestic/industrial/agricultural complex dated c.1830-1898 and occupied/operated by multiple generations of the Aldrich family. These historic cultural resources may contribute to knowledge of 19th-century land use, economy, and settlement patterns in the Blackstone River Valley outside of the heavily industrialized and better documented settlements along the Blackstone River. Prehistoric materials from this site consist of 164 pieces of quartz, quartzite, rhyolite, and unidentified lithic material debitage, as well as two quartz biface fragments. The prehistoric component of this site has potential to contribute to the somewhat sparse knowledge of prehistoric land use and settlement patterns in the immediate region. Therefore, avoidance of these potentially significant cultural resources is recommended. If avoidance is not feasible, an archaeological site examination is recommended. If the cross-country construction option in this section of the project area is chosen, site BLK-HA-03 will be impacted and site examination investigations are warranted. However, no potentially significant archaeological sites will be impacted if the Elm Street and Old Elm Street alternative is selected. Impacts to BLK-HA-03 will be avoided and no further archaeological investigations are recommended.

25-2763 Rainey, Mary Lynne, Richard Petyk, and Joyce Clements
2007 Phase II Site Examination of the Pleasant Street Site (19-PL-169), Route 24 and Pleasant Street Development, Bridgewater, Plymouth County, Massachusetts. 76 pages.

Based on the results of a Phase I study that identified the Pleasant Street Site (19-PL-169) within a proposed 28.54-acre development (see report #25-2709), archaeologists completed a site examination comprised of 203, 50x50cm shovel test pits placed at 10m intervals and 5 judiciously located 1x1m units. The Phase I research recovered 130 artifacts from 38 shovel test pits, and the Phase II survey identified low-density lithic deposits, calcined bone fragments, and 6 tool fragments, none of which is temporally diagnostic. The research suggests that the Pleasant Street Site represents multi-component, short-term activity such as a resource-collecting location peripheral to the large

population centers throughout the upper Taunton and greater Hockomock Swamp area from the Early Archaic through the Late Woodland periods. The site area was likely also affected by intensive artifact collecting over many decades. Archaeologists consider the Pleasant Street Site ineligible for listing on the National Register of Historic Places and recommend no further work for this project.

25-2764 Ritchie, Duncan
2006 Archaeological Site Examination and Public Education Program, Canton Senior Center, Eliot School Site (19-NF-72), Canton, Massachusetts. 59 pages.

Archaeologists completed an archaeological site examination of the Eliot School Site (19-NF-72) within the 22 acre project area. The site examination was carried out in coordination with the Canton Historical Commission and Canton Council on Aging. Volunteers from the Canton Historical Commission and students from Canton High School, Roger Williams University, and Harvard University participated in the field work. An intensive survey at the site completed in 2004 (see report #25-2540) identified pre-contact Native American cultural material including a Middle Archaic Period semilunar knife preform, a Terminal Archaic Period Orient fishtail projectile point, and a non-diagnostic bifacial tool blade fragment. Chipping debris of rhyolite, hornfels, and quartz was also recovered. The portion of the Eliot School Site within the wooded northern portion of the project area appeared to have good integrity and was considered to be a potentially significant cultural resource. The total horizontal extent of the Eliot School Site is estimated to be 7,100sq m. During the site examination, 31, 50x50cm test pits and four, 1x1m excavation units yielded more than 400 pieces of rhyolite, hornfels, quartz, argillite, quartzite, and arkose chipping debris. Several small lithic workshop loci with high to moderate densities of rhyolite and hornfels chipping debris found on the site indicate that stone tool manufacture was the primary activity undertaken. A single suspected Native American hearth feature was investigated during the site examination and found to be likely a post-contact period intrusion. A majority of the pre-contact Native American cultural material was recovered from the plowzone. The research design hypothesized that the Eliot School Site could have been oriented to the headwaters of Pequit Brook and a Native American trail that followed the approximate alignment of the 18th- and 19th-century roadways represented by Chapman and Washington streets. The archaeological site area, which extends from Washington Street across the fairly level upper surface of a glacial outwash feature (kame plain) to the edge of a steep natural slope, appears to support this hypothesis. The archaeologists also predicted, and the site examination showed, that the archaeological deposits would include some high and moderate density patches of cultural material (stone tools, chipping debris) and various features. Several lithic workshop loci marked by high to moderate density patches of rhyolite and hornfels chipping debris were found in the southern portion of the wooded area sampled in the site examination. A narrow range of archaeological features was present. For example, only a few fragments of burnt rock were found and there was no evidence of concentrations marking large roasting platforms or similar features. Hornfels chipping debris found in two concentrations indicated a general episode of site use in the Middle Woodland (ca. 1,600 – 1,000 years ago) to Late Woodland (ca. 1,000 - 500 years ago) periods. The Eliot School Site had lithic workshops located in relatively close proximity to a source area (Blue Hills) for two materials (rhyolite, hornfels). Systematic sampling using a 10m interval for test pits revealed that much of the Eliot School Site was composed of low-density deposits of chipping debris surrounding a few distinct concentrations of rhyolite and hornfels debitage. Although the archaeologists predicted that the lithic assemblage would be dominated by chipped-stone tools, this pattern was not supported; no chipped-stone tools were recovered. No diagnostic projectile points were found on the Eliot School Site during the site examination and it was not possible to address hypotheses about the types of lithic materials used to make any Middle and Late to Terminal Archaic or Woodland Period projectile points present in the site. Further archaeological investigation of the Eliot School Site would be unlikely to produce new or significant information. No additional archaeological investigation is recommended.

25-2765 Barker, F. Timothy, Timothy Binzen, and Quentin Lewis
2007 Archaeological Reconnaissance and Intensive (Locational) Survey for the Route 2 Safety Improvements Project, Orange, Massachusetts. 52 pages.

Two survey units were tested for a proposed replacement ramp on Route 202 for the westbound lane of Route 2 (Survey Unit 1) and a detention basin on the northern side of Route 2, west of the bridge across Lake Rohunta (Survey Unit 2). All other impact areas associated with the project were extremely disturbed or environmentally unfavorable to warrant archaeological testing. In total, 22 shovel test pits were excavated at intervals of 7.5m in linear transects in locations exhibiting high archaeological sensitivity. Seven of the test pits in Survey Unit 2 produced historic and modern materials. These included fragments of pane and bottle glass, whiteware, and brass buttons, but consisted mainly of 20th-century roadside refuse such as pieces of rubber, asphalt, plastic, and candles. Interestingly, one test pit produced one 1940 quarter, nickels from 1944 and 1945, and one 1957 penny. Feature 1, a refuse pit dating to the mid-20th century, was recorded in Survey Unit 2, but does not represent a significant cultural resource. The proposed safety improvements will not affect any possibly significant cultural resources; no additional survey is recommended.

25-2766 Doucette, Dianna L., and A. Peter Mair, II
2007 Intensive (Locational) Archaeological Survey, A.D. Makepeace Preserve at Agawam Phase I Project Area, Plymouth, Massachusetts. 75 pages.

The survey of the 88 acre parcel included archival research, a walkover survey, and subsurface testing. A total of 150, 50x50cm test pits were excavated. One isolated rhyolite projectile point midsection and one jasper flake were recovered. The projectile point midsection has parallel sides and a collateral flaking pattern to suggest it is an Eden type, diagnostic of the Paleoindian or Early Archaic Period (10,000 to 8,000 B.P.). Although the archaeological deposits contribute important information to the extant Native American database for the Taunton River Drainage in southeastern Massachusetts, it does not appear that additional archaeological testing will yield any significant new classes of data. No further archaeological investigations are recommended.

25-2767 Doucette, Dianna L.
2007 Archaeological Site Examination, Deer Pond Site, A.D. Makepeace Wareham Road Core Parcel 1, Plymouth, Massachusetts. 55 pages.

Thirty, 50x50cm test pits and two, 1x1m units were excavated within the Deer Pond Site, resulting in the recovery of 27 pieces of rhyolite chipping debris and three chipped-stone tools (1 rhyolite Brewerton side-notched projectile point, 1 rhyolite Brewerton projectile point preform, and 1 rhyolite knife blade). The Brewerton points are diagnostic of the Laurentian/Late Archaic Period (ca. 5,000 B.P.). During the intensive survey (see report #25-2584), seven pieces of rhyolite chipping debris were recovered from this area. The Deer Pond Site is characterized as a low-density scatter of rhyolite chipping debris and chipped-stone tools representing one or two episodes of lithic reduction. No features were identified, but the cultural material was recovered from 0–40 cmbs in undisturbed A and B horizons suggesting excellent integrity. Based on the distribution of cultural material recovered during the intensive survey and site examination testing, the Deer Pond Site covers an area of approximately 15m north/south by 20m east/west, or at least 300sq m. The archaeological deposits recovered from the Deer Pond Site contribute important information to the extant Native American database for southeastern Massachusetts. The site examination collected sufficient information to answer basic questions about site size, age, and internal complexity. However, because of a lack of radiocarbon-datable contexts and relatively low potential for finding such contexts, it does not appear that additional archaeological testing will yield significant new classes of data. No further archaeological investigation of this site area is recommended.

25-2768 Donohue, Barbara
2007 Report of a Specialized Intensive (Locational) Survey, Lexington Battle Road, Hanscom Air Force Base, Middlesex County, Massachusetts. 276 pages.

On behalf of Hanscom Air Force Base, the Air Force Center for Environmental Excellence requested a specialized archaeological survey, consisting of a metal-detector survey followed by field excavation, in areas with potential for battlefield debris particularly resources associated with the Battle of April 19, 1775. The metal detector survey recovered five artifacts likely to be associated with the battle and two that are less likely to be so. The battle-related artifacts (3 musket balls, a musket ball bullet mold, and a cuprous shoe buckle) were recovered from three loci suggesting the possibility that activity areas associated with the battle existed. To test this theory, a magnetic field gradient survey was conducted in November of 2004. While the presence of activity areas could not be determined, a fascine knife, believed to be from the period under study and possibly associated with the battle, was recovered. Another phase of field investigation, consisting of the excavation of shovel test pits, a metal detector survey, and a magnetic field gradient survey, was conducted in November of 2005 in association with the transfer of a parcel of land to Minute Man National Historical Park. The property to be transferred had potential for battlefield debris as well as prehistoric and historic archaeological resources. The transfer of the property to Minute Man National Historical Park will, in effect, bisect the battlefield site. It is recommended that the boundaries of the battlefield site that remain in Hanscom AFB should be defined and included within the overall site boundaries associated with the Battle of April 19, 1775. Historic research suggests that the recovered battle-related artifacts could be associated with British flanking troops firing at the Lincoln and/or Lexington Minute Men, Pitcairn's troops firing at Parker's Minute Men, or both scenarios occurring simultaneously. Secondary sources suggest that Lincoln Minute Man William Thorning was involved in fighting the British flankers in close proximity to the project area. Additional historic research is recommended to locate the origin of the William Thorning story, as information contained in that source may clarify interpretation of the field results and facilitate interpretive efforts at Minute Man National Historical Park. Documentary research revealed that features associated with the Thomas Nelson Sr. Farm Site (19-MD-347/HA6), in particular landscape characteristics that may be associated with the Battle of April 19, 1775, may be present within Hanscom Air Force Base. Features and/or artifacts associated with this 18th-century farm may also be present. Further documentary research is recommended to determine the extent of the 30-acre parcel that Thomas Nelson Sr. purchased in 1770 and to clarify existing site boundaries.

25-2769 Dujnic, Teresa
2005 Intentions of Independence: Medicinal Practice and Community Identity at Boston's African Meeting House. 217 pages.

The African Meeting House on Boston's Beacon Hill was the center of a vibrant African American community during the 19th century. Members of this community worked toward creating an independent and respectable community identity with their actions and with their words. One way African American community identity was manifested is in the attitudes toward medicine and medicinal practices. This Master's thesis analyzes the medicinal artifacts from the African Meeting House excavations (1975-1985) to investigate questions about medicinal use at the Meeting House and how these practices might have articulated with assertions of equality, citizenship, and community pride. The analysis of documentary and archaeological evidence reveals that the African American community embraces some aspects of mainstream Euro-American medicine in an effort to adopt the symbols of respectability associated with the professional medical sphere. The evidence also speaks to the potential persistence and redefinition of medicine systems with roots in Africa and the American South. The African American community incorporated both traditional African American and Euro-American medicinal practices to create a new African American medicine system distinct in approach and meaning from the various systems they drew upon.

25-2770 Herbster, Holly
2005 A Documentary Archaeology of Magunkaquog, Ashland, Massachusetts. 224 pages.

This Master's thesis examined the documentary records related to Magunkaquog, one of seven Christian Indian communities established in Massachusetts Bay before 1675 by missionary John Eliot. This small "Praying Town" in present-day Ashland was officially established in 1669. The research was designed to help interpret the archaeological components of a small, late 17th- to mid-18th-century fieldstone structure identified at Magunco Hill and thought to be Magunkaquog's meeting house. Seventeenth-century legislative documents and descriptions, written almost exclusively by European Americans, were often used to promote the success of the mission in New England to backers and critics overseas. Although Magunkaquog was portrayed as a site of regular colonial/Native interaction, a close examination of the documents suggests that few European Americans ever visited. This "Praying Town" instead functioned as a place to maintain and even strengthen traditional Native sociopolitical networks throughout a period of increasing change in Massachusetts. Harvard College's purchase of the Magunkaquog lands in 1715 was the first overt colonial attempt to dispossess the Native inhabitants of this land and was met by open resistance in the form of a signed protest letter and the suicide of one individual. Faced with few choices in a rapidly shrinking land base, the Native proprietors agreed to the sale. Even after this event, however, Native people maintained their connections to the land. Despite colonial bias in the past and present, a continuum of Native history is present in the Magunkaquog documents.

25-2771 Mair, A. Peter, II, and Dianna L. Doucette
2007 Intensive (Locational) Archaeological Survey, A.D. Makepeace: Tihonet Business Park, Wareham, Massachusetts. 60 pages.

The survey included archival research, a walkover survey, and subsurface testing within the 42 acre parcel to locate and identify potentially significant archaeological resources that may be affected by project construction. Archival research indicated favorable environmental conditions that suggested the area was sensitive for Native American cultural resources. Subsurface testing with 117, 50x50cm test pits documented natural A and subsoil horizons over the majority of the tested portions of the project area. No cultural material was recovered from any of the test pits. No further archaeological investigations are warranted.

25-2772 George, David R., William F. Keegan, Aaron Palermo, and Catherine M. Labadia
2007 Intensive (Locational) Archaeological Survey of a Proposed Optasite Cellular Telecommunications Facility off Stony Hill Road, Wilbraham, MA. 61 pages.

The proposed facility was situated in close proximity to the South Branch of Mill River, and the project area consisted of a 21.5x21.5m (70x70ft) lease area and an associated access road that measured approximately 3.7m (12ft) in width and extended for a distance of nearly 410m (1,345ft). Following completion of background research and pedestrian survey of the project areas, subsurface testing was undertaken. A total of 53 of 61 planned shovel tests were excavated at 7.5m intervals throughout the lease area and associated access road. The eight planned but unexcavated shovel tests fell within areas characterized by large tree throws, on steep slopes, and/or in highly eroded areas. Each square shovel test measured 50x50cm and glacial till was typically encountered at depths no greater than 80cm. Although several shovel tests exhibited a disturbed soil profile, the project area primarily consisted of well-drained soils that graded from loamy sand to gravelly coarse sand. No cultural deposits or features were identified. No additional fieldwork is recommended.

25-2773 Hart, Siobhan M., and Elizabeth S. Chilton
2006 Summary Report on Archaeological Investigations, Eaglebrook Area C Site, Deerfield, Massachusetts. 170 pages.

The 2004 field school project tested an area of approximately 4,800 sq m and excavated 19, 50x50cm shovel test pits spaced at 5m intervals along 4 east-west transects across a terrace, located on both sides of a long ditch embankment feature. We also excavated a total of 7, 1x2m units and 1, 1x1m unit to the east and west of the ditch embankment features and through them. Three distinct areas were identified and distinguished by subsurface strata: West of the ditch embankment features (no plowzone, developed B-horizon), east of the ditch embankment features (plowzone, developed B-horizon), and the ditch embankment features themselves (no plowzone, feature fill, buried A-horizon, and subsurface features). In addition to the ditch embankment features, two subsurface features were identified. Feature 14 is a pit feature that likely dates to the 17th century, which contained charred maize kernels and other botanical remains, six glass beads, and 36 Native American pottery sherds. Feature 15 consists of a rectangular posthole that measures 30x40cm. Other artifacts recovered from site areas include one lithic projectile point and a variety of floral species. Based on our findings, we conclude that there is potential for other subsurface features in this area. The identification and excavation of three cultural features demonstrates that intact cultural features are present in the project area. Additional archaeological testing is recommended to determine whether there are other intact features and sites in the area or on adjacent terraces. The report includes numerous student-written subsections and papers.

25-2774 Hart, Siobhan M., and Elizabeth S. Chilton
2006 Summary Report on Archaeological Investigations, Rodimon I-3 Site (19-FR-265), Deerfield, Massachusetts. 130 pages.

The 2004 field school project conducted archaeological reconnaissance and investigation at the Rodimon I-3 site (19-FR-265) located at the confluence of the Deerfield and Connecticut Rivers in Deerfield. No prior professional testing of the area is recorded, but amateur collecting is documented and there is evidence of looting in the area. The field school tested an area of approximately 1,200 sq m and excavated a total of 11, 1x1m units spaced at 5m intervals along three east-west transects near the terrace edge. Recent flood deposits, a plowzone, and an alluvial B-horizon were identified. A range of artifact types were recovered from these levels, including lithic flakes, one jasper projectile point fragment, one Woodland stemmed projectile point, Native American ceramics, one whiteware sherd, one brass shotgun shell, and one triangular paving stone. We conclude that there is potential for deeply buried archaeological deposits at this location. The presence of deeply buried A- and B- horizon and/or possible features indicates that there may be intact cultural features across the site at a depth of 1m and possibly deeper. Additional archaeological testing is recommended to determine whether there are intact features at greater depths, and to determine the relationship of this site to adjacent sites on other terraces.

25-2775 Ritchie, Duncan
2004 Intensive (Locational) Archaeological Survey, Scituate Wastewater Collection System Expansion, Phase 2, Scituate, Massachusetts. 91 pages.

This project will involve the installation of approximately 1,400 feet of cross-country sewers and three pump stations. The archaeology included background research, a walkover surface inspection of the project area, and subsurface testing. Subsurface testing within the project area consisted of the placement of 29, 50x50cm test pits, placed along judgmental transects and in three, 15x15m sampling blocks, in areas identified as having the potential to contain archaeological resources. Subsurface testing within the project area identified three ancient Native American archaeological sites, the Sunset Road (19-PL-1026), Conroy Terrace (19-PL-1025) and Collier Road (19-PL-1027) sites. The Sunset Road Site was identified after a Late Woodland Levanna type projectile point and two pieces of rhyolite chipping debris were found within disturbed soils. The Conroy Terrace Site consisted of three pieces of chert and rhyolite chipping debris found within a plow zone and buried A horizon soils. The Collier Road Site yielded pre-contact Native American cultural material including chipped (corner notched projectile point, three bifacial tool blades) and

rough stone (hammerstone, hamerstone/abrader) tools, a ceramic sherd, and a sample of 227 pieces of rhyolite, quartz, chert, quartzite, and argillite chipping debris. Low to moderate amounts of historic/modern period cultural material reflects 19th-century agricultural and modern period use of the area but cannot be associated with a specific archaeological site. These sites possess low information content or have been altered to such an extent that they no longer retain integrity. No further archaeological investigation of is recommended.

25-2776 Waller, Joseph N., Jr. and Holly Herbster
2004 Archaeological Data Recovery Program, Mosquito Brook Site Impact Area, North Andover, Massachusetts. 79 pages.

The Mosquito Brook Site (19-ES-808) is situated atop an elevated knoll overlooking the Mosquito Brook. It was identified during an archaeological survey in advance of a pipeline project, which will entail construction and operation of an approximate 25-mile, 30-inch outside diameter natural gas pipeline from Methuen to Salem (see reports #25-2427). Despite attempts by the proponent to avoid impacts to the site, it was determined that the approximately 297sq m southwestern portion of the Mosquito Brook Site could not be avoided. Consequently, a data recovery program within the impact area of the site was implemented. The data recovery included the excavation 22, 50x50cm test pits and 11 excavation units. Data recovery investigations recovered 402 pieces of lithic chipping debris and one rhyolite projectile point preform that approximates the Susquehanna Broad/Wayland Notched or Orient Fishtail form. Two small Native American refuse or disposal pits were within the site impact area. Temporally diagnostic artifact types including the preform and calibrated radiocarbon dates ranging between 3630 to 3440 cal. B.P. indicate the Mosquito Brook Site impact area was occupied during the Late/Transitional Archaic Period. As part of the mitigation of impacts to the Mosquito Brook Site, the project proponent has undertaken short and long-term protection plans for non-impacted portions of the site. Construction activities within the Mosquito Brook impact area were recommended to proceed as planned.

25-2777 Chartier, Craig S.
2007 Report on the Intensive Survey at Saw Mill Pond, Easton, Massachusetts. 44 pages.

The project area at Saw Mill Pond is located within Furnace Village National Register Historic District. Sixty-two, 50x50cm test pits were excavated. The project area consists of level land adjacent to Mulberry Brook, located west and south, and areas of wetland to the east. Numerous historic period stone walls and stone piles were identified, representing historic period subdivision of extremely rocky land possibly for pasturage and limited planting. No historic or ancient Native American artifacts were recovered, confirming the research prediction that the area had low sensitivity for historic resources, aside from stone walls and possible agricultural evidence, and, due to the extremely stony soils and proximity of better soils in the immediate area, a moderate sensitivity for ancient Native American sites. No further testing is recommended.

25-2778 Binzen, Timothy
2007 Archaeological Reconnaissance of the George D. Harlow Field (Marshfield Municipal Airport), Marshfield, Massachusetts. 31 pages.

Two known sites have been located in or near the project area. Site 19-PL-426, discovered by an artifact collector, is located on the airport property, and site 19-PL-983, identified by a previous archaeological survey (see report #25-2393), is situated north of the airport. Based on the results of the reconnaissance survey, it is proposed that Native American archaeological sensitivity is low in zones that: 1) are paved or contain architectural development; 2) formerly contained dirt roads; 3) were graded down to the glacial substratum during airport construction; 4) consist of built land; and 5) are within tidal marsh or wetland. Areas of moderate to high sensitivity for Native American sites include zones: 1) containing normal sandy loam soils consistent with a historic plow-

zone; 2) where the undulating ground surface pre-dating the airport is preserved; and 3) adjacent to the Green Harbor River and Marsh. For historic resources, the airport exhibits low sensitivity except for areas located between Runway 6 End and Green Harbor River. In this area, the historical Old Colony Lane and a riverside dock known to exist in the 1830s were identified. Recommendations are made for subsurface testing in high-sensitivity areas where future developments are planned.

25-2779 Chartier, Craig S.
2007 Report on Intensive Survey Fieldwork at Tall Timer Estates, Kingston, Massachusetts. 92 pages.

A total of 153 test pits were excavated in this 167 acre parcel. A total of 1,019 artifacts were recovered (24 prehistoric, 995 historic). The majority of the prehistoric material (18 flakes or flake fragments and one piece of shatter) was recovered from a single test pit and one of its four associated array test pits. This site was designated the Fountainhead Brook Site (19-PL-1028); it is located on a level area overlooking the wetlands associated with Fountainhead Brook. The material likely represents a short-term stopover location where a rough biface was finished or simply reduced further. One rhyolite biface, two pieces of quartz shatter, and one rhyolite flake were recovered from another test pit and from the eroding bank bordering the cranberry bog access road to the north of this test pit. These artifacts may have come from an ancient Native American site destroyed by construction of the bog road. This site was designated the Bog Road Site (19-PL-1029). Six historic sites were identified: one 20th-century trash deposit; two possible 19th-century charcoal burn areas; and three cellar holes. Site examinations at each of the cellar holes and associated house yards are recommended if avoidance of these areas is not possible.

25-2780 Hoffman, Curtiss
2006 Middleborough Little League Site, Middleborough, Massachusetts. 134 pages.

This report describes the preliminary results of an ongoing archaeological investigation undertaken at the Middleborough Little League Site (19-PL-520). The 2006 season recovered 1,180 lithic artifacts, 11 pieces of grit-tempered ceramic, 5,104 pieces of debitage, 4,782 fire-burnt rocks, 1,829 pieces of organic material, and 148 post-Contact period artifacts. It identified 17 cultural features, all but one of them previously undocumented. A total area of 10.5 sq m was excavated. Two newly defined components from the Early and Middle Woodland periods, as well as a continuation of the previously explored Late and Transitional Archaic components, were delineated. One further season of fieldwork is needed to complete the study of artifact and feature distributions in the currently threatened portion of the site and to make recommendations to the town regarding the future of the site (see reports #25-1907, #25-2009, #25-2047, and #25-2521).

25-2781 Donta, Christopher
2007 Archaeological Site Examination and Data Recovery Surveys of the Sargasso Sea Site (19-PL-891), Lakeville, Massachusetts. 63 pages.

A total of 53.75 sq m were excavated at the site. A total of 3,091 artifacts were collected from two concentrations of artifacts that contained primarily Small Stemmed components dating to the Late Archaic period. The majority of artifacts came from the southern concentration where three clusters of features were identified. The evidence from radiocarbon dates on three features suggests that the site was occupied between ca. 4,900 B.P. and 3,900 B.P. Features found include small pit hearths, surface hearths, postmolds of a habitation structure and other facilities, living surfaces, storage pits, and a midden. Food remains, such as deer, turtle, shellfish, goosefoot, sedge, and walnut were recovered inside and outside of feature contexts. Lithic artifacts primarily made of quartz and small quantities of argillite and rhyolite were recovered. The Sargasso Sea Site represents a rare, single-component habitation of the Small Stemmed Tradition Information form the

investigation are proposed to be incorporated into an educational exhibit in the new Lakeville Public Library that was constructed over the site (see report #25-2222).

.

25-2782 Chartier, Craig S.
2007 Report on the Intensive Survey Fieldwork at Sabbatia Landing, Taunton, Massachusetts. 38 pages.

Sixteen, 50x50cm test pits were excavated in intact areas in close proximity to Sabbatia Lake; 25 artifacts were found. One prehistoric site was identified however no temporally diagnostic prehistoric material was recovered. The prehistoric artifacts were limited to nine pieces of chipping debris, one biface fragment, and 13 shatter fragments. Historic material was limited to one piece of brick. The density of material recovered indicates the site likely was part of a larger one that extended across the peninsula. The artifacts recovered indicate that lithic reduction was one of the activities at the site. None of the recovered fragments showed signs of the presence of the cortex indicating that the source may have either been quarried blanks or that removal of the cortex from glacial cobbles, several of which were identified during excavation, occurred elsewhere on the site. Due to deep historic plowing and the previous impact caused by construction at the site, the prehistoric site is not considered to have integrity. No further testing is recommended.

25-2783 Chartier, Craig S.
2007 Report on the Site Examination Fieldwork at the Gallt Cellar Hole and Trenches in Wareham, Massachusetts. 73 pages.

The Wareham Historical Commission was made aware of an undocumented cellar hole located on a dirt road believed to be part of a stage coach line from Middleborough to Wareham dating from the 18th to 19th centuries; the parcel is slated for development. No prehistoric archaeological material was recovered during this investigation. In addition to the cellar hole, the Gallt Trench Site was identified. It is either the location of a War of 1812 defensive trench or a boundary or field ditch (“ha-ha”). A reevaluation of this site is included. It was expected that the site examination would yield evidence of ancillary buildings associated with the structure that once covered the cellar hole. The site represented the only historic archaeological house structure to be systematically investigated in the town of Wareham, and it had the potential to provide valuable information on the late 18th through early 19th century agricultural history of the town. Site examination testing revealed that the cellar hole was excavated and the cellar walls erected in the late 19th century, however, it appears that the cellar hole was abandoned soon after construction and no house was built on the site.

25-2784 Chartier, Craig S.
2007 Report on the Intensive Survey Fieldwork at the Proposed Police Station Location, Minot Avenue, Wareham, Massachusetts. 70 pages

Two hundred and two (171 systematically placed along six transects and in five blocks and 31 in nine array brackets) were excavated in high potential areas across the project area. A total of 521 artifacts were recovered (357 prehistoric, 104 historic, 60 unattributable). One large prehistoric site was identified, the Pulaski Site (19-PL-1030), with diagnostic prehistoric material and five features recovered. Prehistoric artifacts consisted of 189 pieces of chipping debris and shatter, two hammerstones, two biface fragments, three projectile point tips, 31 pieces of Native pottery, one piece of steatite, two fragments of a cuprous arrowhead, 112 pieces of shell, 29 pieces of calcined bone (mammal, turtle, bird), and nine pieces of fire-cracked rock. The recovered material dates from the Late Archaic through the Contact periods with the majority related to a Woodland period occupation. It is likely that native occupation of the project area was associated with the Agawam / Car Tracks site (19-PL-188), which is believed to be a part of the larger Agawam Village Site (see report #25-2785).

25-2785 Chartier, Craig S.
2007 Report on Intensive Survey and Site Examination Fieldwork at the Car Tracks / Agawam Site (19-PL-188), Wareham, Massachusetts. 2 Volumes, 274 pages.

Archaeological testing at this site identified significant archaeological remains including 14 features (pits, hearths, shell deposits, one pot drop, and one burial) as well as lithic debitage, steatite, pottery, and faunal remains. Radiocarbon dates ranging from the Early Woodland to Contact Periods were recovered from 4 features. Although the site has been plowed, it retains considerable integrity with intact features remaining below the plow zone and therefore has high research potential and significance. Artifacts recovered from the site suggest a significant occupation from the Transitional Archaic to Contact Period. The site has the potential to significantly add to our understanding of settlement patterns, degrees of mobility, resource procurement and the transition from steatite bowl use to early pottery.

25-2786 Binzen, Timothy
2006 Archaeological Site Examination Survey of the Paleoindian Site, 19-FR-324, at the Turners Falls Municipal Airport, Montague, Massachusetts. 64 pages.

A site examination was conducted for site 19-FR-324, the Turners Falls Airport Paleoindian Site, formerly the Hannemann site, which falls within the area of potential effect for the runway reconstruction and extension project at the Turners Falls Municipal Airport in Montague. A previous intensive (locational) survey had identified four concentrations, here designated Loci A through D, of lithic artifacts on a low sandy ridge, including a Paleoindian side scraper (see reports #25-2330, #25-2447, and #25-2788). Between both surveys, 148, 50x50cm shovel test pits were excavated on a metric site grid, along with 2, 50cmx5m linear trenches. Chipping debris, 2 Gainey-like fluted point basal fragments, 23 channel flake fragments, 2 side scrapers, and 1 unifacial end scraper were recovered from the various loci. The data indicate that a Paleoindian occupation occurred during the Bull Brook phase approximately 12,000 years ago. The site is very well preserved and may represent a pioneering site that was occupied by people who were among the first to explore the upper Connecticut River valley following the last glacial period. The site is located within a protected security zone and geotechnical engineering was applied to eliminate erosion effects and preserve the site.

25-2787 Clements, Joyce M., and Daniel P. Lynch
2007 Phase II Archaeological Site Examination of the Jackson Appleton Middlesex Urban Revitalization and Development Project – Parking Structure, Lowell, Massachusetts. 122 pages.

The site examination included documentary research and analysis, as well as sub-surface investigations of 19.25 sq m in 3 target areas (see report #25-2618). Field testing produced evidence of 21 features, 3 of which were associated with the Hamilton Manufacturing Company, 1 was Native American in origin, and 16 were associated with modern construction and demolition activities. The ancient Native American firepit and lithic deposit was completely excavated. It was a rare survivor in the urbanized setting. The site has undergone extensive modification and does not retain sufficient integrity or additional research potential. No additional investigations are recommended.

25-2788 Binzen, Timothy
2006 Archaeological Intensive and Site Examination Surveys in Vegetation Removal Areas and Investigation of Hearth and Stone Features, Turners Falls Municipal Airport, Montague, Massachusetts. 93 pages.

Archaeological investigations were conducted for the runway reconstruction project. Intensive survey was completed for the Hilltop Survey Unit, where vegetation removal and landform modification is anticipated, and for Survey Units V1, V2, and V3, where only vegetation removal is anticipated. Stone walls and stone piles were detected in the Hill Top Survey Unit and interpreted as a historic property boundary and field stone clearing. In Survey Unit V1, chipping debris were recorded at the Mineral Hill, Sandy Knoll, and West Mineral Road-Findspot sites, and at the Feature 1 site, an unusual pit feature with faunal remains, radiocarbon dated to AD 1430 to 1640 was detected. Further testing in Survey Unit V1 identified the West View Historic Site, a small, late 18th- to early 19th-century farmstead not shown on historic maps. The assemblage was consistent with disposal of domestic refuse. In Survey Units V2 and V3, no significant resources were encountered. Avoidance is recommended for all the archaeological sites recorded in Survey V1, with the exception of the West Mineral Road Findspot. A site examination was conducted at Site 19-FR-313, where a small volume of quartz chipping debris had been recorded by a previous intensive survey. No additional cultural material was recovered from the site, and no additional survey is recommended. At Site 19-FR-324, an isolated hearth feature was sampled. No artifacts were recovered in association with the hearth, but radiocarbon assay was conducted, giving a calibrated result of BC 200 to AD 30. The hearth feature is located in the vicinity of the much earlier Paleoindian artifact deposits that have been defined at Site 19-FR-324, but it is unrelated to those deposits. Avoidance of the hearth feature was achieved (see reports #25-851, #25-2330, #25-2447, and #25-2786).

25-2789 Mulholland, Mitchell T., Jennifer Wendt, and F. Timothy Barker
2005 Phase 1A/B Archaeological Intensive (Locational Survey for the Tennessee Gas Pipeline Company Compressor Station 264 Improvements, Northeast Connexion Project – New England, Charlton, Massachusetts. 53 pages.

Background research and the walkover inspection indicated that portions of the development parcel had a high potential to contain Native American and European American archaeological sites. In this survey, 72 shovel test pits were excavated. No cultural material was recovered from the project area. Three historic stone field walls were observed and recorded during the survey. It is recommended that all the historic stone field walls be avoided during the proposed construction. An existing bar-way, or gate, in a historic rubble fill field wall is located 24.4m (80ft) south of the proposed limit of construction. It is recommended that the existing gap in the “rubble fill” wall be used to gain access to the construction area west of the wall rather than impact it. Provided that the stone walls can be avoided during construction, no further survey is recommended.

25-2790 Bonner Banister, Jennifer, and Duncan Ritchie
2007 Intensive (Locational) Archaeological Survey, The Pinehills, Cornish/Wright Tavern Improvements, Plymouth, Massachusetts. 79 pages.

Thirteen, 50x50cm test pits were excavated within the proposed location of sewer lines, a grease trap, and an addition to the tavern structure. A low-density of post-contact period cultural material consisting mainly of domestic debris (ceramic sherds, kaolin pipestem, button) and structural debris (brick, window glass, nails) was recovered from the test pits. These artifacts were primarily within fill and plow zone soil in areas to be impacted by the installation of the sewer line at the present location of the Cornish/Wright Tavern building. No subsurface features such as trash pits or even discrete artifact deposits relating to the occupation of the tavern were observed during subsurface testing within the proposed sewer lines, nor were any intact archaeological deposits or features associated with the Cornish Wright Tavern identified. No further archaeological investigation is recommended. If future developments on the Cornish/Wright Tavern Site include activities that may result in modification or subsurface disturbance on the site, it is recommended that additional archaeological investigations be conducted (see also report #25-2260).

25-2791 Mahlstedt, Thomas F.
2007 Archaeological Testing for Repairs to the Foundation of the Print Shop, Brook Farm, Boston (West Roxbury). 8 pages.

A total of ten shovel test pits were excavated as part of the survey of the Print Shop proposed foundation repair. Historic artifacts were observed in all ten of the test pits but many of them were of modern or relatively recent provenience, probably associated with the use of the property as an orphanage and children's hospital. However, the creamware and possible pearlware sherds may predate the use of the property as the Brook Farm utopian community, although use of plates and cups could have an extended life. Their presence in disturbed soils does not allow for an accurate association. There were no artifacts that were considered to be quantitatively or qualitatively significant. The archaeological survey of the Print Shop did not locate any significant archaeological resources. The repair of the Print Shop's foundation will have no effect on significant intact archaeological resource of Brook Farm. However, given the historic significance of the property and the extent of the excavation adjacent to the foundation, the DCR Staff Archaeologist will monitor the site work (see reports #25-1167, #25-1257, and #25-1882).

25-2792 Beranek, Christa M.
2007 Merchants, Gentry, Farmers and Brokers: Archaeology of the Complex Identities of the Tyng Family of Dunstable (Tyngsborough), Massachusetts, in the 18th Century. 494 pages.

Archaeological and historical research at the 18th-century core of the Tyng property (TYN-HA-2) in Dunstable (now Tyngsborough), Massachusetts, examines the Tyng family as culture brokers between colonial rural and urban society and the wider British-Atlantic world, through their positions as inland merchants, large-scale agriculturalists, and local political and military leaders. This dissertation highlights the role of material culture in the formation and maintenance of personal identity and social relationships. Following recent studies in anthropological archaeology that approach identity holistically, this dissertation examines the interwoven nature of gender (primarily masculinity), ethnicity (Anglo-American), and various aspects of position such as status and profession. The archaeological data come from three seasons of excavation at the Tyng site in 1980, 1982, and 2002 directed by Mary C. Beaudry and Stephen Mrozowski that tested in and around two successive houses. The artifacts have been analyzed together with documents, visual sources, and comparative case studies to construct a detailed context in which to interpret architecture and land ownership, self presentation through personal adornment, and dining and hospitality as indicated by ceramics and glassware. As both rural residents and elite members of an interrelated merchant network, the Tyngs selectively used material goods to craft their identities, fulfill their particular social needs, and facilitate their participation in multiple communities. They position themselves in relationship to "cultural arguments" of the 18th century by using material statements. These arguments include discussions of gentility and its expression through manners and consumption; the relationships among luxury, trade, dependence and masculinity; and the association of agriculture, patriotism, and moral purity. This contextual perspective presents the Tyngs both as complex individuals and participants in broad social, economic, and political processes.

25-2793 Binzen, Timothy
2007 Archaeological Reconnaissance and Intensive (Locational) Survey: Facilities of the 104th Fighter Wing of the Massachusetts Air National Guard Barnes Airport, Westfield, Massachusetts. 59 pages.

The survey area for this project was divided into two archaeological survey units. Limited zones that had not been previously disturbed were identified within each survey unit. Locations exhibiting high sensitivity were tested. A total of 89 test pits were excavated. There were no locations where historical artifacts were encountered in high concentration or in association with historical features. No archaeological resources were identified in Survey Unit 1, and no additional survey is recommended for that survey unit. In Survey Unit 2, the Barnes Native American Site (19-HD-307) was identified. Archaeologists recovered 11 pieces of chipping debris, made of chert, argil-

lite, quartzite, and quartz, from three of the nine test pits. The site may be eligible for listing in the National Register of Historic Places. Avoidance and preservation is recommended. If avoidance of the site is not feasible, then an archaeological Phase 2 site examination survey is recommended.

25-2794 Lentz, Megan, and Mary C. Beaudry
2007 Report of Limited Site Examination/Archaeological Testing, at the Francis Wyman Property, 56 Wyman Road, Burlington, Massachusetts. 24 pages.

The primary aim of the work was to test areas likely to be impacted by erection of a colonial style timber-frame barn. The excavation involved judgmental placement of 2, 1x2m units and 1, 1x1m unit within a rectangular outline of stones thought to be the foundation remains of a demolished barn, as well as seven additional 1x1m test units placed at 7m intervals along the route proposed for utility trenches. Finds were recovered from the topsoil only, and most of the artifacts were of relatively recent modern date. The archaeological evidence, including complete lack of fire debris, indicates that after a fire in the 1990s the area near the house was scraped down to glacial soils as part of the post-fire clean-up effort. Erection of a barn will not impact significant archaeological deposits.

25-2795 Donta, Christopher, and Timothy Binzen
2007 Archaeological Intensive (Locational) Survey for the Proposed Chang Farms Waste Water Outfall Pipe, Whately, Massachusetts. 65 pages.

Areas surveyed included land along both sides of River Road and across the flood plain to the Connecticut River. The project area impacts include the construction of a 2m-wide trench. Although the recorded site 19-FR-33, which contained lithic waste, is located nearby, background research did not identify any known cultural resources within the project area. A total of 58 test pits and 6, 1x1m units were excavated. No Native American artifacts, subsurface cultural features, or architectural remains were recovered or identified. A low number of historical artifacts were recovered from the plow zone in 10 of the 64 units excavated. These artifacts did not relate to any intact archaeological features or deposits. No further survey is recommended.

25-2796 Binzen, Timothy, and Peggy Kelly
2007 Archaeological Reconnaissance of the Gardner Municipal Airport, Gardner and Templeton, Massachusetts. 47 pages.

A sensitivity map of the entire airport was prepared for this survey. Native American archaeological sensitivity is low in zones that are 1) paved or contain architectural development; 2) graded down to the glacial substratum during airport construction; 3) stony or steep; and/or 4) within wetlands. Zones of moderate to high sensitivity for Native American sites, mostly located in the eastern side of the airport, contain sandy loam soils and appear minimally disturbed. For historical resources, the airport generally exhibits low sensitivity except for the southwestern extremity of the property where the Sheen Site was recorded. The site consists of stone foundations/cellar holes and other visible surface features that correspond to the house of J. Sheen on the 1870 Beers map of Templeton. Recommendations include testing in any areas of high sensitivity where future undertakings are proposed and avoidance and preservation of the Sheen historical site.

25-2797 Binzen, Timothy L, F. Timothy Barker, and Peggy Kelly

2006 Archaeological Intensive (Locational) Survey for Runway Improvements at the Fitchburg Municipal Airport, Fitchburg, Massachusetts. 35 pages.

The airport is located on a broad level plain north of the North Nashua River, downstream from the confluence with Baker Brook. During the construction of the airport in the 1930s the main channels of the North Nashua River, Baker Brook, and their wetlands were entirely filled and diverted to their present locations. The upland hills and terraces adjacent to the eastern side of the airport were cut and graded during airport construction and have been quarried for gravel. A previous reconnaissance survey identified three zones in the airport that exhibit high archaeological sensitivity (see report #25-2435). Subsurface testing was conducted in two survey units within these zones. A total of 68 shovel test pits was excavated. No pre-Contact Native American or European-American cultural materials were recovered, and no subsurface cultural features were identified. Extensive fill deposits resulting from the cutting, filling, and leveling of the pre-airport landscape were encountered. No additional testing is recommended.

25-2798 Donta, Christopher L., and Jaime M. Donta
2007 Phase 1 Archaeological Intensive (Locational) Survey for the Proposed Easthampton Savings Bank Main Street Project, Agawam, Massachusetts. 42 pages.

Background research and archaeological reconnaissance survey were completed on an approximately 1 acre parcel on Main Street. In addition, subsurface testing was completed on a .25 acre portion of the property that was undeveloped. Background research indicated high potential for Native American archaeological sites in the area. The historical background research indicated the possible presence of a late 19th-century structure in or near the project area. Subsurface testing consisted of 12 shovel test pits. No Native American artifacts or features were found. A low number of historic artifacts, mainly structural debris, was collected – mostly in the northern portion of the property, which was partially disturbed. No subsurface cultural features were identified and no architectural remains were encountered. No further survey is recommended.

25-2799 Mahlstedt, Thomas F.
2007 Archaeological Testing for Children's Playground, Winchester, Massachusetts. 10 pages.

Six test pits were excavated to assess the potential impacts to archaeological resources from the construction of a children's playground at Sandy Beach. All six test pits contained recent cultural materials that could be attributed to the recreational use of the site including bottle glass, plastic, bottle tops, and milkware. Other objects typically associated with buildings or construction-related activities such as brick, nails, screws, and bolts have no apparent association with the site and are not of sufficient age to have been associated with the adjacent Middlesex Canal. The manner by which they were introduced is not evident from such a small sample. A single glazed redware sherd is the only specimen with any potential antiquity, but it was derived in the same topsoil with bottle caps and green bottle glass. Because no significant archaeological resources were encountered, it is recommended that the proposed playground be constructed as proposed.

25-2800 Donta, Christopher L., and Jennifer Wendt
2007 Archaeological Intensive (Locational) and Site Examination Surveys for the Proposed Phase 6 Sewer Expansion Project, Raynham, Massachusetts. 83 pages.

In total, 35 test pits were excavated. No artifact or features relating to Native American or historic period archaeological sites were found in either of the two proposed cross-country sections of the project. During the survey of the pump station, however, a historic archaeological site was found and named the Bassett Brook Site. The site contained a small scatter of artifacts, including one sherd of Native American pottery, a calcined bone fragment, three pieces of creamware, and a piece of clear glass. In addition, a stone feature was found, consisting of a paving of flat field-

stones. It was recommended that a site examination survey be completed at the proposed pump station if this feature cannot be avoided. Archaeologists excavated 4 trenches, 8 test pits, and reexcavated the original Phase 1 test pit. Also, the outline of the stone pavement below the surface was probed and its dimensions mapped. The stone pavement is not a domestic structure, but it may be linked to a stone retaining wall uncovered beneath Pine Street just north of the Basset Brook Site. The stone pavement may represent the remains of a floor for a small saw mill beneath a shed structure. No other architectural features were found in association with the feature.

25-2801 Rainey, Mary Lynne, Joyce M. Clements, and Richard Petyk
2007 Supplemental Intensive (Locational) Archaeological Survey, Riverfront Reroute, Freetown, Massachusetts. 63 pages.

This survey included the excavation of 16 test pits in a single transect at 10m intervals within the centerline of a proposed gas pipeline. This survey follows earlier studies that have identified numerous sites along the lower Taunton River, including the Taunton River Marsh Site (19-BR-107), the Barnaby Swamp 2 Site (19-BR-496), and the Riverfront Reroute Find Spot (19-BR-625) (see reports #25-1219, #25-2202, and #25-2468). Field investigations did not recover any important artifacts or features within the project boundaries, therefore no further work is recommended. Archaeologists identified one historic fieldstone wall adjacent to the project boundaries and research indicated that it represents 19th-century agricultural use. No further archaeological investigations are recommended.

25-2802 Doucette, Dianna, and A. Peter Mair, II
2007 Intensive (Locational) Archaeological Survey, Omnipoint Communications Cell Tower 4BN0149A, Wayland, Massachusetts. 47 pages.

The survey included research and field investigations, consisting of 1, 10x10m block containing five test pits arranged in a staggered grid pattern within the 40 square foot proposed cell tower area, and six test pits at 10m intervals along a judgmental transect on the north side of the gravel road in the location of the proposed utility lines. No cultural materials, features, or soil anomalies were identified or collected within the proposed project area. No further archaeological investigations are recommended.

25-2803 Donta, Christopher, and F. Timothy Barker
2006 Connecticut River 2005: Archaeological Survey (Phase 1B) of Three Parcels for the Connecticut River Bank Stabilization Project, Gill and Northfield, Massachusetts and Vernon, Vermont. 48 pages.

In total, 475 STPs, 23 1x1m units, and 7 backhoe trenches were excavated. Evidence of four Native American sites and one historic site was found. The French King Rock Site (19-FR-421) produced three Native American subsurface cultural features and 316 artifacts, including over 180 pottery sherds. The second site, South Split River Farm Site (19-FR-420) produced five Native American subsurface cultural features and 122 artifacts. These artifacts include pottery, two triangular projectile points, and a probable Woodland Lanceolate point. The third site, North Split River Farm (19-FR-303), produced six Native American subsurface cultural features and 826 artifacts. These artifacts include two Small Stemmed projectile points and pottery. The fourth site, Great Meadow South (19-FR-419), produced three Native American subsurface cultural features and 16 artifacts, including thin-walled decorated pottery sherds in association with the features. In addition, the Great Meadow Ferry, site of a historic crossing on the Connecticut River and the historic roadway leading to the ferry, is located at the northern end of the Great Meadow South survey unit. The ferry is present on late 18th and 19th-century maps and may date much earlier. It was recommended that the four Native American and one historic site be avoided. If this is not

possible, site examination surveys are recommended. No sites were found in the Kendall Farm survey unit in Vernon, Vermont, and no further survey is recommended there.

25-2804 Heitert, Kristen, and Anna Graves
2007 Archaeological Site Examination, Barnaby-Wordell Site, Freetown, Massachusetts. 77 pages.

The Barnaby-Wordell Site is a historical farm complex consisting of house, barn, and silo foundations. Archival/deed research revealed that the identified house foundations are the remains of the former Barnaby House, built ca. 1740 and occupied until the early 20th century after which time it, and the barn, likely were dismantled. Subsurface testing at the Barnaby-Wordell Site included the excavation of 50 test pits and five excavation units. A total of 1,163 pieces of post-contact cultural material including domestic and architectural debris ranging from the early 18th through 20th centuries (Westerwald and English white saltglazed stoneware, creamware, pearlware, redware, yellow ware, delft, whiteware, machine-cut and hand-wrought nails, brick, dark green bottle glass, and window glass) was recovered. A builder's trench was identified but no stratified cultural material concentrations or features were identified around the house or within the house lot. Further archaeological investigations have a low probability of recovering additional data sufficient to address substantive research questions about the site; no additional archaeological investigations are recommended.

25-2805 Graves, Anna K., and Dianna L. Doucette
2007 Intensive (Locational) Archaeological Survey, Sharon Commons Lifestyle Center, Sharon, Massachusetts. 51 pages.

A total of 195 test pits were excavated within the 57 acre project area. These test pits were excavated within three 30x30m blocks, along 19 judgmental linear transects, and 15 judgmentally placed test pits were also excavated. The survey identified two new pre-Contact period sites and one find spot, and one post-contact period site. The Sharon Commons 1 Site is located across the top of a broad, flat, wooded knoll that is bounded by low wetlands in all directions. Cultural material was recovered from five distinct small activity areas within the larger site. The recovered materials include quartz and rhyolite chipping debris and several bifacially flaked tool fragments. The Sharon Commons 2 Site (19-NF-644) is located on small, steep sided ridge that is bounded on all sides by wetlands. A total of 11 test pits were placed on the crest of the ridge; seven pieces of rhyolite chipping debris were recovered. The topography and overall low density of the site indicates that the Sharon Commons 2 Site likely functioned as a single-use lithic workstation. Find Spot 1 (19-NF-645) is located south of the Sharon Commons 1 Site on a flat, wooded terrace and consists of one jasper Fox Creek Lanceolate projectile point. A total of 15 test pits were placed in this area and no other cultural material was recovered. A post-contact site was also documented during the intensive survey. The site consists of a depression in a wooded parcel. A moderate density of cultural material was recovered from these test pits, including bottle glass, whiteware, and an unidentified coin. Although the Old Post Road Site could not be identified on maps or in town histories, the artifact assemblage indicates that it dates from the late 1800s to early 1900s. It is unlikely that further archaeological investigation will uncover additional information about the size, complexity or temporal affiliation of this site.

25-2806 Pendry, Stephen
2007 Management Summary Barn Foundation: Frederick Law Olmsted National Historic Site, Brookline, Massachusetts. 9 pages.

Two test pits were placed at the barn at the Frederick Law Olmsted National Historic Site before rehabilitation projects were carried out at the site. One was placed on the east side of the barn and the other on the west side. The test pits yielded many ceramics sherds from disturbed soils. It was

recommended that further work conducted on the east side of the barn be monitored (see report #25-2535).

25-2807 Chartier, Craig S.
2007 Report on the Site Examination Testing and Monitoring of the Reconstruction of the Acton Stone Chamber, Acton, Massachusetts. 62 pages.

The Acton stone chamber has been known for many years, but it is within the last 40 years that, due to both human and environmental factors, it has suffered its most severe deterioration. The deterioration has reached the point where, because of its location on public land with open access and the severe danger of collapse, it must either be rebuilt or demolished. The town decided to restore the structure. Restoration included removing the soil on the roof of the chamber and the walls of the passage leading into it. Archaeological testing was proposed for areas adjacent to the interior and exterior walls of the passage and the adjacent stone foundation before the soil was removed. The archaeology revealed information on the methods of construction of the walls, the original depth of the floor of the passage, the purpose of the foundation adjacent to the stone chamber (likely components of a 19th-century farmstead), and the area between the stone chamber and the foundation. Materials recovered during the course of testing included one possible Middle Archaic Neville-like projectile point recovered from a fill layer as well as artifacts spanning the late 18th to late 20th centuries.

25-2808 Wheeler, Kathleen, and Alexandra Chan
2005 Results of Archaeological Site Investigation and Data Recovery of Bays 1–4 of Carriage Shed/Visitors Center, Little Farm, Newbury, Massachusetts. 154 pages.

Archaeologists tested inside and outside of four bays of the standing 1890s carriage shed at the Little Farm, which Historic New England planned to expand as part of the Little Farm Visitors Center. Testing addressed possible features below a concrete slab within the carriage shed that would become inaccessible once the expansion was completed. The survey also sought to determine dates of construction of an earlier "open" shed thought to have stood at the same location. Intact 19th-century deposits encountered early in the process guided the testing strategy. Of the 28 excavation units, deposits consistently date to the second and third quarter of the 19th century, and were found in particularly high concentrations in certain areas. These findings complement map and documentary evidence of a mid-19th-century construction date for the open sheds. In addition, discovery of 17th- and 18th-century artifacts suggest that these sheds may have obliterated evidence of earlier outbuildings in the same spot. This data recovery provided a representative sample of archaeological deposits associated with the 1890s building as well as structures that stood before (see report 25-2810).

25-2809 Hayes, Katherine Howlett
2007 Site Investigation of Foundation-Associated Archaeological Resources at the Historic Winslow House in Marshfield Massachusetts. 83 pages.

The Winslow House was originally constructed in the early 18th century by Isaac Winslow, grandson of *Mayflower* passenger and Plymouth Colony leader Edward Winslow and was occupied by subsequent Winslow generations until its sale in the early 19th century. Prior to rehabilitation of the house potential impacts to archaeological resources needed to be identified. The site investigation was accomplished in open excavations of 50% of the subsurface area indicated by contractor specifications for impact. This amounted to 10sq m excavated in six separate units distributed judgmentally throughout the area. The investigation indicates that in some very limited areas the remains of the original foundation trench were intact. More frequently, however, those remains were altered by episodes of re-excavation, in some cases for the purposes of structural repair and updates and in other cases for the introduction of new landscape elements. All of the excavated

units contained a moderately high volume of artifacts dating from the 18th through the 20th centuries. A very small number of presumably prehistoric lithic artifacts were also recovered. Given the limited evidence of intact significant archaeological resources despite the high volume of material, the Winslow House was given clearance to proceed with their planned improvements (see report #25-2518).

25-2810 Wheeler, Kathleen, and Anthony Booth
2007 Results of Archaeological Survey and Monitoring for Spencer-Peirce-Little Dry Wells, Newbury, Massachusetts. 32 pages.

Archaeologists conducted a systematic survey to test four proposed dry well sites at the Little Farm. Eight test pits were excavated and contained artifacts dating from the 18th to 20th centuries. A single piece of lithic debitage was recovered from a plow zone in the field east of the house. No features were observed. Archaeologists monitored the mechanical excavation of geotechnical test pits.

25-2811 Chartier, Craig S.
2007 Report on Intensive Survey and Data Recovery Investigations at the Former Location of the Tobey-Fearing-Bliss Burial Ground, Wareham, Massachusetts. 140 pages.

Investigations at the site of the Tobey-Fearing-Bliss Burial Ground identified the former locations of 12 burials that were disinterred in 1935 and moved to Centre Cemetery in Wareham. Investigations also identified other cultural features including pathways, a monument base, and possibly a sitting area. Test trenching outside of the burial ground during the intensive survey detected no burials outside the marked boundaries of the burial ground. A single human humerus was detected during the intensive survey. The data recovery phase consisted of excavation of the single grave where the human remains were encountered. Artifact analysis conducted on the fragments of coffin and casket wood identified several species selected for the caskets. Broader analysis of the burial artifacts, grave markers, and burial ground organization addresses the role of, and the participants' active engagement with the Romantic Movement and the Beautification of Death Movement. The humerus and all grave related artifacts (coffin and casket wood and hardware, milk glass button, and turtle shell comb fragment) will be reburied in Centre Cemetery in the plot containing the remains disinterred in 1935. All other non-grave artifacts will be curated at the Wareham Public Library. Archaeological monitoring was conducted during construction related activities at the site with no further grave shafts being encountered. No further investigations are recommended.

25-2812 Ritchie, Duncan
2007 Archaeological Site Examination, Beaver Pond Site, Beaver Pond Commons, Milford, Massachusetts. 63 pages.

The Beaver Pond Site was identified from chipping debris of several lithic materials and a bifacial tool blade found during an intensive survey conducted in 2006 (see report #25-2745). The hornfels chipping debris indicated the site contained a Middle Woodland Period (circa 1,600 to 1,000 years before present) component, and it was considered a potentially significant cultural resource. Since avoidance of the Beaver Pond Site did not appear to be possible, a site examination was conducted. Subsurface testing for the site examination consisted of 32, 50x50cm test pits and 4, 1x1m excavation units. More than 400 pieces of chipping debris were found during the site examination. The concentration of quartz and quartzite chipping debris forming the central portion of the site was a small lithic workshop or activity area. Four bifacial tool blades, two cores, and a worked flake of quartz and quartzite were found in this lithic workshop area. No diagnostic artifacts or features were found and the site did not yield sufficient charcoal for radiocarbon analysis. Based on the results of the site examination, the Beaver Pond Site was not considered a potentially significant cultural resource. No further archaeological investigation was recommended.

25-2813 Largy, Tonya, Paul Gardescu, and Royce Kahler
2008 Archaeological Intensive (Locational) Survey of the Greenways Conservation Area Canoe Landing/Walkway/Viewing Terrace, Wayland, Massachusetts. 84 pages.

Diagnostic stone tools (a bifurcate base point made of Attleboro Red felsite and a Wayland Notched (Dudley variety) point made of hornfels) and ceramic sherds indicate occupation during three major time periods, Early Archaic, Transitional Archaic, and Late Woodland. Radiocarbon assays of 4150+/-60 (GX-28955) and 460+/-40 (GX-28954) support both the Late Archaic and Late Woodland dates. Biological data contribute to understanding subsistence activities of the people who camped at Greenways in the Late Woodland. Analysis of calcined bone fragments resulted in the identification of at least four taxonomic classes, mammal, turtle, snake, and fish. Bird bones may be present as well. Charred botanical data include wood, a limited quantity of nutshell and one cultigen. The presence of a single maize kernel raises the question of whether pre-colonial horticulture may have been practiced in the arable fields adjoining the knoll, where agriculture has been practiced for at least one century and perhaps longer. Season of occupation suggested by these limited data for both animal and plant remains in dated contexts suggests a spring through fall habitation, or some part of this warm weather season. Ceramics and small animal remains also suggest collecting activities of women and children carried out close to camp.

25-2814 Chartier, Craig
2007 Report on the Intensive Survey at Cavossa Park in Middleborough, Massachusetts. 40 pages.

One hundred and twenty-four 50 x 50 cm test pits were excavated. No historic or ancient Native American artifacts were recovered, confirming the research prediction that the area had a low sensitivity for historic resources, due to the stony soils and general lack of evidence for large scale prehistoric occupation in this section of Middleborough.

25-2815 Chartier, Craig
2007 Report on the Intensive Survey at the Wildcat Hill Definite Subdivision in Norwell, Massachusetts. 71 pages.

Two hundred and twenty-nine 50 x 50 cm shovel test pits were excavated in the project area along eight transects, four blocks and two judgmentally test pit locations. No ancient Native American archaeological resources were encountered. One historical cellarhole dating to the late 18th to early 19th century was identified in the northeastern corner of the project area. Stonewalls forming boundary walls and possible enclosures were encountered across the project area and especially in the eastern half of the area to be impacted. Due to the fact a significant portion of the Edward Humphries Homestead Site, including the cellar hole, has been impacted by previous activities, resulting in a lack of integrity for these areas, coupled with a lack of documentary evidence relating to the occupation by Humphries, this site is not considered significant. No further testing is recommended for the Edward Humphries Homestead Site (see report #25-2717).

25-2816 Cherau, Suzanne G., and Jennifer Bonner Banister
2007 Intensive (Locational) Archaeological Survey, Upper Shawme Lake Dam Rehabilitation, Sandwich, Massachusetts. 105 pages.

Archival research, walkover/surface inspection, and subsurface testing were conducted to locate and identify significant historic and archaeological resources in the terrestrial portions of the project and prepare sufficient photographic and cartographic documentation for archival purposes. The archival research and field investigations resulted in the identification of three spatially distinct historic and archaeological resource areas. The H.D. Tobey Historic Site consists of the dry-laid stone foundation and associated structural, artifact, and landscape remains that straddle both sides of the proposed construction access road. Avoidance and protection of the visible site elements, including the cellar hole/foundation to the north side of the access road, and ancillary work areas and structural remains to the south side, is recommended. The Upper Shawme Lake Native

American Site yielded 46 lithic debitage and one biface tool from 0 to 30 cm below surface in natural A_1 and B_1 soil horizons. These deposits could represent a small campsite where the manufacture/maintenance of chipped stone tools may have been the primary on-site activity. The site has the potential to contribute new information about the use of the Cape's glacial uplands by pre-contact period Native American groups and the relationship of the uplands to coastal resource exploitation and settlement. Avoidance is recommended for the 150-foot (45-m) long section of the proposed access road where associated cultural deposits are present. The Upper Shawme Lake dam and mill remains are potentially significant. Modern period slumpage of the earthen dam and repairs to the spillway along with vegetation overgrowth and high water levels prevented a detailed archaeological and photographic documentation of the historic dam structure. Archaeological monitoring will be conducted during construction to record the historic structural remains within the existing dam and spillway structure, as well as any unrecorded features in the pond drawdown areas.

25-2817 Hodge, Christina, with Thomas F. Mahlstedt, and Sally Pendleton
1999 Historic Archaeological Resources at Breakheart Reservation, Saugus, MA. 63 pages.

The management of Breakheart Reservation, a woodland park owned by the Metropolitan District Commission (now the Department of Conservation and Recreation), requires a balance between the interests of recreational land use and resource protection. This paper summarizes the known cultural resources within the park and recommends management guidelines for resource identification, stabilization, protection, and preservation. Additionally, the Breakheart Reservation should be nominated to the National Register. This paper also contains copies of Thomas F. Mahlstedt's "A Prehistoric Site Overview with Cultural Resource Assessment & Management Recommendations for Breakheart Reservation" (1991) and Sally Pendleton's "The Breakheart Reservation: Deed Research" (1992).

25-2818 Sheppard, William J., Alan Lee Hankin, and Patricia K. Sheppard
2002 People of the Coast: Archaeology and Education. Report of Multi-year Reconnaissance and Intensive Archaeological Study. 2 volumes. 180 pages.

The program People of the Coast was a five-year project in Dartmouth undertaken to introduce 176 teachers to coastal ecology and archaeological excavations as a tool for curriculum development in social studies and environmental education. For the archaeological portion of the program, the concepts of form, function, and cultural process were introduced and used as an integrating theme throughout the workshops. Thirty three 50 by 50 cm shovel test units were excavated at four locations. Two Late Archaic sites, the Sassafras Midden (19-BR-484) and Osprey Point (19-BR-489), were located. The Bragdon Drive Pond (19-BR-549) Site, with a single Late Woodland quartz Levanna point, was recorded. An initial study of the shellfish samples taken from the Sassafras Midden Site suggest that it served as a short duration, task specific site. The site yielded predominately quahog and soft shell clams, a single spear point and no architectural features. The midden appears to have resulted from the intensive harvesting of a single, abundant species rather than the long term foraging along the estuary and was likely part of a larger complex of task specific work sites. Two historic house cellars, the Hardscrabble Farm (DAR-HA-9) and the Crapo-Avilla (DAR-HA-48) house sites, were also identified. Twenty three 1 m square test units and four 50 cm by 1 m units were excavated at the Hardscrabble Farm Site. Several features were located and left for future study with the main emphasis on the identification of yard use areas and 19th-century disposal patterns. These were interpreted through the use of analytical models like artifact density, mean ceramic dating, ceramic value index, bone ratio index and functional group analysis. The distribution of refuse on the site suggests that household refuse accumulated in two areas of the yard, 12 m south of the house site along a stone wall and eight m to the east. In the mid-19th century, as the Hardscrabble farm house was being built, the local economy was shifting to truck farming and fishing to supplying the growing populations of New Bedford and South Dartmouth. Eventually with the rise of industrial capitalism, coastal farms were purchased by the heirs of wealthy capitalists for recreational homes with a gradual decline in local farming. During the five year program, the four reconnaissance transects and the more intensive testing of the Hardscrabble

Farm Site combined covered 8,100 square of the Lloyd Center. This is roughly 2 acres or 4% of the center's 55 acres. It is hoped that the project will form the basis for a long term study of the coastal environment in southern Massachusetts (see report #25-2258).

25-2819 Donohue, Barbara, and Robert Thorson
2007 Tennessee Gas Pipeline Company's Essex-Middlesex Project, The Stone Walls Along the Tennessee Gas Pipeline Corridor Using a Stone Wall Taxonomy to Interpret Vernacular Design. Lynnfield, Saugus, and Wakefield, Massachusetts. 42 pages.

Stone wall structures associated with two historic sites, and 20 historic stone walls were located. Two walkovers of the proposed pipeline corridor were conducted to verify and locate stone walls and to document and evaluate the walls. All stone walls within the pipeline corridor have been described, evaluated, and photo-documented. While it was not possible to date each stone wall, it was possible to associate the stone walls with an appropriate historic context. Treatment of all the stone walls will consist of reconstruction of the stone walls that will be directly impacted by the project.

25-2820 Donohue, Barbara
2007 Archaeological Data Recovery of the Old Country Road (1766-1852), Northampton Water Treatment Plant, Williamsburg, Hampshire County, Massachusetts. 46 pages.

An archeological data recovery consisting of the backhoe excavation of an 8m long trench was conducted across a discontinued section of a 1766 county road in Williamsburg and Whatley, MA in order to investigate, record, analyze, and document archaeological deposits and features relating to the historical construction techniques and engineering of the road. The road had been previously determined eligible for listing in the National Register of Historic Places under Criteria A and C. As a result of the survey it was revealed that the present travelway represents a widening of the road's original layout. The road is tied to the settlement and early development of the town. It is recommended that the road be considered eligible for listing in the National Register under Criterion D also.

25-2821 Parson, Kimberly, and Daniel Cassedy
2007 Phase III Archeological Investigations in Area 7 of the Saugus Iron Works National Historic Site, Saugus, Massachusetts. 74 pages.

Data recovery investigations involved the excavation of 10 test units within the footprint of proposed impacts that produced a total of 5,377 prehistoric artifacts and 936 historic artifacts. Among the prehistoric artifacts were 16 projectile points, 13 bifaces, seven cores, 5,327 pieces of debitage, three sherds of prehistoric ceramics, and 11 pieces of fire cracked rock/cobbles. Features included two prehistoric postmolds, two prehistoric pit features, and one prehistoric disposal trench or infilled drainage swale. Phase III excavations revealed that the major occupations within the excavated area date from the Middle Archaic through Terminal Archaic and Middle to Late Woodland periods. These components are marked, respectively, by the recovery of Neville Stemmed, Squibnocket Stemmed, Vosburg, Broadspear, Fox Creek, and Levanna points at the site. However, testing failed to detect discrete components at the site due to the horizontal overlap of occupation areas within the historic buried plowzone for these components. Data recovery investigations of the historic component at Area 7 revealed a 19th through early 20th-century scatter at the site. This work produced a total of 936 historic artifacts, half of which were comprised of nondiagnostic materials. Diagnostic artifacts indicate manufacturing date ranges from the mid-18th century through the late 19th to early 21st century. An applied label on glass, which indicates a date of 1935, suggests that the historic ground surface may date roughly to the first quarter of the 20th century. Three historic features (Features 18, 21, and 22) were identified during these investigations. Feature 18 represented a builder's trench associated with the residence to the north. Feature 21 consisted of modern utility trench and pipe. Feature 22 represented a cinderblock cesspool with a concrete cap and sandy fill (see report #25-2667).

25-2822 Smith, Leith
2007 Final Report on the Archaeological Intensive Survey of the Long Island Section of the Spectacle Island-Boston Harbor-Long Island Sewer Line (Contract C21AC), Central Artery/Third Harbor Tunnel Project, Boston Harbor Islands, Massachusetts. 56 pages.

Archaeological investigations proceeded in two phases consisting of 10 and 20 m interval shovel testing in areas of high and medium potential respectively, followed by machine-assisted scraping and trenching. Two possible postholes, a metal culvert, abandoned phone cable, a cobblestone pavement, and a ca. 1930s-40s road surface were identified.

25-2823 Smith, Leith
2007 Final Report on the Archaeological Site Examination of the Robert Murray Farmstead Complex on the Gore Place Society Property, Waltham and Watertown, Massachusetts. 42 pages.

Visible cultural resources included the brick foundation of a late 18th to early 19th-century farm house that was moved to the former Gore mansion grounds in the late 1930s. This house served as the home of estate gardener, Robert Murray, between 1837 and 1856. Seven members of Murray's family and nine laborers also lived in the house. An archaeological site examination investigated the former farm core with 29 shovel tests and a 1x1 m excavation unit. Identified features include the house foundation, a possible well, possible raised planting bed, cellar hole and midden area. Deep deposits of mixed later 19th and early 20th-century materials were found around the house and on the terrace to its west. A buried A-horizon containing late 18th to early 19th-century artifacts was present in some tests in the area. A deep midden deposit was found immediately south of the house and an additional midden area identified by artifact scatters and low mounds is present south east of the house. All of the midden deposits appear to be associated with the occupation period of Robert Murray, evidenced by the date of the artifacts and fragmented planting pots. An elevated area of fine sandy loam west of the farm house site is interpreted as a planting bed. The former farm core was found to be in an excellent state of preservation. Due to its association with documented estate manager and gardener, Robert Murray, the site maintains the potential to provide data important to the gardening tradition established by Gore earlier in the century. In addition the site along with Gore Place has important historic and archaeological research and interpretive values for understanding the vital functional role of staff to maintain the estate as well as the social and physical separation with the owners and their families reflecting the trend in social history to interpret the presence, activities and experiences of domestic managers, servants and laborers at the property. The farm site was recommended to meet the Criteria for Eligibility for listing in the National Register of Historic Places under Criteria A and D as a contributing property to Gore Place. The farm core was placed under a preservation restriction to ensure the site's preservation (see report #25-2717 and 25-2845).

25-2824 Cherau, Suzanne G.
2008 Supplemental Cultural Resources Report: Reconnaissance Archaeological Survey MBTA Silver Line Phase III Project, Boston, Massachusetts. 47 pages.

The report examines the archaeological sensitivity of the Core Tunnel Segment along Essex and Boylston streets, and the construction of the Chinatown Silver Line station. Review of borings taken in 2005 and additional documentary review of 1895/1896 plans, papers in the Massachusetts Historical Society, and consultation with the City of Boston Historic Burying Grounds Initiative were conducted to determine the possibility of impacting the Central Burying Ground, previously impacted during the construction of the Tremont Line in the late 19th century. The Boylston street portion of the Core Tunnel Segment is assigned a high sensitivity for redeposited human associated with the 1895 construction of the Tremont Street Subway (see report #25-2551).

25-2825 Doucette, Dianna L.
2007 Intensive (Locational) Archaeological Survey of the Cole Property Water Supply Project Area, Carver, Massachusetts. 54 pages.

The intensive survey included archival research, a walkover survey, and subsurface testing on approximately 123 acres of the 221 acre parcel. A total of 176, 50 x 50 cm test pits were excavated. Two previously undocumented pre-contact period sites and six isolated find spots of pre-contact cultural material were identified. Fifteen test pits were excavated within the Cole Property 1 Site area, with five test pits containing pre-contact period cultural material that include six quartz and two quartzite pieces of chipping debris in a relatively undisturbed, contained area. Twenty-one test pits were excavated within the Cole Property 2 Site that yielded 71 pieces of quartz chipping debris, one quartz Squibnocket projectile point, and one quartz scraper. The concentration of quartz chipping debris and the quartz Squibnocket Triangle projectile point indicate that the site likely functioned as a single-use lithic workstation during the Late Archaic Period (ca. 6000 to 3000 BP). The six find spots of cultural material likely represent activities such as stone tool maintenance and hunting. The isolated pieces of chipping debris likely represent stone tool re-sharpening or manufacturing of an expedient tool such as a scraper or knife, and the projectile point is likely a result of a single hunting incident.

25-2826 Doucette, Dianna L.
2007 Intensive (Locational) Archaeological Survey of the Ellen's Way Subdivision Project Area, Nantucket, Massachusetts. 72 pages.

A total of 100, 50 x 50 cm test pits were excavated. Eighteenth-century ceramics, pipes, nails, and glass were recovered. The majority of the cultural material was recovered from the plow zone (Apz) and the Apz/B_1 interface horizons, and from soils heavily disturbed by access roads, recent drainage systems, modern buildings, as well as root-related bioturbation beneath the plow zone. The low density of cultural material recovered together with the poor site integrity does not suggest a potentially significant site is present.

25-2827 Graves, Anna K., and Holly Herbster
2008 Intensive (Locational) Survey, Industrial Tower and Wireless Grafton Cell Tower, Grafton, Massachusetts. 45 pages.

Twenty-one 50 x 50 cm test pits were excavated within archaeologically sensitive portions of the proposed project area, comprised of the tower and compound area, and the access road. No cultural materials were identified.

25-2828 Gillis, Nichole, and Holly Herbster
2008 Intensive (Locational) Survey, South Natick Hills, Natick, Massachusetts. 47 pages.

The approximately 50.8 acre parcel contains large areas of rock ledge, previous disturbance, and wetlands. Fifty 50 x 50 cm test pits were excavated within the approximately 7.5 acres with moderate to high sensitivity. Subsurface testing was completed along 10 judgmental transects. No potentially significant cultural resources were identified.

25-2829 Pasquariello, Raymond, Anna Graves, Jennifer Macpherson, and Kirk Van Dyke
2002 Maritimes & Northeast Phase III Pipeline Project, Massachusetts Archaeological Site Examinations Summary Report. 120 pages.

This report summarizes the results of archaeological investigations for 25 miles of 30-inch diameter natural gas pipeline through Methuen, Boxford, North Andover, Middleton, Peabody, Danvers, and Salem. Fifteen prehistoric archaeological sites were identified along the proposed route. Included are the results of the 15 site evaluations and provides recommendations for each site. Of these 15 sites, six appear to meet the criteria for National Register of Historic Places eligibility. The Nanson Site (19-ES-847) yielded artifacts suggesting it was a lithic workshop used in the Late Archaic to Transitional Archaic periods. The Mosquito Brook Site (19-ES-808) showed signs of both lithic manufacture and food processing, suggesting it was a short term hunting camp, established at the end of the Transitional Archaic. The Emerson Brook II Site (19-ES-802) appears to be a lithic workshop and campsite with a wide variety of lithic materials. This site also produced a

charcoal lens as well as a post-hole stain. The Dark Pond Site (19-ES-804) contains an exceptionally high density of chipping debris and partially completed tools, interpreted as being a lithic workshop. The South Bend/Tall Pine Site (19-ES-799) was thought to be two separate sites until excavation revealed no distinction between the two loci, showing it to be a single large multi-component site. This large site yielded features and artifacts involved with a range of activities such as pottery, bones, shells, chipping debris, hammerstones, bifaces, and projectile points. As such, the site has been interpreted as site used for habitation, food consumption, refuse disposal, resource processing, and lithic tool maintenance/manufacturing dating from the Middle Archaic to the Middle Woodland. The Kernwood Site (19-ES-408) has a wide variety of artifacts and a stone feature of unknown function. Chipping debris, bifaces, hammerstones, groundstone tools, pottery, as well as historic artifacts and intact soils are found at this site. The sites not considered eligible for listing in the National Register of Historic Places are Hovey's Pond (19-ES-810), the Elred Site (19-ES-809), Boston Brook (19-ES-807), Emerson Brook I (19-ES-800), Hearth Ridge (19-ES-801), the Centerline Site (19-ES-805), Swamp Island (19-ES-804), the Dirt Jump Site (19-ES-798), and the Kiah Site (19-ES-806) (see report #25-2427 and 25-2776).

25-2830 Landon, David B. (editor)
2007 Investigating the Heart of a Community: Archaeological Excavations at the African Meeting House, Boston, Massachusetts. 198 pages.

The African Meeting House was originally built in 1806, and renovations in preparation for the 2006 bicentennial celebration prompted an investigation of areas of the property to be impacted by the proposed construction. The field team opened and explored about 19 m^2 of the site in the backlot south of the Meeting House and alley to the west. These excavations recorded information about a series of significant features and deposits, and collected over 38,000 artifacts and a series of soil samples for a detailed archaeobiological research program. In terms of significant features and deposits, the west alley was almost entirely a series of builders' trenches reflecting the historic sequence of construction and remodeling of the Meeting House and adjacent buildings to the west. In the backlot, the units against the south wall of the Meeting House contained similar builders' trenches. The backlot also contained a series of stone and brick drains and a trash-rich midden layer. The vast majority of artifacts in the Meeting House backlot date from about 1806–1840. The ceramics assemblage is particularly large, and reflects both community meals at the Meeting House and business of Domingo Williams, a caterer who rented a basement apartment. Finally, only one feature was studied in the south yard, a privy that was for the 44 Joy Street property. The bottommost layer of the privy was an artifact rich nightsoil layer, dating to about 1811–1838, and containing the trash of African American tenants living at 44 Joy Street. Together, the archaeological deposits in the backlot provide a variety of insights into living conditions, economic opportunity, foodways, health, and daily life for 19th-century Boston's free black community.

25-2831 Pretola, John P., and Joyce M. Clements
2008 Final Report: Defining a Potential Archaeological District in the Lower Taunton River Basin. 112 pages.

This report describes an archaeological district along the lower Taunton River in Freetown and Fall River. The report distills Wampanoag perspectives on the Taunton River and adjacent landscapes, defines an historical context for the area, evaluates the integrity of known sites, formulates a statement of potential historical significance and eligibility criteria, generates a list of contributing sites, and suggests appropriate boundaries for enclosing the potential district. Contributing archaeological sites date from the Archaic through the Woodland Period and the entire area remains significant to contemporary Wampanoag people. Contributing sites are unified culturally, temporally, and geographically, but are spatially discrete.

25-2832 Herbster, Holly, and Dianna L. Doucette
2008 Intensive (Locational) Archaeological Survey, Red Gate Farm-Lot 1 Project Area, Aquinnah, Massachusetts. 67 pages.

The intensive survey included archival research, a walkover survey, and subsurface testing. One hundred test pits were excavated within 30 x 30 m blocks and along linear transects within the approximately seven acre project area. The survey identified the pre-contact Red Gate Farm Site, which consists of a high density of chipping debris, shell and animal bone fragments, and chipped and groundstone tools, in addition to cultural features including lithic workshops, shell middens and storage pits. The recovery of diagnostic Neville variant, Brewerton, Squibnocket Triangle, Small Stemmed and Levanna projectile points suggests that the site may have been occupied over the past 7,500 years, from the Middle Archaic through the Woodland periods. This site may be associated with the Hornblower II Site (19-DK-44) identified by William Ritchie less than 50 m from the project area. The Red Gate Farm Site is considered potentially significant and may be eligible for listing in National Register of Historic Places.

25-2833 Cherau, Suzanne G., and Jennifer Bonner Banister
2007 Archaeological Investigations, North Point Project including the Lechmere Station Relocation Project Area of Potential Effect, Cambridge/Somerville/Boston, Massachusetts. 145 pages.

The archaeological investigations were undertaken in advance of a large-scale urban development that will transform a nearly abandoned 45 acre industrial site into a new mixed-use neighborhood. Extensive archival research including a review of all extant geophysical data for the area was undertaken. Subsurface testing was conducted in the archaeologically sensitive portions of the project. The testing included three machine-assisted trenches that ranged from 2 m wide by 19 m long designed to specifically intercept potential belowground remains of the documented Millers River seawall and associated shoreline. No archaeological evidence of the large granite seawall and wooden pile and plank wharf documented from the early 1850s to 1902 for the recorded Seawall/Millers River shoreline was identified in any of the three trenches. Two machine-assisted trenches that ranged from 2 m wide by 11 m long were used to investigate belowground remains of the New England Glass Company furnaces and flue system. The testing determined that late 19th-century conversion of the main glassworks furnace and flue system for use in the boiler house and power plant resulted in the large-scale destruction of these resources. The majority of these resources were likely further impacted by earthmoving associated with the use of the area as a 20th-century railroad freight loading facility serviced by a network of multiple parallel tracks. The archaeological testing, however, did locate and identify the probable remains of the mid to late 19th-century factory's central flue for the octagonal draft stack. Forty-one feet of the central flue and several of the connecting subterranean furnace rooms of the New England Glass Company were documented. Excavations also documented the alteration and re-use of these structures for a late 19th-century boiler house and power plant. One additional machine-assisted trench measuring 2 m wide by 10 m long was used to investigate the area of the documented lead furnaces and clay pot house. No evidence of these resources was identified during subsurface testing. The remains of these industrial works appear to have been removed from the site in the early 1900s by the Boston and Maine Railroad.

25-2834 Gillis, Nichole, and Dianna L. Doucette
2007 Intensive (Locational) Archaeological Survey of the Bartlett Farm Windmill Project Area, Nantucket, Massachusetts. 68 pages.

The project area is situated on an approximately 0.03 acre undeveloped parcel within the Bartlett Farm Site (16-NT-102), and is near several other ancient archaeological sites. Seventeen 50 x 50 cm test pits, distributed along one linear transect and eight judgmental test pits, were excavated within the project area. No cultural materials or features were encountered.

25-2835 Cherau, Suzanne G.
2008 Reconnaissance Archaeological Survey, Haverhill-Merrimack River Walkway, Tasks A and B, MassHighway Assignment #34, Haverhill, Massachusetts. 89 pages.

The project involves two separate phases of design and construction that extend about 3,300 feet

on both sides of the Merrimack River between the Basiliere/Main Street (Route 125) Bridge and the Upper County/Joseph C. Comeau Bridge. The survey included archival research and a walk-over survey of the project work areas. The reconnaissance survey of the waterfront area on the south side of Washington and Merrimack Streets between the Basiliere Bridge and the Upper Comeau/County Road Bridge confirmed the extensive historic and modern period earthmoving disturbances (buildings, underground utilities, sea wall and flood wall constructions, etc.) in this section of downtown Haverhill. These disturbances have most likely resulted in the removal and/or severe perturbation of any intact pre-contact/contact period land surfaces and recorded sites that would have been present along the river shoreline. The project work areas on the north side of the river are assigned a low sensitivity. The Task B riverwalk route on the south side of the river is proposed to follow an abandoned railroad right-of-way. The railroad line, constructed in the 1830s for the Georgetown Branch of the Boston and Maine Railroad, included a roundhouse servicing facility at the west end of the project work area and a passenger station and rail-served grain mill at the east end. There is also one recorded Native American site in this area. Below-ground disturbances along this proposed walkway appear to be limited to the raised railroad bed and a municipal sewer easement that runs along the river shoreline. The proposed Task B project area below the railroad fill within the right-of-way is assigned a moderate sensitivity for both pre-contact/contact and post-contact (primarily railroad-related) archaeological resources.

25-2836 Doucette, Dianna L., and A. Peter Mair, II
2007 Archaeological Reconnaissance Survey, Tihonet Mixed-Use Development, Wareham, Plymouth, and Carver, Massachusetts. 61 pages.

Archival research indicated that the 6,000 acre project area was potentially sensitive to contain Native American cultural resources based on favorable environmental conditions. The results of the archaeological reconnaissance survey indicate that the potential for both pre- and post-contact period archaeological resources is high to moderate within the project area.

25-2837 Herbster, Holly, and Dianna L. Doucette
2008 An Intensive (Locational) Archaeological Survey of the Martha's Vineyard Museum New Museum Facility Project Area, West Tisbury, Massachusetts. 61 pages.

The approximately 9.7 acre parcel was tested with 56, 50 x 50 cm test pits placed along transects and in one 30 x 30 m block. The testing resulted in the recovery of a low density of historic field trash and a complete Otter Creek-like rhyolite projectile point designated the Luce Farm Find Spot (19-DK-243), that documents possible Late Archaic Period use of the project area.

25-2838 Mair, A. Peter, II
2008 Intensive (Locational) Archaeological Survey, MassHighway Assignment 38: Relocation of State Route 113 (Pawtucket Boulevard), Tyngsborough, Massachusetts. 53 pages.

Archival research indicated that the project area was considered potentially sensitive to contain Native American cultural resources based on close proximity to the Merrimack River. Fieldwork consisted of a walkover/surface evaluation and subsurface testing. Seventy 50 x 50 cm test pits were excavated along six transects and as eight judgmentally placed pits. No cultural material was recovered.

25-2839 Doucette, Dianna L.
2007 Archaeological Site Examination, Sharon Commons Lifestyle Center, Sharon Commons 1 Site, Sharon, Massachusetts. 45 pages.

The Sharon Commons 1 Site (19-NF-646) is located across the top of a broad, flat, wooded terrace measuring approximately 170 x 100 m, which is bounded by low wetlands in all directions. Ninety-eight 50 x 50 cm test pits and eight 1 x 1 m units were excavated within the Sharon Commons 1 Site. The site consisted of five distinct activity areas. In total, 477 pieces of Native American cultural material were recovered during the intensive survey and site examinations in-

cluding 461 pieces of chipping debris, nine chipped-stone tools (two projectile point fragments, one Stark projectile point, two scrapers, one biface, one uniface, two utilized flakes), four hammerstones, and two pottery sherds. An argillite Stark projectile point diagnostic of the Middle Archaic Period, and two pottery fragments diagnostic of the Woodland Period were among the recovered material. Cultural material was recovered from A_1 and B_1 between depths of 0 and 50 cms below surface. The Sharon Commons 1 Site is not considered eligible for listing in the National Register of Historic Places.

25-2840 Barker, F. Timothy, Mitchell T. Mulholland, Timothy Binzen, and Jennifer Wendt
2006 Archaeological Reconnaissance Survey and Cultural Resource Management Plan, Harrington Conservation Area, Lincoln And Weston, Massachusetts. 59 pages.

The study area consists of approximately 16 acres. Two water impoundments were once part of an 18th-century sawmill and gristmill complex. The survey mapped and documented multiple historic resources: Garfield-Jenkins-Harrington Mill (LIN-HA-57), Headley-Dudley Mill (WSN-HA-7), Bank Barn Foundation (LIN-HA-58), "Little" House (LIN-HA-56), and a historic cart path (LIN-HA-55). These sites are probably eligible for listing in the National Register of Historic Places, and should be avoided and preserved. Two zones were identified that have high potential to contain as yet unrecorded Native American sites. Specific recommendations were made for a proposed parking area. A cultural resource management plan was produced to assist in the future protection of cultural resources on the property.

25-2841 Leveillee, Alan
2007 Reconnaissance Archaeological Survey, Proposed Retail Development, Gill Road, Greenfield, Massachusetts. 41 pages.

The survey included walkover assessment and excavation of 14, 50 x 50 cm test pits in the few areas that retained sufficient integrity. The results of the reconnaissance archaeological survey of confirmed that the parcel is variably disturbed. With the exception of a single argillite flake from a buried topsoil lens one in test pit, no cultural materials were recovered from meaningful contexts.

25-2842 Pasquariello, Raymond D., and Richard Petyk
2008 Intensive (Locational) Archaeological Survey for the New England Power Company's L-14/M-13/N-12 Transmission Line Replacement Project, Fall River and Westport, Massachusetts. 74 pages.

Utility poles were to be replaced with ground disturbing activities of 168, 70 cm wide trenches. Existing ground disturbances, wetlands, and rock outcroppings resulted in eliminating 17 of the 168 proposed 50 x 50 cm shovel test pits. This resulted in 151 shovel test pits produced 86 Native American and 244 historical-era artifacts from plowzone, subsoil, and disturbed contexts at 5 pole locations. The Harold S. Freelove #63 Site (19-BR-637) is a lithic scatter/temporary habitation site. Artifacts were recovered from 16 shovel tests including a quartz scraper and quartzite biface. The Watuppa Water Board #61 Site (19-BR-638) is a lithic scatter/temporary habitation site. Artifacts were recovered from 25 shovel tests including a quartz biface tip and debitage of quartz, quartzite, and chert. Two additional sites were also found, Pole Location 62 (19-BR-636) and Pole Location 75 (19-BR-635) were both sites of less than 3 pieces of debitage.

25-2843 Donohue, Barbara, and Martin G. Dudek
2006 Intensive (Locational) Survey for the Academy Hill Subdivision and Reconnaissance Survey for the Southern Entrance Road to the Academy Hill Subdivision, Groton, Massachusetts. 38 pages.

The intensive survey included documentary research, a walkover survey, and a field investigation across the 95 acre development area in Groton and Pepperell. One hundred and three 50 x 50 cm test pits were excavated, consisting of 100 systematic test pits in 14 transects and three judgmental

test pits. The project area was extensively disturbed by approximately 400 to 500 percolation tests and access roads. Although no prehistoric cultural resources were found, two historic sites and two rural historic landscapes were identified. Historic Site 1 (GRO-HA-16) consists of a cellar hole and a stone-lined well. Historic Site 2 (PEP-HA-4) consists of a historic dump along a stone field wall. The rural historic landscapes consist of two historic dirt roads. A site examination was recommended for the two historic sites and further documentary research was recommended for the historic roads. Following a Notice of Project Change the areas of the two historic sites were avoided. A reconnaissance survey was then conducted at the location of a new second entrance for the development and a proposed detention basin. No further archeological work was recommended as both areas have considerable disturbance.

25-2844 Smith, Leith, and Allen Gontz
2008 Final Report on the Archaeological Intensive Survey for the Thompson Island Salt Marsh Restoration Project, Boston Harbor Islands, Massachusetts. 28 pages.

The construction area was tested with a series of ten, 10 m interval shovel tests arranged in four transects. Sand and gravel predominated with a low density of late 19th and 20th-century waterworn ceramics, glass, brick and coal. The south and west marsh perimeter was previously tested with 20 m-interval shovel tests by Barbara Luedtke in 1993 with only late 19th and 20th-century artifacts found. The remaining east and north tidal zone, therefore, was tested with nineteen, 20 m interval shovel tests. These revealed sandy clay loam soils and a low density scatter of mostly waterworn late 19th and 20th century artifacts. Two gray siltstone flakes and some shatter were identified in one test in plowzone on the northwest pond margin. Array tests revealed an additional gray-green chert flake. The small Native American activity locus identified in a plowzone context was designated Salt Marsh Site, 19-SU-102. The marsh bottom was remotely imaged using a subbottom profiler to search for potential submerged anomalies. Shallow conditions and gas-charged sediments obscured some readings, but a paleo drainage channel was identified approximately 2 m below the marsh bottom.

25-2845 Dubell, Gregory R.
2007 Visions of Grandeur: An Archaeological Investigation of Landscape Organization and Transformation at Gore Place, Waltham, Massachusetts. 122 pages.

This thesis presents a case study of landscape archaeology involving the use of archaeological and documentary evidence to study and interpret the ways the occupants at Gore Place shaped their landscapes through the deployment of cultural and social practices. The landscape was transformed from a working farm into a carefully constructed ornamental landscape. The results of the archaeological investigations and background research indicate that the landscape at Gore Place was altered in a way that reflected cultural influences from popular landscape styles of Europe at the time. The creation of an ornamental gentleman's farm at Gore Place indicates that Gore may have been emulating and imitating his European counterparts in an effort to achieve a level of social acceptance amongst his peers through notions of gentility, wealth, and social status (see report #25-2717 and 25-2823).

25-2846 Mulholland, Mitchell T., Jennifer Wendt, and Joannah L. Whitney
2008 Archaeological Intensive (Locational) Survey and Site Examination for the Bancroft Road/Town Hill Road Bridge Replacement Project, Becket and Middlefield, Massachusetts. 75 pages.

Twelve 50 cm x 50 cm shovel test pits were excavated during the archaeological intensive (locational) survey. The project revealed an interesting, and now largely abandoned mill community of Bancroft that emerged after the construction of the Western Railroad in 1840. In the late 1830s, more than 1,000 railroad workers (mostly immigrants from Ireland, Russia, Quebec, and Italy) lived on the hillsides immediately surrounding Bancroft. Several archaeological loci were identified during the initial survey: the remaining footprint and immediate surroundings of the 19th-century Becket Bulkley Dunton & Co. paper mill, the remains of two 19th-century houses, a his-

toric dump, and a 19th-century schoolhouse. A site examination was recommended at the Becket mill, the two 19th-century houses, and the schoolhouse. The site examination included mapping of the Becket Bulkley Dunton & Co. mill, the two 19th-century houses, and the schoolhouse. The remaining slab foundation for the mill prevented further subsurface testing at that location. The mill burned in 1991 and was razed by the town. This locus was mapped and local informants were interviewed to gather a comprehensive record of the mill complex. Twenty-four shovel test pits, 11 exploratory and 3 excavation trenches, were excavated in the vicinity of the two 19th-century houses, the dump, and the schoolhouse. Soil profiles indicated extensive disturbance and interviews indicated the school had been razed in the late 1990s. The domestic locus revealed two 19th-century house sites and a historic dump. One of the structures was destroyed by fire prior to 1873. While these sites contained useful historical information about the occupants, they were not determined to be significant because of a lack of integrity. In addition, features were identified immediately outside of the project area and included an 1847 railroad station, a ca.1897 railroad station and freight house, a coal chute, two additional mills, a granite quarry, and several house foundations.

25-2847 Binzen, Timothy, and Nancy Seasholes
2008 Cultural Resources Reconnaissance Survey, Route 1 Improvements Project, Malden, Revere, and Saugus, Massachusetts. 28 pages.

The archaeological component of the survey discovered that due to previous disturbances, all three of the sub-alternatives possess low sensitivity to contain significant archaeological resources. The above-ground/architectural component of the survey evaluated numerous structures that either may be threatened by demolition or are located on properties that are contiguous to the project area and exhibit historical characteristics. None of the buildings, billboards or other above-ground resources assessed in this study possesses sufficient architectural integrity and/or significance.

25-2848 Donta, Christopher, and Elizabeth Harlow
2008 Archaeological Intensive (Locational) Survey for the Proposed Utility Trench, Bradley Palmer State Park, Topsfield, Massachusetts. 47 pages.

A total of 33, 50 cm x 50 cm shovel test pits were excavated to test a proposed trench line measuring 420 m (1,375 ft) in length. No Native American artifacts or features were encountered. A historic barn foundation was identified, and designated the Lamson Barn historic site. Artifacts dating from the late 18th and early 19th centuries were found in test pits and a builder's trench at the site. Several other outlying features associated with the site were identified. The proposed utility trench was rerouted further to the south to avoid the site (see report #25-2287).

25-2849 Dudek, Martin G.
2008 Site Examination at the Charles View Site (19-NF-584) and the Bellingham Shoppes Site 1 and an Intensive (Locational) Survey for the Shoppes at Bellingham, Town of Bellingham, Norfolk County, Massachusetts. 156 pages.

The intensive survey consisted of 94 test pits (50 x 50 cm), with 50 systematic pits in nine transects, nine judgmentally-placed and 35 bracket test pits, excavated across archeologically sensitive areas within approximately 200 acres that included a former gravel pit. Two Native American sites and one findspot were identified. At the Shoppes Site 2 and the Shoppes Find Spot six pieces of quartz debitage and one quartz flake were recovered, respectively. At the Shoppes Site 1, 53 artifacts of quartz, rhyolite, and other lithics were recovered from 20 test pits. A site examination was conducted with 80 test pits and three 1 x 1 m excavation units. Three loci were defined across a site area 140 m by 25 m, with the recovery of 219 additional artifacts. Tool-making areas investigated included a rhyolite chipping station with a Neville point and tool fragments, a chipping station with three quartz cores and debitage, and a chipping station with rhyolite bifacial and unifacial tools, rhyolite and chert-like debitage. The Shoppes Site 1 is recommended eligible for the National Register under Criteria A and D. The site examination for the Charles View Site (19-NF-584) consisted of 106 test pits and three 1 x 1 m excavation units. The site extends 85 m east-west

by 50 m north-south, but continues south onto Army Corps of Engineers property. A total of 1,282 Native American chipped lithic artifacts were recovered including an untyped eared triangle point, biface and uniface fragments and utilized flakes. A feature with dense quartz debitage and charcoal was AMS dated to 1570 ± 15 BP (PRI-08-30-1). The site is interpreted as multicomponent, with habitation, tool production, modification and use of quartz, quartzite, Attleboro Red Felsite and other lithics. The Charles View Site is recommended eligible for the National Register under Criterion D (see report #25-2267).

25-2850 Donta, Christopher, and Elizabeth Harlow
2008 Archaeological Intensive (Locational) Survey for the Proposed Great Brook Farm Milk Wastewater Disposal Project, Carlisle, Massachusetts. 37 pages.

Background research identified one Native American site within the immediate area, as well as moderate historic potential related to the 19th century and possibly earlier agricultural use of the vicinity. A total of 40 test pits were utilized in three survey units to test a proposed waste disposal line, wastewater treatment area, and barn footprint. A small scatter of 20th-century domestic and architectural artifacts was found across the three survey units tested, within plowed soils.

25-2851 Donta, Christopher, and Lyzann Harlow
2007 Archaeological Intensive (Locational) Survey for the Proposed Article 97 Land Swap, The Lantana Parcel, Randolph, Massachusetts. 57 pages.

This project consists of background research and archaeological survey of an approximately 3.2 acre parcel within the Blue Hills Reservation. The background research indicated that one Native American archaeological site (19-NF-482) was located in close proximity. Thirty-six shovel test pits were excavated. The parcel contained large rock outcroppings. A quartz triangular projectile point was encountered in a shovel test pit near the western edge of the parcel. Additional units around this test pit did not produce any other cultural materials. The isolated artifact is probably related to a possible rockshelter. This site is south of the previously recorded site 19-NF-482, and will be recorded on a new site form (19-NF-650).

25-2852 Cook, Lauren J.
2003 Phase I Intensive Survey, Proposed Water Treatment Plant and Appurtenant Work, Norwell, Massachusetts. 74 pages.

The project area measured approximately 1.34 acres in extent (5,425 m^2), and included 2,025 m of linear pipeline corridor. In all, 259 shovel tests were excavated, and seven archaeological sites were identified. Locus 1 (19-PL-1016) was a large multicomponent ancient Native American site. Diagnostics included Neville, Neville/Stark Variant, and Wading river projectile points, typical of the Middle Archaic to Late Archaic. Charcoal recovered from Feature 1, a hearth, returned a date of 2230±90 BP (Beta-216085), and charcoal recovered from Feature 2, a pit, returned a date of 2565±65 (Beta-216086). Together these dates bring the site into the Early Woodland. Locus 2 (19-PL-1002) was an undated ancient Native American site, containing lithic debitage and a large bifacial preform. Locus 3 (19-PL-1004) was a small site that contained a Small Stemmed point and a stemmed point similar to a Bare Island or Merrimack point, indicating a date in the Late Archaic or Transitional Period. Locus 4 (19-PL-1005) was a lithic processing station on a small rise adjacent to Wildcat Brook with a high density of quartz flakes indicating cobble reduction. No diagnostic materials were recovered. Locus 5 (19-PL-1006) was located on the eastern edge of wetlands associated with Wildcat/Third Herring Brook. A Small Stemmed point was recovered, indicating a date in the Late Archaic or Transitional Period. Locus 6 (19-PL-1007) was a discontinuous site adjacent to wetlands along Third Herring Brook. The single projectile point fragment was not diagnostic. An historical archaeological site, Locus 5 Historic (NRW-HA-6) consisted of late 19th-century material, possibly associated with an undocumented cellar hole and well. The Town of Norwell agreed to move the water treatment plant to an alternate site nearby, which was the subject of a separate survey. Accordingly, no further investigation was recommended for Locus 1. Site Examination was recommended for Loci 2, 3, 4, 5, and 6. No further investigation was rec-

ommended for Locus 5, because the material recovered dated to the late 19th century, and was located in an area peripheral to the core of the site (see report #25-2615 and 25-2853).

25-2853 Cook, Lauren J.
2004 Additional Phase I Survey, Norwell Water Treatment Plant Project, Alternate Site, Norwell, Massachusetts. 24 pages.

Additional intensive survey was conducted within approximately 1.8 acres (6,300 m^2), and 120 m (394 feet) of a linear pipeline corridor. In all, 60 shovel tests were excavated. A prehistoric site was identified, based on two utilized flakes, a secondary flake, a broken flake and two debitage fragments. None of the prehistoric material was recovered from subsoil; all of it was from duff, topsoil or fill. The site was interpreted as a low-density lithic scatter. Historical material included a variety of structural material and domestic debris dating from the 18th to the late 20th centuries. A single wrought nail was recovered. A scatter of material dating to the period between 1850 and 1920 was encountered, but this appeared to be associated with a 20th century structure. A surface feature, a bocce court built in 1947, was also associated with that structure. Most of the 144 historic period items were from fill, and were likely associated with recent activities on the property (see report #25-2615 and 25-2852).

25-2854 Binzen, Timothy, and Jennifer M. Wendt
2007 Archaeological Reconnaissance and Intensive (Locational) Survey for the Phase 10 Sewer Improvement, Tewksbury, Massachusetts. 63 pages.

A total of 59 shovel test pits were excavated at intervals of 7.5 m (25 ft) in locations exhibiting high sensitivity. Native American artifacts were recovered from one location, designated as the Susan Drive Site (19-MD-1055). A total of 185 rhyolite flakes and one biface midsection were excavated from three test pits. The flakes were recovered from undisturbed B-Horizon subsoil at depths that ranged from 10 to 70 cm. No temporally diagnostic artifacts were recovered. This site appears to be the result of lithic tool manufacturing. Low volumes of historical artifacts were encountered in several survey units, typically in landscaping fill deposits and in association with modern trash.

25-2855 Cherau, Suzanne G., and Stephen Olausen
2007 Annual Report, Cultural Resource Monitoring, Deerfield River Hydroelectric Project, Vermont and Massachusetts. 13 pages.

The 2007 annual report presents the results of investigations carried out as recommended in the 2006 Annual Report action plan, descriptions of cultural-resource-related activities that occurred in 2007, and an action plan for the year 2008. The 2007 projects include enhancements to several recreational areas (see report #25-1898, 25-2062, 25-2142, 25-2226, 25-2316, and 25-2417).

25-2856 Ritchie, Duncan, and Anna Graves
2007 Intensive (Locational) Archaeological Survey of the Reserve at Barton Hill, East and West Parcels, Charlton, Massachusetts. 61 pages.

The Barton Hill East parcel contains about 97 acres and the larger Barton Hill West parcel includes about 165 acres. Subsurface testing of the Reserve at Barton Hill East parcel involved the excavation of 37, 50 x 50 cm test pits placed at 10 m intervals along judgmentally placed transects. Sixty, 50 x 50 cm test pits placed at 10 m intervals along judgmentally placed transects were used to sample zones of moderate archaeological sensitivity in the Reserve at Barton Hill West parcel. Subsurface testing in the Reserve at Barton Hill East parcel identified one pre-contact period Native American archaeological site. Consisting of one piece of cultural material (quartz chipping debris), this find spot was designated as the Barton Hill East Site (19-WR-846).

25-2857 Lydecker, Andrew D.W., Michael K. Faught, and Stephen R. James, Jr.
2008 Marine Cultural Resource Analysis of Remote-Sensing Survey Data Associated with Neptune LNG Project, Offshore, Massachusetts. 170 pages.

A survey was conducted for an environmental evaluation for a proposed offshore liquefied natural gas (LNG) project, including a terminal and a pipeline, within and outside Massachusetts state waters. The terminal will be located 10 miles south of Gloucester and 22 miles northeast of Boston in water depths of approximately 250 feet. A comprehensive remote-sensing survey, consisting of magnetometer, sidescan, subbottom profiler, bathymetry, and DGPS positioning, has been conducted of the pipeline corridor, including the deepwater port facility. The survey was then analyzed for the presence of potentially significant submerged cultural resources that would require avoidance or additional archaeological investigation. Analysis of the data indicates 2,132 magnetic anomalies and 23 sidescan targets located within the entire project area. Analysis also indicates that the sources of the majority of magnetic anomalies are local geology or modern nonsignificant cultural objects. Most are considered nonsignificant, and no further work is recommended. However, a total of 25 targets were located, including two anomaly–only clusters and 23 sidescan sonar targets, some of which were associated with one or more anomalies. Also located were numerous submerged drumlin areas, which the researchers interpreted as the only landform type that had the potential to be the location of significant prehistoric submerged cultural resources. While absolute identification of a target would require physical examination, it is apparent that several of the targets represent wreck sites. It is recommended that 23 of the 25 targets and the drumlin areas be avoided. Analysis of the subbottom data revealed a regionally predictable and a locally variable stratigraphic profile consisting of thick post-glacial marine sediments over draped and ponded glacial and post-glacial sediments. Analysis of 20 vibracore samples did not indicate the presence of buried soils or high probability landforms within the zone of disturbance (see report #25-2865).

25-2858 Gillis, Nichole A., and Dianna L. Doucette
2008 Intensive (Locational) Archaeological Survey, Tennessee Gas Pipeline, Fitchburg Expansion Project, Lunenburg and Framingham, Massachusetts. 73 pages.

The project extends along an existing pipeline for a linear distance of approximately 5.15 miles, with a five acre pipe yard staging area and a pair of new permanent internal inspection (pig launcher/receiver) stations. A total of 848, 50 x 50 cm test pits were excavated. Test pits were excavated along 52 linear transects, as four judgmental test pits, and as two test pit arrays. Test pits were excavated at 10 m intervals along linear transects, and array test pits each contained four test pits placed at 5 m intervals in cardinal directions from a center test pit. Two find spots of quartz chipping debris were identified. In addition, a low-density scatter of historical period cultural material was recovered from the plow zone in 33 of the 848 test pits excavated. No potentially significant cultural resources were identified.

25-2859 Binzen, Timothy
2008 Archaeological Reconnaissance for the Route 2A-Batherick Road-Depot Road Intersection, and Boundary Marking for the Cowee-Smith Historical Site, Westminster, Massachusetts. 23 pages.

The sensitivity of the study area is low, with the exception of undeveloped zones located southeast of the intersection, and southeast of the bridge. These zones are located on a tributary to the Whitman River and exhibit high archaeological sensitivity. Intensive (locational) subsurface testing is recommended prior to any construction impacts in these two zones. To assist in preservation efforts, the boundaries of the nearby Cowee-Smith Historical Site (WST-HA-9) were marked with numbered wooden stakes accompanied by pieces of numbered flagging tape in order to create a 50-foot buffer zone around the complex of historical foundations and surface features that comprise the site (see report #25-1313).

25-2860 Mulholland, Mitchell, Warren Riess, Jeffrey Donnelly, Christopher Donta, and Ilya Buynevich

2003 Remote Sensing Archaeological Survey and Geologic Interpretation, Boston Harbor Navigation Improvement Study, Boston Harbor, Boston, Massachusetts. 75 pages.

A remote sensing study and archaeological reconnaissance survey was conducted for the proposed improvements of the Boston Harbor Shipping Channel. Using site locational characteristics, sea level curves and reconstructed past landforms, the study found that there is a potential for inundated Native American sites to be located within portions of the project area. Subsurface testing through the use of vibratory cores or split spoon borings is recommended. The historic period background study indicated that at least 93 vessels were lost in the general area of the dredging project, but none are known to be specifically in the route. Analysis of the remote sensing data produced 187 targets that required further consideration; however only 3 appear to be potential historically significant shipwrecks. In addition, one obvious sunken barge rests in two sections near the outer (east) entrance to the North Channel. Dive inspections are recommended for the three targets.

25-2861 Herbster, Holly, and Dianna L. Doucette
2008 Intensive (Locational) Archaeological Survey, Aquinnah Wampanoag Tribal Housing Authority Property (Map 8-Parcel 26), Aquinnah, Massachusetts. 39 pages.

A total of 98, 50 x 50 cm test pits were excavated within the approximately 9.4 acre project area. Test pits were placed along parallel transects with test pits located at 10 m intervals, within a test pit block, as judgmental test pits, and as test pit arrays. The subsurface testing resulted in the recovery of 36 pieces of cultural material, consisting of 34 pieces of lithic chipping debris, a bifacial tool fragment, and a shellfish fragment. No post-contact period artifacts or cultural features were identified during the intensive survey. These materials were collected in five spatially distinct activity areas between 0 and 40 cm below the ground surface in the A/topsoil and B/subsoil horizons. The cultural deposits that comprise Find Spots 1 to 5 (19-DK-244, 19-DK-245, 19-DK-246, 19-DK-247, and 19-DK-248, respectively) are all characterized by low density deposits of lithic chipping debris. The recovered artifact assemblage is indicative of stone tool maintenance and short-term activities associated with hunting and/or gathering. These deposits are consistent with many of the small site areas identified in Aquinnah and help to document the use of tribal lands throughout the pre-contact period.

25-2862 Herbster, Holly, Gregg Laskoski, and Brian Ó Donnchadha
2008 Technical Report, Industrial Tower & Wireless Plymouth III Cell Tower Tanglewood Drive, Plymouth, Massachusetts. 37 pages.

Thirteen 50 x 50 cm test pits were excavated along transects and as judgmental test pits. No cultural materials were identified.

25-2863 Robinson, David S.
2006 Supplemental Marine Archaeological Reconnaissance Survey of Revised Layout Offshore Project Area, Cape Wind Energy Project, Nantucket Sound, Massachusetts. 7 pages.

Results from geophysical and geotechnical survey of the revised layout offshore project area were used in conjunction with data recorded during the 2003 survey to determine presence/absence of potentially cultural remote sensing targets (e.g., shipwrecks) and areas of buried paleosols with archaeological sensitivity for containing pre-contact archaeological deposits. Analysis of results of the data generated by the supplemental marine archaeological survey indicates that detected anomalies in the recorded remote sensing data have little or no probability of representing potentially significant archaeological deposits, and geotechnical testing of sub-bottom profiler reflectors produced no evidence of contextually intact paleosols. Given that all archaeologically sensitive areas identified by the 2003 marine archaeological investigation are being avoided, and no additional archaeologically sensitive areas were identified in the revised layout offshore project area, no additional investigation is recommended (see report #25-2328 and 25-2475).

25-2864 Doucette, Dianna L. and Erin Flynn
2008 Archaeological Data Recovery, J.T. Berry Site, Locus 1, Locus 3, Locus 4, Locus 6, and Locus 9, J.T. Berry Rehabilitation Center, North Reading and Wilmington, Massachusetts. 127 pages.

The data recovery program involved a review of previous archaeological investigations within the J.T. Berry Site, including an intensive survey and site examination, and work by Ripley Bullen in the 1940s, to develop theoretical and research contexts that guided the data recovery program. The data recovery investigations revealed that the most intensive utilization of the J.T. Berry Site overall occurred during the Archaic Period. Two of the three cultural phases of the Archaic (Middle and Late) are present at the site. Overall, there is cultural material evidence for pre-contact occupation at the site between approximately 8000 and 1000 years BP, spanning the period from the Middle Archaic through the end of the Late Archaic and again briefly during the Early and Middle Woodland periods. Projectile points representing the Middle Archaic Period (Neville, Neville variant, and Stark), the Laurentian tradition (Brewerton), the Small Stemmed Point tradition (Squibnocket Triangle, Small Stemmed, Susquehanna, and Orient Fishtail), and the Middle Woodland (Jack's Reef) were identified at the J.T. Berry Site among Loci 1, 3, 4, 6, and 9. In addition, 43 features were identified during data recovery investigations on the J.T. Berry Site. Every loci contained features that were exposed and excavated. Features ranged from charcoal pits, fire-cracked rock scatters, storage and/or trash pits, and possible ceremonial pits—large pits exposed at Locus 4 that were 1.5-m in diameter or larger and more than 1 m deep. Charcoal samples obtained from the large pit features ranged from the Late Archaic to Middle Woodland periods. Deep pit features dating from the Early, Middle, and Late Archaic periods have been identified throughout New England and have been interpreted as burial pits, ceremonial pits, storage pits, and possible house structures. The sites' importance lies in their potential to yield information about cultural continuity, settlement patterns and subsistence practices spanning the Middle Archaic to Woodland time periods within the Upper Ipswich and Shawsheen River drainages and more specifically to look at the utilization of a unique ecozone that included Martin's Brook, and direct access to a continuous waterway. The nature of activities represented by the cultural materials recovered includes lithic manufacturing, which appears to be the predominant activity based on the amount of chipping debris recovered, but bifaces and worked tools suggest support activities as well. Evidence of features further suggests a more intensive use of the site beyond stone tool production. Seasonality information gleaned from floral analysis suggests the site was occupied during the late spring to early fall (see report #25-2649 and 25-2678).

25-2865 Lydecker, Andrew D.W., and Stephen R. James, Jr.
2008 Supplemental Marine Cultural Resources Analysis of Remote-Sensing Survey Data Associated with Neptune LNG Project, Offshore Massachusetts. 68 pages.

Changes to the location of the Northern Route Alternative have resulted in the need for additional survey coverage. This coverage is meant to provide additional area for the construction anchor clearance corridor only, as the actual pipeline route is within the area initially surveyed. Part of the additional coverage was satisfied through the use of survey data obtained by Algonquin collected as part of the Northeast Gateway pipeline project, which follows a route similar to that of Neptune. A review of the sidescan sonar records and magnetic data resulted in the identification of two previously unknown wrecks. The subbottom and sidescan sonar data was analyzed to classify and characterize the seabed and subsea geologic features; and to determine locations of any high probability areas for the existence of submerged prehistoric archaeological sites. The presence of a significant amount of marine sediments extending well below the three to four foot maximum depth of anchor penetration indicates that any high probability terrestrial deposits are located well below the project impact zone (see report #25-2857).

25-2866 Leveillee, Alan, and Mark Lance
2008 Reconnaissance/Phase I(a/b) Archaeological Survey, New England East-West Solution Transmission Projects Right of Way, Massachusetts and Rhode Island. 123 pages.

The survey included sections of right-of-way in the Massachusetts towns of Millbury, Sutton, Uxbridge, and Millville and in Rhode Island. The total distance covered by the surveyed project corridor is approximately 60 miles. The survey resulted in the stratification of the easement into zones of high, moderate, and low archaeological sensitivity; the relative projected likelihood to contain archaeological materials in meaningful contexts. The report concludes with recommendations for further archaeological survey within areas of identified sites and areas of high and moderate archaeological sensitivity where subsurface impacts will result from planned improvements. Intensive archaeological survey is recommended for sections of the project where planned construction will have a direct impact at new pole locations, grading areas, and substation construction locations that have been determined to possess high and moderate archaeological sensitivity.

25-2867 Gillis, Nichole, and Dianna L. Doucette
2008 Intensive (Locational) Archaeological Survey of the Mashpee Wampanoag Casino Project Area, Middleborough, Massachusetts. 91 pages.

The intensive survey on several parcels of land totaling approximately 593 acres included archival research, a walkover survey, and subsurface testing. Subsurface testing was conducted in project impact areas with moderate and high archaeological sensitivity to locate and identify archaeological resources. During subsurface testing, 750, 50 x 50 cm test pits were excavated. The test pits were excavated within the project area along 30 judgmental transects, within 29, 30 x 30 m blocks and 24 test pits arrays, and as 27 judgmental test pits. Six previously undocumented pre-contact period sites, one previously undocumented post-contact site, and 18 find spots of pre-contact cultural material were identified as a result of the excavations. Among the archaeological sites, four pre-contact archaeological sites (Casino Sites 1 through 4) contain potentially significant cultural resources that could contribute additional information to the archaeological record of southeastern Massachusetts. The remaining three sites and 18 find spots lack complexity and have limited research potential.

25-2868 Gillis, Nichole A., and Kristen Heitert
2008 Intensive (Locational) Archaeological Survey, Fort Washington Park Irrigation System Project Area, Cambridge, Massachusetts. 85 pages.

The property commemorates and preserves an earthwork that was erected in the fall of 1775 as a defense against occupying British forces in Boston. Thirty 50 x 50 cm judgmental test pits across the project area; no excavation occurred on the historic earthwork revetments. Multiple and deep fill deposits containing a range of architectural and domestic debris were identified across the park, indicating a substantial degree of landscape disturbance associated with multiple remodeling episodes in the park during the 19th and 20th centuries. None of the fill deposits, however, could be associated with potentially significant events dating to either the Revolutionary War period or the commemorative use of the parcel as a park. While intact topsoil and/or subsoil horizons were identified in 28 of the 30 excavated test pits, the strata contained no potentially significant pre- or post contact period cultural material or features (see report #25-1436).

25-2869 Donta, Christopher L.
2008 Archaeological Site Examination Survey of the Agawam Meadow Site (19-HD-269): A Woodland Village in Agawam, Massachusetts. 32 pages.

Excavations consisted of 83 shovel test pits and six 1 x 1 m units, and three excavation units of other sizes, totaling 26.75 square m. Some 1,252 Native American artifacts were collected, including one Large Triangle projectile point, seven other stone tools and 40 sherds of ceramics. The Agawam Meadow Site is large, and in an excellent state of preservation, with artifacts in an undisturbed topsoil and subsoil that is buried under thick alluvial deposits. The artifacts are distributed in two main concentrations, both of which include stone tool debris and ceramics, indicating similar activities in both places. One large pit feature was documented, that contained multiple layers of faunal, floral, and lithic refuse. Three other features were documented, consisting of a lithic reduction area, one postmold, and another possible refuse midden. A radiocarbon sample from the

pit feature was dated to 920 ±70 BP (Beta-155921). The artifacts found in association with these features indicate a Middle to Late Woodland occupation, ca. 2,000 to 400 years ago (see report #25-2270).

25-2870 Hodge, Christina J.
2008 Akin House Archaeology Project: 2007 Summary Report. 188 pages.

This report summarizes the results of an archaeological site examination conducted as a field school at the Elihu Akin House in Dartmouth, in July and August of 2007. The ca. 1762 Akin House was uninhabitable when abandoned in the early 1990s. It has seen extensive architectural mitigation over the past five years in preparation for use as an educational and heritage tourism center. A total of 5,926 artifacts and fragments were recovered. Testing provided baseline knowledge of contexts adjacent to the house in cleared yard areas, yielding fragments of scattered secondary refuse from the late 18th through 20th centuries. A 20th-century slag midden was located in the north yard. A dense sheet midden of partially burned domestic, construction, and mechanical debris and slag was sampled at the verge of the cleared rear/east yard. This midden dates from the early to mid-20th-century. Radar and electromagnetic survey identified two rectangular anomalies in the rear yard. Excavations failed clearly to explain the anomalies. The function and date of a rock-filled feature in the basement also remains unclear. Walkover survey in portions of overgrown yard areas confirmed the locations of an exterior well, two stone outbuilding foundations, and a suspected privy. Currently cleared east and north yard areas have a low potential for significant findings, although materials from them are useful for interpretation of the site. The cleared rear yard deserves further testing. Overgrown yard areas were not sampled or surveyed but have a high potential for significant features and contexts.

25-2871 Vogt, Christy Cathleen
1994 A Toast to the Tavern: An Archaeological Study of a 17th and 18th Century Tavern in Charlestown, Massachusetts. 90 pages.

The excavations of a tavern in the Boston neighborhood of Charlestown provides an opportunity to fill a portion of the gap in our knowledge of colonial drinking establishments during early life in New England. This tavern is known variously as Long's Ordinary, Three Crane Tavern, and the Great Tavern. This thesis explores taverns and their contributions to and reflections of social and political climates from the first colonization to the Revolutionary War. Ceramics, glass, and clay pipes from five privy deposits, excavated from around the Charlestown Tavern, were examined for this study. Vessel types and ceramic types were discussed as they relate to the function of the ordinary and to the social and economic dynamics of the town. Glass and clay pipes were studied in conjunction with ceramics to determine both how tavern-like and how urban or rural this tavern appears in the archaeological assemblage.

25-2872 Doucette, Dianna L.
2008 Intensive (Locational) Archaeological Survey, MassHighway Assignment 43, Nobadeer Farm Road Bike Path Project Area, Nantucket, Massachusetts. 69 pages.

A preliminary review by the Cultural Resource Unit of the Massachusetts Highway Department identified several areas considered to have moderate to high sensitivity for pre-contact period sites. Archival research indicated that the project area was outside the major centers of development and was not considered potentially sensitive for post-contact period sites. Subsurface testing with 70, 50 x 50 cm test pits documented undisturbed soil horizons over the majority of the project area. A low density of pre-contact cultural material was recovered from three test pits. Test pits were excavated along one linear transect, and within three test pit arrays. One quartz drill-tip, broken in two, a quartz projectile point, and one quartz flake were recovered. The quartz projectile point recovered is a Snappit point, diagnostic of the late Middle Archaic Period, ca. 6000 to 5000 BP. The low density of Native American cultural material recovered suggests this area may have been used short-term as a hunting ground where some lithic manufacturing and/or maintenance took place.

25-2873 Leveillee, Alan, and Anna Graves
2006 Intensive (locational) Survey and Site Examination Robbins Pond Park Residential Subdivision, East Bridgewater, Massachusetts. 89 pages.

During and following the acquisition of the 38 acre property, project proponents became aware of an explicit deed reference to a historical cemetery within its limits. One previously identified pre-contact site (19-PL-65) was reported within the project area boundaries. Ninety-one 50 x 50 cm judgmentally placed test pits were excavated during the intensive survey, resulting in the identification of three pre-contact period archaeological sites and two find spots. Additionally, ground penetrating radar survey was conducted as part of the intensive survey to examine the area for possible grave shafts, with negative results. Following the intensive survey, three of the identified site areas (Robbins Pond Find Spot #1, Pond Street Site, Robbins Pond Site) were recommended for site examination. The Robbins Pond Find Spot #1 Site is confined to a small 10 x 10 m region of the project area, and contained a relatively low density of mixed material chipping debris. On the Pond Street Site, 46 50 x 50 cm test pits and six 1 x 1 m units were excavated during site examination. Two rhyolite Neville projectile points, a large argillite chopper, a ground-stone semilunar knife, more than 400 pieces of chipping debris, and several bifacially flaked tools were recovered. Thirty-two test pits and six 1 x 1 m units were excavated in the Robbins Pond Site during site examination. Testing units included two 50 cm-wide hand-dug trenches, excavated extending from the GPR anomaly locations to the adjacent planned access road to investigate for the presence/absence of potential grave-related features. Excavation yielded 1,308 pieces of cultural material including 1,271 pre-contact Native American lithics, including a quartz Levanna, a hornfels Fox Creek, and a rhyolite Small Stemmed projectile point. In an effort to locate potential grave shafts in the site area, the site examination of the Robbins Pond Site included the excavation of a series of 11 machine trenches dug in the central and northern sections of the site. A single machine trench was excavated to the west of the site, on a small flat area in a pine grove. No grave shafts were noted during the shovel testing or machine stripping of the project area.

25-2874 Cherau, Suzanne, John Daly, and David S. Robinson
2008 Cultural Resources Reconnaissance Survey, Boston East Development Project, East Boston, Massachusetts. 111 pages.

The parcel contains about 3.4 acres of land that is vacant of buildings, and consists of filled and flowed Commonwealth tidelands. Approximately 10.8 acres of the parcel are identified as watersheet. The parcel was historically known as the location of the East Boston Dry Dock Company. Portions of maritime industrial features including piers, marine railways, and building foundations are present. The reconnaissance survey for historic resources tasks consisted of research and a walkover of the project area and surrounding neighborhood. The project area coincides with the boundaries of the Boston East Site, which was previously recommended as eligible for the National Register of Historic Places. Immediately south of the project area the Atlantic Works Boiler Shop, Atlantic Works Machine Shop, and Atlantic Works Office Building had also been previously surveyed and recommended as eligible for the National Register as a district. Research conducted for the current survey determined that marine railways and other structures in the south parcel of the Boston East Site and the Atlantic Works buildings listed above are eligible for listing in the National Register as a combined East Boston Dry Dock Company/Atlantic Works Yard historic district. The two north parcels of the Boston East Site are excluded from the recommended district. The proposed development would directly impact historic resources in the south lot (Boston East Site) and would visually impact all three Atlantic Works buildings within the recommended district. The reconnaissance survey for archaeological resources consisted of archival research and a walkover survey for both terrestrial and marine cultural deposits. No previously recorded archaeological sites including shipwrecks are recorded in the project parcel. The survey determined a high sensitivity for potentially significant resources associated with 19th-century clipper shipbuilding and post-clipper ship era waterfront activities. There is also a high potential for deeply buried pre-19th-century shorelines that could contain intact Native American and Colonial period resources. The only areas assigned as having low sensitivity are known modern utility lines

including the two sewer easements. Subsurface testing as part of an intensive (locational) terrestrial archaeological survey is recommended.

25-2875 Doucette, Dianna L., and Erin Flynn
2008 Intensive (Locational) Archaeological Survey, A.D. Makepeace Preserve at Agawam, Phase II Project Area, Plymouth, Massachusetts. 57 pages.

The 45 acres within parcel 15 and 19 in Plymouth is part of planned development of selected portions of holdings in Plymouth, Wareham, and Carver. The intensive survey included archival research, a walkover survey, and subsurface testing to locate and identify any potentially significant archaeological resources that may be affected by project construction. Sixty-five 50 x 50 cm test pits were excavated within the project area. Test pits were excavated within two 30 x 30 m blocks, along six judgmentally placed transects, within one test pit array, and as one judgmental test pit. One isolated chert gunflint was found along a transect within Parcel 15. A test pit array placed around this area did not yield any additional cultural material to signify a site. The gunflint was designated as an historic Find Spot 1.

25-2876 Robinson, David S.
2007 Northeast Gateway Energy Bridge Project, BUAR Shipwreck Study, Massachusetts Bay, Massachusetts. 24 pages.

Underwater inspections of five uncharted shipwrecks located in Massachusetts Bay, Massachusetts were conducted utilizing remotely operated vehicle technology. The shipwrecks were identified during a marine archaeological reconnaissance survey. Results from archaeological field investigations and limited archival research indicate at least two of the shipwrecks are wooden-built, while the remaining three are of iron/steel construction. The shipwrecks appear to range in date from the late 19th to middle 20th century, and include vessels lost accidentally as well as those that were scuttled intentionally. The project documented extensive impacts to each site from commercial ground-fishing activities, the gear from which is entangled in and obscures much of each shipwreck. The former Brenton Reef Lightship, *LV-39*, built in 1875 is identified as potentially historically significant.

25-2877 Doucette, Dianna L., and Gregg Laskoski
2008 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, Taunton River HDD Project Area, Taunton and Berkley, Massachusetts. 57 pages.

The intensive survey included archival research, a walkover survey, and subsurface testing to locate and identify any potentially significant archaeological resources that may be affected by the project construction. Archival research indicated that the project area was sensitive to contain Native American cultural resources because of the favorable environmental conditions. Forty-three 50 x 50 cm test pits were excavated within the archaeologically sensitive portions of the project area. Testing was also completed in areas of low archaeological sensitivity to document the level of disturbance. No cultural material was recovered.

25-2878 Cherau, Suzanne G.
2008 Archaeological Overview Survey, Algonquin Gas Transmission, LLC, J-2 Loop Project, Medford and Somerville, Massachusetts. 65 pages.

The survey was conducted to determine the archaeological sensitivity of the proposed pipeline route in relation to the documented location of the historic Middlesex Canal (SMV-HA-5). The Middlesex Canal has been determined eligible for listing in the National and State Registers of Historic Places. Archival research and mapping of the Middlesex Canal determined that the proposed pipeline route intersects the historic canal route in two locations. The survival potential of canal-related remains (i.e., prism, berm, tow path, bridge) within these two areas was evaluated using available historical maps, street development/widening plans and profiles, and underground utilities plans and profiles. The documented built over section of the Middlesex Canal prism in

Mystic Avenue was filled in and absorbed into the street ROW and adjacent private residential lots by the 1880s. The Mystic Avenue ROW currently contains numerous side-by-side underground utility easements, several of which appear to date back to the late 1800s. The documented built-over section of the Middlesex Canal route across Temple Street contained the "Ten Hills Bridge" that appears on town maps in 1852. The bridge components (timbers and portions of the stone abutments) were likely removed and reused elsewhere, but the extent of this removal/reuse and the presence of cultural strata and deposits associated with the canal bridge crossing is unknown. This section of documented historic Middlesex Canal route with the bridge crossing in Somerville is assigned moderate archaeological sensitivity.

25-2879 Whitney, Joanna L., and Mitchell T. Mulholland
2003 Archaeological Intensive (Locational) Survey for Nextel/Cellular One Wireless Communication Facility SAGE#N1402B, Adjacent to Railroad Parcel, Wayland, Massachusetts. 17 pages.

The project area is located west of the Wayland Center Historic District and Wayland Center Railroad Complex. The railroad complex is located in a parcel that was previously surveyed (see report #25-1894 and 25-2056). The project includes a 70 x 30 ft location for the telecommunications facilities and a 1,220 ft access road. Shovel test pits excavated revealed artificial fill. Three railroad features are in or adjacent to the route of the originally proposed access road: an insulated ground switch; a switch stand; and a railroad stop sign. Avoidance is recommended.

25-2880 Cherau, Suzanne G., and Nichole Gillis
2008 Cultural Resources Reconnaissance and Intensive (Locational) Archaeological Survey, Nashawannuck Pond and Vicinity Project Area, Easthampton, Massachusetts. 71 pages.

Sixty 50 x 50 cm test pits were excavated within the 10 acre disposal work area. The test pits were excavated at 10-m intervals along two judgmental transects and as part of four 30 x 30-m blocks. The intensive survey did not locate any potentially significant cultural resources.

25-2881 Lentz, Megan
2008 Stemware in Colonial Boston: An Archaeological Exploration. 106 pages.

Stemmed drinking vessels are an under-analyzed category of material culture among New World archaeologists. Archaeological excavations have uncovered stemware dating back to the first European settlements in America, yet descriptions, when then occur, tend to be limited to curved glass or drinking glass. These unimaginative classifications contribute little to furthering our understanding of these complex objects. Using the finds from the excavation of the colonial Boston site of Paddy's Alley as a case study, stemware is examined in this thesis at a level of detail often missing from previous stemware analyses. Through an understanding of the cultural role and social implications of stemware, one can attempt to gain insight into the lives of past peoples. While Paddy's Alley provides the opportunity to begin to acquire this information, local, regional, and colonial comparisons are necessary to fully understand the presence of stemware in colonial America.

25-2882 Beranek, Christa M., with contributions by Thomas P. Mailhot
2008 Site Examination of the Col. James Barrett Farm Property, Concord, Massachusetts. 141 pages.

A site examination provided evidence for significant late 18th and early to mid-19th-century landscaping activities around the standing house and discovered and tested a mid-19th-century primary ceramic trash deposit. The property is historically significant because of Col. James Barrett's association with the American Revolution, the well-preserved early 18th-century architecture, and the continuous history of the land as a family farm. The excavations demonstrated that the property is archaeologically important because of the abundant evidence for landscaping activities and the many areas of intact deposits. The 23 test pits and 11 excavation units around the historic house (core constructed ca. 1705) indicate that there are intact strata and deposits in the yards, al-

though many of the areas adjacent to the foundation have been disturbed by more recent foundation repair. Buried cobble pavings survive north of the house, at its southeast corner, and in front (south) of the west ell as well as in the western part of the east ell. Many of these paving sit on top of artificially raised ground surfaces and a buried A horizon dating to the late 18th century almost a meter below the modern ground surface. The trash deposit was located behind the east ell with at least 49 ceramic vessels from this deposit, most dating from the 1820s to the 1850s. The foundation of a former ell was mapped, but no additional outbuildings were discovered. The trash deposit and cobble pavings are associated with members of the Barrett family, who owned the property until the early 20th century. There are also substantial early 20th-century sheet middens in the front yards associated with McGrath households who owned the property from 1905 to 2005. The report compares similar cobble pavements from other New England sites.

25-2883 Ritchie, Duncan, and Anna Graves
2008 Archaeological Data Recovery Program, McLean Hospital Locus 2 Site, Belmont, Massachusetts. 97 pages.

An archaeological data recovery program was conducted on the McLean Hospital Locus 2 Site, first identified from rhyolite chipping debris found during an intensive archaeological survey. The site examination confirmed that McLean Hospital Locus 2 Site contained significant deposits of cultural material and features associated with a single Middle Woodland Period (1,600 to 1,000 years before present) occupation. During the data recovery program, nine excavation units consisting of seven 2 x 2 m units, one 1 x 3 m unit and a single 1 x 1 m unit were excavated. The assemblage of cultural material included three chipped-stone tools, a Late Archaic (Susquehanna Tradition) Atlantic type projectile point, an untyped point fragment and unifacial scraper. The 176 pieces of debitage were mostly rhyolite with some quartz, quartzite and argillite. Five Native American ceramic sherds appeared to be of terminal Middle Woodland or Late Woodland age. Features excavated in the data recovery program were a concentration of rhyolite chipping debris marking a lithic workshop and four small circular deposits of very dark brown stained soil, possibly postmolds, small hearths or refuse pits (see report #25-2307 and 25-2318).

25-2884 Banister, Jennifer Bonner and Holly Herbster
2005 Archaeological Resources Reconnaissance Survey Information in Support of Hanscom Field Environmental Status & Planning Report, Bedford, Concord, Lexington, & Lincoln, Massachusetts. 105 pages.

The survey was conducted within the Hanscom Field property boundaries and within a 200-foot radius of 16 traffic study areas at various road intersections adjacent to and outside of the Hanscom Field boundaries. The reconnaissance survey included archival research, informant interviews, and field survey. Relatively undisturbed portions of the Hanscom Field project area include tracts of woodland peripheral to the runways, terminal, and supporting facilities. The majority of the Hanscom Field project area, however, has been previously disturbed. Areas of high precontact archaeological sensitivity in the project area include previously undisturbed, dry, level areas located adjacent to the natural brooks and wetlands in the peripheral portions of the project area. The extreme southern portion of the Hanscom Field project area has moderate to high archaeological sensitivity for post-contact resources associated with the April 19, 1775 engagement along Battle Road, now part of the Minute Man National Historical Park.

25-2885 Waller, Joseph N., Jr., and Suzanne G. Cherau
2008 Intensive (Locational) Archaeological Survey, Baker's Island Light Soil Remediation Project, Salem, Massachusetts. 81 pages.

The intensive survey consisted of an initial site visit to determine the archaeological sensitivity of the proposed soil remediation work areas and archival research, followed by subsurface testing. The subsurface testing involved the excavation of 48, 50 x 50 cm test pits and two larger 50 x 200 cm and 50 x 100 cm test units. The intensive survey resulted in the recovery of late 18th through 20th-century construction materials, domestic wares, and food waste in nonstratified fill, demoli-

tion, or "sheet midden" archaeological contexts. Below ground structural remains of the former lesser "Ma" Baker's Island lighthouse tower (1816–1926) were exposed, south of the engine house and west of the standing lighthouse tower. Surficial elements of the tower's foundation are visible in an undated photograph of the site. The masonry stonework is present from just below ground surface to the top of the bedrock ledge at about. The masonry stonework of the foundation appears to be intact beneath the layer of demolition debris. Since it would provide a unique opportunity to record the early 19th-century light tower's construction methods, it is recommended that the stonework be left in place and protected during the soil remediation activities. An identified stone-lined well feature near the main keeper's house could date to the earliest period of lighthouse occupation.

25-2886 Ritchie, Duncan
2008 Intensive Archaeological Survey, Lakeshore Corporate Center, Bridgewater, Massachusetts. 77 pages.

A filled foundation for a recently demolished late 19th-century farmstead (Beagle Club property) was located. Eighty-five test pits, excavated within zones of high and moderate archaeological sensitivity, identified two small pre-contact period Native American sites. The Princess Pine Site consisted of a find spot of a non-diagnostic bifacial tool blade and two pieces of quartz chipping debris. The Lakeshore Find Spot 1 Site consisted of a non-diagnostic bifacial tool blade fragment of quartz and one piece of quartz chipping debris. Subsurface testing around the filled foundation marking the Beagle Club Site yielded a low density of 19th-century to modern period artifacts such as ceramics (creamware, pearlware), structural materials (brick, nail,) and faunal remains (oyster, clam shell) from recently disturbed soils. The Princess Pine and Lakeshore Find Spot 1 sites are not considered to be potentially significant cultural resources. The filled foundation and associated features (stone walls, capped well or drain) forming the Beagle Club Site appear to mark the location of a late 19th to early 20th-century farmhouse or other dwelling.

25-2887 Gillis, Nichole A., and Kristen Heitert
2008 Intensive (Locational) Archaeological Survey, 78–82 Ridge St.-Hamilton Farm Cluster Development Parcels, Winchester, Massachusetts. 67 pages.

Hamilton Farm, comprising an early-19th-century farmhouse and six outbuildings, was listed on the National and State Registers of Historic Places in 1983 as the Philemon Wright-Asa Locke Farm. A total of 46, 50 x 50 cm test pits was excavated within the 7.3 acre project area using eight transects with test pits spaced at 10 m intervals and as one 30 x 30 m block. A low-density of post-contact cultural materials dating from the 18th through 20th centuries was recovered from plowed and filled soil contexts. The assemblage included curved glass, hardware, mortar, brick, coal, ball clay tobacco pipes, an agateware door knob, and ceramics. None of the materials, however, exhibited any identifiable horizontal or vertical patterning and none were found in association with cultural features.

25-2888 Ritchie, Duncan
2008 Intensive Archaeological Survey Marian Manor Long Term Care, Assisted and Independent Living Facility, Quincy, Massachusetts. 69 pages.

Archival research included a review of archaeological investigations within the Quarry Hills/Granite Links Golf Course located directly south of the project area. Given the project area's proximity to the complex of post-contact period granite quarries and related industries, the project area had high potential to contain evidence of granite quarrying activity. A walkover inspection identified a number of small post-contact period quarry-related features and sensitivity for pre-contact period Native American archaeological sites. Three small quarry pits (Marian Manor Quarry Pit 1, 2, 3 Sites), small deposits of granite quarry debris, granite blocks with drill holes, and several features were found. Features found near one of the quarry/extraction pits were an iron rod and U-shaped iron bar embedded in a granite boulder. Another boulder showed evidence of drilling to extract large pieces of granite (Marian Manor Boulder 1, 2 Sites). In addition, a short

portion of a cart path or haul road leading to several quarry/extraction pits was identified. Subsurface testing was conducted with 29, 50 x 50 cm test pits excavated at 10 m intervals along judgmentally placed transects. None of these test pits yielded any cultural materials. The post-contact period granite quarry/extraction pits and boulders with iron pins, iron loop and drill holes were investigated with seven judgmentally placed 50 x 50 cm test pits. One of these judgmental test pits yielded a small iron wedge used in quarrying activity. The Marian Manor Quarry Pit 1, 2, 3 and Marian Manor Boulder 1 and 2 sites are comparable to other small quarries and related features that have been found nearby in a portion of the Quarry Hills/Granite Links Golf Course property. They are interpreted as small exploratory pits opened to extract small amounts of granite during the mid- to late 19th century and early modern period. While they contribute to current knowledge about the extent and type of past granite quarrying activity in the town of Quincy, these sites are not considered to be potentially significant.

25-2889 Herbster, Holly, and Dianna L. Doucette
2008 Archaeological Site Examination, The O'Brien Site, O'Brien Property, Aquinnah, Massachusetts. 27 pages.

The O'Brien Site was identified in 2002 by seven pieces of chipping debris and one lanceolate projectile point. Twenty-six 50 x 50 cm test pits placed within a five m grid and three 1 x 1 m units were excavated. An additional 89 pieces of chipping debris, one biface and one uniface were collected and are indicative of a short-term lithic workshop (see report #25-2156).

25-2890 Mair, A. Peter, II, and Nichole Gillis
2008 Intensive (Locational) Archaeological Survey, Andover Park and Ride Lot Expansion Project, Andover, Massachusetts. 63 pages.

Fieldwork consisted of a walkover/surface evaluation and subsurface testing. Twenty 50 x 50 cm test pits were excavated, producing modern glass bottle fragments from fill soils.

25-2891 Medina, Antonio, and Mitchell T. Mulholland
2008 Archaeological Intensive (Locational) Survey at the Mohawk State Forest, Charlemont, Massachusetts. 41 pages.

The work consisted of various utility and waste disposal improvements to the park including the installation of new buried water and electric lines, a well, various waste disposal facilities and a gravel access road. Background research indicated a high probability for the project area to contain buried historic features dating to the Civilian Conservation Corps (CCC) era and earlier, as well as the potential to contain buried Native American sites. A total of 56, 50 x 50 cm shovel test pits were excavated. During the archaeological survey, the remains of two CCC-era structures were identified and documented. Construction plans were modified to avoid the structures and additional shovel test pits were excavated. Soil profiles showed several layers of fill spread throughout the project area and are indicative of the grading and landscaping efforts undertaken at Camp SP-6. Artifact concentrations were generally low except in the areas adjacent to the razed CCC era structures. All of the artifacts recovered dated to the 20th century. One quartzite flake was recovered from a fill layer at a depth of 41-50 cm below the ground surface.

25-2892 Daum, Randy C.
2008 Discovery and Investigation of a Late Seventeenth-Century Colonial Village Site: The Hatfield Old Farms Settlement. 75 pages.

Several local town histories mention a short-lived, fortified settlement that was established near Hatfield prior to 1689. Due to the fear and danger caused by King William's and Queen Anne's Wars, the isolated village, known then as "the Farms" and later as "Old Farms," was abandoned by 1704 and soon forgotten. Recently discovered 17th-century cultural debris scattered across a ten acre area raised the possibility that this was the site of the long-forgotten village. The project made use of documentary research, controlled surface collections, artifact analysis, geophysical

testing, and two excavation units that covered 2.5 square meters. An apparent hand-dug well and areas of brick debris were discovered during these two excavations; geophysical surveys also demonstrate that additional subsurface structural remains likely exist below the plow zone. The accumulated field data provide evidence that the site contained permanent pre-18th-century structures, while documentary sources offer proof that the site is indeed the location of the Old Farms settlement. Old Farms is a rare discovery since other known 17th-century settlements in the Connecticut River Valley have been disturbed by more recent development. As it has been used exclusively as an agricultural field since its abandonment, the Old Farms site has had little disturbance and therefore offers an archaeological snapshot of late 17th-century colonial life**.**

25-2893 Edens, Chris, James Foradas, Stephanie Reiss, and Greg Laden
1993 Archaeological Site Evaluation for Approximately 7.2 Miles of Transmission Line Right of Way in the Towns of Carver, Middleborough, and Rochester, Massachusetts. 102 pages.

Fifteen site examinations were undertaken. All fifteen sites produced prehistoric material. These sites were small and thin lithic scatters, probably representing resource processing and/or tool-kit maintenance at wetland edges. While most sites seemed to reflect single episodes of activity, several were probably occupied more than once. Among these sites was also a felsite chipping station. Only two of these sites were datable: the Susquehanna points in PSS1-4-1 put this site in the Late Archaic period, while the Small Stemmed point in PSS1-25-1a assigned it a Late Archaic to Early Woodland date. The site examination of PSS1-10-2 showed the site to be relatively large and dense, and composed of multiple artifact clusters. Individually, these sites did not contain information that was not better represented at other sites in southeastern Massachusetts, or in the Weweantic drainage. Collectively, however, the localities formed a sample of wetland sites that contributes to better understanding of wetland resource exploitation and regional adaptive patterns (see also reports #25-1163 and #25-1272).

25-2894 Doucette, Dianna L.
2008 Intensive (Locational) Archaeological Survey, Stossel Property Project Area, Wellfleet, Massachusetts. 47 pages.

The proposed project impact area consists of approximately 0.33 acres within the 1.4 acre lot. Twenty 50 x 50 cm test pits were excavated. The subsurface testing was completed along three linear transects with test pits placed at 7 and 10 m intervals from one another, and eight judgmentally placed test pits. Test pits were excavated to a depth of 1 m below surface through sandy wind-blown dune deposits. No cultural material was recovered.

25-2895 Elquist, Ora, and Suzanne G. Cherau
2008 Intensive (Locational) Archaeological Survey, Massachusetts Army National Guard Bourne, Braintree, Dorchester, Chicopee, Gardner, Melrose, Middleboro, and Ware Armory Facilities. Volume I: Bourne and Middleborough, 89 pages; Volume II: Braintree, Dorchester, and Melrose, 95 pages; Volume III: Chicopee, Gardner, and Ware, 109 pages.

Eight test pits were excavated within the Bourne Armory facility project area, 10 test pits were excavated within the Middleboro Armory facility project area, 24 test pits were excavated within the Chicopee Armory project area, 8 test pits were excavated within the Braintree Armory facility project area, 7 test pits were excavated within the Dorchester Armory facility project area, 4 test pits were excavated within the Melrose Armory facility project area, 7 test pits were excavated within the Gardner Armory project area, and 11 test pits were excavated within the Ware Armory project area. All test pits were 50 x 50 cm. Subsurface testing of the Chicopee Armory project area revealed that disturbance was largely confined to surface landscaping fill deposits and historic plowing. A single pre-contact archaeological deposit, the Chicopee Armory Site (19-HD-312), was identified during subsurface testing. Twelve pieces of pre-contact material from four test pits in plow zone and fill contexts consisted of 10 pieces of chert, quartzite and rhyolite debitage, a piece of fire-cracked rock and a grit-tempered, cord-marked ceramic sherd. Post-contact materials included fragments of coal ash, slag, window and bottle glass, whiteware, and unidentified mammal

bone recovered from plow zone and fill deposits. The Chicopee Armory Site is considered to be potentially significant. Although no significant archaeological resources were identified during subsurface testing of the Dorchester armory facility project area, because of the extreme compaction of fill deposits encountered at the Dorchester Armory project area, most test pits were unable to be excavated beyond 50 cm in depth. Historical maps indicate that the property currently occupied by the Dorchester Armory was situated on shoreline and/or swamp. It is possible that the fill deposits encountered at the Dorchester Armory are relatively thick and possibly cap intact sediments that could not be reached by hand excavation methods. Should intact sediments be present underneath the fill, there is potential for these sediments to contain archaeological deposits. It is recommended that any construction or improvements that would involve impacting soils in excess of 50 cm be coordinated with additional archaeological machine-assisted excavations to determine the presence of buried paloesols that could contain Native American resources. No archaeological resources were located and no additional archaeological investigations are recommended for the Bourne, Middleborough, Braintree, Melrose, Gardner, and Ware armory project areas.

25-2896 Donta, Christopher L., and Timothy F. Barker
2008 Archaeological Intensive (Locational) Survey for the Proposed Nickerson State Park Water System Improvements, Brewster, Massachusetts. 56 pages.

Archaeological reconnaissance and intensive surveys were conducted in the vicinity of Flax, Cliff, and Little Cliff Ponds, within Nickerson State Park. Background research identified four Native American sites within the immediate area, as well as high historic potential related to the early 17th-century settlement of Brewster. In total, 166 test pits along transects with 7.5 m intervals were utilized to test 19 different survey units. No Native American artifacts or features were encountered. A brick and concrete mortar campfire pit feature was identified in Survey Unit 8. The campfire pit may be associated with the Civilian Conservation Corps improvements to the park in the 1930s. No artifacts were recovered from testing in the vicinity of the feature.

25-2897 Flynn, Erin, and Dianna L. Doucette
2008 Intensive (Locational) Archaeological Survey, EBI Telecom Antenna, 57 Peck Street, Rehoboth, Massachusetts. 43 pages.

A total of 28, 50 x 50 cm test pits were excavated within the 60 square foot proposed cell tower area and along the proposed access/utility easement. No disturbance was noted during the intensive survey. Several stone walls crisscross and surround the project area. A stone-lined cellar and well, possibly dating to the 1600s according to archival research, are located adjacent to Peck Street, just south of the proposed access route/utility easement. One judgmental test pit was placed between the cellar hole and stone-lined well. This test pit yielded one piece of redware and one piece of flat glass, which likely indicates 17th or 18th century occupation.

25-2898 George, David R., William F. Keegan, Aaron Palermo, and Catherine M. Labadia
2008 Intensive (Locational) Archaeological Survey of Proposed Optasite Cellular Telecommunications Facility 967-0018 off Stony Hill Road, Wilbraham, Massachusetts. 34 pages.

Following completion of background research and pedestrian survey, 44 shovel tests were excavated at 7.5 m intervals. Each shovel test measured 50 cm square and extended to depths typically no greater than 55 cm, when sterile subsoil or large boulders were encountered. No cultural deposits were identified.

25-2899 Doucette, Dianna L., and Holly Herbster
2008 Intensive (Locational) Archaeological Survey, Manaquayak Preserve, West Tisbury, Massachusetts. 47 pages.

The project consists of the construction of an approximately 1,000 sq ft parking area and approximately 400 linear ft of universal accessible trail and the installation of two viewing benches within the existing land bank property around Ice (Old) House Pond. A total of 12, 50 x 50 cm test pits

were excavated. A total of 133 pieces of chipping debris, a Small Stemmed-like quartz projectile point, a quartz stemmed point, and a quartz biface were collected across more than 100 linear m and in both the trail and parking impact areas. While no features were identified the recovery of materials in all sections of the project corridor, as well as an existing foot trail between the project corridor and the pond suggests that additional deposits are likely located within the property. The Ice House Pond Site is potentially significant and avoidance is the preferred option.

25-2900 Robinson, David S.
2006 Marine Archaeological Sensitivity Assessment, Hodge Boiler Works Marina Project, East Boston, Massachusetts. 7 pages.

Results from archival research and visual inspection of the intertidal portion of the project area at low tide were used to assess the archaeological sensitivity and ascertain land use. Archival research and field investigation indicate the area's natural (pre-1833) shoreline is obscured by artificial "made-land" the present configuration of which was established by the mid-19th century. Extending into the water from the made-land shore are the remains of piers repaired/rebuilt using increasingly modern construction materials over the course of their operational history. No significant archaeological deposits or structures were recorded or observed within the marine portion of the project area.

25-2901 Mair, A. Peter, II
2008 Intensive (Locational) Archaeological Survey, Worcester Road Area Sewer Extension Project, Webster, Massachusetts. 57 pages.

Subsurface testing included the excavation of 20, 50 x 50 cm test pits. No Native American cultural material was recovered and the low density of post-contact cultural material is not indicative of potentially significant archaeological resources.

25-2902 Claesson, Stefan
2008 Sustainable Development of Maritime Cultural Heritage in the Gulf of Maine. 346 pages.

In this study the principles of sustainable development and ecosystem-based management are applied to develop a conservation policy for maritime cultural heritage in the Gulf of Maine. This dissertation first examines the effectiveness of existing laws, policies and preservation programs available for the protection and conservation of maritime historical and archaeological resources in the region, and provides an assessment of the diversity and abundance of these resources. The principles of sustainability and ecosystem-based management, including inter- and intra-generational equity, precaution, system interconnectedness, and diversity, are applied to form a theoretical framework upon which policies and cultural resource management techniques are developed. To this end, the study identifies the cultural and economic values associated with maritime cultural heritage and the costs and benefits of conservation projects. Finally, policy recommendations are made regarding the governments' role and responsibility in protecting and managing the public interest in this cultural heritage: government should enact law that asserts public property ownership and protection of all maritime cultural resources in waters under U.S. federal jurisdiction, implement a regional governance structured based on the tenets of ecosystem-based management to manage and develop these resources effectively, and integrate valuation techniques in environmental and historic preservation regulatory procedures. Given these policy developments, governments can make informed decisions about the use of cultural resources, support coastal communities' development efforts, and identify the social and economic benefits of conservation projects.

25-2903 Herbster, Holly, and Nichole Gillis
2008 Archaeological Reconnaissance Survey, Town of Halifax, Massachusetts. 317 pages.

The main goals of the town-wide survey were to: identify known and potential pre-contact and post-contact archaeological sites; develop town-wide archaeological sensitivity maps and an ac-

companying guide to understanding and using these maps; develop management recommendations for the protection of cultural resources and sensitive areas; and, present the information in a format that would be useful to state and local planning and review agencies. The reconnaissance survey included archival research, informant interviews, and field survey that allowed for the collection of information about known and potential archaeological resource areas. This information was then used to compile environmental and cultural contexts, and to develop predictive models for undocumented archaeological sites. The survey resulted in the documentation of 32 previously unrecorded archaeological sites (14 pre-contact and 18 post-contact sites). The predictive model developed for the survey indicates that Halifax contains a wide diversity of natural resources including extensive wetland networks, large areas of limited modern period development, and a documented human presence spanning at least 10,000 years.

25-2904 Mair, A. Peter, II, and Anna Graves
2008 Intensive (Locational) Archaeological Survey, Route 24 Interchange Improvements and Massachusetts Highway Department Assignment 36 and 36B, Freetown, Massachusetts. 93 pages.

An intensive (locational) archaeological survey was conducted for several alternatives and four wetland replacement areas for proposed Interchange 8 1/2. The intensive survey included research, informant interviews, and field investigations. Visual inspection and subsurface testing revealed evidence of past agricultural activity, including evidence of a plow zone in soil profiles, linear patterns of stone walls to define agricultural fields and numerous stone piles located in close proximity to these walls. There is also evidence of quarrying activity as well as a historic quarry. A total of 387, 50 x 50 cm test pits were excavated, identifying two areas of pre-contact period activity and a post-contact home/farmstead. Rhyolite and quartz chipping debris recovered from the Green Briar Find Spot represents an isolated find. The Other Side of the Tracks Site represents a small, temporary campsite evidenced by quartz and rhyolite chipping debris and two quartz bifaces. Despite the small size and low artifact density the site is considered potentially significant and further investigations may shed light on the relationship between small upland sites and the more heavily utilized and occupied riverine environs. The Old House Site consists of a house foundation and possible outbuilding foundation. Subsurface investigations produced a significant amount of early 18th-century cultural material. More importantly, there is very little evidence of later post-contact cultural material. The Old House Site represents a rare, intact assemblage from the early to mid-18th century and could provide detailed information about an early 18th-century farmstead's processes and activities. The Old House Site and the Other Side of the Tracks Site are considered potentially significant and avoidance is recommended. If avoidance is not possible additional archaeological investigations at the site examination level are warranted.

25-2905 Robinson, David S.
2005 Northeast Gateway Energy Bridge Project Marine Archaeological Reconnaissance Survey ROV Inspections of Potential Cultural Targets, Massachusetts Bay, Massachusetts. 13 pages.

Remotely-operated vehicle technology was utilized to conduct underwater archaeological inspections of five remote sensing targets in Massachusetts Bay, Massachusetts. Results from archaeological field investigations indicate three of the targets were natural features, one was a steel beam embedded in the seafloor, and one was the shipwreck of a modern fishing vessel.

25-2906 Doucette, Dianna L.
2008 Intensive (Locational) Archaeological Survey, Nobadeer Recreation Facility Project Area, Nantucket, Massachusetts. 73 pages.

Subsurface testing with 95, 50 x 50 cm test pits in the 18 acre project area documented undisturbed soil horizons over the majority of the area. Test pits were excavated among seven 30 x 30 m blocks and one test pit array. A single pre-contact biface was recovered from a disturbed context along an existing roadway. This artifact (Nobadeer Recreational Facility Site, 19-NT-244) consists of a broken biface resembling a Brewerton type projectile point manufactured from chert,

diagnostic of the early Late Archaic Period, ca. 5000 to 4000 BP. One quartz drill-tip, broken in two, a quartz Snappit projectile point, diagnostic of the late Middle Archaic Period, and one quartz flake was recovered in the adjacent project area. The low density of Native American cultural material recovered suggests this area may have been used short-term as a hunting ground where some lithic manufacturing and/or maintenance took place.

25-2907 Herbster, Holly, and Brian Ó Donnchadha
2008 Intensive (Locational) Archaeological Survey, The Fenn School, Concord, Massachusetts. 69 pages.

Twenty-two 50 x 50 cm test pits were excavated along two judgmental linear transects and as test pit arrays. The survey resulted in the identification of the Fenn Field Find Spot. Eight pieces of chipping debris representing three different lithic material types were collected over a 300 square m area almost entirely within A/topsoil horizons.

25-2908 Graves, Anna K., and Holly Herbster
2008 Intensive (Locational) Archaeological Survey, Cordage Seaport Project, Plymouth, Massachusetts. 75 pages.

Portions of the project area were included in a 1995 archaeological survey which resulted in the identification of the PCC and PCC Locus 1 Native American archaeological sites (see report #25-1576). The PCC Site (19-PL-787) was considered to be a potentially significant archaeological resource and avoidance and preservation were recommended for this site. The main goal of the intensive survey was to locate and identify significant archaeological deposits within the limited areas that had not been subjected to previous archaeological testing. Nineteen test pits were excavated. One isolated Native American deposit, the Cordage Seaport Find Spot, was identified within the project area. As part of the project review, a Site Avoidance and Protection Plan and Post-Discoveries Review Plan were prepared for the PCC Site.

25-2909 Doucette, Dianna L.
2008 Intensive (Locational) Archaeological Survey, Mashpee Wampanoag Trust Parcels, Tribal Housing and Tribal Offices Project Areas, Mashpee, Massachusetts. 59 pages.

The Mashpee Wampanoag Tribe is proposing to take several parcels into trust, and propose to develop two lots for Tribal Housing consisting of approximately 55 acres, and one lot for Tribal Offices consisting of an impact area of approximately 12 acres. The intensive survey included archival research, a walkover survey, and subsurface testing. One hundred forty-six test pits were excavated within six 30 x 30 m blocks and along eight judgmental linear transects within the Tribal Housing parcel. Within the Tribal Offices parcel, 31 test pits were excavated within one testing block and along three judgmental transects. No cultural material was identified.

25-2910 Heitert, Kristen and Nichole Gillis
2008 Intensive (Locational) Archaeological Survey, Hersey House Rehabilitation and Hersey Barn Relocation Project, Hingham, Massachusetts. 79 pages.

A total of 44, 50 x 50 cm shovel test pits spaced at 5 to 10 m intervals was excavated across the 3 acre project area using 11 transects and as three judgmentally placed test pits. The test pits were excavated to an average depth of 70 cm below surface (cmbs) with several test pits dug as deeply as 100 cmbs. Soil profiles typically consisted of between one and five distinct fill layers, overlying variably intact topsoil and subsoil horizons. Intact soil profiles were identified in the wooded northern portion of the property. A total of 1,104 pieces of mid-18th through late 20th-century domestic and architectural debris was recovered from 43 of the 44 test pits. The majority of the material was recovered from filled soil contexts and included a heavily mixed assemblage comprising bottle and window glass, ceramic sherds (redware, creamware, pearlware, porcelain, and whiteware), coal, slag, brick, mortar, and nails, and lower densities of pipe fragments and faunal material. The soil and artifact data recovered from the project area documents widespread land-

scape disturbance over the majority of the property. No evidence of former historic structures known to have existed on the property (i.e., the 19th-century Thaxter House or 18th-century blacksmith shop) was identified, and no intact or potentially significant pre- or post contact features or cultural material concentrations were present.

25-2911 Mair, A. Peter, II
2008 Intensive (Locational) Archaeological Survey, Neponset Street Water Treatment Facility, Canton, Massachusetts. 61 pages.

Thirty-one 50 x 50 cm test pits were excavated within one 30 x 30 m sampling block, along three linear transects, and at five judgmental locations. The investigation confirmed the presence of the previously recorded Fuller Street Site (19-NF-68) within the project area. Twenty-one of the thirty-one test pits yielded pre-contact chipping debris, a Rossville projectile point, and several biface fragments. Sufficient material was recovered from undisturbed subsoils to suggest the potential for subsurface features. The horizontal distribution of recovered material suggests a large site, at a minimum 80 m east/west by 30 m north/south. Based on the information recovered, the Fuller Road Site is considered a potentially significant archaeological resource that may provide information relative to past Native American activities in the Neponset River/Fowl Meadows area of Canton, in particular during the Middle Archaic to Middle Woodland periods.

25-2912 Leveillee, Alan, and Mark Lance
2008 Intensive (Locational) Archaeological Survey, Legacy Farm, Hopkinton, Massachusetts. 69 pages.

In total, 398 test pits were excavated in the 733 acre parcel. Of these, 42 contained pre-contact period cultural material and 34 contained post-contact period cultural material. Eleven Native American sites/find spots and four post-contact sites were identified. The Reservoir Ridge Site, the Christmas Tree Site, the Seat Ridge Site, the Flat Woods Site, and the Black Field Find Spot are not significant. The Cracked Rock Site overlooks a drop off with several large boulders creating overhangs. The site contains a moderate density assemblage of chipping debris in a crack in a ledge, with several possible rock shelter areas adjacent. The Boulder Point Site contains 12 pieces of relatively low grade quartz chipping debris recovered from a single test pit. The Tumbled Rocks Site is situated among a naturally formed tumble of ledge rock. A small opening among the rocks faces north and could have provided marginal shelter from the elements. No diagnostic material was discovered, but the quality of most of the pieces is similar to that of the Boulder Point and the Cracked Rock sites. The Verdant Pines Site is located in a planned open space area and resulted in the recovery of 39 pieces of cultural material, including Woodland Period ceramics. The Border Pot Rock Shelter Site assemblage includes 45 artifacts recovered from seven test pits and is temporally associated with the Middle Woodland Period. The Chopper Ridge Site is situated on a narrow elevated ridge surrounded by wetlands. Nineteen pieces of chipping debris were recovered. These sites will not be impacted by current development plans. The William Bixby Farmstead Site contains an assemblage of early to mid-19th-century artifacts. There appears to have been no further use past the mid-19th century, and the foundations are in good condition with almost no disturbance. The Benjamin Phipps Farmstead Site contains early to mid-19th-century artifacts. The structure and foundations were completely removed in the early 1970s, and all that remains is a scatter of artifacts. The Samuel Smith Farmstead Site contains early to mid-19th-century artifacts. The structure and foundations were completely removed at some point, and all that remains is a scatter of artifacts. The Legacy Farms Historic Trash Dump Site consists of surface and shallow deposits of debris from the late 19th to early 20th century. The four post-contact sites will not be impacted by development at the Legacy Farms project, as currently planned.

25-2913 Ritchie, Duncan
2008 Intensive Archaeological Survey, The Regency at Methuen Residential Community, Methuen, Massachusetts. 51 pages.

Subsurface testing was conducted with 118, 50 x 50 cm test pits excavated within two 30 x 30 m

sampling blocks and along 16 judgmentally placed transects. Eleven judgmentally placed test pits were placed. No pre- or post-contact period archaeological sites were found during subsurface testing.

25-2914 Mair, A. Peter, II
2008 Intensive (Locational) Archaeological Survey, Route 28 at Reine's Corner Reconstruction, Falmouth, Massachusetts. 65 pages.

Survey was conducted within a proposed 3,436 square foot wetland mitigation area adjacent to Bourne's Pond/Brook. Fieldwork consisted of a walkover/surface evaluation and subsurface testing. Seventeen 50 x 50 cm test pits were excavated, producing three quartzite flakes. Additional, close interval testing did not produce any additional cultural material.

25-2915 Ritchie, Duncan
2008 Intensive (Locational) Archaeological Survey, Revolutionary Training Field, Sudbury, Massachusetts. 63 pages.

Archival research indicated there was some potential for the Revolutionary Training Field (SUD-HA-21) to contain remains of Revolutionary War period storehouses or warehouses located on or near the Training Field parcel in the late 18th to early 19th century. Fifty-two 50 x 50 cm test pits were excavated across the project area at 10 m intervals using seven linear transects, and as one array and three judgmentally placed test pits. The test pits revealed plowed horizons underlain by intact subsoils. The southern and central portions of the project area yielded a low-density scatter of late 18th to 19th-century domestic debris consistent with the use of the parcel as agricultural lands throughout the post-contact period. None of the materials exhibited any identifiable horizontal or vertical patterning, and none were found in association with cultural features. The fact that the artifacts were recovered exclusively from plow zone contexts, indicate that the assemblage is best characterized as secondary deposition field scatter. A higher concentration of historic debris, including redware, creamware, brick, a glass button, and a ball clay pipe stem fragment, was found in the northern portion of the project area. Given the primarily late 18th-century temporal profile of the recovered domestic debris and the amount of architectural materials in the area, it could be argued that the assemblage is related to activities associated with the use, maintenance, and eventual relocation of one of the Revolutionary War-era storehouses reported to have stood in that location. No military-related artifacts, however, were found in any of the test pits and no structural remains of the storehouse were identified. As such, the assemblage cannot be conclusively associated with Revolutionary War period activity on the Training Field Site.

25-2916 Mair, A. Peter, II
2006 Reconnaissance Archaeological Survey, South Weymouth Naval Air Station/Route 3 Access, Rockland, Massachusetts. 55 pages.

Research and field investigations revealed that the majority of each access alternative traverses areas of low archaeological sensitivity because of existing environmental and topographic setting and/or prior disturbance associated with recent development of the general area. One small area of moderate/high sensitivity for pre-contact archaeological sites was identified.

25-2917 Dubell, Greg, Jonathan Patton, and Joe Bagley
2008 Results of Site Examination, Nichols House Museum, 55 Mount Vernon Street, Boston, MA. 17 pages.

Prior to the initiation of structural repairs to the rear courtyard and two outbuildings (laundry and woodshed) of the Nichols House Museum on Beacon Hill, an intensive (locational) archaeological survey was conducted. Two 1 x 1 m excavation units and one 50 x 50 cm shovel test pit were excavated to 80 cm below surface level. Three features relating to previous gardening and/or 1980s repairs of the woodshed, brick footings, and downspout were encountered in the excavation units. Artifacts included iron nails, fragmentary coarse and fine earthenwares, brick, coal, slag, and

glass. No significant historic or archaeological resources were recovered. This report includes two addenda analyzing the 2006 artifact assemblage and reporting on the 2008 archaeological monitoring.

25-2918 Ritchie, Duncan, and Anna Graves
2007 Intensive (Locational) Archaeological Survey, Independence Mall Expansion, Kingston, Massachusetts. 51 pages.

Twenty-five 50 x 50 cm test pits were excavated along judgmentally placed transects and within a 15 m square sampling block in areas of high and moderate archaeological sensitivity. No archaeological sites or other cultural resources were identified (see report #25-814 and 25-1137).

25-2919 Mair, A. Peter, II
2006 Reconnaissance Archaeological Survey, South Weymouth Naval Air Station/Trotter Road Access, Weymouth, Massachusetts. 57 pages.

A reconnaissance level archaeological survey was conducted along an approximately 800-foot-long corridor encompassing Trotter Road between the South Weymouth Naval Air Station and Route 18. Research and field investigations revealed that the project area has low archaeological sensitivity because of prior disturbance associated with recent development of the general area.

25-2920 Law, Heather, Guido Pezzarossi, and Stephen Mrozowski
2008 Archaeological Intensive Excavation, Hassanamesit Woods Property, The Sarah Boston Farmstead, Grafton, Massachusetts. 102 pages.

This report summarizes the results of archaeological investigations conducted at the Sarah Boston Farmstead (GRF-HA-26, also known as the Muckamaug Site). The site had previously been examined during an intensive survey conducted in 2005, and through documentary research that identified it as a parcel occupied by a succession of Nipmuc women. Seventeen 2 x 2 m units were excavated in 2006, and an additional seventeen 2 x 2 m units were excavated in 2007. In addition, ground penetrating radar was employed within the farmstead area to detect subsurface features, including the cellar hole that was the focus of the excavations. Historical materials recovered include architectural debris (nails, window glass), coarse and refined earthenwares, stonewares, and porcelain, vessel glass, clay pipes, buttons, and faunal remains, all of which provide insight into a Native American farmstead in late 18th/early 19th-century Central Massachusetts. The report contains analyses of all of the material culture, with particular emphasis on the ceramic and glass assemblage. In addition, a steatite bowl fragment recovered along with material culture of European origin is discussed in the report as an heirloom artifact. The report concludes with a discussion of Native negotiations of class through architecture and social space, foodways, and identity (see report #25-2391, 25-2565, and 25-2757).

25-2921 Duffin, Michael, and Deborah C. Cox
2006 Archeological Investigations, Highlands Center Utilities Upgrade, Cape Cod National Seashore, Truro, Massachusetts. 38 pages.

An intensive survey was completed within a 0.5 acre parcel within the former North Truro Air Force Station as part of a National Park Service water main relocation project. Twenty-five test pits were excavated along a linear transect and within a 30 x 30 m block. The survey documented modern period ground disturbance within most tested areas. No cultural materials were recovered.

25-2922 Doucette, Dianna L.
2008 Intensive (Locational) Archaeological Survey and Archaeological Site Examination, Kline Property Project Area, Truro, Massachusetts. 83 pages.

The property owner is planning the construction of a single family home on a 9.36 acre parcel of land bounded on the west by Cape Cod Bay. The proposed project impact area consists of ap-

proximately 0.73 acres within the lot. Twenty-four 50 x 50 cm test pits were excavated. The subsurface testing resulted in the recovery of 103 pieces of pre-contact Native American and post-contact Euro-American cultural material. The pre-contact material consists of lithic chipping debris, Native American clay pottery, one quartz scraper, one rhyolite biface, burnt rock, clam shell, and seeds within a concentrated area of 5 of the 24 test pits excavated. The cultural materials were collected between 0 and 40 cm below the ground surface (cmbs) in A/plow zone and B/subsoil strata. The Native American pre-contact cultural material was designated as the Kline Site. The site could not be avoided and an archaeological site examination was undertaken. Twenty 50 x 50 cm test pits and three 1 x 1 m units were excavated at the site. A total of 243 pieces of pre-contact Native American and post-contact Euro-American cultural material were recovered, including 48 pieces of lithic chipping debris (quartz, quartzite, argillite, and rhyolite), ten sherds of Native American clay pottery, one rhyolite Fox Creek projectile point, one rhyolite projectile point tip, one hornfels biface/blade base, one quartz scraper, and one Native flaked bottle glass scraper. Based on the presence/absence of cultural material, the horizontal boundaries of the Kline Site were determined to be approximately 15 m north/south by 15 m east/west, or 225 square meters. Vertically, cultural material was found between 0 and 40 cmbs, the majority of which was recovered between 10 and 30 cmbs in the A/plow zone horizon. No cultural features were identified. The density of Native American cultural material within the 225 square m area, suggests that this area may have been used as a small, short-term campsite where lithic manufacturing and/or maintenance and food processing activities were taking place. The recovery of a Fox Creek stemmed point and pottery suggests that the site dates to at least the Middle Woodland Period, approximately 2,000 to 1,000 years before present. In addition, the recovery of a Native flaked piece of green bottle glass, suggests some occupation or visit to the site during the post-contact period. The location of the majority of these cultural materials in the plowzone indicates that the site is relatively shallow and that the integrity of the deposits is poor. The site examination collected sufficient information to answer basic questions about site size, age, and internal complexity. Because of a lack of features and radiocarbon-datable contexts and relatively low potential for finding such contexts based on the level of subsurface testing conducted, it did not appear that additional archaeological testing within the Kline Site will yield significant new classes of data. Upon completion of the site examination of the Kline Site, machine-assisted soil stripping was conducted and no subsoil features were identified.

25-2923 Flynn, Erin, and Dianna L. Doucette
2008 Intensive (Locational) Archaeological Survey, Retreat at Union Pond, Wareham, Massachusetts. 63 pages.

Fifty-one, 50 x 50 cm test pits were excavated within the project area. A total of 269 pieces of post-contact refuse and three pieces of pre-contact cultural material (one quartz scraper and two pieces of quartz chipping debris) were recovered. One previously undocumented pre-contact site, the Union Pond Find Spot 1 (19-PL-1076), and one previously undocumented post-contact site, the Wright Homestead, were identified. The Wright Homestead Site consists of two stone foundations, located approximately 30 m apart. The post-contact Wright Homestead is already well documented, and has limited research potential.

25-2924 Donta, Christopher L., and F. Timothy Barker
2008 Phase I Archaeological Intensive (Locational) Survey and Phase 2 Archaeological Site Examination Survey of the New Middle Line Road Housing Project, Chilmark, Massachusetts. 71 pages.

The project area consists of two locations: an approximately 21.4 acre area where the housing development is to be built, and a 90 m long realignment of Middle Line Road and its intersection with Tabor House Road. Background research indicated that two historic period Native American sites were located in the vicinity of the Middle Line Road realignment: the Indian Chapel Site (CHL-HA-6) and the Francis Family Wigwam Site (CHL-HA-7). The reconnaissance survey did not identify any clear indications of these sites within the proposed impact areas. During the Phase 1 survey, two Native American archaeological sites were identified: The Crow Feathers Native

American isolated find, located in the housing development area; and the Middle Line Road Native American Site, located in the area of the Middle Line Road realignment. The Crow Feathers Site consisted of a single quartz flake, and additional close interval testing did not identify any more artifacts. The Middle Line Road Native American Site included over 50 artifacts from three test units. The site examination survey identified a lithic reduction feature associated with over 500 lithic flakes, two cores, two hammerstones, and anvil stone. No temporally diagnostic artifacts were identified. The site is interpreted as a single episode of secondary lithic reduction with no associated structural feature.

25-2925 Lance, Mark, and Alan Leveillee
2008 Intensive (locational) Archaeological Survey, Stone Ridge Development, Milford, Massachusetts. 83 pages.

A total of 118, 50 x 50 cm test pits were excavated along judgmentally placed transects in areas of high and moderate archaeological sensitivity. Remains of two post-contact period farmsteads were found along the western edge of the project area along Deer Street. In addition, one dam and millrace complex and a possibly related mixed use industrial/residential complex were discovered on the south side of Wildcat Pond. Subsurface testing identified three pre-contact period Native American archaeological sites (Crystal Quarry Site, Small Pines Find Spot Site, and the Cheney Farmstead Site) and sampled the post-contact period farm and industrial complexes (Cheney Farmstead Site, Albee Farmstead Site, Shea/McDevitt Complex, and Wildcat Pond Dam and Millraces) within the project area. The Small Pines and Shea/McDevitt sites were not considered to be potentially significant cultural resources. The Crystal Quarry Site is a quartz extraction quarry containing dense concentrations of chipping debris. It has potential to expand knowledge of quartz extraction methodologies and pre-contact period use of space in related activities (reduction areas) and landscape features (marking boulders) related to the quarry extraction. The Cheney Farmstead is a multi-component site whose pre-contact period component is likely related to the Crystal Quarry Site. The post-contact period farmstead has been dated to the early 19th century and has good preservation of multiple foundations and features. It has potential to increase understanding of early 19th-century agricultural landscapes and domestic life. The Albee Farmstead Site contains early to mid-19th-century artifacts. There has been no further use past the mid-19th century, and the foundations are in good condition with almost no disturbance. The Albee Farmstead Site and the Wildcat Pond Dam and Mill Races Site will not be impacted by the construction at the Stone Ridge Development project as currently planned. The remaining dam and mill race features are elements of the retention and flow of water within Wildcat Pond and should be maintained.

25-2926 Herbster, Holly
2008 John Fitzgerald Kennedy National Historic Site, Archeological Overview and Assessment, John Fitzgerald Kennedy National Historic Site, Brookline, Massachusetts. 93 pages.

The Archeological Overview and Assessment (AOA) focused on two main research tasks; the collection and review of background historical and environmental information and the collection and analysis of archaeological data from the John Fitzgerald Kennedy National Historic Site and other archaeological sites in the vicinity. Archaeological testing included the excavation of four 50 x 50 cm test pits within the yard areas surrounding the house. The subsurface testing provided some important baseline information about the general soil stratigraphy in the front and backyard areas and provided an assemblage of artifacts that document the use of the property. The AOA produced important data that can be used to help direct and interpret future archaeological investigations and/or artifact finds at the site.

25-2927 Robinson, David S.
2007 Marine Archaeological Survey, Siasconset Beach Nourishment Project, Nantucket, Massachusetts. 71 pages.

The investigation consisted of archival research and marine geophysical (remote sensing) field survey along track lines spaced apart at a 50 foot interval. A geotechnical (vibratory coring) field

survey was conducted with samples recovered from 16 different locations within and in close proximity to Borrow Areas 1 and 2. Geophysical and geotechnical field surveys identified no targets/anomalies or buried geological features suggestive of archaeological deposits or potential paleosols (see report # 25-2932).

25-2928 Cherau, Suzanne, John Daly, and David S. Robinson
2008 Cultural Resources Reconnaissance Survey, New Street Development Project, East Boston, Massachusetts. 251 pages.

The proposed project consists of the redevelopment of a 3.93 acre waterfront parcel at 6-26 New Street. The project parcel currently contains a 9-story warehouse, a 5-story warehouse, a 3-story building, all attached, as well as accessory structures, dilapidated wharves and timber piers, concrete slabs, granite seawall, and a paved parking lot. The parcel was historically used for shipbuilding and repair, and later cold storage among other businesses. The reconnaissance survey consisted of research; a walkover of the project area and surrounding neighborhood. The reconnaissance survey identified one resource in the project area, the New Street Sea Wall, that is recommended as eligible for the National Register. Four resources – the Atlantic Works Boiler Shop; Atlantic Works Machine Shop; Atlantic Works Office Building; and the East Boston Dry Dock Company/Atlantic Works Railway Dry Docks Site – were previously recommended as eligible for the National Register of Historic Places. These resources may be subject to visual impacts from the proposed project. One area, the Maverick-Border-Liverpool Street Block, may be eligible for the National Register but is on the perimeter of the project and is not recommended for further research. The reconnaissance survey for archaeological resources consisted of archival research and a walkover survey for both terrestrial and marine cultural deposits. The survey identified high sensitivity areas where potentially significant terrestrial archaeological resources may be present. These sensitive areas could contain the belowground remains of early to late 19th-century shipbuilding. There is also the potential for intact buried land surfaces that could contain evidence of Native American resource procurement and processing activities including a possible shell (oyster) midden situated below the historic and modern period fill deposits.

25-2929 Herbster, Holly
2008 Addendum to Technical Report, Intensive (Locational) Archaeological Survey, Martha's Vineyard Airport Improvement Program, West Tisbury and Edgartown, Massachusetts. 4 pages.

The current project was added to the overall project after completion of the 2003 survey (see report # 25-2402). Fifty-four test pits were excavated at 10 m intervals within the proposed project impact areas. No cultural materials were identified.

25-2930 Donta, Christopher, and Jennifer Wendt
2008 Archaeological Intensive (Locational) Survey and Site Examnation for the Deerfield Academy, Science, Math and Technology Building, Deerfield, Massachusetts. 167 pages.

An intact portion of a Native American archaeological site was uncovered on an open, level terrace. In the area of investigation, which included the excavation of 41 shovel test pits, three 1 x 1 m units, an exploratory trench 12 m x 50 cm, and four shovel test pits, pre-Contact Native American artifacts and features were found. Site examination testing included two 8 m x 50 cm long trenches, three 1 x 1 m units and six shovel test pits. This testing exposed a dense concentration of features and artifacts in a small area bounded by disturbance to the west, and a slope to the north. The site, which was named the Pocumtuck Meadows, represents an area of Native American settlement dating from the latter part of the Middle Woodland period. The truncated fire hearth and the storage pit date from this time period, along with some of the postmolds. The artifacts consist of a mix of Native American items and historic period artifacts, with the largest proportion represented by chert flakes, but also including rhyolite, quartz, and quartzite flakes. Sherds of Native pottery, along with fire-cracked rock, and a variety of stone tools, including projectile points, bifaces, cores, perforators, scraping tools, and a hammerstone were recovered. Organic remains and charcoal were also recovered from the storage pit and other features. The charcoal has been dated

to approximately 1,160 years in age. In addition to Native American artifacts, a number of historic period artifacts were also uncovered, including two pieces of kettle copper, two flakes of English ballast flint, olive-colored blown glass, several 18th-century ceramic types, and a large-bore clay pipe stem, along with later historic materials, which are distributed above the intact portions of the site and in areas of disturbance. Because the Pocumtuck Meadows Site still contains significant information related to the Native American occupation of Deerfield in the Woodland period, it was recommended that the proposed project be altered to avoid the site. Deerfield Academy complied with this request, altering the site plans to avoid the intact portions of the Pocumtuck Meadows Site.

25-2931 Heitert, Kristen
2008 Archeological Overview and Assessment, Bunker Hill Monument, Charlestown, Massachusetts. 103 pages.

The Archeological Overview and Assessment of the Bunker Hill Monument encompassed the review of the documentation and associated artifact collections for the eight archaeological surveys projects that have been conducted on the monument property from 1980–2006, and resulted in the identification of a total 18 archaeological properties. Of those properties, six were recommended as potentially eligible for listing in the National Register including the remains of the redoubt trench feature associated with the Battle of Bunker Hill Period of Significance (1775) and the monument foundation and associated structural elements and the remains of the Holmes hoisting apparatus, all of which are associated with the Commemorative Period of Significance (1825–1902). In consideration of the actual and potential contributions of archaeological research to a more substantive understanding of the history of the Battle of Bunker Hill and the Bunker Hill commemorative period, it is recommended that any future amendments to the existing National Register documentation for the Bunker Hill National Monument include post-contact period archaeology as an area of significance for the property under Criterion D. The report also provides an archaeological sensitivity map of the property for resources dating to both the Battle of Bunker Hill and Commemorative periods of significance, recommends more reliable geo-prospecting techniques as the most cost effective and least destructive method of archaeological research at the site (when the reliability and accuracy of the technology improves), and concludes with suggestions for public education opportunities using the archaeological data collected from the property to date.

25-2932 Robinson, David S.
2008 Siasconset Beach Protection Project, Supplemental Marine Archaeological Reconnaissance Survey, Pilot Cobble Bottom Mitigation Area, Nantucket Shoals, Massachusetts. 25 pages.

The investigation consisted of a marine geophysical (remote sensing) field survey along track lines spaced apart at a 50 foot interval using differentially-corrected GPS, a marine magnetom, dual-frequency side scan sonar, and a sub-bottom profiler. No features in the sub-bottom data suggestive of archaeological deposits or potential paleosols were identified (see report #25-2927).

25-2933 Herbster, Holly
2006 Intensive (Locational) Archaeological Survey, Charlotte White and Main Road Development Project, Westport, Massachusetts. 89 pages.

The 40 acre property includes an historic cemetery that is partially bounded by stone walls. The survey, which included archival research, walkover survey, ground-penetrating radar, hand excavation, and machine-assisted stripping, verified the presence of eight individual grave shafts and a range of eight to thirteen individual burial plots within a 2,500 square foot area. The archival and historic data suggest that the cemetery was included within the Benjamin Howard property prior to 1870, and a burial ground referenced in two sets of deeds dating from 1877 and 1881 may be the same one located within the project parcel. Permanent preservation of the cemetery through a Preservation Restriction was achieved.

25-2934 Cherau, Suzanne G., and Matthew Kierstead
2007 Historic Structures Documentation, Fisherville Mill Project Area, Grafton, Massachusetts. 105 pages.

The mill is included in two National Register Historic Districts (Fisherville Historic District and Blackstone Canal Historic District) and reflects the Town of Grafton's development as a 19th-century industrial center. This area contains the dam and control gate remains, canal trench, mill structure remains, and two turbine pits (one of which is documented through oral tradition as possibly being the remains of Blackstone Canal Lock #30). The study also included a roughly one-quarter-mile long section of the canal. The current study concluded that the masonry and concrete turbine pits chamber at the Fisherville Mill appears to be a specialized waterpower structure dating from the ca. 1881 rebuilding of the mill. Both pits appear to have been built at the same time based on masonry characteristics. The stone blocks themselves appear to share some characteristics with those seen at other Blackstone Canal locks, however, those characteristics are not conclusive regarding origin. None of the walls in the turbine pits chamber appears to be an intact, in situ wall from Blackstone Canal Lock #30.

25-2935 Mair, A. Peter, II
2008 Intensive (Locational) Archaeological Survey, Phase 4H & 4I Chelmsford Lateral Sewer Project, Chelmsford, Massachusetts. 59 pages.

Fieldwork commenced with a walkover/surface evaluation of the various pump station and cross-country lateral areas. Subsurface testing included the excavation of 49, 50 x 50 cm test pits, distributed among seven proposed pump stations and three cross-country laterals. No evidence of archaeological sites was identified.

25-2936 Herbster, Holly
2008 Intensive (Locational) Archaeological Survey, Sperling Property and Site Examination, Sperling Site, Aquinnah, Massachusetts. 63 pages.

The intensive survey identified the Sperling Site which included chipped and ground stone tools and a gunflint in association with quartz chipping debris. The combined results of the two investigations indicated that the Sperling Site appears to be a short-term single component activity area.

25-2937 Doucette, Dianna L.
2008 Report Addendum, Phase I Archeological Survey for Province Lands Bike Path, Cape Cod National Seashore, Provincetown, Massachusetts. 11 pages.

A locational survey was conducted for a 3-mile section of the original bike path plan in 2006. The project redesign resulted in possible impacts to areas of both low and high archaeological sensitivity. Subsurface testing included the excavation of 48, 50 x 50 cm shovel test pits in 6 linear transects. No pre-contact cultural materials were recovered. Post-contact cultural material were limited to transfer print whiteware. Archaeological monitoring is recommended (see report #25-2723).

25-2938 Binzen, Timothy, Mitchell T. Mulholland, Sheila Charles, Chistopher Donta, and Kit Curran
2008 Community-Wide Archaeological Reconnaissance Survey of Kingston, Massachusetts. 222 pages, 4 folded maps (Appendix A-D), and map user's guide, 5 pages (Appendix E).

The project included background research, ranking of town lands into zones possessing low and high sensitivity to contain archaeological resources, a walkover inspection of selected archaeological sites and areas of high sensitivity, interviews, and integration of this information into thematic narratives of the town's past and development of an archaeological site protection plan for sensitive resource areas. The study found that Kingston contains many areas of high sensitivity for additional, unrecorded archaeological sites. Most of these areas have been subject to minimal disturbance, while some are known by artifact collections from agricultural areas and are partially

disturbed. The sites represent a vital part of the town's heritage, and have a high likelihood to contribute information of importance to archaeology. It is generally assumed that historical structures possess associated archaeological deposits, and should be considered as sites. It is recommended that the town adopt a bylaw and establish a system of review designed to require archaeological surveys of sensitive areas and to protect archaeological sites.

25-2939 Landon, David B.
2009 Archaeology of the African Meeting House: A Dig and Discover Project in Boston, Massachusetts. 18 pages.

This publication showcases the results of the 2005 archaeological data recovery at the African Meeting House on Beacon Hill in Boston, in a full-color illustrated booklet written for the general reader. As part of the preparations by the Museum of African American History's celebration of the meeting house's bicentennial in 2006, in conjunction with the rehabilitation and restoration of the National Historic Landmark, archaeological excavations were undertaken in the backlot and alley of the meeting house. Excavations recovered over 38,000 artifacts and explored drains and a privy. The artifacts and features are interpreted to rediscover details about daily life for African Americans who lived in the neighborhood and who visited the meetinghouse. The booklet conveys the archaeological investigation processes from research to excavation to analysis to conservation, and highlights the way that archaeological interpretation created new stories about the past to achieve a connection to Boston's 19th-century free African American community. Eight main themes and 28 subtopics are explored in the booklet. These include: the historical and symbolic importance of the meeting house and the central role archaeological investigations since 1975 have served to foster the museum's mission; the methods and results of the 2005 investigations; how significant artifacts interpreted in their depositional and historical contexts convey meaningful stories; historical and biographical details of the property's occupants and their productive careers; African American foodways in Boston; health in an urban neighborhood; institutional symbols of community action for social and economic change towards equality for African Americans in educational opportunities and the military; and, ways to learn more about historical archaeology and the history of African Americans in Boston. (See also report #25-2830.)

25-2940 Chartier, Craig
2005 Intensive Archaeological Survey at the Westville Village Estates in Taunton, Massachusetts. 65 pages.

One hundred and forty-five 50 x 50 cm test pits (93 systematically placed along four transects in one 30 m block, 10 judgmental, and 42 arrays) were excavated in high potential areas on the west side of the Three Mile River on the property of the proposed residential subdivision. In total, 285 artifacts were recovered (29 ancient, 256 historical). One previously identified ancient site (19-BR-551) was investigated, yielding a limited amount of diagnostic ancient cultural material. Historical (early 19th- to 20th-century) field scatter was encountered in the majority of the test pits but no historical sites were identified. Due to very deep historical plowing and the low density of ancient cultural material recovered, site 19-BR-551 is not considered a significant archaeological resource.

25-2941 Medina, Antonio, Timothy L. Binzen, F. Timothy Barker, Jennifer Wendt, and Mitchell T. Mulholland
2007 Archaeological Intensive (Locational) Survey and Site Examination for the Relocation of Liberty Street, Greenbush Line Restoration Project, Braintree, Massachusetts. 82 pages.

The intensive survey consisted of 18, 50 x 50 cm shovel test pits within the proposed realignment of Liberty Street, in a paved parking lot at the southwest portion of the park and a grassy area facing Union Street. Subsurface testing produced a moderate volume of 19th- and 20th-century artifacts from historical fill deposits created during the re-deposition and re-grading of soils and landscaping in the park. The artifacts were likely related to the historical structures that formerly stood on the property, which included the Jonas Perkins Parsonage/Loud House and the Jonas Perkins

School. No structural or architectural features were encountered as a result of archaeological testing along the grassy portion of the project area facing Union Street. Excavation of test pits below the paved portion of the park exposed a two-course alignment of cobblestones that ran perpendicular to Liberty Street, possibly related to the Jonas Perkins Parsonage or an associated outbuilding. Granite stones were also uncovered and may have been related to an architectural structure(s). A site examination was performed using machine and hand-excavated exploratory trenches and test pits. Twelve 50 x 50 cm test pits and six trenches exposed more stone features (cobblestones), forming an alignment at the northern edge of the paved lot. This likely served as a border that marked the edge of a pre-existing driveway associated with the Perkins School. The granite stones uncovered are not associated with other architectural features, such as a foundation. No intact archaeological resources were identified and the stones uncovered appear to be within a disturbed context. (See also report #25-2686.)

25-2942 Barker, F. Timothy, Timothy L. Binzen, Christopher L. Donta, Mitchell T. Mulholland, Kimberly Kasper, Quentin Lewis, and Antonio Medina
2009 Archaeological Investigations at the Town Brook Site for the Hingham Underpass and Town Brook Culvert, Greenbush Line Restoration Project, Hingham, Massachusetts. 367 pages.

Archaeological investigations were conducted in areas identified by previous reconnaissance surveys prior to multiple undertakings related to the restoration of the Greenbush Line commuter rail. Small portions of the site were excavated at different times based on construction requirements and on damage to the site caused by a contractor, but excavations generally consisted of a combination of 50 x 50 cm shovel test pits and 1 x 1 m excavation units. Subsurface testing resulted in the identification and analysis of the Town Brook site, which covered an approximately 336 m^2 area. Numerous site features and artifacts were associated with the pre-contact Native American occupations of the site area, which occurred during the Middle and Late Archaic periods and during the greater Woodland period as represented by a Meadowood point, a Greene point, and pottery. Many of the Native American artifacts were recovered from historical fill deposits. An occupation surface in one portion of the site appeared to be consistent with a wigwam-like structure. However, attributes of interior features and 17th century European artifacts in the associated artifact assemblage were interpreted as being more consistent with an "English wigwam," a form of temporary dwelling used during the initial English settlement of coastal Massachusetts in the early 17th century. It was difficult to discern between the Native American and European-American features at the site, a situation further complicated by the post-occupation admixture of Native American and European materials in fill deposits. All of the temporally diagnostic Native American artifacts pre-date the Contact period. A high water table at this site resulted in unusually good organic preservation, including wood discs, interpreted as parts of 17th-century drinking vessels, branches and stumps from clearing, bone (medium to large sized mammals including cattle), wood, and seeds. After its occupation in the 17th century, the site area was covered with deposits of fill and was partly buried during construction of the railroad in the 1840s. (See also reports #25-2354, 25-2248, 25-2249, 25-2686, 25-2694, and 25-2943.)

25-2943 Barker, F. Timothy, Timothy L. Binzen, Antonio Medina, Mitchell T. Mulholland, and Jennifer Wendt
2008 Archaeological Investigations of Historical Resources For the Hingham Square Underpass, Greenbush Line Restoration Project: Underpass Site 1, Underpass Site 2, Thaxter's Bridge Wall Site, and Main Street Survey Area, Hingham, Massachusetts. 238 pages.

Subsurface testing consisting of 50 x 50 cm shovel test pits in machine-excavated trenches concentrated exhibiting high likelihood to contain pre-contact Native American sites or historical sites. Intensive surveys identified the Underpass Historic Sites 1 (HIN-HA-22) and 2 (HIN-HA-23) and the Thaxter's Bridge Wall Site in Hingham. Phase 2 site examination surveys were completed at the Hingham Underpass 1 Site, which consisted mainly of a soil layer containing 17th- and 18th-century materials (Feature 40) overlying a dense deposit of cut wood vegetation. No additional survey is recommended. A Phase 2 site examination survey and a Phase 3 data recovery program were completed at the Hingham Underpass 2 Site, which consisted of a substantial, bur-

ied wooden structure. It was determined that the Hingham Underpass 2 site had been constructed for use as a vernacular well/water-house or springhouse built into the peaty bank against the northern side of Town Brook. The Thaxter's Bridge Wall Site, consisting of a stone masonry wall, represents a section of the western retaining wall of the bridge abutment for the historical Thaxter's Bridge. Excavation of the Thaxter's Bridge Wall Site determined its date of construction to the late 18th century. An intensive survey was conducted as required for the intersection of Main Street and the proposed underpass right-of-way. A machine-assisted exploratory trench was excavated on the western side of Main Street and no intact historical architectural features related to the location of the historical Broad Bridge were identified. (See also report #25-2714.)

25-2944 Barker, F. Timothy, Bruce Clouette, Mitchell T. Mulholland, and Timothy L. Binzen
2009 Archaeological Data Recovery Program, Cohasset Village Railroad Roundhouse Site, Greenbush Line Restoration Project, Cohasset, Massachusetts. 197 pages.

In 2004, archaeological investigations below the Cohasset Village municipal parking lot discovered the intact structural remains of the historical Old Colony Railroad's Cohasset steam locomotive servicing facility (COH-HA-7). The excavations revealed a turntable pit 16.99 m in diameter constructed with a substantial perimeter wall built of granite blocks. The adjacent roundhouse contained four bays and had overall dimensions of 30.48 x 18.9 m. The roundhouse and turntable in Cohasset were constructed in the late 19th century and serviced steam locomotives until the structures were demolished in the 1920s. South of the roundhouse, and next to a service track, stood the facility's water tower. A series of stone block footings for the water tower were identified during the archaeological excavations. The data recovery team excavated and documented all of the railroad features that were accessible beneath the parking lot. These archaeological remnants of Cohasset's railroad heritage are preserved at this location and will remain as an historical resource for posterity.

25-2945 Barker, F. Timothy, Timothy L. Binzen, Eric S. Johnson, Antonio Medina, Mitchell T. Mulholland, and Jennifer Wendt
2004 Archaeological Investigations for the Greenbush Line Restoration Project, Foundry Pond Native American Site, Hingham, Massachusetts. 168 pages.

An intensive survey, site examination survey, and data recovery program were completed at the Foundry Pond Site, a rhyolite quarry site. Situated on a natural terrace adjacent to the Weir River, near a rhyolite outcrop and a potential fishweir, the portion of the site that was investigated measures approximately 3,080 m^2. Seventy-five 50 x 50 cm shovel test pits, twelve 1 x 1 m excavation units, and five 2 x 2 m excavation units were completed. The presence of Neville-Variant, Brewerton, Small Triangle/Squibnocket, Fox Creek, possible Levanna projectile points, and decorated pottery sherds indicates a multi-component occupation of this site throughout the Middle Archaic, Late Archaic, and Woodland periods. With the exception of chert, raw materials were available on-site and imported from the Boston basin and beyond. The high degree of chipping debris concentrated around an apparent anvil stone, along with other tools that are pre-forms, whole, broken or unfinished, indicates that the Foundry Pond Site primarily served as a quarry, lithic reduction, and tool-manufacturing site. (See also reports #25-1859 and 25-2686.)

25-2946 Clements, Joyce M., and Jacob Freedman
2009 Phase I Intensive (Locational) Archaeological Survey for the SHELD Electrical Utility Line Expansion, South Hadley, Hampshire County, Massachusetts. 64 pages.

Researchers conducted documentary and field investigations for a proposed electrical transmission line expansion area, electrical pole locations, access roads, and staging areas, covering 6.1 acres. No professional excavations are reported from this vicinity, but a Native American Woodland period site (19-HS-220) is located within 200 m. Archaeologists excavated 64, 50 x 50 cm shovel test pits, judgmentally positioned along 2 staggered transects, at 10 m intervals on dry, flat terrain. Excavations produced modest quantities of historical material as well as three tiny trimming flakes

suggestive of an ancient Native American chipping station (the SHELD Findspot Site).

25-2947 Chartier, Craig
2006 Analysis of the Archaeological Collections of the Kingston Public Library Local History Room: Cram and Allerton Site Collections, Kingston, MA. 115 pages.

The Kingston Public Library Local History Room currently curates 4,321 artifacts from two archaeological collections: the Cram collection and the Allerton Site. The Cram collection contains artifacts gathered by amateur archaeologists Lester and Jon Cram from sites along the Smelt Pond area of Kingston, including the Resnick Site and the Williams site. The Cram collection, dating from possibly the Paleo-Indian period to the 17th century, represents a collection atypical of those usually amassed by amateur archaeologists. The collectors were careful and thorough in recovering a wide range of materials and objects. The Allerton Site (KIN-HA-19) is the remains of a mid-17th-century house built upon a Native American site (19-PL-118) and was excavated by James Deetz and Eric Ekholm in 1972. These collections were catalogued and analyzed to identify the sites, the types of artifacts, their temporal associations, the raw materials used, and any significant information trends in the collection.

25-2948 Robinson, David S., and David Trubey
2008 Marine Archaeological Reconnaissance Survey, Weaver's Cove Energy Proposed Offshore Berth and Submarine PiP Transfer System, Fall River and Somerset, Massachusetts. 69 pages.

The archaeological investigation involved archival research, field survey to record marine geophysical and geotechnical data, and analysis and synthesis of the research and survey results to assess the project study area's archaeological sensitivity and determine presence/absence of pre- and post-contact period submerged archaeological deposits. The project area contains no previously identified significant archaeological properties and contains no evidence of contextually intact paleosols with pre-contact archaeological sensitivity. It does contain three post-contact remote sensing targets that are or have high potential to be post-contact period shipwrecks. The three post-contact targets are located outside the preferred locations all work areas as presently configured; however, establishment of a protective buffer zone around each of these targets to avoid project-related impacts from affecting the identified targets was recommended.

25-2949 Clark, Dylan, Erin Frey, Christina J. Hodge, and Indira Phukan
2005 Harvard Yard Archaeology Project: 2005 Survey and Excavation Report. 86 pages.

This project was initiated in September 2005 on the campus of Harvard University in Cambridge and designed as a field course in historical archaeology with the overlapping goals of investigating the history of the university and campus life with particular emphasis on material culture associated with the Harvard Indian College period (ca. 1655–1695) and mitigating the impact on cultural resources of planned construction near the west foundation of one of the earliest structures on the university campus. Nine 1 x 1 m excavation units were excavated as well as five additional units that were opened adjacent to two early structures. Cultural material dating from the 17th through the 20th centuries was recovered from both loci. No artifacts or features have been conclusively linked to the Harvard Indian College.

25-2950 Sexton, Rachel
2000 Holden Chapel: An Archaeological Window into Harvard's Medical History. 87 pages.

The purpose of this undergraduate thesis was to compile and compare the data from the Holden Chapel dig to the history of the Medical School at Harvard Yard, Cambridge, and the general history of anatomy instruction. In 1999, renovation construction was halted after an archaeological feature containing human remains was exposed in the basement of the structure. Further investigation was warranted due to the nature of the archaeological find and the fact that no documentation indicating a basement to the structure exists. Three features in total were excavated with only one containing artifacts. Excavated in 14 levels, six of the levels yielded artifacts, including types such

as human and other faunal remains, ceramics, glass, architectural components, and various small finds. The deposits originate from the mid-19th century. Some human remains exhibit cut marks consistent with medical dissections; others were uncovered still articulated in situ. The archaeological assemblage speaks to the way the Harvard Medical School was established and maintained, as well as how 19th century medical instruction was conducted.

25-2951 Mair, A. Peter, II
2007 Intensive (Locational) Archaeological Survey, Willowbend Study Area, Slaymaker and Peck Properties, Mashpee, Massachusetts. 102 pages.

This survey consisted of background research, informant interviews, and field investigations. Evidence from known sites in the general area suggest that the project area has a high probability of containing pre-contact archaeological sites, and was also owned and occupied by Native American families between 1840 and 1929/30. A total of 168, 50 x 50 cm shovel test pits were excavated in moderate and high archaeologically sensitive portions of the project area, resulting in the identification of a number of loci of pre- and post-contact Native American cultural material that have been identified as the Maushop and Peck sites. Both sites are defined by a number of separate loci of both pre- and post-contact cultural material and further investigations would be required to address whether these loci represent individual sites or activity area of a much larger site.

25-2952 Donta, Christopher L., Patricia Mangan, Richard D. Holmes, and Mitchell T. Mulholland
1995 Archaeological Site Examination of the Cook-Newell-Freedley Marble, Saw and Grist Mills, West Stockbridge, Massachusetts, for the Main Alford Road Bridge Replacement Project. 43 pages.

This survey was conducted on two mill-related cultural features to be partially impacted by the replacement of the bridge. The survey included three backhoe-assisted trenches, 18, 50 x 50 cm hand-excavated shovel test pits, and mapping and photography across 0.158 acres. The project area was known as Freedleyville in the 19th century. The survey examined a raceway feature associated with the 19th-century Freedley Marble Mill and a foundation of the 18th-century Cook-Newell marble, saw and gristmill. The main structures of both mills are outside the project area. The early mill foundation was found to be largely intact and portions near the road/bridge were fully documented. A limited number of artifacts were found in association with the saw and gristmill. The raceway to the Marble Mill was explored on both sides of the road and was found to have been disturbed by past road construction activities. (See also report #25-2978.)

25-2953 Luhman, Hope, Mark E. Penney, Niels Rinehart, Roger Ciuffo, and Delland M. Gould
2009 Archaeological Reconnaissance and Intensive (Locational) Survey, 115kV K-163 Transmission Line Project. 267 pages.

An archaeological survey was conducted for an electrical transmission line improvement project in the towns of Amesbury, Groveland, Merrimac, and West Newbury. Proposed structure locations and laydown areas were tested with a total of 161, 50 x 50 cm shovel test pits. Historical period artifacts were found at six areas (typically brick fragments and small ceramic sherds dated from the early 19th century through 20th century). All artifact finds were either in disturbed contexts (e.g. plowzone/fill) or interpreted as isolated finds. A single above-ground historical period foundation (circa 1900) was also identified. This area was designated as the Bachelor Street-01 Site. (See also report #25-3151.)

25-2954 Harper, Ross, Mary Harper, Bruce Clouette, and Daniel Forrest
2009 Intensive (Locational) Archaeological Survey for the Proposed New Westhampton Memorial Library Addition to Sylvester Judd, Jr., House, Westhampton, Massachusetts. 94 pages.

Archaeological survey was conducted for construction of a 40 x 100 ft library addition to the house structure. The testing included the excavation of 16, 50 x 50 cm shovel test pits. The survey determined that the house cellar/foundation was constructed using a splayed-foot construction

technique; i.e., the exterior subterranean foundation walls extend two feet outward from the cellar, graduated from top to bottom and angled downward from the cellar walls. This construction technique created stronger foundation walls and directed rainwater away from the cellar. It is recommended that the French drains necessary for the project be placed more than three feet away from the house to avoid impacting the splay-footed foundation/cellar walls. A total of 310 artifacts were recovered, primarily early to mid-19th-century domestic and architectural material. Members of the Judd family, though living in the rural periphery of the Middle Connecticut River Valley, clearly were sophisticated people of substantial social status. The light density of artifacts and pervasive ground disturbance in the area resulting from septic system installation indicate that further archaeological testing is unlikely to yield additional information.

25-2955 Cherau, Suzanne, and Ora Elquist
2008 Intensive (Locational) Archaeological Survey, Lower Waban Brook Remediation Project, Wellesley, Massachusetts. 98 pages.

The archaeological survey of an approximately 660 m stretch of the brook consisted of a walk-over/ground surface inspection and the excavation of 49, 50 x 50 cm shovel test pits at 2.5 m, 5 m, and 10 m intervals along six judgmental transects, as three testing arrays, and as 10 judgmental test pits. Seventy-seven artifacts were recovered within disturbed/fill, plow zone, and intact A and B soil horizons. The survey resulted in the location and identification of one Native American cultural deposit, designated the Tee-5 Site (19-NF-705). Testing in this area recovered 10 pieces of chipping debris (two rhyolite, two chert, two hornfels, three quartz, and one quartzite) in six of the test pits. The types of lithic material suggest a probable Woodland period component, although an earlier Archaic period association cannot be discounted. The Tee-5 Site is not considered to represent a potentially significant archaeological resource as close-interval testing did not recover any additional data classes, such as diagnostic stone tools and other artifact types or radiocarbon-datable feature contexts.

25-2956 Dudek, Martin G., and Barbara Donohue
2009 Archeological Reconnaissance Survey Report for National Grid's A127/B128 Reconductoring Project, Millbury, Auburn, Leicester and Worcester, Massachusetts. 224 pages.

An archaeological survey was conducted for approximately 9 miles of existing transmission lines within a corridor containing zones of high, moderate, and low archaeological sensitivity. Three historical archaeological sites were identified in Millbury, including the Grafton Street Tower 567 Site (MLB-HA-30), the Greenwood Street Tower 544 Well Site (MLB-HA-29), and the Hawthorne Street Site (MLB-HA-31). A concrete-slab foundation was identified in Auburn, but is not considered to be significant. Archeological testing is recommended at the locations of six proposed replacement structures located in archeologically sensitive zones. (See also report #25-2956.)

25-2957 Ritchie, Duncan
2008 Intensive (Locational) Archaeological Survey, Ponkapoag Golf Course Restoration, Canton, Massachusetts. 90 pages.

Subsurface testing consisted of 62, 50 x 50 cm shovel test pits excavated at 10 m intervals along six judgmental transects, in two close-interval (2.5 m, 5 m) array patterns, and as four judgmental test pits. An assemblage of pre-contact Native American cultural material recovered from the reported location of Site 19-NF-220 consisted of two bifacial tool blade fragments and 111 pieces of Blue Hill rhyolite, Braintree Slate, and quartz and quartzite chipping debris. The chipping debris and bifacial tool blade fragments were clustered in two small concentrations, possibly lithic workshop loci where chipped-stone tools were made from rhyolite. A flake of Braintree Slate indicated that activities on this site included the manufacture of groundstone tools. A small amount of historical/modern period material found near Ponkapoag Brook most likely represents domestic refuse deposited in open fields in the 18th to 19th centuries. It cannot be definitively associated with the Ezekiel Fisher Mill Site (CAN-HA-8). No potentially significant cultural resources were found

within the proposed locations of the detention pond and drainage ditch or adjacent to the concrete/stone weir on Ponkapoag Brook. It is recommended that proposed golf course improvement activities, such as the borrow pit, avoid site 19-NF-220. (See also reports #25-708 and 25-1752.)

25-2958 Wheeler, Kathleen, Jacob Tumelaire, and Ellen Marlatt
2009 Results of Phase IA Archaeological Sensitivity Assessment and Phase IB Intensive Site Locational Survey for Upgrade/Improvements of the Interceptor Sewer, Winchendon, Massachusetts. 23 pages.

The project area includes a proposed overland route approximately 122 m in length that will connect the sewer interceptor with an existing overland route along Millers River. The walkover survey confirmed the alignment for the interceptor traversed a wooded lot. Map review indicated that the area was not developed until the 1970s, so the project area was evaluated with low sensitivity for Euro-American archaeological resources. Archaeologists excavated 15, 50 x 50 cm shovel test pits along the property boundary at 8 m intervals. No cultural material was collected.

25-2959 Baker, F. Timothy, Quentin Lewis, Timothy L. Binzen, and Mitchell T. Mulholland
2008 Archaeological Intensive (Locational) Survey and Site Examination Recordation of the Historic Resources for the Smith Road Bridge Replacement Project, Chester, Massachusetts. 76 pages.

Mapping and photo-documentation were performed for historical resources that will be affected by the relocation of the bridge, including the remnants of the Stevens-Plunkett-Cook Mill (CHT-HA-03), the Stevens Sawmill, a house foundation at the Stevens Sawmill, and a Cribwork Dam, all contributing elements within the North Chester Historic District. Six 50 x 50 cm shovel test pits were excavated. Topsoil and fill deposits as well as two areas of surface collection produced an assemblage of 19th-century materials.

25-2960 Ritchie, Duncan
2008 Intensive (Locational) Archaeological Survey, Canton Water Main Upgrades, 92 Pleasant Street, Canton, Massachusetts. 73 pages.

Research indicated that in addition to the Pachen Plain (19-NF-71) and Eliot School (19-NF-72) sites located directly northwest of the project area, other pre-contact Native American and post-contact period cultural resources were located in proximity to the project area. Subsurface testing within zones of high and moderate sensitivity was conducted with 37, 50 x 50 cm shovel test pits excavated at 10 m intervals along two judgmental transects, in two 5 m array patterns, and as one judgmental test pit. Two small, pre-contact Native American sites were identified during the intensive survey. Both consisted of isolated pieces of argillite chipping debris likely discarded during single events of stone tool manufacture or maintenance. Neither site is considered to be a potentially significant cultural resource. Post-contact period materials found in plow zone, landscaped soils, and fill contexts date to the 19th century and Early Modern period, during the construction and occupation of the Ward-Dorr-Endicott Estate and Roger Williams House (CAN.137), and likely represent domestic refuse.

25-2961 Binzen, Timothy L., Brian D. Jones, and Jennifer Wendt
2009 Archaeological Site Examination Surveys for the Dracut Expansion Project, Billerica and Tewksbury, Massachusetts: Shawsheen River Native American Site (19-MD-875), Saville Street Native American Site (19-MD-878). 74 pages.

Archaeological survey at the Shawsheen River Site (19-MD-875) in Billerica recovered approximately 600 pieces of gray rhyolite chipping debris, fragments of fire-cracked rock, and one partially finished Orient Fishtail projectile point. The site is significant as it has the potential to provide additional important data concerning Native American settlement, land use, and lithic material procurement and tool manufacture in the Shawsheen River drainage during the Transitional Archaic period. Archaeological survey at the Saville Street Site (19-MD-878) in Tewksbury re-

covered one Small Stemmed point, two Levanna points, two Triangular points, and fragments of Middle or Late Woodland undecorated pottery and fire-cracked rock. An assemblage of 370 pieces of rhyolite, chert, and quartzite chipping debris was recovered from stratified deposits. The site is significant because it possesses the potential to provide further information about pre-contact Native American settlement, land use, and subsistence strategies in the Concord River drainage during the greater Woodland period.

25-2962 George, David R., William F. Keegan, Aaron Palermo, and Catherine M. Labadia
2008 Intensive (Locational) Archaeological Survey of Proposed Omnipoint Communications Cellular Telecommunications Facility at 106 Central Street, Wellesley, Massachusetts. 45 pages.

An archaeological survey was completed at the proposed facility, situated on the Wellesley College campus. It consisted of a 4.5 x 9 m lease area, which will be accessed by an existing gravel access road. Following completion of background research and pedestrian survey, subsurface testing of the areas of potential effect was undertaken. A total of 3, 50 x 50 cm shovel test pits were excavated at 7.5 m intervals. Although several anthropogenic disturbances were observed, excavated test pits exhibited intact soil profiles. The well-drained soils contained within the project area graded from loamy to gravelly coarse sand. No cultural deposits or features were identified.

25-2963 Binzen, Timothy L., and Antonio Medina
2009 Archaeological Reconnaissance and Intensive (Locational) Survey for the Wareham Sewage Improvements Program, Wareham, Massachusetts. 66 pages.

Archaeological surveys were conducted to assess the archaeological sensitivity of proposed work areas. A total of 32, 50 x 50 cm shovel test pits were excavated at intervals of 7.5 m in locations exhibiting high sensitivity. Previous disturbances were widespread. No Native American artifacts were recovered, and no significant historical deposits or features were encountered.

25-2964 Brett, William, and Gregory R. Dubell
2009 Intensive (Locational) Archaeological Survey, Tennessee Gas Pipeline Company, Station, Lincoln, Massachusetts. 44 pages.

Subsurface testing consisted of two judgmental test pit transects, one block, and three judgmental test pits, for a total of 25, 50 x 50 cm shovel test pits. A low density of 20th-century cultural material was recovered from six of the 25 test pits, all from a plow zone stratum. As the cultural material was considered to be modern, it was not saved for cataloging and was discarded in the field. No cultural features or structures were observed.

25-2965 Robinson, David S., and David Trubey
2009 Marine Archaeological Reconnaissance Survey, Hull Offshore Wind Project, Hull, Massachusetts. 163 pages.

The investigation involved archival research and field survey to record marine geophysical and geotechnical data within the 1,817 acre project area. The research and survey results were analyzed and synthesized to assess the archaeological sensitivity and presence/absence of pre- and post-contact period submerged archaeological deposits within the project area. It is concluded that the project area possesses a low archaeological sensitivity for containing submerged pre-contact archaeological deposits and a high archaeological sensitivity for containing submerged post-contact archaeological deposits. Additionally, no evidence of contextually intact paleosols with pre-contact archaeological sensitivity and no remote sensing evidence of post-contact period shipwrecks were identified within the project area.

25-2966 Herbster, Holly, Nichole Gillis, and Jennifer Bannister
2009 Archaeological Reconnaissance Survey, Town of Chatham, Chatham, Massachusetts. 256 pages.

The main goals of the community-wide survey were to identify known and potential pre-contact and post-contact archaeological sites; develop town-wide archaeological sensitivity maps and an accompanying guide to understanding and using these maps; develop management recommendations for the protection of cultural resources and sensitive areas; and present the information in a format that would be useful to state and local planning and review agencies. The survey included archival research, informant interviews, and walkover/drive-over field survey. The survey resulted in the documentation of 12 unrecorded archaeological sites (four pre-contact and eight post-contact). The predictive model indicates that Chatham contains a wide diversity of natural resources including extensive wetland networks, limited modern period development, and a documented human presence spanning at least 8,000 years. Management recommendations focus on a coordinated development review through local and regional planning agencies.

25-2967 Binzen, Timothy L.
2009 The Sanderson Tannery Historical Site at the Harvard Forest: An Archaeological and Historical Baseline, Petersham, Massachusetts. 80 pages.

This research project combined documentary research and comprehensive mapping (no subsurface testing was conducted). The tannery was established by John Sanderson, an eminent 19th-century figure in Worcester County, and was in operation from circa 1800-1880. The facilities were located along a stream, and are represented by stone masonry features that include the foundations of tannery structures, a dam, a headrace and tailrace, a wheel pit, and retaining walls. The tanner's house is represented by a cellar hole. The report provides a documentary profile of the Sanderson family and of the tannery operation, a review of the historical tanning process, detailed descriptions of the Sanderson tannery site features, and an analysis of operational dynamics and spatial organization at the tannery. Recommendations are offered for future archaeological and historical research directions, ecological considerations, and site preservation.

25-2968 Brett, William, and Gregory R. Dubell
2009 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission Company, G-1L 2000 Integrity Project, Westport, Massachusetts. 52 pages.

An archaeological survey was conducted for a project that involves constructing 130 m of pipe to bypass a section that currently exists. This activity will require the use of temporary extra workspace on the east side of Route 195, adjacent to the existing pipeline encasement, measuring approximately 11 x 33 m. Two parallel, judgmental test pit transects were used as well as one additional judgmental test pit, placed between the test pit transects to provide further sampling of the limited workspace area. Two pieces of cultural material (quartz shatter) were recovered. During the laboratory processing of these materials, it was determined that the quartz had shattered naturally, and had not been culturally altered. The material was discarded before cataloging. The subsurface testing did not yield any cultural material and no archaeological sites were found.

25-2969 Davin, Ann K.
1992 Archaeological Investigations, Hathaway Pond Project Area, Barnstable, Massachusetts. 114 pages.

An archaeological survey resulted in the identification of Hathaway Pond I and Hathaway Pond II Native American archaeological sites. The Hathaway Pond I Site is situated on a level terrace overlooking Hathaway Pond. Diagnostic cultural material indicated that the site was reoccupied from the Late Paleo-Indian through Contact periods. The Hathaway Pond II Site yielded materials consistent with Middle Archaic through Late Woodland occupations. An array of bifacial tools (bifaces, scrapers, cobble tools) and an assortment of food processing and storage/trash features associated with each of these deposits reflect low intensity, periodic resource collection around this inland freshwater source on the Cape.

25-2970 Dubell, Gregory R.
2009 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, Pine

Hills Meter Station, Plymouth, Massachusetts. 66 pages.

An archaeological survey of the proposed project area was conducted on a currently undeveloped parcel adjacent to an existing right-of-way. The project proposes to construct a new, aboveground facility adjacent to the existing right-of-way, requiring a new impact area of approximately 0.4 acres. Fieldwork included a sensitivity assessment, walkover survey, and subsurface testing. A total of 15, 50 x 50 cm shovel test pits were excavated along three linear transects at 10 m intervals. The survey did not identify any significant cultural resources.

25-2971 Ingham, Donna, and Duncan Ritchie
2006 Archaeological Site Examination, Clam Pudding Pond Farmstead Site, Pinehills Development Area, Plymouth, Massachusetts. 100 pages.

The Clam Pudding Pond Farmstead Site is located in the eastern portion of a 72 acre land parcel within the Pinehills Development Area. During subsurface testing, 59, 50 x 50 cm shovel test pits were excavated within a 5 m grid pattern to define the horizontal limits of the farmstead site. Sterile test pits and low-density, dispersed deposits of cultural material within a plow zone delineated the boundaries of the site. Six 1 x 1 m excavation units were placed in and adjacent to the cellar hole/foundation and other features or artifact concentrations to collect information about the farmhouse, several other features, and associated deposits of domestic refuse. Two distinct activities areas were identified. A previous intensive survey found a pre-contact Native American component dating to the Terminal Archaic through Early Woodland periods on the Farmstead Site. While activities associated with construction, occupation, and abandonment of the farmstead altered most of the pre-contact Native American components, they appear to have retained some integrity. The Clam Pudding Pond Farmstead Site is a well-preserved early rural farmstead, likely built and occupied from about 1820 to1860 and then abandoned. The Farmstead has the potential to yield information about past activity at this site, its former owner/occupants, and how Sandwich Road was used in the early to mid-19th century. (See also reports #25-2539 and 25-2972.)

25-2972 Ritchie, Duncan, Anna K. Graves, and Erin Kuns
2008 Archaeological Data Recovery Program, Clam Pudding Pond Farmstead Site, Pinehills Development Area, Plymouth, Massachusetts. 298 pages.

Construction of the proposed development was considered to have an adverse effect on the Clam Pudding Pond Farmstead Site and a data recovery program was developed to mitigate the impact or adverse effect of proposed residential development on the site. Seventeen excavation units (12, 2 x 2 m and 5, 1 x 2 m) were completed, and more than 6,300 artifacts were recovered. Diagnostic Native American stone tools associated with Paleo-Indian, Middle Archaic, Late/Terminal Archaic, Early, Middle, and Late Woodland periods document activity on the site from about 11,000 to 450 years ago. The recovery of pre-contact cultural materials in re-deposited soils used to fill an outbuilding footing confirmed a hypothesis that historical period landscape modifications had also altered an older Native American component on the site. Analysis and interpretation of artifacts and features was carried out within the framework of two research contexts and sets of hypotheses. The results of this analysis contributed to current knowledge about late 18th- to mid-19th-century farmsteads in the rural interior of Plymouth County, where there has been little archaeological study of this kind of site. (See also reports #25-2539 and 25-2971.)

25-2973 Dudek, Martin G., and Barbara Donohue
2009 Archeological Reconnaissance Survey Report for National Grid's Z126 Project, Millbury and Auburn, Massachusetts. 143 pages.

An archaeological survey was conducted for approximately 7 miles of new transmission line within an existing right-of-way. Archaeological testing is recommended at the locations of proposed utility structures located in archaeologically sensitive zones. Protection and avoidance of two historical archeological sites identified in Millbury is also recommended and includes a stone-lined well near Greenwood Street and a stone foundation and well near I-90. (See also report #25-

3028.)

25-2974 Cherau, Suzanne, Jennifer Banister, A. Peter Mair, II, and Ben Ford
2008 Circumferential Transportation Improvements Urban Ring Corridor: Phase 2 Archaeological Reconnaissance Survey and Supplemental Sensitivity Assessment of the Four Preliminary Build Alternatives, Boston, Brookline, Cambridge, Chelsea, Everett, Medford, and Somerville, Massachusetts. 242 pages.

An archaeological survey was completed for a multiphase initiative project in the greater Boston area, involving four preliminary build bus-way route alternatives that traverse more than 20 miles. Fieldwork was limited to a visual drive-over of the project corridor since most of the build alternatives consist of surface routes on existing city streets, highways, and abandoned and/or active railroad corridors. With few exceptions, these roadways and rail corridors are considered extensively disturbed and retain no archaeological sensitivity. Of the 43 originally proposed stations/stops, only four were identified as located in areas that have undergone little or no historical development through the years and may contain archaeological resources with good integrity. The tunnels including potential portals and underground station/stops are assigned moderate and high archaeological sensitivity for pre-contact through post-contact period resources. The proposed new route crossings at the Malden River (bridges) and Charles River (tunnel) may also require marine survey to identify any potential underwater archaeological sites. The additional research would be used to refine the horizontal extent and vertical depths of archaeologically sensitive strata within direct project impact areas.

25-2975 Binzen, Timothy L., Broughton Anderson, F. Timothy Barker, and Marcus Tate
2009 Archaeological Reconnaissance and Intensive (Locational) Survey for the Rag Rock Mountain Storage and Distribution Project, Woburn, Massachusetts. 42 pages.

Archaeological surveys consisted of 29, 50 x 50 cm shovel test pits were completed. One test pit produced an isolated find, a single piece of quartz chipping debris, providing evidence of Native American use of the hill. No other artifacts or features were recovered.

25-2976 Binzen, Timothy L., and Antonio Medina
2009 Archaeological Reconnaissance and Intensive (Locational) Survey, Dracut Sewer Expansion Program (Contracts 26, 26A, 27, & 30), Dracut and Methuen, Massachusetts. 50 pages.

The survey assessed the archaeological sensitivity of 11 cross-country sewer lines and three pumping stations. In total, 150, 50 x 50 cm shovel test pits were excavated at intervals of 7.5 m in locations exhibiting high sensitivity across 5 mi^2. The Lake Avenue Native American Site was identified in one proposed cross-country line. Nine pieces of quartz chipping debris and one rhyolite flake were recovered from four test pits. Since most of the artifacts came from disturbed, modern fill contexts associated with recent construction, the site was not considered significant and avoidance was not recommended. The historical period Broadway Road Outbuilding Foundation Site was identified next to a proposed pumping station. It consists of a stone foundation, wall, and depression that may be related to a historical farmstead or residence in the vicinity. Avoidance of the resource will be achieved through modification of the original design plan.

25-2977 Thompson, John, and Electa Kane Tritsch
2009 Report on Emergency Data Recovery, Dwight-Derby House Breezeway, Medfield, Massachusetts. 23 pages.

Extensive documentary, architectural, and archaeological research has been conducted for the Dwight-Derby House property, indicating that the structure incorporates two late 17th-century rooms as part of a largely 18th-century building with several 19th- and 20th-century alterations and additions. The house is connected to a 19th-century barn by what likely began as a 19th-century kitchen wing, altered in the 1950s with the pouring of a concrete floor and installation of screen walls as a breezeway or passageway. More in keeping with the original structure, the pas-

sageway was proposed to be replaced with a modern entry space that required removal of the concrete floor and excavation for footings. Excavation consisted of one 1.5 x 0.5 m, two 1 x 0.5 m, one 1.5 x 1.7 m, three 1 x 1.3 m, and one 1 x 1.8 m units. A well was identified under the concrete floor; other notable features include a builder's trench and a coal dust deposit. Domestic and architectural artifacts were found, as well as animal bones, shell, and floral specimens. Preservation of organic artifacts was notable – textile, paper, leather, and wood artifacts were found. Discrete activity areas (such as a children's play area and a garden) were identified, and datable deposits were related to historical households and changes to the structure. (See also reports # 25-1812 and 25-1974.)

25-2978 Holmes, Richard D., Carolyn Hertz, Christopher L. Donta, and Mitchell T. Mulholland
1995 An Archaeological Site Locational Survey for the Main Alford Road Bridge Replacement and Realignment Project, West Stockbridge, Massachusetts. 43 pages.

An archaeological survey was conducted for a project area on the Williams River of approximately 0.158 acres. To the north is a marble quarry and to the south is a late 19th-century marble mill. Adjacent to the project area on the northwest is a stone foundation of a mill dating from the late 18th to the early 20th century. On the northeast is a depression possibly related to a mill race and a 19th-century railroad right-of-way. The proposed project will impact the mill foundation and may impact the mill race to a marble mill located to the south of the project area. Eighteen 50 x 50 cm shovel test pits were excavated. A limited site examination of these two sites is recommended. (See also report #25-2952.)

25-2979 Doucette, Dianna L.
2009 Intensive (Locational) Archaeological Survey of the Quaker Road Bikepath Project Area, Nantucket, Massachusetts. 123 pages.

An archaeological survey was conducted using ground penetrating radar, subsurface testing, and machine-assisted soil stripping. The proposed bikepath runs along the eastern edge of the Quaker Cemetery. Ground penetrating radar survey identified several subsurface anomalies that resembled possible unmarked graves. Sixteen 50 x 50 cm shovel test pits were placed within the approximately 5 m x 146 m area at intervals ranging from 8 to 10 m. Several of the test pits fell on anomalies identified during the ground penetrating radar survey, and others were located in between the anomalies. Six of the 16 test pits exhibited undisturbed soil profiles. In the remaining 10 test pits, disturbed soil profiles were displayed indicating anomalies or features, such as grave shafts, possible areas of the old meetinghouse, or trash middens. A moderate density of post-contact cultural material was recovered dating to the late 18th and 19th centuries, which is likely associated with the Euro-American community living in the vicinity of the Quaker Cemetery, or from the old town dump located to the south on Milk Street. The post-contact material does not suggest a strong association with the meetinghouse that dated from 1732 to 1792. In addition, two stone tools were recovered that are associated with Native American occupation on Nantucket. The machine-assisted archaeological stripping revealed several Quaker grave shafts, as well as a possible Native American feature, confirming that the Quaker graves extend to at least the edge of Quaker Road in the northeast section of the cemetery. Machine stripping was terminated once the grave shafts were exposed. Avoidance of the Quaker Road site is recommended.

25-2980 Gillis, Nichole, and Holly Herbster
2008 Intensive (Locational) Archaeological Survey, Little Neck Village, Marion, Massachusetts. 80 pages.

An archaeological survey was conducted of the approximately two acre Little Neck Village Senior Housing Project area. Portions of the project area were surveyed as part of a 1978 Brown University archaeological project that identified the Little Neck Shell Midden (19-PL-294) to the south of the current project. The survey included archival research, walkover survey, and the excavation of 48, 50 x 50 cm shovel test pits. Low densities of pre- and post-contact artifacts were recovered from within plowzone and disturbed soils across the majority of the project area. The materials

collected from the Little Neck II Site are consistent in both type and density to those collected during the 1978 survey. Based primarily on a lack of integrity, the Little Neck II Site was not considered to represent a potentially significant archaeological deposit.

25-2981 Waller, Joseph N., Jr., Brian Ó Donnchadha, and Holly Herbster
2009 Green River Stabilization Project: Archaeological Burial Removal and Relocation of a Portion of the Green River Cemetery, Greenfield, Massachusetts. 72 pages.

Erosion along the south bank of the Green River has resulted in the destabilization of a portion of the cemetery's eastern limits and the loss of several graves. Forty-nine individuals who died between 1848 and 2005 were removed and relocated from an approximate 1,000 m^2 area. The relocated interments were organized into eight family plots and included former Massachusetts Governor William Washburn and his wife. The cemetery is recorded as the location of the Petty's Plain Native American Burial Site (19-FR-332), however machine-assisted stripping within the excavation and re-interment areas did not locate any evidence of pre- or post-contact Native American activity or burial. (See also report #25-197.)

25-2982 Waller, Joseph N., Jr., and Alan D. Leveillee
2009 Intensive (Locational) Archaeological Survey, Utility Pole Locations, I135S Power Transmission Line / Flagg Pond Substation No. 234, Fitchburg, Massachusetts. 74 pages.

An archaeological survey was completed of 35 acres upon which the proposed four new utility poles are projected. Subsurface testing of planned utility pole locations in close proximity to the substation consisted of 17, 50 x 50 cm shovel test pits, and resulted in the recovery of mid-19th- through early 20th-century artifacts: brick fragments, coal and coal ash, glass shards, iron nails, and whiteware and yellow ware ceramic sherds. The low-density artifact recoveries reflect domestic refuse of the households present in the area during the 19th century, however are not a significant archaeological resource.

25-2983 Mulholland, Mitchell T., Maureen Manning, Jennifer Wendt, and Joannah L. Whitney
2005 Archaeological Intensive (Locational) Survey for the Proposed Cell Tower-Sage BS33XC088, New Salem, Massachusetts. 64 pages.

An archaeological survey was conducted for the proposed project area located at the southern end of Blueberry Hill Road, measuring approximately 9 acres. The parcel of land once included the town's poor farm and is on the northeast side of a high hill overlooking the Swift River Valley (Quabbin Reservoir). The project area includes a 23 x 23 m tower location and a 183 m long access road. The fieldwork included the excavation of 21, 40 x 40 cm shovel test pits placed at 7.5 m intervals. In addition, a 1 x 1.5 m trench was excavated to evaluate damage from the construction of the access road that was built prior to consulting the MHC. A structure that was once the main building of the poor farm still exists west of the project area. No archaeological sites associated with the poor farm were identified within the project area. Because burial grounds often are associated with poor farms, this possibility was included in the research. No evidence of a burial ground was found on the property.

25-2984 Herbster, Holly, and Dianna L. Doucette
2009 Archaeological Site Examination, Squibnocket Ridge Lot 15, Chilmark, Massachusetts. 70 pages.

An archaeological survey was completed as part of the planned construction of a single-family residence and associated utilities within a limited building envelope on an approximately 27 acre parcel of land. Limited archaeological testing was conducted within the building envelope in 1993 as part of an intensive archaeological survey of the Squibnocket Ridge subdivision. Although no cultural materials were during the intensive survey, significant cultural deposits including unmarked burials have been identified in other lots in similar environmental settings. The site examination included hand-excavated test pits and excavation units followed by machine-assisted

stripping of the entire building envelope. Seven pieces of quartz chipping debris and a bifacially flaked quartz fragment were collected during the hand testing. Five pre-contact period features were identified during the machine stripping and were likely created during short-term periods of use away from living areas. No potential human burial features were identified. (See also report #25-1314.)

25-2985 George, David R., William F. Keegan, and Catherine M. Labadia
2009 Archaeological Reconnaissance Survey of Proposed Cellular Telecommunications Facility at 509 Bedford Road, Concord, Massachusetts. 58 pages.

An archaeological survey of 0.0187 acres consisted of background research, pedestrian survey, and subsurface testing. A total of 27 auger tests were excavated at 8 m intervals throughout the proposed lease area and associated access road. Each auger test measured 10 cm in diameter and extended to depths of approximately 120 cm. The excavated auger tests exhibited disturbed soil profiles; only eight historical and modern artifacts were recovered. The results of the field effort indicate that the archaeological deposits lacked depositional integrity and research potential.

25-2986 Fairlie, Jennifer, Mitchell T. Mulholland, Richard Holmes, and Christopher L. Donta
2001 Archaeological Site Locational Survey and Monitoring Project for the Proposed Water Main, Canada Hill Road, Greenfield, Massachusetts. 42 pages.

An archaeological survey and monitoring of a water main trench and two residential lateral connections covered an area of approximately 200 m^2. The survey was conducted because there was concern that human burials associated with the Mackin Sand Bank Site (19-FR-12) (also known as Wissitinnewag) may extend into the area of the proposed water main. Three backhoe trenches and three 50 x 50 cm shovel test pits were excavated in an unpaved area. Two utility trenches were observed in the backhoe trenches. Only historical artifacts were recovered from shovel test pits. Datable artifacts placed deposits within a time frame of circa 1820-1900. No Native American material was recovered. Upon completion of the survey it was concluded that westward extension of the Mackin's Sand Bank Site (19-FR-12) was not observed in the Canada Hill Road area.

25-2987 Binzen, Timothy L., and Antonio Medina
2009 Archaeological Reconnaissance and Intensive (Locational) Survey for Phase 11 (Eleven) of the Sewer Improvements Project, Tewksbury, Massachusetts. 82 pages.

Archaeological surveys were conducted to obtain clearances for 12 proposed cross-country lines and seven pumping stations. The discovery of Native American sites necessitated design alternatives for three of the cross-country lines and for two of the pumping stations. Ultimately, 17 alternative cross-country lines were subject to reconnaissance, and 14 were tested, covering a combined area of approximately 2,000 acres. Twelve alternative pumping station locations were subject to reconnaissance, and eight were tested. In total, 117, 50 x 50 cm shovel test pits were excavated at intervals of 7.5 m, or at reduced intervals for verification shovel test pits. No historical resources were located; however, five well-preserved Native American sites were identified as being from the Late Archaic and Woodland periods. This was notable because the survey units were very small and located within densely settled residential areas. The findings suggest a great diversity of sites await discovery by systematic survey of broader areas of Tewksbury.

25-2988 Mair, A. Peter, II, and Erin Flynn
2008 Intensive (Locational) Archaeological Survey, River Run Wastewater Treatment Facility, Plymouth, Massachusetts. 74 pages.

An archaeological survey was conducted within the 5 acre project area, including archival research, a walkover survey, and subsurface testing. Subsurface testing consisting of 58, 50 x 50 cm shovel test pits documented natural A and subsoil horizons over the tested portions of the project area. No cultural material was recovered from any of the test pits.

25-2989 Ritchie, Duncan, and Anna K. Graves
2008 Archaeological Data Recovery Program, Keith Farm Site, Bridgewater, Massachusetts. 186 pages.

The proposed 10 lot residential subdivision is confined to an approximately 13 acre parcel of uplands within a larger 95 acre tract. The Keith Farm Site was identified during an intensive survey of the Lakeside Estates project area in 2005. In 2006, a site examination found two primary concentrations (Areas I, II) of cultural material and features in the northern and southern ends of the delineated site area. The site was found to contain evidence of occupation during the Middle and Late Archaic periods. A Middle to Late Woodland period component also appeared to be present on the site. The chipped-stone tool assemblage from the site consisted mostly of Middle Archaic and Late Archaic projectile points and bifacial tool blades, and Middle Woodland period tools. Two adjacent features found in Area II in the southern end of the site consisted of small hearth/fire pits with dense charcoal fill. A third feature in Area II was of uncertain origin and could be related to post-contact period activity. The various categories of information collected from the Keith Farm Site during the data recovery program contributed to a more detailed reconstruction of Native American settlement at this location and the resulting deposits of cultural materials, features and activity areas within it. (See also report #25-2682.)

25-2990 Dudek, Martin G.
2009 Archeological Intensive (Locational) Survey for the Clarksburg State Park, Berkshire County, Massachusetts. 86 pages.

The archaeological survey included 71, 50 x 50 cm shovel test pits excavated across 1.18 acres of archeologically sensitive areas. A low to moderate density of modern or historical artifacts was encountered. Most artifacts were related to use of the campground since becoming a state park in 1956. Two pieces of early, green free-blown glass were recovered from two test pits along the existing paved access road where utility lines are proposed. These fragments were recovered from fill or redeposited soils, but could be related to products from the Farmers Glass Factory dating circa 1814-1819, located near Mauserts Corner near the park.

25-2991 Waller, Joseph N., Jr., Michael J. Hubbard, and A. Peter Mair, II
2009 Intensive Archaeological Investigation of the Queset Commons Development and Site Examination of the Morse Pond Site (19-BR-480), Easton, Massachusetts. 122 pages.

Archaeological surveys of the previously documented Morse Pond Site (19-BR-480) were conducted within a planned mixed residential and commercial development on approximately 21 acres. Survey involved the excavation of 61, 50 x 50 cm shovel test pits, resulting in the recovery of pre-contact Native American and post-contact period cultural materials as well as materials dating from the 18th to the 20th century. Isolated or low densities of quartz flakes were recovered from disturbed or plowed stratigraphic contexts in association with 19th- through 20th-century refuse and do not represent significant cultural properties. Intensive archaeological investigation within the eastern project area also resulted in the identification of the Queset Site. The Queset Site is considered to be a significant cultural resource and site avoidance is recommended. Archaeological site examination of the Morse Pond Site (19-BR-480) was accomplished using 99, 50 x 50 cm shovel test pits and four 1 x 1 m excavation units. Subsurface testing produced an array of cultural materials including quartz and rhyolite chipping debris, bifaces and bifacial tool fragments, and projectile points and point fragments. The site appears to have been primarily a single-component Late Archaic Squibnocket Complex site encompassing an approximately 6,000 m^2 area of terrace edge along Morse Pond. Project redesign is recommended to avoid impacts on the Morse Pond Site. If avoidance is not feasible, then implementation of an archaeological data recovery program is recommended.

25-2992 Graves, Anna K., and Duncan Ritchie
2006 Archaeological Site Examination, North River Village 3 and North River Plano Sites, Marshfield and Pembroke, Massachusetts. 86 pages.

The proposed residential development is contained within a roughly 22 acre parcel. The North River Village 3 Site consists of a filled cellar hole for a small house or farmstead on Old Pembroke Road occupied in the late 17th to early 18th century. The 26, 50 x 50 cm shovel test pits and four 1 x 1 m excavation units placed on this site yielded over 700 pieces of post-contact cultural material. Over 50 pieces of chipping debris found in intact and modified soil horizons are associated with a pre-contact period Native American component on this site. An untyped lanceolate projectile point found in historical period cellarhole fill could be a late Paleo-Indian or Middle Woodland period artifact. Subsurface testing more accurately defined the portion of the North River Plano Site within the project area. This site covers an area of approximately 4,800 m^2 extending around three sides of a large glacial kettle hole. Forty-seven 50 x 50 cm shovel test pits and four 1 x 1 m excavation units placed on the site yielded 415 pieces of pre-contact Native American cultural material. Post-contact period materials were found in small amounts in several test pits. The North River Village 3 Site contains well-preserved remains of an early historical period farmstead from the late 17th to mid-18th century. This site has a relatively limited occupation span estimated to range from circa 1680-1750, after which it was abandoned. No evidence of later 19th-century use was found. It has the potential to yield additional information about early Euro-American settlement in Marshfield and could also contribute to a better understanding of the establishment and use of Old Pembroke Road, a locally important roadway. The section of the North River Plano Site within the proposed development parcel for North River Village contains a high-density deposit of pre-contact period Native American cultural material. This site has been reported by avocational archaeologists to contain Late Paleo-Indian period material and is known to contain a Middle Archaic period component. It has the potential to yield additional information about methods of stone tool manufacture and the use of space within large encampment areas by Native American groups. It is also a potential source of information about aspects of pre-contact period settlement along the lower North River drainage, a core area of past Native American activity. Both the North River Village 3 and North River Plano sites are within a proposed residential development parcel with frontage along Old Pembroke Road. Both of these archaeological sites will also be impacted by the proposed improvements to Old Pembroke Road. Based on the results of the site examination, the North River Village 3 Site and North River Plano Site are both considered significant cultural resources and avoidance of the two delineated site areas and preservation in place is recommended. The project did not proceed, and the property was acquired for conservation.

25-2993 Mair, A. Peter, II
2004 Reconnaissance Archaeological Survey, CenTech Park East, Shrewsbury, Massachusetts. 66 pages.

An archaeological survey was completed for the proposed business park occupying approximately 69 acres in Shrewsbury and Grafton. The parcel has within its boundaries the 5 acre Hillcrest Cemetery associated with Grafton State Hospital. The cemetery will remain in the care and control of the Commonwealth and will not be developed. Archival research and field investigations consisting of walkover survey confirmed the location of a concrete reservoir formerly utilized to provide water to the Grafton State Hospital and a man-made pond and pump house foundation within the area of the parcel to be developed. Based on preliminary plans provided, the historical period reservoir and pump house foundation will be avoided. The survey also resulted in the identification of a number of areas of moderate to high archaeological sensitivity for both pre-contact Native American and post-contact historical sites. (See also reports #25-2994 and 25-2995.)

25-2994 Ritchie, Duncan
2008 Intensive Archaeological Survey, CenTech Park East, Shrewsbury and Grafton, Massachusetts. 104 pages.

An archaeological survey of the 69 acre project area was conducted after a previous survey delineated zones of high, moderate and low archaeological sensitivity. Archival research indicated the potential presence of small, temporary encampments used by Native Americans during the Middle

and Late Archaic periods. Archival research was also conducted on the known post-contact period resources (pond/dam, pump house, reservoir) associated with the former Grafton State Hospital complex and the M. Daly House. Walkover inspection of the project area refined the archaeological sensitivity rankings previously developed. Subsurface testing within zones of high and moderate sensitivity for both pre- and post-contact period archaeological sites consisted of 77, 50 x 50 cm shovel test pits excavated at 10 m intervals along eight judgmental transects. Suspected pre-contact Native American rock-shelter and boulder shelter sites and the known post-contact period structural features (pump house foundation) were investigated with 10, 50 x 50 cm judgmental test pits. The complex of post-contact period features including the dam, pond, concrete and fieldstone foundations, concrete reservoir, and a culvert feature associated with the former Grafton State Hospital complex were documented with scaled drawings and digital photographs. Three pre-contact sites were found near the stream and wetland environment in the southern part of the project area. The Green Hill Findspot 1, 2, and 3 sites all contained low-density deposits of quartz and rhyolite chipping debris. Fragments of a bifacial tool blade and projectile point, both of quartz, were found on the Green Hill Findspot 2 and 3 sites. The Green Hill Boulder Shelter Site consisted of 39 pieces of quartz and quartzite chipping debris found within a cluster of large glacial boulders about 25 m north of Green Street. The Green Hill 1, 2, and 3 sites and the Green Hill Boulder Shelter Site contain non-diagnostic chipping debris and chipped-stone tool fragments. Investigations of the dam, pond and pump house complex yielded information about the water supply facilities used to support the Grafton State Hospital complex during its operation in the late 19th to early 20th century. The pump house, dam/pond, and culvert feature will likely remain intact within a buffer zone along the wetland and stream environment in the southern end of the project area, affording protection to these sites. (See also reports #25-2993 and 25-2994.)

25-2995 Daly, John, and Matthew Kierstead
2009 Supplemental Historical Survey and Documentation, Grafton State Hospital Ice Pond Complex, Reservoir, Green Street Culvert, Shrewsbury, Massachusetts. 170 pages.

An archaeological survey in 2008 investigated several suspected pre-contact Native American sites and known post-contact period features associated with the Grafton State Hospital in Shrewsbury and Grafton. As a result of the survey, it was requested that prudent and feasible alternatives for the project be considered that allow for avoidance of pre-contact sites. Additional information, in the form of an addendum report and historical documentation, was also requested so that the full significance of the Grafton State Hospital resources including the pond, dam, pump house foundation (now referred to as the Ice Pond Complex), the reservoir, and the Green Street culvert could be considered. The evaluation of these resources indicates that these sites were important infrastructure elements of the Grafton State Hospital complex and that their means of construction using patients as laborers was reflective of institutional beliefs concerning patient therapy. These resources are contributing elements within the Grafton State Hospital National Register Historic District. (See also reports #25-2993 and #25-2994.)

25-2996 Doucette, Dianna L., and Erin Flynn
2008 Intensive (Locational) Archaeological Survey, Hubline/East to West Expansion Project, Q-1 System, I-10 Extension, and NSTAR Alternative. 490 pages.

An archaeological survey located in Avon, Braintree, Canton, Holbrook, Randolph, Rehoboth, Sharon, Stoughton, Walpole, and Weymouth was conducted of the first 6.25 miles of the Q-1 System, 2.7 miles of the NSTAR Alternative, and the first 10 miles of the I-10 Extension, and the proposed aboveground facilities in the town of Rehoboth. Archival research, together with the presence of eight previously recorded sites within the project area as well as 54 sites located within one mile of the project facilities, indicated that the project area was sensitive to contain Native American cultural resources. In total, 1,375, 50 x 50 cm shovel test pits were excavated within the archaeologically sensitive portions of the Q-1 System, NSTAR Alternative, and I-10 Extension, and an additional 203 test pits were excavated within the proposed Rehoboth compressor station project areas. The survey yielded areas of low-density scatters of chipping debris interpreted as episodes of lithic reduction and/or maintenance, as well as high-density areas of chipping de-

bris, features, and chipped stone tools. In total, 98 artifacts were recovered during the subsurface testing, including 84 pieces of pre-contact cultural material (chipping debris, bifaces, projectile points, scrapers, cores, choppers, and ground stone tool fragments), and 14 fragments of post-contact cultural material (glass, nails, ceramics, clay pipes, and mammal bone). Subsurface testing resulted in the identification of four pre-contact archaeological sites and 18 pre-contact findspots. Cultural material diagnostic of the Middle Archaic through Late Woodland time periods is included among the pre-contact assemblage. The majority of the post-contact materials consists of late 19th- and early 20th-century refuse from plowed fields. No post-contact sites were identified. Among the archaeological sites identified, Wardwell Road (Canton) and Three Swamp Brook (Avon) sites are potentially significant. Wardwell Road Site includes 14 pieces of chipping debris as well as one rhyolite biface stone tool and one groundstone tool, while Three Swamp Brook Site includes 18 pieces of chipping debris, predominantly quartz. Additional archaeological evaluation is recommended for these sites. The remaining two sites and the 18 findspots lack complexity and/or have limited research potential. However, some of the findspots did yield projectile points and stone tools, including one quartz Squibnocket projectile point from Q-1 Findspot 13, one argillite biface from Q-1 Findspot 16, an argillite Neville projectile point from NSTAR Alternative Findspot 2, and one rhyolite Levanna projectile point from I-10 Findspot 6. (See also reports #25-2997, 25-2998, 25-2999, and 25-3001.)

25-2997 Doucette, Dianna L., and Erin Flynn
2008 Intensive (Locational) Archaeological Survey East to West Hubline Expansion Project. 2 volumes. 469 pages.

An archaeological survey located in Attleboro, Avon, Bellingham, Bourne, Boxford, Braintree, Canton, Fall River, Franklin, Holbrook, Medway, Middleborough, Milford, Millis, Norfolk, Plymouth, Randolph, Rehoboth, Sharon, Stoughton, Walpole, Wellesley, Weston, and Weymouth was conducted of 18 miles of the Q-1 System, 12 miles of the I-10 Extension, and facility construction workspace in Rehoboth and Boxford. Archival research, together with the presence of 12 previously recorded sites within the project area as well as 53 sites located within one mile of the project facilities, indicated that the project area was sensitive to contain Native American cultural resources. In total, 2,800, 50 x 50 cm shovel test pits were excavated within the archaeologically sensitive portions of the Q-1 System and I-10 Extension, and an additional 343 test pits were excavated within the proposed Rehoboth and Boxford compressor station project areas. The survey yielded areas of low-density scatters of chipping debris interpreted as episodes of lithic reduction and/or maintenance, as well as high-density areas of chipping debris, chipped stone tools, and features. In total, 1,709 artifacts were recovered during the subsurface testing, including 1,300 pieces of pre-contact cultural material (chipping debris, bifaces, projectile points, scrapers, cores, choppers, and ground stone tool fragments), and 409 fragments of post-contact cultural material (glass, nails, ceramics, clay pipes, and mammal bone). Subsurface testing resulted in the identification of 20 pre-contact archaeological sites and 29 pre-contact findspots. Cultural material diagnostic of the Middle Archaic through Late Woodland time periods is included among the pre-contact assemblage. The majority of the post-contact materials consists of late 19th- and early 20th-century refuse from plowed fields. No post-contact sites were identified. Among the archaeological sites identified, the Pond Street (Franklin), Elm Street (Franklin), Shepards-Charles Loci 1 and 2 (Franklin), Populatic (Medway), Cifre Farm Locus 1 (Medway), Rockville Locus 3 (Norfolk), Cypress Lane (Walpole), Neponset River West (Walpole), Neponset River East (Walpole), Wardwell Road (Canton), and Three Swamp Brook (Avon) sites are potentially significant. Pond Street Site includes a high density of quartz chipping debris, bifacially-flaked tools, scrapers, and projectile points, including one quartz Squibnocket Triangle and one Levanna. At Elm Street Site, 98 pieces of quartz chipping debris were recovered along with three quartz bifacially-flaked tools and three quartz cores. The Shepards-Charles Locus 1 site includes a high density of chipping debris as well as five bifacially-flaked tools, one quartz core, two quartz hammerstones, and two quartz scrapers, while the Shepards-Charles Locus 2 site includes a high density of chipping debris along with three quartz cores, one worked rhyolite flake, and one unidentified quartz projectile point. Populatic Site included three Small Stemmed projectile points, and the Cifre Farm Locus 1 site included a high density of chipping debris and stone tools such as one abrader, one hammerstone,

one ulu knife, and three projectile points, as well as one piece of aboriginal pottery, in addition to two pre-contact cultural features with chipping debris and chipped-stone tools. Recovered at Cypress Lane Site was an argillite Stark projectile point. Additional archaeological evaluation is recommended for these sites. The remaining nine sites and the findspots lack complexity and/or have limited research potential. However, School Meadow Brook Site contained one argillite Orient Fishtail projectile point; one quartz Squibnocket projectile point was recovered from Q-1 Findspot 13; and one rhyolite Levanna projectile point was recovered at I-10 Findspot 6. (See also reports #25-2996, 25-2998, 25-2999, and 25-3001.)

25-2998 Doucette, Dianna L., and Erin Flynn
2008 Addendum Report: Intensive (Locational) Archaeological Survey Hubline/East to West Expansion Project, Cross Country Portion of the I-10 Extension [(M.P.10.5 to M.P. 12.9) and the Q-1 System (M.P. 18.5 to M.P. 19.7)]. 206 pages.

An archaeological survey of 1.2 miles of the Q-1 System and 2.4 miles of the I-10 Extension in Canton and Stoughton included archival research, a walkover survey, and subsurface testing. Archival research, together with the presence of 23 pre-contact and two post-contact archaeological sites located within one mile of the project area, indicated that the project area was sensitive to contain Native American cultural resources. In total, 437, 50 x 50 cm shovel test pits were excavated within the archaeologically sensitive portions of the I-10 Extension project area. Subsurface testing resulted in the identification of five pre-contact archaeological sites, two pre-contact findspots, and two post-contact sites. Cultural material diagnostic of the Middle Archaic through Late Woodland periods is included among the pre-contact assemblage. No cultural material was identified in test pits at Glen Echo Park Site, but at Cattle Well Site, nine earthenware ceramic sherds were recovered, which may represent refuse. The majority of the post-contact materials recovered consist of late 19th- and early 20th-century refuse from plowed fields. Among the archaeological sites identified, the Glen Echo Pond and the Glen Echo Boulevard 1, 2, and 3 sites are potentially significant. Glen Echo Pond Site contained a high density of chipping debris as well as one Levanna projectile point. The Glen Echo Boulevard 1 site yielded 12 pieces of chipping debris and one core, while the Glen Echo Boulevard 2 site contained 87 pieces of chipping debris along with one biface, and the Glen Echo Boulevard 3 site contained 152 pieces of chipping debris, three bifacially-flaked tools, one core, and two projectile points: one Neville and one Brewerton. Additional archaeological evaluation is recommended for these sites. The area around Glen Echo Pond in Canton may comprise an archaeological district. The area is also important to the Ponkapoag Tribe. The remaining sites and the findspots lack complexity (one rhyolite Brewerton drill was recovered at Findspot 1) and/or have limited research potential. (See also reports #25-2996, 25-2997, 25-2999, and 25-3001.)

25-2999 Doucette, Dianna L., Erin Flynn, and Gregory R. Dubell
2009 Addendum Report, Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC., Hubline East to West Expansion Project Additional Testing. 82 pages.

An archaeological survey was conducted for revised facility areas in Braintree, Canton, Stoughton, and Weymouth. In total, 154, 50 x 50 cm shovel test pits were excavated within areas exhibiting archaeological sensitivity. The survey yielded areas of low-density scatters of chipping debris interpreted as episodes of lithic reduction and/or maintenance, as well as high-density areas of chipping debris, features, and chipped stone tools from two of the six areas. The two sites containing pre-contact cultural material include the Glen Echo Boulevard 4 Site in Stoughton, which yielded 37 pieces of chipping debris, two bifaces, and one projectile point midsection, and Commercial Street Site inWeymouth, which yielded 25 pieces of chipping debris and two projectile point fragments (tip and midsection). In addition, four of the six areas yielded a low density of post-contact cultural material (glass, nails, ceramics, clay pipes, and mammal bone). The majority of the post-contact material consists of late 19th- and early 20th-century trash from plowed fields. Subsurface testing identified two pre-contact archaeological sites. Glen Echo Boulevard 4 Site is potentially significant and additional archaeological evaluation is recommended. Commercial Street Site is not likely to contribute significant information. (See also reports #25-2996, 25-2997,

25-2998, and 25-3001.)

25-3000 Gillis, Nichole, and Dianna L. Doucette
2008 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, Norfolk Meter Station, Norfolk, Massachusetts. 74 pages.

Fieldwork included a sensitivity assessment, a walkover survey, and subsurface testing in an approximately one acre area. Nine 50 x 50 cm shovel test pits were excavated along two linear transects at 10 m intervals. No archaeological material was found.

25-3001 Doucette, Dianna L., Erin Flynn, and Gregory R. Dubell
2009 Archaeological Site Examinations, Wardwell Road, Three Swamp Brook, Glen Echo Pond, and Glen Echo Boulevard 1, 2, and 3 Sites, Algonquin Gas Transmission, LLC., Hubline/East to West Expansion Project. 286 pages.

Archaeological site examinations were conducted on six pre-contact sites along the I-10 Extension project in Avon, Canton, and Stoughton at the Wardwell Road (Canton), Three Swamp Brook (Avon), Glen Echo Pond (Stoughton), and Glen Echo Boulevard 1, 2, and 3 sites (Stoughton). Three Swamp Brook Site, however, was subsequently destroyed by the landowner and no further work was recommended. In total, 356, 50 x 50 cm shovel test pits and 22.5, 1 x 1 m excavation units were excavated. Twenty-two excavation units and 136 test pits yielded pre-contact cultural material. The initial archaeological investigations at Three Swamp Brook Site and subsequent investigations at the Wardwell Road and Glen Echo Boulevard 1 and 2 sites indicated that the sites were likely single use, temporary sites used for stone tool maintenance and/or manufacture and possibly wetland resource procurement based on the lack of diagnostic artifacts and features. The Glen Echo Boulevard 3 Site yielded diagnostic artifacts of the Middle and Late Archaic periods and a pit feature which provided a Middle Archaic radiocarbon date (7,400 ± 60 B.P. [Beta-249684]). Glen Echo Pond Site contained diagnostic artifacts of the Middle and Late Archaic periods and the Late Woodland, as well as radiocarbon dates from the Late Archaic and Middle Woodland periods (3,550 ± 40 B.P. [Beta-249686], 1,320 ± 40 B.P. [Beta-249685], and 1,240 ± 40 B.P. [Beta-249687]). Based on the results of the archaeological investigations it is recommended that Wardwell Road, Three Swamp Brook, and the Glen Echo Boulevard 1 and 2 sites are not significant. The Glen Echo Boulevard 3 and Glen Echo Pond sites were found to contain a variety of cultural deposits and depositional integrity indicating a relatively high potential for these sites to contain significant new classes of archaeological data. The area around Glen Echo Pond in Canton may comprise an archaeological district. The area is also important to the Ponkapoag Tribe. (See also reports #25-2996, 25-2997, 25-2998, and 25-2999.)

25-3002 Banister, Jennifer, John Daly, and Suzanne G. Cherau
2009 Additional Archaeological Investigations: Survey, Documentation and Monitoring Upper Lake Dam Rehabilitation Project, Sandwich, Massachusetts. 114 pages.

Archaeological investigations on the Upper and Lower Shawme pond shorelines and the historical dam structure and spillway occurred to monitor and document any additional dam features that were exposed during the rehabilitation. Additional photographic and cartographic documentation was also conducted for archival purposes. The survey of the pond drawdown area did not identify any significant archaeological resources exposed along the shoreline. Several late 19th-/early 20th-century granite headstone bases were observed along the shoreline adjacent to the Old Town Cemetery. No actual headstones or evidence of earlier grave markers were observed in this area. The monitoring of the dam removal work documented a number of the historical dam's internal structural components, including a cast concrete gate structure (mid- to late 20th-century) and timber cribbing and sheet piling. Construction methods and materials documented during the construction indicate that this dam is possibly the original structure from the early 19th century. The other identified wood and earthen dam/ford structure in Upper Shawme Lake upstream of the dam may also date to the early to mid-19th century. This structure was left intact and will be resubmerged after completion of dam rehabilitation work. (See also report #25-2816.)

25-3003 Adams, Virginia H., Maureen A. Cavanaugh, Beth P. Miller, Stephen Mrozowski, and Catherine deJ. Vieth
1996 North-South Rail Link, Boston, Cambridge, and Somerville, Massachusetts, Cultural Resources Survey. 100 pages.

A reconnaissance archaeological and historical resources survey was conducted for proposed underground rail service between Boston's South and North Stations. The analysis of project impacts focused on those locations where the tunnel and stations interface with the surface. Five areas of archaeological sensitivity for ancient and historical period sites were identified and recommended for additional archaeological survey, including Northwest and Northeast Headhouses for Central Station (possible remnants of several historical buildings and the circa 1816 Central Wharf), Southwest Headhouse for Central Station (possible remnants of 18th-century wharves and early 19th-century warehouses, shipyards, and the Bulfinch buildings), Headhouse at Medford and North Washington Streets for North Station (possible intact ancient sites located below modern fill), and Headhouse at Merrimac, Portland, Friend, and Market Streets for North Station (possible mid-19th-century features associated with land use).

25-3004 Doucette, Dianna L.
2008 Technical Memorandum, Tom’s Neck Farm Subdivision, Lot 1 Access Road Improvements, Edgartown, Massachusetts. 12 pages.

An archaeological survey was conducted of an impact area of approximately 110 linear meters located on Chappaquidick Island, within a portion of the subdivision property that was not included in the initial intensive survey in 1999 and 2000. Twelve 50 x 50 cm shovel test pits were excavated along one judgmental linear transect and as one judgmental test pit. Seven test pits yielded pre-contact cultural material, primarily chipping debris as well as one rhyolite core, one rhyolite uniface, one quartz scraper, and one quartzite projectile point tip. Two test pits yielded post-contact cultural material, presumably a result of post-depositional processes, including ceramic sherds dating from the late 18th century to 20th century and brick and bottle glass dating from the late 19th to early 20th century. (See also report #25-2177.)

25-3005 Binzen, Timothy L., and Antonio Medina
2009 Archaeological Phase 1B Intensive (Locational) Survey for Runway and Terminal Area Improvements and Fencing, Harlow Field/Marshfield Municipal Airport, Marshfield, Massachusetts. 77 pages.

An archaeological survey was completed where improvements and fencing are proposed at the airport, located within a Native American site area (19-PL-426) that was identified in the 1960s when a collector found artifacts during airport construction. A total of 117, 50 x 50 cm shovel test pits were excavated at 7.5 m intervals in locations exhibiting archaeological sensitivity. Native American artifacts were recovered from all six of the survey units. The areas surrounding the positive test pits were designated as Loci 1-6 of Site 19-PL-426. In most cases in Loci 2-6, artifacts were recovered from fill deposits dating to airport construction, and no additional survey was recommended. In Locus 1, three adjacent test pits produced artifacts of quartz and argillite as well as a biface fragment from comparatively well-preserved topsoil and subsoil. Locus 1 is a potentially significant archaeological resource and a site examination was recommended. (See also report #25-2778.)

25-3006 Binzen, Timothy L.
2009 Archaeological Phase 2 Site Examination Survey for the Mount Holyoke College Boathouse Project, South Hadley, Massachusetts, Southern Locus of Native American Site 19-HS-75. 50 pages.

An archaeological survey was conducted, consisting of 53, 50 x 50 cm shovel test pits at 5 m in-

tervals and three 1 x 1 m excavation units. One central area of high artifact concentration was identified, consisting almost exclusively of chipping debris, with no temporally diagnostic artifacts. The predominant materials in the assemblage were chert and rhyolite, followed by lower quantities of more locally available quartz and quartzite. No conclusively Native American subsurface features were identified. However, three buried topsoil lenses were identified, one of which may be contemporaneous with at least one Native occupation. The great majority of artifacts were recovered from the plowzone. The Southern Locus was a fairly task-specific lithic workshop, although it was probably part of a much larger site. The research value of the Southern Locus itself was found to be low. (See also report #25-2596.)

25-3007 Dudek, Martin G., Barbara Donohue, and Douglas C. McVarish
2008 Summary Report for an Archeological Reconnaissance Survey and an Intensive (Locational) Survey for the Tennessee Gas Pipeline Company's Essex-Middlesex Project, Lynnfield, Saugus, and Wakefield, Massachusetts. 668 pages.

Archaeological surveys were conducted for a proposed 7.8 mile pipeline and included excavation of 854, 50 x 50 cm shovel test pits excavated within 18 high to moderate sensitivity zones. Twenty pre-contact archaeological sites were encountered and consist of nine previously undiscovered sites (19-ES-838, -839, -841, -842, and 19-MD-1058, -1059, -1060, -1061, and –1063), seven previously recorded sites (19-MD-731 and –732, and 19-ES-673, -674, -675, -688, and –831), and four findspots of one or more pre-contact artifacts (19-ES-840, -843, -844, and 19-MD-1062). Site examinations are recommended for 15 pre-contact archaeological sites (19-ES-673, -674, -675, -688, -838, -839, -841, -842, and 19-MD-731, -732, -1058, -1059, -1060, -1061, and –1063). Temporal components identified at one or more sites include the Middle Archaic, Late Archaic, Early Woodland, and Middle Woodland periods. Rhyolite predominates in the lithic assemblage from all sites. Avoidance of one pre-contact archaeological site (19-ES-831) is recommended. No additional archaeological work is recommended for the four findspots. Three historical archaeological sites, the Altamount Street Crossing Site, the North of Howard Street Site, and the North of Water Street Site, were identified and recommended for site examinations if avoidance is not feasible. (See also reports #25-1333, 25-1445, and 25-2542.)

25-3008 Herbster, Holly
2009 Addendum to Technical Report, Machine-Assisted Stripping and Archaeological Monitoring, MassHighway Route 6 Improvements, Bourne, Massachusetts. 20 pages.

Archaeological monitoring was conducted of the recently constructed Route 6. In 2007 an intensive survey of the project area was completed; no cultural deposits were identified and no additional investigations were recommended. In 2008 cultural materials including two Late Woodland Period (Levanna) projectile points were observed in the project area during a tribal site visit. In consultation with the Wampanoag Tribe of Gay Head/Aquinnah and Mashpee Wampanoag Tribe, it was requested that machine-assisted stripping and archaeological monitoring be completed within the approximately 500 linear meter section of the project area where cultural materials were observed on the ground surface and which was designated as the area of archaeological sensitivity. No cultural features or materials were observed. (See also report #25-2761.)

25-3009 Adams, Virginia H., Suzanne Cherau, Jennifer Banister, John J. Daly, Jenny R. Fields, and Quinn Stuart
2008 MBTA Green Line Extension Project, Historic and Archaeological Resources Reconnaissance Survey. 2 volumes. 713 pages.

Historical and archaeological surveys were completed for the proposed extension of service from Lechmere Station through Cambridge, Somerville, and Medford. Archaeological survey identified a total of five sensitive areas, associated with Alternatives 1 through 5, including: 1) Middlesex Canal (SMV-HA-1) stone bridge crossing in Somerville and Medford and the canal prism and tow

path in Medford; 2) mid- to late 19th-century worker housing on Joy Street in Somerville; 3) late 19th- to early 20th-century meat-packing plant factory complex in Somerville; 4) early to mid-19th-century Clark Bennett residence, outbuildings, and yard area in Somerville; and 5) late 19th-century dwelling (possible worker housing) on the subdivided Clark Bennett estate property in Somerville. No other areas of archaeological sensitivity were identified because of the presence of extensive fill and/or previously disturbed contexts.

25-3010 Donta, Christopher L., and F. Timothy Barker
2008 Archaeological Survey (Phase 1B) of the Kaufhold Parcel, Connecticut River Bank Stabilization Project, Gill, Massachusetts. 72 pages.

A plan for erosion control along a bank spanning 365 m in length along the Connecticut River called for the building of an access road, the placement of a machine staging area, and the alteration of the riverbank. Background research identified one Native American site in the project area, 19-FR-303, while several others were located in the immediate area. Subsurface testing consisted of 141, 50 x 50 cm shovel test pits excavated at 7.5 m intervals and five 1 x 1 m excavation units. Pre-contact Native American artifacts and subsurface cultural features were found concentrated in three locations at both the Kaufhold Parcel survey unit and the proposed northern access road. A fourth location was determined to be an isolated find. The sites that were identified include the North Split River Farm Site continuation and the Split River West and Split River Pond sites. None of the three include temporally diagnostic lithics, however the North Split River Farm Site did contain Native American pottery. A total of 177 Native American artifacts were recovered. (See also report #25-1104.)

25-3011 Dudek, Martin G., and Barbara Donohue
2009 Archeological Intensive (Locational) Survey for National Grid's A127/B128 Reconductoring Project, Auburn, Leicester and Worcester, Massachusetts. 97 pages.

Archaeological testing along the nine mile powerline right-of-way, consisting of 45, 50 x 50 cm shovel test pits, was conducted for the locations of six replacement utility structures. Modern materials and a low density of historical artifacts were recovered. An isolated find of an 18th-century Chinese coin in Worcester may be related to adjacent 19th-century railroad work. No archaeological sites were identified. (See also report #25-2956.)

25-3012 Cherau, Suzanne, Matthew Kierstead, Jennifer Banister, and John Daly
2009 Reconnaissance and Intensive (Locational) Historic and Archaeological Surveys, Eel River Headwaters Restoration Project, Plymouth, Massachusetts. 212 pages.

Archaeological surveys conducted in the area of a mill dam site included archival research, walk-over surveys, and sixteen 50 x 50 cm shovel test pits at 5 m intervals. These resulted in the identification of a significant historical cranberry bog landscape (PLY.919) of 38 acres that is a contributing element of the South Pond Village Historic District (PLY.Y). The cranberry bog complex includes Bogs 1 through 7 and associated features and structures as well as two additional contributing elements of the historic district, the R. Sampson House (PLY.1087), and the Cranberry Bog Screen House (PLY.1088) that will be indirectly (visual) impacted by the project. The surveys also resulted in the identification and evaluation of a significant historical water-powered industrial mill and dam site (Glendale Mill PLY-HA-19) located downstream from the bogs, which is also a contributing element of the South Pond Village Historic District. The site appears to have been used in the early 19th and perhaps late 18th century as a local sawmill, followed by adaptive re-use as a stave and cotton-batting mill in the mid- to late 19th century (See also report #25-3137.)

25-3013 Labadia, Catherine M., William F. Keegan, Kristen Keegan, Aaron Palermo, and David R. George
2009 Intensive (Locational) Archaeological Survey of the Proposed Town of Stockbridge Water System Improvement Project, Stockbridge, Massachusetts. 73 pages.

An archaeological survey was conducted of the project area for a proposed water tank, equipment storage area, earthen berm, and piping corridor. The subsurface testing consisted of 94, 50 x 50 cm shovel tests excavated at 10 m intervals. Two test pits yielded a total of four chert flakes.

25-3014 Mair, A. Peter, II
2008 Intensive (Locational) Archaeological Survey, MassHighway Assignment 39, Brimbal Avenue Interchange Improvements, Beverly, Massachusetts. 84 pages.

An archaeological survey was conducted for the proposed improvements on Route 128. Thirty-two 50 x 50 cm shovel test pits, excavated at 10 m intervals along four linear transects, did not produce any pre-contact cultural material or evidence of subsurface features. Walkover survey identified what appears to be a former homestead/farmstead (Dunham Road Site) that was razed when Route 128 was built or widened. Elements of the property include a dry-laid stone foundation, a cinderblock foundation, and what appear to be the remnants of stone walls. Visual inspection and subsurface testing indicate that the area around the foundations has been previously disturbed. Post-contact cultural material was limited to fragments of glass and ceramics with some pieces of brick and metal recovered from disturbed contexts, and is more indicative of sheet trash than midden deposits. Based on the paucity of cultural material, the absence of subsurface features, and the disturbed contexts of the project area, no further archaeological work is recommended.

25-3015 Stein, Ninian R.
2007 Native Peoples and Subsistence in Late Woodland and Early Contact Period Southern New England. 443 pages.

Using an intensive review of archaeological data as well and organic residue analyses, this dissertation tests the hypothesis that the majority of Native American groups in Southern New England practiced multiple subsistence strategies during the Late Woodland and Early Contact periods. The dissertation is divided into three sections. The first section is a re-examination of archaeological evidence for Late Woodland subsistence, including published reports, gray literature, and artifact collections. First creating a database of Late Woodland sites in Southern New England with either direct or indirect evidence for foraging and/or cultivation, the author then selected 30 of these sites which were scientifically excavated and documented, representing a range of subsistence strategies. The author additionally re-examined artifact collections from twelve of these sites spanning Connecticut, Massachusetts, and Rhode Island, using the criterion of presence in a pond core catchment area to facilitate leaf wax residue analysis. Drawing on stable isotope analyses for compound specific markers to identify maize leaf wax residues in pond sediments from Blood Pond in Dudley and Charlton, the second section explores preliminary results of leaf wax residue analysis, a new technique aimed at overcoming difficulties in analyses of subsistence as a result of poor preservation of maize kernels. The author concluded that leaf wax residues have promise but further testing is necessary to confirm their use in detecing maize in pond sediments.The third section considers issues underlying the debate over the extent and intensity of maize cultivation in Late Woodland New England through Contact Period texts and the cultivation/foraging and nature/culture dichotomies. Based on this detailed examination of existing archaeological data in the region, the preliminary leaf wax residue analysis results, and a careful reading of both Native and European Contact period texts about subsistence, it is argued that maize cultivation in Late Woodland Southern New England was limited to small spaces on the landscape, and where it occurred, it was always part of a mixed economy where foraging strategies were as significant a contribution to the diet as cultivation. Appendix 1 of the dissertation provides a table of Late Woodland archaeological sites in Southern New England with evidence for subsistence, including sites in Massachusetts in Acushnet, Canton, Chatham, Chicopee, Chilmark, Clinton, Concord, Deerfield, Dover, Gill, Greenfield, Kingston, Marshfield, Millbury, Montague, Nantucket, Norton, Palmer, Plymouth, Sutton, Uxbridge, and Wilbraham. Appendix 2 details the ownership history of the land around Blood Pond, in order to ascertain which farms surrounding the pond may have participated in maize production throughout the 19th century that could affect the pond sediment core and thus the leaf wax residue analysis results.

25-3016 Banister, Jennifer, and Suzanne Cherau
2008 Intensive (Locational) Archaeological Survey, Fitchburg Commuter Rail Line Improvements Project, South Acton Station, Acton, Massachusetts. 67 pages.

An archaeological survey was conducted consisting of archival research, a walkover/ground surface inspection, and subsurface testing in two areas totaling approximately 6,718 m^2. Twenty-four 50 x 50 cm shovel test pits were excavated at 10 m intervals within three judgmental transects. The survey identified previous cutting/grading and filling episodes. No intact soil strata were encountered. A low density of post-contact cultural material was recovered in the fill soils, along with modern debris. None of these items are potentially significant cultural deposits. They are most likely related to the documented 19th- and 20th-century landscape alterations for the railroad bed and station site. No further archaeological investigations are recommended.

25-3017 Dudek, Martin G., Barbara Donohue, William J. Chadwick, and Thomas F. Mailhot
2009 Archeological Intensive Survey for the Route 2 Reconstruction at the Concord Rotary, Town of Concord, Middlesex County, Massachusetts. 209 pages.

An archaeological survey was conducted which included 159, 50 x 50 cm shovel test pits across six archaeologically-sensitive areas, as well as ground penetrating radar in and around the Massachusetts Reformatory prison cemetery. The survey identified four archaeological sites, including an early 20th-century midden associated with prison worker housing and three fieldstone building foundations (Historic Sites 1, 2, and 3). A site examination is recommended for the Prison Worker Housing Midden, which consists of a refuse pit containing 12 bottles and other artifacts and food remains. Historic Site 1 consists of a stone-lined channel or foundation with two parallel walls spaced three feet apart, while Historic Sites 2 and 3 consist of fieldstone-lined cellar holes; avoidance of all three sites is recommended. Additionally, ground penetrating radar defined the limits of probable grave shafts within and around the cemetery, and a minimum buffer of 20 feet around the limits of the cemetery is recommended.

25-3018 Mair, A. Peter, II, Dianna L. Doucette, and Nichole Gillis
2009 Intensive (Locational) Archaeological Survey, Rosebrook Parcel, Wareham, Massachusetts. 87 pages.

An archaeological survey of 20 acres included archival research, a walkover survey, and subsurface testing. Subsurface testing, consisting of 50, 50 x 50 cm shovel test pits excavated at 10 m intervals, documented intact A and subsoil horizons over the majority of the tested portions. The majority of recovered cultural material (e.g., bottle glass and nail) was modern. One piece of precontact quartz chipping debris is interpreted as an isolated find that has limited research potential.

25-3019 Herbster, Holly
2009 Intensive (Locational) Archaeological Survey and Cultural Resource Management Plan, Allen's Mill, Dartmouth, Massachusetts. 139 pages.

An archaeological survey, consisting of archival research, a walkover survey, and 26, 50 x 50 cm shovel test pits excavated at 7.5 m intervals, was conducted of the approximately three-quarter acre property. The mill site dates to 1711 or earlier and mill operations occurred there until the 1950s. The cultural material recovered consists of high quantities of iron hardware and lower quantities of brick, glass, industrial waste, and whiteware. The aboveground structural remains and features associated with Allen's Mill have been well documented and possess a high degree of integrity. It is likely that the significant archaeological deposits associated with the construction, occupation, and abandonment of the grist and saw mills, together with the structural remains of the mills and the surrounding landscape, represent an archaeological site or district. (See also report #25-3063.)

25-3020 Banister, Jennifer, Kristen Heitert, and A. Peter Mair, II
2008 Massachusetts Highway Assignment 36C, Archaeological Site Examination, Old House Site, Route 24 Interchange Improvements, Freetown, Massachusetts. 97 pages.

Forty-five 50 x 50 cm shovel test pits were excavated at 5 m intervals within the proposed interchange and access roadway on Route 24. Thirty-five of the 45 test pits contained post-contact cultural material. Densities were highest around the house foundation, decreasing to the west and south. Once the site boundaries were established, three 2 x 1 m units were excavated in the location of a possible feature and around the house foundation; two 50 x 100 cm units were excavated inside the foundation; and one 1 x 1 m unit was excavated in an area that contained a historical shell deposit. The integrity of the main house and its surrounding landscape combined with the identification of at least one outbuilding of indeterminate function has the potential to provide information about a near-coastal farmstead during the second half of the 18th century. (See also reports #25-2575 and 25-2904.)

25-3021 Mair, A. Peter, II
2009 Intensive (Locational) Archaeological Survey, Reconstruction of Route I-93 and Route 110/113 (Methuen Rotary), Methuen, Massachusetts. 88 pages.

An archaeological survey was conducted on approximately one-half acre that was identified as sensitive for pre-contact period sites. A walkover/surface evaluation suggested the area is disturbed as a result of construction associated with I-93 and the Methuen Rotary. Thirty-two 50 x 50 cm shovel test pits were excavated at 10 m intervals, producing a low density of post-contact and modern debris, limited to fragments of redware, creamware, glass, nail, brick, coal, slag, asphalt shingle, concrete, and asphalt, and associated with former standing structures within and adjacent to the existing rotary. All material was recovered from disturbed contexts.

25-3022 Gillis, Nichole A.
2009 Intensive (Locational) Archaeological Survey, B154/C155S Electrical Transmission Line Shield Wire Replacement Project, Danvers, Peabody, and Salem, Massachusetts. 114 pages.

An archaeological survey including archival research, walkover survey, and subsurface testing was conducted of a project involving maintenance to 38 poles at 18 existing tower structure locations. In total, 133, 50 x 50 cm shovel test pits were excavated along three miles of the transmission lines. One previously documented pre-contact period site (Sumac Site in Danvers) and four previously undocumented, isolated pre-contact findspots (Findspots 1 through 4) were identified. Test pits excavated within the Sumac Site during the current investigation yielded 11 pieces of rhyolite chipping debris from fill and plow zone contexts. Both recent and early post-contact period cultural materials were identified in the same stratigraphic context as the pre-contact cultural materials. The moderate density of cultural material identified suggests that the site may represent one or more lithic workshops. The cultural material from the four findspots represents stone tool-related activities, such as stone tool resharpening or maintenance.

25-3023 Barker, F. Timothy, and Timothy L. Binzen
2009 Archaeological Intensive (Locational) Survey for the Proposed Lower Riverside Park, South Hadley, Massachusetts. 78 pages.

An archaeological survey was conducted, consisting of background research, a field assessment, and subsurface testing. Four 50 x 50 cm shovel test pits were hand-excavated and five machine-assisted exploratory trenches were completed. Evidence of the 19th-century Glasgow Mill Gashouse was identified in the form of foundation remains. The research value of this resource was low due to disturbance associated with the demolition of the building. Mapping was performed for the existing section of the South Hadley Canal, near the proposed viewing platform. Construction of the platform will not affect the canal. The undertakings related to the park will not impact any significant archaeological resources.

25-3024 Binzen, Timothy L.
2009 Archaeological Phase 2 Site Examination Survey at the Mariamante Native American Site (19-FR-268), Gill, Massachusetts. 81 pages.

Seventy-seven 50 x 50 cm shovel test pits and six 1 x 1 m excavation units were excavated at 5 m intervals on approximately 10 acres. The assemblage of Native American artifacts, recovered from both plow zone and subsoil, consists mainly of chipping debris of chert, rhyolite, quartzite, and quartz; projectile points include an Orient point and a Small Stemmed point. Point base fragments, stone tools, cores, and pottery fragments were also recovered. The five features uncovered consisted of anomalous soil stains, consistent with postmolds or hearth remnants. The most significant feature, Feature 5, appears to be a large, deep pit, as wide as three m across and at least 110 cm deep, with multiple lenses of fill and a large amount of charcoal. Feature artifacts included chert, rhyolite, and quartz chipping debris, in addition to pottery. A radiocarbon assay on a sample (Beta-248847) obtained in close association with pottery produced a conventional radiocarbon age of 2,120 ± 40 B.P., associating the feature with an occupation near the end of the Early Woodland period or the beginning of the Middle Woodland period. Avoidance and permanent preservation of this area, as well as a surrounding buffer zone of at least 25 feet, is recommended; if not feasible, a data recovery program is recommended. (See also report #25-2697.)

25-3025 Dudek, Martin G., and Deena L. Duranleau
2009 Archeological Intensive (Locational) Survey for the Evergreen Wireless Telecommunications Antenna Monopole Facility, Natick, Massachusetts. 76 pages.

The archaeological survey tested the proposed location of the monopole facility, access drive, and underground utility easement. Sixteen 50 x 50 cm shovel test pits were excavated in the form of one block, one transect, and three judgmental test pits. No cultural material was recovered.

25-3026 Donohue, Barbara, and Craig Chartier
2009 Results of an Archaeological Intensive (Locational) Survey at Bicknell Road, Weymouth, Massachusetts. 171 pages.

The archaeological survey conducted consisted of documentary research, informant interviews, two ground penetrating radar surveys, and the excavation of 64, 50 x 50 cm shovel test pits at 5 m intervals within a 1.18 acre project area. The purpose of the survey was to determine if the project area had been associated with the 17th-century settlement of Wessagusset as well as to determine the validity of a story associated with the residence on the property – that seven skulls, five of which were embedded in the foundation wall of the house, found when building the house, belonged to a "settler's tomb." Only three historical period artifacts, all ceramic sherds, were recovered from the field testing, suggesting that the project area witnessed little historical period activity. A ground penetrating radar survey in the area of the field testing revealed one anomaly that when ground-truthed proved to be a naturally occurring concentration of rock. A second ground penetrating radar survey along the basement wall of the house identified five anomalies in the foundation wall. It is recommended that an archaeological historical site form be completed for the house to provide protection against future development until such time as the validity of the oral history can be determined.

25-3027 Doucette, Dianna L.
2009 Intensive (Locational) Archaeological Survey, Town of Chatham Sanitary Sewer Extension Project, Pump Station #43 Project Area, Chatham, Massachusetts. 71 pages.

An archaeological survey conducted of the approximately 325 m^2 project area, part of the Water Pollution Control Facility, included archival research, a walkover inspection, and subsurface testing. Ten 50 x 50 cm shovel test pits were excavated along two judgmental transects. A low density of post-contact cultural material was recovered, including six pieces of modern bottle glass and a machine-cut nail. This material was recovered from the A/topsoil horizon and was likely discarded

by nearby residents.

25-3028 Dudek, Martin G., and Barbara Donohue
2009 Archeological Intensive (Locational) Survey for National Grid's Z126 Transmission Line Project, Millbury and Auburn, Massachusetts. 162 pages.

Archaeological testing consisted of 305 shovel test pits measuring 50 x 50 cm, excavated at 5 m intervals for the locations of new utility structures for the approximately seven miles of proposed transmission line. Two pre-contact findspots of stone chipping debris were identified in Millbury. Historical and modern artifacts were recovered in low to moderate densities, with moderate densities of historical artifacts from disturbed contexts. Two previously identified historical archeological sites in Millbury, a stone-lined well near Greenwood Street and a stone foundation and well near I-90, are recommended for protection and avoidance. (See also report #25-2973.)

25-3029 Gillis, Nichole, and Kristen Heitert
2009 Intensive (Locational) Archaeological Survey, Gillett Cigar Factory and Warehouse Relocation Project Area, Southwick, Massachusetts. 76 pages.

An archaeological survey was completed in the 1.9 acre project area, currently home to the Roger Moore House, a two-story structure built in 1751. Twenty 50 x 50 cm shovel test pits were excavated along seven linear transects and revealed both plowed and disturbed surficial soil profiles underlain by intact subsoils and shallow bedrock. A total of 507 pieces of domestic and structural material was recovered from plow zone and fill contexts, including redware, whiteware, domestic stoneware, window and bottle glass, wire, and machine-cut nails. The diffuse distribution and lack of any associated structural, landscape, or household features suggests that the assemblage is best characterized as yard/field scatter with no locational or associative integrity.

25-3030 Donta, Christopher L., and F. Timothy Barker
2009 Archaeological Intensive (Locational) Survey for the Deerfield Fire District Improvements, Deerfield, Massachusetts. 48 pages.

Archaeological research was conducted at four proposed impact locations: 1) a new water tank on a hill within the Pocumtuck Range, north of Pine Nook Road; 2) a pipeline crossing of Route 5 and 10 on the north side of Memorial Street; 3) a 675 m water main with fire hydrants along Mill Village Road; and 4) a meter manhole on Lower Road in the north part of Deerfield. In total, 62, 50 x 50 cm shovel test pits were excavated at 7.5 m intervals in two survey units determined to have high archaeological potential. A small number of historical period artifacts were found in plowed or otherwise disturbed soils, typical of domestic occupation or agricultural activities.

25-3031 Waller, Joseph N., Jr.
2009 Intensive Archaeological Investigation, United Teen Equality Center, Former St. Paul's United Methodist Church, Lowell, Massachusetts. 75 pages.

Machine-assisted archaeological testing was conducted within the building expansion footprint. The Reverend Daniel Dorchester reported in 1866 that several Native American graves were disturbed during construction of St. Paul's church. Machine-assisted topsoil removal demonstrated that the previous construction, the cutting and grading of original topsoils, and subsequent filling have largely impacted the building expansion area. Documented cultural resources were limited to a remnant brick walkway and a mortared brick well coincident with the Methodist's 19th-century use of the property. No Native American cultural materials or human remains were observed or recovered from site area fills and no Native American cultural features were witnessed in remnant intact soils.

25-3032 Cherau, Suzanne, Kirk Van Dyke, and Gregory R. Dubell
2009 Summary Report, J-2 Loop Project, Medford and Somerville, Massachusetts. 35 pages.

Archaeological monitoring and documentation were completed on the section of proposed pipeline route identified as having moderate sensitivity to contain possible structural remains and associated cultural strata and deposits associated with a 19th-century bridge crossing over the Middlesex Canal. The construction monitoring took place along a span of approximately 225 linear feet, and resulted in the identification of suspected canal features associated with the documented Temple Street canal bridge crossing. These features were only visible in the south wall of the construction pipeline trench and include soil strata and stonework indicative of a portion of the canal tow path, canal prism and associated clay puddling, and the western bridge abutment (possibly also the eastern bridge abutment). These remains had been severely truncated by the construction of modern utility easements and the asphalt road bed construction. They were fully documented in the pipeline construction trench during the archaeological monitoring. A stone culvert was also identified during construction of the pipeline trench in Somerville. The stone culvert is not a significant archaeological resource and no further archaeological investigations were conducted. (See also report #25-2878.)

25-3033 Ritchie, Duncan, and Kirk Van Dyke
2002 Intensive (Locational) Archaeological Survey, Cobbler's Knoll Residential Subdivision, Mendon, Massachusetts. 121 pages.

Subsurface testing consisting of 105, 50 x 50 cm shovel test pits excavated at 10 m intervals was conducted on a suspected Native American rockshelter site, three historical period boulder quarries, and a historical/modern period farmstead. Two pre-contact Native American sites were found adjacent to wetlands flanking Muddy Brook. The Purple Mushroom Site contains low-density deposits of argillite, chert, quartz, rhyolite, and quartzite chipping debris. The Cobbler's Knoll Locus 1 Site is an isolated findspot consisting of two pieces of quartz chipping debris found near wetlands along Muddy Brook. The Muddy Brook Mill Site consists of a fieldstone foundation for a mill and a long ditch or tailrace with fieldstone gates. Based on a historical map, this rural industrial complex (the Olney Cook complex) appears to be of 19th-century construction, including a house, barn, and outbuilding used as a cobbler's shop. A cut granite and fieldstone foundation for a second barn is also located within the farmstead. Subsurface testing of the house revealed an archaeological component containing early to mid-19th-century cultural material (ceramic sherds, bottle glass, and structural materials). The Cobbler's Knoll Boulder Quarry Sites 1-3 are large granite boulders with drill holes and other evidence of quarrying.

25-3034 Cassedy, Daniel, Marvin Brown, Mechelle Kerns Nocerito, and Edward Morin
2010 Phase IA Archaeological Reconnaissance Study, City of Peabody, Goldthwaite Brook Flood Mitigation Project, Peabody, Massachusetts. 88 pages.

The study within this 60,000 ft^2 corridor included documentary and background research as well as visual inspection. No subsurface investigations were conducted. The setting of the project suggests a high potential for prehistoric and contact-period Native American land use. In addition, background data indicate that this area was the location of 17th- and 18th-century residential settlement and industries, including gristmills, saw mills, and early tanneries. Three separate sections within the overall corridor have been identified where there is potential for archaeological sites to be found.

25-3035 Ritchie, Duncan
2009 Phase I Archaeological Identification Survey, Road and Trail Improvements, Assabet River National Wildlife Refuge, Sudbury and Maynard, Massachusetts. 297 pages.

An archaeological survey was conducted consisting of archival research and subsurface testing, involving the excavation of 190, 50 x 50 cm shovel test pits at 8 m intervals. The survey identified six pre-contact archaeological site areas, three of which contained sites (Puffer Pond, Site 34-1, Site 35-1/Puffer Beach) first identified in a 1986 survey of the former Sudbury Training Annex. Cultural materials recovered from these sites included diagnostic projectile points, bifacial tool blades, ceramic sherds, more than 300 pieces of chipping debris (quartz, rhyolite, mylonite, chert,

quartzite, argillite), and burnt rock fragments. The Craven Lane Loci 1, 2, and 3 sites consist of previously unknown findspots of pre-contact Native American cultural material (chipping debris). The temporal/cultural affiliation of these sites is unknown. These loci are not considered significant cultural resources, given their limited contents and potential to yield additional information. The Puffer Pond Site (l9-MD-657) is a large area with evidence of occupation during the Middle/Late Archaic to Woodland periods. This site contains hearth fire pits and lithic workshops indicative of a range of on-site activities including resource processing, cooking, heating, and stone tool manufacture. Site 34-1 (19-MD-654) consists of deposits of pre-contact Native American cultural material, such as bifacial tool blades and chipping debris, as well as hearth fire pit and lithic workshop features. Ceramic sherds indicate an Early to Middle Woodland period affiliation for this site. Middle and Late Archaic period components including pre-contact Native American cultural materials and a hearth fire pit feature are associated with the Puffer Beach Site (19-MD-652). Post-contact materials were found in all parts of the project area, mostly in small amounts within plow zone contexts not associated with specific sites. (See also report #25-2732.)

25-3036 Dudek, Martin G., and Deena L. Duranleau
2009 Archeological Intensive (Locational) Survey for the Telecommunications Antenna Monopole Facility, Littleton, Massachusetts. 74 pages.

The archaeological survey tested the proposed location of the monopole facility, access drive, and underground utility easement. A total of 14, 50 x 50 cm shovel test pits in the form of one block, one transect, and four judgmental test pits were excavated. Modern and historical materials were recovered from landscaping fill at one test location. No archaeological sites were identified. (See also report #25-2080.)

25-3037 Doucette, Dianna L., Holly Herbster, and Kristen Heitert
2010 Phase I Archaeological Identification Survey, Parker River Utility Project, Parker River National Wildlife Refuge, Newbury, Massachusetts. 91 pages.

An archaeological survey on Plum Island was conducted for the proposed construction of a new 214 m utility line for the United States Fish & Wildlife Service. Consultation and archival research were conducted for this project, along with subsurface testing consisting of 31, 50 x 50 cm shovel test pits excavated along three judgmental transects at 8 m intervals. One test pit yielded post-contact cultural material consisting of a brick fragment and a piece of coal slag. All material was recovered from disturbed contexts. (See also reports #25-289 and 25-384.)

25-3038 Ritchie, Duncan
2009 Intensive (Locational) Archaeological Survey, Faulkner Homestead, Acton, Massachusetts. 130 pages.

An archaeological survey conducted of the project area included archival research, walkover inspection, and subsurface testing. Archival testing revealed one previously documented pre-contact Native American site (19-MD-147), a findspot of a single ground-stone tool (adze or celt), located north of the property. During the walkover inspection, four granite boulders potentially used as a source of building material were found near the southern boundary of the property. A large fieldstone barn foundation with a rectangular addition or ell is located along the western edge of the property. Ninety 50 x 50 cm shovel test pits were excavated during fieldwork, in two 30 x 30 m sampling blocks (at 15 m intervals), along nine judgmentally placed transects (at 10 m intervals), and as 14 judgmental test pits. A number of features and subsurface archaeological deposits associated with post-contact occupation of the Faulkner Homestead property were identified. The small boulder quarries (Faulkner Estates Boulder Quarry sites) should be protected as elements of the farmstead landscape and for their value in interpreting the land use history of the property. Fragments of European flint were found in a fill deposit above what may be a fieldstone floor within the barn ell. High and moderate density deposits of 18th- and 19th-century domestic refuse are located near the exterior kitchen door on the north side of the Jones-Faulkner House and parts

of the slope above High Street. The archaeological deposits are a potentially significant source of information about the foodways/diet, use of yard space in close proximity to the house, and types of ceramics and glassware used by occupants of the property. It is recommended that the sewer line be run from the northeast corner of the ell at the west end of the house (1774 ell) rather than from the kitchen area to minimize impact to archaeological deposits. The remainder of the proposed sewer line will be placed at the base of the slope along High Street where there will be no impact to archaeological resources.

25-3039 Ritchie, Duncan
2009 Town Wide Archaeological Reconnaissance Survey, Acton, Massachusetts. 240 pages.

An archaeological survey was completed to identify pre-contact and post-contact archaeological sites, develop town wide archaeological sensitivity maps, develop management recommendations for the protection of cultural resources and archaeologically sensitive areas, and develop predictive models for undocumented archaeological sites. There were 18 previously recorded pre-contact period sites and five previously recorded post-contact sites in the town of Acton. The survey included archival research, informant interviews, and walkover field survey, resulting in the documentation of one new, previously unrecorded pre-contact Native American site and documentation of 25 previously unrecorded post-contact period sites. The pre-contact period site, the Great Road Condominium/Nagog Brook Site, is a single-artifact findspot consisting of a surface find of a grooved, groundstone plummet. Management recommendations developed from the survey focus on a coordinated development review of future projects through regional and local planning agencies. Partnerships with both preservation and conservation advocacy groups, Native Americans, land owners, and the general public are suggested as ways in which Acton can help to document, protect, and preserve important cultural resources.

25-3040 Binzen, Timothy L., F. Timothy Barker, Kathryn Curran, and Mitchell T. Mulholland
2009 Archaeological Predictive Modeling Analysis for the Greater Springfield Reliability Project, 345-kV System and Additional 115-kV Segments, Hampden County, Massachusetts. 93 pages.

This project includes the rebuilding of existing overhead transmission and distribution lines and the construction of underground networks in Agawam, Chicopee, East Longmeadow, Hampden, Longmeadow, Ludlow, Springfield, West Springfield, and Wilbraham. Because this study is being conducted at an early, conceptual phase of the overall project, its findings are preliminary and are not equivalent to a Phase 1A Reconnaissance survey, to be conducted once design plans and work areas are more fully developed. Rather, the present study is intended to assist in planning by showing which parts of the project are most likely to contain unrecorded archaeological resources (either pre-contact Native American or historical), and which areas are of lesser concern because of low sensitivity. This information will help indicate the necessity for future archaeological survey and testing in specific locations, and will assist in the future evaluation of design alternatives. (See also reports #25-3053, 25-3054, 25-3056, and 25-3057.)

25-3041 Duffin, Michael, and Holly Herbster
2009 Intensive (Locational) Archaeological Survey, Chasin Property, Edgartown, Massachusetts. 76 pages.

An archaeological survey of the 60 acre project area on Chappaquiddick Island consisted of archival research, a walkover survey, and subsurface testing. One hundred and ninety-six 50 x 50 cm shovel test pits were excavated across seven building envelopes and associated access/utility easements, resulting in the documentation of two isolated deposits of lithic chipping debris (Quammox Findspots 1 and 2) and low to moderate densities of 19th-century domestic and structural field trash.

25-3042 Donta, Christopher L., and F. Timothy Barker
2009 Archaeological Intensive (Locational) Survey for the Southwest Area Wastewater Improve-

ments Project, Agawam, Massachusetts. 66 pages.

Archaeological testing was completed at three of five proposed impact areas, on Barry Street, Pine Street, and White Fox Road. Two additional locations were not tested because the project proponents were denied access. Eighteen 50 x 50 cm shovel test pits were excavated at 7.5 m intervals in the three survey units. A small number of historical artifacts were recovered, consisting mainly of glass sherds, along with some metal fragments and ceramic sherds. All of the finds came from fill. (See also report #25-178.)

25-3043 Waller, Joseph N., Jr.
2009 Supplemental Archaeological Data Recovery, Kensington Court at Lakeville Station Project, Lakeville, Massachusetts. 316 pages.

Archaeological monitoring of machine-assisted soil removal within the 13.44 acres of the Riverside Park Archaeological District resulted in the exposure of 147 cultural features associated with six loci of Native American activity. Data recovery within each of these loci, the previously recorded Riverside 2 and 4 sites as well as the newly recorded Riverside 9, 10, 11, and 12 sites, demonstrated that the greater Riverside Park Archaeological District hosted a range of Native American site types. Excavated features included storage pits, refuse pits, fire pits, and hearths. At the Riverside 11 Site, cremated human cranial fragments and pieces of long bones were contained within Feature R11-31, evidently used as a burial plot following its use as a storage pit. Wood charcoal from the feature yielded a radiocarbon date of 950 ± 40 B.P. (Beta-247963). The Riverside 2 Site is interpreted as a place of resource acquisition, exploitation, and processing resulting from a series of overlapping occupations dating to the Late/Transitional Archaic period. The Riverside 4 Site was a locus of domestic processing and camping contrasted with an area of food storage with Transitional Archaic, Middle Woodland, and Late Woodland occupations. Riverside 9 represents a temporary campsite likely created during the Late Archaic as people traveled between resource extraction zones or habitation areas along the Nemasket River. The Riverside 10 and Riverside 12 sites were similar low-density deposits of cultural materials and features resulting from short duration camping episodes. The Riverside 11 Site is interpreted as a concentration of early Late Woodland food storage. (See also reports #25-1039, 25-2111, 25-2387, 25-2429, and 25-2695.)

25-3044 Gillis, Nichole, Kristen Heitert, Mark Lance, and Alan Leveillee
2009 Archaeological Site Examination, Crystal Quarry Site and Cheney Farmstead Site, Stone Ridge Development, Milford, Massachusetts. 183 pages.

An archaeological survey was conducted on one pre-contact Native American site and one historical site, both identified during intensive survey in 2008. Seventy-four 50 x 50 cm shovel test pits and three 1 x 1 m excavation units were completed at the Crystal Quarry Site, which was likely used for quarrying to extract high-quality siliceous mineral quartz and for subsequent manufacture of stone tools in workshops around the source area. Temporally diagnostic artifacts indicate occupations during the Middle and Late Archaic periods. Fifty 50 x 50 cm shovel test pits (at 5 m intervals), nine 1 x 1 m excavation units, one 0.5 x 1 m excavation unit, and two 50 x 50 cm excavation units were completed at the Cheney Farmstead Site, encompassing the domestic core of the larger Cheney farm complex and including the Cheney house, a cellar outbuilding, a barn, and a fieldstone well. Three animal pens are located outside of the domestic core, along the periphery of the farm complex. Land record, census, and probate data for the property suggest the site was used for small- to moderate-scale subsistence farming from the late 18th century to the mid-19th century. (See also report #25-2925.)

25-3045 Mair, A. Peter, II, and Erin Flynn
2009 Intensive (Locational) Archaeological Survey, Fair Havens Rest Home, Middleborough, Massachusetts. 77 pages.

An archaeological survey was conducted within 4.8 acres where construction of a new building is

proposed to replace the existing Fair Havens Rest Home (MID.181). The survey included research, a walkover survey, and subsurface testing consisting of 45, 50 x 50 cm shovel test pits excavated within two 30 x 30 m blocks, one sampling cluster, along three judgmental transects, and as two judgmental test pits. Two concrete footings, most likely sheds or garden beds, were located in the northern portion of the project area. A small amount of post-contact cultural material recovered is suggestive of field scatter.

25-3046 Clements, Joyce M.
2010 Archaeological Mitigation at the Huguenot Fort Site (OXF-HA-1), Oxford, Massachusetts. 15 pages.

Archaeological testing was conducted prior to construction of an interpretive sign at the fort's entrance. Two 50 x 50 cm shovel test pits were excavated to sterile subsoil at the locations of the sign support posts. No archaeological features or artifact deposits were found (See also reports #25-578 and 25-977).

25-3047 Donta, Christopher L., F. Timothy Barker, and Jennifer Wendt
2008 Archaeological Intensive (Locational) and Site Examination Surveys for the Proposed Phase 6 Sewer Expansion Project, Part Two, Raynham, Massachusetts. 95 pages.

An archaeological survey was conducted within 11 survey units, including subsurface testing of a total of 43, 50 x 50 cm shovel test pits excavated at 7.5 m intervals. Five survey units contained small amounts of European-American artifacts recovered from plow zone or fill contexts. A pre-contact Native American site was identified and was designated as the Dean Street 1 Site, containing four quartz flakes and one piece of quartz shatter. A second pre-contact Native American site, the Dean Street 2 Site, is a small area containing a scatter of lithics, associated with a single possible burn feature. (See also report #25-2800.)

25-3048 Beranek, Christa M., and Katie L. Kosack
2009 Collections Inventory of the Roland Robbins Archaeological Collection from the Hancock-Clarke House, Lexington, Massachusetts. 64 pages.

In order to preserve the house of Lexington's 18th-century ministers and their families, the Lexington Historical Society purchased it and moved it across the street in 1896. In the 1960s, they acquired the house's original site and arranged for excavations by Roland Wells Robbins prior to moving the house back to its traditional location. Robbins relocated the foundation of the house and also discovered four previously unknown cellar holes, in addition to the two filled cellars associated with the existing building. Three of the newly discovered cellar holes contained rich deposits of artifacts manufactured in the 1720s through the early 1740s, the time that the Hancock family occupied the property. The three filled cellars probably represent the foundations of earlier buildings, filled shortly after the move to the new house. The collection contains a full range of domestic material culture, but is particularly noteworthy for its assemblage of personal adornment items, marked smoking pipes, redware vessels, tin-glazed wares, and early white slip-dipped stoneware. The other cellar holes were filled in the 19th century. As a high-style, relatively elite dwelling in a rural area, the site and collection can address the spread of practices associated with gentility and refinement into rural Massachusetts and the ways in which elite goods and social practices were or were not adapted and adopted in a minister's household in a rural setting.

25-3049 Binzen, Timothy L., F. Timothy Barker, Kathryn Curran, and Mitchell T. Mulholland
2007 Archaeological Predictive Modeling Study for the Springfield Area 115-kV Projects, Agawam, Chicopee, Ludlow, Springfield and West Springfield, Hampden County, Massachusetts. 83 pages.

The present study is intended to assist in planning by showing which parts of the study area are most likely to contain unrecorded archaeological resources (both pre-contact Native American and historical), and which areas are of lesser concern because of low sensitivity. Undeveloped portions

of both the East and West Project study areas possess moderate to high sensitivity to contain unrecorded or significant Native American archaeological resources. The report includes a table listing the survey unit numbers and their overall archaeological sensitivity rating. This information will help indicate the necessity for future archaeological survey and testing in specific locations, and will assist in the future evaluation of design alternatives.

25-3050 Doucette, Dianna L.
2009 Intensive (Locational) Archaeological Survey, Wellfleet Water System Expansion Project Area, Wellfleet, Massachusetts. 62 pages.

An archaeological survey was conducted prior to the expansion of a water system within and peripheral to the town center, including the installation of water mains and extensions beneath existing paved roads, a storage tank and associated access road and line off Long Pond Road and to Lawrence Road respectively, and a well and associated building and access road off Old King's Highway. The survey consisted of archival research, walkover inspection, and subsurface testing. Fifty-eight 50 x 50 cm shovel test pits were excavated along three judgmental transects, within one testing block, and within one modified test pit array consisting of five test pits spaced at 7.5 m intervals. One silver quarter was recovered from test pit TB-8, dating to 1951.

25-3051 Mair, A. Peter, II, and Erin Flynn
2009 Intensive (Locational) Archaeological Survey, Cranberry Bog, Wareham, Massachusetts. 77 pages.

An archaeological survey including archival research, walkover survey, and subsurface testing was conducted of the 8.9 acre project area. Archival research revealed information about prior disturbances in the project area. Subsurface testing, consisting of 24, 50 x 50 cm shovel test pits, documented intact A and subsoil horizons over the majority of the tested portions of the project area. No cultural materials or evidence of subsurface features were identified.

25-3052 Banister, Jennifer, and A. Peter Mair, II
2009 Intensive (Locational) Archaeological Survey, Whittier Bridge/I-95 Improvement Project, Salisbury, Amesbury, and Newburyport, Massachusetts. 93 pages.

An archaeological survey including archival research, walkover survey, and subsurface testing was conducted of the proposed 4.25 linear mile project area. Forty 50 x 50 cm shovel test pits were excavated at 10 m intervals within three archaeologically sensitive portions of the right-of-way. No pre-contact cultural materials or subsurface features were encountered. Subsurface testing resulted in the recovery of a low density of post-contact material indicative of randomly deposited field trash that is not considered significant.

25-3053 Binzen, Timothy L., Kathryn Curran, Antonio Medina, and Mitchell T. Mulholland
2010 Archaeological Phase 1A Reconnaissance and Phase 1B Intensive (Locational) Survey for a Proposed Wetland Mitigation Area in Agawam, Greater Springfield Reliability Project (GSRP). 52 pages.

Archaeological surveys were conducted for a 5 acre parcel of land that will be transformed into a new wetland. After completing background research and a walkover survey of the project area, subsurface testing was conducted. Eighty-nine 50 x 50 cm shovel test pits, laid out in a 15 m interval grid pattern, were completed. A 20th-century fencing staple was the only artifact collected at the site. (See also reports #25-3040, 25-3054, 25-3056, and 25-3057.)

25-3054 Binzen, Timothy L., Kathryn Curran, Meghan Borowiec, and Mitchell T. Mulholland
2010 Archaeological Phase 1A Reconnaissance and Phase 1B Intensive (Locational) Survey for a Proposed Wetland Mitigation Area in Agawam, Agawam to West Springfield Circuit Separation Project (AWS). 57 pages.

Archaeological surveys were conducted for a one acre parcel of land that will be transformed into a new wetland. After completing background research and a walkover survey of the project area, subsurface testing was conducted. Twenty-four 50 x 50 cm shovel test pits were placed throughout the agricultural field at 7.5 m intervals. No cultural materials were recovered. (See also reports #25-3040, 25-3053, 25-3056, and 25-3057.)

25-3055 Heitert, Kristen
2010 Intensive (Locational) Archaeological Survey, Aberjona River Flood Control Project, Project Elements #2, #4, and #8, Winchester, Massachusetts. 80 pages.

An archaeological survey was completed of Project Element #2 (Waterfield Road to Bacon Street), Project Element #4 (Mt. Vernon Street Bridge), and Project Element #8 (Swanton Street Bridge). Twenty 50 x 50 cm shovel test pits were excavated using two judgmental test pits and four linear transects with test pits spaced at 10 m intervals. The testing revealed soil profiles consisting entirely of fill within all of the test pits. The soil profiles are attributable to a range of wide-scale landscape alterations during the late 19th century, 1930s, and 1940s. The filling episodes have effectively destroyed the integrity of any relict landscape surfaces pre-dating the mid-19th century, and the fill contained no artifact or structural data that might provide new information about the chronology, scale, or function of the landscape alterations.

25-3056 Binzen, Timothy L., F. Timothy Barker, Antonio Medina, and Kathryn Curran
2010 Agawam to West Springfield Circuit Separation Project (AWS) (1311/1412 Line Separation) Phase 1 Reconnaissance and Intensive (Locational) Survey Testing of Right-Of-Way (ROW) and Potential Off-ROW Access Roads, Hampden County, Massachusetts. 119 pages.

An archaeological survey was conducted of the existing overhead power line right-of-way (ROW) between the Agawam substation and the West Springfield substation, as well as eleven potential off-ROW access roads. Within the ROW, ten units were subject to reconnaissance survey, while intensive testing was conducted in eight of the survey units. The testing identified three previously undocumented Native American sites in Agawam (Walnut Street Site, Heron Site, and Westfield River Site) and an additional portion of the previously documented Agawam Meadow Site (19-HD-269). Each of the four sites offers evidence of Native American settlement along the Westfield River, and site examination survey is recommended for all four sites. Additionally, fourteen potential off-ROW access roads were subject to reconnaissance survey, while intensive testing was conducted in five of the off-ROW access road survey units. No significant archaeological resources were identified within any of the access road survey units; however, two of the potential roads are located in direct proximity to the Agawam Meadow Site and the Westfield River Site. Site examination survey is recommended for those two locations. (See also reports #25-3040, 25-3053, 25-3054, and 25-3057.)

25-3057 Binzen, Timothy L., Antonio Medina, and Kathryn Curran
2010 Greater Springfield Reliability Project (GSRP), Preferred Alternative Archaeological Phase 1A Reconnaissance & Phase 1B Intensive (Locational) Survey. 171 pages.

The 24 mile “Preferred Route/Alternative” follows right-of-way in the towns of Agawam, Chicopee, Ludlow, and West Springfield. Archaeological predictive model studies were previously reported for the project area. Archaeological survey included walkover inspection and subsurface testing of sixty units exhibiting archaeological sensitivity. Approximately 1,140, 50 x 50 cm shovel test pits were excavated at 7.5 m intervals. In total, 15 previously unrecorded Native American sites were identified, ranging in size and complexity from isolated find-spots to large, multi-component settlement locations. Avoidance or site examination survey is recommended for ten of the sites (AG-1, AG-2, AG-17, AG-18, WS-19, WS-21, CH-28, CH-31, CH-39, and LU-45). AG-1 and AG-2 contained primarily chipping debris and likely represent small seasonal camps used for tool production and/or food processing. The Native American artifacts at AG-17 included one quartzite flake and one quartz flake, and the small, circular feature stains recovered possibly represent postmolds associated with a Native American campsite. AG-18 represents a

large, complex site containing multiple components of occupation, which span a period of at least 7,000 years. The site consisted of 656 Native American artifacts (including chipping debris, tool fragments, steatite vessel fragments, and two Brewerton projectile points) as well as 11 Native American features representing possible storage pits, fire pits, postmolds, and lithic workshop areas. At WS-19 and WS-21, chipping debris and fire-cracked rocks were recovered along with a number of cultural features, likely representing Native American seasonal campsites. CH-28 consisted of lithic chipping debris and a possible pit feature, representing a small, temporary campsite; CH-31 consisted of a small sherd of pottery, a quartz scraper, and a chert Rossville projectile point, suggesting Early Woodland occupation; and CH-39 included chipping debris, a projectile point, and a drill fragment, as well as six Native American features, indicating a likely seasonal campsite. At LU-45, chipping debris, flakes, one core, one ground stone tool, and three pieces of Native American pottery were recovered, along with two Native American features consistent with a burn episode. (See also reports #25-3040, 25-3053, 25-3054, and 25-3056.)

25-3058 Doucette, Dianna L., and A. Peter Mair, II
2009 Intensive (Locational) Archaeological Survey, A.D. Makepeace Preserve River Run: Phase III Project Area, Plymouth, Massachusetts. 72 pages.

An archaeological survey of the 176.7 acre parcel included archival research, walkover survey, and subsurface testing. Archival research indicated that the project area had a strong potential to contain pre-contact Native American archaeological sites, given the reported presence of four sites adjacent to and within two miles of the project area. In total, 497, 50 x 50 cm shovel test pits were excavated within 17, 30 x 30 m blocks and along 18 judgmentally placed transects; three judgmental test pits were additionally placed around a bottle dump identified in Parcel 10. Recovered post-contact material came from the bottle dump and consists of a ceramic button, earthenware and stoneware ceramic sherds, an unidentified piece of brass, a screw, a horseshoe, 12 wire and machine-cut nails, a staple, an unidentified iron fragment, 11 pieces of glass, and five bottles.

25-3059 Donta, Christopher L., and F. Timothy Barker
2009 Archaeological Intensive (Locational) Survey for the Community Boathouse Project, Northampton, Massachusetts. 72 pages.

Background research and subsurface testing were conducted in a three acre area adjacent to the Connecticut River and Damon Road. No recorded sites exist in the project area, although Native American site 19-HS-115 is located across the street, and a house was noted to have been standing in the property as recently as the last few years. Substantial areas of disturbance were evident, in the form of former road layouts, paved parking areas, underground utilities, bulldozed areas, and standing structures. The subsurface testing, consisting of 22, 50 x 50 cm shovel test pits excavated at 7.5 m intervals, recovered three flakes of quartz, quartzite, and chert, two of which were in disturbed soils. Historical period artifacts were recovered from fill contexts and included of a mix of domestic and architectural items of the 19th and 20th centuries.

25-3060 Donta, Christopher L., and F. Timothy Barker
2009 Archaeological Intensive (Locational) Survey for the Ponkapoag Camp Improvements Project, Randolph, Massachusetts. 64 pages.

Archaeological surveys were conducted for proposed improvements to an existing one acre camping facility adjacent to Ponkapoag Pond. Background research identified several Native American sites within the general vicinity, including one site, 19-NF-519, which includes the project area, based on information provided by a local collector. Twenty-three 50 x 50 cm shovel test pits were excavated at 7.5 m intervals to test impact areas for a pavilion structure, four tent platforms, and general use of the surrounding area. One Native American artifact was recovered, a quartz triangular point of uncertain age, from disturbed soils, where a razed building once stood.

25-3061 Holmes, Richard D., Carolyn D. Hertz, and Mitchell T. Mulholland

2009 Archaeological Site Locational Survey for the Piccadilly Mill Open Space Community, Westborough, Massachusetts. 84 pages.

An archaeological survey was conducted for the project area overlooking the Cedar Swamp Archaeological District. Within the project area is site 19-WR-499, a Native American site associated with Cedar Swamp, but no additional Native American material was found during this survey. In total, 155, 40 x 40 cm shovel test pits were excavated at 8 m intervals across 108 acres. One of the sewer easements passes through the 19th- to 20th-century Dea Tidd–William Morse farmstead that is now in ruins. A possible stone and wood cesspool bordering the project area was observed in Survey Unit 2; this structure and the adjacent remains in Open Space 5 should be avoided. A stone retaining wall and two potential building sites were observed in Survey Unit 3; the wall should be avoided, but upon further inspection it does not appear that structures existed at either potential building site. Quartz fragments were recovered in the Grindstone Court area and a site form was completed for this findspot.

25-3062 Herbster, Holly
2010 Intensive (Locational) Archaeological Survey, Apponegansett Meeting House Improvements Project, Dartmouth, Massachusetts. 70 pages.

An archaeological survey was conducted ahead of proposed improvements to the property, including the construction of a composting toilet and a new gatepost along the existing cemetery fence. The survey included archival research, walkover survey, and subsurface testing, which consisted of five 50 x 50 cm shovel test pits and one 140 x 80 cm excavation unit. No evidence of pre-contact period land use or activity was recorded. The recovered artifact assemblage consisted of low densities of structural materials collected adjacent to the meetinghouse in the topsoil and within modern disturbance fills.

25-3063 Herbster, Holly
2010 Addendum to Technical Report, Intensive (Locational) Archaeological Survey, Allen's Mill Fence Installation, Dartmouth, Massachusetts. 9 pages.

The archaeological survey conducted included an archaeological sensitivity assessment, subsurface testing and field mapping, and laboratory processing and analysis. Eighteen 50 x 50 cm shovel test pits were excavated at each fence post location, spaced at approximately 8 m intervals across a three-quarter acre area. Sixty-eight pieces of cultural material were recovered from 15 of the 18 test pits, consisting primarily of low densities of 19th- and 20th-century structural and domestic materials. No potentially significant archaeological deposits were identified. (See also report #25-3019.)

25-3064 Hoffman, Curtiss
2009 Middleborough Little League Site (19-PL-520), Archaeological Intensive Survey Interim Report and Permit Renewal Request. 101 pages.

Previous excavations at the site have concentrated on the third, highest terrace above the Nemasket River. This report documents survey work done on the first terrace, closest to the river, during the summer of 2009. Excavation of 35, 50 x 50 cm shovel test pits at 10 m intervals revealed 34 features, 716 lithic artifacts, 318 pieces of debitage, 482 historical period artifacts, 734 pieces of charcoal, two pieces of turtle bone, one piece of partially charred wood, and 2,404 pieces of fire-cracked rock. In general, the types of activities identified on the third terrace were comparable with those identified on the first, interpreted as the collection of materials for use and redistribution in ceremonies – red hematite, black graphite, and yellow limonite paintstones, polished pebbles mostly of quartz, quartz crystals, and pendants. Evidence indicates a higher emphasis on the processing of vegetal foods on the first terrace, and a higher emphasis on the processing of hides and lithic reduction on the third. Preliminary analysis of the cultural material suggests site occupation from the Middle Archaic to the Early Woodland periods, and additional excavations are pro-

posed for the summer of 2010. (See also reports #25-1829, 25-1907, 25-2009, 25-2521, 25-2780, and 25-3138.)

25-3065 Robinson, David S., and Justin M. Bailey
2008 Remote Sensing Archaeological Survey, Great Harbor, Woods Hole, Massachusetts. 149 pages.

An archaeological survey of the proposed improvement areas in the navigation channel and at the National Oceanic and Atmospheric Administration's docking facilities in Falmouth was conducted to identify and document any remote sensing anomalies with potential to be significant archaeological deposits (i.e., shipwrecks), or intact paleosols with archaeological sensitivity containing pre-contact archaeological deposits. The survey consisted of archival research and field investigation using differential GPS, high-frequency side-scan sonar, a cesium-vapor marine magnetometer, CHIRP and "boomer" sub-bottom profilers, and a single beam fathometer to acquire data within the proposed "Nearshore" and "Offshore" portions of the project area along a series of parallel primary survey track lines spaced 50 feet apart. No anomalies, buried geological features, archaeological deposits, or potential paleosols were identified in the 65 acre survey.

25-3066 Binzen, Timothy L., Kathryn Curran, and F. Timothy Barker
2010 Archaeological Reconnaissance and Intensive (Locational) Survey for the Echo Village/Hatfield Common Development, Hatfield, Massachusetts. 82 pages.

An archaeological survey was conducted for a proposed condominium development within the project area containing the previously documented Native American site 19-HS-270. Local informants also described unmarked Native American burials that were uncovered in close proximity to the project area in the early 20th century. One hundred and fifty-one 50 x 50 cm shovel test pits were excavated at 15 m intervals in a 9.35 acre agricultural field. Forty-five Native American artifacts were recovered from 16 test pits, concentrated in two sections of the project area, now called the southern locus and central locus of 19-HS-270. Five Native American cultural features were also identified; three small hearths and two pit features. In total, 794 Euro-American artifacts were collected from the plow zone, but no cultural features were identified. To protect what remains of Native American site 19-HS-270, it is recommended that the southern locus be avoided during construction, and a 50 foot buffer zone be established.

25-3067 Binzen, Timothy L., Antonio Medina, Marni Blake Walter, and Kathryn Curran
2010 Archaeological Reconnaissance and Intensive (Locational) Survey for the Tri-Town Water Treatment Plant Project, Braintree, Massachusetts. 68 pages.

An archaeological survey was conducted to assess the sensitivity of the nine acre construction site. Seventy-five 50 x 50 cm shovel test pits were excavated at 7.5 m intervals in locations exhibiting high sensitivity. Native American artifacts were recovered in four loci, designated collectively as the King Hill Road Native American Site. Twenty-eight gray rhyolite flakes, seven quartz flakes, a rhyolite biface/knife, and a rhyolite projectile point distal fragment were collected from 20 test pits. Both of the rhyolite tools as well as 14 flakes were recovered from undisturbed subsoil. Historical European-American use of the project area is evidenced in two former granite quarries and (possibly) related remnant stone walls; architectural features suggest that the project area was once the site of a granite quarrying complex.

25-3068 Binzen, Timothy L., and Mitchell T. Mulholland
2010 Archaeological Intensive (Locational) Survey for a Conduit Trench and Historical Pathway, Emily Dickinson Museum Property, Amherst, Massachusetts. 68 pages.

The archaeological survey conducted consisted of the excavation of a narrow trench to contain a conduit linking the two main structures on the museum property (the Dickinson Homestead and the Evergreens). The survey focused on determining the potential impacts of the proposed conduit

on potential archaeological features, and attempted to locate a historical pathway. Initially, 11, 50 x 50 cm shovel test pits were excavated at 7.5 m intervals, along with four 0.50 x 2 m exploratory trenches. A second round of testing consisted of 12, 50 x 50 cm shovel test pits. A low volume of artifacts recovered consisted of fragments of brick, glass, nails, redware and whiteware. If the proposed southern alternative fiber-optic trench route were chosen for construction, no significant archaeological deposits or features would be impacted, and a known domestic midden area and the historical pathway would be avoided. (See also report #25-2436.)

25-3069 Dudek, Martin G.
2010 Archeological Site Examination for the Populatic Pond Site (19-NF-183), Norfolk Landing Subdivision, Norfolk County, Norfolk, Massachusetts. 121 pages.

The archaeological survey investigated 10 loci/site areas identified as containing pre-contact Native American artifacts by a previous intensive survey. Ninety-eight 50 x 50 cm shovel test pits at 5 m intervals and three 1 x 1 m excavation units were completed across 15 acres. In total, 1,258 pre-contact Native American artifacts were recovered, including Stark projectile points and/or Stark argillite preforms, Attleboro Red Felsite and quartzite, and quartz Small Stemmed points. Other tools included a rhyolite lanceolate, a quartz triangular point, biface fragments, preforms, edge tools, and utilized flakes. The Populatic Pond Site has multiple components and may have been occupied during different seasons throughout the Middle and Late Archaic periods. Portions of the site have been looted and disturbed; however, more intact areas are extant that contain calcined bone and features. Charcoal from one small pit feature was dated to 4,280 ± 80 B.P (GX-32434). (See also reports #25-2631 and 25-2997.)

25-3070 Smith, Leith, Christa M. Beranek, and John Steinberg
2010 Archaeological Site Examination of the Field East of the Grapery/Greenhouse, Drive Circle, Straight Walk, and South Lawn at Gore Place, Waltham, Massachusetts. 144 pages.

A landscape restoration plan for the 45 acre historical estate in Waltham and Watertown recommended archaeological investigations to identify the location, character, and integrity of Gore-period features that could potentially be included in restoration efforts. Investigations began in 2004, focusing on landscape elements including the carriage drive, carriage house foundation, greenhouse, vegetable and flower gardens, and the site of the grapery/fruit wall. The 2008 investigations focused on the new site of the carriage house and on lesser-known elements of the estate that functioned in the daily running of Gore's farm. Transects of staggered 50 x 50 cm shovel test pits at 5, 10, and 20 m intervals, along with 1 x 1 m excavation units and trenches, were employed. Investigation of the drive circle north of the mansion showed the centrally-located well to have a wide builder's trench of large cobblestones covered at the ground surface by a hard-packed layer of silty sand with gravel and clay, potentially to prevent contaminants in the immediate vicinity from entering the water. Identified by subsurface testing and ground penetrating radar was a well access walk that joined a straight-edged carriage drive south of the well. Also revealed was a possible square fieldstone feature that surrounds the well. The bedding of Gore's historically documented straight walk east of the library was also found. Examination of the south lawn revealed much of the area to have been plowed in the past and to have been subjected to fertilizing during the Gore period. A number of Gore-period and non Gore-period features were identified, including two dry wells, drainage pipes, post holes, buried fieldstones of unknown association, a deposit of reddened soil and stones of unknown function, golfing features associated with the use of the property during the 1920s, and a possible cellar or cesspool filled with Gore-period masonry from late 19th-century cellar and chimney alterations. Investigation of a known cistern revealed similar surface treatment to the drive circle well. An EM-31 conductivity meter survey identified a zone of the south lawn that appears to be the site of numerous anomalies, possibly related to the house's heating, cooling, or water systems. Recommendations specific to each area consist of examining the square feature surrounding the well in the drive circle and determining the nature of the drive bedding that adjoins the well access walk, exploring the east end of the straight walk to determine the nature of the feature at that location, further investigating the south lawn cellar or cesspool fea-

ture to determine its function and age, and testing several other south lawn features to determine age and function. (See also reports #25-2717, 25-2823, and 25-2845.)

25-3071 Dudek, Martin G.
2010 Archeological Intensive (Locational) Survey for the Telecommunications Antenna Monopole Facility, East Bridgewater, Massachusetts. 89 pages.

Archaeological testing consisted of a block of five shovel test pits and 10 judgmental test pits, all 50 x 50 cm, at the proposed location of the monopole facility, access drive, and utility easement. A low to moderate density of modern or historical materials was encountered in the plow zone, fill layers, and the upper B horizon. Available historical and oral information indicates that the project area was once used as a piggery for the Town Farm and for cornfields and composting after 1932. Although no evidence for historical structures was identified, oral history indicates there was a chicken coop and that horses were buried in the field circa 1930s-1940s.

25-3072 Parno, Travis
2010 Report of Archaeological Testing at the Fairbanks House Property, Dedham, Massachusetts. 127 pages.

The central goal of the archaeological assessment was to investigate an area of land for which grading and paving was planned as part of a driveway expansion. A secondary goal of the project was to explore other areas of the property that had been identified as containing cultural material by both geophysical and documentary surveys. The excavation targeted two main areas: the strip of land directly adjacent to the western edge of the existing driveway, and an area to the north of the house which geophysical survey identified as potentially significant. Seventeen excavation units ranging in size from 1 x 1 m to 1.5 x 1 m were placed across the property. The artifacts recovered from the fieldwork date predominantly from the early 19th century to the mid-20th century. Test excavations revealed two major structural features. The first was a subterranean feature at the northern end of the driveway, a portion of which is covered by a gas line and the existing driveway. The grading and paving necessary to expand the driveway would not negatively impact the feature; in fact, the asphalt would seal the feature, protecting it from disturbance. No other significant cultural material was found in the impacted area. Efforts to ground-truth the 2003 geophysical survey proved successful, as the second major feature, a cobble-floored outbuilding, was uncovered approximately 8 m north of the house. A number of other, smaller features were discovered at various locations around the property, including a shallow, circular posthole, two lenses of ash (probably evidence of the scattering of furnace refuse), and two clay-filled features of uncertain function. The results from the 2009 excavation season provide evidence of land use, outbuilding construction, and consumption practices at the Fairbanks House in the 19th and 20th centuries. (See also reports #25-850 and 25-1139.)

25-3073 Lynch, Kerry J., and Timothy L. Binzen
2010 Archaeological Reconnaissance and Intensive (Locational) Survey for the Dracut Sewer Expansion Program (Contract 28/Broadway II Pumping Station), Dracut, Massachusetts. 80 pages.

Archaeological surveys were conducted for the proposed location of a pumping station to evaluate the potential to contain archaeological resources. Six 50 x 50 cm shovel test pits were excavated at 7.5 m intervals. No artifacts or features were recovered.

25-3074 Donta, Christopher L., and Antonio Medina
2010 Archaeological Intensive (Locational) Survey for the Regatta Point, Quinsigamond State Park Improvements Project, Worcester, Massachusetts. 69 pages.

Archaeological surveys were conducted in the project area that is considered to have potential to contain Native American sites. The survey identified heavy disturbance due to prior construction, underground utilities, and paving. Subsurface testing consisted of 47, 50 x 50 cm shovel test pits placed in areas of possible undisturbed ground at 7.5 m intervals across the 25 acre project area.

One shovel test pit produced Native American artifacts, and a nearby surface find of debitage was also noted; together these were designated as Quinsigamond Island Native American Site. A scatter of historical period materials was also noted.

25-3075 Doucette, Dianna L.
2010 Intensive (Locational) Archaeological Survey, Culvert Replacement Project and Archaeological Site Examination, Lee Baldwin Trail Site, Brewster, Massachusetts. 92 pages.

Archaeological investigations were completed for a project involving the replacement of a failing culvert at Route 6A, the improvement of an existing boardwalk, and the construction of a new section of boardwalk and observation platform on an uplands parcel adjacent to the wetlands and the Cape Cod Museum of Natural History. Eight 50 x 50 cm shovel test pits were excavated along one transect at 5 and 8 m intervals, yielding low- to moderate-density scatters of chipping debris, stone tools, and burned bone. These finds were interpreted as a short-term campsite where episodes of lithic reduction and/or maintenance were taking place along with specialized activities for processing specific resources. Additional testing of this potential site included 45, 50 x 50 cm shovel test pits and four 1 x 1 m excavation units. Post-contact cultural material, consisting of one piece of bottle glass and two fragments of rusted iron, was recovered from the plow zone in one of the test pits. Twenty of the 45 test pits and all four of the 1 x 1 m units yielded pre-contact cultural material, consisting of 90 pieces of chipping debris, five projectile points (one rhyolite Snappit point, one quartz Small Stemmed point fragment, one quartz Squibnocket Triangle, and two quartz projectile point tips), two rhyolite bifaces, one quartz biface, three quartz cores, one rhyolite scraper, one perforated antler bone tool or pendant, one piece of red ocher, and one piece of calcined (burned) bone. In addition, two cultural features were identified in intact soils, one of which yielded an uncalibrated radiocarbon date of 4,430 ± 40 B.P., falling within the late Middle Archaic and early Late Archaic period range. (See also report #25-3076.)

25-3076 Doucette, Dianna L.
2010 Technical Report Addendum, Additional Site Examination Testing at the Lee Baldwin Trail Site, Brewster, Massachusetts. 17 pages.

Eleven 50 x 50 cm judgmental test pits and one 1 x 1 m excavation unit were placed in the exact locations where the footings for the new viewing platform will be placed. Three of the test pits as well as the 1 x 1 m unit yielded pre-contact cultural material, including eight pieces of chipping debris, three projectile points (one quartz Squibnocket triangle and two quartz projectile point tips), and one rhyolite scraper. (See also report #25-3075.)

25-3077 Doucette, Dianna L., and Nichole Gillis
2010 Intensive (Locational) Archaeological Survey, MassHighway Assignment 10, Cliff Road Multiuse Path Extension Project Area, Nantucket, Massachusetts. 101 pages.

An archaeological survey was conducted using a combination of archival research, walkover inspection, and subsurface testing. Subsurface testing consisting of 55, 50 x 50 cm shovel test pits, excavated along six linear transects, as one judgmental test pit, and within three arrays, documented disturbed soil horizons over the majority of the project area. A range of post-contact cultural material was identified from fill contexts including mixed recent (e.g., plastic, bottle glass, asphalt, tinfoil, and Styrofoam) and historical (e.g., brick, shell, window and bottle glass, coal, ceramics, metal fragments, nails, a glass insulator, pipe stems, a gun flint, and bone) materials. The fill deposits containing a mixture of recent and historical artifacts are likely related to recent road construction, utility installations, and landscaping events.

25-3078 Johnson, Katharine M., and Christa M. Beranek
2010 Documentary Research and Archaeological Investigations at the Waite-Kirby-Potter Site, Westport, Massachusetts. 130 pages.

Research on the Waite-Kirby-Potter house included mapping historical resources visible on the

surface and excavating a total of 25 shovel test pits (50 x 50 cm) and excavation units (1 x 1 m) near the house foundations. The visible historical features include elements associated with the former “stone ender” house type (the standing stone end and chimney, an adjacent brick chimney, and a stone-lined cellar hole), stone walls, a 19th-century barn foundation, a family cemetery, and the standing Restcome Potter house. The excavations uncovered a clean gravel work yard in front of the stone end house and sheet trash scatters with artifacts from the mid-18th to early 20th centuries behind and west of the house, as well as the remains of post holes for an agricultural outbuilding or fence at the edge of the near-by agricultural field. A primary trash deposit from a space within the chimney complex was probably deposited circa 1860 and contained numerous ceramic vessels and glass bottles. Several of the ceramic vessels date to the previous century and had been curated for some time before being discarded. Test pits around the foundations of the western addition to the stone ender uncovered stone foundations and sill supports intact immediately beneath the modern ground surface.

25-3079 Cherau, Suzanne, Jennifer Banister, and John Daly
2009 Reconnaissance and Intensive (Locational) Historic and Archaeological Surveys, Town Brook Restoration Project, Plymco and Off-Billington Street Dams, Plymouth, Massachusetts. 190 pages.

Historical and archaeological surveys were completed for the proposed project, consisting of extensive archival research using town histories and records, historical maps, and land evidence and probate records to assist in the location, identification, and evaluation of significant historic and archaeological resources. Field survey consisted of a walkover with close ground surface inspection, followed by existing conditions photography, total station mapping, and subsurface testing (50 x 50 cm shovel test pits at 10 m intervals along judgmental transects; three machine-assisted trenches). The combined surveys determined that direct project impact areas at the Plymco Dam and Mill Site and the Off-Billington Dam and Mill Site encompass a portion of the Town Brook National Register district. Archaeological resources identified within the Off-Billington Dam and Mill Site consist of cultural material and structural remains, including a circa 1901 annealing oven brick floor and firebox, associated with the Plymouth Mills period of site occupation (circa 1844–1926). The archaeological testing along the east side of the brook in this part of the project area also identified a segment of wood pipe that appears to extend both north and south from the survey trench. The pipe is interpreted as the remains of the documented 1797 wooden aqueduct for the Plymouth Water Supply System Aqueduct (PLY-HA-27).

25-3080 Mair, A. Peter, II
2010 Reconnaissance Archaeological Survey, Route 18 Reconstruction, New Bedford, Massachusetts. 112 pages.

An archaeological survey including archival research and a walkover inspection was to identify undisturbed areas of potentially significant archaeological resources. The majority of disturbance associated with the proposed project is within previously disturbed soils and will have no impact on potential resources. The potential for encountering significant archaeological deposits between 8 and 18 feet below existing surface is unknown.

25-3081 Waller, Joseph N., Jr.
2010 Reconnaissance Archaeological Survey, Holyoke Appleton Street Area (Drainage Area 13), Sewer Separation Project, Holyoke, Massachusetts. 87 pages.

An archaeological survey was completed for proposed sewer and drainage lines located beneath existing streets or alleyways with a long history of prior use, in order to evaluate the potential for the project area to contain unmarked burial sites. A Native American burial ground (19-HD-55) was discovered in the 19th century in the vicinity of the project area, reportedly containing 20 skeletons along with Native American artifacts such as stone and copper projectile points, stone pipes and tubes, copper beads, and shell beads. The proposed project will be limited to areas of urbanized development, where subterranean utilities and the construction of nearby mills, apart-

ments, businesses, and rail lines have effectively remodeled the original landscape, impacting the subsurface integrity of Drainage Area 13.

25-3082 Harper, Mary, Timothy Ives, Bruce Clouette, and Ross Harper
2010 Intensive (Locational) Archaeological Survey of the Replacement of Bridge S-22-005 Routes 202/10 over Johnson Brook, Southwick, MA. 67 pages.

An archaeological survey was conducted of a 3,080 ft^2 proposed wetland replication area. Six 50 x 50 cm shovel test pits were excavated at 10 m intervals. Two of the pits contained no artifacts; the remaining four pits contained only small amounts of modern material. A kaolin pipe stem fragment was recovered on the ground surface in a gravel drive west of the proposed area; it may be associated with field scatter or refuse disposal from the circa 1785 Robert Forward House across the street.

25-3083 Dudek, Martin G., and Barbara Donohue
2010 Archeological Intensive (Locational) Survey for the Wachusett Mountain State Reservation Parkway Rehabilitation Project, Princeton and Westminster, Massachusetts. 75 pages.

The archaeological testing for the proposed roadway improvements consisted of six auger tests and seven 50 x 50 cm shovel test pits. No archaeological sites were identified. Fill was encountered at all test locations, with natural strata identified at several historical trail crossings below fill. Low densities of historical or modern materials were recovered from fill.

25-3084 Waller, Joseph N., Jr., and A. Peter Mair, II
2010 Intensive (Locational) Archaeological Survey and Site Examination, Route 79 Relocation Project, Lakeville, Massachusetts. 200 pages.

Archaeological surveys within the project area included subsurface testing consisting of a total of 252, 50 x 50 cm shovel test pits and 13, 1 x 1 m excavation units. Testing documented seven discrete loci of pre-contact Native American activity designated as the Quelle 1, Quelle 2, Leonard 1, Leonard 2, Ridge 1, and Ridge 2 sites, and Route 79 Findspot. The Leonard 2 Site and the Route 79 Findspot were each characterized as a tight cluster of isolated or low-density quartz or rhyolite stone flakes. The Quelle 1 Site produced a concentration of chert, rhyolite, and quartzite chipping debris underlying 19th- to 20th-century fill deposits. The Quelle 2 Site is a Native American activity area containing a low-density deposit of chipping debris. The Ridge 1 Site is a moderately small, temporary encampment dating to the Early Woodland period. Cultural materials recovered from the site include the base to a discarded projectile point and an argillite knife blade in association with a dense deposit of chert and rhyolite chipping debris. The Ridge 1 Site activities appear to have been focused on a central campfire. The Ridge 2 Site appears to have been the result of multiple, overlapping occupations focused along the margins of a wetland. The Leonard 1 Site dates to the Late/Transitional Archaic period, with cultural material including primarily rhyolite debitage recovered in association with a food processing station/cookfire.

25-3085 Ritchie, Duncan
2009 Intensive (Locational) Archaeological Survey, Wampanoag Estates, Bridgewater, Massachusetts. 91 pages.

An archaeological survey of the project area included archival research, walkover inspection, and subsurface testing. One Native American archaeological resource, the Cajewaters Site (19-PL-370), was reported to be in or adjacent to the project area. During a walkover inspection, two pieces of quartz chipping debris and a bifacial tool blade fragment of rhyolite were found on the surface. Forty-five 50 x 50 cm shovel test pits were excavated at 10 m intervals along nine judgmental transects and as five judgmental test pits. Fifty-six pieces of pre-contact Native American cultural material were found during the intensive survey, primarily chipping debris of quartz, rhyolite, jasper, hornfels, and chert. A projectile point tip fragment made of white quartz may be part of a Small Stemmed point. A portion of a feature exposed in one test pit may be the remains

of a small pre-contact Native American fire pit. Post-contact period cultural materials (ceramic sherds, brick, nails, window glass) found during subsurface testing represent domestic refuse deposited in areas that were likely open fields or plowed in the mid- to late 19th century to early modern period. Three historical period sites discovered during the survey, including two post-contact period dam features (Wampanoag Estates Dam 1 and 2 sites) and a small boulder quarry (Wampanoag Estates Boulder Quarry Site), are not considered to be potentially significant cultural resources.

25-3086 Medina, Antonio, and Timothy L. Binzen
2009 Archaeological Reconnaissance and Intensive (Locational) Survey for Highway Reconstruction and Related Undertakings, Route 116, Amherst, Massachusetts. 74 pages.

Archaeological testing was completed for proposed work areas associated with improvements along both sides of Route 116. Thirteen survey units were investigated, and 330, 50 x 50 cm shovel test pits were excavated at 7.5 m intervals. The Route 116 Native American Findspot, consisting of an isolated chert flake, was recorded. A cellar hole representing a late 19th-century house was identified but is not considered a significant resource.

25-3087 Mair, A. Peter, II, and Nichole Gillis
2009 Intensive (Locational) Archaeological Survey, Alewife Greenway Corridor Improvement Project, Arlington, Cambridge, and Somerville, Massachusetts. 180 pages.

An archaeological survey was completed for the proposed project area where two Native American sites, 19-MD-262 and 19-MD-264, have been previously recorded. The potential for recovery of intact significant archaeological resources was expected to be low because of extensive prior disturbance, with the possible exception of two areas at the northern end of the project area. Twenty-four 50 x 50 cm shovel test pits were excavated within one 30 x 30 m sampling block, along two 10 m transects, and as four judgmental test pits. Eight soil cores were also taken, revealing multiple sequences of disturbed fill and wetland soils to depths of 100 cm below surface. Pre-contact, contact, and modern cultural material recovered from fill contexts lacked integrity.

25-3088 Mair, A. Peter, II
2010 Addendum to Technical Report, I-95/I-93/University Avenue/Dedham Street Interchange, Canton, Dedham, Norwood, and Westwood, Massachusetts. 19 pages.

A walkover survey and a drive by were conducted to evaluate existing conditions and the potential for archaeological resources. All areas were assessed as disturbed, having little or no potential for intact archaeological sites with the exception of one detention basin location. Subsurface testing, consisting of 17, 50 x 50 cm shovel test pits excavated within three linear transects, produced a low-density scatter of post-contact and modern cultural material from A horizon soils and fill contexts. Three pieces of pre-contact chipping debris, named Dedham Street Findspot #1, were also recovered from A horizon soils, in association with post-contact material.

25-3089 Harper, Mary, Timothy Ives, Bruce Clouette, and Ross Harper
2010 Intensive (Locational) Archaeological Survey of the West Street (Route 183) Roadway Reclamation Project, Lenox, Massachusetts. 60 pages.

An archaeological survey was conducted of a 3,750 ft^2 proposed wetland-replication area. Six 50 x 50 cm shovel test pits were excavated at 10 m intervals; four of the six pits had stratigraphically intact soils. One pit close to the road edge was disturbed, and the sixth pit was abandoned due to the appearance of water just below the duff layer. The only two artifacts found were a piece of asphalt and a fragment of modern bottle glass; both were discarded as modern trash.

25-3090 Banister, Jennifer, John Daly, Erin Timms, and Suzanne Cherau
2010 Intensive (Locational) Archaeological Survey and Site Examination, Wilson Mill Site (BED-HA-1), Wilson Mill Dam Rehabilitation Project, Bedford, Massachusetts. 111 pages.

Archaeological surveys were conducted for the dam rehabilitation project area, which includes the previously recorded Wilson Mill Site. The archaeological investigations consisted of archival research and field investigations, including a walkover survey and subsurface testing. The walkover survey was used to obtain information about the physical layout and configuration of visible structural remains of the remnant mill building(s) and waterpower infrastructure. Subsurface testing consisted of the excavation of 14, 50 x 50 cm shovel test pits and six 1 x 1 m excavation units. The investigations identified the presence of masonry structural remains that are commensurate with the documentary evidence for the 19th- and early 20th-century mill operations at the site. There was no archaeological evidence of the documented 17th- and 18th-century mill occupation in the testable portion of the site. The recovered cultural material assemblage dates primarily from the 19th and 20th centuries.

25-3091 Herbster, Holly, and Kristen Jeremiah
2010 Intensive (Locational) Archaeological Survey, Plimoth Plantation Visitor Walkway, Plymouth, Massachusetts. 72 pages.

An archaeological survey was conducted involving the construction of an approximately 650 linear foot walkway between the Wampanoag Homesite and Carriage House Craft Center. A portion of the previously recorded Plimoth Plantation Spring Site (19-PL-522) was identified within the Homesite, approximately 20 meters from the current project area. Sixteen 50 x 50 cm shovel test pits were excavated within the project corridor, producing low densities of chipping debris, shell, and Native American ceramics primarily within disturbed A and slopewash soils. Within judgmental test pit 1, a small, possible pit feature was located, containing fourteen pieces of chipping debris, suggesting a potentially significant archaeological deposit.

25-3092 Waller, Joseph N., Jr.
2010 Intensive (Locational) Archaeological Survey, Pentucket Bank Branch Project Area, Haverhill, Massachusetts. 110 pages.

An archaeological survey was completed for the project area, located within the historical boundaries of the Haverhill Asylum and Town Farm (HVR-HA-1) and situated adjacent to the existing Glynn Memorial Nursing Home (HVR.1028) historical property. Twenty-five 50 x 50 cm shovel test pits were excavated at 10 m intervals, resulting in the recovery of 19th- and 20th-century cultural materials including brick fragments, nails, window glass and container glass shards, ceramic sherds, coal fragments, animal bones, and smoking pipe bowl and stem fragments from redeposited fill and/or plow zone soil contexts. Artifacts contained within the plow zone represent incidental discards by asylum inmates that were subsequently incorporated within the farm fields or backyards of the almshouse.

25-3093 Vitelli, Giovanna
2009 Equilibrium, Well-Being, and Exchange: The Basis of Algonquian Mortuary Practice in Seventeenth Century Southern New England. 336 pages.

This dissertation is a comprehensive critique and reassessment of the mortuary archaeology from Algonquian 17th-century southern New England, as well as a critical reassessment of related primary ethnographic sources. An innovative methodology is created in order to adopt ways of entering into past Native existence and philosophies that can accord with the way contemporary Native Americans are accessing their own past, and can contribute to a reintegration of mortuary studies into current archaeological research on past belief and identity. The thesis discusses the connections between the collective knowledge archive required for the maintenance and regeneration of past religious practice, and the knowledge sources used in the construction and maintenance of identity. Traditional philosophies are identified through the prevailing metaphors found in ethnography and anthropological analogy, and are equated with religious belief as expressed through everyday life and death practices. The overarching belief that shapes collective perceptions of the world is recognized through metaphorical constructs as the desire for universal equilibrium and its

correlate, well-being, which is managed through practices of redistribution and exchange. An increasing interest in the regeneration of well-being in the 17th century is connected to the negative impact of colonialism on Native lifeways; practices are increasingly elaborated and channeled towards potential sources of "wisdom" and well-being in the afterworld. Intensified connections are created to ancestors as counterparties in a multi-generational exchange cycle through the selection of valued community members to represent the group, individuals whose bodily integrity is as carefully curated in death as in life, as they seek to engender a cycle of obligations that will produce a return of wisdom and well-being for the future health of the community. Throughout the 17th century, traditional strategies to engender well-being are continually reassessed and reworked, with Protestant practices influencing not only Indians but also their close kin in independent settlements. Religious syncretism is examined across the cultural spectrum and into the 18th century, and mixed mortuary practices that highlight the increasing divisions between Indian and English performance of faith are identified through extensive reinterpretations of documentary sources and material culture. Archaeological evidence for mortuary practices is based on burial sites throughout southern New England; those in Massachusetts are located in the Boston, Middleboro, New Bedford, Newton, Plymouth, Swansea, Wareham, Wellfleet, and Winthrop.

25-3094 Harper, Mary, Timothy Ives, Bruce Clouette, and Ross Harper
2010 Intensive (Locational) Archaeological Survey, East Street and Housatonic Street Multi-Use Path Project, Lenox, Massachusetts. 76 pages.

Forty-five 50 x 50 cm shovel test pits were excavated in the proposed path area at 7.5 and 10 m intervals. Most of the pits encountered relatively intact soil profiles, but pockets of disturbed and filled areas were observed, along with small amounts of modern trash. Two whiteware sherds and a curved glass fragment evidenced a small, late 19th- to 20th-century locus, but these artifacts were found in a disturbed context. A single chert flake was found. An array of four test pits around this findspot produced no additional cultural material, despite the presence of intact soil sequences.

25-3095 Chartier, Craig, and Lauren Cook
2010 Final Report for the Intensive Survey Testing at 176 Sandwich Street in Plymouth, Massachusetts. 67 pages.

Archaeological testing was conducted for condominium construction on a 4.3 acre parcel which lies within the Wellingsly Historic District (PLY.M). Forty-seven 50 x 50 cm shovel test pits were excavated and 781 artifacts (771 historical and 10 prehistoric) were recovered. Historical period artifacts include ceramics, glass, machine-cut nails, charcoal, faunal remains, one piece of English flint, and a latten spoon handle. This historical cultural material associated with the George Fuller Homesite was recovered from fill deposits and is not considered potentially significant. Prehistoric artifacts were limited to one fragment of a Levanna type projectile point, eight rhyolite flakes and flake fragments, and one piece of quartz shatter, all from fill and all associated with machine-cut nails. The prehistoric site, designated the Holmes Point Site, was identified as a short-term, limited activity site.

25-3096 Mair, A. Peter, II
2010 Intensive (Locational) Archaeological Survey, Charlotte Furnace Solar Project, Wareham, Massachusetts. 90 pages.

An archaeological survey including archival research and subsurface testing was conducted within the 50 acre project area. Subsurface testing, consisting of 120, 50 x 50 cm shovel test pits, documented a fairly consistent soil profile across the entire project area. Two pieces of pre-contact chipping debris were recovered from two test pits from B horizon soils. Subsequent testing did not produce any additional cultural material.

25-3097 Donta, Christopher L., and F. Timothy Barker
2007 Archaeological Site Locational Survey for the Ashfield Historical Society Museum, Ash-

field, Massachusetts. 42 pages.

An archaeological survey was conducted ahead of proposed renovations to the museum building, including installing a foundation under a privy at the rear of the building. Excavations were conducted around all sides of the building and in the privy, totaling 15 judgmental test pits, one 1 x 1 m excavation unit, and one 2 x 0.5 m trench. No prehistoric artifacts or features were found. European-American diagnostic artifacts are dated to the period from 1850 to 1950; low to moderate amounts of architectural related artifacts were found scattered around the front and sides of the house, and higher concentrations of domestic artifacts were identified in excavations at a dooryard to the rear of the east side of the house and at the rear of the building. Excavation beneath the floor of a two-story privy addition to the rear of the structure yielded late 19th- and 20th-century artifacts related to that portion of the house.

25-3098 Mair, A. Peter, II
2010 Intensive (Locational) Archaeological Survey, Forestdale Village, Sandwich, Massachusetts. 75 pages.

One hundred and seventy-two 50 x 50 cm shovel test pits were excavated within the archaeologically sensitive portions of approximately 43 acres. The subsurface investigations resulted in the recovery of a low density of historical period material indicative of field trash that was randomly deposited.

25-3099 Duranleau, Deena L., and Martin G. Dudek
2010 Archeological Intensive (Locational) Survey for the Telecommunications Antenna Monopole Facility, Canton, Massachusetts. 90 pages.

Archaeological testing consisted of a block of five shovel test pits and six judgmental test pits (50 x 50 cm) at the proposed location of the monopole facility, access drive, and utility easement. Modern refuse was recovered from a series of fill layers in the test pits, indicating previous soil removal, truncation of substrata, and grading due to the construction of the adjacent railroad track and nearby industrial complex.

25-3100 Harper, Mary, Timothy Ives, Bruce Clouette, and Ross Harper
2010 Intensive (Locational) Archaeological Survey of the Reconstruction of Route 10/202 (College Highway), Southwick, Massachusetts. 70 pages.

An archaeological survey was conducted of a 27,650 ft^2 proposed detention basin area, as part of the reconstruction of a 1.5 linear mile portion of Route 10/202. Twenty 50 x 50 cm shovel test pits were excavated at 10 m intervals. Small amounts of modern artifacts (asphalt, bottle glass, plastic and styrofoam) were found in five test pits. Stratigraphic profiles indicate fill deposited over natural strata in most (12) of the pits. It would appear that the original ground surface of the proposed detention basin was lower than its current grade, and was filled to current grade, perhaps as part of previous road construction.

25-3101 Chartier, Craig, and Barbara Donohue
2010 Report on Site Examination Testing at the Samuel Fuller Homesite, Tall Timbers Estates, Kingston, Massachusetts. 2 volumes. 261 pages.

Archaeological testing was conducted across the 167 acre project area prior to residential subdivision development at the site, one of three contemporaneously occupied homesites dating to the middle to late 19th century. In total, 153, 50 x 50 cm shovel test pits were excavated in a grid pattern, followed by the excavation of three trenches and six 1 x 1 m excavation units. Pre-contact cultural material was recovered from several contexts, all believed to have come from one site with scattered material. The pre-contact site, Cranberry Bog Road Site, was determined to be a low-density lithic scatter likely resulting from short-term occupation, possibly during the Middle

Archaic period. Historical cultural material consisted of ceramics, faunal remains, and household architectural material. No outbuildings were identified. While it was difficult to attribute various deposits to time periods, there appears to be spatial patterning of subsurface artifacts and features across the site. Further investigations at the site have the potential to yield significant information regarding the lives of individuals living at a low economic level throughout much of the 19th century.

25-3102 Dudek, Martin G., Barbara Donohue, and Thomas P. Mailhot
2010 Archeological Intensive (Locational) Survey, Telecommunications Antenna Facility, Wakefield, Massachusetts. 95 pages.

The project area is immediately adjacent to the Montrose Terrace Site (19-MD-732), a multicomponent site with occupations from the Late and/or Transitional Archaic, Middle Woodland and Late Woodland periods. Fourteen 50 x 50 cm shovel test pits were excavated, consisting of a block of five test pits at the proposed 20 x 20 ft lease area, seven test pits at 5 m intervals along the proposed access road, and two judgmental test pits. While portions of the project area were disturbed with truncated soil horizons and re-deposited soil, intact B horizon subsoil with pre-contact artifacts was present along portions of the proposed access road and roadway turn-around. In total, 54 rhyolite flakes, five pieces of shatter (one quartz, four rhyolite), and one piece of Woodland period grit-tempered pottery were recovered.

25-3103 Cherau, Suzanne, Jennifer Banister, and Matthew Kierstead
2009 Historic Architectural Reconnaissance Survey and Intensive (Locational) Archaeological Survey/Site Examination, Rockport Commuter Rail Station Improvement Project, Rockport, Massachusetts. 121 pages.

A historical architectural survey and an archaeological survey were conducted for the project area, consisting of extensive archival research using Boston and Maine Railroad records, town histories, and historical maps to assist in the location, identification, and evaluation of potentially significant historical and archaeological resources. Field survey consisted of a walkover with close ground surface inspection, followed by existing conditions photography and subsurface testing (three machine-assisted trenches). Archaeological resources identified include the belowground remains of a small surviving portion of the 19th-century turntable pit and the surviving portion (about one-half) of the boiler house foundation that functioned at the Rockport Station Site from circa 1870 to 1900. These structures appear to have been either severely impacted or destroyed by the construction of the 20th-century (extant) Rockport Station commuter rail platform and tracks.

25-3104 Herbster, Holly
2010 Intensive (Locational) Archaeological Survey, AFCEE/MMR Wind Turbine Project, Bourne, Massachusetts. 62 pages.

An archaeological survey was conducted within an 8 acre parcel where construction is proposed for up to four wind turbines. A walkover inspection of the project area determined the exact areas for subsurface testing. Fifty 50 x 50 cm shovel test pits were excavated at 10 m intervals and in four test pit blocks within the project area. No archaeological deposits were identified.

25-3105 Laskoski, Gregg, and Gregory R. Dubell
2010 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, Needham Ground Bed Project, Needham, Massachusetts. 79 pages.

An archaeological survey including archival research, a walkover survey, and subsurface testing was conducted for the proposed installation of a new ground bed. Thirty-five 50 x 50 cm shovel test pits were excavated in linear transects at 10 m intervals, resulting in the identification of small amounts of post-contact material including ceramic and glass from plow zone contexts. Pre-contact material was limited to a single piece of rhyolite chipping debris. Additional test pits ar-

rayed around this pit did not contain any additional cultural materials, suggesting the chipping debris may be an isolated find (Findspot 1).

25-3106 Binzen, Timothy L., and Antonio Medina
2003 Archaeological Site Examination Surveys for the Little Bay Multi-use Trail, Fairhaven, Massachusetts. 83 pages.

Archaeological surveys were conducted at three pre-contact sites recorded during previous Phase I survey at the site of a proposed multi-use trail on Sconticut Neck. The Taber's Brook Site produced 24 lithic artifacts from locations where quartz tools were used. Evidence suggests that a short-term seasonal encampment occurred at the site during the Woodland period. Locus A of the Nasketucket River Site produced 36 lithic artifacts, and Locus B produced 33 lithic artifacts, from small lithic work stations located away from the central portion of the site. The Little Bay Site produced 590 lithic artifacts, including quartz and rhyolite chipping debris, edge tools, biface fragments and Small and Large Triangle projectile points. Pit features and postmolds suggest that a habitation structure was located at the site, where a long-term Late Woodland occupation occurred in proximity to resources for fishing, hunting, and the processing of wild plant foods. The sample obtained from the northern section of the Little Bay Site reduced the future research potential of the part of the site affected by the proposed trail. (See also report #25-2430.)

25-3107 Gould, Donna Rae
2009 Contested Places: The History and Meaning of Hassanamisco. 331 pages.

This dissertation focuses on a cultural landscape in southern New England: the Hassanamisco Reservation and Cisco Homestead in Grafton, Massachusetts. I demonstrate how this place is a significant location to be studied and recognized as a cultural landscape important to the region's history. The focal point of this dissertation is the transformation of this place between the 1860s and 1930 from a domestic landscape to a tribal reservation that today symbolizes the continued presence of Nipmuc people. This transformation was the result of decisions and actions by the homestead's occupants, the Cisco family, dating back to the late 1850s (when this parcel became the final piece of Nipmuc land in Grafton). In addition to the importance of this land base as a symbol of the continued presence of Nipmuc people, the Cisco Homestead is also an important historical structure, believed to be the oldest surviving timber-framed house built for and continuously occupied by Native Americans in the region. The research for this dissertation was conducted within the framework of an interdisciplinary ethnohistorical approach, integrating anthropology, documentary research, architectural history, archaeological investigations, and oral history. This study also provides an example of a Native scholar reappropriating her past, correcting misconceptions about Native people, and beginning a dialogue about a cultural landscape in southern New England that can serve as a model for how to investigate similar places. As an example of a reappropriation of my tribe's past and present, this study reaffirms that Native voices can be more powerful and influential than ever. The representation of non-Western cultures through the writing of anthropological and historical texts and how these acts constitute power relations that mirror those that have defined the colonial and neo-colonial relations between peoples are also important concepts of this study, as well as the issue of authenticity and who decides what a "real" Indian is. Studies such as this, which reflect on the history and meaning of contested places (and, by association, the contested people associated with them), address issues that help us better understand the cultural, identity, and heritage differences that exist in today's more globalized world.

25-3108 Dimmick, Frederica R.
2010 Archaeological Investigations at Bearberry Hill, Truro, Massachusetts. 21 pages.

To aid in directing Bearberry Hill trails hikers to a specific destination, low profile signs along the trail with numbers have been placed to correspond with a visitor pamphlet. Subsurface investigations at the locations of each trail sign consisted of 12, 40 x 40 cm shovel test pits and one 30 x 30 cm shovel test pit, for a total of 13 units. Ten units were devoid of artifacts and features; three

units produced a small assemblage of artifacts. One very thin cortical flake of quartzite was recovered, offering a small suggestion of Native cultural activity at Bearberry Hill. The low density of historical period artifacts includes structural materials such as iron nails and a screw, as well as road construction material.

25-3109 Doucette, Dianna L., Gregg Laskoski, and Erin Flynn
2010 Intensive (Locational) Archaeological Survey, Buffumville Lake, Charlton, Massachusetts. 189 pages.

An archaeological survey was conducted of 100 acres within an Army Corps of Engineers New England District flood control project area. The survey included archival research, a walkover survey, and subsurface testing. In total, 493, 50 x 50 cm shovel test pits were excavated along 35 transects, within seven blocks, as four judgmental test pits, and along 13 arrays. The excavations resulted in the identification of seven pre-contact archaeological sites (Buffumville Recreation Area Loci 1–5, A.F. Putnam, and South Fork sites) and four pre-contact findspots (Buffumville Recreation Area Findspots 1–4). The Buffumville Recreation Area Locus 1 Site contained chipping debris, one quartz scraper, and two Small Stemmed projectile points, suggesting occupation of this stone tool maintenance and food processing site during the Late Archaic to Early Woodland periods. At Buffumville Recreation Area Locus 2, a lower density of lithic materials suggests a small-sized campsite, while the slightly U-shaped quartzite biface recovered suggests Middle Archaic period occupation. Quartz and quartzite chipping debris were recovered at Buffumville Recreation Area Locus 3, indicating a brief span of stone tool maintenance. A Brewerton projectile point preform, dating to the Late Archaic Period, was recovered alongside chipping debris at another site of stone tool maintenance, Buffumville Recreation Area Locus 4. At Buffumville Recreation Area Locus 5, a cultural feature along with 10 pieces of quartz chipping debris and one quartz biface indicate site activities of stone tool maintenance and food processing. Quartz chipping debris and one quartz biface at the A.F. Putnam Site suggest a small Native American campsite. The South Fork Site contained 44 pieces of chipping debris, one quartz scraper, four bifaces, one Vosburg-type projectile point preform, one quartzite Neville projectile point, and one granitic nutting stone. Charcoal from Feature 1 yielded an uncalibrated radiocarbon date of 3,840 ± 40 B.P (Beta-273944). The recovered materials and feature at the South Forks Site suggest occupation during the Middle and Late Archaic periods, with activities including stone tool manufacture and maintenance as well as food processing. Additional evaluation of each site is recommended to determine significance. All four of the findspots contain a low density of cultural material, lack complexity, and have limited research potential. (See also reports #25-646, 25-1358, and 25-2083.)

25-3110 Cox, J. Lee, Jr.
2010 Phase 1 & 1B Underwater Archaeological Investigations, South Terminal Marine Infrastructure Park, New Bedford, Massachusetts. 42 pages.

A remote-sensing marine archaeological survey was conducted of the sub-tidal portions of the proposed project area, involving the use of side scan sonar, sub bottom sonar, and a magnetometer. Analysis of the remote sensing data identified 29 magnetic and/or acoustic targets in the project area. Only one target, a combined magnetic/acoustic target, M4/S5, was considered to be significant, located close to the center of the project area. Characteristics of the magnetic and acoustic signatures of the target were suggestive of a shipwreck and additional Phase 1B archaeological investigations were recommended. No additional investigations were recommended at the other remote sensing target locations. Follow up Phase 1B investigations confirmed the source of the remote sensing target M4/S5 was a wooden hull vessel, likely a sailing ship dating to the late 19th/early 20th century. Only the bottom of the hull remains; divers recorded an approximately 89 x 30 ft intact section.

25-3111 Ritchie, Duncan
2010 Intensive (Locational) Archaeological Survey, Nantucket Disc Golf Project, Nantucket, Massachusetts. 74 pages.

An archaeological survey was conducted of the proposed project area within the South Pasture section of the Nantucket State Forest. Subsurface testing, consisting of 96, 50 x 50 cm judgmental test pits, was completed at proposed locations of tee pads, disc golf baskets, and signposts. The survey resulted in the identification of one pre-contact Native American archaeological site (South Pasture Site), investigated with an array of four test pits at 2.5 m intervals. The South Pasture Site consisted of an isolated findspot of a hornfels Levanna-type projectile point, diagnostic of the Late Woodland period. The survey also yielded a small sample of post-contact to modern period materials (brick, nail, bottle glass) that are not considered significant, probably deposited in the project area when it was open land under agricultural land use/cultivation.

25-3112 Mair, A. Peter, II
2010 Intensive (Locational) Archaeological Survey, Fitchburg Commuter Rail Extension Project, Fitchburg and Westminster, Massachusetts. 88 pages.

The majority of the project area is located in previously disturbed areas including the existing railroad bed and an operating sand and gravel pit. Subsurface testing consisted of fifteen 50 x 50 cm shovel test pits excavated within three transects and as one judgmental test pit. No cultural material was identified.

25-3113 Chartier, Craig, and John Pretola
2010 Final Report for the Intensive Survey Testing at the New Generation Wind Project in Bourne, Massachusetts. 73 pages.

Archaeological testing was conducted on 140 of the 403.5 acres associated with the proposed construction of seven 100 m tall renewable energy wind turbines and associated infrastructure on the north side of the Cape Cod Canal. In total, 349, 50 x 50 cm shovel test pits were excavated in four 60 x 60 m blocks and five transects, at 8 m intervals. No cultural material was recovered. Two historical period roadways were encountered, consisting of parallel tire ruts averaging 1.5 m apart. The roadways are believed to be associated with lumbering of the area. Two large glacial erratics were encountered within or adjacent to areas of proposed impact. No cultural significance is ascribed to the erratics by the Mashpee, Aquinnah, or Herring Pond Native individuals interviewed.

25-3114 Doucette, Dianna L.
2010 Phase I Archaeological Identification Survey for a Proposed Water Line, North Attleborough National Fish Hatchery, North Attleborough, Massachusetts. 81 pages.

An archaeological survey was conducted for the proposed construction of a new 600 m waterline for the United States Fish & Wildlife Service. Seventy-eight, 50 x 50 cm shovel test pits were excavated at 8 m intervals along three transects and within two test pit arrays. Of these, three test pits yielded pre-contact cultural material and five test pits yielded post-contact cultural material. Recovered pre-contact cultural material consists of two quartz flakes, six rhyolite flakes, and one quartz scraper. A low density of post-contact cultural material was also identified within the A_1 and fill layers in the disturbed portion of the project area, including bottle glass, whiteware, brick, and a wire nail. Two findspots of pre-contact activity were identified consisting of a low density of chipping debris and one stone tool (Findspots 1 and 2). These findings have been interpreted as isolated episodes of stone tool maintenance.

25-3115 Doucette, Dianna L., Erin Flynn, Gregg Laskoski, and Kathleen A. Atwood
2010 Archaeological Site Examination, Hodges Village Dam, Oxford, Massachusetts. 262 pages.

Archaeological investigations consisted of evaluations conducted on eight pre-contact sites (Stumpy Pond Sites 1, 2, 3, and 4, Yellow Trail, Black Racer, Hodges Rockshelter, and the River Terrace Site), and five post-contact sites (HS-1a: Hodges Ice House/ Carriage House, HS-4: Jason Brown Cellar Hole, HS-15: Kidder Cellar Hole, HS-16: H.P. Foundation, and HS-6: Charlton Road Bridge Abutments). The 13 sites were identified during reconnaissance and intensive sur-

veys in 1995. In total, 256, 50 x 50 cm shovel test pits, one 1 x 0.5 m excavation unit, and 15, 1 x 1 m excavation units were excavated among the 13 sites. Overall, seven of the pre-contact sites (the Black Racer, Hodges Rockshelter, Yellow Trail, River Terrace, Stumpy Pond 2, 3, and 4 sites), and four of the post-contact sites (HS-1a: Hodges Ice House/ Carriage House, HS-15: Kidder Cellar Hole, HS-16: H.P. Foundation, and HS-6: Charlton Road Bridge Abutments) did not yield significant information to warrant further investigations. The Stumpy Pond 1 Site finds included chert, quartz, quartzite, and rhyolite chipping debris, as well as a pit feature containing charcoal, which yielded a Late Archaic period radiocarbon date of 3,860 ± 40 B.P. (Beta-271385). The diversity in raw materials and the presence of a pit feature suggest that a range of activities took place at this site. The Jasper Brown Cellar Hole Site, part of the 19th-century Brown farm estate, consists of a cellar hole for a small outbuilding, with the presence of features such as a builder's trench and a canine burial. The archaeological investigations additionally revealed a previously undocumented intact pre-contact occupation below and around the cellar hole, dating to the Late Archaic period, based on the recovered rhyolite Brewerton projectile point, as well as the charcoal radiocarbon-dated to 3,730 ± 40 B.P. (Beta-271384). (See also reports #25-541, 25-1443, and 25-2106.)

25-3116 Donta, Christopher L., Jennifer Wendt, and Antonio Medina
2010 Archaeological Intensive (Locational) Survey for the Bement Dormitory Project, Deerfield, Massachusetts. 67 pages.

An archaeological survey was completed for the proposed construction of a dormitory building, removal of three existing structures, and other associated land surface alterations on the campus of the Bement School. The subsurface testing, consisting of 12, 50 x 50 cm shovel test pits, documented 19th and 20th century fill soils in the area proposed for the dormitory. The fills are interpreted as being related to a historical house that was moved to this location in 1967, and a modern house constructed in 1979, as well as agricultural activities conducted in the area. Intact soils were identified below the fills in the western portion of the dormitory footprint, but no artifacts or features were found in these intact soils. Soils to the south in the proposed detention basin were found to be largely intact soils, but also without any cultural materials. The test pits excavated to the west of the Stebbins house were found to be entirely disturbed to 80 cm. Despite the high potential to contain both Native American sites and historical period sites, no archaeological sites were found.

25-3117 Steinberg, John, Christa M. Beranek, John Schoenfelder, and Kathryn A. Catlin
2010 Loring-Greenough House North Yard Archaeogeophysics, Jamaica Plain, Massachusetts. 69 pages.

The survey was carried out using ground penetrating radar systems with a 500 MHz antenna over a 28 x 26 m grid immediately northeast of the Loring-Greenough house in the Jamaica Plain section of Boston. Three major anomalies were identified. These anomalies have not been ground truthed, but they appear to be archaeological features. First, there is a builder's trench just north of the house. Second, there could be three east-west garden paths or other landscape features about 30 cm below the surface crossing the entire length of the survey grid. Third, there could be a buried foundation or cellar hole 110 cm below the ground surface and 20 m north of the house.

25-3118 Mair, A. Peter, II
2009 Archaeological Site Examination, Fuller Street Site (19-NF-68), Neponset Street Water Treatment Facility, Canton, Massachusetts. 98 pages.

An archaeological survey was completed to determine the horizontal boundaries and location of concentrations of cultural materials or features within the Fuller Street Site. Fieldwork included the excavation of 85, 50 x 50 cm shovel test pits within a 10 x 10 m grid and five 1 x 1 m excavation units placed in areas to further investigate suspected features and higher artifact concentrations. The site is approximately 5,650 m^2 in size, as defined by natural features and/or sterile test pits. The categories of Native American cultural material include projectile points (Rossville and

Small Stemmed), bifacial tool blades, pottery sherds, and concentrations of burnt and fire-cracked rock indicating that activities such as hunting and constructing hearth/fire pit features for cooking, heat, or other purposes were undertaken by the site's occupants. The distribution of cultural material and features suggest three loci of activity at the site, including good examples of lithic workshops of specific raw materials from source areas, both local (Blue Hills for rhyolite and hornfels) and more distant (jasper). Hearth features dating to the Late/Transitional Archaic period, diagnostic artifacts (Rossville projectile points), and a pit feature dating to the Middle/Late Woodland period indicate that the Fuller Street Site is the result of multiple occupations. Based on the evidence gathered to date, the Late/Transitional Archaic period component may be characterized as a number of short-term occupations focused on the production and maintenance of lithic tools. The Middle/Late Woodland occupation of the site may have been for a longer period, based on the presence of a pit feature suggesting storage or trash, and pottery sherds suggesting storage and/or cooking. A number of lithic tools, primarily scrapers, suggest that support activities were also taking place at the site. (See also report #25-2911.)

25-3119 Dudek, Martin G., and Thomas P. Mailhot
2010 An Archeological Intensive (Locational) Survey for the Telecommunications Antenna Monopole Facility, 521 Great Road, Littleton, Massachusetts. 79 pages.

The archaeological survey tested the proposed location of the monopole facility, access drive, and underground utility easement. Twenty-one 50 x 50 cm shovel test pits were excavated in the form of a 24 x 24 m block, a transect of six test pits at 10 m intervals, and one judgmental test pit. No archaeological sites were identified.

.

25-3120 Mair, A. Peter, II
2010 Intensive (Locational) Archaeological Survey, Princeton Road Bridge (S-25-006) Replacement Project, Sterling, Massachusetts. 70 pages.

An archaeological survey was conducted for the proposed bridge replacement on a 0.3 acre parcel within the historical agricultural landscape of the Stillwater Farm/Redding Chandler Farm. Eighteen 50 x 50 cm shovel test pits were excavated within one 30 x 30 m block, as three judgmental test pits, and as one array of three test pits, revealing inconsistent soil profiles, suggesting prior disturbance or reworking of the soils. A low density of post-contact materials was recovered from eight test pits, including brick fragments, redware, glass, nail, and plastic. A low density of quartz chipping debris and field shatter was also recovered in direct association with post-contact materials.

25-3121 Donta, Christopher L., F. Timothy Barker, and Mitchell T. Mulholland
2010 Phase I Archaeological Intensive (Locational) Survey and Phase 2 Archaeological Site Examination Survey of the Brush Hill Road and Blue Hills Avenue Archaeological Sites, for the Proposed Neponset River Esplanade, Boston and Milton, Massachusetts. 120 pages.

The Phase 1 testing, consisting of 83, 50 x 50 cm shovel test pits, identified two archaeological sites in the eastern portion of the project area: the Brush Hill Road Native American Site and the Blue Hill Avenue Site. The Brush Hill Road Site consists of 37 pieces of rhyolite and argillite debitage from nine test pits along 110 m of riverfront soils. The Blue Hill Avenue Site consists of both a Native American component and a historical period component. Seven Native American artifacts were found in five test pits. Historical items were concentrated in three test pits, dating to the early to mid-18th century. An additional Phase 1 survey was conducted for a possible realignment to avoid the Blue Hill Avenue Site, and resulted in further finds of Native American artifacts, including two rhyolite triangular projectile points. An avoidance route was recommended around the western portion of the site. The additional Phase 1 survey and the site examination survey together consisted of the excavation of 73, 50 x 50 cm shovel test pits, four 1 x 1 m excavation units, and one 2 x 0.5 m trench. The site examination of the Blue Hill Avenue Site identified additional Native American artifacts in the central locus, but all in disturbed contexts. Historical features

were identified, including a stone foundation, builder's trench, and fill soils. A concentration of artifacts confirms a mid- to late 18th-century site, which may be the location of a mill or associated outbuilding. The site examination of the Brush Hill Road Site defined a concentration in the central locus, which included a hearth feature and postmold. Both sites can be avoided by rerouting the original proposed project route.

25-3122 Donta, Christopher L., C. Broughton Anderson, F. Timothy Barker, and Mitchell T. Mulholland
2010 Phase IA Archaeological Reconnaissance Survey of Three Options for the Neponset River Greenway, Mattapan and Milton, Massachusetts. 73 pages.

This project included archaeological background research and a field survey of three proposed pathway options. Several historical foundations were identified, and while no Native American sites were found, there remains a high potential for the site to contain Native American sites, if free from prior ground disturbance. Historical site potential is highest at the western and eastern ends of the project area, where mills, rail lines, and stations and associated outbuilding remains might be encountered. Historical maps indicate other areas may also contain structural evidence of 18th- and 19th-century industrial and domestic sites.

25-3123 Mair, A. Peter, II
2010 Intensive (Locational) Archaeological Survey, Ashby West Road Bridge Replacement, Fitchburg, Massachusetts. 77 pages.

An archaeological survey focused on proposed slope work on the east side of Ashby West Road that will extend beyond the existing disturbed areas. Ten 50 x 50 cm shovel test pits were excavated within two linear transects and as three judgmental test pits. Subsurface testing produced three pieces of glass from slope wash and fill deposits, as well as one piece of plastic.

25-3124 Mair, A. Peter, II
2010 Intensive (Locational) Archaeological Survey, Site 4 at Mashpee Transfer Station and Landfill Property, Mashpee Watershed Nitrogen Management Planning Study, Mashpee, Massachusetts. 71 pages.

An archaeological survey was conducted for a new wastewater treatment and effluent disposal facility on an approximately 10 acre parcel of land. The survey included archival research, a walkover survey, and subsurface testing in project impact areas with moderate archaeological sensitivity. During subsurface testing, 52, 50 x 50 cm shovel test pits were excavated within three 30 x 30 m blocks and along one judgmental linear transect. No cultural material was identified.

25-3125 Mair, A. Peter, II
2010 Intensive (Locational) Archaeological Survey, Wankinco Cranberry Bog Expansion, Carver, Massachusetts. 101 pages.

An archaeological survey including archival research and subsurface testing was conducted of the proposed project located on 25 acres of wooded uplands. Subsurface testing consisted of 120, 50 x 50 cm shovel test pits, excavated within five 30 x 30 m blocks, six transects, and two arrays. Seventeen pieces of chipping debris, a Stark-like projectile point, and one piece of charcoal were recovered from six test pits at the northern end of the project area. Two findspots identified during field investigations lack sufficient density of material to warrant further investigation. The Wankinco Bog Site is considered a potentially significant archaeological resource. The vertical distribution of cultural material exhibits good separation between the quartz and rhyolite chipping debris, with the later concentration dating to the Middle Archaic period.

25-3126 Flynn, Erin, and Suzanne Cherau
2010 Intensive (Locational) Archaeological Survey, A-127/B-128W Transmission Line Reconductoring Project, Massachusetts Portion, Franklin and Worcester Counties, Massachusetts. 289

pages.

An archaeological survey was conducted for the Massachusetts portion of the proposed project, crossing through the towns of Colrain, Erving, Gill, Greenfield, Heath, New Salem, Rowe, and Wendell in Franklin County; and in the towns of Barre, Leicester, Oakham, Paxton, Petersham, Rutland, and Spencer in Worcester County. The survey consisted of an initial sensitivity assessment of project work areas where ground disturbances are planned, followed by subsurface testing in sensitive work areas. In total, 253, 50 x 50 cm shovel test pits were excavated within 12, 30 x 30 m blocks, nine arrays, 12 transects, and eight grid test pits. The survey resulted in the identification of low densities of late 19th- and early 20th-century domestic sheet refuse discarded in plowed fields at eight structure locations in the towns of Barre, Colrain, Greenfield, Paxton, Rowe, and Spencer. Stone walls identified within work areas around Structures 22, 36, 383, and the Paxton Laydown area have been previously disturbed and are in generally poor condition, although these walls will be avoided and protected during construction activities. The survey also identified three areas of pre-contact period Native American occupation in Barre, Greenfield, and Spencer. The Structure 146 Findspot in Greenfield consists of two pieces of chipping debris (quartz, rhyolite) and the Structure 447 Findspot in Spencer consists of an isolated quartz flake, both indicating the presence of stone tool manufacturing/maintenance activities. The Structure 383 Site in Barre is identified as a small camp affiliated with late Paleo-Indian period occupation, based on a radiocarbon date of 8,910 ± 40 B.P. obtained from charcoal (Beta-282453). Munsungan chert chipping debris and charcoal were recovered from intact A and B soil horizons, despite the presence of disturbed soils in the immediate area. The site retains sufficient integrity and content, including the likelihood of cultural features such as hearths and fire pits and diagnostic artifact assemblages.

25-3127 Mailhot, Thomas P.
2010 Farmstead and Household Archaeology at the Barrett Farm, Concord, Massachusetts. 107 pages.

In this thesis, changes in the landscape across the farmstead are examined and related to changes in the household during the 1850s and 1860s. Although the Barrett family had a long and prosperous tradition of farming in Concord, this changed at the end of the 19th century, as the farm was reduced in size and the operation reduced in scale. The majority of artifacts and data recovered from an excavation in 2007 dealt with the 19th-century occupation of the farmstead. Changes in the household and across the farmstead in the 19th century can be seen archaeologically through the formation of features, including a ceramic midden behind the collapsed east ell. Changes in the landscape are linked to specific households. The economic factors affecting the 19th-century households are examined. The archaeological evidence, supported by documents, helps show how external pressures shaped the landscape of a New England farmstead. (See also report #25-2882.)

25-3128 Donta, Christopher L., F. Timothy Barker, and Antonio Medina
2010 Archaeological Site Examination Survey for the Proposed Eustis Street Firehouse Restoration, Boston, Massachusetts. 65 pages.

Proposed restoration of the standing brick structure in Roxbury, which dates from the mid-19th century, includes impacts around the existing foundation and portions of the historic Eustis Street cemetery. Because prior excavation had identified unmarked burials, testing designed to look for grave shafts and disarticulated remains in areas of proposed impact was employed. Eight 50 x 50 cm shovel test pits were excavated around the north, east, and south sides of the structure, and additional machine-assisted trenching was conducted to the rear (east) of the building, where an addition is proposed. Trenching identified several features, including the brick foundation piers for a 19th-century addition, a large pit, and two grave shafts. Several disarticulated remains were recovered to the north and west of the firehouse, all in disturbed contexts. Native American artifacts recovered included worked rhyolite, flakes of chert and quartz, and four sherds of Native American pottery, designated the Eustis Native American Site.

25-3129 Flynn, Erin, and Suzanne Cherau
2010 Intensive (Locational) Archaeological Survey, E205W Reconductoring and Shield Wire Replacement Project, Massachusetts Portion, Rowe, Massachusetts. 97 pages.

An archaeological survey was conducted for the 5.6 mile project. The survey resulted in the identification of five foundations and 11 stone walls. None of the foundations are located in project construction work areas; they will be protected by the placement of high visibility barriers (e.g., orange construction fencing) during the contractor access to the replacement pole and wire work areas. The visible stone walls will also be avoided during vehicular and equipment access for the project. Forty-five 50 x 50 cm shovel test pits were excavated during the survey as five test pit arrays, two linear transects, and two judgmental test pits. No artifacts were recovered during the survey.

25-3130 Levin, Ellen, and Thomas Mahlstedt
1990 Middlesex Fells Reservation Historic Land-Use Study. 94 pages.

This study of the 2,060 acres of land in Malden, Medford, Melrose, Stoneham, and Winchester marks the first step in developing a comprehensive cultural resources management program for the reservation. Tracing the land-use history of the metropolitan park, the report highlights the importance of the mill industry, agriculture, and quarrying in the economic history of the Fells, and delineates relevant, historical properties and structures. While a systematic historical archaeological survey has not been conducted on the reservation, a preliminary inventory is provided, which lists the 41 known historic sites (primarily located in Stoneham). A base map provides overlays of these known historical sites and of potential historical sites, identifying sensitive areas. This document is the first step in accumulating, synthesizing, and interpreting the historical record in order to provide information regarding the reservation's historical significance. Further archaeological surveys are recommended to verify the presence or absence of pre-contact and historical sites identified during the historical land-use survey.

25-3131 Mailhot, Thomas P., and Martin G. Dudek
2010 Intensive (Locational) Archeological Survey at the Proposed Site of a 150-Foot Monopole Telecommunications Antenna, Scituate, Massachusetts. 83 pages.

The archaeological survey tested the proposed location of the monopole facility, access drive, and utility shed/turn around area. A total of 15, 50 x 50 cm shovel test pits, in the form of one block, one transect, and one judgmental test pit, were excavated at 10 m intervals. Test pits encountered natural or plowed stratigraphy. Recovered cultural material consisted of two pieces of machine-made bottle glass from one test pit.

25-3132 Herbster, Holly
2010 Intensive (Locational) Archaeological Survey, Shay Property, Assessors Parcel 11-25.2, Aquinnah, Massachusetts. 46 pages.

An archaeological survey was conducted for the development of a single-family dwelling and associated access utilities within a 2.05 acre lot. The survey included background research, a walk-over survey, and subsurface testing, consisting of 15, 50 x 50 cm shovel test pits at 5 and 10 m intervals. The survey identified one Native American archaeological deposit, the Shay Findspot, consisting of a low-density deposit of quartz chipping debris. No diagnostic tools or cultural features were identified. The recovered artifact assemblage is indicative of stone tool maintenance and short-term activities associated with hunting and/or gathering.

25-3133 Leveillee, Alan, and Kristen Jeremiah
2010 Intensive (Locational) Survey and Archaeological Site Examination, Transflo Project Area, Westborough, Massachusetts. 73 pages.

Two archaeological surveys were conducted at sites Cedar Swamp 1, Cedar Swamp 2, and Cedar Swamp 24, within the Cedar Swamp Archaeological District. Seventy 50 x 50 cm shovel test pits were placed in two transect lines at 10 m intervals, and five 1 x 1 m excavation units were placed in areas yielding moderate to high densities of pre-contact materials. The pre-contact assemblage, recovered from 20 of the test pits and all five excavation units, includes 546 pieces of chipping debris (quartz, rhyolite, quartzite, and argillite), two rhyolite bifacially-flaked tools, one quartz scraper, two quartzite Brewerton-eared projectile points, calcined bone, and a single fragment of pre-contact period ceramics. Post-contact material, one nail, was retrieved from natural A horizon soil in one test pit. The project area contains significant archaeological resources comprised of multiple components dating from the Laurentian Tradition of the Late Archaic to the Woodland Period. (See also report #25-1519.)

25-3134 Gillis, Nichole, and Dianna L. Doucette
2010 Intensive (Locational) Archaeological Survey, Hampden County Reliability Project, New England Power Company d/b/a National Grid, Palmer, Monson, and Hampden, Massachusetts. 172 pages.

An archaeological survey was conducted of the proposed right-of-way expansion areas, equipment staging/laydown areas, and a new substation and access road. In total, 840, 50 x 50 cm shovel test pits and six 1 x 1 m excavation units were excavated. Nine previously undocumented pre-contact period archaeological sites and two pre-contact period findspots were identified. Five of the sites and the two findspots are located in Monson, while the remaining four sites are located in Hampden. The sites include isolated projectile points and chipping debris, lithic manufacture locations, and probable camp sites. Most sites were located near tributary streams or wetlands, though two small sites were identified in upland/mountainous locales. Only two diagnostic artifacts were recovered: a Small Stemmed projectile point at the Stebbins Road Wetlands Site in Monson, and a Brewerton Corner-Notched projectile point from the Wilbraham Foothills Site in Hampden. Four of the identified pre-contact sites are significant resources, the Hunter Hill Road Site in Monson, the Chicopee Brook Wetland Site 2 in Monson, the Stebbins Road Wetlands Site in Monson, and the East Brook Site in Hampden. Avoidance of these sites is recommended. The remaining five pre-contact archaeological sites (Chicopee Brook Wetland Site 1, Waid Road Site, Big Brook Hill Site, Mount Vision Overlook Site, and Wilbraham Foothills Site) and two findspots (Findspots 1 and 2) contained a low density of cultural material, lacked integrity or complexity, and possessed limited research potential. No further archaeological investigation is recommended for these sites.

25-3135 Banister, Jennifer, John Daly, and Suzanne Cherau
2010 Historic and Archaeological Intensive Survey, Jones River Restoration, Wapping Road Dam Removal, Kingston, Massachusetts. 247 pages.

The subsurface testing consisted of 12, 50 x 50 cm shovel test pits excavated along two transects at 5 m intervals. Previously obtained ground penetrating radar data indicates the probable location of a raceway for a suspected gristmill in this area, and deep fill deposits in several test pits supports this. The disturbances are likely due in large part to road construction and/or bridge construction, industrial and post-abandonment filling of the presumed gristmill raceway, and the construction of the extant Mayflower Worsted Company Dam in the early 20th century.

25-3136 Harper, Mary, Timothy Ives, Bruce Clouette, and Ross Harper
2010 Intensive (Locational) Archaeological Survey, Nemasket River Drainage Improvement Project, Middleborough, Massachusetts. 110 pages.

An archaeological survey was conducted of three proposed detention-basin areas on the west side of the Nemasket River. As part of this project, the existing concrete-block retaining wall immediately adjacent to the fish ladder just north of Wareham Street will be replaced. Subsurface testing consisted of 86, 50 x 50 cm shovel test pits excavated at 5 m intervals. All three areas were highly disturbed and comprised of fill interspersed with modern refuse. The base of one Orient-like point

was recovered in Area 1, a quartz Levanna was found in Area 2, and in Area 3, five lithic flakes and a biface fragment were found. Although it is possible that the lithic artifacts may be associated with pre-contact sites outside of the project area, the three detention-basin areas are so disturbed that there is little if any possibility for intact pre-contact site remnants to be present within them.

25-3137 Daly, John, and Suzanne Cherau
2010 Supplemental Report, Eel River Headwaters Restoration Project, Plymouth, Massachusetts. 153 pages.

The report contains the results and interpretations of the archaeological monitoring for the Saw Mill Dam and includes the suggested public education interpretive text for the Cranberry Bog Complex and the Saw Mill Dam. The archaeological investigations documented aspects of the Saw Mill Dam's internal construction and uncovered evidence in the form of buried structural features of earlier dams and associated industrial campaigns at the site. The Saw Mill Dam was probably a late 19th-century structure containing the remains of two possible earlier dam structures. The presence of early 19th-century waterpower infrastructure contained within the Saw Mill Dam confirms that dam structures may be significant historic resources in the present landscape, but as a record of a continuum of industrial activities at the site. Archaeological recording of the dam's internal structure allows for a more precise analysis of site chronologies and construction activities than visual and documentary evidence alone. (See also report #25-3012.)

25-3138 Hoffman, Curtiss
2010 Middleborough Little League Site (19-PL-520), 2010 Archaeological Intensive Survey Interim Report and Permit Renewal Request, Middleborough, Massachusetts. 138 pages.

This report describes the preliminary results of an ongoing archaeological intensive survey undertaken on the first terrace above the Nemasket River during the 2010 field season. It details the research design, sampling strategy, field methodology, and field results, and provides preliminary conclusions. The 2010 season included excavation of 41, 50 x 50 cm test pits and recovered a total of 1,002 lithic artifacts, 677 pieces of debitage, 8,656 fire-burnt rocks, 2,597 pieces of organic material, and 1,104 post-contact period artifacts. It identified 35 cultural features. The main activities in the excavated portion of the site are interpreted as the manufacture and storage of items for ceremonial purposes, food and hide processing, and tool-making. The report compares results from the first and third terraces and concludes that there is substantial continuity between the two areas, though the chronological range on the first terrace may be more constrained.. (See also reports #25-1829, 25-1907, 25-2009, 25-2521, 25-2780, and 25-3064.)

25-3139 Harmon, James M.
2010 Archeological Investigation at the Hovagimian Barn Stow-Hardy House, Minute Man National Historical Park, Concord, Massachusetts. 28 pages.

The report summarizes the results of an archaeological investigation conducted within the interior of the small, 20th-century structure. Three 1 x 1 m excavation units were placed at impact areas in the floor of the barn, associated with the installation of new vertical supports for an overlying floor. The units were found to contain a large amount of mid-20th-century cultural material, primarily flat glass, vessel glass, and nails; each unit also contained a feature associated with earlier supports that had been located in the same areas. The entire area of potential effect for the project was archaeologically excavated.

25-3140 Dudek, Martin G., and Thomas P. Mailhot
2010 Archeological Intensive (Locational) Survey for the Wachusett Mountain State Reservation Summit Area Enhancement Project, Princeton, Massachusetts. 94 pages.

The archaeological testing consisted of 43, 50 x 50 cm shovel test pits excavated within project work areas including the proposed parking lot expansion, proposed handicap accessible lot, and

proposed summit observation tower. Fill layers were encountered at a number of test locations, with natural strata identified below fill. Bedrock or large boulders were encountered in every pit, ranging in depth from 12 to 64 cm. Historical or modern materials were recovered primarily from fill although small amounts of historical materials were also recovered from natural strata. While no archeological sites were identified by the testing, protection of survey markers or inscriptions within or adjacent to the proposed improvements is recommended.

25-3141 Chartier, Craig, and John Pretola
2010 Final Report for the Intensive Survey Testing at the Cronin Parcel, Farrington Road, Dennis, Massachusetts. 49 pages.

Archaeological testing was conducted on a piece of property proposed to be subdivided into a cluster development. Testing was limited to two areas of previously identified high potential: a section of the proposed roadway measuring 50 x 6 m, and the eastern portion of Lot 7, which totaled approximately 0.08 acres. Extensive disturbance was found along the proposed roadway. This disturbance can be attributed to earlier plans, dating back to the 1920s, to subdivide this parcel and construct an access road. Eight 50 x 50 cm shovel test pits were excavated with no cultural material being recovered.

25-3142 Wheeler, Kathleen, and Anthony Booth
2009 Phase IB Archaeological Survey, Reverend John Hale House, Beverly, Massachusetts. 29 pages.

A limited archaeological survey revealed a mix of 18th- through 20th-century artifacts that provides little new information about the inhabitants of the Hale House. The house dates to 1694 originally, with additions made in 1745 and in the 20th century. Archaeologists excavated two 50 x 50 cm shovel test pits and one 60 x 40 cm test pit in the front (north) yard along the proposed route of a perimeter drain, as well as a small 30 x 25 cm test hole at the doorstep. A relatively small number of artifacts were found, primarily architectural debris relating to the 350 years of construction and maintenance of the 1745 ell addition. Although the stratigraphy shows cultural layering, pre-1745 strata are almost sterile.

25-3143 Fitzell, Sean, Susan Hathaway, and Cynthia Auman
2002 Phase I Archaeological Survey, Sagamore Hill Antenna Complex, Hamilton, Massachusetts, and Eagle Hill Antenna Facility, Ipswich, Massachusetts. 136 pages.

As part of ongoing cultural resources management work at Hanscom Air Force Base, recent archaeological surveys have been conducted in Hamilton and Ipswich. Investigation of the Sagamore Hill Antenna Complex (Hamilton) was based upon an earlier assessment of the property conducted in 1994. The survey included background research, a surface inspection/pedestrian survey, and a limited program of subsurface testing, resulting in the identification of nine areas exhibiting moderate probability for the location of historical period resources. Previously recorded historical properties in the vicinity include HAM-HA-1 and HAM.905. Four of the nine areas also contained moderate probability for the location of prehistoric resources. The gravesite of a Native American is located just outside the south boundary of the property. A 100 ft buffer zone was established around the grave. The current survey focused on the nine moderate probability areas identified during the 1994 assessment, designated Areas A-I. Sixty 50 x 50 cm shovel test pits were excavated at 20 m intervals, along transects spaced at 25 m. All nine areas exhibited a combination of intact soils and some soil disturbance. Four of the nine testing areas each contained one test pit with artifacts (totaling five flakes). These finds constitute a prehistoric archaeological site, 19-ES-745, characterized as a short-term resource foray area of unknown temporal period. No previous archaeological assessment of the 65 acre Ipswich Property (Eagle Hill Antenna Facility) has occurred. The current survey focused on high probability areas and resulted in the excavation of 108, 50 x 50 cm shovel test pits, including 11 radials, excavated at 20 m intervals. The survey revealed that previous construction and improvements had disturbed many portions of the property. A total of 27 test pits contained artifacts in both the plow zone and intact sub-plow zone hori-

zons. Of these, 24 constituted prehistoric and historical site 19-ES-744. Site 19-ES-744 included a prehistoric component consisting of a small lithic scatter of 53 flakes, which likely represent knapping debris associated with resource foray and not habitation. The historical period component consisted mostly of small fragments of glass and shell, with limited quantities of whiteware, porcelain, and redware sherds. This material was likely deposited in the early 20th century. The low numbers of artifacts and lack of diversity suggest that the artifacts were a secondary deposit. (See also reports #25-1409 and 25-3144.)

25-3144 Donohue, Barbara
2004 Archaeological Sites Record Notebook for Hanscom Air Force Base, Middlesex County, Massachusetts. 28 pages.
Donohue, Barbara
2007 Update of Archaeological Sites Record Notebook for Hanscom Air Force Base, Middlesex County, Massachusetts. 6 pages.
Dudek, Martin G.
2010 Hanscom Air Force Base Integrated Cultural Resources Management Plan. 7 pages.

As a result of eight archaeological surveys conducted within Hanscom Air Force Base since 1993, two prehistoric and two historical period sites have been identified. In 1998, historical site LEX-HA-9 was identified on the main base during an intensive survey, consisting of a short-term use dump dating from the 1910s to the 1930s. A 2003 specialized metal detector survey identified one historical site associated with the Battle of April 19, 1775, whose limits were defined during additional archaeological and geophysical surveys in 2004 and 2005. No further artifacts were recovered during the 2005 investigations, but the results suggested that features associated with the 18th-century Thomas Nelson Farm Site (19-MD-347/LEX-HA-6) were located within both Hanscom Air Force Base and Minute Man National Historical Park. In Hamilton, a 2001 intensive survey at the Sagamore Hill Antenna Complex identified one prehistoric site (19-ES-745) consisting of five flakes, characterized as a short-term resources foray area. Another 2001 intensive survey in Ipswich, at the Eagle Hill Antenna Facility, identified Site 19-ES-744, containing both prehistoric and historical period materials. Surveys in Bedford, Scituate, and Sudbury did not result in the identification of any archaeological sites. The Notebooks and the Cultural Resources Management Plan describe the inaccuracies that were discovered in the 2002 archaeological catalogue for the sites in Hamilton and Ipswich and how these were rectified in 2003, including cataloging historical period artifacts that had not been previously recorded, revising incorrect prehistoric flake categorization, and revising incorrect paper tags for artifact bags. (See also reports #25-1409, 25-3143, and 25-3145.)

25-3145 Donohue, Barbara
2010 Results of Research Conducted on the Thomas Nelson Farm Site (19-MD-347/LEX-HA-6) in Hanscom Air Force Base, Middlesex County, Massachusetts. 64 pages.

A 3.1 acre parcel of land in Lexington within the western portion of Hanscom Air Force Base (HAFB), which had not been included in a previous specialized archaeological survey in 2007, was transferred to Minute Man National Park (MIMA). The area was considered to have high potential for battlefield debris as well as high potential for prehistoric and historical archaeological resources. Prior to the property transfer a specialized archaeological survey was conducted on the parcel that included documentary research, metal detector and magnetometer surveys, and an archaeological field investigation. Documentary research for the specialized archaeological survey revealed that the area under study or a significant section of it might hold an association with the Thomas Nelson, Sr. Farm Site (19-MD-347/LEX-HA-6). It was determined that significant landscape features possibly associated with the Battle of April 19, 1775, as well as vestiges of historical land use practices, may still exist within both the parcel being transferred to MIMA and in HAFB. The 2009 survey consisted of documentary research into primary and secondary sources and a field walkover at both HAFB and MIMA. As a result of the survey, four landscape features associated with the Thomas Nelson Farm Site, one landscape feature belonging to either Nelson or his neighbor, and two that post date Nelson's farm have been identified in HAFB. Within the par-

cel transferred to MIMA, 10 landscape features associated with the site, one landscape feature suspected to belong to either Nelson or his neighbor, and two that post date Nelson's farm have been identified. (See also reports #25-750, 25-2768, and 25-3144.)

25-3146 Stephens, Sarah Ann
2010 Modest Ministers or Posh Preachers? A Study of the Personal Adornment Collection of the Hancock-Clarke House, Lexington, Massachusetts. 135 pages.

This thesis focuses on identity and presentation and their balance with growing consumerism in a heavily religious society, in order to determine how two influential ministers, Reverends John Hancock and Jonas Clarke, were utilizing adornment and clothing throughout the 18th century. Were they displaying their power and high status through fashionable accessories or were they maintaining a modest appearance to set an example of piousness and humility for the community? Roland Wells Robbins excavated the Hancock-Clarke House site for the Lexington Historical Society in 1965-1966; however no analysis was conducted on the artifacts at that time. Fifty-four personal adornment artifacts were separated from the entire assemblage for this analysis. Each artifact was analyzed based on design and style, and the objects were dated to determine to which family they belonged. When available, documentary evidence of purchasing patterns and individual preferences was used for comparison and reference. A comparison to the tin-glaze ceramic assemblage from the excavation was conducted, as was a comparison to a high-status household's adornment collection from Portsmouth, New Hampshire. The analysis determined that the Hancocks and Clarkes were not using adornment as a method of displaying their power and status in the community. Instead, they created several public identities with their adornment to maintain leadership among various groups. When preaching, they were very humble and modest, choosing muted styles when possible and rejecting excessive fashion. When among other social groups, they recognized the power of fashion and adornment. These men were maintaining a balance between piety and presentation to represent themselves and their communities.

25-3147 Kosack, Katie L.
2010 Entertaining, Dining, and Novel Drinking: Rural Gentility and the Reverend John Hancock's Household, Lexington, Massachusetts, 1700-1750. 128 pages.

In early 18th-century Massachusetts, the rise of refined behavior paralleled the expansion of colonial markets and consumer choice. Objects related to the refined consumption of food and drink took center stage in the transformation of colonial entertaining. The availability of new foodstuffs and the associated equipage transformed sociability and the meaning of eating and drinking. These changes coupled with the high level of social mobility meant that performances with novel objects became dynamic symbols of one's social status. By examining the archaeological material from the Hancock-Clarke House excavation in 1966, specifically artifact classes including ceramic tableware, glass tableware, and assorted metal cutlery, this thesis explores how Reverend John Hancock, minister of Lexington, expressed his social status through refined entertaining. Ultimately, this research provides evidence that spiritual leaders of communities adopted the social protocols of polite society and used new status-laden goods. Genteel entertaining was a social strategy that allowed ministers to perform and solidify their social status and position in the secular community. Reverend Hancock's profession and education offered a certain level of status; however, specialized objects for entertaining suggest that Hancock was also incorporating many of the new mannerly and novel consumption protocols that became part and parcel of gentility. Reverend Hancock, as the spiritual leader of Lexington, experienced a status transformation during the first half of the 18th century, as he was economically middling but culturally elite. In many ways the social role and high level of cultural capital that ministers assumed required that they also assume polite ways of entertaining and living as a way of signaling and performing their high level of social status to those around them.

25-3148 Way, Michael A.
2010 Beef, Mutton, Pork, and a Taste Of Turtle: Zooarchaeology and Nineteenth-Century African American Foodways at the Boston-Higgenbotham House, Nantucket, Massachusetts. 159 pages.

In 1774, nearly ten years before slavery was abolished in Massachusetts, an emancipated African American weaver named Seneca Boston purchased a tract of land in the Newtown section of Nantucket. It is here that over the next thirty years Seneca Boston and his Wampanoag wife, Thankful Micah, would build a house, now known as the Boston-Higgenbotham House, and raise six children. The Boston-Higgenbotham House was home to the descendants of Seneca Boston and Thankful Micah for over one hundred years. Throughout the 19th century a vibrant and active African American community was developing in Newtown, and several generations of the Boston family played an integral role in this community's development. This thesis utilizes foodways as an entrée into the lives of these individuals through a zooarchaeological analysis of faunal remains deposited as trash from the meals they consumed. Focusing specifically on the animal components of their diets, this thesis considers the role that the foods they consumed may have played in constructing, reconstructing, and negotiating social and economic statuses and ethnicity and in challenging racist stereotypes and ideologies.

25-3149 Allard, Amelie
2010 Foodways, Commensality and Nipmuc Identity: An Analysis of Faunal Remains from Sarah Boston's Farmstead, Grafton, Massachusetts, 1790-1840. 136 pages.

The Sarah Boston Farmstead site consists of the remains of a late 18th- to early 19th-century Nipmuc household. The head of the household, Sarah Boston Phillips, was the fourth of four generations of Nipmuc women to inherit and settle on the Muckamaug parcel, the tract of land that was allotted to the family in 1728. Previous studies have suggested that Sarah Boston's house may have served as a locus for the creation of a Native, Nipmuc identity, as well as a gathering place for the members of the community wherein they could eat, drink, and converse about their daily lives and concerns. Through the analysis of faunal remains recovered on the site, this thesis aims not only to provide rare information on Nipmuc diet and foodways during this period, but also explore whether the faunal remains support the idea of the site as a place of communal gathering. This study further considers the historical context and ramifications of the adoption of animal husbandry by Native people of New England in general and by the inhabitants of the site in particular, and argues that raising livestock was for Native Americans a politically and culturally charged decision influenced by a number of interrelated historical circumstances, such as the pressures of land encroachment and missionary agendas, the cycle of debt, land sale, and indentured servitude, and intermarriages between Native women and African American men. This leads to the examination of the relationship between food, foodways, and the process of identity formation, and considers the ways in which food and related daily practices communicate Nipmuc identity on the site.

25-3150 Ferguson, Kelly A.
2010 A Macrobotanical Analysis of Native American Maize Agriculture at the Smith's Point Site. 119 pages.

The Smith's Point Site was a seasonally inhabited Native American encampment in Yarmouth, Massachusetts, occupied from the Middle Woodland through the early Colonial periods. Excavations at the site in the early 1990s yielded the remains of a multi-component site including both an agricultural field and an adjacent living area. The macrobotanical remains from the agricultural and living area features were examined for this thesis in order to investigate subsistence practices at the site. The findings show that Native Americans actively shaped these ecological niches for purposes such as maintaining and improving their subsistence base. These landscape management activities included field burning and maize agriculture. The macrobotanical data also lend insights into social dynamics at the site, specifically women's roles in shaping these landscapes. As women were the primary inhabitants, farmers, wild plant managers, and shellfishers at the site, their cumulative niche-construction activities not only nourished the community but also made a measurable impact upon the landscape and indicate horticultural innovation over time. Lastly, the use of radiocarbon dating on charred maize and bayberry remains from the agricultural field helped to pinpoint landscape management events at the site. The results suggest a Middle Wood-

land landscape-clearing event that enriched soil fertility and promoted wild edible plant growth. Agricultural remains dating to the 17th century suggest inhabitants expanded subsistence practices at Smith's Point over time, adding agriculture to their well-established seasonal round.

2010 Supplemental Archaeological Field Investigation, 115kV K-163 Transmission Line Project, Towns of Groveland, West Newbury, Merrimac, and Amesbury, Essex County, Massachusetts. 40 pages.

A supplemental archaeological field investigation was conducted for an electrical transmission line improvement project, in response to a request by the Narragansett Indian Tribal Historic Preservation Office. In the initial reconnaissance and intensive survey report, the project area was tested with a total of 161, 50 x 50 cm shovel test pits, and no pre-contact archaeological deposits were located. However, historical period artifacts were found in six areas. All artifact finds were either in disturbed contexts or interpreted as isolated finds. For the supplemental investigation, a total of 33, 50 x 50 cm shovel test pits were excavated, and no cultural material was found. (See also report #25-2953.)

25-3152 Donta, Christopher L.
2009 Archaeological Intensive (Locational) Survey for the Lot 25 Housing Project, First Discovery Road, Truro, Massachusetts. 66 pages.

Twelve 50 x 50 cm shovel test pits were excavated to test an area of impact measuring 0.63 acres. No Native American artifacts or features were encountered. No historical features were found, other than disturbance related to an abandoned roadcut, and recent period artifacts that likely date from use of the project area for outdoor gathering.

25-3153 Gillis, Nichole, and Gregory R. Dubell
2010 Intensive (Locational) Archaeological Survey and Archaeological Site Examination, Tennessee Gas Pipeline Company, Northampton Expansion Project, Southwick, Massachusetts. 212 pages.

Archaeological surveys were conducted for the proposed project involving construction of a new natural gas compressor station and pipeline connection within a 5.3 acre parcel and 0.31 acre easement. The survey resulted in the identification of one multi-component archaeological site, designated the Edwin Newton Farmstead Site. The site consists of a post-contact period fieldstone house foundation and associated cultural material, and two pre-contact loci (Pre-contact Loci 1 and 2). The remainder of the project area contained a low density of domestic and structural refuse from plow zone contexts. Both the pre- and post-contact components of the Edwin Newton Farmstead Site contained sufficient data in undisturbed contexts to be considered potentially significant archaeological resources. A portion of the site could not be avoided and an archaeological site examination was undertaken within the impact area. Pre-contact Locus 1 of the Edwin Newton Farmstead Site consists of 45 pieces of chipping debris and an Otter Creek projectile point and likely represents a single, short-term episode of late stage tool manufacture and maintenance during the early Late Archaic period. Pre-contact Locus 2 of the Edwin Newton Farmstead Site consists of one piece of rhyolite, one piece of quartz, and three pieces of quartzite chipping debris. The post-contact component of the Edwin Newton Farmstead Site is represented by an H-shaped, dry-laid fieldstone foundation, demolition debris from two possible outbuildings, and a relatively small post-contact period cultural material assemblage. The Edwin Newton Farmstead Site is considered to be a potentially significant archaeological resource given its association with the rural settlement of Southwick. The domestic core of the Edwin Newton Farmstead Site east of the current access road, including the house foundation, will not be impacted during construction.

25-3154 Pendery, Steven R.
2009 Archeological Testing for Museum Fire Suppression Water Line and Condensing Unit Pads,

Saugus Iron Works National Historic Site, Saugus, Massachusetts. 21 pages.

A project involving the installation of a fire suppression system for the recently rehabilitated museum requires construction of four-inch water lines, crossing about 15 m from the street to the building at a depth of about two m. In addition, three 1 x 1 m excavations at a depth of 10 cm from the surface are required for the emplacement of condensing unit pads immediately west of the museum annex. A ground penetrating radar survey was conducted of the project area in an attempt to locate existing disturbances to use as a corridor for the water line and to evaluate the general integrity of the area. No disturbances were found except for an existing water line; however, the immediate area west of the building and an area with tree root disturbance were detected, so the line will extend through that area. Two 50 x 50 cm shovel test pits were excavated to the east and west of the tree disturbance. Most deposits, including the earliest, contained a mixture of pre-contact lithics and late 19th- and early 20th- century artifacts.

25-3155 Skinas, David C.
2000 Intensive Archeological Investigation of the Damde Meadows Wetland Restoration Project at World's End, Hingham, Plymouth County, Massachusetts. 22 pages.

An archaeological survey for the proposed installation of culverts in two earthen dikes was conducted, consisting of three 50 x 50 cm shovel test pits and six auger cores, as well as a ground penetrating radar study of the outer dike. No cultural material was recovered and it was determined that the project as currently designed will not adversely effect any element of the 17th-century earthen dike. All ground disturbance through the outer dike will be contained within early 20th-century fill material only.

25-3156 Shaw, Leslie C., with contributions by Mitchell T. Mulholland, Tonya Largy, and Robert Hasenstab
2000 The Fox Run 3 Site: Woodland Period Adaptations on Cape Cod. 177 pages.

An archaeological excavation was conducted at the Fox Run 3 Site (19-BN-286), a prehistoric shell midden located on a protected terrace near Shoestring Bay in Mashpee. The first stage in the excavation involved two 50 cm wide trenches in the center of the site to provide long, continuous profiles. Adjacent to the two trenches, 2 x 2 m squares were excavated using an alternate-square technique. The first occupation of the site occurred during the Early Woodland period, based on non-shell deposits located below the midden, including side-notched, Small Stemmed, and Rossville lithic bifaces, rolled copper beads, and grit-tempered ceramics. A pit feature radiocarbon-dated to 2,400 ± 150 B.P (Beta-31992). contained a cache of pigment stones, deer antler, and a complete ceramic vessel. One human burial, left unexcavated, likely dates to this early occupation as well. The majority of the cultural deposits at the site are associated with the Middle Woodland period. Three Fox Creek Lanceolate and 71 triangular points were recovered from clearly Middle Woodland contexts. The Middle and Late Woodland strata include 41 features and both shell-bearing and non-shell layers. The site was occupied during the late fall through early spring, with occupants exploiting terrestrial species (predominantly deer), small anadromous fish, and shellfish. The combination of good stratigraphy, excellent preservation of organic materials, and the large artifact assemblage makes the Fox Run 3 Site an important cultural resource in the study of regional prehistory. It is recommended that the area of the Early Woodland component (the area most likely to contain human burials) be protected with a buffer area; no further archaeological treatment is recommended to the north of the burial area. (See also reports #25-821 and 25-2338.)

25-3157 Herbster, Holly, and Dianna Doucette
2006 A Cultural and Archaeological Context for the Peace Haven Site (19-BR-108), Freetown, Massachusetts. 42 pages.

The 20 acre Peace Haven Site (19-BR-108) is located just north of the Fall River town line on the eastern bank of the lower Taunton River, The site was utilized by Native Americans for more than

10,000 years, with the earliest component dating to the Early Archaic period and the most extensive occupation during the Middle Archaic period. Freetown and Fall River residents have identified this site and the surrounding sites in the area as a priority heritage landscape. The goals of this project were to gather background information about the Peace Haven Site and its surrounding area, assess the relationship of the Peace Haven Site to other archaeological resources in the vicinity, assess the site's National Register eligibility, and update the MHC site form. The Peace Haven Site, and possibly the cluster of smaller sites that surround it, appear to be eligible for listing on the National Register of Historic Places as an archaeological district.

25-3158 Handsman, Russell G.
2010 First Whalers: Wampanoag Indian Communities and the New Bedford Whaling Industry, 1825-1925. 168 pages.

Historical studies of the whaling industry in New England assume that native whalers dramatically decreased in number throughout the 18th century. In this research report, the author rejects this notion by extensively researching 19th-century Wampanoag whalers based in New Bedford, tracing individuals through crew lists, diaries, journals, and ledgers to document their continued participation in the industry into the early 20th century. Close analysis of whaler lists allows for the study of Native communities at sea, as well as the tracing of Wampanoag individuals' movements between ancestral communities and New Bedford. The author concludes that in the first half of the 19th century, relatively large numbers of Wampanoag individuals were whalers based in New Bedford. Little evidence suggests that an Indian enclave or community existed in New Bedford, suggesting the maintenance of close ties with ancestral homelands. In the second half of the 19th century, the rise of industrialization and urbanization created increased worldwide demand for whale-based lubricants and illuminants, necessitating longer whaling voyages and larger ships. This shift in voyage length likely led to more permanent Wampanoag households within New Bedford, which were clustered together in neighborhoods but were never exclusively Indian enclaves. The author suggests that this trend indicates that ancestral communities, homelands, and histories "back home" were still the core of these individuals' cultural identities, even when they lived in New Bedford. By the early 20th century, as New Bedford's economy shifted from its reliance on whaling, the "urban Indians" of New Bedford more often were occupied as farmers and laborers than whalers. In his conclusion, the author presents four core ideas about whaling that were enriched, challenged, or transformed by his study: 1) the long history of Wampanoag Indian whaling took place within an ancient world of social and cultural landscapes; 2) the history of Wampanoag Indian whaling needs to be a profoundly historical enterprise; 3) as a group, whalers of color may not have had common or similar experiences despite being assigned a shared, race-based identity; and 4) ancestral place and community are key concepts in exploring the lives and experiences of Indian whalers.

25-3159 Kirakosian, Katharine V., Angela M. Labrador, and Siobhan M. Hart
2011 Summary Report on 2008 Archaeological Investigations, Eaglebrook Area D Site (19-FR-415), Deerfield, Massachusetts. 141 pages.

During the 2008 field season, students and teaching staff conducted archaeological reconnaissance at the site as a continuation of professional testing conducted in 2006 and 2007. In total, 42 test units of varying sizes were excavated within the project area, totaling 24.55 m^2. Twenty features and over 15,500 individual artifacts were documented through excavation and soil flotation. Documented features included two refuse pits with associated postmolds, two refuse pits without postmolds, one possible postmold, the base of a fire hearth, and 11 unexcavated features of varying size. Flotation samples from two refuse pits with associated postmolds were analyzed by an archaeobotanist. Feature soils contained a range of artifacts, including cut brass, fire-cracked and reddened rock, glass trade beads, Native American ceramics, white clay pipe fragments, animal and fish bones, freshwater and marine shell, charred flora (including maize), lithic debitage, one flaked biface, and one piece of wampum. The 2008 findings support previous conclusions that a significant number of subsurface features are intact in the project area. The pattern of large, circular features in close proximity across the project area suggests there was an intense period of oc-

cupation(s) at this site, which necessitated varied resource storage and processing. The site's artifacts could be broadly grouped into two different occupational periods: Native American presence during the late 16th to mid-17th centuries, and an agricultural component consistent with other European-American sites of the late 18th to mid-20th centuries. (See also report #25-2773.)

25-3160 Dudek, Martin G., and Thomas P. Mailhot
2011 An Archeological Intensive (Locational) Survey for the Relocation of the Caesar Robbins House in the Town of Concord, Middlesex County, Massachusetts. 89 pages.

Archaeological testing within the relocation area consisted of 38, 50 x 50 cm test pits at 5 m intervals. Excavations led to the identification of a former roadbed, parking lot disturbance, and a former agricultural field, with a mix of 18th- to 20th-century artifacts recovered primarily from the plowzone or fill. The materials represent field trash and modern activities. A Native American site, the Robbins House North Locus Site, was discovered on the northern edge of the project area. The site consists of a low density (eight artifacts) of quartz and rhyolite debitage and a quartz core, with seven artifacts recovered from the plowzone and one rhyolite flake from the B horizon. The site appears to continue into wetlands north and west of the project area.

25-3161 Donohue, Barbara
2011 Archaeological Monitoring Report of Construction Activities at the Eustis Street Firehouse, Roxbury, Massachusetts. 29 pages.

As a result of a site examination archaeological survey for construction activities associated with the restoration of the Eustis Street Firehouse in the Roxbury neighborhood of Boston, two grave shafts as well as the articulated remains of three unmarked burials were revealed. The firehouse, constructed in 1859, is located within the original boundaries of the Eliot Burying Ground dating to 1630. One of the recommendations of the site examination was that an archaeologist be present to monitor construction-related excavations associated with the proposed project. Archaeological monitoring revealed 11 features associated with the burial ground and former activities associated with the firehouse, four of which may be associated with intact human burials. It is recommended that the locations of all features associated with unmarked human burials and those features that cover the possible burials be mapped on the final project plans so that their location will be protected in perpetuity. (See also report #25-3128.)

25-3162 Blancke, Shirley B.
2011 A Report on the H.C. Wheeler Collection of Native American Artifacts, Concord Museum, Concord, MA. 13 pages.

A research project was aimed at identifying the provenience of a 19th-century collection of Native American artifacts attributed only to an "H.C. Wheeler" that were allegedly surface collected from sites near the Concord River. Through genealogical research as well as contact with current Wheeler family members, it was possible to associate the collection with H.C. Wheeler who lived at the Thoreau (Birthplace) Farm from 1883 to 1915 and was known to be an avid collector. The collection is comprised of 725 stone artifacts, only 92 of which can be linked to the Thoreau Farm specifically. These 92 artifacts include a wide range of projectile points from the Middle and Late Archaic periods as well as the Early and Middle Woodland periods, suggesting the presence of multiple short-term camps of hunter-gatherer peoples over thousands of years. Although three ancient Native American sites have been identified within one mile of the Thoreau Farm (19-MD-472, 19-MD-86, and 19-MD-87), the provenance of the collection can neither be confidently established at any of these sites nor on any specific area within the farm land itself.

25-3163 Lavin, Lucianne
2011 Mohicans Past & Present: A Study of Cultural Survival. 38 pages.

Located at the Stockbridge Mission House, artifacts collected from Stockbridge Mohicans living in Wisconsin between 1929 and 1937 along with associated documents show that although they

had been Christianized, victimized, and precariously depopulated through European diseases, poverty, and warfare over the past 300 years, the Mohicans remained a tribal community throughout the historical period. They achieved this through adherence to core cultural and spiritual traditions and strong leadership that focused tribal members on several key survival strategies, which allowed the Mohican people to remain together physically and politically. Their story is one of courage and persistence in the face of seemingly unbeatable odds.

25-3164 Cox, J. Lee, Jr., Joel I. Klein, T. Arron Kotlensky, and Douglas C. McVarish
2011 Phase II Investigation of Target M4/S5, Proposed South Terminal Marine Infrastructure Park, New Bedford, Massachusetts. 79 pages.

Underwater archaeological investigation of a shipwreck located within sub-tidal areas of the New Bedford Harbor, combined with documentary research, assisted in establishing the identity of the wreck. The wreck has been confirmed as the *Thomas H. Lawrence*, a three-masted schooner constructed in Boston in 1891, retrofitted in 1939 and abandoned in New Bedford Harbor in 1940. The abandoned vessel burned and sank in 1941 at the foot of Potamska Street in New Bedford. Data collected from the underwater investigation and through historical research was used to evaluate the significance of the wreck. The archaeological research potential of the *Thomas H. Lawrence* wreck site is very limited. In addition to the vessel having burned prior to sinking, the site's integrity has been seriously diminished by dredging activities and the effects of ice and storms in New Bedford harbor. No evidence was found suggesting the *Thomas H. Lawrence* was associated with a significant event.

25-3165 Waller, Joseph N., Jr., and Michael J. Hubbard
2011 Intensive (Locational) Archaeological Survey, Brewster Wind Energy Turbine A, Brewster, Massachusetts. 70 pages.

Archaeological investigation of the sensitivity of the project area concluded that Wind Turbine A is situated within an environmental and geographic setting known to correlate with Native American site locales. Excavation of 20, 50 x 50 cm shovel test pits within the approximately two acre area did not yield any cultural materials or locate any cultural features.

25-3166 Herbster, Holly, and Erin Flynn
2011 Intensive (Locational) Archaeological Survey, Zoia Property, Chilmark, Massachusetts. 72 pages.

The archaeological survey consisted of 40, 50 x 50 cm shovel test pits excavated within the proposed 1.8 acre project area. The subsurface testing resulted in the recovery of 162 pieces of cultural material, including 129 historical and modern period artifacts and 33 pieces of quartz and rhyolite chipping debris. No artifact concentrations or cultural features were identified. The cultural materials were collected in disturbed A/landscaped soils and in fill deposits. The lack of site integrity combined with a lack of diagnostic tools or features limits the information potential of the site.

25-3167 Dudek, Martin G., and Thomas P. Mailhot
2011 Archeological Monitoring for Percolation Tests for Proposed Septic System Improvements at the Codman Estate, 34 Codman Road, Town of Lincoln, Middlesex County, Massachusetts. 42 pages.

Archaeological testing for a proposed septic system involved excavation of five backhoe trenches for geotechnical and percolation data. Archeological monitoring and documentation of the trench excavation identified artificial terrace landscaping at the two trench locations south of the 18th-century Codman House, soil truncation at two trench locations in a field east of the house, and several feet of historic fill east of the house. The historic fill was associated with brick and mortar rubble from a demolition event, possibly chimney replacement.

25-3168 Waller, Joseph N., Jr., Michael J. Hubbard, and Alan Leveillee
2009 Intensive (Locational) Archaeological Survey, South Hadley Landfill Expansion Project, South Hadley, Massachusetts. 81 pages.

An archaeological survey of the 21 acre expansion area included background research and the excavation of 109, 50 x 50 cm shovel test pits in areas assessed as having moderate to high sensitivity for containing archaeological resources. No cultural materials were identified.

25-3169 Robinson, David S.
2010 Marine Archaeological Documentation and Assessment, New Bedford Harbor Superfund Site, Unanticipated Shipwreck Discovery, New Bedford Upper Harbor, Acushnet, Massachusetts. 167 pages.

In response to the discovery of an unanticipated shipwreck, a marine archaeological investigation was undertaken. This investigation involved performing a marine remote sensing field survey to assess site integrity and identify additional shipwreck elements potentially still lying on the harbor floor, the subsequent recovery of identified additional shipwreck elements, the documentation and analysis of hull timbers and artifacts recovered from the site, and archival research to identify the wreck. The study resulted in the identification, recovery, and documentation of the ship's remains, and the assessment that the site lacked contextual integrity. The recovered hull components and artifacts were determined to be either too degraded and/or too contaminated to be conserved and curated. Archival research in combination with the analysis of the remote sensing survey and archaeological data suggests that the wreck dates from the late 18th century and likely represents the remains of a once-common class of ship, the 100-ton inter-colonial-West Indies merchant vessel. The discovered ship remains appear to be those of a vessel that was abandoned at the end of its service life and left derelict on the eastern edge of the Acushnet River.

25-3170 Dudek, Martin G., and Thomas P. Mailhot
2011 Archeological Intensive (Locational) Survey for the Proposed Site of a Telecommunications Monopole Facility, 59 Thresher Road, Town of Hardwick, Worcester County, Massachusetts. 73 pages.

The archaeological survey tested the proposed location of the monopole facility, access drive, and underground utility easement. The excavations included 15, 50 x 50 cm shovel test pits, consisting of a 30 m block of nine test pits at 10 m intervals and 6 judgmental test pits. No cultural material was recovered.

25-3171 Cook, Lauren J.
2011 Archaeological Monitoring, 73 Ocean Grove Ave., Swansea, Bristol County, Massachusetts. 42 pages.

Archaeological monitoring was conducted to identify archaeological resources, specifically potential ancient Native American burials, within the project area for a proposed cellular telecommunications compound. The excavations monitored included the 7 x 7.5 m tower foundation area and a 50 x 1.5 m utility trench. Plans were prepared showing the locations and depths of features, and representative profiles (the west and south walls of the compound and tower excavations, and the south side of the trench) were prepared. Soil profiles indicated that the area was intensively disturbed by the construction of a parking area in the 1980s. In all, 11 features were recorded in the footprint of the compound, and three in the utility trench. Six features were interpreted as planting holes, which exhibited irregular morphology and various fills around clearly identifiable root casts. Four features were identified as filled disturbances associated with the construction of the parking lot and landscaping activities in the adjacent verge. The latter features contained diagnostic material, including beer bottle fragments, candy wrappers, ice cream bar wrappers, and asphalt fragments, all dating to the second half of the 20th century. The final feature was initially identified as a possible posthole, but proved to be a geophysical test boring that was drilled as part of the present project. Three additional features were encountered during the excavation of a utility

trench on the property. Two of these were pipe trenches leading from the Legion Hall to a nearby leach field; the third was a filled trench, possibly associated with the leach field itself. No significant archaeological features or deposits were noted. All material and features recovered dated to the mid- to late 20th century.

25-3172 Barnes, Ruth Carol
1972 Bear Swamp 2, A Preliminary Report. 559 pages.

Archaeological excavations at the Bear Swamp 2 Site (19-BR-119) in Berkley, Massachusetts, occurred ahead of highway reconstruction-related activities in 1970. The site was located in what was then an abandoned field about 400 ft long and 230 ft wide, and the surrounding area was known to have been heavily occupied in the ancient period, with previously documented Native American sites nearby including the Late Archaic Bear Swamp 1 Site and, Sweets Knoll, an Early Woodland site. Based on the lack of pottery and shells in the artifact assemblage, the site was thought to represent a Late Archaic single-component campsite. The archaeological food remains, including bird and animal bones, nuts, and seeds, indicate that the site may have been used as a camp during fall and winter hunting expeditions. The recovery of a variety of projectile point types, including triangular points, long, slender stemmed point, and short, stubby stemmed points suggests that the site might have been occupied on at least three separate occasions, although temporal overlap between some of these tool types was recognized. Other lithic artifacts from the site included quartz knives, atlatl weights, hammerstones, paint cups, and gouges. The only features at the site that could potentially provide insight into the housing at the site were reddened areas, which may represent house floors, and deep pits which could potentially have been used as shelters. Excavations also resulted in the discovery of charcoal pit features, hearth features, and garbage pits. In terms of the spatial occupation of the site, the first group to come to Bear Swamp may have camped near its bank and used triangular points and atlatl weights; over time this group may have discovered better resources on the hillside and experimented with slightly modified stone tools in order to better exploit these resources.

25-3173 Laskoski, Gregg, and Holly Herbster
2011 Intensive (Locational) Survey, Industrial Tower & Wireless Upton Cell Tower, Upton, Massachusetts. 58 pages.

An archaeological survey of the 4,096 ft^2 monopole tower compound and an approximately 100-foot-long access roadway involved the excavation of 31, 50 x 50 cm shovel test pits. No cultural materials were identified.

25-3174 Herbster, Holly
2011 Intensive (Locational) Archaeological Survey, Osprey Ridge Residential Parcel, Assessors Map 35, Lot 17-2, Chilmark, Massachusetts. 74 pages.

An archaeological survey was conducted of the approximately 13,500 ft^2 parcel in the Squibnocket Ridge section of Chilmark. Two previously identified Native American archaeological sites (19-DK-61 and 19-DK-93) are located within and/or adjacent to the property, and unmarked human burials have been identified in adjacent areas. Seventeen 50 x 50 cm shovel test pits were excavated, followed by machine-assisted topsoil stripping across all proposed impact areas. A low density of chipping debris, a single biface, and shell fragments were collected in addition to the identification and mapping of 20 cultural features. No feature excavation was conducted. The Native American deposits are all likely associated with the previously identified Hornblower I and/or Hornblower Shellheap Sites.

25-3175 Waller, Joseph N., Jr., and Alan Leveillee
2011 Cultural Resources Review and Assessment, USDA-NRCS Cape Cod Improvement Projects, Barnstable County, Massachusetts. 107 pages.

An archaeological assessment survey was conducted for the 19 proposed stormwater management,

five salt marsh restoration, and five fish passage improvement projects in Barnstable, Bourne, Brewster, Eastham, Falmouth, Harwich, Mashpee, Orleans, Provincetown, and Wellfleet, Massachusetts. This survey included cultural resource database and literature review and site visits to assess the archaeological sensitivity of the proposed work areas. The Bay Street and Little River Road (Barnstable); Barley Neck Road, Gilman Lane, and Quanset Pond Landing (Orleans); Ellis Road (Eastham); and Saint's Landing and Paine's Creek Road (Brewster) practices are located in areas assessed as archaeologically sensitive. Archaeological monitoring of construction was recommended at each of these practices. The Holway Axe Factory is located in Bourne within an area of 17th-century Native American occupation and late 17th- through early 20th-century occupation and industrial activity. Intensive archaeological survey, including documentary research and subsurface testing along the proposed fishway, was recommended. The Santuit Pond practice is located along the southern impoundment of Santuit Pond in Mashpee. The site assessment visit and walkover established that 19th-and 20th-century cultural features are located within the planned improvement area. Historical features may be significant, and additional documentary research and detailed mapping and photo-documentation of the structural features were recommended.

25-3176 Donta, Christopher L., Marni Blake Walter, F. Timothy Barker, Antonio Medina, and Broughton Anderson
2011 Archaeological Reconnaissance, Intensive (Locational), and Site Examination Surveys for Lattice Structure Replacements in Peru, Windsor, Plainfield, Ashfield, Amherst, and Granby, Massachusetts. 177 pages.

Background research and surveys identified 15 areas of archaeological potential out of 39 replacement locations. Subsequent subsurface testing was conducted at the 15 locations in Windsor, Plainfield, Ashfield, and Amherst, resulting in the identification of one archaeological site in Amherst. Testing at Strong Street Native American Site resulted in the excavation of 43, 50 x 50 cm shovel test pits and one 1 x 1 m excavation unit across the site. Artifacts found consist primarily of chert and quartz chipping debris, associated with a burn feature radiocarbon dated to 1750 ± 40 B.P. (Beta-289041), in the Middle Woodland period. This site appears to be a small, perhaps seasonal campsite where Native Americans engaged in subsistence related activities such as tool sharpening, hunting, and food preparation.

25-3177 Doucette, Dianna L.
2008 Intensive (Locational) Archaeological Survey, Spring Street Access Road Project Area, Carver, Massachusetts. 74 pages.

Archaeological investigations were conducted along a proposed access road measuring 900 ft long by 60 ft wide. Thirty-five 50 x 50 cm shovel test pits were excavated along three judgmental transects and within three test pit arrays. Subsurface testing yielded historical cultural material from two test pits and pre-contact cultural material from one test pit. Historical cultural material included window and bottle glass, brick fragments, earthenware, and nails. One piece of chipping debris was recovered from the B_2 soil horizon, designated Findspot 1. No additional cultural material was recovered. The isolated piece of chipping debris likely represents stone tool resharpening or manufacturing of an expedient tool such as a scraper or knife.

25-3178 Dudek, Martin G., and Thomas P. Mailhot
2011 Archeological Intensive (Locational) Survey for National Grid's E157 Transmission Line Project, Westborough, Massachusetts. 73 pages.

Archaeological survey consisted of the excavation of 35, 50 x 50 cm shovel test pits at 10 m intervals and two judgmental test pits for proposed work areas. Only isolated historical and modern artifacts were recovered. No archaeological sites were identified.

25-3179 Flynn, Erin, and Holly Herbster
2011 Intensive (Locational) Survey, New Telecommunications Facility (BN537/Crescent Farm), Haverhill, Massachusetts. 63 pages.

The proposed project will include the construction of an approximately 125 ft monopole tower within a 75 x 75 ft enclosure. The project will also include the construction of an approximately 1,800 ft access easement and approximately 1,010 ft underground utility corridor. Twenty-five 50 x 50 cm shovel test pits were excavated along four linear transects at 10 m intervals. No archaeological deposits were identified.

25-3180 Smith, Leith
2011 Report on the Archaeological Site Examination of the Cistern Room, Furnace Room, and Blower Unit Locations in the Mansion House Cellar at Gore Place, Waltham, Massachusetts. 55 pages.

A landscape and structural restoration plan for the 45 acre historic estate recommended archaeological investigations to identify the location, character, and integrity of Gore-period features that could potentially be included in restoration efforts. Recommendations included investigation of the mansion's extensive cellar, better understanding the functioning of cellar spaces, and identifying sources of moisture that needed to be addressed as part of the restoration work. Cellar investigations began in 2008 and focused on the cistern room, new furnace locations in the furnace room, and heating blower unit locations in the servant's food preparation room, the cellar under the east entryway, and under the library. Work in the cistern room revealed the former presence of a marble tile floor 50 cm below the present floor surface, suggesting this room may have functioned as a dairy during the Gore period. The floor was removed and replaced by sand and gravel fill possibly to alleviate moisture problems due to fluctuating levels of ground water. Opening of one excavation unit in the servant's food preparation room revealed intact brick flooring that likely dates to the Gore period or earlier. Investigations in the furnace room found that the two brick pavements likely date to the Gore period and to the later 19th century respectively, and artifact-bearing deposits that contain construction/demolition rubble, ceramics, and glass of the pre-Gore and Gore periods. Work in the cellar under the east entryway found a Gore or pre-Gore period floor surface consisting of 3 cm of dark brown loam as well as a stone-lined passage that may have carried air to a late 19th-century furnace and possibly to a Gore-period chimney. Opening of one unit in the cellar under the library revealed a brick floor and brick partition wall that date to the pre-Gore or Gore period. Future work on a room-by-room basis will focus on developing a better understanding of these deposits and features. (See also reports #25-2717, 25-2823, 25-2845, 25-3070, and 25-3185.)

25-3181 Elquist, Ora, and A. Peter Mair, II
2010 Intensive (Locational) Archaeological Survey, Uxbridge High School, Uxbridge, Massachusetts. 109 pages.

The archaeological survey conducted included archival research, a walkover survey, and subsurface testing. The excavation consisted of 202, 50 x 50 cm shovel test pits along 17 judgmental linear transects, six 30 x 30 m blocks, six test pit arrays, and six judgmental test pits. Archival research revealed that the project area is in close proximity to the previously documented and significant ancient Lavallee Site 2 (19-WR-880), and the historic Blackstone Canal and associated historical features. The proposed area of project impacts will not have an effect on either of these resources. Subsurface testing resulted in the identification of four findspots. Findspot 1 consists of an isolated unidentified rhyolite projectile point fragment and Findspot 2 consists of four pieces of quartz and quartzite chipping debris recovered from a single test pit. Findspots 3 and 4 each consist of one piece of quartz chipping debris. The recovered Native American materials may represent brief visits to the uplands west of the Blackstone River for resource procurement by occupants of the nearby Lavallee Site 2. Activities associated with these brief visits include hunting forays as evidenced by the projectile point fragment find, and brief episodes of stone tool manufacture and/or maintenance represented by the chipping debris. (See also report #25-3183).

25-3182 Ritchie, Duncan
2011 Intensive Archaeological Survey, T-Mobile 2G Telecommunications Facility, Site No. 4BS-0442-I NSTAR, Wayland, Massachusetts. 69 pages.

An archaeological survey was conducted of the 3 x 200 ft utility and access easement as well as the 13 x 23 ft equipment lease area. The project area was close to but outside of the eastern boundary of the Wayland Center Railroad Complex (WAY-HA-4), located where the Boston & Maine Railroad easement reaches the west edge of Millbrook Road. Archival research indicated the project area is within a core area of Native American settlement centered on the Sudbury River and Mill Brook. A local informant identified three structures that were formerly located near the project area in the first quarter of the 20th century, including a crossing tender's shanty located adjacent to Millbrook Road, a grain company building on a siding directly east of Millbrook Road and north of the project area, and a small wood frame hand car house on the southern side of the Boston & Maine Railroad easement. Based on a walkover inspection, the Boston & Maine Railroad easement was built on artificial fill, but a majority of the project area had some potential to contain intact natural subsoil horizons under deposits of fill. Subsurface testing consisted of 11, 50 x 50 cm shovel test pits excavated at 10 m intervals along a single judgmental transect. Sixty-nine artifacts recovered from test pits consisted of coal, coal ash, clinker/coke, ceramic sherds (redware, creamware, whiteware), clear or aqua colored bottle glass, and structural materials (brick, window glass, iron wire, bolt, nail).

25-3183 Banister, Jennifer Bonner, and A. Peter Mair, II
2007 Intensive (Locational) Archaeological Survey, Blackstone River Bikeway, Section 2, and Archaeological Site Examinations, River Road Site 1, River Road Site 2, Lavallee Site 1, and Lavallee Site 2, Millville and Uxbridge, Massachusetts. 126 pages.

Archaeological surveys resulted in the identification of Native American archaeological sites named River Road 1&2 Site (19-WR-896) and Lavallee Sites 1 & 2 (19-WR-897 and –880, respectively). A site examination investigation was completed for each of the sites. These investigations resulted in the collection of 2,547 pieces of chipping debris, 33 chipped-stone tools (13 projectile points, 12 bifaces, one scraper, four cores, three worked flakes), four steatite sherds, seven fire-cracked rock, one granitic cobble, one quartz cobble, one graphite raw material, 10 calcined bone, one fish vertebrae, four shell, and charcoal. One definitive cultural feature was also identified, which yielded an Early Woodland radiocarbon date of 1,850 ± 40 B.P. (Beta-225494) and a Late Woodland radiocarbon date of 920 ± 40 B.P. (Beta-225495). The majority of the cultural material was recovered in intact, well-drained soils. The River Road Site and the Lavallee Site 2 contained significant evidence to yield information about cultural continuity, settlement patterns, and subsistence practices spanning the Late Archaic to Late Woodland time periods. Based on the amount of chipping debris recovered, lithic manufacturing appears to be the predominant activity at these sites. Evidence of features consisting of charcoal smearing, reddened soils, and the presence of calcined bone and fire-cracked rock further suggests a more intensive use of the sites beyond stone tool production.

25-3184 Mulholland, Mitchell T., and Margaret Kelly
2011 Archaeological Consultation for the Massachusetts Town Commons Preservation Initiative. 165 pages.

The Town Commons Preservation Initiative was sponsored by the Department of Conservation and Recreation to provide information to municipalities useful in planning for future use of and construction on town commons. The project provided technical assistance to communities to assess the historic potential of commons, assess their condition, threats, and pressures, and to establish methodologies for repairing, restoring, preserving, and revitalizing commons. This document presents the result of the archaeological component of the project. The project evaluated 26 town commons for their potential to contain archaeological sites (some in more detail than others), and made recommendations for avoiding inappropriate impacts to site. The town commons that were evaluated include Acushnet, Ashby, Brimfield, Cambridge, Douglas, Fitchburg, Framingham, Haverhill, Lawrence, Leominster, Lexington, Ludlow, North Andover, Northbridge, Northfield, Norton, Salem, Shirley, Springfield, Sturbridge, Taunton, Wareham, West Bridgewater, Westfield, Whitman, and Yarmouth. The study involved background research, interviews and a walkover in-

spection.

25-3185 Beranek, Christa M., J.N. Leith Smith, and John M. Steinberg
2011 Data Recovery Excavations of the Carriage House, Greenhouse, and Greenhouse/Carriage House Well at Gore Place, Waltham, Massachusetts. 222 pages.

Excavations and ground penetrating radar survey at Gore Place examined the original 1793 carriage house site, the 1806 greenhouse, and the greenhouse/carriage house well, all associated with Christopher and Rebecca Gore. The carriage house was moved in 1968, and its cellar was filled at that time. Mechanical removal of the fill in a portion of the carriage house cellar revealed that the lower portion of at least the rear (north) foundation wall is well preserved along with the cellar floor. Documentary evidence indicated that the carriage house cellar had been used for manure (compost) preparation, while the first floor was used to house horses and to store gardening tools and firewood. Four 1 x 1 m excavation units set into the cellar floor revealed no evidence of its former use for manure production (such as organic staining), indicating that it had been thoroughly cleaned. The artifacts present in the floor units represent a considerable time period from that of the Gores through the early 20th century. The majority of objects date to the Gore period, and the wide variety may reflect the incorporation of refuse into manure production. Investigations north of the structure showed that some of the soil in the parking lot constituting the western portion of Gore's vegetable garden was removed and replaced with a uniform mixture of sand and gravel, probably at the time the carriage house was moved. While the gravel is at least 2 m deep close to the carriage house foundation, its depth lessens with distance northward, as indicated by soil profiles from shovel testing in 2004. Early 19th-century maps indicated that the greenhouse was roughly 18 m long and up to 6.5 m wide with a small extension on the west end. Thirteen contiguous 2 x 2 m excavation units were excavated at the west end, uncovering the trapezoidal brick floor of the extension and an associated stone drain; ground surfaces contemporary with the greenhouse; post holes for a fence that separated the greenhouse area from the carriage house; layers relating to the greenhouse's destruction (early 1840s); and, later landscaping features including a stone wall and two drains. Documentary, archaeological, and geophysical data suggest that the greenhouse was a formal space intended to grow and display exotic plants and that it was built in the relatively new lean-to style, with a tall back wall and short front wall. The artifact assemblage includes architectural elements, tools and small finds related to the greenhouse operation (including the remains of at least 149 planting pots), and bone stockpiled for soil enrichment. The greenhouse was constructed by the Gores during a period of intense interest in agricultural experimentation by members of the Massachusetts commercial and political elite. Scholars have argued that these men used the positive associations of agriculture to offset some of the contemporary negative connotations of commerce. This report examines the greenhouse as a space for the display of exotic plants in the context of this scientific agricultural movement and posits that Rebecca Gore may have played a significant role in managing it. (See also reports #25-2717, 25-2823, 25-2845, 25-3070, and 25-3180.)

25-3186 Ritchie, Duncan, and Matthew Kierstead
2009 Archaeological Reconnaissance Survey, Graniteville Woods Subdivision, Westford, Massachusetts. 185 pages.

An archaeological survey of the approximately 104 acre project area included archival research on both ancient and historical period settlement/land use and a walkover inspection to evaluate its archaeological sensitivity. Photo-documentation of two standing residential structures scheduled for demolition (WSR.343, WSR.344) on North Main Street within the Graniteville Area (WSR.F) was also carried out. Four previously recorded historic granite quarries (Samuel Fletcher Quarry [WSR.901], Benjamin Palmer Quarry [WSR.929], William Reed Quarry, and David Reed Quarry) are within or adjacent to the project area. The 31 previously unrecorded granite quarries and related features identified in this survey are within three clusters or groups. Archival research indicated that much of the project area was used for granite quarrying on Snake Meadow Hill from the early 19th century to the first half of the 20th century. Features associated with this activity include quarry pits, waste/grout piles, derrick or engine bases, iron anchor pins, trim shed sites, earth

fill and granite block ramps, and haul roads. The area also contains zones of high and moderate sensitivity for Native American archaeological resources, including a potential rockshelter, as well as unrecorded Native American sites such as single findspots of chipped-stone tools and small or moderate-sized temporary campsites.

25-3187 Parno, Travis
2011 Report of the Second Season of Archaeological Testing at the Fairbanks House Property, 511 East Street, Dedham, Massachusetts. 229 pages.

In May 2010, a second season of archaeological assessment was conducted at the Fairbanks House property, with the central goal of investigating a cobble-floored feature that was identified during the 2009 field season. The investigation focused on an area approximately 8 m north of the Fairbanks House (c.1641) where previous excavation of three test units had located portions of a cobble floor and stone foundation. Seventeen test units ranging in size from 1 x 1 m to 1 x 3 m (a total excavation area of 44m^2) were excavated according to natural stratigraphic layers. Excavation was terminated either at the feature's cobble floor or at the underlying subsoil. The more than 20,000 artifacts recovered from the fieldwork date predominantly from the late 18th century to the mid-20th century. Included within the assemblage were ceramic, glass, metal, and composite/organic/mineral/stone/synthetic artifacts. Excavations revealed a substantial structural feature, tentatively identified as a barn based on its large size (measuring approximately 7.25 m x 6.75 m), constructed with a robust stone foundation and a floor of densely packed cobbles. A thick layer of furnace refuse and artifacts covering the floor and foundation was probably deposited or moved there following the deconstruction of the building's superstructure. A thin slot trench was excavated between the house and the feature (centered on an 18th-century door at the back of the house), but no path or architecture connecting the two structures was found. Based on archaeological and documentary evidence, the barn was constructed sometime in the late 18th century and was used until its destruction in the mid-19th century (between 1842 and 1870), after which the area was filled with domestic refuse. An interpretive sign could be placed near the current barn foundation outline to explain the findings and their significance for Fairbanks House visitors. (See also reports #25-850, 25-1139, and 25-3072.)

25-3188 Curran, Kathryn, F. Timothy Barker, and Mitchell T. Mulholland
2011 Archaeological Phase 1A Reconnaissance and Phase 1B Intensive (Locational) Survey for Lucia Lumber Equipment and Material Storage Yard in Agawam, Agawam to West Springfield Circuit Separation Project. 51 pages.

Archaeological surveys were conducted to assess a 0.9 acre parcel of land to be used as an equipment and storage area during construction of electrical transmission line upgrades. After completing background research and a walkover of the project area, subsurface testing was conducted in undisturbed portions of the property. Twelve 50 x 50 cm shovel test pits were excavated to the depth of culturally sterile soil. No cultural materials were found.

25-3189 Mair, A. Peter, II
2011 Intensive (Locational) Archaeological Survey, Kenneth F. Burns Memorial Bridge Replacement, Shrewsbury and Worcester, Massachusetts. 88 pages.

Subsurface testing, consisting of four 50 x 50 cm shovel test pits in an ca. 10,000 ft^2 area on Ramshorn Island produced only modern artifacts in fill deposits. (See also report #25-3190.)

25-3190 Robinson, David S., and Jeffrey D. Gardner
2011 Marine Archaeological Reconnaissance Survey, Kenneth F. Burns Memorial (Route 9) Bridge Replacement Project Over Lake Quinsigamond, Shrewsbury and Worcester, Massachusetts. 96 pages.

A marine archaeological survey of the underwater portion of the proposed bridge replacement involved research, marine remote sensing survey, and a visual/tactile survey by an archaeological

diver to identify submerged archaeological deposits within the underwater project area. As a result of the survey, the anticipated underwater project area was assessed to be situated within a region that possesses high archaeological sensitivity for containing submerged archaeological deposits; however, the area contains no previously identified archaeological deposits. Comprehensive survey coverage revealed that the majority of the underwater area was disturbed/buried as a result of impacts related to the construction and partial destruction of an earthen causeway across the lake that preceded the current bridge. The surveyed area included one sidescan sonar target and 28 magnetic anomalies, none of which were interpreted to be potentially significant. (See also report #25-3189.)

25-3191 Elam, Jenifer C., Suzanne G. Cherau, Laura J. Kline, and Virginia H. Adams
2011 Intensive (Locational) Archaeological Survey and Historic Architecture Survey, Proposed US Attleboro Army Reserve Center, North Attleborough, Massachusetts. 82 pages.

Archival research and field survey of the 27 acre project area were conducted, including a walk-over survey which determined that severe earthmoving disturbances had occurred in the northern two-thirds of the project parcels. Subsurface testing was conducted in the form of thirty 50 x 50 cm shovel test pits placed at 10 m intervals along judgmental transects and as judgmental test pits. No cultural material was recovered.

25-3192 Mair, A. Peter, II
2011 Intensive (Locational) Archaeological Survey, Plymouth Municipal Airport Runway Extension Project, Plymouth, Massachusetts. 104 pages.

An archaeological survey was conducted within three areas of proposed improvements in sensitive areas as determined in a reconnaissance survey conducted across the entire 700 acre airport parcel in 2003. During the survey, 102, 50 x 50 cm shovel test pits were excavated at 10 m intervals using nine test pit transects and six judgmental test pits. The low density of historical material found was interpreted as field trash. (See also reports #25-1321 and 25-2370.)

25-3193 Herbster, Holly
2011 Intensive (Locational) Archaeological Survey, Delano Trust Property, 10 State Road, Tisbury, Massachusetts. 88 pages.

The Vincent Site (19-DK-21) is located within and/or in proximity to the Delano Trust Property. The Vincent Site was partially excavated by William Ritchie in 1966 and contains Late Archaic through Late Woodland deposits indicative of a seasonal habitation site. An archaeological survey was completed on the adjacent State Road parcel in 2007 and additional information was collected about the Vincent Site. The survey included machine-assisted removal of several feet of sand fill and hand excavation of 11, 50 x 50 cm shovel test pits at 5 m intervals. Subsurface testing resulted in the recovery of 698 pieces of highly fragmented Native American and historical period cultural material collected from both previously disturbed soil contexts, and from intact shell midden deposits and subsoils. One Late Woodland Levanna fragment and a pottery sherd were collected in addition to historical and modern materials. The midden materials were interpreted as components of the Vincent Site. (See also report #25-2742.)

25-3194 Chartier, Craig S.
2011 Wareham Townwide Reconnaissance Archaeological Survey Planning and Review Process Project, Wareham, Massachusetts. 3 volumes. 300 pages.

The archaeological survey had three main objectives: 1) to define areas of archaeological and historical sensitivity; 2) to develop a town-wide archaeological map and user's guide; and 3) to develop a town-wide by-law amendment and establish a review process for the Wareham Historical Commission. The town was evaluated for its archaeological sensitivity and each area was ranked as to the likelihood and types of archaeological sites potentially present. Three areas containing significant archaeological sites and the potential for other significant sites were recommended for

the creation of archaeological districts. Six other areas having a high ancient period archaeological sensitivity (due to topographic features and proximity to known archaeological sites) were designated as areas of concern where future development and impact should be closely monitored. Fifteen additional sites were identified, additional information was gathered from collector research on two sites, and three ancient and three historical period local cores were identified.

25-3195 Chartier, Craig S.
2011 Final Report on the Intensive Survey Fieldwork at the Maple Grove Residential Subdivision and the Site Examination at the Lot 7 Site in Wareham, Massachusetts. 95 pages.

Archaeological testing in the proposed project area consisted of 99, 50 x 50 cm shovel test pits (71 systematically placed 10 m apart along two transects, and 28 placed 5 m cardinally in seven array brackets). The project area is situated on an elevated terrace overlooking the Weweantic River. Ruins including a mill, dam, and cooper shop foundations that are associated with the Kinney and Morse saw mill (1829-1919) are located within the 100 ft wetland buffer zone along the edge of the river within the project area. These ruins will not be impacted by the proposed development. A total of 172 artifacts were recovered and three Native American sites, the Lot 7, 8, and 9/10 Sites, were identified. Artifacts recovered consisted of six pieces of chipping debris, one core fragment, ten shatter fragments, and one green rhyolite projectile point midsection, with a possible hearth also identified in association with this midsection at the Lot 7 Site. Two of the sites (the Lot 8 and Lot 9/10 Sites) were determined to consist of low-density lithic scatters. One historical site was identified, the Kinney and Morse House and Mill Site, consisting of a refuse disposal area and potential house site and the associated Kinney and Morse Stave Mill. Historical artifacts recovered date the site to the late 19th century. Site examination testing at the Lot 7 Site yielded evidence of a small fire-cracked rock hearth and associated fire-cracked rock dump pile. Artifacts recovered included lithic debitage, one steatite bowl rim sherd, and one rolled copper bead. The Lot 7 Site is believed to date to the Transitional Archaic period and likely served as a resource procurement camp associated with the larger Conant's Hill Site (19-PL-189), located to the south. (See also report #25-3194.)

25-3196 Lynch, Kerry J., Christopher L. Donta, Garry Kozak, and Mitchell T. Mulholland
2009 Maritime Archaeological Reconnaissance and Intensive (Locational) Survey for the Salem Port Expansion Project, Salem, Massachusetts. 91 pages.

A shoreline walkover, background research, and an underwater remote sensing survey were conducted for the proposed dredging area planned for the submerged portion of the project. The remote sensing survey, consisting of a side-scan sonar and a sub-bottom profiler, located 32 side-scan sonar anomalies and 2 sub-bottom anomalies that required visual and subsurface inspection. Historical maps show a series of wharves and shoreline development including shipyards and tanneries at the foot of Blaney Street beginning in 1680. Long wharves extending into the harbor at this location are present in the late 18th century and continue to be extant into the early 20th century. The sub-bottom results revealed a layer at approximately 2 m below the sea floor that could be a buried, paleo-sediment horizon that may contain embedded ancient Native American archaeological sites. The topography of the submerged project area, including the degree of slope, slope orientation, proximity to a water source, proximity to subsistence resources and proximity to known Native American sites, is consistent with a predictive model of high archaeological sensitivity. Field investigations of the side-scan sonar targets revealed evidence of a possibly intact wharf structure and a debris field of historical artifacts within the survey area. Vibratory cores were collected to investigate the sub-bottom anomalies and the buried horizon. Analysis of the cores revealed a potential pre-contact archaeological deposit, also with buried terrestrial sediment. (See also reports #25-3197 and 25-3198.)

25-3197 Lynch, Kerry J., Sheila Charles, and Mitchell T. Mulholland
2010 Archaeological Phase 2 Site Examination of Three Maritime Sites, Salem Port Expansion Project, Salem, Massachusetts. 201 pages.

Further archaeological investigation was conducted for three locations within the proposed port expansion impact area. Two areas of potential historical significance were identified, along with intact terrestrial sediments of potential ancient Native American significance. The historically sensitive areas consisted of a series of parallel timbers visible on the sea floor that were likely the intact remains of a wharf, as well as a concentration of historical artifacts that included a piece of ship structure, 'a wooden knee'. The wharf timbers were mapped using a total station and three excavation trenches were used to investigate these features. Five 50 x 50 cm shovel test pits were excavated at and surrounding the wooden ship's knee. Intact timbers associated with the 18th-century Ingersoll/Allen/Orne/Webb Wharf were identified, intersecting joinery was recorded, and a light density of historical and modern artifacts was recovered from the wharf area. Testing at the location of the ship's knee determined there was no associated ship structure embedded in the marine sediment and the artifact was part of a debris scatter. Buried, intact, submerged terrestrial sediments indicating a low energy, fresh water deposit and adjacent organic horizon were recognized in vibratory cores collected during the initial survey. Embedded in the organic horizon and the sediment above it were charcoal fragments, charred seeds, and laminated shell hash. Twenty-nine vibratory cores were collected to test the area around the buried organic horizon with associated charcoal and ecofacts, and to determine the extent of the buried terrestrial deposits. One vibratory core, T-60, contained two chert micro flakes (pressure flaking/sharpening debitage). These flakes were recovered from an aeolian horizon that underlies a peat deposit/buried A-horizon. Both the aeolian deposit containing the flakes and the overlying peat horizon have been dated using Accelerator Mass Spectrometry (AMS). A charcoal fragment from the aeolian deposit containing the flakes was AMS dated to 5750 ± 40 B.P. (Beta-279745). A charcoal fragment from the peat horizon was AMS dated to 4490 ± 40 B.P. (Beta-279746). Charcoal, charred and uncharred organics, and a charred insect gall were also recovered from the aeolian horizon. Charcoal, seeds, and shell were recovered from multiple surrounding vibratory cores. The vicinity of vibratory core T-60 contains significant Late Archaic period Native American archaeological resources. (See also reports #25-3196 and 25-3198.)

25-3198 Lynch, Kerry J.
2010 New England Terrestrial Settlement in a Submerged Context: Moving Pre-Contact Archaeology into the Twenty-First Century. 224 pages.

Human occupation of the New England region during the early Holocene has long been established archaeologically. However, the data exist almost solely from terrestrial sites. Vast portions of land once available to early occupants for resource procurement and living surfaces are now submerged. Underwater ancient period sites embedded in these submerged landforms contribute to a holistic understanding of New England's cultural history. Examination of current archaeological procedures reveals that the archaeological standards, practices, and theories commonly employed in terrestrial archaeology are largely not being extended past the coastline into the underwater environment. This is due, in part, to the past history of professional skepticism regarding the preservation and accessibility of now submerged terrestrial archaeological deposits. A report of global, submerged, terrestrial archaeology projects that show submerged, intact resources challenges this skepticism. A detailed review of underwater surveys in Boston Harbor and Salem Harbor, designed to predict, locate, and investigate submerged pre-contact sites, were used as a case study to argue that these resources deserve the same rigorous methods as terrestrial archaeological resources. Post-glacial deposition may act as an agent of preservation in New England waters, and past concerns of transgressive erosion are discussed in light of current geophysical research. (See also reports #25-2860, 25-3196, and 25-3197.)

25-3199 Harper, Mary G.
2011 Intensive (Locational) Archaeological Survey, Additional Work, Nemasket River Drainage Improvements, Middleborough, Massachusetts. 35 pages.

An archaeological survey was conducted of two proposed detention-basin areas on the west side of the Nemasket River, supplementing an intensive survey of three detention-basin areas in 2010. Twenty-seven 50 x 50 cm shovel test pits were excavated at 7.5 m intervals. Both areas were

highly disturbed, characterized by fill levels comprised of late historical period material culture intermixed with modern refuse. In Area 5, at the end of Mayflower Avenue, three quartz flakes and one argillite flake were found in a disturbed fill context in association with modern trash. A small portion of Area 5 on the southern edge contained intact soil horizons, but test pits there were sterile. In Area 6, off of East Main Street, four quartz flakes were found in disturbed fill contexts with late historical material, industrial debris, and modern refuse. All of Area 6 was pervasively disturbed. (See also report #25-3136.)

25-3200 Mair, A. Peter, II
2008 Intensive (Locational) Archaeological Survey, MassHighway Assign Number 4, Route 24 Detention Basin, Freetown, Massachusetts. 12 pages.

Supplemental subsurface investigations were conducted for three proposed detention basins. Forty-nine 50 x 50 cm shovel test pits were excavated at 10 m intervals, arranged within each of three detention basins. The testing recovered two fragments of historical period ceramics from the plowzone of an abandoned field in Detention Basin 10. An accumulation of cut granite near Detention Basin 1 appeared to be the result of deposition of spoil materials from construction of Route 24. (See also reports #25-2575, 25-2904, and 25-3020).

25-3201 Lynch, Kerry J., and F. Timothy Barker
2010 Archaeological Intensive (Locational) Survey and Archaeological Monitoring For Four Department of Conservation and Recreation Facilities in Boston, Easton, Falmouth, and Topsfield, Massachusetts. 111 pages.

Archaeological testing was conducted at three state facilities for proposed waterless toilet systems installation, drainage pipe installations, and landscape grading, and archaeological monitoring of a machine excavated utility trench was conducted at the Bradley Palmer State Park in Topsfield. In the Boston project area on Lovell's Island, four 50 x 50 cm shovel test pits were excavated at 5 m intervals, resulting in the recovery of building material related to the military occupation of Fort Standish discovered in disturbed soils. Eight 50 x 50 cm shovel test pits were excavated in two locations in a campground in Falmouth. At one location, the northern end of the campground, test pits were placed at 7.5 m intervals, where a total of two Native American rhyolite flakes were recovered from undisturbed B-horizon subsoil in a single shovel test pit. Two Native American quartz flakes and mid-20th-century construction materials were recovered from a disturbed context in a second test pit. In the second location, at the southern end of the campground, test pits were placed at 4 m and 7.5 m intervals. One Native American rhyolite flake was recovered from undisturbed subsoil. A total of eight 50 x 120 cm slit trenches were excavated around the Wilbur House at Borderland State Park in Easton. Native American quartz flakes, a quartz core, and a quartz biface fragment were recovered from undisturbed soil in a single trench located on the south side of the house. A builder's trench feature relating to the initial construction of the Wilbur House was recognized in Trenches 7 and 8 on the west half of the original house. A stone-lined, cobble feature was recorded on the west side. Stone walls were recorded, as was a cellar hole and foundation to the south of the Wilbur House. Monitoring of the electrical trench at Bradley Palmer State Park in Topsfield began at the foundation of the Palmer mansion, and continued for the length of the trench through the front yard and beyond for a total of 110 m west of the mansion. Only one brick fragment was noted from a section of the trench 43 m west of the mansion. No additional artifacts and no subsurface cultural features were identified in the eastern half of the electrical trench within 110 m west of the mansion. The western and southern half of the electrical trench, as it follows the edge of the entrance drive from the mansion through graded and landscaped sloping topography, was determined to have a low potential for archaeological resources due to the early 19th-century construction of the road.

25-3202 Donta, Christopher, Mitchell Mulholland, Sheila Charles, and Brian Jones
2011 Community-Wide Archaeological Reconnaissance Survey of Groton, Massachusetts. 197 pages.

The project was conducted for the purpose of identifying previously recorded and possible archaeological resource areas within the town. Data produced by this survey were integrated into a proposed archaeological site protection plan for Groton. The project included five aspects: 1) background research; 2) ranking of town lands into zones possessing low and high potential to contain archaeological resources based on topography, water sources, soils, and previously recorded sites; 3) a walkover inspection of selected archaeological sites and areas of high potential; 4) interviews with local informants and town personnel; and 5) integration of this information into thematic narratives of the town's past and development of an archaeological site protection plan for sensitive resource areas. Groton contains many areas of high potential for additional, unrecorded Native American and historical archaeological sites. Most of these areas have been subject to minimal disturbance. Some sites were indentified through artifacts collected from agricultural areas and are partially disturbed. When the survey began, three Native American sites and 16 historic sites in Groton were recorded at the Massachusetts Historical Commission. During the course of the project, nine additional Native American sites and 41 historical sites were added to the state inventory. The sites represent a vital part of the town's heritage and have a high likelihood to contribute information of importance to archaeology and history.

25-3203 Rainey, Mary Lynne, and Donna Ingham
2006 Intensive (Locational) Archaeological Survey, Proposed Nantucket High School Staff Housing Project Area, and Archaeological Site Examination, Proposed Nantucket High School Staff Housing Project Area, The Dwelling Site, Nantucket, Massachusetts. 184 pages.

Archaeological surveys were completed for a proposed housing development on a 1.25 acre parcel. In total, 28, 50 x 50 cm shovel test pits were distributed among three transects, one 30 x 30 m block, and one 5 m array. Subsurface testing resulted in the identification of the Seaweed Reed Site consisting of four flakes (felsite, quartz, and rhyolite), a piece of calcined bone, and one quartzite Orient Fishtail projectile point. No pre-contact features were identified. This site is likely associated with generalized use of Nantucket's central outwash plains area as a hunting territory in the Late/Transitional Archaic periods, similar to a number of sites identified throughout the region. The limited information content, lack of integrity, and spatial extent of the Seaweed Reed Site suggested that additional archaeological investigation would not result in the recovery of important information. Following subsurface testing, machine stripping resulted in the identification of features associated with an 18th-century Native American Dwelling Site used by one or more members of the late 17th- through 18th-century Miacomet Praying Indian Village. Archival research was unsuccessful in linking the Dwelling Site property to an individual Native American or family. The Dwelling Site included a portion of a *wetu* (wigwam) floor with a central hearth (Feature 2) and a small animal bone refuse pit. The *wetu* and refuse pit were considered related based on proximity, domestic functional relationships, and the recovery of 18th-century artifacts. The site examination identified additional features associated with the *wetu*, including exterior cooking hearths, postmolds, and wood plank stains. A rectangular area of gray soil characteristic in appearance to modern backdirt was embedded into a thin layer of Pennsylvania sedge. Designated Feature 2E, the deposit was interpreted as a floor mat or insulation under a platform bed within the *wetu.* However, radiocarbon dating determined that the sedge was modern (0 B.P., BETA-192283). Whether Feature 2E was a modern geotechnical test location might be determined from review of pre-construction engineering records. A long, irregularly shaped, dark soil stain, around 15 m long x 1.5 to 3 m wide, was interpreted to be a possible *nushwetu* (longhouse) or meetinghouse (Feature 5). Data to support those interpretations were limited and ambiguous. No hand testing was conducted in that location prior to machine stripping. No graphic representation of the soil strata above the feature was presented. The narrative description is that the soils ranged from compact, oxidized and mottled, to loose and mottled with complex patterns of postmolds. Feature 5 consisted of homogenous dark soil. Small patches of gray soil similar to the Feature 2E deposit of modern sedge were noted during clearing. Small clay tobacco pipe fragments, presumably historical kaolin tobacco pipe fragments, were the most frequent artifact observed during troweling of Feature 5. Animal bones, ceramics, tobacco pipe fragments, and glass were observed in the general area during machine stripping. After the soil stripping, two 1 x 1 m units were systematically excavated within Feature 5 that yielded aboriginal pottery, argillite and quartz chipping debris,

clay tobacco pipe fragments, European ceramics that may date from the 17th or 18th century (buff-bodied coarse earthenware, Delft) and that do date from the later 18th and 19th century (pearlware, whiteware), a machine-cut nail, and coal, brick, bone, shell, seeds, and charcoal. The immediate perimeter of Feature 5 had many postmolds in widely variable soil contexts, but because of the complexities of the site and time limitations, all of the postmolds were not mapped. Six postmolds arranged in two rows circa 1 m to 0.75 m wide were mapped immediately southwest of Feature 5, in an area that measured circa 1.5 x 0.75 m. Further southwest, four roughly square soil stains were considered to be the possible remains of large structure supports. Another alternative interpretation of Feature 5 is that the irregularly shaped soil stain parallel to a 2004 water utility trench and Cow Pond Lane may have been recently created by the utility excavations or road maintenance that disturbed complex features and deposits associated with the 18th-century Indian houselot. That scenario could account for the anomalous mid-19th-century artifacts (coal and whiteware) within and below the feature, the soil descriptions that suggest disturbance, and the small patches of gray soil similar to Feature 2E. In totality, the Dwelling Site exhibits integrity and provides important information about foodways, material culture, feature technology, domestic spatial arrangement, and architecture of 18th-century Native Americans on Nantucket, and provides useful information to advance methodologies to investigate and interpret historical Native American habitation sites in New England.

25-3204 Beebe, Tyler, Kelly Ferguson, and Emily Pierce
2011 The Harvard Yard Archaeology Project, 2007 and 2009 Field Seasons, Survey and Excavation Report. 253 pages.

The second and third seasons of Harvard Yard Archaeology Project (HYAP) occurred during the fall of 2007 and the summer and fall of 2009 on the campus of Harvard University in Cambridge, Massachusetts. The HYAP field site was excavated by students enrolled in the course *Anthropology 1130: The Archaeology of Harvard Yard*. The course was designed by faculty of the Department of Anthropology and curatorial staff of the Peabody Museum of Archaeology and Ethnology as a methods course in historical archaeology with the goals of 1) investigating the history of the university and campus life with particular emphasis on material culture associated with the Harvard Indian College period (c.1655–1695); 2) teaching the basic methods of historical and public archaeology; 3) investigating and documenting subsurface resources to better take care of them; and, 4) teaching about the stewardship of resources and archaeological collections. In 2007, 21, 1 x 1 m test units were excavated in two areas of the "Old Yard." Seven units were excavated to the north of the known location of the Old College, and the remaining 14 units were placed between the known location of the Old College and the conjectured location of the Indian College. In 2009, 10, 1 x 1 m test units were excavated at the conjectured location of the Indian College. Cultural material was recovered from all loci of both excavations, dating from the 17th through the 20th centuries. The HYAP team recorded a major trench feature in 2009 that may be linked to the Harvard Indian College. (See also report #25-2949.)

25-3205 Cherau, Suzanne, and John Daly
2011 Historic Properties Survey and Archaeological Reconnaissance Survey, Green River Ecosystem Restoration Project, Greenfield, Massachusetts. 388 pages.

Archival research included a review of available literature and historical maps related to the dams and associated mill complexes. Field survey consisted of a walkover followed by photography, recording, and mapping. The survey identified moderate and high sensitivity areas for Native American and European-American resources. The types of expected Native American resources include stone and wood stake fishweirs at the natural bends and fall lines of the river, as well as dugout canoes and evidence of habitation and resource processing sites on the shorelines. At the Mill Street Dam, expected resources consist of mill remains, including structures and artifacts in the riverbank and former mill yards. At the Wiley & Russell Dam, expected resources consist of mill building foundations, waterpower infrastructure, and timber crib dam remains.

Scofield, and Quinn Stuart
2011 Updated MBTA Green Line Extension Project, Historic and Archaeological Resources Reconnaissance Survey and Historic Resources Intensive Survey, Cambridge, Medford, and Somerville, Massachusetts. 2 volumes. 1,050 pages.

The archaeological survey identified a total of five sensitive areas where potentially significant archaeological resources could be located. These sensitive areas include: 1) historic Middlesex Canal (SMV-HA-1) stone bridge crossing, canal prism, and tow path within and adjacent to the Lowell Line ROW in Medford; 2) mid- to late 19th-century worker housing on Joy Street in Somerville; 3) late 19th- to early 20th-century meat-packing plant complex off Somerville Avenue in Somerville; 4) early/mid-19th-century Clark Bennett residence, outbuildings, and yard area on Prospect Street in Somerville; and, 5) late 19th-century dwelling on the subdivided Clark Bennett estate property on Prospect Street in Somerville. Two areas were identified as having moderate sensitivity: mid- to late 19th-century worker housing on Joy Street in Somerville near the proposed Washington Street Station, and potential for buried intact ground surfaces that could contain Native American sites in the Maintenance Facility Option L area. Subsequent analyses provided updated assessments for these project elements as having no/low archaeological sensitivity. (See also report #25-3009.)

25-3207 Herbster, Holly, and Erin Flynn
2011 Intensive (Locational) Archaeological Survey and Feature Excavation, Barnes 51 Witchwood Lane Property, Edgartown, Massachusetts. 88 pages.

Nine 50 x 50 cm shovel test pits were excavated. The survey identified an intact shell midden deposit over a 15 m linear area in addition to 452 pieces of cultural material (rhyolite, quartz, quartzite, chert, and jasper lithic debitage and tool fragments; animal bone; fire-cracked rock; and several historical and modern materials). Archaeological monitoring of topsoil removal within the building envelope identified at least 20 features, including several features that were considered to be possible human burials. The features contained high densities of lithic debitage, Native pottery fragments, and calcined bone, in addition to fire-cracked rock, charred floral materials, and chipped and ground stone tools. Diagnostic Jack's Reef, Brewerton, and Small Stemmed projectiles points were collected in addition to a single charred maize kernel. No definitive human skeletal remains were identified in these features. Several projectile point types (Brewerton, Small Stemmed) that are usually indicative of the earlier Late Archaic Period (5,000 – 3,000 B.P.) were also identified. These tool types have also been found at several sites in the Squibnocket Ridge section of Chilmark that also contain Woodland Period features and deposits, suggesting continuity in the creation and use of coastal sites over several millennia. The limited excavation makes it difficult to make more conclusive interpretations, however the pattern of deposits at the site resembles that seen elsewhere in Edgartown and at other island coastal locations. The collective assemblage, designated as the Witchwood Site, appears to represent a habitation site that may also have been utilized for ceremonial purposes. The diagnostic materials suggest that the site was occupied during the Middle and/or Late Woodland Periods and possibly also in the Late Archaic Period.

25-3208 Dubell, Gregory R.
2011 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, I-2L System Launcher Facility, Canton, Massachusetts. 64 pages.

An archaeological survey including archival research, a walkover survey, and subsurface testing was conducted for the proposed installation of a new natural gas launcher facility. Fifteen 50 x 50 cm shovel test pits were excavated in linear transects at 10 m intervals, resulting in small amounts of modern material including plastic flagging tape, asphalt, and bottle glass from fill contexts. Disturbances associated with previous pipeline construction activities were noted throughout the project area.

25-3209 Herbster, Holly, and Erin Flynn

2011 Machine-Assisted Stripping and Archaeological Monitoring, Squibnocket Ridge Lot 4 Building Envelope, Chilmark, Massachusetts. 70 pages.

An archaeological survey within the 32,800 ft^2 building envelope and ancillary impact areas was completed in 1993 and resulted in the documentation of the Lot 4 Site (19-DK-137), which consisted of seven pieces of chipping debris collected from topsoils within the building envelope. The recent machine-assisted stripping exposed 17 potential features; 14 of these are likely postholes and small trash or storage pits, previous testing units, and/or modern disturbance. The placement of the intensive survey pits in the central portion of the building envelope was sufficient to identify cultural deposits within the building envelope, and while none of the cultural features were identified during the survey, the same limited lithic material pattern was observed across the entire building envelope during the machine-stripping. Three of the 17 features (Features 2, 3, and 14) were consistent in shape and size with burial pits located in other sections of Squibnocket Ridge. This archaeological interpretation is based on surface morphology alone, since no excavation into the features took place. Wampanoag Tribe of Gay Head/Aquinnah Tribal Historic Preservation Officer staff observed these features and agreed that they were consistent with unmarked burial pits. Based on previous archaeological research across Squibnocket Ridge and elsewhere in Chilmark and Aquinnah, these features were probably created during short-term periods of use in proximity to living areas. It is likely that the present-day Lot 4 area was part of a larger Native American settlement area that has been documented within the nearby Lots 5, 6, 11, and 13 (19-DK-138, -143, -144). The Lot 4 area appears to have been utilized for specific activities that did not include food processing or tool production. These activities may or may not have been associated with ceremonial activities including human burials. (See also reports #25-1314, 25-2057, 25-2157, 25-2360, and 25-2984.)

25-3210 Cherau, Suzanne, John Daly, and Matthew Kierstead
2011 Historic and Archaeological Intensive Surveys, Taunton State Hospital Dam Removal, Taunton, Massachusetts. 319 pages.

Historic and archaeological surveys of the approximately 5 acre project area consisted of archival research and fieldwork to assist in the identification and evaluation of historic properties. Field survey included photography, mapping, and subsurface testing. The testing consisted of 33, 50 x 50 cm shovel test pits excavated at 5 and 10 m intervals and judgmental test pits in proposed access roads on either side of the current spillway/river channel. This testing resulted in the collection of 972 artifacts from topsoils and fill deposits. All but two of the items are temporally associated with the 19th- and 20th-century mill and state hospital. Two quartz flakes were recovered from fill deposits on either side of the spillway. Because of a lack of meaningful context, they are not considered significant resources but they attest to the presence of pre-contact period Native Americans in the Mill River drainage. The surveys also resulted in the identification of the 19th-century Hopewell Mills Archaeological Site, including remnants of a boiler house, wheel house, turbine wheel pit, gate house, and the earthen dam structure that may contain components of its original 1818 structure below the grade of the existing structure.

25-3211 Keim, Alexander
2010 “Very sacred to me are the memories that cluster around my old home…”: Archaeological Sensitivity Assessment at the Mary Baker Eddy Historic House, Lynn, Massachusetts. 14 pages.

At the request of the Longyear Museum, an on-site archaeological consultation and assessment of a partially demolished domed subsurface brick and mortar feature was conducted. The purposes of this study were to identify and record this feature, and to assess its potential archaeological and historical significance. This consultation included visual inspection of the feature and surrounding area, limited excavation, background research, and the preparation of a report. The subsurface feature was most likely a cesspool system, the construction of which coincided with the construction of the house in 1871.

25-3212 Keim, Alexander

2010 Report for Archaeological Excavation at Pleasant St, Boston, Massachusetts. 14 pages.

The standing two-story Federal Style residence located in the Dorchester section of Boston is thought to date to 1804, built at least partially upon the foundations of an earlier structure possibly dating to 1636. Current renovation and restoration efforts entailed excavating a large portion of the front yard. A team of professional archaeologists and preservationists conducted a two-day exploratory and salvage archaeological excavation. Using heavy construction equipment, the team removed a large amount of material to the base of the extant foundation wall. The results of the excavation suggest that there are no 17th- or 18th-century materials present at the front of the house, as pre-19th-century contexts were removed during the construction of the standing structure.

25-3213 Harper, Mary, Ross Harper, Bruce Clouette, Timothy Ives, and Brian Jones
2011 Intensive (Locational) Archaeological Survey, Replacement of Bridge S-03-004, Routes 8 and 57 over the West Branch of the Farmington River, Sandisfield, Massachusetts. 84 pages.

An archaeological survey was conducted of a proposed underground electrical conduit alignment on the property of the Humphrey-Daniels House (SAN.9), a two-story stone Greek Revival-style house built circa 1830-1840. The house is immediately adjacent to Bridge S-03-004, a badly deteriorated bridge over the Farmington River that is scheduled for replacement. Particular care is being taken to protect and preserve the integrity and setting of the Humphrey-Daniels House, at the southwest corner of the bridge. As part of this effort and at the request of the owner, an overhead electrical service line between North Main Street and the house will be buried along a 75 ft conduit traversing the side and front yards of the house. Based on the conduit's location adjacent to the historic house, it was determined that the conduit installation may affect archaeological deposits. Eight 50 x 50 cm shovel test pits were excavated at approximately 5 m intervals. Several fill-soil strata were visible, and the resulting assemblage of artifacts predominantly dates to the first occupation period of the house, ca. 1830-1850. Testing of alternative conduit lines about 4 m north and south found similar stratigraphy and contemporaneous artifacts, but in slightly lower numbers. In total, 330 artifacts were recovered, including ceramics, bottle glass, window glass, nails, bone and personal items such as glass buttons, kaolin tobacco pipe fragments, a slate pencil, and a clay marble. The artifacts represent household refuse that was redeposited, probably from a midden elsewhere on the property, likely the rear of the house, to the front and side yards as part of landscaping activities from 1840 to 1850. Although the deposits may be informative, their integrity has been impacted by their removal from their original location(s) and redeposition in the front and side yards.

25-3214 Donta, Christopher L., Marni Blake Walter, and F. Timothy Barker
2011 Archaeological Reconnaissance and Intensive (Locational) Surveys for H-Frame Structure Replacements along the 1512 Line in Southwick, Granville, Russell, and Blandford, Massachusetts. 196 pages.

Background research and reconnaissance surveys identified 21 areas of archaeological potential out of 47 H-Frame structure replacement locations. In addition, Tribal Historic Preservation Officer representatives requested that five additional areas be tested. Twenty-seven of the 47 replacement locations were tested, with excavations consisting of 208, 50 x 50 cm shovel test pits and one 1 x 1 m excavation unit. Of the 27 locations tested, two contained Native American artifacts, and one contained a historic period site. One of the Native American sites, in Southwick, was found to be an isolated artifact findspot. The Teaberry Native American Site in Blandford contained chert and quartz flakes and a hearth feature. The historical site in Southwick includes a house foundation and well, and appears to date from circa 1770-1800, based on an abundance of creamware, pearlware, and Jackfield type ceramics.

25-3215 Banister, Jennifer, Suzanne Cherau, and Nichole Gillis
2011 Archaeological Intensive Survey and Site Examination Investigations, Natick Soldier Systems Center, Five Acres, Natick SSC Site Locus 1 and Locus 3, Natick, Massachusetts. 143 pages.

The intensive survey resulted in the identification of three previously undocumented Native American archaeological sites designated Natick SSC Site Locus 1, Locus 2, and Locus 3. Of these three loci, Locus 1 and Locus 3 were considered potentially significant, and subsequent site examinations were conducted. The Locus 1 site examination consisted of the excavation of 38, 50 x 50 cm shovel test pits at 5 and 10 m intervals within a coordinate grid as well as five 1 x 1 m excavation units. This testing resulted in the recovery of an additional 419 pieces of chipping debris for a total of 518 pieces of rhyolite, chert, quartzite, hornfels, and unidentified metamorphic chipping debris and one quartzite biface. No diagnostic artifacts or cultural features were identified at Locus 1. The Locus 3 site examination consisted of the excavation of 25, 50 x 50 cm shovel test pits at 5 and 10 m intervals within a coordinate grid as well as two 1 x 1 m excavation units. This testing resulted in the recovery of an additional 81 pieces of chipping debris for a total of 110 pieces of rhyolite, quartz, quartzite, and argillite chipping debris along with one quartz biface, one piece of fire-cracked rock, one quartz Small Stemmed projectile point, two pieces of calcined mammal bone, and one quartz core. Based on the recovered cultural material assemblage, Locus 1 and Locus 3 are interpreted as areas where chipped stone tool manufacture and maintenance were the primary activities. The presence of calcined bone and a Small Stemmed projectile point at Locus 3 suggests resource procurement, processing, and consumption activities. Locus 3 was tentatively identified as dating to the Late Archaic Period, based on the recovery of the Small Stemmed point type. Both sites appear to represent small, limited duration occupations consisting mostly of chipping debris, possibly at the periphery of a larger base camp on the shores of Lake Cochituate.

25-3216 Dudek, Martin G., and Thomas P. Mailhot
2011 Archeological Intensive Survey for the 43L6 River Crossing Project, Haverhill, Massachusetts. 92 pages.

Archaeological testing consisted of 16, 50 x 50 cm shovel test pits for two proposed utility structures on either side of the Merrimack River. Test pits were excavated at each pole and anchor location, for a total of eight test pits per structure. The south side of the Merrimack River is the location of a reported multi-component pre-contact site identified as the Walker Camp “C” (19-ES-551). Twenty pieces of lithic debitage (rhyolite, quartz and quartzite), two pieces of grit-tempered pottery, and 43 pieces of fire-affected rock were recovered from seven of eight test pits. A feature consisting of a dark stain with charcoal was also identified. The site continues outside of the project lease area. Portions of the project lease area have been filled by an adjacent road or previously disturbed; however, testing revealed intact stratigraphy at seven of eight test pits. A site examination is recommended for the portion of the Walker Camp “C” site within the project area. On the north side of the Merrimack River all eight test pits encountered deep fill and disturbance related to former use of this area for dumping.

25-3217 Dudek, Martin G.
2011 Archeological Intensive (Locational) Survey for the Proposed Site of a Telecommunications Monopole Facility, Lot “E,” 0 Industrial Way, Rockland, Massachusetts. 79 pages.

The archaeological survey tested the proposed location of the monopole facility, access drive, and underground utility easement. Eleven 50 x 50 cm shovel test pits were excavated, consisting of five test pits in the lease area and six test pits at 10 m intervals for the access road/utility easement. No cultural material was recovered and no archaeological sites were identified.

25-3218 Herbster, Holly
2011 Intensive (Locational) Archaeological Survey, Set-Off Lot 232, Map 12, Parcel 38, Aquinnah, Massachusetts. 59 pages.

An archaeological survey was completed of an approximately three acre parcel off Moshop Trail where proposed construction includes a single-family residence and associated utilities. A total of 22, 50 x 50 cm shovel test pits was excavated and resulted in the identification of a bermed feature, one piece of quartz shatter, ten mammal bone fragments, nine probable nail/hardware frag-

ments, and three redware ceramic vessel sherds, designated as the Set-Off Lot 232/233 Site. The map and background review did not identify any known structures or homesteads in the area of the feature, and the site was not identified in land records. The materials collected in the field are indicative of a Wampanoag site. The feature may be associated with a Wampanoag homestead, or may have served another function. More definitive interpretations are not possible given that the majority of the feature is located outside of the project area and that testing within the small section of the feature within the project area did not produce temporally diagnostic artifacts.

25-3219 Flynt, William A.
2011 A Dendrochronology Study of Select Timbers Excavated from the Town Dock, Boston, Massachusetts. 19 pages.

A dendrochronological examination was conducted of 11 sections of water-logged timbers from archaeological excavations adjacent to the north wall of Faneuil Hall in downtown Boston. A bandsaw was used to extract 1 inch to 2 inch wide samples of each timber, resulting in the identification of nine of the 11 samples as hemlock containing sufficient ring counts for dating. These nine samples exhibit varying ring growth, suggesting that the timbers did not necessarily come from the same tree stand. Timber samples are usually compared to each other as well as against one or more dated regional master chronologies of the same species. The samples were compared to hemlock data from eastern New York, western Massachusetts, and southern Vermont, with limited results. The samples were then compared to a more local hemlock master chronology associated with several early buildings in Gloucester and Beverly, which resulted in good correlations for a number of the samples. As a result, seven of the samples were assigned dates (1628, 1680, 1693, 1700, 1700, 1703, and 1708) which should each be considered a *terminus post quem*. The majority of the dated material clusters around the turn of the 18th century, suggesting that the wooden structure that the samples were taken from may have been a later addition or repair to the Town Dock, likely between 1710 and 1720.

25-3220 Leach, Peter A., Joel I. Klein, William Chadwick, and Martin A. Dudek
2010 Assessment of Prehistoric Archaeological Site Potential, Subtidal Portions of the Proposed South Terminal Marine Infrastructure Park, New Bedford, Massachusetts. 96 pages.

A marine archaeological assessment including remote sensing and a coring survey was conducted for the subtidal portions of the proposed 19.95 acre project area. In total, 69 individual seismic profiles were analyzed and five vibracores were selected. Vibracore analysis and interpretation of sediments resulted in the identification of an intact, buried, and submerged paleosol in Vibracore NB-VC-04, and a truncated B horizon in Vibracore NB-VC-05. The paleosol is located in the south/southwestern portion of the proposed turning basin. Resultant sieving, floatation, and detailed analysis of resulting sorted sediments under magnification did not identify any cultural materials. However, the paleosol is well preserved and provided a radiocarbon date of 2660 ± 40 B.P. (Beta-285531). The paleosol represents a paleolandscape that would have been available for human use at a lower stand of sea level, giving it moderate archaeological potential for submerged ancient sites. (See also report #25-3221.)

25-3221 Leach, Peter A., Joel I. Klein, William Chadwick, and Martin A. Dudek
2010 Assessment of Archaeological Site Potential, Intertidal Portions of the Proposed South Terminal Marine Infrastructure Park, New Bedford, Massachusetts. 206 pages.

An archaeological assessment consisting of a hand auguring survey was conducted of the intertidal portions of the proposed 19.95 acre project area. Analysis of 116 gouge augers and five geotechnical boring logs from within the project area resulted in the conclusion that the intertidal area has low archaeological potential. No evidence for preserved, buried upland landscapes was identified, nor were any ancient period cultural materials recovered. The high-energy environment, historical period disturbance on adjacent upland areas, lack of evidence for buried upland landscapes, and augur refusal on lag deposits and eroded coarse outwash and till indicate that the area has been reworked by marine processes resulting in erosion of former upland landscapes and any archaeo-

logical sites context. Approximately 50 ft outside the proposed project area is an isolated area of high sedimentologic preservation which has moderate archaeological potential. Resultant sieving of the preserved upland soils below the peat deposits resulted in the recovery of small fragments of industrial material, the majority of which comprised industrial slag.

25-3222 Flynn, Erin, and Holly Herbster
2011 Intensive (Locational) Archaeological Survey, New Telecommunications Facility (MA1178-S/Clapboardtree Street), Westwood, Massachusetts. 61 pages.

The proposed new cell tower development will include the construction of a 98 ft monopole tower within a 30 x 36 ft enclosure, a 40 ft long access easement, and a 60 ft underground utility corridor. Nine 50 x 50 cm shovel test pits were excavated within the project area. A low density of mid- to late 19th-century domestic refuse/field trash was collected in disturbed and plowzone soils.

25-3223 Donta, Christopher L.
2011 Archaeological Reconnaissance and Limited Intensive (Locational) Survey for Chang Farms Well Construction, Whately, Massachusetts. 36 pages.

Background research and an archaeological survey were conducted of two well banks that had already been constructed on either side of River Road, followed by limited testing in the area of the constructed western well bank. Prior testing for an outfall pipe adjacent to the eastern well bank made this area less likely to contain archaeological sites. Twelve 50 x 50 cm shovel test pits were completed in agricultural areas along the western edge of the Connecticut River terrace landform, adjacent to a large wetland area at the base of a higher terrace. No Native American artifacts or features were found in this area, despite several recorded sites known in the immediate vicinity. Recent trash associated with the current use of the farm fields was noted, such as plastic cellophane and tarp fragments. Older materials such as brick, coal, bottle glass, and some ceramics were also noted on the ground surface. Testing produced only four artifacts from the subsurface, in plowed contexts, including one piece of clear bottle glass, two fragments of salt-glazed stoneware with lead-glazed interior, and one piece of late 18th-century slipware.

25-3224 Dudek, Martin G., Deena L. Duranleau, and Eric C. Metzger
2011 Archeological Intensive (Locational) Survey for the Proposed Orchard Estates Subdivision, 167 School Street, Seekonk, Bristol County, Massachusetts. 110 pages.

The project area includes the Cyril Read farmhouse (SEE.20) and is within the northern limits of the Read Farm Site (19-BR-75). Intensive survey testing consisted of 150, 50 x 50 cm shovel test pits, with 134 test pits excavated at 10 m intervals along transects spaced 10 m apart across the 3.2 acre parcel. An additional 16 test pits were excavated at 5 m intervals around test pits with lithic tools and at a small quartz debitage concentration. The parcel has been in agricultural use for many years. Landscape alteration, plowing, and recent percolation tests have had a negative effect on the integrity of the site. Native American lithics (quartz, rhyolite, quartzite, hornfels and argillite) were recovered in low densities across the project area but primarily from the plowzone, with few artifacts recovered from intact natural substrata. No features were identified. Historical period artifacts associated with the Cyril Read farmhouse predominately came from disturbed strata near the house or from the plowzone.

25-3225 Mair, A. Peter, II
2011 Intensive (Locational) Archaeological Survey, Rowley Water Treatment Plant, Rowley, Massachusetts. 94 pages.

An archaeological survey consisting of research, field investigations and laboratory analysis was conducted. Research did not identify any recorded archaeological sites in the project area though Pingree Farm Road is identified on early maps. A field review resulted in locating a dry-laid stone foundation and the excavation of 62, 50 x 50 cm shovel test pits. Subsurface testing revealed

highly disturbed soil profiles of fills and reworked soils. Cultural material was limited to a low density of historical period and modern artifacts from around the foundation. Subsequent research failed to produce any information on the foundation, and field investigations indicated that the site is disturbed through intentional filling of the cellar hole with upper courses of the foundation and materials from adjacent areas.

25-3226 Herbster, Holly, and Erin Flynn
2011 Intensive (Locational) Archaeological Survey, Higgins-Wallen Property, Aquinnah, Massachusetts. 47 pages.

An archaeological survey was completed of the six acre Higgins-Wallen property, including two adjacent lots proposed for single-family residences. In total, 40, 50 x 50 cm shovel test pits were excavated within the impact areas. The Higgins-Wallen Findspot was identified as a low-density deposit of quartz chipping debris. A possible gravestone was also identified between two large erratics by Wampanoag Tribe of Gay Head/Aquinnah Tribal Historic Preservation Officer staff. At the request of the tribe, the stone feature was avoided and no subsurface testing was completed in the immediate vicinity.

25-3227 Mair, A. Peter, II
2011 Intensive (Locational) Archaeological Survey, Anderson Memorial Bridge Rehabilitation, Boston and Cambridge, Massachusetts. 119 pages.

Subsurface testing consisted of 41, 50 x 50 cm shovel test pits in the northwest quadrant of the project area where landscaping, construction staging, and drainage improvements are proposed. In addition to hand testing, one machine trench (part of the geophysical survey) exposed numerous fill layers, groundwater at 2.7 m below surface, and at a depth of 3 m a blue/gray lens of fine silt and organic materials.

25-3228 Descoteaux, Kate Ryan
2011 Creating a Community: A Study of Boston's 19th-Century African American Population. 125 pages.

Boston's African Meeting House is one of the oldest and most significant African American churches in the country. Middle-class African Americans created a thriving community on Beacon Hill where businesses flourished, children were educated, and revolutionary social changes were made. In an effort to understand how this community was created and sustained, the material culture from a privy on the site was examined. Ceramics along with a small sample of glass and other artifacts linked consumer choice with the creation and negotiation of a middle-class, African American identity.

25-3229 Herbster, Holly, and Gregg Laskoski
2011 Intensive (Locational) Archaeological Survey, NSTAR Line 322 Structures Replacement Project, Plymouth and Barnstable Counties, Massachusetts. 186 pages.

An archaeological survey was completed of the proposed project corridor in Plymouth, Sandwich, and Bourne. In total, 226, 50 x 50 cm shovel test pits were excavated within four archaeologically sensitive portions. These test pits resulted in the recovery of 1,604 pieces of cultural material within three Native American findspots and two previously identified sites (Federal Pond and Town Line), as well as historical period non-site deposits. Two of the findspots were comprised of a single piece of chipping debris; one findspot within the Massachusetts Military Reservation/Camp Edwards consisted of a Stark projectile point. Cultural materials collected at the Federal Pond Site in Plymouth include 10 pieces of quartz, jasper, chert, rhyolite, and metamorphic and igneous chipping debris and seven calcined bone fragments. These materials, together with the deposits identified as part of the same site within the adjacent NSTAR corridor, represent a potentially significant archaeological site that may date to the Middle Archaic Period. Native American cultural materials located at the Town Line Site in Sandwich consist of 1,405 artifacts including

1,356 pieces of lithic chipping debris, 17 bifaces, seven projectile points/fragments, 7 chipped and groundstone tool fragments, four pieces of aboriginal ceramic, a steatite vessel sherd, and several pieces of charcoal, animal bone, and shell. Diagnostic artifacts include Brewerton and Levanna projectile points and, together with the clay pottery and steatite, suggest that the site was utilized during the Late Archaic and Woodland Periods.

25-3230 Ritchie, Duncan
2011 Phase I Archaeological Identification Survey, White Pond Road Parking Lot, Assabet River National Wildlife Refuge, Stow, Massachusetts. 137 pages.

An archaeological identification survey was conducted within the proposed location of a parking lot and other amenities in an approximately one acre area. Two known archaeological sites (19-MD-656, 19-MD-649) were located near the project area adjacent to the Assabet River. However, no evidence of Native American activity was found during fieldwork for this survey. The project area also contained a known historical period site. Site 4 and 5/Wolcott House (STW-HA-9) was identified in a prior archaeological survey of the former Fort Devens Sudbury Training Annex. Site 4 consists of two fieldstone and concrete foundations (house, garage) and a filled well located at the base of a low knoll. Site 5 is located on the crest of a low knoll and consists of a single unmortared fieldstone foundation capped with poured concrete that likely supported a small house. During the survey, 66, 50 x 50 cm shovel test pits were excavated at 8 m intervals. This sampling yielded an assemblage of historical period cultural materials consisting mostly of ceramic sherds, bottle glass, and structural materials. The ceramic sherds and bottle glass are primarily of mid-19th-century to early modern period manufacture and represent domestic refuse associated with occupation of the structures on Site 4 and 5/Wolcott House by members of the Wolcott and Waugh families. A few ceramic sherds with manufacture date ranges in the early to mid-18th century may be from an older dwelling or farmstead located outside the project area. All of these cultural materials were distributed in a low-density scatter typical of domestic refuse discarded as field trash.

25-3231 Harper, Ross K., and Bruce Clouette
2011 Site Examination Survey, Hancock Shaker Village Trustees' Office and Store, Pittsfield, Massachusetts. 87 pages.

An archaeological survey was conducted of the area to be impacted by proposed drainage improvements and foundation repairs to the Trustees' Office and Store Building within Hancock Shaker Village (HSV). The Trustees' Office was built in 1813; it was doubled in size in 1852 and the orientation was changed from facing north toward Route 20, to the west, where a carriage road led from the building entrance to Route 20. The Trustees' Office was the locus of several important functions for the Shaker community. Business with non-Shakers, from the "The World," was conducted at the office for goods and services exchange, and visitors purchased Shaker-made items here. Village guests also dined and lodged at the office. The Shakers who served as Trustees lived in the building, where, in addition to business with "The World," they managed the village's property and investments. The building was in use by the Shakers until 1959. Scholarly research undertaken as part of the survey summarized the history of HSV, the Trustees' Office and Store, archaeological studies of Shaker sites, household archaeology and architecture, and Federal-period archaeological house-lot studies. The project area of the proposed drainage improvements included the immediate perimeter of the building, where regrading and drainage pipes will be used to direct water away from the building, and brick-wall buckling will be remediated. Thirteen 50 x 50 cm shovel test pits consistently demonstrated soils comprised of deep fill, cellar ejecta, and building debris (nails, brick, mortar, and stone) dating from the 1813 original building construction and later expansions and modifications. These deep layers of fill may in part be related to the Shakers' use of massive cut-stone blocks for the foundation, which would have required teams of oxen and ramps and extensive modification of the house lot area to accommodate draft animals, sledges and workers. The land around the office may also have originally been much lower, sloped down toward Shaker Brook, and was extensively filled in when the office was constructed. The artifact assemblage was dominated by a scatter of architectural elements associated with the building

construction and remodeling episodes, such as nails, brick, mortar, and window glass. Only a very small amount of domestic artifacts was found—primarily refined tablewares such as creamware, pearlware and whiteware—indicating that refuse was not deposited in the immediate vicinity of the office and store. This is consistent with the changing rural lifeways of 19th-century Massachusetts, where the "slovenly" countryside was no longer acceptable and it also reflects the junction of the office as the meeting place for commerce and hospitality between Shakers and the outside community. The office needed to be a welcoming, clean, attractive place. Interestingly, it appears that while meals were cooked and consumed on site, food-processing and storage were not part of the site activities, as archaeological evidence for the latter is completely lacking. Test pits placed next to the foundation walls showed that the below-grade foundation/cellar walls were not built using the "splayed-foot" construction technique which has been found at other 18th- and early 19th-century houses in New England, particularly at very sturdy, heavy buildings like the office. The splayed-foot construction technique involved buttressing the outside cellar/foundation walls below grade by corbelling fieldstone outward from the top to bottom. This technique strengthened the cellar/foundation walls and directed rainwater away from the cellar interior, important for preventing the spoiling of stored foodstuffs. In contrast, the exterior foundation/cellar walls of the original Trustees' Office are vertical and straight on the exterior, with no outward splayed-foot or dripstones to support the walls and direct water away from the foundation. Based on the test pit soil profiles it is clear that the entire lot around the Trustees' Office is manmade, and was likely constructed when the original 1813 building and the 1852 addition were built. That the Shakers built such a solid base for their buildings and went to such great efforts to modify the landscape around it says much of their world view. The Trustees' Office, like many other building at HSV, was built to last far beyond the lifetimes of the builders.

25-3232 George, David R., William F. Keegan, Aaron Palermo, and Catherine M. Labadia
2011 Orcutts Field Site Examination Associated with a Proposed Cellular Telecommunications Facility at 62 Park Street, Oxford, Massachusetts. 60 pages.

An examination of the Orcutts Field Site (19-WR-431) was completed as part of an archaeological investigation for a proposed cellular tower located on residential property near Lowe's Pond. The project area consisted of a 30 x 30 m lease area and an associated access road that measured 6 m in width and 45 m in length. A total of 28, 50 x 50 cm shovel test pits were excavated at 7.5 m intervals throughout the lease area and access road. In addition, a single 1 x 1 m unit was excavated in close proximity to the previously identified Orcutts Field Site. The shovel testing resulted in the recovery of a single machine cut nail. The excavation of the unit resulted in the collection of seven historical period artifacts (2 brick fragments, 3 machine cut nails, and 2 glass shards) and five ancient period artifacts (3 chert thinning flakes, 1 argillite thinning flake, and a single nondiagnostic chert projectile point/knife tip). All of the artifacts were collected from the topsoil and lacked stratigraphic integrity. (See also report #25-578.)

25-3233 Donta, Christopher L., and F. Timothy Barker
2011 Archaeological Intensive (Locational) Survey 2010 Work Areas, Turners Falls Municipal Airport, Montague, Massachusetts. 55 pages.

Archaeological investigations were conducted for a portion of the runway reconstruction project, consisting of 169, 50 x 50 cm shovel test pits in the four designated areas. Two Native American sites were identified during the testing. The Industrial Boulevard Site was found in Area 1. A quartz Small Stemmed projectile point was recovered from the subsoil. In addition, a bifacially worked milk quartz scraper and a flake of the same material with cortex were recovered from the plow zone at the site. Area 3 contained the Duneside Native American Site. The Duneside Site contained concentrations of quartzite, quartz, and chert chipping debris in the plow zone, but mainly from the B-horizon subsoil, as well as a grooved plummet. A feature tentatively identified as a Native American hearth was found within the main locus of the site. The feature contained a quartz Small Stemmed projectile point base. (See also reports #25-851, 25-2330, 25-2582, and 25-2786.)

25-3234 Donta, Christopher L., Marni Blake Walter, Broughton Anderson, Antonio Medina, and F. Timothy Barker
2011 Phase I Additional Archaeological Intensive (Locational) Survey and Phase 2 Archaeological Site Examination Survey of the Starch Factory Historic Archaeological Site for the Proposed Neponset Greenway, Boston and Milton, Massachusetts. 103 pages.

Archaeological testing was conducted for a proposed multi-use pathway along the Neponset River between Mattapan and Milton Village. Several alternative routes were proposed by the Department of Conservation and Recreation. Initial testing consisted of 217, 50 x 50 cm shovel test pits in six survey units along both sides of the river. Three archaeological sites were identified: the Tileston structure historical site, the Starch Factory historical site, and the Black Locust Native American Site. The Tileston structure site is related to the late 18th-and 19th-century industrial development on the north side of the Neponset River, but it is unknown whether this was an industrial outbuilding or a domestic structure. The Black Locust Site lacks temporally diagnostic artifact types, but is likely related to Native American use of the Neponset River as a transportation corridor. Additional documentary research and subsurface testing (29, 50 x 50 cm shovel test pits, one 50 cm x 2 m trench, one 1 x 1 m excavation unit, and one 1 x 1.5 m excavation unit) at the Starch Factory details its use as a mill prior to the production of starch and its association with the Liversidge family of Dorchester, identifies some of the construction techniques in the building, and documents artifacts associated with the building and its occupants.

25-3235 Herbster, Holly, and Erin Flynn
2011 Intensive (Locational) Archaeological Survey, OpenCape Fiber Optic Network, Cape Cod Canal Crossing, Bourne, Massachusetts. 67 pages.

The archaeological survey was conducted within a proposed 900 m^2 directional drill impact area between Scusset Road and the Cape Cod Canal. In total, 22, 50 x 50 cm shovel test pits were excavated within the project area, resulting in the collection of a low density of historical and modern materials, along with a nondiagnostic quartz biface fragment. The biface provides additional documentation of the use of the former Scusset River area by Native Americans.

25-3236 Herbster, Holly
2011 Archaeological Reconnaissance Survey, Town of Mashpee, Mashpee, Massachusetts. 195 pages.

The main goals of this survey were to identify known and potential archaeological sites in Mashpee; develop town-wide archaeological sensitivity maps and an accompanying guide to understanding and using these maps; develop management recommendations for the protection of cultural resources and sensitive areas; and present the information in a format that would be useful to state and local planning and review agencies. The survey included archival research, informant interviews, and field survey that allowed for the collection of information about known and potential archaeological resource areas. Ancient period archaeological sensitivity is highest along the major wetland margins, including those associated with Popponesset Bay, the majority of the town's kettle ponds, and in proximity to smaller streams, swamps, and ponds. Historical period sensitivity is highest in the areas of documented Native American homesteads, institutional and civic meeting areas, and along established transportation corridors where activities have been documented from the mid-17th century to the present.

25-3237 Herbster, Holly, Dianna L. Doucette, and Kristen Heitert
2010 Archaeological Overview, Parker River National Wildlife Refuge, Newbury, Newburyport, Rowley, and Ipswich, Massachusetts, Essex County. 192 pages.

The overview and assessment survey included archival research and a walkover survey focused on collecting information about previously identified archaeological sites in the project vicinity, as well as the history of the lands that comprise the Parker River National Wildlife Refuge (NWR). The data were used to refine the archaeological sensitivity ranking developed by previous surveys,

to produce a predictive model of the types and locations of expected sites, and to produce an archaeological sensitivity map of the NWR. Seventeen Native American sites (Late Archaic to Middle Woodland) and 29 European-American sites (17th to 20th century) have previously been identified within the Parker River NWR. The ancient sites consist of shell middens, fishing/hunting camps, villages, burials, and lithic workshops. The historical sites include 19th- and 20th-century hunting camps, dwellings, seasonal farmsteads, shipwrecks, and a grain mill. Zones of high sensitivity include known and/or documented historic and archaeological sites and their proximate areas. Moderate sensitivity zones include areas with no known sites, limited levels of disturbance, and similar environmental attributes to those within known site areas, as well as areas where previous archaeological studies have predicted that cultural resources could be present. Zones of low sensitivity include areas known or likely to have been extensively disturbed by development or other types of modern land use, as well as areas with unfavorable environmental attributes such as poorly drained upland areas or permanent waterbodies. (See also reports #25-289 and 25-384.)

25-3238 Donta, Christopher L., Marni Blake Walter, and F. Timothy Barker
2011 Archaeological Reconnaissance and Intensive (Locational) Surveys for H-Frame Structure Replacements on the 1371 Line in Lee, Massachusetts. 90 pages.

Background research and reconnaissance surveys identified ten areas of archaeological potential out of the 20 replacement locations. Subsequent subsurface testing, consisting of 62, 50 x 50 cm shovel test pits, resulted in the identification of one historical period site, the Wood Mill Site, located along the north side of Washington Mountain Road. The site was the location of a saw and cider mill in the 19th century.

25-3239 Donta, Christopher L., Marni Blake Walter, and F. Timothy Barker
2011 Archaeological Reconnaissance and Intensive (Locational) Surveys for H-Frame Structure Replacements Along the 1421 Line in Blandford, Otis, Becket, and Lee, Massachusetts. 198 pages.

Background research and reconnaissance surveys identified 22 areas of archaeological potential out of 65 replacement and access road locations. In addition, Tribal Historic Preservation Officer (THPO) monitors requested eight additional areas be tested. In total, 30 of the 65 replacement locations were tested, including eight recommended by a THPO monitor. Subsequent subsurface testing consisted of 155, 50 x 50 cm shovel test pits. Of the 30 locations tested, three contained historical period archaeological sites, four additional locations contained historical period artifacts but were not classified as sites, and one contained an isolated Native American artifact. The historical sites include two late 19th-century domestic sites in Otis (the Lee-Westfield Road and Hugins sites) and one early 20th-century railroad depot in Otis (the Huckleberry Depot Site).

25-3240 Dudek, Martin G., and Frederick Sutherland
2011 Archeological Investigation for the Lucy Mead Tomb Restoration Project, King Street Old Burying Grounds, Littleton, Massachusetts. 242 pages.

A data recovery excavation was conducted of a vandalized early 19th- century tomb at the Old Burying Ground. The tomb, based on an inscription on the slate door, was believed to be the resting place of Lucy Kimball Mead (d. 1821). The tomb had been vandalized in the mid-20th century, leaving scattered coffin fragments, human bones, and 20th-century refuse throughout the interior. The 3.65 x 2.75 m tomb was mapped, excavated and fine-screened using a 50 cm grid. Over 11,000 fragments of wood, human and animal bone, and artifacts were recovered and catalogued. Special analysis was conducted on osteological remains, coffin hardware and coffin wood, and textiles and clothing-related artifacts. Based on this work it appears that the tomb was used at least three times for interments: Lucy Kimball Mead in 1822; a child, possibly Sherman Dix Mead (d. 1833); and later an elderly man, possibly Benjamin Kimball (d. 1858). Lucy’s remains and the child’s remains were largely absent. Documentary research suggests that they were reburied at Westlawn Cemetery in a family plot.

25-3241 Bruchac, Margaret M.
2007 Historical Erasure and Cultural Recovery: Indigenous People in the Connecticut River Valley. 337 pages.

This work explores the impact of the "vanishing Indian" paradigm on historical, museological, and anthropological interpretations of Native American Indian peoples along the *Quinneticook* –the middle Connecticut River Valley of west-central Massachusetts. The 17th-century documentation of the region's Agawam, Nonotuck, Pocumtuck, Quaboag, Sokoki, and Woronoco people is surprisingly dense, but their presence after that time is poorly understood. Sophisticated systems for reckoning and maintaining Indigenous governance, trade, kin relations, and inter-tribal alliances, and various means of preserving localized knowledges, were in operation long before colonial settlement, and survived after colonization. The records of this activity and the movements of Native families to other locales were obscured, during the 19th century, by local White historians. Accurate understandings of local Native histories have subsequently been difficult to reconstruct, given the lack of ethnographic information in Euro-American records, the flawed representations of Native people and events in local town histories, and the failure to recognize the lineal descendants of middle Connecticut River Valley Native families among today's Western Abenaki populations. The "invisibilizing" of the valley's Native peoples is a trick of misdirection, caused, in part, by the research interests of three local collectors: geologist Edward Hitchcock, Jr. of Amherst College, antiquarian George Sheldon of the Pocumtuck Valley Memorial Association, and zoologist Harris Hawthorne Wilder of Smith College. These men unearthed numerous Native individuals from local gravesites and amassed thousands of artifacts, portraying the skeletal remains of dead Indians as "real," while representing their descendants as "unreal" remnants of the presumably more authentic Native past. This project, therefore, discusses the ways in which local Native histories and oral traditions were marginalized, ignored, or colonized, at the same time that Native bodies were being exoticized, fetishized, and commodified. One means of decolonizing the valley's Native history is a four-part process that: first, reveals the discursive processes that disconnected living Native peoples from their own histories; second, investigates the physical interferences of archaeological collectors; third, articulates the persistence of Native families over time by linking oral traditions, family names, and material evidence; and fourth, begins to repair some of the damage done by restoring and repatriating the scattered archaeological collections. To illustrate the impact of misrepresentation on local Native histories, this dissertation discusses the appearances, in various documents over time, of one local Native family lineage (from Shattoockquis to Sadochques to Msadoques to Sadoques), and their repeated efforts to make their presence known to Deerfield historians. This case study directs attention to some of the Indigenous knowledges and territorial understandings that could be used to construct more accurate regional narratives. In sum, this work aims to demonstrate how decolonizing methodologies can reveal heretofore missing connections, while establishing a more equitable social venue within which the real work of restorative history can begin.

25-3242 Duranleau, Deena L.
2009 Flexible Sedentism: The Subsistence and Settlement Strategies of the Pre-Contact Residents of Coastal New England and New York. 224 pages.

This dissertation utilizes an often-overlooked resource in developing a regional database of archaeological sites. The so-called "gray literature" produced by cultural resource management firms working in southern coastal New England and New York offers a wealth of site-based data. When thousands of these sites are brought together and compared synchronically and diachronically, it is possible to make assertions about the habitation patterns of the pre-contact residents of coastal southern New England and New York. By focusing on Late Archaic and Late Woodland Period short-term, seasonal, and flexible sedentary sites, this study offers a broad-based, multi-level analysis of subsistence and settlement patterns both across the region and through time. An important finding is the overall homogeneity across the region and through time in the archaeological evidence left behind of the Native inhabitants of this coastal zone. This finding comes from a detailed analysis of the types of activities occurring at each site, as represented in the archaeological record, which reveals similar types of activities occurring at sites across the coastal region,

and as a result of comparisons of the amount of site re-use through time. These findings support an hypothesis that the archaeological record for southern coastal New England and New York is characterized by long-term continuity. The homogeneity in habitation pattern across the region and between the Late Archaic and Late Woodland periods is evidence that this pattern of repeated reoccupation of sites for generations was a successful coastal strategy. One result of this stable habitation pattern is that at certain sites or groups of sites, Native inhabitants remained year-round, a strategy of flexible sedentism.

25-3243 Keim, Alexander, and Jennifer Wildt
2009 “Let us organize to re-establish the contact between the land and the people.”: Archaeological Excavation Report for the Wakefield Summer Archaeological Institute, 2009, Milton, Massachusetts. 61 pages.

Archaeological investigations were conducted in the summer of 2009 at the 22 acre Wakefield Estate. Graduate students led local high school students in excavations with the goals of ground-truthing results of a 2008 geophysical survey as well as producing a comprehensive archaeological management program for the estate. Two areas were selected for investigation, one east of the farmhouse near the visible foundations of a 19th-century barn (Barn Foundation Area) and one northwest of the farmhouse near a chicken coop (Chicken Coop Area). Eight 50 x 50 cm shovel test pits were dug in the Barn Foundation Area and nine 50 x 50 cm shovel test pits were dug in the Chicken Coop Area. Material recovered from the shovel test pits dates from the mid-19th century to the early 20th century. The assemblage is dominated by coal and coal by-products but also includes significant numbers of glass, metal, and earthenware ceramics. Shovel Test Pit 1 confirmed the presence of cobble flooring associated with the 19th-century barn, and a feature discovered near the barn foundation contained a significant quantity of ash and coal by-products, suggesting it might have been deliberately filled in order to dispose of waste from a coal-burning stove or furnace. While the artifacts recovered from the Barn Foundation Area were primarily architectural, the artifacts near the Chicken Coop Area represented more of a domestic assemblage. The excavations overall, exhibiting limited evidence for intensive land use and broad disposal activities, confirmed that the ground surface of the estate was kept very clean. Possible horticultural activities in the early 20th century may have involved clearing, leveling, and/or filling, offering one explanation for the paucity of early 19th-century materials. (See also report #25-3244.)

25-3244 Keim, Alexander
2010 The Landscape and Inhabitants of the Wakefield Estate in the Late 19th and Early 20th Centuries: Archaeological Excavation Report for the Wakefield Summer Archaeological Institute 2010, Milton, Massachusetts. 225 pages.

Archaeological investigations were continued in the summer of 2010 at the 22 acre Wakefield Estate. Graduate students led local high school students in excavations with the goals of continuing to ground-truth results of a 2008 geophysical survey as well as producing a comprehensive archaeological management program for the estate. The fieldwork continued excavations around the Barn Foundation Area and began excavations around a stone retaining wall west of the farmhouse. Fourteen shovel test pits of various sizes were excavated, resulting in the recovery of early 19th-century to mid-20th-century materials, primarily glass, metals, and ceramics. Test pits excavated in the Barn Foundation Area revealed a large deposit of cobble-sized stones with interspersed artifacts. The deposit was likely created in the mid-19th century but it is unclear whether the stones are the result of a land-clearing event or whether they came from the demolition of a cobble feature. Another test pit in the Barn Foundation Area revealed a large deposit of items pertaining to clothing, personal adornment, consumption and personal health. A variety of buttons, beads, buckles, fasteners, snaps, and jewelry were recovered, as well as a crucifix, a rosary fragment, and a shamrock tie clip or lapel pin. Documentary records indicate that these household objects might have belonged the Burns family, Irish tenant farmers who occupied the estate around 1920. The material culture associated with this occupation suggests that the Burns family, likely a working class family with children, felt strongly about their Irish Catholic heritage. Excavations near the retaining wall to the west of the farmhouse were conducted to determine the use of the land be-

tween the retaining wall and the farmhouse, the potential presence of outbuildings in this space, and the date of the retaining wall construction. Maps indicate that the complex of stone walls to the west of the farmhouse was altered between 1865 and 1937. The recovery of materials dating to the turn of the 20th century from the base of the wall indicates that around that time, a sloped area of the yard was landscaped into two terraced areas on either side of the retaining wall, which was originally a freestanding stone wall. These activities were likely part of a large-scale land clearing and movement episode, possibly related to horticultural activities, which occurred in the early 20th century. (See also report #25-3243.)

25-3245 Gillis, Nichole A.
2011 Intensive (Locational) Archaeological Survey, A-127/B-128W Transmission Line Reconductoring Project, Hardwick Laydown, Hardwick, Massachusetts. 34 pages.

Archival research, a site visit, and subsurface testing were conducted for the approximately 1 acre proposed grading area. There are no recorded or documented sites within the proposed area. Subsurface testing consisted of 25, 50 x 50 cm shovel test pits excavated within one 30 x 30 m block and along three linear transects at 10 m intervals. Mostly intact soil profiles were observed within the project area. A low density of 20th-century refuse, recovered from plowed and fill soil contexts, is not considered a potentially significant archaeological deposit.

25-3246 Ritchie, Duncan
2011 Intensive Archaeological Survey, 15 Great Road Development, Littleton, Massachusetts. 63 pages.

An archaeological survey of the project area was conducted near Nagog Pond along the east side of Great Road (Route 2A). Archival research indicated that the project area had the potential to contain evidence of Ancient period Native American activity. This activity was expected to range from low-density scatters of chipping debris or isolated chipped stone tools to small or moderate sized temporary encampments. The Christian Indian settlement of Nashoba was located on or near Nagog Pond in the mid-17th century. Eight historic architectural resources (ACT.23 - ACT.30) consisting of standing 18th- and 19th-century structures are within one half mile of the project area. A late 19th-century to Early Modern period granite quarrying complex (Acorn Park Quarries, ACT-HA-1) is south and east of the project area in Acton. Subsurface testing consisted of 78, 50 x 50 cm shovel test pits excavated at 10 m intervals along three judgmental transects, in three 30 x 30 m sampling blocks, and as one judgmental test pit. A small amount of historical period cultural material was found in test pits placed within the open fields in the southern part of the project area and next to a small granite block feature. This material consists of ceramic sherds and structural materials (brick, nails, window glass, hardware). The ceramic sherds (whiteware, redware) date from the 19th to the 20th century, and this cultural material represents domestic refuse discarded in the open fields when they were in active agricultural use.

25-3247 Mair, A. Peter, II
2010 Reconnaissance Archaeological Survey, Worcester Regional Airport Vegetation Management Program, Leicester and Worcester, Massachusetts. 102 pages.

One potentially significant archaeological site (LEI-HA-5) falls within the study area in Leicester, and many historical period residences were once located in the project area. The archaeological survey resulted in assigning general sensitivity rankings of low, moderate, and high to specific areas within the study area. Field review of each of the 42 vegetation management areas identified potential archaeological resources in seven areas in the form of stone walls, foundations, or cellar holes. These areas were mapped on project plans with notes outlining measures to avoid impacting these features.

25-3248 Mulholland, Mitchell T., and Meghan Borowiec
2009 Archaeological Monitoring of the Memorial to the Founders of Watertown Improvements, Watertown, Massachusetts. 24 pages.

Archaeological monitoring and limited intensive survey were conducted at the location of the renovations planned for the Saltonstall Monument, located just north of the Charles River. Built in 1931 and dedicated on the 300th anniversary of the founding of Watertown, the Founders Memorial consists of a large bronze statute of Sir Richard Saltonstall and two bronze bas-reliefs. The survey consisted of the excavation of 4, 50 x 50 cm shovel test pits at the location of proposed dogwood tree planting. The artifacts recovered were associated with artificial fill, probably brought to the site from another location. While the fill contained 19th-century artifacts, such as glazed redware, square cut nails, green glass, possible utilized bone, and a "Peter Dorni" pipe stem fragment, it also contained modern trash. One test pit contained a rhyolite flake, possibly of Native American origin.

25-3249 Herbster, Holly
2011 Intensive (Locational) Archaeological Survey, Tisbury Water Works Redevelopment, Tisbury, Massachusetts. 74 pages.

An archaeological survey was completed for the proposed restoration of the "Spring House" within the Tisbury Water Works. The Tashmoo Springs Pumping Station, listed in the National Register of Historic Places, includes a less than one acre parcel of land within which the archaeological testing occurred. The Tashmoo Springs Site (19-DK-109), located nearby is recorded as a large artifact collecting area where materials dated to the Middle and Late Archaic periods have been identified. In total, 21, 50 x 50 cm shovel test pits were excavated within the septic tank and water line impact areas. Thirty-five pieces of lithic chipping debris were collected in low densities from disturbed/fill soils with the exception of one flake collected in natural subsoil. Historical/Modern period materials were collected in low densities across all sections of the project area and are likely associated with the operation and use of the facility from the late 19th century through the present day. A buried stone drainage feature (Feature 1) was identified along a small portion of the existing Water Works access road in an area where the road cuts through a steep slope.

25-3250 Ritchie, Duncan
2010 Townwide Archaeological Reconnaissance Survey, Westford, Massachusetts. 514 pages.

Primary objectives of the project were to identify patterns of ancient and historical period settlement and land use and to determine known and probable locations of archaeological resources associated with these patterns. Using written and cartographic materials, investigations by avocational and professional archaeologists, and research by local historians, it was possible to document important cultural resources and predict the types of archaeological sites potentially located throughout the town. The results of archival research were used to develop predictive models and archaeological sensitivity maps for known and expected ancient and historical period cultural resources. Other products of the reconnaissance survey included a guide to understanding and using the sensitivity maps, and management recommendations for the protection of cultural resources and archaeologically sensitive areas in the town. Zones of sensitivity for ancient Native American sites are clustered along the tributary stream and wetland network formed mostly by Stony, Nashoba, Beaver, Snake Meadow, and Tadmuck brooks. The margins of the larger water bodies such as Forge, Long Sought For, Keyes, Heart, and Burges ponds with unaltered land, some smaller ponds, and wooded wetlands also contain zones of sensitivity for ancient period Native American cultural resources. Zones of sensitivity for historical period archaeological resources related to past industrial development are primarily along sections of Stony Brook in Forge Village, Graniteville, Westford Depot and Brookside. Other zones of sensitivity for historical period cultural resources are along the older streets and roads where there is intact land containing late 17th-, 18th-, and 19th-century farmsteads, houses, stores, taverns, and artisan/craftsmen shops. A total of 10 previously unrecorded ancient period Native American archaeological sites were identified during the survey. The 55 unrecorded or under-documented historical period European-American sites identified in the survey reflect many aspects of the town's historical period development. The reconnaissance survey report is intended to serve as a guide for Westford to take an active role in

managing its cultural resources. It was recommended that the town develop local review for proposed development of remaining archaeologically sensitive open land and developed areas containing known cultural resources. An archaeological site protection program could be formalized in a town bylaw, the purpose of which would be to protect the archaeological resources of the town and provide a means for coordinated review of proposed development through town boards and commissions.

25-3251 Dudek, Martin G., and Thomas P. Mailhot
2012 Intensive (Locational) Archeological Survey at the Proposed Site of a 100-ft Uni-Pole Telecommunications Antenna, Duxbury, Massachusetts. 90 pages.

The archaeological survey consisted of 15, 50 x 50 cm shovel test pits, consisting of a block of five test pits and 10 judgmentally placed test pits. One ancient period Native American archaeological site was identified, the Elm Street site, which consists of a lithic workshop with 198 pieces of rhyolite chipping debris flakes and a preform. Additional pieces of rhyolite, quartz, and argillite chipping debris were recovered from several other test pits.

25-3252 Gillis, Nichole, and Holly Herbster
2012 Intensive (Locational) Archaeological Survey, Moon Island Wind Turbine Project, Quincy, Massachusetts. 63 pages.

The project will include the construction and installation of a monopole tower within a 300 x 400 ft clearing and a 400 ft utility corridor. The survey included archival research, a walkover survey, and subsurface testing. In total 30, 50 x 50 cm shovel test pits were excavated, resulting in the recovery of low densities of primarily 20th-century refuse from plowed contexts.

25-3253 Waller, Joseph N. Jr., and Gregg Laskoski
2011 Intensive (Locational) Archaeological Survey, Lower SEMA 345 kV Transmission Project, Plymouth and Barnstable Counties, Massachusetts. 107 pages.

Archaeological investigation of the proposed transmission line in Barnstable, Bourne, Carver, Plymouth, and Sandwich involved the excavation of 1,249, 50 x 50 cm shovel test pits. Test pits were organized within four 30 x 30 m sampling blocks, 30 linear test pit transects, and three sampling arrays. Transect testing involved the excavation of a test pit every 10 m in areas of proposed ground disturbance or tree clearing. Archaeological testing resulted in the identification of the Federal Pond Native American Site in Plymouth. Ancient period Native American cultural materials including quartz, argillite, and rhyolite chipping debris, a quartz scraping tool, and a Middle Archaic Neville-Variant type projectile point.

25-3254 Cherau, Suzanne G., and Nichole Gillis
2011 Phase I Archaeological Identification Survey, Proposed Visitor Facilities, Oxbow National Wildlife Refuge, Devens (Harvard), Massachusetts. 118 pages.

The project area encompassed approximately six acres on a wooded terrace overlooking the Nashua River to the west, as well as an adjoining area of riverbank south of Hospital Road on the former Main Post of Fort Devens. There were no previously recorded archaeological sites within the project area, although archaeological inventory surveys in 1993 and 1995 assigned archaeological sensitivity to the central wooded portion of the project area, as well as areas to the south along the river corridor. The 2011 archaeological survey consisted of archival research and subsurface testing within approximately one acre of the project area. Subsurface testing in the form of 67, 50 x 50 cm shovel test pits was conducted in wooded areas and adjacent to the river. The recovery of historical period artifacts in plowzone and disturbed/fill soils contexts were interpreted as refuse discarded during agricultural activities (plowing) associated with nearby documented 19th-century home and farmstead occupations. The provenience of many of these materials in fill/disturbed contexts suggests that re-deposition occurred during 20th-century military activities. None of the materials were found in association with any structural remains or other features such

as cellar holes, refuse pits, privies, or wells.

25-3255 Lynch, Kerry J., and Kathryn Curran
2012 Report Addendum for Potential Ceremonial Areas Identified by the Narragansett and Wampanoag (Aquinnah) Indian Tribes for the Agawam to West Springfield Circuit Separation Project (AG-WS) (1311/1412 Line Separation), Phase 1 Reconnaissance and Intensive (Locational) Survey, Hampden County, Massachusetts. 47 pages.

Supplemental testing in Agawam and West Springfield included the excavation of 18, 50 x 50 cm shovel test pits at proposed structure locations, crane pads, and an access road at the Agawam Substation; two machine-excavated 4 x 4 m excavation units at proposed structure locations in the vicinity of the Walnut Street Site (19-HD-332); nine machine excavated 4 x 4 m excavation units, six associated 50 x 50 cm shovel test pits, and one vibratory core at proposed structure locations along the south bank of the Westfield River in the vicinity of the Heron Meadow (19-HD-330), Agawam Meadow (19-HD-269), and Westfield River (19-HD-331) sites; one machine excavated soil berm and two associated 50 x 50 cm shovel test pits near the Heron Meadow Site; and archaeological monitoring of drilling operations at eight proposed structure locations on Bondi's Island in West Springfield. A small density of historical period artifacts was recovered from fill deposits in the shovel test pits excavated at the Agawam Substation, the soil (fill) berm, and from four 4 x 4 m units. Ancient period Native American artifacts were recovered from one 4 x 4 m unit at the Walnut Street Site, two 4 x 4 m units adjacent to the Heron Meadow Site, and one 4 x 4 m unit adjacent to the Agawam Meadow Site. A possible ancient period Native American posthole feature was recorded in the 4 x 4 m unit adjacent to the Heron Meadow Site. A truncated, possible hearth and a small pit feature were recorded in the 4 x 4 m unit adjacent to the Agawam Meadow Site. (See also report #25-3054 and 25-3056.)

25-3256 Dudek, Martin G., Barbara Donohue, and Thomas P. Mailhot
2012 Archeological Intensive (Locational) Survey for the I-93 Tri-Town Interchange Project (EOEA #14159) in the Towns of Andover, Methuen, Tewksbury and Wilmington, Essex and Middlesex Counties, Massachusetts. 137 pages.

The archaeological survey involved a reconnaissance walkover and the excavation of 322, 50 x 50 cm shovel test pits within the project's area of potential effect. Two ancient period Native American archaeological sites were identified. The County-Line Site (19-ES-860) is located at the Essex-Middlesex county line (town lines of Andover and Wilmington), with 36 rhyolite flakes, one quartz flake, and six pieces of fire-cracked rock recovered from nine test pits. The Spicket River Canal Site is located in Methuen east of I-93 and west of the Spicket River canal, with ten rhyolite flakes, one quartzite flake, and a piece of fire-cracked rock recovered from two test pits.

25-3257 Gillis, Nichole, and Alan Leveillee
2011 Intensive (Locational) Archaeological Survey, SunGen Andover Solar Project Area, Andover, Massachusetts. 62 pages.

An archaeological survey of the project area included archival research, a walkover survey, and subsurface testing of the construction footprint. In total, 120, 50 x 50 cm test pits were excavated within archaeologically sensitive areas, within eight 30 x 30 m blocks and along four linear transects. Mostly intact soil profiles were observed in the western portion of the project area, while a mix of intact, graded, and filled soil profiles were observed within all other block and transect test pits. The intensive survey identified a 20th-century concrete and cinder block foundation and low densities of 20th-century refuse from disturbed soil contexts.

25-3258 Mastone, Victor T., Craig Brown, and Christopher Maio
2011 Chelsea Creek – First Naval Engagement of the American Revolution, Chelsea, East Boston, Revere, and Winthrop, Massachusetts. 228 pages.

Overshadowed by the iconic battles at Concord/Lexington and Bunker Hill, the Battle of Chelsea

Creek (1775) is often overlooked as part of the siege of Boston. This multi-disciplinary study involved evaluation of documentary records, reconstruction of the historic landscape, a military terrain analysis known as KOCOA (Key or Decisive Terrain; Observation and Fields of Fire; Cover and Concealment; Obstacles; and Avenues of Approach and Withdrawl), and a preliminary field investigation. The primary historical sources contained a number of time cues and locational information that initially permitted only a general reconstruction of the battle, making it difficult to identify the defining features on the actual battlefield. A high resolution Geographic Information Systems (GIS) dataset and Citation Data Model of the temporal and spatial features associated with the Battle of Chelsea Creek and the 1775 Boston landscape were developed, and base-level and battlefield maps were produced. By joining the battle narrative with a military terrain analysis, the authors were able to identify the likely location of key features on the geo-referenced, reconstructed 1775 landscape. This application provided a clearer understanding of how the physical landscape influenced the battle, as well as valuable insights into battlefield events and preservation. Six core areas within the battlefield study area were visually inspected and three areas were identified as having potential for site preservation and more intensive investigation: Crooked Creek engagement area; Mill Hill/Chelsea Neck engagement area; and Winnisimmet Ferry Landing with HMS *Diana* grounding site. Field investigations verified that the majority of the battlefield has been heavily impacted by urban development. More detailed topographic and land use analyses coupled with additional ground-truthing, intensive archeological sampling, and geophysical surveys within core areas were recommended.

25-3259 Donta, Christopher L.
2008 The Northwoods Site (19-BR-611): A Small Stemmed Tradition Camp in Taunton, Massachusetts. 200 pages.

A data recovery program consisted of 81 shovel test pits, two 10 m x 50 cm trenches, one 6 m x 50 cm trench, one 4 m x 50 cm trench, one 2 m x 50 cm trench, 17, 1 x 1 m units, and four 50 cm x 1 m units. The 81 shovel test pits, in combination with the 56 shovel test pits previously excavated at the site, covered most of the site at a 4 m grid interval. Ten features were identified and excavated, consisting of six burn related features and four chipping stations. Seven of the features were either associated with Small Stemmed projectile points, or were found in very close proximity to Small Stemmed points. Two of these also contained Small Triangle (i.e., Squibnocket) points. All four of the chipping station features contained Small Stemmed points. Radiocarbon dates from three of the hearths fall into the ranges of 5610-5320 B.P. (Beta 208624), 5450-4790 B.P. (Beta 208625), and 3230-2840 B.P. (Beta 208626), within the Late Archaic and Early Woodland periods. Pollen core data illustrated the presence of an oak-pine forest during the Late Archaic period, followed by an increase in fire activity in the Early Woodland. Faunal material from the site indicated deer hunting and the exploitation of wetland game such as turtle. Two Brewerton points were also found at the site. The excavations recovered a total of 16,732 artifacts, raising the total from the site to 18,049 for all three phases of the project. (See also report #25-2534.)

25-3260 Dudek, Martin G., and Thomas P. Mailhot
2012 Archaeological Intensive (Locational) Survey for the 90 Pine Street (Assessor's Parcel 28.2) Property, Town of Douglas, Worcester County, Massachusetts. 91 pages.

The purpose of this survey was to identify whether the 55 m x 30 m project area may contain unmarked graves. The project area is associated with a ca. 1794 to 1856 Quaker meetinghouse and is adjacent to the walled Chase Family Cemetery. Testing consisted of a grid of 41 test pits set 5 m apart in transects 8 m apart, and 8 judgmentally placed test pits (all 50 x 50 m). Soil cores were taken at 1 m intervals between test pits along transects. Four test pits were expanded into trenches to investigate soil anomalies. An isolated quartz flake was recovered from one test pit. Archaeological testing also identified an area approximately 16 x 16 m where brick and mortar fragments, window glass and wrought nails were recovered near a stack of quarried stone blocks. This area likely contains the site of the former Quaker meetinghouse, a potentially significant site, and avoidance or additional archaeological documentation is recommended. Three possible grave loca-

tions have been identified, and are avoidable. Testing around one headstone suggested that it was displaced. Testing at the other headstone identified a probable grave shaft, with a second granite marker adjacent, also associated with a probable grave shaft. These two probable graves are located outside the limit of work. Another possible grave shaft has been identified near the Chase Family Cemetery. Additional unmarked graves are possible within the surveyed area.

25-3261 Kelly, Margaret, and Timothy L. Binzen
2002 Archaeological Reconnaissance Survey for Stabilization and Restoration of Buildings 5/6, 11 and 19 and Damage Assessment for a Utilities Trench at the Springfield Armory National Historic Site, Springfield, Massachusetts. 64 pages.

A reconnaissance survey was conducted to assess archaeological sensitivity at Buildings 5/6, 11 and 19 at the Springfield Armory National Historic Site. The potential for Native American archaeological resources is considered to be low. However, the potential for historical archaeological deposits and features is considered high in the lawn areas adjacent to Buildings 5/6 and 11 and beneath the pavement adjacent to the north, east, and south sides of Building 19. It is expected that archaeological testing could provide evidence of military activities, arms manufacturing, and domestic and recreational activities associated with military officers and their families. In 1863, construction activities near the western end of Building 19 uncovered unmarked historical human burials, and additional human remains could still be located beneath the pavement. A damage assessment was conducted for a 455 ft backhoe trench located on the south side of the parade ground. Twelve features were recorded, consisting generally of small trenches for utilities. Two noteworthy historical features were revealed by the backhoe trench, including a buried brick and mortar walkway and a brick and mortar dry well.

25-3262 Mulholland, Mitchell T.
2012 Archaeological Monitoring of a Pollen/Peat Core on Calf Island, Boston Harbor, Boston, Massachusetts. 48 pages.

A pollen/peat core was extracted by a team of forest biologists from the University of Massachusetts at Amherst. Because Calf Island contains known archaeological sites, and comes under federal and state jurisdiction, the Massachusetts Historical Commission requested archaeological monitoring to assure that sites were not impacted by the extraction of the 10 cm core. The location of the pollen/peat core was carefully selected to maximize peat and pollen recovery, and to avoid impacts to nearby archaeological sites. Located just to the south of site 19-SU-16, the core was inserted in poorly drained, wet ground, in an area unlikely to contain significant archaeological sites. Results of the core indicate that the location chosen was wetland when Native Americans were in occupation. A radiocarbon date, sediment rates, and peaks in charcoal to pollen ratios suggest Native American activities on the island occurred between approximately 925 to 650 years before present, and from 275 to 460 years before present.

25-3263 Gillis, Nichole, and Alan Leveillee
2012 Intensive (Locational) Archaeological Survey B154N/C155N Transmission Line Project, Boxford, North Andover, Middleton, North Reading, Peabody, and Danvers, Massachusetts. 106 pages.

Subsurface testing of 147, 50 x 50 cm shovel test pits was completed at eight proposed pole structure replacement locations and at or near locations where 15 archaeological sites are reported. Native American cultural material was recovered at three previously identified archaeological site locations including the Dirt Jump Site (19-ES-798) and the South Bend/Tall Pine Site (19-ES-799) in Peabody, and the Dark Pond Site (19-ES-803) in Middleton. The Dirt Jump Site is affiliated with the Late Archaic period based on the recovery of a Brewerton Eared projectile point. The South Bend/Tall Pine Site dates from the Middle Archaic through the Middle Woodland periods and is characterized by chipping debris and a range of Native American artifacts including pottery and diagnostic stone tools (Neville, Brewerton Eared, Small Stemmed, and Meadowood). The Dark Pond Site was occupied from the Late Archaic through the Transitional Archaic periods and

is characterized by a lithic assemblage that includes chipping debris and diagnostic stone tools (Brewerton Corner-Notched, Wayland Notched, and Susquehanna).

25-3264 Medina, Antonio, Timothy Binzen, Peggy Kelly, C. Broughton Anderson, F. Timothy Barker, and Mitchell T. Mulholland
2011 Archaeological Intensive (Locational) Survey and Data Recovery for Proposed Construction at Building 11 and New Duct Bank Northeast of Building 14 of the Springfield Armory National Historic Site, Springfield, Massachusetts. 108 pages.

Constructed as an arsenal in 1807, Building 11 is the oldest standing structure at the Armory. Excavation of shovel test pits and 1 x 1 m units in the grassy areas outside of the structure revealed 80 to 150 cm of historical fill containing architectural debris and19th-century ceramics, clay smoking pipes, buttons, and coins. Also recovered were several large whole gunflints, many broken gunflints, and pieces of flint flakes and shatter. Several quartz flakes, presumed to be Native American, were also encountered in the historical fill material. Monitoring of construction activities at the basement level resulted in the discovery of an almost intact, brick paved floor, which extends across the entire basement. Two nearby structures dating to the 1840s contain the same brick paved basement floor. Excavation exposed the remains of two pier footings. It was observed that the original support columns were built upon brick footings based on large recycled stone grinding wheels, probably used in the nearby water shops during the early days of the Armory and discarded after they were worn beyond use. No further survey is recommended.

25-3265 Doucette, Dianna L., and Nichole Gillis
2012 Archaeological Site Examinations, Hunter Hill Road, Chicopee Brook Wetland Site 2, Stebbins Road Wetlands, and East Brook Sites, Monson and Hampden, Massachusetts. 137 pages.

In total, 38, 50 x 50 cm shovel test pits and 11, 1 x 1 m units were excavated. The Hunter Hill Road Site likely represents a temporary campsite and consists of a low density of chipping debris, one Brewerton projectile point preform and a pottery sherd. The Chicopee Brook Wetland Site 2 was a campsite that may have been utilized repeatedly. It is characterized by chipping debris and several tools including bifaces, projectile points, a scraper and a utilized flake. The site contained two Neville projectile points, diagnostic of the Middle Archaic period. The Stebbins Road Wetland Site, a possible seasonal campsite, is characterized by diagnostic projectile points, chipping debris, several types of stone tools, calcined bone and charcoal. Two projectile points, including a quartzite Squibnocket Triangle and quartz Small Stemmed are diagnostic of the Late Archaic period. The East Brook Site consists of a low density of chipping debris consistent with a single, brief occupation episode and possibly wetland resource procurement. (See also report #25-3134.)

25-3266 Doucette, Dianna L.
2011 Intensive (Locational) Archaeological Survey, Mashpee Pow Wow Road, Mashpee, Massachusetts. 63 pages.

The Mashpee Wampanoag Tribe is proposing to build a new road around a gravel and grass area that is used for the Tribe’s annual Powwow. The proposed road will be approximately 244 m long by 9 m wide. The intensive survey included archival research, a walkover survey, and subsurface testing to locate and identify any potentially significant archaeological resources that may be affected by project construction. During subsurface testing, 26, 50 x 50 cm shovel test pits were excavated at 10 m intervals along one judgmental linear transect. No cultural material was identified.

25-3267 Volmar, Michael A.
1994 Archaeological Site Locational Survey at the Herman Melville House, Pittsfield, Massachusetts. 34 pages.

Historical documents reviewed suggest the land has been farmed since it was cleared in the 1780s. Thirty six shovel test pits were excavated and the plowed portions of the project area were surface collected. One lithic flake of green-grey chert and several quartz chunks were recovered. Histori-

cal materials recovered included plain and transfer-printed whiteware (1820-1900), Chinese export porcelain (1800-1835), late industrial porcelains, cut nails, and a Buddha effigy. The majority of the remaining material was 20th-century sheet refuse. No further survey is recommended. (See also report #25-1278 and 25-1609.)

25-3268 Curran, Kathryn, F. Timothy Barker, Antonio Medina, Brian Jones, and Mitchell T. Mulholland
2011 Archaeological Phase 2 Site Examination Studies of the Walnut Street (19-HD-332), Heron (19-HD-330), Agawam Meadow (19-HD-269), and Westfield River (19-HD-331) Native American Sites in Agawam, Massachusetts. 305 pages.

At the Walnut Street Native American site (19-HD-332), 12 m^2 were excavated. Eighteen Native American artifacts were recovered, the majority from the plowzone. The only diagnostic artifact, a piece of steatite, dates from the Late Transitional Archaic to Late Woodland periods (ca. 3,500-2,500 B.P.). The Heron Meadow (19-HD-330), Agawam Meadow (19-HD-269) and Westfield River (19-HD-331) Native American sites are contiguous from west to east. Some 3,841 artifacts were collected from the three sites: 3,641 of Native American manufacture and 200 from the historical period. At Heron Meadow (19-HD-330) and Agawam Meadow (19-HD-269), artifacts were associated with feature soils, while at the Westfield River site (19-HD-331) artifacts were more often recovered from alluvium and plowzone deposits. Temporally diagnostic lithics were sparse. A Levanna point (1,300-350 B.P.) was recovered from the Agawam Meadow Site (19-HD-269). Steatite (3,500 – 2,500 B.P.) was collected from multiple sites. Three distinct pottery vessels were identified at the Heron Meadow Site (19-HD-330). Two of the vessels share attributes with the Windsor Tradition and date from the late Middle Woodland to Late Woodland period. The third vessel had Windsor traits, but could not be conclusively typed. The artifact assemblage from the three sites in Agawam Meadows points to a Late Transitional Archaic to Late Woodland occupation, between 3,500-350 B.P. Some 29 cultural features were identified, including hearths, storage pits, food processing areas, midden/buried A-deposits, and postmolds. Floral analysis of the features suggests that occupation at Agawam Meadows occurred in late summer or fall. (See also report #25-2270, 25-2869, and 25-3056.)

25-3269 Herbster, Holly, and Nichole A. Gillis
2012 Archaeological Reconnaissance Survey, Myles Standish Industrial Park Expansion Project Area, Taunton, Massachusetts. 76 pages.

The proposed 220 acre Myles Standish Industrial Park Expansion and Life Science Center project involves the phased redevelopment of the former World War II Camp Myles Standish and the Paul A. Devers State School (MHC TAU.AH). The property also includes the 19th-century Harvey Burial Ground (TAU.829). The archaeological reconnaissance survey resulted in the collection of archival and documentary background on historical period land use history and a comprehensive evaluation of existing conditions. While large portions of the project area have been extensively developed and were ranked as having a low archaeological sensitivity, limited areas of moderate and high sensitivity were identified. These areas could contain archaeological deposits associated with ancient Native American land use, 18th- and 19th-century agricultural and residential land use, and/or World War II-era military land use.

25-3270 Doucette, Dianna L.
2012 Intensive (Locational) Archaeological Survey Westborough Retirement Community, Westborough, Massachusetts. 106 pages.

The proposed undertaking includes five acres of uplands and five acres of wetlands. The property contains an existing 1790s residence called the J. Warren House. Of the 60 test pits excavated, 16 yielded ancient Native American cultural material, including 19 pieces of debitage and two stone tools that were likely used for scraping or chopping. The J. Warren Site can be interpreted as a Native American site where episodes of stone tool manufacturing and/or maintenance took place, along with other activities such as subsistence processing, based on the two scrapers recovered.

The majority of the deposits consist of quartz and quartzite chipping debris. There were no diagnostic Native American artifacts recovered or cultural features identified during the intensive survey. In addition, 114 pieces of historical material were recovered from the plowzone, including glass, nails, ceramics, and coal ash. The historical material is most likely associated with the existing residence, some of which could date back to the 1790s occupation. Test pits excavated around the existing structure did not reveal any historical features. The J. Warren Site is likely associated with sites within the adjacent Cedar Swamp Archaeological District; however, given the low density of material combined with the fact that the majority was recovered from the plowzone, the site does not appear to exhibit good integrity.

25-3271 Elam, Jenifer, and Kristen Heitert
2012 Phillips House Landscape Restoration Project, Intensive (Locational) Archaeological Survey/Site Examination, Salem, Massachusetts. 188 pages.

A total of 19, 50 x 50 cm test pits, one 0.5 x 1 m excavation unit, and two 1 x 1 m excavation units were excavated in the yard area between the main house and carriage barn. The excavations resulted in the recovery of 4,034, 17th- through 20th-century artifacts, and the identification of several landscape features dating to the 20th-century period of significance for the property, including structural elements associated with a former wooden fence line and shed, a posthole associated with a former clothesline, and a buried asphalt walkway. The testing also identified a buried topsoil stratum dating to the 18th century as well as what appears to be a fieldstone foundation segment. While not of immediate interpretive interest to the museum, this data suggests that the 18th-century archeological signature of the property survives substantially intact and has the potential to provide important information about the early occupational history of the parcel.

25-3272 Donta, Christopher L., Sheila Charles, and F. Timothy Barker
2011 Archaeological Assessment for the Wastewater Treatment Facility Improvements Project, Newburyport, Massachusetts. 123 pages.

Prompted by the find of intact wharfage dating from the late 18th or early 19th century, an assessment of archaeological features was completed. Background research documents construction stages of Coombs' Wharf, and details about the life of Philip Coombs. Recommendations were made for archaeological monitoring of the construction phase in order to identify and document features associated with Coombs' Wharf, as well as later structures on the created landform. The monitoring documented two sections of an intact, masonry wharf bulkhead wall from the second half of the 19th-century Coombs' Wharf. Monitoring further documented evidence for the locations of timber cribbing and a timber bulkhead wall that were associated with the 18th-century Coombs' Wharf structure. Dendrochronology of the bulkhead timbers points to dates of either ca. 1760 or 1800. Sections of foundation walls and a concrete pad of a late 19th-century sawing and planing mill building were documented during utilities excavations in the central portion of the project area. The excavations for utilities recorded cellar hole fill deposits indicating an 18th- and 19th-century structure, which may have been the dwelling of Philip Coombs referred to in the inventory upon his death in 1757. Monitoring in this area consequently recorded foundations indicating the presence of a later 19th-century structure built over the remains of the earlier structure and identified as the "I. Poor" store on the 1872 and later maps.

25-3273 Manning Sterling, Elise H.
2012 Samuel Harrison Homestead, Pittsfield, Massachusetts. 94 pages.

Reverend Samuel Harrison, an African American clergyman, and shoemaker by trade, was a significant voice in the American Abolitionist Movement. A Phase I archaeological reconnaissance survey of the Samuel Harrison Homestead lot focused on potentially significant deposits located in the vicinity of the extant house foundation and attached workshop footprint, which could be impacted by planned restoration work. The archaeological survey entailed the excavation of a total of 8.65 m^2, including 3, 1 x 1 m units, 1, 1.5 x 1 m unit, 1, 1.5 m x 50 cm unit, 1, 85 x 50 cm unit, 1, 75 x 75 cm unit, and 14, 50 x 50 cm shovel test pits. The excavations identified the presence of

several deposits, features, and structural elements, as well as areas of disturbance. Six of the eight identified features were associated with the workshop, located in the east yard, providing important details about this no longer extant addition. The site's artifact assemblage included structural debris (window glass, nails, brick, metal pipes, faucets, and doorknobs), ceramic and glass tableware, and personal items (buttons, pins, jewelry, marbles, and toys). The assemblage allows for a general interpretation of domestic activities at the site, and general preferences of the Harrison family throughout the late 19th and 20th centuries.

25-3274 Elam, Jenifer, and Kristen Heitert
2012 Intensive (Locational) Archaeological Survey/Site Examination, Stone Ridge Development, Shea-McDevitt Complex, Milford, Massachusetts. 104 pages.

Archaeological investigations were conducted at the Shea-McDevitt Complex (MIL-HA-25). The excavation focused on the east-facing poured concrete stairway and eastern walls of Foundation 1 of the residential complex, and the adjacent historical roadway and retaining walls. A total of 27, 50 x50 cm shovel test pits and two excavation units were excavated, and resulted in the recovery of 2,037 pieces of historical cultural material. The assemblage was comprised of mid-19th- to mid-20th-century architectural and domestic debris, including ceramics (whiteware, yellow ware, pearlware, American stoneware, redware, and ironstone), window, bottle, and tableware glass, machine cut and wire nails, whole and partial bricks, and coal. Elements of an earlier, truncated stair entry were also identified. The recovered data corroborate the documented occupation of the house, first occupied by Dominick McDevitt ca. 1851, then by Timothy Shea in 1898, and then the complete abandonment of the site by the Shea family ca. 1950. (See also report #25-2925 and 25-3044.)

25-3275 Ritchie, Duncan
2011 Intensive (Locational) Archaeological Survey, Plymouth Rock Studios, Plymouth, Massachusetts. 72 pages.

Archaeologists surveyed a proposed access road, shared use pathway, and approximately 2,500 foot long section of sewer. Subsurface testing included 155, 50 x 50 cm test pits placed at 10 m intervals along 16 judgmentally placed transects. Five judgmental test pits were also excavated. No artifacts were found.

25-3276 Ritchie, Duncan
2012 Intensive Archaeological Survey, Graniteville Woods Rockshelter Site within the Graniteville Woods Subdivision, Westford, Massachusetts. 102 pages.

The location of the Graniteville Woods Rockshelter Site (19-MD-1107) was first identified during a prior archaeological reconnaissance survey of the project area. Archival research indicated that the project area contains historical period granite quarries and associated features, some of which are contributing elements to the Graniteville National Register District. A systematic inspection of the Graniteville Rockshelter Site resulted in the identification of fragmented human skeletal remains within a narrow crevice at the rear of the rockshelter site. Forensic analysis of the bone fragments determined they were from a Native American individual, most likely a child less than five years in age. The bone fragments had been subjected to cremation before being placed in the rockshelter as part of a burial or mortuary practice. Subsurface testing of the Graniteville Woods Rockshelter Site was done with five judgmentally placed 50 x 50 cm test pits, and did not yield any additional human remains or other potentially significant Native American cultural materials or features. Based on the presence of human remains and its function as a Native American burial place, the Graniteville Woods Rockshelter Site was considered to be a significant cultural resource. The Massachusetts Commission on Indian Affairs requested that the remains be reinterred at a location outside the project impact area, within an area proposed for conservation, and a preservation restriction. (See also report #25-3186.)

25-3277 Carvino, Frank M.

2008 From Coast to Consumer: The Archaeology of Smuggling in Eighteenth-Century New England. 128 pages.

For the 18th-century consumer, purchasing smuggled goods was one way to circumvent rules and taxes. This thesis argues that smuggling and its socioeconomic implications can be detected in the archaeological record. Seldom examined before, artifacts uncovered in a context related to smuggling may help deepen particular site interpretations. Information drawn from the artifacts recovered at the Narbonne House, located in Salem, Massachusetts, as well as other 18th-century New England sites provide the context for this research. In most cases, while these sites listed specific artifacts uncovered, they did not address smuggling. Considering the various taxes and trade laws of the period, non-English wares should not be archaeologically visible. The fact that these goods are visible requires a more thorough understanding of their potential origins. This thesis adds to the overall understanding of smuggling in relation to the archaeological record. (See also report #25-548, 25-1357, 25-1366, 25-2054, and 25-2587.)

25-3278 Doucette, Dianna L.
2012 Intensive (Locational) Archaeological Survey, Kidder Property, Chappaquiddick Island, Edgartown, Massachusetts. 87 pages.

Archaeological investigations were conducted on a 20 acre project area. The survey included archival research, a walkover survey, and subsurface testing to locate and identify any potentially significant archaeological resources that could be affected by the project. Of the 110, 50 x 50 cm test pits excavated, 43 yielded ancient Native American cultural material, including 302 pieces of chipping debris (rhyolite, quartz, quartzite, argillite, and shale), two scrapers (rhyolite and quartz), one rhyolite biface/chopper, one rhyolite utilized flake, and one rhyolite serrated Brewerton projectile point, diagnostic of the Late Archaic period. In addition, 91 pieces of clam shell were recovered. Historical cultural material recovered in four of the test pits consists of low densities of domestic and structural sheet refuse, including 12 pieces of unidentified oxidized metal, four pieces of clear flat glass, three brick fragments, one copper bullet, one piece of transfer-print whiteware, and one piece of coal. The collection of cultural materials, consisting of chipping debris, stone tools, and shell, have been designated as the Kidder Site (19-DK-269). The ancient Native American cultural materials suggest that stone tool manufacturing and/or maintenance activities were taking place at the site during the Late Archaic period, along with food processing. Seventeen percent of the deposits found within the Kidder Property project area extend below historical period plowing and pasturing soil strata. These deposits have good physical integrity and could yield important information relating to Native American settlement and subsistence patterns on Chappaquiddick Island during the Late Archaic period.

25-3279 Chartier, Craig S., and Lauren Cook
2011 Intensive Survey Testing at the Taylor Bray Farm in Yarmouth, Massachusetts. 93 pages.

Testing was conducted on 11 of 23 acres. A total of 226 test pits were excavated, and roughly half contained cultural material. Two historical period sites were identified: the Richard and Ruth Taylor Homesite (YAR-HA-5) (ca. 1640-1780) and the Samuel and Lucretia Taylor Homesite (YAR-HA-6) (ca. 1780 to present.). Five ancient sites were identified, including the Knoll Site (19-BN-946) (a low density scatter of lithics and one piece of shell-tempered pottery); the Bray Farm Site (19-BN-951) (a low density lithic scatter); the Locus 1 Site (19-BN-947) (a concentration of fire-cracked rock and debitage that was concentrated in one test pit); the Locus 2 Site (19-BN-948) (a large area of lithic scatter and one Small Stemmed point), and the Locus 3 Site (19-BN-945) (a large area of lithic scatter where two postmolds, one possible pit, one piece of grit-tempered pottery, and Small Stemmed, Rossville, Atlantic, and a possible English flint Levanna points were found). The last two sites are believed to represent possible residential base camps or Late Woodland/historical period horticultural sites. Because the Locus 1, Locus 2, Locus 3, and Richard and Ruth Taylor Homesite sites are in areas that may be subjected to potential impacts, these sites are recommended for further testing.

25-3280 Mair, A. Peter, II
2012 Site Examination of the Queset Site (19-BR-649), Queset Commons Project, Easton, Massachusetts. 102 pages.

A site examination was undertaken using 63, 50 x 50 cm test pits and five 1 x 1 m excavation units. Site examination testing produced an array of cultural materials, including quartz and rhyolite chipping debris, bifaces and bifacial tool fragments, projectile points and point fragments, and a large, deep pit feature containing a large amount of rhyolite chipping debris and a radiocarbon date of 4,430±30 B.P. (Beta 318504). The Queset Site appears to be a single component campsite, encompassing two separate loci within an approximately 1,805 m^2 area of terrace edge along Morse Pond. Based on the presence of numerous Squibnocket Triangle projectile points and the radiocarbon date, the period of occupation was during the Late Archaic Squibnocket Complex. The recovery of a rhyolite Neville projectile point from a questionable stratigraphic context and a broken biface of rhyolite resembling a Susquehanna point (suggesting Middle Archaic and Transitional Archaic occupations) cannot be used to assign additional temporal periods at the site. Together with the Morse Pond Site (19-BR-480), the Queset Site has contributed to understanding Native American activities within this area of the Taunton River drainage. (See also report #25-2991.)

25-3281 Ritchie, Duncan
2011 Intensive Archaeological Survey, Lakeview Estates, Bellingham, Massachusetts. 85 pages.

An intensive archaeological survey was conducted within the proposed 63.4 acre project. Previous archaeological investigations identified nine ancient Native American archaeological sites in or near the project area. Site E-1 (19-NF-230), first identified during an intensive archaeological survey of the Shores at Silver Lake development in 1986, was known to be within the project area. A walkover survey confirmed that Site E-1 was intact and in good condition. A total of 121, 50 x 50 cm test pits were excavated. These test pits were placed at 10 m intervals along 13 judgmentally oriented transects and at 7.5 m offset spacing within three 30 x 30 m sampling blocks. A single judgmental test pit was used to investigate a specific archaeologically sensitive location within the project area. Three array patterns with four 50 x 50 cm test pits placed at 2.5 m intervals in the cardinal directions were used to investigate findspots of ancient Native American cultural material. Subsurface testing identified four other ancient Native American sites in the Lakeview Estates project area. The Lakeview Estates Locus 1, 2, and 3 sites (19-NF-718, 19-NF-719, and 19-NF-720) consisted of small amounts of quartz chipping debris. The Lakeview Estates Locus 4 Site (19-NF-721) appears to be a small temporary camp, possibly dating to the Late Archaic/Early Woodland period (ca. 4,500 to 2,500 years ago), based on a quartz Small Stemmed point and a projectile point pre-form. (See also report #25-777 and 24-1383.)

25-3282 McManamon, Francis P. (Editor)
2011 Chapters in the Archeology of Cape Cod, IV: Faunal Analysis and Metallurgical Analysis from the Cape Cod National Seashore Archaeological Survey. 80 pages.

Between 1979 and 1985 the National Park Service conducted an archaeological survey of the Cape Cod National Seashore area, identifying many ancient and historical period sites. This report describes and interprets faunal remains and metal artifacts found in some of the Native American sites discovered in the Nauset Harbor area (19-BN-308 and others), near Wellfleet Harbor (19-BN-387), and at High Head (19-BN-415 and 19-BN-481), in Eastham, Wellfleet, and Truro, respectively. Faunal analysis includes burial and midden contexts and examines seasonality, subsistence, and butchery practices. Metallurgical analysis is used to examine a rolled copper bead and piece of copper sheet metal to further understand Native American trade. (See also report #25-298, 25-616, and 25-717).

25-3283 Flynn, Erin, and Holly Herbster
2012 Intensive (Locational) Survey, Industrial Communications, Braley Road Cell Tower (MA-110223), Freetown, Massachusetts. 64 pages.

The proposed project involves the construction of a new, 315 ft guyed communications tower enclosed within a 32,000 ft^2 fenced compound. The project will also include the construction of an approximately 900 ft long access road. A total of 23, 50 x 50 cm test pits were excavated within the project area. The testing was completed along one linear transfect with 12 test pits placed at varied intervals to avoid disturbance, six judgmental test pits, and one five-pit array. No cultural materials were recovered.

25-3284 Donta, Christopher, Barbara Donohue, and Mitchell T. Mulholland
2011 City-Wide Archaeological Reconnaissance Survey of Newton, Massachusetts. 390 pages. Volume II: Users Guide to Archaeological Sensitivity Maps, City of Newton, Massachusetts. 8 pages. Volume III: City of Newton City-Wide Archaeological Reconnaissance Survey, Public Education Report. 63 pages.

The project included background research, development of a model for archaeological sensitivity, a walkover inspection of selected archaeological sites and areas of high sensitivity, interviews, and integration of this information into thematic narratives of the town's past. The information gathered was used to develop an archaeological site protection plan. The study found that although Newton is densely settled, it still contains areas of high sensitivity for unrecorded archaeological sites, particularly with respect to sites of the historical period. Newly identified sites include nine Native American archaeological sites, and an additional 56 historical period sites. This is an addition of 65 new archaeological sites to the state archaeological records for the City of Newton. Native American sites in Newton are known from the Middle Archaic period (ca. 8,000 years ago) up to contact with European settlers. A wide range of historical sites are also now recorded, including domestic, industrial, and civic sites dating primarily from the 18th and 19th centuries. Further research could lead to the recording of numerous additional sites. The archaeological sites represent a vital part of the city's heritage. It is generally assumed that historical structures possess associated archaeological deposits, and should be considered as sites. It is recommended that the city adopt an ordinance and establish a system of review designed to require archaeological surveys of sensitive areas and to protect archaeological sites.

25-3285 Pezzarossi, Guido
2008 Consumption as Social Camouflage: "Mimicry" and Nipmuc Survival Strategies in the Colonial World. 152 pages.

This thesis serves as an interpretation of a Nipmuc family's history, informed by the historical archaeology of the Sarah Boston Farmstead site in Grafton, Massachusetts. The research agenda for this interpretation is two-fold: The exploration of the dialectical relationship between Nipmuc cultural persistence and continuity while engaging "European" material culture, and a nuanced analysis of Native consumption patterns of mass produced material culture in a rural New England context. The primary goal of this project is to examine issues surrounding Native engagement and consumption of mass produced material culture, and to offer a critique of the notion that Native consumption of mass produced goods entails a "loss" of culture and Native identity. The secondary theme develops as an extension of the first anthropological goal, and looks to archaeologically explore issues surrounding how the consumption of mass produced material culture can serve to push class boundaries as part of a survival strategy by engaging material expressions of class and the fluid boundaries they produce. It is argued that the ultimate goal of such a consumer endeavor may lie in alleviating inequality, oppression, and marginalization. The Sarah Boston Farmstead ceramic assemblage is used as a case study in the exploration of the nuances of just such a strategy of Native resistance and survival in the colonial world. (See also report #25-2391, 25-2565, 25-2757, and 25-2920.)

25-3286 Donta, Christopher L., Marni Blake Walter, and F. Timothy Barker
2012 Archaeological Reconnaissance and Intensive (Locational) Surveys for the Redevelopment of Ludlow Mills, Ludlow, Massachusetts. 79 pages.

A survey was conducted at the location of an existing mill complex, and on adjacent undeveloped woodlands for proposed construction. In total, 141 shovel test pits were excavated. Two ancient Native American sites were identified: the Chicopee River Terrace Site (19-HD-349) and the Ludlow Mills Site (19-HD-348). The Chicopee River Terrace Site consisted of a small amount of quartz chipping debris and a Native American hearth feature containing fragments of bone. The Ludlow Mills Site contained a Native American hearth feature within an undisturbed subsoil context, and had associated chipping debris in the overlying fill and plowzone. These sites have the potential to contain additional diagnostic artifacts and cultural features in undisturbed contexts.

25-3287 Johnson, Eric S.
2011 Ancient Winters: The Archaeology of the Flagg Swamp Rockshelter, Marlborough, Massachusetts. 58 pages.

The archaeological research described in this public booklet was completed in several stages between 1978 and 1982, on a site known as the Flagg Swamp Rockshelter (19-MD-445). It contained artifacts that dated from more than 4,000 years ago, with high quality preservation of animal bone. Studying the bones from the rockshelter gave archaeologists important clues about what people ate, how they found food in the surrounding area, and the seasons during which they occupied the site. The rockshelter was not a year-round residence; it was a cold-season home. By excavating and studying the Flagg Swamp Rockshelter, archaeologists learned how people kept warm, dry, and well-fed through the coldest months of the year. (See also report #25-232, 25-233, and 25-485.)

25-3288 Johnson, Eric S.
2012 Roads, Rails, and Trails: Transportation-Related Archaeology in Massachusetts. 58 pages.

This public booklet contains a series of descriptions of notable sites that have been studied in advance of a variety of transportation construction projects including roads, railways, and bike paths. The sites described in this booklet range over several thousand years and include ancient Native American settlements, dwellings, and workshops, Colonial period homes, urban and rural taverns, and 19th-century factories and businesses. The sites include the Route 495 project sites (Mansfield, Norton, Taunton, Raynham, and Bridgewater), the Annasnappet Pond Sites (Carver), the Oak Knoll Site (Lincoln), the Hartford Avenue Rockshelter (Uxbridge), the Foundry Pond Site (Hingham), the Franklin County Bikeway Site (Deerfield), the Polpis Road Bicycle Path Sites (Nantucket), the Metropolitan Railroad Site (Roxbury), the Highland Foundry Site (Roxbury), the Sampson's Tavern Site (Lakeville), the Kingsley Tavern Site (Royalston), and the Big Dig project sites (Boston).

25-3289 Jones, Brian, Timothy Binzen, Christopher Donta, and Mitchell T. Mulholland
2011 The Indian Crossing Site in Chicopee, Massachusetts. 61 pages.

This public booklet examines the Indian Crossing Site (19-HD-1), located on a small island at the confluence of the Chicopee and Connecticut Rivers. It was one of the first sites in the region to be excavated with modern scientific methods in advance of a highway project. During the course of the work, more than 200, 1 x 1 m excavation units were excavated. About 750 Native American pottery fragments, over 2,000 stone artifacts (most chipping debris), and 2,000 burned stones from cooking features were carefully exposed, documented, and collected. Fifty wood charcoal samples were saved for future radiocarbon dating and about 500 soil samples were collected. This booklet discusses Native American technologies, including pottery manufacture, stone tool making, and cooking methods, during a time of transition from hunting and gathering to farming and agriculture. (See also report #25-45.)

25-3290 Dudek, Martin G.
2012 Archeological Site Examination for the I-93 Tri-Town Interchange Project (EOEA #14159), Andover and Wilmington, Middlesex and Essex Counties, Massachusetts. 61 pages.

The site examination was conducted for the County-Line Site (19-ES-860), and involved the excavation of 35, 50 x 50 cm test pits and two 1 x 1 m excavation units across a 45 x 30 m area. The site boundaries were defined as 30 x 15 m. In all, 59 rhyolite flakes, two quartz flakes, one chert-like flake, and six pieces of fire-cracked rock were recovered from all phases of work. Only four artifacts were recovered from the B horizon; the remainder of the ancient artifacts came from A horizon soils mixed with historical materials or from disturbed contexts. No features, diagnostic tools, faunal or floral remains, or significant artifact concentrations were identified. (See also report #25-3256.)

25-3291 Elam, Jenifer, and Holly Herbster
2012 Archeological Survey, Old King's Highway, North Union Field Well Construction Program, Water and Electric Utility Installation, Towns of Provincetown and Truro, Cape Cod National Seashore, Barnstable County, Massachusetts. 64 pages.

The archaeological project area consists of an approximately 2,300 ft linear section of an unpaved roadway known as the Old King's Highway, which may be an historic Cape Cod feature. The project area is partially situated within the Cape Cod National Seashore, and the archeological survey was conducted only within the portion of the project area located on land owned by the National Park Service. The goal of the survey was to identify archaeological resources within the project area including the original Old King's Highway. The intensive survey included archival research, a walkover survey, and subsurface testing. A total of 15, 50 x 50 cm test pits and five machine-assisted trenches were placed within the project corridor. No potentially significant archeological deposits or features were identified. While some of, or the entire project corridor may have been utilized as a transportation corridor prior to its appearance on an 1880 atlas map, no archival or archaeological evidence of the original Old King's Highway was identified.

25-3292 Waller, Joseph N., Jr.
2012 Archaeological Site Examination, Federal Pond Archaeological Site (19-PL-1156), Lower SEMA 345 kV Transmission Project, Plymouth, Massachusetts. 104 pages.

Site examination involved the excavation of 172, 50 x 50 cm test pits and seven 1 x 1 m excavation units. Two distinct loci were identified. Federal Pond Locus 1 is located west of Federal Pond. Locus 1 is interpreted as a series of overlapping hunting and processing camps dating to the Early Archaic, Middle Archaic, and Early or Middle Woodland periods. Recovered cultural materials include rhyolite, quartz, felsite, and argillite chipping debris, bifacially flaked tools and tool fragments, projectile points or fragments, and a ceramic vessel sherd. Samples from a pit feature within Locus 1 produced a radiocarbon age of 8,260±40 B.P. (318503). Federal Pond Locus 2 is located approximately 270 m east of Federal Pond. Recovered cultural materials included rhyolite, quartz, felsite, and argillite chipping debris. Locus 2 is interpreted as a location of stone tool maintenance or manufacture, and similarities in lithic materials between Loci 1 and 2 suggest the site is Archaic in age. (See also report #25-3229 and 25-3253.)

25-3293 Dudek, Martin G.
2012 Archaeological Site Examination for the 43L6 Line River Crossing Project (MHC #RC.41133) in the Town of Haverhill, Essex County, Massachusetts. 121 pages.

Site examination testing consisted of 16, 50 x 50 cm test pits and three 1 x 1 m excavation units. The project area is within a multi-component ancient and historical Native American site identified as the Walker Camp "C" site (19-ES-551), recorded by avocational archeologist Frederick Luce ca. 1914-1940s. Testing was conducted at 5 m intervals, with adjustments to avoid disturbed areas. The site had been plowed but otherwise exhibits good integrity. Two pit features, probable hearths consisting of dark stains with charcoal and fire-cracked rock, were excavated. Feature 1 produced a radiocarbon date of 410 $\pm$ 30 B.P. (Beta-311809) on charcoal recovered from the same level as a quartz Small Stemmed point. Two broken, side notched points (possibly Early Woodland Meadowood points), two bifacial and three unifacial tools, five cores, four cobble tools, 260 pieces of lithic debitage (rhyolite, quartz, quartzite, schist, chert-like, hornfels-like and unidenti-

fied), 34 pieces of grit-tempered pottery, and 439 pieces of fire affected rock were recovered from the site examination. Based on prior discoveries at the site, occupations span the Middle Archaic through the historical period. (See also report #25-3216.)

25-3294 Chartier, Craig, and Frank M. Carvino
2012 Intensive Survey Testing at Lot 76 Chequessett Yacht and Country Club in Wellfleet, Massachusetts. 110 pages.

Testing was conducted on a 1.148 acre parcel. A total of 44 test pits were excavated, and cultural material was recovered from approximately half of them. The Baker House Site (WLF-HA-34) was identified through an interview with a local resident. This historical site consists of two filled depressions (possibly cellar holes), a yard scatter, and possible fill deposits. Recovered artifacts consisted of architectural and household cultural material dating to the first half of the 19th century.

25-3295 Gillis, Nichole A., and Dianna L. Docuette
2012 Intensive (Locational) Survey, New England Power Company Y151 Transmission Line Reconductoring Project, Tewksbury, Andover, Dracut, and Methuen, Massachusetts. 168 pages.

This intensive survey included archival research, a walkover survey, and subsurface testing. A total of 869 test pits was excavated. The 50 x 50 cm test pits were excavated as 33 arrays at pole structures, six judgmental test pits, one 10 x 10 m block, and as 74 linear transects. Seventeen additional arrays were completed around selected test pits where cultural material was identified. One previously documented ancient archaeological site (Bartlett Brook Site [19-MD-984]) and four previously undocumented Ancient period findspots (Find Spot 1 [19-MD-864], Find Spot 2 [19-MD-863], Find Spot 3 [19-MD-862], and Pride Rock Find Spot [19-MD-861]) were identified. The four findspots are located in Andover, south of the Merrimack River. Each findspot contained one to three pieces of chipping debris, and the Pride Rock Find Spot also contained one unifacially worked flake. The Bartlett Brook Site is located in Dracut, and contained 20 pieces of chipping debris from 13 test pits. No diagnostic ancient artifacts or tools were recovered, and no features were identified. The Bartlett Brook Site and four findspots contained a low density of cultural material, lacked complexity, and possessed limited research potential. The intensive survey identified generally low densities of primarily 19th- to 20th-century domestic and structural refuse. The generally diffuse distribution of the materials, combined with the lack of any associated structural, landscape, or household features, suggests field scatter with no locational or associative integrity.

25-3296 Pendery, Steven R.
2012 Monitoring and Testing of Gore Place North Porch Demolition, September 27 and October 3, 1989. 19 pages.

This study presents the results of a volunteer documentation project in response to the demolition and reconstruction of the west side of the north porch. Fieldwork involved monitoring and documenting demolition activity and excavating a single 50 x 50 cm test pit against the west side of the north porch to evaluate possible archaeological impacts. A vaulted brick buttress and vertical brick wall system was interpreted to be part of the 1805-1806 porch construction intended for structural and hydraulic support. (See also report #25-2717, 25-2823, 25-2845, 25-3070, 25-3180, and 25-385.)

25-3297 Keim, Alexander D.
2012 In Search of “A Large Pretentious Building of Two Stories”: Report for Sanford Tavern Archaeological Excavation and Education Project 2011. 53 pages.

As part of an educational project, students led by a team of educators, volunteers, and professionals excavated six 50 x 50 cm test pits at the Sanford Tavern Site (HW-HA-1) in Hawley. The site is a 24 m2 area on which historical sources indicate that a tavern operated between 1800 and 1840.

Five of the test pits were placed at irregular intervals (based on surface conditions) along a 22 m transect, with the final test pit located in the interior of the foundation of an addition. Significant artifacts recovered include ceramics and faunal remains possibly related to the preparation and serving of food at the tavern, and architectural debris likely related to the dismantling and abandonment of the tavern after 1840. No material culture related to the consumption of alcohol was recovered, which may be a result of local alcohol prohibition enacted in the early 1830s. This survey found very good preservation conditions at the site.

25-3298 Mair, A. Peter, II
2012 Intensive (Locational) Archaeological Survey, Proposed Wetland Replication Area, Plymouth Municipal Airport Runway Extension Project, Plymouth, Massachusetts. 106 pages.

An intensive (locational) archaeological survey was conducted in Plymouth and Carver within the area of impact for a proposed wetland replication area. During the intensive survey, 115, 50 x 50 cm test pits were excavated, distributed among two sampling blocks, four transects at 10 m intervals, two test pit arrays, and one judgmental test pit. Seven pieces of quartz and rhyolite chipping debris were recovered from five tests. This material has been organized into two findspots that demonstrate an ancient Native American presence in the general area. However, the materials are widely dispersed, exhibiting low densities. (See also report #25-2370.)

25-3299 Ritchie, Duncan
2012 Intensive Archaeological Survey of the Carey's Flowers Cell Tower, South Hadley, Massachusetts. 55 pages.

A walkover inspection revealed that most of the proposed location for the 50 x 50 ft^2 lease area and cell tower/monopole was not archaeologically sensitive due to previous disturbance and alteration. A total of 13, 50 x 50 cm test pits were excavated at 5 m intervals along three judgmentally oriented transects within the project area. Soil profiles observed in these test pits had evidence of past disturbance and use for composting and the greenhouse.

25-3300 Mair, A. Peter, II
2012 Supplemental Intensive (Locational) Archaeological Survey, Kenneth F. Burns Memorial Bridge Replacement, Shrewsbury and Worcester, Massachusetts. 11 pages.

Subsurface testing produced modern cultural material from fill contexts. Test pit profiles suggest that the original soils within the project area were most likely stripped away prior to depositing fill materials to create the current topography and setting, which is a parking area. (See also report #25-3189, 25-3190, and 25-3301.)

25-3301 Robinson, David S.
2012 Supplemental Report, Marine Archaeological Reconnaissance Survey, Kenneth F. Burns (Route 9) Bridge Replacement Project, 231/249 Lake Avenue Staging Area, Worcester, Massachusetts. 82 pages.

The survey area is located on the western shore of Lake Quinsigamond. Although no submerged archaeological properties were identified in a previous survey, the area is near the Dugout Canoe Site (19-WR-700), an area that contained three dugout canoes, or "mishoonash." Work included remote sensing (magnetometry, bathymetry, and side scan sonar) and archaeological diver survey of the project area. Comprehensive high-resolution survey coverage was obtained throughout the survey area. No archaeological deposits or bottom features associated with submerged cultural resources were observed. (See also report #25-3189, 25-3190, and 25-3300.)

25-3302 Doucette, Dianna L., Nichole A. Gillis, and Jenifer Elam
2012 Intensive (Locational) Survey, New England Power Company S145/T146 Transmission Line Reconductoring Project, Tewksbury, Andover, Wilmington, and North Reading, Massachusetts. 228 pages.

This intensive survey included archival research, a walkover survey, and subsurface testing on 9.3 miles of transmission lines. A total of 784 test pits were excavated within the area of potential effect. The testing identified six ancient sites (Great Swamp #2 [19-MD-1135], Heather Row [19-MD-1134], Bligh Site [19-MD-1133], Pinnacle Brook #1 [19-MD-1132], Pinnacle Brook #2 [19-MD-1131], and Pinnacle Street [19-MD-1142]), two ancient findspots (Find Spots 2 and 3), and two historical sites (Roadside Towers [TEW-HA-3] and Cutbank [TEW-HA-4]) in Tewksbury; one ancient site (Shawsheen Overlook [19-ES-865]) in Andover; and four ancient sites (Martins Brook [19-MD-1136], Rat Snake [19-MD-1137], Secret Garden [19-MD1141], and North Reading Municipal Station [19-MD-1140]) and one ancient findspot (Find Spot 1) in North Reading. Among the archaeological sites identified, nine contain potentially significant cultural resources that could contribute additional information to the archaeological record of the Shawsheen and Ipswich River basins in northeastern Massachusetts: Bligh Street Site, Pinnacle Brook #1 Site, Pinnacle Brook #2 Site, Pinnacle Street Site, Shawsheen Overlook Site, Martins Brook Site, Rat Snake Site, Secret Garden Site, and the North Reading Municipal Station Site. (See also report #25-3303.)

25-3303 Doucette, Dianna L.
2012 Archaeological Site Examination, Bligh Street, Pinnacle Brook #1, Pinnacle Brook #2, Pinnacle Street, Martins Brook, Rat Snake, Secret Garden, and North Reading Municipal Station Sites, New England Power Company S145/T146 Transmission Line Reconductoring Project, Tewksbury and North Reading, Massachusetts. 232 pages.

This archaeological site examination evaluated eight ancient sites. In total, 227, 50 x 50 cm test pits, 13, 1 x 1 m excavation units, and three 1 x 3 m excavation units were excavated. Overall, 86 test pits and all of the excavation units contained cultural materials. These materials consist of 3,068 pieces of chipping debris (rhyolite, quartz, slate, argillite, quartzite, hornfels, basalt, feldspar, and chert), 33 chipped-stone tools (11 projectile points, 19 bifaces, 2 scrapers, 1 uniface), two hammerstones, two anvil stones, and 14 pieces of fire-cracked rock, as well as organic material and one piece of calcined mammal bone. In addition, 10 cultural features were identified. The Bligh Street, Pinnacle Street, Secret Garden, and North Reading Municipal Station sites yielded moderate to high densities of cultural material as well as cultural features. Charcoal samples obtained from features at these sites yielded uncalibrated radiocarbon dates of 4440±30 B.P. (Bligh Street [Beta 326630]), 7440±40 B.P. (Pinnacle Street [Beta 326631]), 4750±30 B.P. (Secret Garden [Beta 327422]), and 600±30 B.P. (North Reading Municipal Station [Beta 327172]). The remaining four sites (Pinnacle Brook #1, Pinnacle Brook #2, Martins Brook, and Rat Snake) appear to be short term use sites for stone tool manufacture. Charcoal from a feature at the Pinnacle Brook #2 Site yielded an uncalibrated radiocarbon date of 2510 ± 30 B.P. (Beta 326629). (See also report #25-3302.)

25-3304 Herbster, Holly
2012 Intensive (Locational) Archaeological Survey, Rose Meadow - Lot 4, Aquinnah, Massachusetts. 48 pages.

The planned development includes construction on approximately 0.25 acres within a 1.35 acre lot. The intensive survey included background research, a walkover survey, and subsurface testing. A total of 25, 50 x 50 cm test pits were excavated, resulting in the recovery of 241 cultural materials including 222 pieces of chipping debris, three chipped stone tool fragments, a cobble fragment, six brick fragments, five pieces of glass, and two charcoal fragments. The cultural deposits that comprise the Rose Meadow Site (19-DK-270) represent a potentially significant archaeological resource. The density of recovered materials and the identification of chipped stone tools and tool fragments indicate that stone tool manufacture and maintenance occurred on the site, and that the site may have been used for other activities such as food preparation and/or processing.

25-3305 Harper, Ross K., Bruce Clouette, and Brian D. Jones
2012 Intensive (Locational) Archaeological Survey, Proposed Park and Ride Lot Improvements,

Northampton, MA. 66 pages.

An intensive survey was conducted at a proposed park and ride facility at the Veteran's Administration Medical Center. A total of 56 shovel test pits were excavated across three areas of potential effect at 10 m intervals. The majority of the test pits were disturbed. In 17 of the test pits asphalt was discovered, likely reflecting remnants of earlier hospital roadways. A total of 48 artifacts were recovered, including clear glass, slag, brick, linoleum fragments, and one piece of whiteware. The artifacts came from disturbed contexts, and likely represent a combination of field scatter and the early 20th-century hospital occupation. Two Native American lithic artifacts were found; however, they were recovered from a disturbed context. One round, concrete feature, about 1 m in diameter, and a 1 x1 m concrete feature were identified and may relate to Quonset huts.

25-3306 Donta, Christopher L., Marni Blake Walter, and F. Timothy Barker
2012 Archaeological Reconnaissance and Intensive (Locational) Surveys for Structure Replacements on the Northeast Utilities 312 Line, Montague to Plainfield, Massachusetts. 243 pages.

Archaeological reconnaissance and intensive surveys were conducted in western Massachusetts for the replacement of electrical transmission line structures in the towns of Montague, Deerfield, Shelburne, Conway, Ashfield, and Plainfield, Massachusetts. Background research and reconnaissance surveys identified 20 areas of archaeological potential out of 28 replacement locations and 11 areas of access road improvements. Testing was conducted in 31 areas, resulting in the excavation of 226, 50 x 50 cm test pits and the identification of two Native American sites. The Wills Hill 2 Site (19-FR-435) in Montague contained quartz and chert flakes as well as a hammerstone. The Arthurs Seat Site (19-FR-434) in Deerfield contained quartz debitage from three test pits.

25-3307 Doucette, Dianna L., and Jenifer Elam
2012 Intensive (Locational) Survey, NSTAR Electric Lines 118-119 (115 kV) Transmission Lines Upgrade Project, Barnstable, Yarmouth, and Dennis, Barnstable County, Massachusetts. 154 pages.

A total of 701, 50 x 50 cm test pits were excavated. Seventy two yielded cultural material. In total, 69 pieces of debitage, five projectile points, two bifacially worked tools, two cores, one scraper, one uniface, and one blank of raw material were recovered. Three of the projectile points (Burwell, Squibnocket Triangle, and Wayland Notched types) are diagnostic of the Late and Transitional Archaic periods (ca. 5,000 to 2,700 years ago). The majority of the ancient material was recovered from seven sites. In addition, ten findspots were identified, as well as a low density of historical material culture. No features were exposed. The Muddy Pond (19-BN-968, Yarmouth), Greenough Pond (19-BN-967, Yarmouth), Mill Pond (19-BN-966, Yarmouth), Mayfair Road (19-BN-965, Yarmouth), Flax Pond 2 (19-BN-964, Dennis), Flax Pond 1 (19-BN-963, Dennis), and Clay Pond (19-BN-962, Dennis) sites contain potentially significant cultural resources that could contribute additional information to the archaeological record of Cape Cod. The remaining ten findspots lack complexity and have limited research potential.

25-3308 Kotlensky, T. Arron, and Joel I. Klein
2012 Cultural Resources Background Study and Archeological Sensitivity Assessment, South Terminal Marine Infrastructure Park, City of New Bedford, Bristol County, Massachusetts. 115 pages.

The archaeological sensitivity assessment focused on a 103 acre study area along the Acushnet River estuary. The assessment included background and archival research, site visitation, and conditions photography. The site of the former Potomska Mills is located in the approximate center of the study area. Four historic textile mill sites were within the study area between the mid-19th century and present. At least 29 residential structures were once located within the study area but were subsequently demolished. Twenty-three of these residences were company-owned houses associated with the Acushnet Mills. The locations of the former residences and their associated yard areas together constitute an area of archeological sensitivity called the Acushnet Mills Workers'

Housing site (NBE-HA-14).

25-3309 Doucette, Dianna L., and Jennifer Ort
2012 Intensive (Locational) Archaeological Survey of the EBI Sharon Cell Tower, Sharon, Massachusetts. 46 pages.

Eighteen 50 x 50 cm test pits were excavated at 10 m intervals along judgmental linear transects. No cultural material was identified.

25-3310 Ritchie, Duncan, and Katie Miller
2012 Intensive Archaeological and Reconnaissance Architectural Survey, Proposed US Army Reserve Center, Raynham, Massachusetts. 24 pages.

The proposed US Army Reserve Center project area consisted of 35 acres in close proximity to the Taunton River. Four above-ground architectural resources were identified consisting of a winery building, garage, caretaker's residence, and a lean-to shed all built around 1961. Limited subsurface testing in the project area identified two pieces of quartz chipping debris, now designated the Church Street Site (19-BR-656). Two sherds of plain and blue transfer printed whiteware were found in test pits in the plowzone.

25-3311 Leveillee, Alan, and Michael Duffin
2012 Intensive (Locational) Archaeological Survey, Tobey Road Retail Development, Wareham, Massachusetts. 72 pages.

Subsurface archaeological testing of a 26 acre parcel included the excavation of 113, 50 x 50 cm test pits, and one 1 x 1 m excavation unit. The survey resulted in the recovery of 99 pieces of cultural material, which constitute the Strow's Folly Site (19-PL-1161). The Strow's Folly Site consists of low to moderate densities of ancient cultural materials present in three spatially separate loci. Locus 1 was created during a short-term encampment during the Woodland period (3,000-500 years ago), as indicated by the presence of pottery. Locus 2 is located to the northwest, and the presence of a Small Stemmed point indicates the site was used between the Late Archaic and Woodland periods (4,000-2,000 years ago). Locus 3 is in the northeast corner of the project area. While no temporal diagnostics were recovered from Locus 3, the rhyolite and quartz flakes found are consistent with those recovered from Locus 1 and Locus 2. All three site loci likely result from relatively short-duration occupations. They were created by Native American hunters and gatherers who focused resource procurement logistical camps along the slightly elevated vantage points provided by high ground overlooking the brook.

25-3312 Ritchie, Duncan
2011 Phase III Archaeological Data Recovery Program on the Puffer Pond Site (19-MD-657) and Site 34-1 (19-MD-654) for Road and Trail Improvements, Assabet River National Wildlife Refuge, Sudbury and Maynard, Massachusetts. 2 volumes. 677 pages.

The data recovery program involved two significant Native American archaeological sites (Puffer Pond Site and Site 34-1) that were first identified in a 1985 survey. Based on the results of a Phase I survey, these three sites were multi-component and were repeatedly occupied from the Middle Archaic to Late Woodland periods. Subsurface testing consisted of 28 excavation units totaling 43 sq m at the Puffer Pond Site, and 37 excavation units totaling 103 sq m at Site 34-1. A majority of both sites will be preserved. The Puffer Pond Site included a dense deposit of rhyolite and quartzite chipping debris, and a deep pit feature from the Middle Archaic period, radiocarbon dated to 7,330 ± 40 years B.P. (Beta 288788). Another Middle Archaic concentration contained a Neville point and preforms for Stark points made from mylonite. A Late Archaic component of this site included Squibnocket Triangle and Small Stemmed points and a pit feature radiocarbon dated to 3,880 ± 60 years B.P. (Beta 288787). On Site 34-1, a small, dense cluster of Middle Archaic material included Neville points, bifacial preforms, and more than 1,000 pieces of distinctive rhyolite chipping debris. A sequence of Late Archaic activity was represented by Brewerton, Squibnocket

Triangle, and Small Stemmed points. A deep Terminal Archaic pit feature was radiocarbon dated to 2,630 ± 50 years B.P. (Beta 289764). Features within an important Early to Middle Woodland component yielded radiocarbon dates of 1,890 ± 40 years B.P. (Beta 289762) and 1,660 ± 30 years B.P.(Beta 289763). The Woodland period was represented by ceramic vessels with cord marked surfaces and dentate and rocker stamped decoration, and a substantial amount of chert debitage. (See also report #25-655 and 25-3035.)

25-3313 Gillis, Nichole A., and Alan Leveillee
2012 Archaeological Data Recovery TRANSFLO Project Area, Westborough, Massachusetts. 376 pages.

An archaeological data recovery program was completed within the Cedar Swamp Archaeological District at Cedar Swamp 1 (19-WR-417), Cedar Swamp 2 (19-WR-419), and Cedar Swamp 24 (19-WR-434). A total of 112 m^2 was excavated. In total, 8,801 artifacts were recovered, including 8,767 pieces of Native American cultural material and 34 pieces of historical cultural material. The majority of the cultural assemblage consisted of chipping debris, though a large number of stone tools, Native American pottery sherds, and fire-cracked rock were also recovered. The assemblage also contained 1,221 pieces of organic material, including calcined bone, floral materials, and charcoal. Eleven cultural features were identified. Three features produced Early Woodland period radiocarbon dates (2490±40 [Beta 293463], 2480±40 [Beta 293462], and 2370±40 B.P. [Beta 293461]), and one feature produced a Middle Woodland period radiocarbon date (1190±30 B.P. [Beta 293459]). Five Native American features were refuse pits that date to the Late Archaic, Early Woodland, and Middle Woodland periods. Also identified was an Early Woodland hearth, an ephemeral hearth, a postmold within a refuse pit, and a lithic cache. The central island in the swamp was occupied between approximately 8,000 and 1,000 B.P., spanning the Middle Archaic through the Middle Woodland periods. Archaic and Woodland populations repeatedly utilized the site for domestic and subsistence-related activities targeting a wide range of lithic, faunal, and floral resources available within the wetland and adjacent upland environment. The cultural material and feature assemblages indicate site occupation was most intensive from the Late Archaic through the Early Woodland periods. (See also report #25-1519 and 25-3133.)

25-3314 Leveillee, Alan, and Erin Flynn
2012 Intensive (Locational) Archaeological Survey, Line D-21 Transmission ROW, Fall River, Massachusetts. 123 pages.

The project will include reconductoring and pole replacement along the 4.2 mile existing line. In total, 190, 50 x 50 cm test pits and one 1 x 1 m excavation unit were excavated. One Native American site and two findspots were identified. A single piece of argillite chipping debris was recovered from Find Spot 1, representing an isolated find that is not considered potentially significant. Find Spot 2 consisted of a low density of cultural materials from disturbed contexts: a fill lens associated with the installation of the existing pole. The Praying Mantis Site (19-BR-657) consists of a moderate density of lithic cultural materials from intact soil strata. The assemblage includes two argillite Small Stemmed projectile points diagnostic of the Late Archaic period, as well as rhyolite, quartz, quartzite, argillite, and jasper chipping debris that appears to have had an associated feature.

25-3315 Herbster, Holly, and Gregg Laskoski
2013 Intensive (Locational) Archaeological Survey, Stage Coach Residences, Barnstable, Massachusetts. 50 pages.

New construction is planned on 2.5 acres of a 6.9 acre parcel in the village of Centerville. The project will include the demolition of a condemned and abandoned cottage residence. A total of 30, 50 x 50 cm test pits were excavated within the proposed project impact areas. No cultural materials were recovered.

25-3316 Donta, Christopher L., F. Timothy Barker, and Kerry Lynch

2012 Archaeological Reconnaissance and Intensive (Locational) Survey for the Dracut Sewer Expansion Program (Contract 31), Dracut, Massachusetts. 58 pages.

The proposed locations of two pumping stations and a cross-country section of pipe were evaluated. A predictive model based on site location criteria was used to assess Native American site sensitivity, and historical documents were used to evaluate the potential for historical resources. A total of 53, 50 x 50 cm shovel test pits were excavated in the three survey units. No Native American or historical period sites were identified. A small number of historical artifacts were found as field scatter in an agricultural field.

25-3317 Lynch, Kerry J.
2012 Report Addendum for Potential Ceremonial Areas Identified By The Narragansett and Wampanoag (Aquinnah) Indian Tribes For The Greater Springfield Reliability Project (GSRP) Phase 1B Reconnaissance and Intensive (Locational) Survey, Hampden County, Massachusetts. 54 pages.

Previous intensive survey and site examinations were conducted along a 24 mile right of way in Agawam, West Springfield, Springfield, Chicopee, and Ludlow. This report addendum is the result of additional testing completed at the request of Native American Tribes consulting on the project. Following completion of the site examinations, a walkover with Native American representatives took place, and concerns regarding undiscovered resources, possible burial locations, and ceremonial areas were expressed. Additional testing included the excavation of 220, 50 x 50 cm shovel test pits along the transmission corridor. Three Native American sites in West Springfield were identified and recommended for avoidance or site examination. These were designated the Brooks Place Native American Site (19-HD-351), the Piper Road Native American Site (19-HD-352), and the Riverdale Street Native American Site (19-HD-353). In total, 61 artifacts were recovered and consisted of quartz, quartzite, rhyolite, and chert flakes, two quartz bifacial performs, 12 pieces of pottery, and 16 pieces of fire-cracked rock. (See also report #25-3040, 25-3053, 25-3054, 25-3056, and 25-3057.)

25-3318 Smith, J.N. Leith
2012 Archaeological Site Examination of the Pump Room in the Mansion House Cellar, Gore Place, Waltham, Massachusetts. 36 pages.

A landscape and structural restoration plan for Gore Place recommended archaeological investigations to identify the location, character, and integrity of Gore-period (1806-1822) features. Previous work in the cistern room revealed a Gore-period dairy. Continued investigations focused on the pump room immediately south of the dairy to determine if a subfloor cistern or well that provided water for the wall-mounted pump was present. The room as a whole was determined to have had a brick floor that was doubled in thickness, potentially around 1816 when the laundry was installed on the first floor and the house was winterized. A series of drains was in the western third of the room, but all had been removed with the exception of the lead pipe for the pump that was installed in the 1830s to 1840s. A Gore-period brick drain was also present under the floor, but was mostly removed, probably to combat moisture problems. Another brick drain was not deeply buried, and probably dates to the late 19th century. No evidence of a subfloor cistern or well was found to be present in the pump room. Future archaeological work in the cellar will continue to be performed on a room by room basis. (See also report #25-2717, 25-2823, 25-2845, 25-3070, 25-3180, 25-3185.)

25-3319 Heitert, Kristen, and Ora Elquist
2012 Frederick Law Olmsted National Historic Site Archeological Overview and Assessment, Brookline, Massachusetts. 2 volumes. 147 pages.

An archaeological overview and assessment included archival research, a walkover survey, ancient and historical cultural context development, the summary and critical evaluation of previous archaeological surveys, the production of archaeological sensitivity maps, National Register of

Historic Places eligibility determinations for known sites, and the development of recommendations for future research. The assessment encompassed the review of the documentation and associated artifact collections for the nine archaeological research and survey projects that have been conducted at the park from 1991 to 2011, and resulted in the identification of a total of five historical period sites. These sites include the Boylston House Site, the Olmsted Barn Site, the Olmsted Offices Site, the Olmsted House Site, and the Original Barn Location Site. (See also report #25-1640, 25-2535, 25-2536, 25-2806, and 25-3320.)

25-3320 Gillis, Nichole A., and Kristen Heitert
2012 Archeological Assessment for Frederick Law Olmsted National Historic Site Elm Tree Project Area, Brookline, Massachusetts. 182 pages.

The archeological compliance work was conducted in advance of the removal of an elm tree root system. Subsurface testing included 15, 1 x 1 m excavation units in the south lawn, in the location of the proposed tree removal which found deep landscape fill deposits up to 1 m below surface. Additionally, a ceramic pipe and pipe trench were identified. Based on historical property maps, it appears that the landscaping fill and ceramic drainage pipe all were laid down before 1895, during the Olmsted occupation. A total of 2,198 pieces of historical period cultural material was recovered consisting of a range of structural, domestic, and personal items from fill contexts dating between the 18th and 19th centuries. While the earlier ceramic types may have originated from one of the18th-century occupations of the property, their recovery from thoroughly mixed fill contexts effectively precludes their interpretive potential or significance. The composition of the identified fill deposits suggests that drainage concerns prompted the landscaping episode. (See also report #25-1640, 25-2535, 25-2536, 25-2806, and 25-3319.)

25-3321 Doucette, Dianna L.
2012 Intensive (Locational) Archaeological Survey, EBI West Tisbury Cell Tower, West Tisbury, Massachusetts. 53 pages.

Subsurface testing consisted of the excavation of 23, 50 x 50 cm test pits and resulted in the recovery of 17 pieces of cultural material from four test pits, including 1 quartz flake, 1 piece of window glass, 3 brick fragments, 1 piece of redware, and 11 fragments of calcined animal bone exhibiting butcher marks. The single quartz flake was designated as the West Tisbury Cell Find Spot. It was an isolated find associated with stone tool maintenance, and provides additional documentation of the use of the West Tisbury interior. The low density of historical period materials is consistent with the documented historical use of the general project area for agricultural activities, and does not appear to represent concentrated activity.

25-3322 Flynn, Erin, and Holly Herbster
2013 Intensive (Locational) Archaeological Survey, Industrial Communications, ITW Falmouth Cell Tower, Old Meeting House Road (MA-10120), Falmouth, Massachusetts. 56 pages.

A survey was completed of the areas where direct impacts are proposed, including the 10,000 ft^2 fenced cell tower compound and 540 foot-long access road. A total of 20, 50 x 50 cm test pits was excavated within these areas. No cultural materials were recovered and no archaeological deposits were identified.

25-3323 Jones, Brian D.
2012 Archaeological Reconnaissance and Intensive (Locational) Surveys, Proposed Hangar Expansion, Mansfield Municipal Airport, 265 Fruit Street, Mansfield, Massachusetts. 20 pages.

A reconnaissance archaeological survey was conducted of a 2.65 acre area on which the construction of four new hangars and a storm water basin is proposed. The survey assessed a 1.2 acre portion as apparently intact and sensitive for the recovery of cultural material associated with Site 19-BR-1, an ancient Native American site recorded within the airport. The remainder of the area was demonstrated to be pervasively disturbed. An intensive (locational) survey was conducted, consist-

ing of 22 shovel test pits placed in sensitive areas at approximately 10 m intervals. With a single exception, all of the test pits were in disturbed locations. The testing indicated that approximately 0.4 acres of the apparently sensitive area were comprised of unanticipated wetland sediments. No artifacts were found.

25-3324 Robinson, David S.
2007 Supplemental Report, Northeast Gateway Energy Bridge Deepwater Port, Marine Mammal Acoustic Monitoring and Response Plan – Stellwagen Bank National Marine Sanctuary, Massachusetts Bay, Massachusetts, Marine Archaeological Assessment Survey of Acoustic Receiver Study Areas (AB-3, AB-5, and AB-6, and MARU-3, MARU-4, MARU-12, MARU-13, MARU-14, MARU-15, and MARU-16). 30 pages.

This report summarizes the results of an archaeological assessment survey in an area several miles west of the Stellwagen Bank National Marine Sanctuary's boundaries in Massachusetts Bay. This assessment evaluates an area of potential effect surrounding each of 11, 500 x 1,000 m proposed acoustic monitoring buoy sites. Investigation focused on identifying potential historic submerged archaeological deposits including shipwrecks, which, because of their location embedded in or on the seafloor, stand the greatest chance of being impacted by the installation and maintenance of the proposed buoys. Survey included magnetometry and side scan sonar. No anomalies or targets were found to be suggestive of archaeological deposits or archaeologically sensitive buried geological features within the study area. (See also report #25-2865, 25-2876, and 25-2905.)

25-3325 Mailhot, Thomas P., and Barbara Donohue
2012 An Archaeological Intensive Survey for the Foundation Renovations of the Cadman-White-Handy House in the Town of Westport, Bristol County, Massachusetts. 149 pages.

Archaeological testing consisted of thirteen 50 x 50 cm test pits around the perimeter of the house, one south of the house, and one north of the house. Soil probing was carried out with a one inch soil probe, and two of the test pits were expanded to 1 m x 50 cm test trenches to better identify two possible features. An historical walkway with a possible reused lye leaching stone was identified on the north side of the house. The walkway was documented and test pits excavated beneath it. A total of 3,013 modern or historical artifacts and 21 Native American artifacts (19 in fill horizons) were recovered. Historical artifacts appear to be the result of yard refuse that had been redistributed from its original location or integrated into layers of fill. One Native American site of an unknown period, the Handy House Find Spot (19-BR-655), was recorded. This site consisted of a quartz flake and an argillite flake in a truncated B horizon. Three historical features were recorded, including a midden and two stone features (WSP-HA-44). (See also report #25-3326.)

25-3326 Mailhot, Thomas P.
2013 An Archaeological Intensive Survey for the Proposed Building Foundation at the Cadman-White-Handy House Property in the Town of Westport, Bristol County, Massachusetts. 156 pages.

Archaeological testing consisted of a total of 37, 50 x 50 cm test pits. In 2011, a geophysical survey, including electromagnetic survey, a magnetic survey, a soil moisture survey, and a limited ground penetrating radar, was conducted. The results of this intensive survey are compared to the results of the geophysical survey. A total of 3,241 modern or historical artifacts and one historical feature (a cobbled surface) were identified. This feature, located in the eastern tree line, is a possible walkway through the historic garden. In addition, a 1 x 1 m excavation unit was placed on a historical feature, the Handy House Midden, which was located during an earlier survey. This excavation unit contained 2,867 artifacts and was determined to be the result of secondary deposition. Based on the artifacts recovered, the primary deposition appears to be mid- to late 19th century, with the secondary deposition taking place in the early to mid-20th century. Between this survey and the last survey, all of the Handy House Midden soil was removed, with 2,125 total artifacts recovered from the feature alone. Additional evidence of a Native American site, the Handy House Lithic Site (19-BR-655), was recorded. This low density site, which consisted of 18 pieces of quartz and argillite debitage, was located in the northwest section of the 2.2 acre property. This

site could be the remnants of a small campsite or low-density lithic workshop. (See also report #25-3325.)

25-3327 Weiss Belding, Meredith
1975 Archaeological Investigations at Chesterwood. 107 pages.

A rubbish dump dating to approximately 1900-1940 was discovered at Chesterwood in Stockbridge, home of the sculptor Daniel Chester French. Artifacts typical of the turn of the 20th century and later were recovered at the site, and are analyzed in this report. Most of the artifacts were made of glass and metal and represented domestic kitchen items. Interpretations, made using advertisements from popular magazines and trade catalogues dating from 1890 to 1960, indicated that the majority of artifacts in the dump were representative of the 30 year period from 1920-1950. Use of this site as a test site for future archaeological investigations is discussed in this report. (See also report #25-1830, 25-3328, 25-3329, and 25-3336.)

25-3328 Parker, Scott K.
1987 Chesterwood, Phase II Dump Site Investigation, Phase I Parking Lot and Meadowlark Surveys. 9 pages.

This excavation included two shovel test surveys and one limited excavation survey of a purported Daniel Chester French-era dump at Chesterwood in Stockbridge. Test surveys yielded no significant cultural material or structural evidence. The excavation of a 10 x 2.5 ft trench and a 5 x 5 ft trench yielded household items including bottle glass, metal, and ceramics (predominately whiteware and ironstone). In addition, limited amounts of sculpting material, including re-bar, wire, and plaster, were identified. A sample of the artifacts was kept. A circular feature was identified, containing plaster-stained earth, large pieces of plaster, re-bar, and wire, however was determined to be a deposition of plaster molding, insignificant in terms of identifiable Daniel Chester French sculpture. The site was almost exclusively used as a domestic dump, with no other concentrated evidence of sculpting. (See also report #25-1830, 25-3327, 25-3329 and 25-3336.)

25-3329 Sternerup, Lani S.
1997 The 1997 Archaeological Reconnaissance for the Studio Drainage Correction Project at Chesterwood, Stockbridge, Massachusetts. 37 pages.

This survey included four test units placed in the interior of the studio basement and three test units placed around the exterior of the studio. Excavations focused on a clay chute, used by Daniel Chester French to dispose of sculpture materials such as clay from his casting room, which was directly above it. It was believed that this chute was mainly used to recycle clay and materials used during the sculptural process and therefore this area was potentially telling of French's artistic process. A total of 479 artifacts were recovered, concentrated at the clay chute. Household items (ceramics, glass, bottle caps, etc.), architectural materials (brick, nails, and mortar), plumbing, and other artifacts were recovered. However, of note were the 41 artifacts that were classified as artistic materials, including clay, wire armatures, wooden armature fragments, oil canvas cloth, and plaster. Artistic materials were only uncovered from the test units located in the interior of the studio basement. (See also report #25-1830, 25-3327, 25-3328 and 25-3336.)

25-3330 Dudek, Martin G.
2012 Archeological Site Examination for the Upton Chamber Masonry Rehabilitation and Drainage Improvement Project, 18 Elm Street (Assessor's Parcel 28), Town of Upton, Worcester County, Massachusetts. 254 pages.

This site examination consisted of five, 1 x 1 m excavation units for a stone structure known as the Upton Chamber (UPT-HA-15). Since 1893 the Upton Chamber has been the focus of speculative claims about its builders, its age, and its function. In 1955 the chamber and its entrance were excavated, uncovering a wooden floor with corroded nails and a small, lead glazed ceramic fragment. Deed research indicates the property was owned by a tanner whose business was discontinued by

1879. The 2011 site examination sought to identify whether intact cultural strata were present. The testing did not encounter any intact strata within the flooded interior of the chamber's entrance, although lead glazed redware was recovered in disturbed strata within the chamber's passageway. The area immediately outside of the chamber's entrance also consisted of recent (post-1955) soil and rock accumulation. Outside the chamber's entrance, intact strata were identified, but with little cultural material. Optically stimulated luminescence dating by the United States Geological Survey of a sediment sample from behind a boulder in the chamber passageway yielded a minimum age of between 1664 A.D. and 1632 A.D. The age estimate is provisional, as the method is experimental and not yet verified as to precision and reliability. No conclusive evidence for an ancient origin of the Upton Chamber has been identified. Various ideas on the function of the chamber are discussed, including possible agrarian use as an ice house or root cellar, and possible use as a shelter of refuge for Native Americans or settlers during times of colonial or inter-tribal warfare.

25-3331 Chartier, Craig S.
2004 Analysis and Cataloging of the Prehistoric Archaeological Collection of the Mattapoisett Historical Society. 93 pages.

The archaeological collections consist of five assemblages from known locations and one large, mounted assemblage with no known proveniences. The five documented assemblages were surface collected from Mattapoisett (general), Aptucxet Trading Post in Bourne, North Rochester Indian Camp Site on Wallen Place, Rochester (general), and Aucoot Cove in Mattapoisett. The collections were analyzed to identify sites present in the collection, types of artifacts and their temporal associations, significant trends in the collection, and research potential. The collection consists primarily of lithic tools (points and bifaces) manufactured from quartz, quartzite, argillite, and rhyolite. The assemblage is biased by the preferences of the collectors, but still yields research potential.

25-3332 Brown, Craig J.
2012 The Battle of Chelsea Creek, May 27-28, 1775: KOCOA Military Terrain Analysis Applied to Heavily Urbanized and Coastal Marine Environments, Boston, Chelsea, and Revere, Massachusetts. 143 pages.

Conflict Archaeology is a sub-discipline of archaeology evolving out of the realization that battles are not the only form of military endeavor. KOCOA (Key or Decisive Terrain; Observation and Fields of Fire; Cover and Concealment; Obstacles; and Avenues of Approach and Withdrawal) is a form of military terrain analysis used in defining battlefield boundaries and interpreting battlefield archaeological remains. The National Park Service requires the application of military terrain analysis in locating boundaries and evaluating the preservation potential of historical battlefields as part of the American Battlefield Protection Program. To date, military terrain analysis has mostly been applied to terrestrial battlefields that are already at least partially preserved or are otherwise relatively undisturbed. There have been few applications of military terrain analysis to urbanized sites or to coastal or riverine sites where naval engagements have taken place. This thesis tests the applicability and utility of military terrain analysis in urban coastal environments through the examination of the Battle of Chelsea Creek, an important but little known battle between American Provincial Militia and British naval forces on May 27-28, 1775, on the outskirts of Boston. (See also report #25-3258.)

25-3333 Dudek, Martin G., and Alan F. Smith
2013 Archeological Intensive (Locational) Survey for the Douglas Wind Farm Project, Douglas, Massachusetts. 98 pages.

This survey included 165, 50 x 50 cm test pits. Four archeological sites were identified in the project area, consisting of three stone structures and a rockshelter. The stone structures were built of angular fieldstone, with baked earth remaining in Structure 1. Stone Structures 1 and 2 consist of U-shaped stacks, possibly stone chimneys. Stone Structure 3 consists of a stacked stone pile associated with hand molded bricks. Judgmentally placed test pits at Stone Structure 1 did not recover

cultural material, while testing at Stone Structure 2 identified charcoal-rich features associated with a green siltstone celt, a quartz bifacial tool, and a wrought/cut nail fragment. All three stone structures are considered to be potentially significant archaeological sites that might be related to the historical Nipmuc occupation of the Lake Chaubunagungamaug area; or might be dwelling locations related to the use of the Douglas Woods area for timber related products that included cedar shingles, hoops, and barrel staves supplied to Boston in the 18th century. A bedrock outcrop with several arranged rocks or short stacks,which may be of cultural significance, was also identified. At the Rockshelter Site, a quartzite corner-notched point fragment and large biface fragment were recovered, as well as a quartz edge tool and shatter. The site is considered to be potentially significant. An old logging road with associated dumping is not potentially significant. An avoidance and protection plan is recommended for Stone Structures 1, 2, and 3 (DOU-HA-26, DOU-HA-27, and DOU-HA-28) and the Rockshelter Site (19-WR-901), to protect these potentially significant sites during construction.

25-3334 Harper, Ross, Bruce Clouette, and Brian D. Jones
2012 Intensive (Locational) Archaeological Survey, Proposed Traffic and Roadway Improvements, Sutton Street, Northbridge, Massachusetts. 88 pages.

A survey was conducted along a 2.1 mile portion of Sutton Street. Three areas were determined to have moderate to high archaeological potential: two 19th-century stone foundations, and a 7,500 ft^2 wetland replication area. Twenty-three shovel test pits were placed in the three sensitive areas. Only two artifacts—a whiteware sherd and nail fragment—were found in the wetland replication area. No additional work is recommended at this locus. Documentary research indicated that the larger of the two stone foundations likely represents the remains of the 19th-century Dudley Cider Mill (NBD-HA-50). Testing inside and outside of this foundation found 19th-century artifacts that were more structural than domestic. Iron barrel hoops and curved glass support the site's function as a cider mill. The portion of this site that will be impacted by the project is extensively disturbed. The smaller foundation represents the 19th-century Dickey/Mason house (NBD-HA-51), the modest home of a laborer, which then served as a tenant house. The small area between the foundation and roadside that will be impacted has been previously disturbed.

25-3335 Dudek, Martin G.
2013 Archeological Monitoring Report on the Drilling of Geothermal Wells for the Boston Architectural College's Urban Sustainability Initiative Renovation Project, Public Alley #444, Back Bay, Boston, Suffolk County, Massachusetts. 88 pages.

The project area is located within the Back Bay National Register Historic District. The deeply buried remains of Native American wooden fishweirs are a contributing element of the historic district. The project area consisted of tidal flats in 1871, but by 1882 the flats had been filled in and the present-day streets laid out. Archaeological monitoring of the drilling of eight geothermal wells to depths of 40 to 50 ft below grade was conducted. The monitoring identified natural organic clay-silt deposits below historic fill, at depths varying from 16 ft to over 30 ft below grade. Peat rootlets and sporadic woody root or splintered wood fragments were encountered, but none appeared to be culturally modified. Sand and gravel deposits were encountered below the organic clay-silt deposits, not the marine clays conducive for preservation of wood stakes seen at the Boston fishweirs. Based on the results of the monitoring, the project area consisted of marshes and mudflats prior to 19th-century filling, but evidence for fishweirs was not present at the well locations.

25-3336 Mulholland, Mitchell T., Joannah Whitney, Christopher Donta, Richard Douglas Holmes, and Carolyn Hertz
2013 An Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Sewer Extension and Improvement Project, Chesterwood Museum, Stockbridge, Massachusetts. 72 pages.

An archaeological investigation was conducted in advance of a proposed sewer upgrade at Mead-

owlark Cottage, formerly Daniel Chester French's "Little Studio." The building is a contributing structure to the Chesterwood National Historic Landmark. The survey consisted of background research, a field reconnaissance, and subsurface testing. Testing consisted of the excavation of two 50 x 50 cm shovel test pits, and four 50 cm x 1 m trenches. The survey revealed an existing stone entrance walkway, which is partially made up of broken stones that may have been cast-offs from French's sculpting activities before his death in 1931. Recovered artifacts and many redistributed fill layers were associated with construction of the cottage in 1911, and related sewer facilities that impact much of the proposed construction area. Artifacts are associated with later use of the cottage as a guest house, and construction of the sewer facilities. (See also report #25-1830, 25-3327, 25-3328 and 25-3329.)

25-3337 Jones, Brian, and Bruce Clouette
2013 Intensive (Locational) Archaeological Investigation, Taunton Municipal Airport Improvement Project, Westcoat Drive, Taunton, Massachusetts. 79 pages.

The survey included 182 shovel test pits at 10 m intervals across five acres. One test pit contained an abundance of early 20th-century domestic refuse. Further testing suggested that this material reflects a single episode of dumping. Two locations contained Native American artifacts. The first location produced a single mudstone flake from a topsoil context. Four additional test pits placed around this location produced no additional Native American material, thus this location is not considered significant and no further testing is recommended here. The second location produced a single quartz artifact from the topsoil. Two of seven additional test pits around this findspot also produced single quartz artifacts from the topsoil. The site, designated 400-Taun1 (19-BR-660), was very small and did not contain a significant quantity of artifacts. (See also report #25-1841.)

25-3338 Senulis, John, and Charlotte W. Thomson
1978 Field Research and Excavation, Sanitary Sewer Construction, Town of Williamsburg, Massachusetts. 22 pages.

A previous survey at this location identified a 19th-century trash deposit excavated at Test Pit #9. The purpose of further research and possible salvage operations was to recover a statistically valid sample of artifacts from the site to determine if the refuse was deposited by occupants of the Hayden Cotton Mill tenement houses. Shovel test pits sampled each meter out from the original test pit. This work was discontinued when it became evident through surface examination of the surrounding area that the refuse was more broadly distributed than had been previously noticed. Of the 19 test pits excavated, 13 were positive for historical artifacts. However, association with the Hayden Cotton Mill tenements is in doubt. An alternative explanation, based on surface survey, interviews, examination of town records, and site inspection upstream and across the river, is that dump refuse from the known dump across the river was redeposited as a result of erosion and numerous floods that have occurred in the Mill River during the last 100 years. (See also report #25-66.)

25-3339 Donta, Christopher L., and Marni Blake Walter
2012 Archaeological Reconnaissance and Intensive (Locational) Survey for the Proposed Waquoit Bay National Estuarine Research Reserve Headquarters Area Improvements, Falmouth, Massachusetts. 70 pages.

Background research, reconnaissance, and a site locational survey were conducted. A total of 83 test pits were excavated. Native American artifacts were found in two locations within the project area. There was one isolated find of Native American artifacts from disturbed fill soils along the proposed pathway north of the visitor center, and one area of intact Native American site deposits was identified. Six test pits along the proposed lighting corridor to the boat house contained Native American artifacts. While two test pits contained only single artifacts from fill deposits, four test pits contained Native American artifacts from intact subsoil. Additional undisturbed cultural resources associated with the Waquoit Bay Site likely exist in and around the proposed lighting line, and would be endangered by the proposed impacts. In total, 22 artifacts were collected, in-

cluding a rhyolite lanceolate point, 18 quartz flakes, 2 rhyolite flakes, and a quartzite flake, along with fragments of shell, designed the Waquoit Bay Native American site (19-BR-802).

25-3340 Santoro, Linda, and Christa M. Beranek
2013 Archaeological Investigations of the Rear Ell and Terrace at the Munroe Tavern, Lexington, Massachusetts. 187 pages.

Excavations at the 18th-century Munroe Tavern tested the area under an 1860s ell. In total, 34, 1 x 1 m units, one 1 m x 50 cm unit, and three 50 x 50 cm shovel test pits were excavated. The work uncovered several features that date prior to the construction of the 1860s ell, but no primary trash deposits from the tavern period. These include the builder's trench for the 1770s well, large post-holes that may have supported the well house, and a disturbed deposit of building stones. Monitoring revealed the foundation wall of a cellar, probably from the 18th or early 19th century. This feature is preserved in place and was minimally affected by construction. The most intact features, dating from the time when the building was owned by William H. Munroe, were the foundation of the 1860s ell and a custom built brick plumbing system that was integral to the ell foundation. This system carried wastewater from the house and fresh water from the well through an indoor brick privy trough, located in a back corner of the ell. The water-flow acted as a flushing mechanism for the privy, which then drained to a cesspool. Systems like this were built at a number of Massachusetts houses in the 1850s and 1860s, and represent state of the art domestic technology of the time period. This report also includes a summary and analysis of Roland Wells Robbins' excavation in the 1980s and of the artifact collection recovered by Don Matson in 1998.

25-3341 Mair, A. Peter, II
2012 Intensive (Locational) Archaeological Survey, A.D. Makepeace Phase C2 Development, Cranberry Bog and By-Pass Canal, Plymouth and Wareham, Massachusetts. 112 pages.

The development includes the creation of a series of cranberry bogs, a by-pass canal, and a soil blending facility in the vicinity of Frogfoot Brook. The intensive survey included archival research, a walkover survey, and subsurface testing. A total of 594, 50 x 50 cm test pits were excavated. Given the uneven nature of the terrain, the majority of test pits were excavated along judgmentally placed transects providing even coverage over the project area. Eleven pieces of chipping debris and one piece of unworked flint were recovered from isolated test pits representing five findspots. The isolated nature of the finds and the absence of any evidence of subsurface features indicate that this material represents isolated finds.

25-3342 Jones, Brian, Ross Harper, and Mary G. Harper
2013 Intensive (Locational) Survey of Seven Impact Areas for Runway 6-24 Extension, Wetland Replication/Restoration, and Turtle Habitat Enhancement and Site Examination of Loci 7, 8, 9 and 10, Improvements to George D. Harlow Field/Marshfield Municipal Airport, Marshfield, Massachusetts. 495 pages.

Seven areas of potential affect, totaling 25.9 acres, are in proximity to known loci of the Native American site 19-PL-426. Previous reconnaissance and intensive (locational) surveys identified intact loci associated with the site. A total of 454 shovel test pits were excavated at 10 m intervals, identifying four new Native American archaeological loci, numbered 7 through 10 (19-PL-1167, 19-PL-1170, 19-PL-1169, 19-PL-1168, respectively). An additional 202 shovel test pits were placed at 5 m intervals, as were 9, 1 x 1 m excavation units, within the identified loci. The testing produced 3,911 lithics, 84 faunal remains, and 242 historical artifacts. Thirty diagnostic projectile points date from the Early Archaic through Late Woodland periods. Identified projectile point types include Bifurcate-based, Neville, Stark, possible Merrimack, Wading River, Rossville, and possible Madison, in addition to untyped Small Stemmed forms. The most abundant of these types likely date to the Early Woodland period. Three of the four loci have the potential to provide additional important information about Native American lifeways. Two historical components were also identified within Locus 9. A concentration of domestic artifacts, dated to around 1750-1775,

suggests that a house stood nearby. A possible small historical hunting camp is suggested by European flint, a cut brass button, and red earthenware. (See also report #25-2778 and 25-3005.)

25-3343 Cassedy, Daniel, Kimberly Morrell, Thomas Kutys, Matt Jorgenson, and Edward Morin
2013 Archeological Investigations in Support of the Transportation and Information Hub Project, Faneuil Hall, Boston, Massachusetts. 2 volumes. 687 pages.

This investigation was initiated by plans to install a below-grade stairway on the northern side of Faneuil Hall. The footprint of the archaeological investigation was located immediately adjacent to the north wall of the 1805 Faneuil Hall addition. The investigation encountered successive layers of fill ranging from the end of the 17th century through the 20th century, containing more than 7,000 artifacts. A triangular biface from the Late Woodland period and several other potentially ancient artifacts were recovered from within historical contexts. The collected material is generally associated with domestic or residential use, although several objects related to Boston's manufacturing and maritime history were also recovered. Artifact analysis, coupled with the results of specialized studies (dendrochronological, macrobotanical, palynological, archaeoentomological, and faunal), identified discrete strata generated through privy content disposal, as well as through more generalized filling activities. Toward the base of the excavations, archaeologists exposed a stratum that contained at least four horizontal layers of hewn hemlock timbers, with each layer stacked perpendicular to the layer below. Dendrochronological analysis of sampled logs dates the timber between 1628 and 1708. This date, in concert with an associated artifact assemblage, suggests that the grillage is likely an element of the Town Wharf, built in the Town Cove in 1711. (See also report #25-3219.)

25-3344 Doucette, Dianna L.
2013 Intensive (Locational) Archaeological Survey, Attleboro Landfill Expansion, Seekonk, Massachusetts. 66 pages.

The project consists of four acres of undeveloped woodlands situated north of the Ten Mile River. Subsurface testing, consisting of 65, 50 x 50 cm test pits, found one quartz Squibnocket Triangle projectile point in the plowzone between 10 and 20 cm below surface. The Squibnocket Triangle is diagnostic of the Late Archaic period (5,000 – 3,000 B.P.). The findspot was designated as the Attleboro Landfill Find Spot 1 (19-BR-662). The artifact indicates the site was briefly occupied during the Late Archaic period for small scale hunting activities.

25-3345 Doucette, Dianna L.
2013 Intensive (Locational) Archaeological Survey, Kingston Water Treatment Facility, Kingston, Massachusetts. 51 pages.

In total, 30, 50 x 50 cm test pits were excavated in the two acre project area and no artifacts were found.

25-3346 Flynn, Erin, and Alan Leveillee
2012 Intensive (Locational) Archaeological Survey, D-21 Transmission Line, Dartmouth, Massachusetts. 71 pages.

The intensive (locational) archaeological survey extended 1.2 miles, from the Fall River/Dartmouth municipal line east into Dartmouth to the High Hill Road substation. In total 57, 50 x 50 cm test pits were excavated within the project area. Cultural material was recovered from 7 of the 57 test pits. This includes 5 test pits containing historical and modern cultural material, and 2 test pits containing Native American cultural material. Two findspots were identified during the intensive survey. Find Spot 1 consisted of one piece of argillite and one piece of quartz chipping debris. Find Spot 2 consisted of an isolated piece of quartz shatter.

25-3347 Hoffman, Curtiss

2012 Middleborough Little League Site (19-PL-520), 2012 Site Examination Management Summary and Permit Renewal Request. 27 pages.

The 2012 season was undertaken as a field school through Bridgewater State University. The goal was to investigate a number of features discovered during the 2010/2011 field seasons. A total of 14 features were investigated by expanding the original 50 x 50 cm test pits to 1 x 1 m units. A total of 44,775 Native American artifacts and 696 historical artifacts were recovered from the site. Most of the diagnostic artifacts are indicative of a Late to Transitional Archaic occupation (Small Stemmed Points, Squibnocket Triangle, Atlantic Point). Two new feature types were encountered: a possible house floor (Feature 175/195) and a hearth (Feature 187.1). This report provides preliminary results and requests a renewal of the permit from the State Archaeologist to continue the site examination. (See also report #25-1829, 25-1907, 25-2009, 25-2521, 25-2780, 25-3064, and 25-3138.)

25-3348 Mailhot, Thomas P., and Barbara Donohue
2013 Archaeological Intensive Survey for the Proposed New French Drains at the Heard House in the Town of Ipswich, Essex County, Massachusetts. 152 pages.

Archaeological testing consisted of 21 test pits. In total, 1,422 artifacts were recovered, including 53 Native American artifacts. Lithics recovered from intact subsoil include rhyolite, felsite, and quartz debitage, a rhyolite scraper, and a rhyolite projectile point tip. The site is located southeast of the location of the Ipswich Cove Archaeological Site (19-ES-853). Similar lithics, including rhyolite and quartz, suggest that the two sites are probably related. The results of the Ipswich Cove survey are compared to the findings at the Heard House, and the original avocational report for the Ipswich Cove site is included as an appendix. Lithics recovered in natural context were compared to lithics found in intact subsoils at the Ipswich Cove Site. (See also report #25-3351.)

25-3349 Mrozowski, Stephen, and Joseph M. Bagley
2012 Intensive Archaeological Survey, Men's Comfort Station on Boston Common, Boston, MA. 80 pages.

The intensive survey included background research, a walkover examination of the project area, and19, 50 x 50 cm shovel test pits. This survey identified no intact archaeological deposits; however, evidence of Native American and historical archaeological deposits and extensive filling and re-deposition episodes were identified. Ancient artifacts include 91 pieces of Braintree Slate, Blue Hills Rhyolite, and Boston Basin argillite chipping debris. These materials have been identified as the Ridge Hill Site (19-SU-111). Historical artifacts were predominantly 18th- and 19th-century domestic refuse, likely deposited as fill on the Boston Common, and included a single piece of 17th-century Borderware found in a disturbed context with a plastic bottle cap. Because of extensive ground disturbance, likely dating to the Olmsted firm's improvements to the Common ca. 1913, the project area no longer has archaeological integrity.

25-3350 Bagley, Joseph M.
2013 Cultural Continuity in a Nipmuc Landscape. 104 pages.

This thesis examines the lithic and knapped glass assemblage from the 2005-2012 field seasons at the Sarah Boston site in Hassanamesit Woods in Grafton. This site is associated with a multigenerational Nipmuc family living at the site from the late 18th through early 19th centuries. In total, 163 lithic artifacts, primarily quartz flakes and cores, were found throughout the site with concentrations north of a house foundation associated with the Nipmuc family. Reworked gunflints and worked glass were examined as examples of lithic practice associated with artifacts that are conclusively datable to the period after European arrival. Presence of quartz artifacts in an undisturbed B-horizon demonstrates a much-earlier Native component to the site. Lithics and ground stone tools present in the later, intact midden deposit demonstrate that the Nipmuc family interacted with these materials. It is likely that some portion of flakes, as well as reworked gunflints, and knapped glass were actively used, and perhaps produced, by the occupants of the house. This

thesis concludes that the practice of knapping persisted on this site into the 19th century, indicating a cultural continuity of Nipmuc cultural practices and identity in addition to the adoption of European-produced materials. (See also report #25-1665, 25-2391, 25-2565, 25-2611, 25-2757, 25-2920, 25-3107, and 25-3285.)

25-3351 Mailhot, Thomas P.
2013 Artifact Analysis and Re-Cataloguing of the Ipswich Cove Site (19-ES-853) Collection Located at the Heard House in the Town of Ipswich, Essex County, Massachusetts. 124 pages.

In 2007, an avocational archaeological excavation was carried out at the Heard House Museum property. A total of 13 test pits were excavated, and 1,005 artifacts recovered initially, including 264 Native American and 741 historical artifacts. The site was called the Ipswich Cove Archaeological Site (19-ES-853). The majority of the ancient artifacts were recovered from disturbed contexts and included a hornfels Neville-Variant, a rhyolite Mansion Inn blade (Watertown variety), and Native American pottery. The initial survey may have identified a small lithic workshop in undisturbed context. Lithics recovered from the workshop include quartz, rhyolite, hornfels, felsite, and chert. Additional Native American tools recovered include a graver, a spokeshave, a wedge, a whetstone, and a number of scrapers. A short avocational report is with the artifacts at the Ipswich Museum, and a copy is included as an appendix in this report. The artifacts were reorganized, re-analyzed and re-cataloged. The initial test pit descriptions were expanded based on the analysis, with diagnostic artifact types added to the description. The possible lithic workshop was compared to artifacts found at the Heard House in 2012. The Ipswich Cove Site is multicomponent, featuring artifacts from the Late Archaic, Transitional Archaic, Early Woodland, and historical periods, with a possible Paleoindian component. (See also report #25-3348.)

25-3352 Robinson, David S., and Christopher F. Wright
2013 Supplemental Marine Archaeological Investigations, New Bedford Harbor Superfund Site, Dredge Area P and Dredge Area H, Acushnet River, Acushnet and New Bedford, Massachusetts. 83 pages.

The supplemental survey of Area P was undertaken after the discovery in 2009 of the remains of a late 18th- to early 19th-century sailing vessel within a portion of the Upper Harbor that had been previously surveyed. The 2012 marine survey of Dredge Area P consisted of geophysical survey (side scan sonar and magnetometry), visual/tactile inspection of targets identified through geophysical survey, and visual/tactile inspections of sediments to locate the margin of the buried paleo-channel observed in subbottom data acquired on the eastern side of the Dredge Area P survey area. The submerged or buried paleo-landforms are considered to have archaeological sensitivity for containing ancient submerged cultural resources; however, it appears that they lie below the shallow depth of dredging, and no further supplemental marine archaeological investigation of Dredge Area P is recommended. The investigation in Dredge Area H consisted of a bathymetric survey with comparison to 2007 post-dredge survey data; the purpose of the comparison was to evaluate net accretion or erosion in a previously dredged portion of the site. Analysis on Dredge Area H indicates sediment accumulation that ultimately serves to protect any archaeologically sensitive buried paleo-channel features that could be present.

25-3353 Leveillee, Alan, and Phillip Mendenhall
2013 Intensive (Locational) Archaeological Survey, Harrison Boulevard Substation, Avon, Massachusetts. 43 pages.

Subsurface testing within two testing blocks (30 x 30 m), each consisting of 13, 50 x 50 cm test pits a transect of 12 test pits found no artifacts.

25-3354 Doucette, Dianna L.
2013 Intensive (Locational) Archaeological Survey, EBI Sharon-Knollwood Cell Tower, Sharon, Massachusetts. 70 pages.

Subsurface testing within a 3,575 ft^2 fenced compound and within a 25 ft x 220 ft utility and access easement included 72, 50 x 50 cm test pits. In total, 21 of the 72 test pits yielded ancient cultural material, two yielded ancient and historical material, and one test pit yielded historical material. Three historical artifacts (flat glass, whiteware, and coal) and 92 ancient artifacts were recovered (including 79 pieces of chipping debris, three projectile points, two lithic cores, two hammerstones, two pieces of calcined bone, and four fragments of charcoal). The survey identified two previously undocumented ancient sites, the Knollwood Cemetery Site (19-NF-731) and the Knollwood Ledge Site (19-NF-730). The Knollwood Cemetery Site included chipping debris, two Stark type projectile points, a hammerstone, charcoal, and animal bone, indicating Middle Archaic site occupation. Cultural materials from the Knollwood Ledge Site include chipping debris, a Neville type projectile point, and a hammerstone, also indicating a Middle Archaic period occupation of the site.

25-3355 Donta, Christopher L., Marni Blake Walter, and F. Timothy Barker
2013 Archaeological Reconnaissance and Intensive (Locational) Surveys for the Norwood Municipal Light Department 115kV Replacement Project, Norwood, Massachusetts. 120 pages.

Archaeological reconnaissance and intensive surveys were conducted in Sharon and Norwood, along 5.1 km of existing electrical transmission right-of-way. Two Native American archaeological sites were identified. The Edge Hill Road Native American Site (19-NF-732, Sharon) contained one piece of hornfels and one piece of quartz debitage from two test pits. The Ponkapoag Bog Native American Site (19-NF-733, Norwood) contained 20 pieces of quartz debitage, one flake of rhyolite, and two pieces of fire-cracked rock from seven different test pits.

25-3356 Berkland, Ellen P.
2011 Archaeological Testing at Maynard Street Sanitary Sewer Extension, Arlington, Massachusetts. 10 pages.

Due to potential sensitivity of the project area, which is adjacent to the Mystic River, one test pit was excavated to make sure the project would not impact below ground resources. This report presents the results of the archaeological testing. No ancient artifacts, features, or sites were located during the test. Modern period artifacts were recovered from a re-deposited fill level in the test pit.

25-3357 Berkland, Ellen P.
2011 Archaeological Testing for Relocation and Reconstruction of Brookwood Farm Barn at Brookwood Farm, 11 Blue Hill River Road, Canton, MA. 9 pages.

A number of ancient sites are located within a one-mile radius of the property. Considering the potential for sensitive resources in this area, two test pits were placed in the locations sited for the barn relocation. Both test pits were excavated to a sterile glacial level (approximately 55 cm in depth), and both contained recent historical period artifacts (modern brick, nail, bottle glass, and plastic). This area has a long history of agricultural use, and the proposed barn location was subject to development and mechanical disturbance.

25-3358 Berkland, Ellen P.
2011 Site Visit and Recordation, Fort Phoenix National Historic Site, Fairhaven, Massachusetts. 9 pages.

This report represents the results of an archaeological site visit after a metal detector find. The artifact was uncovered, documented, identified, and covered again. It was determined to be a large piece of earth-moving machinery used to create the beach in the 1960s. (See also report #25-1496, 25-2191, and 25-2289.)

25-3359 Berkland, Ellen P.
2011 Archaeological Monitoring During Clivus Installation on Washburn Island, Falmouth, Massachusetts. 8 pages.

Previous archaeological field work in 2009 led to a recommendation that the proposed Clivus system be limited to a certain area. Due to the sensitivity of the project area, back hoe operations were monitored during the installation with no observed significant discovery. (See also report #25-904 and 25-3201.)

25-3360 Berkland, Ellen P.
2011 Archaeological Testing for Proposed Campground, Peddock's Island, Hull, MA. 25 pages.

The results of a walkover survey located seven archaeological features associated with the military use of the island. Between 1898 and 1902 the proposed campground area on Peddock's Island was stripped of vegetation, graded, and impacted in preparation for the construction of several batteries between. In 1908, water service was established through a conduit from Nut Island, the Fire Tower was built, and associated utilities were dug. From the archaeological data, it is apparent that another grading episode occurred at this time, and the surface was prepared with a thin level of gravel, possibly for drainage purpose, before capping the utility system with clay. One cultural feature (excluding the water pipe) was located during the archaeological testing. The feature appeared to be a floor or a truncated foundation; bullet casings or cartridges, two machine cut nails, and mortar were associated. The site area has been fenced off and will be avoided. (See also report #25-101, 25-2477, and 25-2480.)

25-3361 Berkland, Ellen P.
2011 Archaeological Testing for Percolation Tests for Proposed Septic System Replacement, Bradley Palmer State Park, Whitehead House, 290 Linebrook Road, Ipswich, MA. 11 pages.

Archaeological testing and monitoring of backhoe operations were conducted. Five test pits were located in the areas sited for percolation testing. All five test pits were excavated to a sterile glacial level (approximately 50 cm in depth) and all five contained a few historical artifacts, representing modern field scatter. Plow scars in the test pit profiles revealed the past agricultural use of the property. During the machine excavation of percolation pits, two artifacts were uncovered (a plastic game piece and a white ball clay tobacco pipe bowl fragment).

25-3362 Berkland, Ellen P.
2011 Archaeological Testing at the MWRA Spot Pond Covered Storage Facility, Stoneham, MA. 10 pages.

Three test pits were excavated and contained cut nail fragments, glass, and a terracotta flower pot fragment.

25-3363 Berkland, Ellen P.
2011 Results of the Archaeological Reconnaissance Survey for the Watertown Riverfront Park Restoration Project, Watertown, Massachusetts. 26 pages.

The survey consisted of 2, 50 x 50 cm shovel test pits. Soil coring was also undertaken. One test pit had artificial fill, which appears to be dredged soil from the Charles River. One small, disturbed ancient fire pit containing cobbles and pink/beige volcanic flakes was located during the testing (Perkins Site, 19-MD-1146). This feature was exposed but not fully excavated. The feature was only a few inches below ground surface, in a previously graded area. Three intact historical features (historical walls, seawalls, and retaining walls) were located and documented.

25-3364 Berkland, Ellen P.
2011 Archaeological Locational Survey for the Neponset River Canoe Launch Improvement and Educational Signs, Boston, Milton, Canton, Quincy. 12 pages.

Archaeological testing was limited to Boston (Mattapan) and Milton. Four test pits were excavated, all of which were disturbed. Two ancient artifacts were recovered (grey felsite flake and

Saugus red jasper debitage) from a fill context, and many modern or historical artifacts were recovered from all four test pits (including creamware, plastic, brick, bottle glass, etc).

25-3365 Dudek, Martin G., Barbara Donohue, and Eric C. Metzger
2013 Archeological Intensive Survey for the Blackstone River Bikeway in Millbury, Sutton, Grafton, Northbridge, Uxbridge, and Blackstone, Massachusetts. 290 pages.

Intensive survey testing consisted of 476, 50 x 50 cm test pits excavated in 24 archeologically sensitive areas. Two historical archeological sites were identified in Millbury: the First Unitarian Church Site (MLB-HA-32, 1888-1922), and the Colonel A. H. Waters Atlanta Mills/Armory (MLB-HA-5, ca. 1808 to the late 19th century). MLB-HA-5 is considered to be potentially significant, as the armory was a major supplier to the federal military from 1808 through the Civil War. The First Unitarian Church site consists of demolition rubble and is not considered to be potentially significant. Five ancient sites and two findspots were also identified. Goat Hill Locus 1 (19-WR-905) produced a quartz Small Stemmed point, a quartzite scraper, and 18 pieces of quartzite, granite, and argillite/slate debitage. Goat Hill Locus 2 (19-WR-906) produced a quartz biface and eight pieces of debitage of rhyolite and quartz. The U3 Esker Site (19-WR-907) produced a quartzite Brewerton Eared-Notched point (Late Archaic period), 9 chert flakes, 27 pieces of quartz debitage, and a granite hammerstone. These sites exhibit good integrity and are likely to extend beyond the tested limits. The remaining ancient sites had low density of artifacts and/or disturbance. These include the Riverbend Site (19-WR- 903), the G3-15 Findspot (19-WR-904), U4 Findspot (19-WR-908), and the U4 Substation Site (19-WR-909). (See also report #25-3183.)

25-3366 Cherau, Suzanne, Jenifer Elam, and Jennifer Banister
2013 Intensive (Locational) Archaeological Survey, Stoughton and Whittenton Alternatives, South Coast Rail Project, Easton, Raynham, Taunton, Freetown, Fall River, New Bedford, Massachusetts. 499 pages.

The testing consisted of excavating 599, 50 x 50 cm test pits and 6 machine-assisted trenches, and resulted in the identification of 16 archaeological sites (five of which are within the Lower Taunton River Basin archaeological district) in Easton (Easton Village Railroad Station Site [EST-HA-28], Skunk Trapper Site [19-BR-677], Saws Wood Site [19-BR-676]), Raynham (King Philip Street Site [19-BR-672], Chickering Road Site [19BR-674], East Britannia Street Site [19-BR-673], Mel's Diner Site [19-BR-672], Pine Crest Site [19-BR-671], ATV Trail Site [19-BR-670]), Taunton (Cedar Swamp Site [19-BR-669]), Freetown (Landowner's Folly Site [19-BR-668], Quartz Vein Site [19-BR-667], Circling Hawk Site [19-BR-666]), and Fall River (Cold Toad Site [19-BR-665], Overlook Site North [19-BR-664], Overlook Site South [19-BR-663]). For the Braley Cemetery in Freetown (FRE.823), the intensive survey ascertained the modern boundaries of the cemetery and determined that the cemetery was in existence prior to the construction of the railroad line.

25-3367 Cherau, Suzanne G., and John Daly
2012 Salem Intermodal Station Project, Intensive (Locational) Archaeological Survey/Site Examination, Salem, Massachusetts. 156 pages.

An intensive archaeological survey/site examination consisted of archival research, a walkover survey, and subsurface testing (five machine-assisted trenches). The Salem North River Railroad Roundhouse Site (SAL-HA-25)included subsurface structural components (masonry foundation walls, brick and concrete work floors, brick inspection pit, wood and metal rail supports and track) and associated utilities (steam and water pipes, valve control) of the documented 1888 Boston and Maine Railroad roundhouse and turntable. Other components of the documented 19th-century railroad maintenance facility likely survive in the site area, including the remains of the first railroad engine house and turntable, which were destroyed by fire in 1887 along with a water tank, sand shed, coal bunker, and coaling tower. (See also report #25-3460.)

25-3368 Mulholland, Mitchell T., Melissa Wales, Christopher Donta, Richard Douglas Holmes, and Caro-

lyn Hertz
2013 An Archaeological Intensive (Locational) Survey for a State Police Communication Antenna in Northampton, Massachusetts. 110 pages.

Six 50 x 50 cm shovel test pits were excavated in an 18 m^2 area. The survey observed substantial redistributed fill interpreted as having been associated with construction of a State Police barracks in 1931, a leach field, and a parking lot for abandoned vehicles. Two 19th- to 20th-century historical artifacts were found, possibly associated with a 19th-century residence that once stood on the site.

25-3369 Flynn, Erin, and Holly Herbster
2013 Intensive (Locational) Archaeological Survey, Industrial Communications, ITW Mattapoisett Cell Tower, Marion Road (Route 6), Mattapoisett, Massachusetts. 54 pages.

A total of 9, 50 x 50 cm test pits were excavated, but no artifacts were found.

25-3370 Dudek, Martin G., James A. Chiarelli, and Thomas P. Mailhot
2009 Archeological Intensive (Locational) Survey for the Baldwin Pond Water Treatment Facility, Town of Wayland, Middlesex County, Massachusetts. 90 pages.

Numerous historical and modern artifacts were recovered from 21 of the 24, 50 x 50 cm test pits. Historical artifacts include 18th- and early 19th-century domestic ceramics, glassware, tobacco pipe fragments and architectural brick, window glass, and wrought or cut nails. One quartzite flake was recovered from fill. Most historical artifacts were recovered from re-deposited soil layers. Extensive filling and disturbance was noted throughout the project area.

25-3371 Robinson, David S., and Christopher F. Wright
2011 Supplemental Marine Archaeological Survey, New Bedford Harbor Superfund Site, Dredge Areas N, O, K, and L, Acushnet River, Acushnet and New Bedford, Massachusetts. 197 pages.

Supplemental survey using an improved and expanded suite of marine archaeological remote sensing and data processing technologies, as well as a more conservative survey transect spacing than was employed during the original 1999 survey were employed. A total of 84 sidescan sonar contacts and 138 magnetic anomalies were recorded. Four clusters of these contacts and anomalies identified as potential submerged cultural resources were subjected to systematic visual inspection and further characterization using a surface-deployed, Global Positioning System guided, video hydro-probe. Advancement of 73 probes at the four target areas revealed them to be naturally occurring deposits of shell, gravel, and/or cobbles. A buried relict paleo-channel feature identified in the Dredge Area L sub-bottom profiler data below the anticipated dredging's depth of impacts was confirmed. This paleo-channel feature was expected to extend through Dredge Areas K, O, and N, as well; however, organic-rich gaseous sediments in these areas prevented acquisition of sub-bottom profiler data within them. Post-dredge (i.e., after gaseous sediments are removed) sub-bottom profiler resurvey of areas K, O, and N, and video hydro-probe ground-truthing of sub-bottom reflectors was recommended to further map and characterize the location, extent, and nature of the buried paleo-channel and its archaeologically sensitive intact margins in these three dredge areas.

25-3372 Chartier, Craig S.
2009 Site Examination Fieldwork at the Second Meeting House Site in Duxbury, Massachusetts. 2 volumes. 171 pages.

Site examination was conducted to determine if it is the location of the Second Meeting House of Duxbury (1708-1785). A ground penetrating radar survey was conducted, but did not reveal cultural anomalies. A total of 64.25 m^2 were excavated in a combination of shovel tests and excavation units. A total of 6,856 ancient and historical artifacts were recovered. A Native American site was identified (19-PL-1158) with artifacts dating from the Late Archaic to Middle Woodland pe-

riods, consisting of chipping debris and tools made of quartz, rhyolite, argillite, chert, quartzite, Saugus jasper, and Attleboro red felsite. Tools include an Orient Fishtail point, scrapers, a Small Stemmed point, and a Fox Creek lanceolate point. Historical artifacts consisted of predominately 18th-century architectural remains (bricks, mortar, nails, and flat glass), 18th- and 19th-century ceramics, and small finds. Based on distribution of architectural artifacts it is believed that the Second Meeting House (DUX-HA-8) was wooden, earthfast construction, with brick underpinning and diamond shaped window panes set in lead kames. Non-architectural historical artifacts date to a period consistent with the Second Meeting House.

25-3373 Pendery, Steven R.
2012 Archaeological Testing at the Nichols House Museum. 37 pages.

Two 1 x 1 m units were excavated inside and adjacent to the porch vestibule of the Nichols House Museum on Beacon Hill, Boston. The excavations were conducted in 1989. Each of the two units revealed stratified deposits, which contained early 19th-century artifacts associated with architectural remains seemingly derived from construction of the porch vestibule. The archaeological evidence supports a construction date for the porch in the 1830s.

25-3374 Leveillee, Alan
2013 Intensive (Locational) Archaeological Survey, Line 109 Structure Replacement Project, Dartmouth, Massachusetts. 105 pages.

A total of 99, 50 x 50 cm test pits were excavated in the 10 mile electrical transmission right-of-way. Six fragments of possible quartz shatter were found exposed along the access road. A single rhyolite biface was found on the surface along the access road. A low density of chipping debris was identified during subsurface testing; subsequent additional testing included ten test pits surrounding the initial find. The site is designated the West of the Wall Site (19-BR-678). The Native American cultural materials recovered from the West of the Wall Site are limited to chipping debris recovered predominately from within disturbed contexts.

25-3375 Leveillee, Alan, and Mark Lance
2010 Intensive (Locational) Archaeological Survey, New England East-West Solution Transmission Projects Right of Way, Line 366, Millbury, Sutton, Northbridge, and Uxbridge, Massachusetts. 192 pages.

The survey included approximately 19 miles of the Massachusetts section of the right of way. In total, 591 shovel test pits were excavated, resulting in the discovery of 28 previously unreported archaeological sites (14 ancient, 13 historical, 1 multi-component) and 27 areas of interest or concern to Native American Tribal Representatives. Nine of the archaeological sites are potentially significant and recommended for site examination investigations. This includes 7 ancient sites (Crystal Pond [19-WR-893], Sleepy Turtle [19-WR-892], Wetland Ridge [19-WR-886], Wasp Hill [19-WR-883], Flat Rock Hill [19-WR-884], Blackstone Hill [19-WR-881], and Sands of the Blackstone [19-WR-882]), one historical site (Richardson Street Foundation [UXB-HA-68]), and one multi-component site (Purgatory Pines [19-WR-888; SUT-HA-35]). (See also report #25-3376.)

25-3376 Leveillee, Alan, and Deborah C. Cox
2012 Archaeological Site Examination, New England East-West Solution Interstate Reliability Project 366 (MA) Line, Millbury, Sutton, Northbridge, Douglas, and Uxbridge, Massachusetts. 219 pages.

Previous archaeological survey along the 15.4 mile project area identified nine archaeological sites that were subject to site examination. Among the eight ancient sites, most represent short duration, limited activity, and generally low density Late Archaic hunting-related campsites created between 5,000 and 3,000 B.P. Most of the sites have low complexity, limited in range of material and some have a relative lack of overall integrity: these include the Crystal Pond (19-WR-893), Sleepy Tur-

tle (19-WR-892), Purgatory Quartz Quarry (19-WR-890), Purgatory Pines (19-WR-888), Wasp Hill (19-WR-883), Flat Rock (19-WR-884), and Blackstone Hill (19-WR-881) sites. The Richardson Street Foundation Site (SUT-HA-35) is the stone foundation of a former ice house that dates from the late 19th to early 20th centuries. The Sands of the Blackstone Site (19-WR-882) is a Paleoindian site. The stone tool assemblage, range of lithic materials, and the site's complexity may change current ideas on Paleoindian lifeways. (See also report #25-3375.)

25-3377 Banister, Jennifer, and John Daly
2013 Wilson Mill Dam Rehabilitation, Archaeological Construction Monitoring, Bedford, Massachusetts. 46 pages.

Archaeological monitoring of construction work associated with the rehabilitation of the Wilson Mill Site (BED-HA-1) was conducted. These areas were not accessible for conventional archaeological investigations at the time of the 2010 intensive survey/site examination. The site and the related Wilson Mill Dam/Old Burlington Road Bridge (BED.931) are contributing elements within the Historic Wilson-Old Burlington Road Historic District (BED.K). The mill site is documented to have been occupied from the late 17th through early the 20th centuries for a variety of operations (sawmill, gristmill, paper mill, and cider mill). Archaeological monitoring of the existing dam, culverts, and mill building foundation provided new data that informed the understanding of site modifications during the first half of the 20th century. Excavations at the dam and Vine Brook/Secondary Channel Culvert provided data relating to construction materials and techniques. Diversion of the stream and excavations around the east and west channel foundation walls revealed additional information regarding the construction of these structures and a possible flow control structure. Cast and wrought iron artifacts (including a strap hinge, T-shaped joinery brace, and masonry tie-back) were recovered. Site features uncovered during construction monitoring provide more specific indications of the historical footprint of the 1847 mill, while also indicating that substantial modifications of the dam and foundation infrastructure occurred in the early 20th century. (See report #25-3090.)

25-3378 Cherau, Suzanne, and John Daly
2013 Phase IA Cultural Resources Reconnaissance Survey, Red Brook Headwaters Restoration, Wareham, Massachusetts. 65 pages.

The reconnaissance survey was conducted in advance of the restoration of the Red Brook headwaters in Wareham and Plymouth. The project focuses on more than 200 acres including the "Century Bog," an active cranberry bog. Archival research and a field walkover were used to locate and identify previously recorded and visible historical and archaeological resources and sensitive areas within the project area. The Century Bog appears to possess historical significance for its association with the early development of cranberry agriculture in Wareham. However, the continuous use of the bog has resulted in 20th-century modifications to its components. The survey also identified archaeologically sensitive areas for both Native American resources and documented late 19th- through mid-20th-century cranberry workers' housing (shanties and the "boss" house). The cranberry industry is significant to industry and agriculture in Wareham, and as such any potential archaeological resources related to this type of land use and settlement could contribute important local/regional information.

25-3379 Seasholes, Nancy S., Timothy L. Binzen, Kathryn Curran, Kerry Lynch, Mitchell T. Mulholland, and Steven R. Pendery
2008 Archeological Overview and Assessment of the Boston Harbor Islands National Park Area. 2 Volumes. 1,000 pages.

Background research was performed to create an inventory of ancient and historical archaeological resources and to identify previously unrecorded sites. Many sites were visited to refine locational data and to evaluate current site conditions. The archaeological record of the islands consists of many known Native American sites, which reflect occupations that occurred during the Middle and Late Archaic periods and evidently increased as coastal areas were settled more intensively

during the greater Woodland period. Documentary and archaeological evidence indicates that Native American settlement also occurred during the early historical period (A.D. 1500 – 1620). During King Philip's War (A.D. 1675 – 1676), many Native Americans were incarcerated on some of the islands. The study also identifies numerous historical archeological sites relating to private residences; use of natural resources; navigational aids, lifesaving institutions, and associated cemeteries; military resources; resorts and recreation; industry; and waste disposal. Emphasis is given in the study to the 18 islands to which the National Park Service has given priority because they contain resources that may be threatened by erosion, development, or other factors. Recommendations are provided for future archaeological resource management and research priorities.

25-3380 Robinson, David S.
2010 Marine Archaeological Underwater Pre-Dredge Visual Assessment Survey, Sengekontacket Pond Inside Channel Dredging Project (EOEA #14413; MHC #RC.46295), Oak Bluffs, Massachusetts. 35 pages.

A pre-dredge visual underwater survey of the proposed 100 ft wide, approximately 1.25 mile long project area was completed in response to the concerns of the Wampanoag Tribe of Gay Head (Aquinnah) that ancient Native American archaeological deposits could be present within and impacted by the proposed dredging project, which would deepen the currently maintained channel depth. The survey involved a systematic visual examination of the salt pond floor. The survey was accomplished by towing an underwater archaeologist equipped with an underwater video camera behind the survey vessel along a series of six survey lines spaced 20 feet apart. This diving mode enabled communications with Tribal monitors onboard the survey vessel. Based on the prior disturbances to the salt pond floor within the project area from multiple previous episodes of channel maintenance dredging, no submerged cultural resources or bottom features of potential archaeological interest were observed. (See also report #25-3381.)

25-3381 Robinson, David S.
2012 Marine Archaeological Underwater Post-Dredge Visual Assessment Survey, Sengekontacket Pond Inside Channel Dredging Project (EOEA #14413; MHC #RC.46295), Oak Bluffs, Massachusetts. 31 pages.

A post-dredge visual underwater survey of the proposed 100 ft wide, approximately 1.25 mile long project area was completed in response to the concerns of the Wampanoag Tribe of Gay Head (Aquinnah) that ancient Native American archaeological deposits could be present within and impacted by the proposed dredging project, which would deepen the currently maintained channel depth. The post-dredge survey involved a systematic visual examination of the salt pond floor within the dredged area. The survey was accomplished by towing an underwater archaeologist equipped with an underwater video camera behind the survey vessel along a series of three survey lines. This diving mode enabled communications with the Tribal monitor onboard the survey vessel. No submerged cultural resources or bottom features of potential archaeological interest were observed. (See also report #25-3380.)

25-3382 Robinson, David S., Joseph Cozzi, and Christopher F. Wright
2012 Marine Archaeological Remote Sensing Reconnaissance Survey, Martha's Vineyard Hybrid Cable Project (EEA# 14755), Falmouth to Tisbury, Massachusetts. 151 pages.

The project in Vineyard Sound between Falmouth and Tisbury was survey with a total of 17 side scan sonar targets, and 32 magnetic anomalies were identified, none of which were interpreted to be archaeological deposits.

25-3383 Robinson, David S.
2011 Marine Archaeological Sensitivity Assessment, NSTAR Gas New Bedford Harbor Inner and Outer Boat Slips RAA2 Remediation Project (EOEA#13067), New Bedford, Massachusetts. 61 pages.

A submerged area approximately 400 ft long and between 45 and 120 ft wide was survey. Environmental and historical/archaeological literature, high-resolution (i.e., 500 kHz) side scan sonar data, and 147 core logs from previous programs of geotechnical sampling were examined. The side scan sonar data recorded a flat and featureless harbor floor with only a few displaced granite blocks from the adjacent bulkhead and isolated modern refuse on it. Review of core logs indicated a sediment regime dominated by silts and finer sands to coarser sands and gravel that are consistent with the sediments of a marine/estuarine environment and lacked any evidence of cultural material or archaeologically sensitive terrestrial paleosols.

25-3384 Herbster, Holly, and Kristen Heitert
2011 Phase IA Archeological Background Research and Sensitivity Assessment, Herring River Tidal Restoration Project, Cape Cod National Seashore, Towns of Wellfleet and Truro, Barnstable County, Massachusetts. 101 pages.

A combination of archival research and a reconnaissance surface survey was used to document known archaeological resources and plot areas of high, moderate, and low archaeological sensitivity.

25-3385 Flynn, Erin, and Holly Herbster
2013 Archaeological Sensitivity Assessment and Intensive (Locational) Archaeological Survey MAARNG UTES and RTI Areas, Camp Edwards, Massachusetts. 79 pages.

Two parcels in Bourne and Sandwich, 56 acres and 58 acres, were determined to have low archaeological sensitivity.

25-3386 Elam, Jenifer, and Suzanne G. Cherau
2013 Intensive (Locational) Archaeological Survey, Massachusetts Army National Guard Facility, Newburyport Facility, Newburyport, Massachusetts. 108 pages.

Subsurface testing was limited to a total of 11 test pits, 9 of which were positive for late 18th- and early 19th-century material recovered from fill soils, which also contained 20th-century debris.

25-3387 Elam, Jenifer, and Suzanne G. Cherau
2013 Intensive (Locational) Archaeological Survey, Northampton (Florence) Facility, Agawam Armory, and Springfield Armory, Northampton, Agawam, and Springfield, Massachusetts. 165 pages.

Subsurface testing consisted of 184, 50 x 50 cm test pits. Three ancient sites were recorded. The Trail End Site (19-HS-355) on the Northampton Armory property consisted of two pieces of quartz chipping debris. The Picnic Site (19-HD-354) at the Agawam facility yielded chert and ryholite chipping debris and an Orient Fishtail point, indicative of a Transitional Archaic/Early Woodland occupation. The Skate Park Site (19-HS-355) yielded six pieces of quartzite and chert chipping debris.

25-3388 Herbster, Holly
2013 Addendum to Intensive (Locational) Archaeological Survey, Set-Off Lot 232, Map 12, Parcel 38, Aquinnah, Massachusetts. 6 pages.

This survey follows the 2011 intensive survey. Subsurface testing consisted of 10, 50 x 50 cm test pits within a proposed 800 ft long alternative driveway corridor. No archaeological deposits were identified. (See also report #25-3218.)

25-3389 Chartier, Craig, and Frank Carvino
2013 Intensive Survey Fieldwork at 52 and 78 Coles Pond Road, Dennis, Massachusetts. 40 pages.

A total of 18, 50 x 50 cm shovel test pits were excavated, but no artifacts were recovered.

25-3390 Chartier, Craig, and Joyce Clements
2013 Intensive Survey Fieldwork at the Proposed West Brookfield Solar Farm, West Brookfield, Massachusetts. 37 pages.

Intensive survey testing was conducted on 18 acres. Background research included interviewing local collectors, residents, and members of the West Brookfield Historical Commission and the Quaboag Historical Society to determine if any previously collected artifacts came from the project area. The Quaboag Historical Society could not identify if projectile points they have on display came from the project area. An iron hatchet head is on display in the museum, reportedly associated with the 1707 "Haymaker Massacre." Records indicate that it was found adjacent to the project area behind the ca. 1850s house. Two stone gouges on display were also found nearby, but not in the project area. A total of 171, 50 x 50 cm shovel test pits were excavated, but no artifacts were recovered.

25-3391 Arbuthnot, Michael, and Scott Wolter
2013 Nomans Land Stone Site Examination, Nomans Land Island, Chilmark, Massachusetts. 18 pages.

In 1926, a large black rock ("Nomans Land Stone") inscribed with Latin letters and Roman numerals was noticed on the southwestern beach of Nomans Land Island in Dukes County, Massachusetts. Efforts to decipher the inscription concluded that the first two lines read "Leif Eriksson, MI" (the Roman numeral for 1001). The modified stone has been uncritically cited as evidence of Vinland as documented in the Norse sagas, although the inscription is an early 20th-century hoax. Although Nomans Land Stone was submerged at the time of examination, rough measurements were taken and the presence of the inscription was confirmed.

25-3392 Lynch, Kerry J., and F. Timothy Barker
2013 Phase 2 Archaeological Site Examination Survey for the Wilbur Farmhouse, Borderland State Park, Easton, Massachusetts. 102 pages.

. Previous survey on the property identified Native American cultural material, as well as historical features associated with the construction of the Wilbur Farmhouse, ca. 1786, and development of the farm. A total of 7.5 m^2 was tested. Two building phases of the kitchen ell were identified. The first construction phase included a fully enclosed ell, with a possible open or three sided structure attached to its rear wall. This section was enclosed later in a second construction phase, perhaps in the 20th century. The artifacts and stratigraphy suggest the original ell was constructed around the turn of the 19th century. Diagnostic ceramics included creamware, pearlware, whiteware, redware, and yellow ware. Buttons and marbles were used to date stratigraphic levels, establishing a chronology for the ell. A stone lined well is located at the northeastern corner of the original house. The east sill of the ell sits directly on the well shaft stones, and the portion under the existing ell is intact. (See also report #25-3201.)

25-3393 Lynch, Kerry J., and F. Timothy Barker
2013 Archaeological Phase I Intensive (Locational) Survey for Green River Soil/Sediment Remediation and Port-A-Dam Installation, Berkshire Gas Company, Greenfield, Massachusetts. 96 pages.

A diverse array of manufacturing enterprises was operated by multiple tenants in an historical industrial building on the river shore. The original enterprise was a foundry, constructed ca. 1823. The area was tested with a 50 cm x 2 m trench. The Greenfield Steel Stamp Works operated on the site between 1926 and 1992. A total of 21 test pits were excavated on the south shore, producing a few historical artifacts and a single piece of quartz chipping debris. A stone feature with associated industrial fill is interpreted as a retaining wall. Fill deposits near the stone feature contained evidence of 20th-century steel stamp and tap and die industries. Excavation was limited in depth due

to concreted deposits, and sterile soil was not reached. Deposits pre-dating the steel stamp industry are likely present under the cemented deposits near the stone feature. The proposed disturbance for soil remediation on the south shore will not impact any intact archaeological resources, and no further survey is recommended. The area adjacent to the steel stamp building contains an historical stone feature and deposits relating to the industrial use of the property.

25-3394 Lynch, Donta, Christopher L., F. Timothy Barker, Steven Pendery, and Sheila Charles
2013 Archaeological Reconnaissance and Intensive (Locational) Survey for the Hall and Calista Properties, Kingston, Massachusetts. 146 pages.

The Calista parcel contains Bradford's Wharf, visible at low tide, which was built by Ellis Bradford in the early 19th century, and is one of only a few such relatively intact wharves along the Jones River. A 19th-20th century vessel was found in this survey, and potential exists for additional submerged resources in the vicinity of the wharf. Native American sites were found on both parcels. The Halls Swamp Site (19-PL-1067) contained Native American artifacts in over 90% of the test units, reflecting a dense occupation. Artifacts indicate that it was occupied repeatedly, from 8,000-7,000 years ago, from 5,000-4,000 years ago, and from 2,500-1,500 years ago. Projectile points include Neville, Small Stemmed, Wading River, and Cape Stemmed. Tools include a scraper, a perforating tool, and a pounding stone. Intact features include two hearths. The Spring Street Site (19-PL-118) contained Native American artifacts from 8,000-7,000 years ago, with a larger overlying Woodland period component (3,000-500 years ago). A Wading River projectile point was recovered, and a pit feature containing numerous Native American ceramic sherds was also identified. Both sites appear to be dense and largely intact, with features found in both locations.

25-3395 Herbster, Holly, and Erin Flynn
2013 Intensive (Locational) Archaeological Survey, Myles Standish Industrial Park Expansion Project Area and Site Examination, Watson Pond Site, Taunton, Massachusetts. 184 pages.

The proposed project involves redevelopment of the former Paul A. Devers State School/Camp Myles Standish in Taunton, MA. Survey included reconnaissance and intensive investigations across the 220 acre project area and site examination at the Watson Pond Site. It also included delineation study of the Harvey Burial Ground (TAU-HA-33; TAU.829), a 19th-century family burial ground. Native American artifacts were documented in four discrete areas. Low density artifact findspots included the Myles Standish Find Spot 1 (19-BR-679) and Find Spot 2 (19-BR-680) sites, and moderate density deposits were at the Camp Myles Standish-Watson Pond Site (19-BR-681). The sites do not represent potentially significant archaeological deposits. The intensive survey and site examination testing at the Watson Pond Site (19-BR-681) resulted in chipping debris, chipped stone tools, and tool fragments representing an occupation range that could span 8,000 to 1,000 years before present, as well as low densities of floral and faunal material. While the internal configuration of the Harvey Burial Ground is unknown, the existing fence line delineates the cemetery and should be used as the physical boundary.

25-3396 Herbster, Holly, and Erin Flynn
2013 Archaeological Reconnaissance and Assessment Survey, Comprehensive Wastewater Management Plan, Foxborough, Massachusetts. 75 pages.

The Town of Foxborough is undertaking a multi-phase study to determine the viability of current wastewater disposal practices and future needs. The survey included archival research, a walkover inspection of the project parcels, and limited subsurface testing to identify intact versus disturbed soils within four parcels (#8- Foxborough Hospital; #9- North Street; #11- Oak Street; and #14- Spring Street). Each of the four project parcels contains areas of high, moderate, and low sensitivity, but all retain the potential for intact archaeological sites to be present. As part of the assessment, one previously unidentified Native American site was identified in the North Street parcel, characterized by five pieces of chipping debris (rhyolite, quartzite, quartz, and Lynn volcanic rhyolite). Potential exists for historical features within the Oak Street parcel, including the possibility

for features related to the 18th-century National Register-listed site of the Stoughtonham Furnace complex. The Spring Street parcel has potential for historical archaeological deposits pertaining to 19th-century residences and associated outbuildings. An intensive (locational) archaeological survey is recommended for all areas of high and moderate archaeological sensitivity.

25-3397 Doucette, Dianna L.
2013 Intensive (Locational) Archaeological Survey, Red Gate Farm-Lots 6 and 8, Aquinnah, Massachusetts. 60 pages.

The Lot 6 parcel contains the previously identified Red Gate Farm Site (19-DK-250). A total of 12, 50 x 50 cm test pits were excavated, followed by archaeological monitoring of the machine-assisted removal of topsoils within four 10 x 3 ft trenches. Artifacts include two projectile points, 144 pieces of chipping debris (quartz, rhyolite, hornfels, chalcedony, jasper, and quartzite), two stone net sinkers, one sherd of Native American pottery, one biface fragment, one digging tool/hoe, one piece of calcined animal bone, and 53 fragments of shell. The projectile points include one rhyolite Brewerton point and one argillite Small Stemmed point. Four test pits were placed in Lot 8, one of which yielded a quartzite flake, a rhyolite Jack's Reef projectile point, a piece of charcoal, and a piece of light green glass. The presence of ancient and historical cultural material in the same contexts indicates the site may have been occupied during the Middle Woodland period and again during the historical period.

25-3398 Elquist, Ora, and Suzanne G. Cherau
2009 Intensive (Locational) Archaeological Survey, Massachusetts Army National Guard Facilities, Framingham Armory and Westfield (Barnes Airforce Base) Facility, Framingham and Westfield, Massachusetts. 84 pages.

Subsurface testing was conducted in the form of 7, 50 x 50 cm test pits excavated along two linear judgmental transects at 10 m intervals, and 1 judgmental test pit within the Framingham Armory project area. At Westfield, 24, 50 x 50 cm test pits were excavated along one 30 x 30 m block and three linear judgmental transects at 10 m intervals. The testing within the Framingham Armory revealed extensive and deep fill deposits, while soils at the Westfield facility exhibited evidence of past plowing activity. At Framingham, no artifacts were found. At Westfield, late 19th- to 20th-century field trash was found.

25-3399 Jones, Brian, Bruce Clouette, and Mary Harper
2013 Intensive (Locational) Archaeological Survey, Replacement of Bridge S-03-005 (07F), Clark Road Extension over the West Branch of the Farmington River, Sandisfield, Massachusetts. 92 pages.

Two areas on opposite sides of the west branch of the Farmington River were tested. One 1,750 ft^2 area near a standing 19th-century house yielded late historical and modern refuse. A 14,000 ft^2 area produced 600 artifacts from 27 shovel test pits placed at 5 m intervals. The assemblage includes a combination of late 18th- and early 19th-century domestic and architectural artifacts, as well as slag and iron shoeing nails. Many artifacts are burned or melted. Documentary research indicates the area was the site of the 1812-1830s Mills Brothers triphammer shop and associated dwelling house. All of the artifacts were found in disturbed contexts, most from a large area from which all natural soil horizons had been removed before deep layers of artifact-laden fill were deposited.

25-3400 Herbster, Holly, and Erin Timms
2012 Intensive Archaeological Survey and Evaluation, Gallops Island Remediation, MCP Phase II Investigation Project Area, Boston, Massachusetts. 89 pages.

An archaeological and disturbance assessment and archaeological investigations were conducted as part of the ongoing remediation of hazardous materials on Gallops Island, part of the Boston Harbor Islands Archaeological District, and a component of the Boston Harbor Islands National

Park Area. The review of historical documents and maps provides a general chronological background for historical period land use on Gallops Island. This chronology includes documentation of several building demolition efforts. Previous archaeological studies were focused on specific sections of the island with limited below ground excavation. These focused studies, coupled with documented structural demolition and debris removal and prior hazardous waste clean-up, make it difficult to tie below ground archaeological deposits to specific historical features or periods of use. Three pieces of chipping debris were collected in disturbed soils on the western side of the island. Above ground structural remains are visible in some areas, and one potentially intact section of a stone floor was identified, in addition to the documentation of previous demolition and remediation activities.

25-3401 Doolittle, Jim
2013 Ground Penetrating Radar Report in Support of Eight Cultural Resource Projects in Connecticut and Massachusetts. 34 pages.

Ground penetrating radar was used at the Albany Road Burying Ground in Deerfield, MA. The Old Burying Ground (DEE.801) was primarily used in the 18th to early 19th centuries. More than 493 gravestones have been recorded, but it is suspected that early grave markers have been lost. The purpose of this survey was to search for unmarked graves, potentially including those of Native Americans, African slaves, and transients, as well as to examine a mound purported to be a mass grave, which may contain as many as 48 settlers killed in the 1704 French and Indian raid. The results of the ground penetrating radar survey provide no reflection patterns that are indicative of a mass grave, but instead illustrate undisturbed surface soils signifying no excavation was present at the mound. Throughout the rest of the burying ground, several reflectors appear at uniform depths or in linear patterns (especially those with east-west orientation) that are indicative of potential unmarked graves.

25-3402 Mulholland, Mitchell T.
2013 Archaeological Study of the Deerfield and Berkshire Segments
Mahican-Mohawk Trail, Deerfield to Williamstown, Massachusetts. 116 pages

This study, begun in 1998 and updated in 2013, presents the archaeological sensitivity of locations for the proposed Mahican-Mohawk Trail. Two segments are considered: the Deerfield Segment (Deerfield, Conway, Shelburne, Charlemont), and the Berkshire Segment (Florida, Savoy, North Adams, Williamstown). This report provides an overview of the past Native American and historical environment, and concludes that the trail passes through a landscape that has been occupied for the past 12,000 years. Several historical and Native American sites are located either within or immediately adjacent to the various proposed trail routes. It is recommended that these sites be avoided during placement of the final trail. To avoid vandalism, site locations should not be disclosed to the general public. The final route should stay within existing trails, abandoned railroads, existing roads, or disturbed areas. For any trail routes that are not within previously disturbed areas, an archaeological survey is recommended. A version of this report prepared for the public does not include archaeological site locations.

25-3403 Donohue, Barbara
2013 Results of Archaeological Monitoring at the Fidelity Bank Branch Project Millbury, Massachusetts. 58 pages.

Archaeological monitoring for construction related activities at the location of the Asa Waters Armory Site (MLB-HA-05) revealed a landscape with considerable fill dating to the 20th century. Located beneath approximately 1.8 m of fill was an intact section of a dry-laid stone wall. A brick and iron feature adjacent to the bottom of the east side of the wall was located on a buried A soil horizon. Excavated to approximately 2.4 m below ground surface, natural soils were not revealed on the west side of the dry-laid stone wall, the former location of a mid-19th-century mill pond. Various features associated with the water powered system of the armory site had been previously documented as part of the archaeological survey for the Blackstone Bikeway Project. (See also re-

port #25-3365.)

25-3404 Leveillee, Alan, and Duncan Ritchie
2012 Intensive (locational) Archaeological Survey S8 Clearance Correction Project Structures 83 and 84, Archaeological Site Examination, The Riverwest Site, Berkley and Dighton, Massachusetts. 94 pages.

An archaeological survey included the excavation of 27, 50 x 50 cm shovel test pits. Of the test pits, 25 contained cultural material that included 92 Native American artifacts and 34 historical period artifacts. The assemblage indicated occupation during the Early and Late Archaic periods. The site was designated the Riverwest Site (19-BR-683). Archaeological site examination survey was conducted with 60, 50 x 50 cm shovel test pits and two 1 x 1 m excavation units. The 129 Native American artifacts collected during the site examination include chipping debris (n=115); projectile points and point fragments (n=6); bifacial flaked tool fragments (n=4); a single hammer stone; and one sample of charcoal recovered from a feature. The range of stone tool types is limited to isolated examples of projectile points, preforms, and small biface fragments, indicating that the site was used as a camp by hunters. Charcoal from a truncated feature was radiocarbon dated to 3920±30 years B.P (Beta 336200)., supporting the conclusion that the site was most frequently occupied during the Late Archaic period.

25-3405 Stewart, Joshua L., and David B. Landon
2013 Archaeological Site Examination of the Westport Town Farm, Westport, Massachusetts. 66 pages.

Archaeological testing was conducted around the foundations of the house and in other areas that were to be affected by the construction work. Initial testing included an electromagnetic soil resistivity survey along the south façade of the building. Informed by this survey, 20, 50 x 50 cm shovel test pits and 5, 1 m excavation units were excavated. No additional structures were located, nor did the excavations discover any discrete concentrations of artifacts that would have indicated a midden or other refuse dump. Personal adornment artifacts identified types of residents and their patterns of thrift-based clothing retention. The arms and ammunition artifacts suggest change in population at the Town Farm around the early 1900s. Historical landscape features included a walkway, a retaining wall, and an embankment feature. The site was an institution from 1824 to 1954, and previously a private home from 1732 to 1824.

25-3406 Herbster, Holly, and Erin Flynn
2013 Intensive (Locational) Archaeological Survey, MAARNG Central Impact Area Groundwater Treatment System, Camp Edwards, Bourne, Massachusetts. 77 pages.

A total of 120, 50 x 50 cm test pits were excavated. A single rhyolite Squibnocket Triangle point was found, designated as the Burgoyne Road Find Spot (19-BN-969).

25-3407 Ritchie, Duncan
2013 Intensive (Locational) Archaeological Survey, Pinehills PRD VI Development Area, Plymouth, Massachusetts. 105 pages.

An intensive survey was completed within the 69.4 acre project area, which is in proximity to a small cluster of documented sites along the Eel River. A total of 150, 50 x 50 cm test pits were excavated. Six small sites or loci of Native American cultural material, designated as Pine Hill Lookout Loci 1-6 (19-PL-1176, 19-PL-1175, 19-PL-1174, 19-PL-1173, 19-PL-1172, 19-PL-1171, respectively) were identified. These sites all appear to mark small, temporary camps and consisted of small, low density deposits of cultural materials. Five sites (Pine Hill Lookout Loci 2-6) contained only nondiagnostic pieces of quartz, quartzite, and argillite chipping debris. Pine Hill Lookout Locus 1 consisted of an isolated Small Stemmed projectile point that indicates the Late to Terminal Archaic period. These sites provide new information about Native American settlement patterns in the Manomet and Pine Hills section of Plymouth.

25-3408 Mendenhall, Phillip A., and Alan Leveillee
2013 Intensive (Locational) Archaeological Survey, NSTAR 111 Transmission Line, Dartmouth, Massachusetts. 143 pages.

An approximately 10 mile segment in Dartmouth and New Bedford was tested with 123, 50 x 50 cm test pits. One Native American site, the Cold Brook Lane Site (19-BR-687), and three findspots (each with less than 5 pieces of cultural material) were identified. Find Spot 1 and Find Spot 2 each contained one piece of quartz chipping debris. Find Spot 3 contained one piece of rhyolite chipping debris in a modern fill context. The Cold Brook Lane Site consisted of 32 lithic artifacts, including one unifacially flaked piece of quartz, one rhyolite flake, and 30 pieces of quartz debitage.

25-3409 Jones, Brian, and Mary G. Harper
2013 Intensive (Locational) Archaeological Survey, Reconstruction of Route 187, Drainage Line, MassDOT Project No. 604446, Westfield, Massachusetts. 74 pages.

A proposed 470 m long drainage line from Little River Road (Route 187) through an agricultural field to the Westfield River was tested with 96 shovel test pits spaced along both sides of an existing drain line at 10 m intervals. A single shovel test yielded a Native American artifact: a quartzite flake knife from the plowzone. Eight additional test pits around this findspot did not find additional Native American material. The flake knife appears to be an isolated find. Fifty of the 104 test pits were sterile or contained only modern refuse. Fifty-three pits produced a small assemblage of 19th-century field scatter, typical of backlot field-manuring activities likely associated with the house lots of farming families along Little River Road.

25-3410 Ritchie, Duncan
2013 Intensive (Locational) Archaeological Survey for MIT Lincoln Laboratory's Southwest Lab Project on Behalf of Hanscom Air Force Base, Lexington, Massachusetts. 93 pages.

A four acre area situated on Katahdin Hill was tested with a total of 99, 50 x 50 cm test pits. One small site was identified by three pieces of chipping debris (rhyolite and unidentified igneous rock) and designated the Katahdin Hill Site (19-MD-1147). This site is a small, temporary camp that provided new information about settlement patterns in the upper Shawsheen and Concord River drainages. The only historical artifact was a single sherd of whiteware or ironstone.

25-3411 Herbster, Holly, and Gregg Laskoski
2013 Addendum to Intensive (Locational) Archaeological Survey, NSTAR Line 322 Structures Replacement Project, Plymouth and Barnstable Counties. 28 pages.

Supplemental archaeological investigations were completed in Plymouth, Sandwich, and Bourne. Previous archaeological survey of the proposed project corridor in 2011 resulted in the documentation of three findspots and two ancient sites. The two sites were designated as part of the previously recorded Federal Pond Site (19-PL-1156), located in Plymouth, and the Town Line Site (19-BN-943), located in Sandwich. Consultation with the Mashpee Wampanoag and the Wampanoag Tribe of Gay Head/Aquinnah Tribal Historic Preservation Offices resulted in a request by the tribes for additional archaeological investigations, including excavation and monitoring at both site areas. Supplemental testing included the placement of two 1 x1 m excavation units at the Federal Pond Site and four 1 x 1 m units at the Town Line Site. At the Federal Pond Site, four pieces of chipping debris (3 rhyolite, 1 quartzite) were collected. At the Town Line Site, artifacts included 1,024 pieces of chipping debris, 15 bifaces, and 7 complete or partial projectile points in addition to a uniface, a drill, a hammerstone, a manuport, and 6 pieces of fire-cracked rock. (See also report #25-3229).

25-3412 Harper, Ross Kenneth
1999 To Render the God of the Water Propitious: Hunting and Human-Animal Relations in the

Northeast Woodlands. 468 pages.

Through a holistic and regional approach, this dissertation presents a comprehensive account of hunting and human-animal relations among historical Northeast Woodland peoples. Major issues that are addressed include animals as key components of Woodland Indian lifecycles and everyday life; the technical and spiritual aspects of game animal hunting and processing; and the retention of Native hunting related behavior in the face of the cultural changes brought about by European colonization. Also discussed is the similarity of hunting behaviors and belief systems among Native groups across the Northeast. It is proposed that the shared hunting related techniques, beliefs, and material culture associated with Native American cultures in the region comprise a Northeast Woodlands Hunting Complex.

25-3413 Parno, Travis Gordon
2013 "With the Quiet Sturdy Strength of the Folk of an Older Time": An Archaeological Approach to Time, Place-Making, and Heritage Construction at the Fairbanks House, Dedham, Massachusetts. 2 volumes. 629 pages.

Historic houses function as the stages for, and central figures in, processes of place making and heritage construction. In this dissertation, I offer the case site of the Fairbanks House (completed in 1641) in Dedham as the subject of my investigation into these issues. Touted as the oldest timber frame house in North America, the Fairbanks House is widely regarded as a significant example of early Colonial period architecture in the United States; it has operated as a house museum since it was purchased by the Fairbanks Family in America, Inc., stewardship group in 1904. This study expands beyond antiquity to include all eight generations of Fairbanks families who lived on the property. I argue that longevity and a durational perspective that links the past with the present are equally vital to peoples' understanding and appreciation. I trace the biography of the Fairbanks House from its creation in the early 17th century to its current use as a heritage site. This perspective emphasizes the continued saliency of accumulated individual decisions and actions, reified by both material culture and immaterial processes such as tradition and memory. I use archaeological, architectural, documentary, and oral sources to reconstruct the landscape of the Fairbanks farm, and I demonstrate how residents made day-to-day choices, such as land purchases or neighborly socializing, to improve their socio-economic standing and establish a future for their children. In doing so for eight generations, they established a legacy that was celebrated beginning in the 19th century, when Fairbanks women living in the house promoted their family's history through storytelling and published media. These processes of heritage construction remain continuous and personal, as shown by the results of an ethnographic study that I designed, which reveals that Fairbanks House museum visitors define historicity not through specifics about the Fairbanks family but through their own narratives based on their engagement with the site's material culture. In addition to providing an important example of how generations of modestly successful New England farmers adapted their surroundings to fit their values and goals, this study positions local house museums as dynamic spaces for creative, personal engagements with the past. (See also report #25-850, 25-1139, 25-3072, and 25-3187.)

25-3414 Herbster, Holly, and Erin Flynn
2013 Intensive (Locational) Archaeological Survey, Martha's Vineyard Museum Marine Hospital, Tisbury, Massachusetts. 119 pages.

The museum is planning the restoration and reuse of the historic Marine Hospital property on Vineyard Haven Harbor. The property includes two standing structures: a ca 1854 brick building, originally used as a lighthouse (TIS.141), and a larger wooden hospital building (TIS.136), built in 1885 and attached to the brick structure. A total of 60 test pits were excavated. Cultural materials were collected in 54 of the 60 test pits. An ancient site, designated the Lagoon Pond Bluff Site (19-DK-274), was identified extending across the majority of the project area. Subsurface testing resulted in the recovery of 1,402 Native American artifacts and 543 historical artifacts. Cultural materials, including chipped and ground stone tools, lithic chipping debris, Native American pottery, and food remains such as shell midden deposits, were identified across the level terrace that

comprises the majority of the property. Historical and modern period construction and land use have disturbed the upper levels of the site deposits; however, in many areas buried intact soils contain undisturbed site deposits, including features such as trash middens and small pits. Diagnostic materials collected during the survey, including a possible Susquehanna style projectile and pottery, suggest that the site may have been utilized from the Late Archaic through the Woodland period.

25-3415 Ritchie, Duncan, and Phillip Mendenhall
2013 Intensive (Locational) Archaeological Survey and Site Examination, Fiskdale Road /Route 148 Bridge (B-26-002) Project (604175) MassDOT Assignment #07, Contract No.62358 Statewide Open Services, Brookfield, Massachusetts. 110 pages.

Within the project area is a dry-laid stone foundation, which historical maps suggest is part of a 19th-century farmstead owned by Michael Smith. Field investigations for the intensive survey included 45, 50 x 50 cm shovel test pits. The site examination consisted of the excavation of four 1 x 1 m units and recordation of the fieldstone foundation. The foundation may be a section of a larger, older barn foundation that was modified in the early 20th century for use as a footing to support a garage and boathouse. A total of 589 historical period artifacts dating from the mid- to late 19th century to the modern period were found, including structural materials, bottle glass, ceramics, and tobacco pipe fragments. The highest density of artifacts was from units near the foundation, designated the Michael Smith Homestead Site (BKF-HA-6). Ancient artifacts were limited to two pieces of chipping debris (quartzite and quartz), which were found in modern fill deposits.

25-3416 Flynn, Erin, and A. Peter Mair, II
2013 Intensive (Locational) Archaeological Survey, Rehabilitation of Tiffany Street, Attleboro, Massachusetts. 76 pages.

The survey included 10, 50 x 50 cm shovel test pits. Historical period cultural material was collected from three test pits and included whiteware, a machine cut nail, coal, and bottle glass. One piece of quartz and one piece of quartzite raw material are interpreted as non-cultural inclusions in road fill deposits. Several stone and soil piles are located within the project area. Although it appears that these surface accumulations of stone and soil may be the result of more recent dumping episodes, they were also identified by the Wampanoag Tribe of Gay Head/Aquinnah as of possible Native ceremonial use. Each of the piles was investigated with a single 50 x 50 cm test pit. These pits exposed loose, unconsolidated soils containing loose stone, asphalt, concrete, and plastic over B horizon soils. This additional information confirms that these piles are the result of historical dumping.

25-3417 Barber, Russell Jeffrey
1979 Human Ecology and the Estuarine Ecosystem: Prehistoric Exploitation in the Merrimack Valley. 4 volumes. 695 pages.

Using general ecological theory, models were presented in this dissertation for subsistence and settlement in temperate estuarine zones by hunter-gatherers. Hypotheses were generated and tested, using archaeological data from the Merrimack River/Estuary of northeastern Massachusetts. Survey and excavation were undertaken in the course of testing these hypotheses, and the results of this field work were presented and interpreted. The structure of the estuarine ecosystem favored specialized foraging, with most subsistence coming from only a few sources. Further, it favored seasonal exploitation and heavy utilization of permanently resident species and transient species in the lower estuary. Other topics addressed include a tentative explanation for basic differences between estuarine adaptations on the northeastern and northwestern coasts of North America, the development and testing of hypotheses regarding trade (developed out of theory from economic geography), description and assessment of the use of moisture and subsurface interface radar for the investigation of ancient archaeological sites, and the development and application of technical means of molluscan analysis to derive paleo-ecological information.

25-3418 Pendery, Steven
2013 Archaeology at the Dorchester Pottery Works, 105 Victory Road, Dorchester, Massachusetts. 65 pages.

Dorchester Pottery Works (BOS-HA-157) was established by George Henderson in 1895. Although there are collections of products and tools from the site in private and public collections, excavations revealed a better approximation of the relative quantities of wares produced and how they were manufactured. Archaeological monitoring included the former location of the main production building and portions of the Henderson house. Archaeological excavation focused on an area acquired by a retail store for expansion towards the north, impacting a 1910 storehouse built by Henderson. Plaster molds, stoneware, kiln furniture, iron fittings, and other objects were recovered from the excavations.

25-3419 Mair, A. Peter, II, and Jennifer Ort
2013 Intensive (Locational) Archaeological Survey, Mohegan Sun Massachusetts, Palmer, Massachusetts. 83 pages.

The survey on approximately 150 acres included research and field investigations, consisting of the excavation of 127, 50 x 50 cm test pits. No cultural material was recovered.

25-3420 Clements, Joyce M.
2013 Archeological Investigations, Proposed Rehabilitation of the Nauset Bike Trail, Eastham, Massachusetts. 80 pages.

The survey included documentary and contextual research, as well as the excavation of 349 shovel test pits within two transects located on the north and south of the existing bikepath. Archaeologists recovered 146 pieces of debitage (88 rhyolite, 40 quartz, and 18 quartzite flakes), 54 historical ceramic sherds, 35 glass fragments, 63 brick fragments, 3 pieces of coal, 1 horseshoe, 33 nails, and 504 shell fragments. One potential feature was identified, consisting of a concentration of shell in a semi-circular soil stain within the subsoil matrix.

25-3421 Mair, A. Peter, II, Suzanne G. Cherau, and Erin Timms
2013 Intensive (Locational) Archaeological Survey and Site Examination, North East Fitzwilliam Road Bridge (R-12-004) Project (604175), Royalston, Massachusetts.152 pages.

A review of historical maps identified the location of a 19th-century saw and turning mill. To record the historic mill, 210 points were collected on visible structural features and elevations. Subsurface testing included 40, 50 x 50 cm shovel test and a 1 x 2 m trench. Located near the waterwheel, this trench exposed a cobble floor and dry laid stone foundation. In total, 1,055 historical artifacts were recovered, with densities highest within and around the mill complex. A number of turning knives in the assemblage suggest the shaping of raw materials for finished products. The mill complex, designated the Newton-Davis Mill Site (ROY-HA-27) contributes to understanding broad trends of the sawmilling industry in northern Worcester County and its association with the furniture making industry in nearby Gardner.

25-3422 Curran, Kathryn, Antonio Medina, F. Timothy Barker, Brian Jones, and Mitchell T. Mulholland
2013 Results of a Phase 1A Archaeological Reconnaissance, Phase 1B Intensive (Locational) Survey, Four Phase 2 Site Examinations, and Two Archaeological Site Avoidance and Protection Plans for Proposed Off-ROW Access Roads, Switching Stations and Substations for the Greater Springfield Reliability Project (GSRP) in the Towns of Agawam, Springfield, West Springfield, Chicopee, and Ludlow, Hampden County, Massachusetts. 313 pages.

Five Native American sites and one historical site were found during intensive survey. Site examinations were conducted at four Native American sites. Two of the sites are in Agawam: AR-AG-01 (19-HD-319), a Late Archaic through Late Woodland period village site; and AR-AG-19 (19-HD-315), a lithic scatter dating to the Late Archaic period. Two sites are in Chicopee: AR-CH-03

(19-HD-326), two lithic debitage concentrations with distinct raw material types that represent separate episodes of tool manufacture; and the Fairmont Switching Station (19-HD-350) with Middle Archaic and Woodland period occupations. AR-AG-08 (19-HD-345), a small Middle Archaic campsite in Agawam and the Pendleton Historic Site (CHI-HA-03), the remnants of an early 19th-century outbuilding foundation in Chicopee were avoided. Intensive survey testing consisted of 348 shovel tests. Site examination testing at the four Native American sites included 164 shovel tests, 13, 1 x 1 m test units, and 1, 1 x 1.5 m unit for a total of 55.25 m^2.

25-3423 Hodge, Christina J.
2013 Akin House Archaeology Project, 2008 and 2009 Summary Report. 267 pages.

Archaeological site examinations were conducted at the ca. 1762 Elihu Akin House in South Dartmouth. A total of 6,973 artifacts were recovered in 2008. In 2009, work focused on characterizing and testing contexts in the east and north yard areas, including a barn foundation in the north yard. A total of 3,820 artifacts and fragments were recovered in 2009, raising the two-year total to 10,793 artifacts. Scattered secondary refuse from the late 18th through 20th centuries, as well as 20th-century features, were identified and sampled in both seasons. Archaeology characterized one known 20th-century midden and three newly discovered 20th-century middens; the site of a pre-20th-century outbuilding in the east yard; a supposed defunct cellar entrance; a late 20th-century drainage feature; a well; and a 19th- to 20th-century barn foundation and former outbuilding/coal shed in the north yard. Earlier 19th- and late 18th-century artifacts were recovered at the eastern edge of the cleared yard area. The overgrown eastern portions of the yard (not yet sampled or surveyed) have the highest potential for significant features and contexts dating before the late 19th century. (See also report #25-2870.)

25-3424 Mulholland, Mitchell T., Quentin Lewis, Christopher Donta, Richard D. Holmes, and Carolyn Hertz
2013 Archaeological Intensive (Locational) Survey for the Proposed UMass Tractor and Hay Storage Facility, Deerfield, Massachusetts. 66 pages.

A walkover inspection of the proposed tractor repair facility was conducted, and revealed that much of the area of construction has been disturbed by a slurry pond, observed bulldozing, gravel access roads, and a beetle colony used by the University of Massachusetts Amherst Department of Veterinary Science. The beetle colony was determined to be a health hazard to the field crew and was not tested. The pond area and surrounding gravel road are disturbed by construction, and have no archaeological potential. An undisturbed area was predicted near the beetle colony where the hay barn is proposed to be constructed. This area was surveyed with 8, 50 x 50 cm shovel test pits revealing construction disturbance throughout.

25-3425 Dudek, Martin G., Barbara Donohue, Bonnie L. Locking, and Michael Roberts
2013 Summary Report for 15 Archeological Site Examinations, and Additional Intensive (Locational) Survey for the Tennessee Gas Pipeline Company's Essex-Middlesex Project, Lynnfield, Saugus, and Wakefield, Massachusetts. 317 pages.

Site examinations were conducted for a total of 15 ancient sites and one historical site, for a total of 705, 50 x 50 cm test pits, 32 excavation units, and one trench. Two other historic sites in Saugus **(**the North of Howard Street [SAU-HA-19] and the Altamount Avenue Historic sites [SAU-HA-18]) were investigated through documentary research. More than 7,000 ancient artifacts were recovered from the site examinations. The majority of the artifacts (about 6,500) consisted of rhyolite debitage. Diagnostic points include Middle Archaic, Late Archaic, Early Woodland, and Middle Woodland point types. Charcoal from a hearth feature at the Montrose Terrace Site was AMS dated to 530 ± 40 B.P. (Beta 237908), a Late Woodland designation. Charcoal from a hearth feature at the Camp Curtis Guild 28/Carney Road Site was AMS dated to 3210 ± 40 B.P. (Beta 237907), a Late Archaic designation. Site types range from small activity areas to multi-component campsites with lithic workshops. The sites reveal recurrent habitation patterns along the Saugus River in Saugus and Wakefield and Cedar Swamp in Lynnfield, as well as exploitation

of Lynn volcanic sources for tool production. Ten ancient sites were considered significant: the Breakheart #1 (19-ES-673), Water Street Overlook (19-ES-675), and Dry Pond North Locus (19-ES-838) sites in Saugus; the Montrose Terrace (19-MD-732), Briarwood South (19-MD-1060), and Vocational School (19-MD-1061) sites in Wakefield; and the Goodby (19-ES-688), Camp Curtis Guild 26 (19-ES-831), Camp Curtis Guild 27 (19-ES-839), and Camp Curtis Guild 28/Carney Road (19-ES-841) sites in Lynnfield. The North of Howard Street and the Altamount Avenue Historic sites retain stone walls and other features. Six ancient sites and an historical component at one site had limited research value and disturbance. Additional intensive survey testing was conducted with a total of 15, 50 x 50 cm test pits for a proposed rectifier and ground bed. No cultural material was recovered. (See also report #25-1333, 25-1445, 25-2524, and 25-3007.)

25-3426 Ritchie, Duncan, and Jenifer Elam
2013 Intensive (Locational) Archaeological Survey Clinton Landfill Remedial Cover, Clinton, Massachusetts. 73 pages.

Subsurface testing included 22, 50 x 50 cm test pits. A soil anomaly consisting of a lens of oxidized subsoil with charcoal fragments was identified; however, no ancient cultural material was found in or around it, and sampling around the anomaly did not reveal additional evidence of the feature. A few pieces of historical period cultural material were found (brick, nail, pearlware, coal, and bottle glass), likely domestic refuse disposed in land under agricultural use, or more recent landfill. Machine assisted soil stripping was then conducted. In addition to the oxidized soil feature identified in the prior survey, six other similar anomalies with burnt, stained soil and charcoal found through soil stripping were excavated and recorded. No cultural materials were found during soil stripping or in association with these oxidized subsoil anomalies. They were not the locations of unmarked burials, and most likely resulted from past removal and burning of tree stumps during forest clearing and agricultural land use from the 18th century to modern period.

25-3427 Sportman, Sarah, and Kristen Heitert
2013 Spencer-Peirce-Little Farm Drainage and Water Supply Project, Intensive (Locational) Archaeological Survey, Newbury, Massachusetts. 253 pages.

Archaeological investigations were completed throughout the domestic core of the property, as well as along the main entry drive and surrounding farm fields.
The subsurface testing comprised 120, 50 x 50 cm shovel test pits and 6 excavation units, and resulted in the recovery of a total of 6,537 ancient and historical period artifacts. A broad cross-section of soil contexts were encountered that reflect the many construction, renovation, landscaping, and grading episodes that characterize the landscape history of the property. This includes landscaping fill likely associated with Edward H. Little's alterations to the property in 1861; a deeply buried pit feature located immediately west of the tenant house, which may date to the early Peirce tenure (ca. 1651–1711); and a concentration of ancient materials along the east elevation of the main house (including 109 Native pottery sherds, a biface fragment, a thumbnail scraper, and chipping debris). Subsurface testing at the visitor center and gravel drive identified foundation elements associated with the previously recorded granary structure. Survey along the main entry drive, the circular drive and farm road, the extant barn, and in the main and tenant house cellars documented a combination of intact and disturbed soil horizons but no interpretively significant artifact deposits or features. (See also report #25-1248, 25-1249, 25-1250, 25-1251, 25-1252, 25-1367, 25-1404, 25-1790, 25-1818, 25-2052, 25-2119, 25-2438, and 25-2810.)

25-3428 Donta, Christopher L., Jennifer Wendt, F. Timothy Barker, and Antonio Medina
2013 Archaeological Intensive (Locational) and Site Examination Surveys of the Muttock-Pauwating Native American Site, 19-PL-292, Middleborough, Massachusetts. 418 pages.

Background research for a proposed 26 acre housing development identified three recorded Native American sites within the project area: the Muttock-Pauwating Site (19-PL-292), the Nemasket River Site (19-PL-421), and the Wood Site (19-PL-726). Limited excavations conducted by local archaeology enthusiasts from the 1930s through the 1960s produced artifacts from the Early Ar-

chaic through Woodland periods. Intensive subsurface testing included 64 test pits and a 1 x 1 m unit, yielding 1,717 Native American artifacts, which included 644 pieces of pottery. Also found were 24 features from 22 different test units. Large, intact pit features, hearths, and ceramic deposits were documented, along with postmolds and associated dense artifact scatters. Subsequent site examination research included the excavation of 161 test pits and 17, 1 x 1 m units. Another 6,641 Native American artifacts were recovered from the site, raising the total from the two projects to 8,358 artifacts. In addition, the project resulted in the further documentation of 50 features from seven proposed house lots, including multiple living surfaces and hearths, numerous postmolds and pit features, and a human burial. The artifacts include diagnostic projectile points of the Neville, Amoskeag, Stark, Small Stemmed, Small Triangle, Brewerton, Atlantic, Susquehanna Broad, Rossville, and Large Triangle types, as well as numerous sherds of decorated pottery. Floral analysis provided evidence of maize horticulture. The artifacts and features attest to habitation of the site from the Middle Archaic period into the Woodland period, as recent as 500 years ago. The Muttock-Pauwating Site contains a high density of artifacts in association with a variety of intact features. The density of features may be of great interest in assessing the question of mobile lifeways among Native Americans of southern New England. The Muttock-Pauwating Site maybe the best preserved Native American village site along the entire Nemasket River.

25-3429 Hutchins, Karen Anne
2013 In Pursuit of Full Freedom: An Archaeological and Historical Study of the Free African American Community at Parting Ways, Massachusetts, 1779-1900. 613 pages.

African Americans living in the small community of Parting Ways, near Plymouth, Massachusetts, realized their newly achieved independence through the construction of homeplace using the material culture of respectability and socioeconomic integration into the community. This dissertation expands upon a previous study of this community, which identified evidence that the former slaves retained African cultural traditions, to analyze material evidence of consumption and subsistence. This study reveals that African Americans living at Parting Ways crafted identities that emphasized independence, refinement, and respectability, despite living in a society that stereotyped African Americans as dependent members incapable of full social participation. The archaeological data comes from five seasons of excavation, 1975 – 1978 and 1989, on the properties of two African American families who lived at Parting Ways. I situate the artifacts together with deed, probate, court, town, and census records to construct a detailed historical context in which to interpret the material practice of daily life, identity creation, and community formation. Paternalism and dependence, features of slavery in New England, continued after emancipation, and were seen at Parting Ways through the actions of town leaders who permitted the families to build houses on public lands and also assumed legal and financial guardianship of the families. Within their homes, however, the families participated in the material culture of respectability through the rituals of tea drinking, refined dining, formal clothing, and the use of orthodox medicines. The records reveal that they also participated actively in the town's economic life by exchanging their manual labor for livestock products, such as cattle heads and feet. Through their household goods, their customs, and their labor, these families embodied respectability, integrated themselves into the community, and constructed a homeplace—a place of refuge, family building, and identity formation. At Parting Ways, African Americans worked to negate the implications of their continued dependence on town leaders by developing individual personas that espoused the values of independence, freedom, refinement, and family unity and in so doing defined their own participation in Plymouth, and American, society.

25-3430 Doucette, Dianna L.
2013 Intensive (Locational) Archaeological Survey, Madaket Wastewater Treatment Facility, Nantucket, Massachusetts. 77 pages.

Subsurface testing of 124, 50 x 50 cm test pits documented undisturbed and disturbed soil horizons within the 25 acre project area, relatively little cultural material, and no subsurface or above ground features. A total of 42 artifacts were recovered, including ceramic sherds, nails, shell, white clay smoking pipe fragments, clam shell, and burned bone. The majority of the material

came from fill contexts. The generally diffuse distribution of the cultural material assemblage from road fill contexts, combined with the lack of any associated structural, landscape, or household features, suggests that it is best characterized as yard or field scatter. Fill deposits in the project area contained a mixture of recent and historical cultural materials. Analysis of the soil profiles and cultural material suggests that these fill deposits are likely related to road construction as well as more isolated utility installations, driveway construction, and landscaping events.

25-3431 Doucette, Dianna L., and Jenifer Elam
Intensive (Locational) Archaeological Survey, Y-177 Transmission Line Refurbishment Project, Rowe, Heath, Colrain, and Greenfield, Massachusetts. 166 pages.

The intensive survey consisted of an initial sensitivity assessment followed by subsurface testing. A total of 777, 50 x 50 cm test pits were excavated. An assemblage of historical cultural material was recovered, consisting of bottle glass, brick, ammunition shell casings, ceramic sherds, window glass, nails, and miscellaneous hardware, characterized as field scatter. Nine stone walls made of dry-laid fieldstone were also documented, but lack association with other structural features in their vicinities. The survey identified two areas with ancient Native American material: Find Spot 1 (in Colrain) and the Short Corn Site (in Greenfield). Find Spot 1 consists of an isolated utilized quartz flake. The Short Corn Site yielded six pieces of quartz chipping debris, five of which were recovered from the plowzone, along with brick and ceramic fragments.

25-3432 Mair, A. Peter, II
2013 Intensive (Locational) Archaeological Survey, Sackett Brook Restoration/Gravesleigh Pond Dam Removal, Pittsfield, Massachusetts. 99 pages.

An intensive (locational) archaeological survey was conducted in the Canoe Meadows Wildlife Sanctuary. Several Native American sites are recorded near the project area, including an historical period Native American cemetery. Subsurface testing included 93, 50 x 50 cm test pits. Additionally, after East Pond was drained, the newly exposed surface was inspected for evidence of submerged archaeological sites. The inspection did not identify any archaeological sites. Ancient chipping debris was recovered from 10 test pits in the sediment reuse area, designated the Sackett Brook Site (19-BK-197). The recovered lithic material (including a utilized flake and unifacial tool) suggests lithic manufacture and heat treatment. The presence of chert chipping debris in undisturbed subsoils indicates there is a potential for intact features. The dark gray chert is similar to Onondaga chert, possibly from the upper Hudson River Valley, suggesting interaction between groups in the Pittsfield and eastern New York areas. (See also report #25-576.)

25-3433 Dubell, Gregory R.
2013 Intensive (Locational) Archaeological Survey, Maritimes & Northeast Pipeline, LLC, Methuen Compressor Station, Methuen, Massachusetts. 75 pages.

The project area is 5.11 acres in Methuen. Fieldwork consisted of a walkover/surface evaluation and subsurface testing. Fifty-two 50 x 50 cm test pits were excavated, producing a low density of historical/modern debris associated with a modern greenhouse complex.

25-3434 Daly, John, and Jennifer Banister
2013 Section 106 Mitigation Measures, Taunton State Hospital Dam Removal, Taunton, Massachusetts. 110 pages.

Photographic documentation of the Taunton State Hospital Dam and archaeological monitoring during the drawdown and construction were conducted. The archaeological monitoring resulted in the recordation and interpretation of substantial structural remains associated with the water control and power generation of the former Hopewell Mills Site. These resources include the gatehouse and penstock, wheelhouse and boiler house, spillway, and location of the 1818 dam.

25-3435 Dubell, Gregory R., and Ora Elquist

2013 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission, LLC, Tiverton Power Associates Pipeline Replacement Project, Millville, Massachusetts. 61 pages.

An intensive survey of the 20 x 20 ft workspace was performed, and eight test pits were excavated along two parallel, judgmentally placed test pit transects. No cultural materials were found.

25-3436 Cherau, Suzanne, John Daly, and David S. Robinson
2013 Historic and Archaeological Reconnaissance Surveys, Former Gloucester Gas Light Company Manufactured Gas Plant, Massachusetts Contingency Plan Remediation Project, Gloucester, Massachusetts. 319 pages.

The reconnaissance survey consisted of archival research and a walkover/existing conditions assessment (terrestrial and marine). The historic resources survey identified two resources, the Granite Wharves and Burnham's Marine Railway (GLO.939, GLO.1340, and GLO.1341) that contribute to the significance of the Gloucester Harbor Area (GLO.AU). The archaeological resources survey was conducted for both upland and marine (near and off-shore) areas. For the upland areas, archaeological sensitivity was assigned to the 1868 (and possibly earlier) seawalls and the adjacent, proposed source excavation areas for the new seawalls and backfill on two of the project lots. The historic seawalls, or "Granite Wharves," were identified as a contributing resource to the Gloucester Harbor Area. Monitoring during the construction related removal of the seawalls was recommended. The survey also identified the potential presence of one charted shipwreck of unknown origin in the underwater project area, as well as the submerged portions of the Burnham's Marine Railway. Further marine archaeological survey consisting of close-interval, high-resolution side scan sonar survey, sub-surface probing, and archaeological diver-based non-disturbance visual examination and hand-measuring were recommended.

25-3437 Waller, Joseph N., Jr., and Suzanne G. Cherau
2011 Cultural Resources Overview Study, Silvio O. Conte National Fish and Wildlife Refuge, Twelve Refuge Divisions in Connecticut, Massachusetts, New Hampshire, and Vermont. 2 volumes. 858 pages.

The overview study includes 12 divisions located in the Connecticut River drainage of Connecticut, Massachusetts, New Hampshire, and Vermont, representing a total of 32,958.35 acres of refuge owned lands. The seven refuge divisions in Massachusetts are Honey Pot Wetlands (Westfield), Mount Tom (Holyoke), Mill River (Northampton), Fort River Grasslands (Hadley), Mount Toby (Sunderland), Third Island (Deerfield), and Mackin (Wissatinnewag) [Greenfield]). These lands are predominantly undeveloped woodland and wetland areas that border the Connecticut River and its tributaries. The overview contains paleo-environmental, geomorphological, ancient, and historical contexts. Paleo-environmental summaries specific to each of the seven divisions are also provided, along with information about known cultural resources. Based on this information, archaeological predictive models for ancient and historical archaeological site locations were developed. No new fieldwork was conducted as part of this study. The Massachusetts divisions include six previously recorded sites: three in Greenfield (19-FR-46, 19-FR-12, and 19-FR-95) and three in Hadley (19-HS-130, 19-HS-144, and 19-HS-145). Three newly identified historical sites include the location of a World War II B-17 airplane crash (FWS #SOC-001) on Mount Tom in Holyoke, and a potential farmstead and sawmill within the Fort River division in Hadley. Archaeologically sensitive areas were determined for all of the Massachusetts divisions in accordance with local and regional predictive models.

25-3438 Leveillee, Alan, and Erin Flynn
2013 Intensive (Locational) Archaeological Survey Line D-21 Transmission ROW, Site Examination of the Praying Mantis Site, Fall River, Massachusetts. 98 pages.

During the intensive survey along a 4.2 mile long right of way, a total of 190, 50 x 50 cm test pits and 1, 1 x 1 m excavation unit were excavated within the project's area of potential effect. One potentially significant ancient site (the Praying Mantis Site) was identified. The assemblage collected

from the site during the intensive survey included two argillite Small Stemmed projectile points, diagnostic of the Late Archaic period, as well as rhyolite, quartz, quartzite, argillite, and jasper chipping debris, which appear to have had an associated feature. An archaeological site examination survey included the excavation of 23, 50 x 50 cm shovel test pits and 2, 1 x 1 m excavation units. The ancient materials collected during the site examination include 62 pieces of chipping debris (rhyolite, quartz, quartzite, argillite, and granite, one quartz biface fragment, one reworked rhyolite Stark projectile point, and one quartz Small Stemmed projectile). Feature 1 yielded an uncalibrated radiocarbon date of 4190 ± 30 B.P. (Beta 341124), dating to the Late Archaic period. The site represents a temporary campsite for stone tool maintenance and resource collection during the Late Archaic period. Given the low density of material and the extent of the testing, additional investigation of the site was not expected to provide new information. The Praying Mantis Site was not recommended as eligible for listing in the National Register of Historic Places. (See also report #25-3314.)

25-3439 Lynch, Kerry J., and Mitchell T. Mulholland
2008 Archaeological Reconnaissance and Intensive (Locational) Survey for the Residential Subdivision, Ponterril Outdoor Recreational Area, Pittsfield, Massachusetts. 94 pages.

The survey identified nine archaeological sites and findspots. In total, 93 shovel test pits were excavated. Survey Unit 1 contained three ancient sites and one historical site. They are the Boathouse Findspot (19-BK-198), which yielded one quartzite flake from fill; the Lakeview Site (19-BK-192), which yielded chert, quartz, and hornfels flakes; the Lakeview 2 (PIT-HA-11), which yielded 19th- to 20th-century artifacts; and the Ponterril 2 Site (19-BK-196), which yielded chert and hornfels flakes. Survey Unit 2, which is a terraced slope located east of Survey Unit 1, contained five ancient sites or findspots. They are the Ponterril 1 Site (19-BK-195), which yielded quartz flakes; the Chapel Site (19-BK-191), which yielded quartz flakes; the Maplewood Site (19-BK-193), which yielded quartz flakes; the Maplewood 2 Findspot (19-BK-199), which yielded one quartz flake; and the Merrill Site (19-BK-194), which yielded chert, quartz, quartzite, slate, and chalcedony flakes. Four features were recorded at the Merrill site, consisting of soil stains, charcoal concentrations, and postmolds.

25-3440 Herbster, Holly, and Michael Hubbard
2013 Intensive (Locational) Archaeological Survey, Falmouth Wastewater Management Treatment Plan, Site 7, Falmouth, Massachusetts. 62 pages.

The proposed project involves the construction of two new sand beds and the construction of an approximately 12 ft wide and 675 ft long access road connecting to existing facilities. Fifty-two 50 x 50 cm test pits were excavated within the area of potential effect. One isolated, Brewerton style, Late Archaic projectile point was recovered.

25-3441 Donta, Christopher L., Antonio Medina, and F. Timothy Barker
2012 Phase I Archaeological Intensive (Locational) Survey and Phase II Archaeological Site Examination Survey of the UMass Boston Field Station, Nantucket, Massachusetts. 194 pages.

Archaeological site intensive, site examination, and impact stripping surveys were conducted at the UMass Field Station on Nantucket Harbor. Based primarily on prior surveys at the Field Station selected portions of the property were tested, then the entire project impacts were stripped. Testing identified multiple features. The landform around the main house contained multiple midden deposits, postmolds, and pits, as well as an occupation level and a human burial. To the south, a large human burial pit, a midden, and a fire hearth were found. Carbonized maize kernels were found in two features at the Open House Site (i.e. a locus of the Nantucket Field Station Site, 19-NT-116). A probable historical era drainage feature was found in the proposed leach bed near Polpis Road. The recovery of Small Stemmed points suggests a Late Archaic component; the Woodland materials are predominant, consisting of mainly rhyolite debitage, with Rossville and Levanna projectile points, pottery, and a small number of other lithic tools, such as a rhyolite perforator and a bifacial knife. The artifacts recovered from the portions of the survey that overlapped

with the Open House Site consisted of all Late Woodland materials, confirmed using two radiocarbon dates. The identification of numerous features, dense deposits of artifacts, and faunal material leads to a recommendation of continued attention in planning any future soil disturbance at the field station. At least four human burial locations are now known at the property, and there are likely more to be identified. The field station is a sensitive cultural area, frequented by Native Americans for at least 8,000 years. (See also report #25-241 and 25-245.)

25-3442 Banister, Jennifer, and Holly Herbster
2013 Archeological Investigations, Farwell Jones Septic and Stow House Waterline, Minute Man National Historical Park, NRAP Project No. MIMA 2012 C, Concord, Massachusetts. 99 pages.

Investigations at the Farwell Jones and Stow House at Minute Man National Historic Park in Concord included 58, 50 x 50 cm test pits, resulting in the recovery of approximately 2,500 artifacts. At the direction of the National Park Service, only 400 artifacts were cataloged with the collection and associated documentation, and the remaining uncataloged artifacts returned upon completion of the project. One Late Archaic, quartz, Small Stemmed projectile point was identified and called the Farwell Jones Find Spot (19-MD-1150). It is considered to be an isolated Native American artifact deposit. The Historical period materials represent more than 300 years of use of this property by local residents and farmers, but do not represent a distinct archeological site. Foundations 1 and 2 are surface features that were identified as components of the property prior to the archeological survey; Foundation 1 may also contain buried cobble flooring. These features may represent potentially significant historical and/or archeological features, but additional testing would be necessary to determine their eligibility. Alternate routes for the proposed water line were identified and tested during the fieldwork so that the two foundations would not be impacted by the new construction.

25-3443 Banister, Jennifer, and Holly Herbster
2013 Archeological Investigations, Burke House New Gas Line, Minute Man National Historical Park, NRAP Project No. MIMA 2012 D, Concord, Massachusetts. 133 pages.

Archaeological investigations were completed for the proposed Burke House New Gas Line in Concord. In 2010, National Park Service archaeologists excavated nine shovel test pits on the north side of the Burke House, where the gas line was initially proposed. Archaeological deposits were identified, and the corridor was eliminated from further consideration. The current project included subsurface testing in the relocated gas line area, as well as the incorporation of the 2010 investigation into the results and analyses. This project includes 31, 50 x 50 cm test pits and two 1 x 1 m units. A total of 1,174 artifacts were collected. The historical archeological assemblage represents a long period of land use and includes domestic and structural materials from the 18th century through the modern period. No archeological features associated with the historical period use of the site were identified. The ancient materials included 58 pieces of Native American pottery, 4 pieces of chipping debris, and an incomplete quartzite projectile point. A possible ancient hearth feature was also identified. The pottery sherds, many with an incised chevron decoration, and a Jack's Reef Corner Notched projectile point, suggest a Middle to Late Woodland period date for the Burke House Site (19-MD-1149).

25-3444 Doucette, Dianna L.
2013 Addendum to the Intensive (Locational) Archaeological Survey Technical Report for the EBI West Tisbury Cell Tower: Results of the Subsurface Testing for the West Tisbury 2 Cell Tower, West Tisbury, Massachusetts. 13 pages.

An intensive (locational) archaeological survey was conducted for the proposed West Tisbury 2 Cell Tower project area in West Tisbury, Massachusetts. Field investigations involved the excavation of 12, 50 x 50 cm test pits. The subsurface testing resulted in the recovery of a single quartz flake. A test pit array placed at 2.5 m intervals around the findspot did not yield any additional cultural material. This deposit, designated as the West Tisbury Cell 2 Find Spot, was an isolated find likely representing stone tool maintenance. (See also report #25-3321.)

25-3445 Garman, James C.
1990 Archaeological Site Locational Survey at the Jones Library/Strong House, Amherst, Massachusetts. 22 pages.

Subsurface archaeological testing was conducted within a construction easement granted to the Jones Library by the Amherst Historical Society. The survey attempted to locate features associated with the Strong House or with properties once standing on the lot now occupied by the Jones Library. Although distinct features were not encountered, test trenching revealed evidence of an early 19th-century scatter of sheet refuse probably created by occupants of the Strong House. Stratigraphic profiles from excavation units provided insight into the cutting and filling of the library lot during the building's construction in 1927. (See also report #25-3446.)

25-3446 Jones, Brian D.
2013 An Educational Archaeology Program at the Strong House, Amherst Historical Society and Museum, Amherst, Massachusetts. 59 pages.

This report summarizes an archaeology educational outreach program conducted in 2011 at the 18th-century Strong House, the location of the Amherst Historical Society and Museum. The program included a limited subsurface investigation of three portions of the Strong House yard. The program was held in one hour sessions that included a brief introduction to the site's history and excavation methods, a hands-on excavation opportunity for participants, and a discussion of finds. Five 50 x 50 cm shovel test pits were excavated, resulting in the recovery of 902 artifacts. The mean date of the diagnostic ceramic materials is 1805, indicating that most were discarded at the turn of the 19th century, primarily in the east side yard and between the north ells. The finds document episodes of house renovation and upkeep, as well as changing patterns of household waste discard during the early 19th century by one of the area's most prominent families. (See also report #25-3445.)

25-3447 Barker, F. Timothy, Antonio Medina, and Steven Pendery
2013 Archaeological Reconnaissance Survey and Monitoring for the Springfield Technical Community College Central Plant Design/Build Project, Decentralization of HVAC Systems, Springfield, Massachusetts. 88 pages.

A reconnaissance survey and monitoring project at Springfield Technical Community College included buildings associated with the Springfield Armory National Historic Site. The survey was conducted between Buildings 20/25 and 27, and along the northern sides of Buildings 2, 13, and 17. Background research indicated that the greatest potential for historical archaeological resources was located in the section of machine trench excavated beneath an existing parking lot between Buildings 20/25 and 27. Monitoring at this location identified portions of two 20th-century concrete foundation walls. The foundation walls represent two structures: an electric locomotive shed, extant from 1918 to 1939, and Building 30, which stood on the same location from 1939 to 1957.

25-3448 Lynch, Daniel J.
2013 Ground Penetrating Radar Investigations at the East Parish Burial Ground, Newton, Massachusetts.165 pages.

A ground penetrating radar survey was conducted on the East Parish Burial Grounds. The purpose of the geophysical study was to identify locations of potential unmarked human burials outside of the cemetery fence, in a public area along Centre Street known as Loring Park. An additional survey was conducted within the burial grounds to determine the location of the original 17th-century meetinghouse, which is reputed to be inside of the East Parish Burial Ground fence, and is memorialized with a large, white marble obelisk known as the First Settlers Monument. The survey identified a total of 74 anomalies that can be tested further using subsurface methods. In the Loring Park survey area, 30 anomalies had the potential to be unmarked burials. At the meetinghouse

area, near the First Settlers Monument, 41 anomalies have the potential to be burials. Three anomalies in the meetinghouse area have potential to be architectural remains associated with the original Newton Meeting House. An archaeological field survey is recommended to determine the nature of the anomalies.

25-3449 Chartier, Craig S.
2010 Report on the Archaeological Collections from the C-07 Harlow Old Fort House Cellar, Plymouth, MA. 95 pages.

This report summarizes and analyzes previous excavation at the Harlow Old Fort House (PLY-HA-49; 19-PL-1013) in Plymouth. The collections were originally excavated by James Deetz in 1960 (designated then as site C-7), though no formal report was written and no field notes are known to exist. Now housed at Plimoth Plantation, the collections resulted from the excavation of a cellar hole in the Harlow House and included ceramics, faunal remains, glass, metal, and lithics (two pieces of burned English flint and a rhyolite Levanna projectile point). Additional information from the more recent 2006 excavation was also considered. Artifacts range from the late 17th century through the 19th century. The earliest artifacts are likely the result of gradual accumulation, while the 19th-century artifacts were more likely the result of episodic disposal in the cellar over a short period of time. (See also report #25-2647.)

25-3450 Banister, Jennifer, and Joseph N. Waller, Jr.
2013 Historic Cemetery Delineation, Berry Farm Cemetery, Riding Academy Preserve Project Area, North Andover, Massachusetts. 67 pages.

An historical cemetery delineation was conducted at the Berry Farm Cemetery in North Andover. The Berry Farm Cemetery was in use from 1764 to 1875, and is bound by a partial split-rail fence. Burial markers include slate, marble, and rough cut fieldstones. A mini-excavator equipped with a flat bladed scraping edge removed topsoils along the cemetery's northwest, west, and southwest sides in search for unmarked graves. Topsoil removal demonstrated that the cemetery was established atop a rise elevated above a surrounding wetland. No unmarked graves or other human burial related features were identified outside the limits of the fenced enclosure.

25-3451 Donohue, Barbara, and Michael E. Roberts
2013 Part I of an Archaeological Site Examination of the Pondville Mill Site, Auburn, Massachusetts. 59 pages.

Documentary research and a physical inspection of the Pondville Mill complex (AUB-HA-2) was conducted. This investigation was undertaken to assess the site prior to new dam construction. Documentary research revealed that the site followed a pattern of development typical of New England water power sites. No innovations were incorporated into the mill and research did not identify the potential for unique features. Physical inspection in the company of a specialist in water power sites did not identify any important innovations at the site and disclosed that little of the early mill structure remains, probably as a result of rebuilding and expansion throughout the 19th and 20th centuries. The principal value of the site is in its interpretive potential.

25-3452 Banister, Jennifer, and Dianna L. Doucette
2013 Intensive (Locational) Archaeological Survey, Angier Elementary School, Newton, Massachusetts. 85 pages.

Two known archaeological sites are on the property and adjacent playground to the west, including the Native American Waban Playground Site (19-MD-1124) and the historical period Waban Poor House Site (NWT-HA-36). The archaeological testing was conducted in the playing field west of the Angier Elementary School and in the front yard spaces. Twenty-five 50 x 50 cm test pits were excavated. The recovered artifact assemblage consists of a low density of primarily 19th-century domestic and architectural debris, recovered entirely from fill deposits. Any remnants of the 1837 Waban Almshouse were likely removed, or are located under the existing school and

parking lot.

25-3453 Gillis, Nichole A.
2013 Archaeological Data Recovery, South Bend/Tall Pine and Dark Pond Sites, Peabody and Middleton, Massachusetts. 310 pages.

Archaeological data recovery programs were completed for the South Bend/Tall Pine Site (19-ES-799) in Peabody and the Dark Pond Site (19-ES-803) in Middleton. Twenty-eight, 2 x 2 m units were excavated within the South Bend/Tall Pine Site. Five 2 x 2 m units were excavated within the Dark Pond Site. At the South Bend/Tall Pine Site, there is evidence for occupation spanning the Middle Archaic through the Middle Woodland periods, with intense occupation during the Late and Transitional Archaic periods. The cultural assemblage likely represents a residential campsite occupied by a moderately mobile group who pursued hunting, gathering, woodworking, lithic reduction, tool manufacture and maintenance, and resource processing and consumption, and targeted a wide range of locally available lithic, faunal, and floral resources. In contrast, the Dark Pond Site was exclusively utilized during the Late and Transitional Archaic periods. The range of activities is more limited and represents a special purpose campsite occupied by a highly mobile group engaged in hunting and tool manufacture and maintenance. While the archaeological data indicate that the upper Ipswich River drainage was occupied by Native American groups from the Early Archaic through the Woodland periods, the data from the South Bend/Tall Pine and Dark Pond sites suggest that the landscape was intensively utilized during the Late and Transitional Archaic periods. (See also report #25-3263.)

25-3454 Leveillee, Alan, Michael Duffin, and Jennifer Ort
2013 Intensive (Locational) Archaeological Survey, Archaeological Site Examination, Strow's Folly Site, Tobey Road Retail Development, Wareham, Massachusetts. 86 pages.

The intensive survey on a 26 acre parcel resulted in the recovery of 99 pieces of ancient artifacts in three discreet loci, collectively designated the Strow's Folly Site (19-PL-1161). Archaeological site examination focused on these three loci. Strow's Folly (locus) 1 and Strow's Folly (locus) 2 are small, low density scatters of chipping debris with isolated tool fragments, created during short duration occupations by Late Archaic to Early Woodland hunters and gatherers who camped on the elevated ridges in proximity to the brook. Strow's Folly (locus) 3 is spatially, temporally, and by type, functionally related to both Strow's Folly loci 1 and 2. It is distinguished from them, however, by yielding more material culture. (See also report #25-3311.)

25-3455 Mailhot, Thomas P., and Eric Gradoia
2013 An Archaeological Intensive Survey for the Proposed Handicap Accessible Ramp at the Cadman-White-Handy House Property in the Town of Westport, Bristol County, Massachusetts. 42 pages.

During the replacement of shingles on the north side of the house, a ghost outline of a former structure was noticed. Archaeological remains of this structure may have been present at the location of a proposed handicap accessible ramp. The archaeological survey consisted of monitoring while topsoil and recent fill was removed with a mini-excavator, then hand excavating three test pits. A total of 98 ancient and historical artifacts were recovered, and three possible historical features were identified. Two features were probable early stone drainage features, which may have been connected to each other in the past. The third feature is an incomplete rectangular outline of stones that may have been part of the foundation for the former structure. The archaeological excavation showed that the structure did not have a basement, and was probably built on dry-laid fieldstones. An examination of the house's architectural history, and the style of the ell based on the archaeological findings, provided a possible date for the structure between 1785 and 1812. (See also report #25-3325 and 25-3326.)

25-3456 Bower, Beth, and Duncan Ritchie
1975 Preliminary Archaeological Investigations at the African Meeting House, Boston, Mass.

May-June 1975. 14 pages.

Excavation began at the African Meetinghouse on Beacon Hill in 1975 at the request of the Museum of African American History (then known as the Museum of Afro-American History). Excavations were conducted in the backyard, which is approximately 15 x 6 m. The primary purpose of the excavation was to aid the restoration architect in dating structural changes made in and around the meetinghouse. A second purpose of the excavation was to recover information concerning the material culture of the free Black community on the north side of Beacon Hill in the 19th century. Two test trenches were excavated; however, further excavation was suspended until scaffolding was removed from the building to allow further access. Four features were identified, including a small pit, a trench, a drainage box, and a drain. At the time of this report, only a small fraction of artifact bags had been processed. This represented 6,100 historical artifacts, 4,000 of which were ceramics including redware, tin glazed, creamware, pearlware, Jackfield, yellow ware, stoneware, and porcelain. Artifacts including a child's mug, writing slate, and toys could be associated with the school located at the meetinghouse. An analysis of the 900 pieces of bone from the site could prove valuable information on the foodways of the community. (See also report #25-868, 25-1130, and 25-2501.)

25-3457 Marten, Catherine
1987 Foodways Research Project, in Conjunction with Analysis of Archaeological Investigations Conducted on the Site of the African Meeting House, Boston, Massachusetts: A Survey of Available Data. 23 pages.

This report gathers and examines data to look at where people in Boston in the first half of the 19th century got their food--specifically meat--and how this relates to the African Meeting House. The history of Boston markets, livestock, and garbage disposal are examined through reference to primary documents.

25-3458 Law, Heather B.
2008 Daily Negotiations and the Creation of an Alternative Discourse: The Legacy of a Colonial Nipmuc Farmstead. 129 pages.

This thesis combines archival and material evidence to examine the structural restraints employed by Colonial forces to administer the lives of Nipmuc Indians living in Grafton and the steps taken by several Nipmuc individuals to counter those restraints. Through the use of documentary analysis I construct a picture of the elements of control, both governmental and social, that categorized and marginalized Nipmuc people, especially women, living in Grafton during the 19th century. A combination of archival and material evidence examined the practices used by four generations of Nipmuc women to maintain their autonomy in the face of governmental attempts to structure their lives. In analyzing both the structures of Colonial restraint as well as Native opportunities for agency, a more thorough understanding of this history will prove useful in the study of historical archaeology in New England and contemporary politics alike. (See also report #25-1665, 25-2391, 25-2565, 25-2611, 25-2757, 25-2920, 25-3107, 25-3285, and 25-3350.)

25-3459 Bulger, Teresa Dujnic, and David Landon
2013 Scrubbing the Whitewash from New England History: Citizenship, Race and Gender in Eighteenth- and Nineteenth-Century Nantucket. 148 pages. Volume II: Seneca Boston-Florence Higginbotham House Site Examination Summary and Management Recommendations. 11 pages. Volume III: Boston-Higginbotham House Artifact Summary. 71 pages.

This three item compilation includes a dissertation, a summary and management memorandum, and an artifact catalogue. The house is significant for its association with a series of prominent African American families during the late 18th through 20th centuries, and the archaeological record at the site contributes important information to understand the growth and development of the African American community on Nantucket. The testing involved the excavation of 12.95 m^2 in 12 excavation units and eight shovel test pits, placed around the house and three outbuildings stand-

ing on the property. Most artifacts and features dated to the 19th and 20th centuries. Three lithic flakes of an undescribed material were found in a historical period depositional context. Few 18th-century artifacts were recovered; however, several deeply buried features, including two postholes, could date to that period. Additional 18th-century deposits are most likely to exist in the northern part of the property, behind the house and between the cottage and the eastern property line. The dissertation by Bulger examines how racial ideologies have historically been entangled with discourses on citizenship and gender difference in the United States. The separate site examination summary and management memorandum by Bulger and Landon provides archaeological management and site sensitivity recommendations, and includes an archaeological sensitivity map of the property. An artifact summary (catalogue) is separately bound. (See also report #25-3148.)

25-3460 Cherau, Suzanne, John Daly, and Erin Timms
2013 Salem Intermodal Station Project, Archaeological Data Recovery Program, Salem North River Railroad Roundhouse Site (MHC #SAL.HA.25), Salem, Massachusetts. 196 pages.

An archaeological data recovery program was conducted for the Salem North River Railroad Roundhouse Site (SAL.HA.25). The site contained the well preserved architectural remains of the Boston and Maine Railroad's 1888 locomotive maintenance facility, and the possible remains of an earlier engine servicing complex built by either the Essex or Eastern Railroads. The research design addressed the roundhouse site's historical land uses and periods of occupancy, engineering and architectural design, and material culture. The field investigations (machine stripping and targeted feature excavations) exposed the 1888, 12-stall roundhouse brick and masonry foundation, including brick inspection pits, brick foundation ells and concrete floor additions, and the associated masonry turntable pit foundation with center pivot base support. The structural remains of several iterations of masonry water tank supports and a sand shed were also identified, along with water and drainage infrastructure. Artifacts included domestic/personal items, structural materials, and industrial-railroad items. No archaeological data relating to the earliest railroad engine servicing facility was identified, but documentary research was able to identify its construction date of ca. 1851 by the Essex Railroad. The identified architectural remains of the second engine servicing facility at the site, constructed in 1888 by Boston and Maine Railroad, provided a large volume of data concerning structural modifications and additions to the roundhouse and turntable, as well as their adaptive use in the 1940s and 1950s when the Boston and Maine Railroad was transitioning from steam to diesel motive power. (See also report #25-3367.)

25-3461 Waller, Joseph N., Jr., Brian Ó Donnchadha, Holly Herbster, and Ora Elquist
2013 Green River Stabilization Project, Archaeological Burial Removal and Relocation of a Portion of the Green River Cemetery and Green River Cemetery Landslide Mitigation Project, Greenfield, Massachusetts. 17 pages.

Erosion along the riverbanks destabilized portions of the terrace edges occupied by the Green River Cemetery. In 2006, a slide along the northern side of the cemetery resulted in the exposure of several gravestone bases. Archaeological excavation and monitoring were completed to recover and relocate human remains from 49 graves—including former Massachusetts Governor William Washburn and his wife—from an approximately 10,800 ft^2 area. The fieldwork also included testing in the relocation area due to the previously recorded Petty's Plain Native American Burial Site (19-FR-332). No ancient archaeological deposits were identified. In 2012, another landslide occurred along the eastern side of the cemetery. The cemetery is proposing to stabilize the slope. Hand testing followed by machine-assisted removal of topsoils and archaeological monitoring occurred in the proposed staging area at the top of the slope and along the edge of the maintained cemetery grounds. One possible ancient feature was identified in the proposed staging area, but was not excavated because no subsurface impacts were planned for that area. (See also report #25-2728 and 25-2981.)

25-3462 Ritchie, Duncan, Peter Leach, Michael Hubbard, and Joseph Waller
2013 Intensive (Locational) Archaeological Survey, Wayland Department of Public Works Building, Wayland, Massachusetts. 114 pages.

The survey was conducted on a six acre project area. It is within a known area of Native American settlement, an area of continuous historical use from the mid-17th century to the 20th century adjoinging two transportation corridors (Old County Road and the Boston Post Road). Consultation included a landscape survey. Stone features identified by this survey were photographed and mapped. A ground penetrating radar survey included 42 judgmentally placed transect lines. Subsurface testing consisted of 43, 50 x 50 cm test pits. Judgmental test pits were excavated in a small zone of archaeological sensitivity and on four anomalies identified in the remote sensing survey. Historical ceramic and glass sherds, metal artifacts, and faunal remains represent low density domestic refuse from nearby houses or farmsteads deposited in the project area, and are not associated with a specific site. Two small Native American sites, designated as Wayland DPW 1 Site and Wayland DPW 2 Site, were found within the project area. The Wayland DPW 1 Site consists of a low density deposit of rhyolite chipping debris. The Wayland DPW 2 Site is an isolated findspot of a tip fragment of a quartz projectile point. These sites appear to mark small, temporary camps or activity areas.

25-3463 Miller, Aaron F.
2013 Archaeological Reconnaissance Survey at the Sanford Tavern Site, Hawley, MA. 132 pages.

In 2011 and 2012, a survey of a portion of the Hawley Old Town Common focused on the Sanford Tavern site, a dwelling, tavern, and shop operated by William Sanford and family from 1798-1840. In 2011, excavation consisted of 8, 50 x 50 cm test pits and 1, 1 x 1m excavation unit. Extant foundations were visible for the primary tavern structure as well as outbuildings. In 2012, the survey was expanded to an additional 5, 50 x 50cm test pits. More than 1,500 artifacts were found, nearly all of which dated from the period of operation of the Sanford Tavern. These offer insight into the operation of a tavern in an upland community in early 19th-century Massachusetts, the trade networks that supplied ceramics and glassware to communities like Hawley, and the changing patterns of consumption in the period.

25-3464 Sportman, Sarah, Michael Hubbard, and Holly Herbster
2014 Intensive (Locational) Archaeological Survey, Industrial Communications, ITW Plymouth Cell Tower (Center Hill Road), Plymouth, Massachusetts. 58 pages.

The proposed project involves the construction of a new 135 ft monopole communications tower enclosed within a 5,250 ft^2 fenced compound, and an approximately 760 ft long access road. A total of 31, 50 x 50 cm test pits were excavated. A single piece of quartz chipping debris was identified on the surface, and two pieces of quartz chipping debris, a possible quartz Small Stemmed preform, and a felsite projectile point base or preform were collected in topsoil horizons in the test pit array placed around the surface find. No cultural features or soil anomalies were noted in association with these materials, designated as the Sassafras Find Spot. A small number of historical artifacts were recovered from topsoils. The site appears to be small and likely concentrated around the initial findspot.

25-3465 Banister, Jennifer, and Suzanne Cherau
2013 Intensive (Locational) Archaeological Survey, Parcel 10 Development Project, Boston (Roxbury), Massachusetts. 122 pages.

A survey for a portion of the Parcel 10 Development project area was conducted to locate and identify potentially significant archaeological deposits in the back lots of four former 19th-century domestic and/or commercial buildings. The field investigations consisted of hand- and machine-assisted subsurface testing within the 8 x 35 m sensitive area in the paved parking lot. A total of 9 test pits were excavated, resulting in the recovery of 196 historical cultural materials, entirely in fill deposits, and the identification of two brick features (chambers). The size, depth, configuration, and relative location to the former buildings indicate that these brick features were likely related to late 19th- to early 20th-century sanitation/drainage infrastructure for the historic lot. Their exact construction date is unknown, but they could have been built when the no-longer-extant

brick buildings were constructed between 1890 and 1895. The buildings were demolished in 1988, and the presence of a possible 1977 dollar coin indicates that at least one of the chambers was likely filled around the same time. Modern disturbances in the project area compromised any meaningful stratigraphy.

25-3466 Curran, Kathryn
2013 Archaeological Reconnaissance and Intensive (Locational) Survey at the New Beacon Location, the New T-Hangar Location, the Shifted Parallel Taxiway/Main Apron/Runway Tie-In, and the North Development Area at the Turners Falls Municipal Airport, Montague, Franklin County, Massachusetts. 118 pages.

Archaeologists excavated 292, 50 x 50 cm shovel test pits in four areas in Montague to survey a new airport beacon location, the site of additional T-Hangars, the impact area for a shift in the parallel taxiway, main apron, and runway tie-in, and a potential development area. Field staff collected 11 Native American artifacts, including one white quartzite and three tan argillite flakes, from fill deposits in the new beacon location, one white quartz flake from fill deposits at the T-Hangars, and two quartz flakes and four pieces of quartz angular debris from intact subsoil deposits in a 15 x 4 m portion of the north development area. In addition, the 29 modern historic artifacts recovered included three pieces of glass from fill deposits in the parallel taxiway, as well as ten asphalt chunks, five red brick, four pieces of slag, two orange brick, two porcelain, two glass, and one coal fragment from fill deposits and a modern dump in the north development. The report describes eight prior archaeological surveys completed at the airport. The document also provides detailed maps and aerial photographs to summarize landscape development, land use, and property history from the 18th century through the present day. Archaeological sites at this location span Paleoindian through 19th-century occupations. (See also report #25-851, 25-2330, 25-2447, 25-2582, 25-2786, 25-2788, and 25-3233.)

25-3467 Sportman, Sarah P., and Kristen Heitert
2013 Report Addendum, Spencer-Peirce-Little Farm Drainage and Water Supply Project, Archaeological Monitoring, Newbury, Massachusetts. 36 pages.

The soil profiles observed corroborated the results of the intensive archaeological survey and verified that no significant cultural features or artifact deposits were located within the construction impact areas. Several additional soil contexts associated with late 19th-century landscape alterations were identified during the work and have been included in a revised soil context inventory. A single historical period trench feature (Feature 2) was identified and is interpreted as part of a former cesspool, likely dating to the late 19th or early 20th century. Grading activities at the west yard of the tenant house were shallower than proposed, and Feature 1 (a ca. 1651-1711 Peirce-era pit) remains deeply buried. During the ground disturbing activities, portions of the previously identified scullery floor immediately north of the main house and the granary foundation remains west of the visitors' center were partially re-exposed; work plans were immediately altered to preserve the remains of these shallowly buried structural remains. Future ground disturbing work in these areas should take into account the locations and shallow depths of these features to ensure their continued preservation. (See also report #25-1248, 25-1249, 25-1250, 25-1251, 25-1252, 25-1367, 25-1404, 25-1790, 25-1818, 25-2052, 25-2119, 25-2438, 25-2810, and 25-3427.)

25-3468 Herbster, Holly, and Michael Duffin
2014 Archaeological Effects Assessment, MassBroadband 123 Project, Western MA Regional Police Academy, Building 11 Site (SPR.71), Springfield Armory National Historic Site, Springfield, Massachusetts. 26 pages.

Construction trenching next to Building 11 at the Springfield Armory occurred prior to archaeological review, so the effects assessment included archival research, a ground penetrating radar survey, monitoring of trench fill re-excavation, screening all excavated soil, and documenting the exposed trench walls and floor. No potentially significant features were identified. A complete French blonde gunflint was recovered in disturbed soils, and is likely associated with the use of

Building 11 as an armory between 1807 and 1880. (See also report #25-3261, 25-3264, 25-3387, and 25-3447.)

25-3469 Medina, Antonio, and Christopher M. Douyard
2014 Summary of the Phase 1A Archaeological Reconnaissance Survey and Monitoring for the Springfield Technical Community College Repair of Buried Condensate Line Between Buildings 19 and 28, Springfield, Massachusetts. 27 pages.

Emergency monitoring was conducted for machine trenching to replace a condensate line utility between Buildings 28 and 19. The new route lay in a disturbed area. No artifacts were recovered.

25-3470 Herbster, Holly, and Erin Flynn
2014 Intensive (Locational) Archaeological Survey, NSTAR Line 112 Tower Replacement Project, Acushnet, Rochester, and Wareham, Massachusetts. 232 pages.

A sensitivity assessment was completed for the NSTAR Line 112 rights-of-way 140 and 143. A total of 136, 50 x 50 cm test pits were excavated and 126 pieces of cultural material were collected, including 92 ancient artifacts. Six ancient sites were identified. The Wheldon Find Spot in Acushnet consisted of four pieces of quartz and quartzite chipping debris. The High Street Find Spot in Rochester consisted of six pieces of quartz chipping debris. The Belanger Street Site in Acushnet and the Mattapoisett River Bluff Locus 1, 2, and 3 sites in Rochester were recommended as potentially significant sites. A total of 6, 2 x 2 m excavation units were excavated around the leg of each existing structure at these four sites. The combined results of the intensive survey and supplemental testing determined that lithic types and artifacts are similar to one another and consist of moderate densities of chipping debris (mostly quartz and rhyolite). The Mattapoisett River Bluff Loci sites included a Late Archaic, quartz Squibnocket Triangle projectile point and charcoal fragments, as well as shellfish fragments and calcined and unburnt animal bone, suggesting that food preparation occurred at the sites. Features at these sites include a possible hearth and possible postmold.

25-3471 Doucette, Dianna L., and Nichole A. Gillis
2013 Intensive (Locational) Archaeological Survey, Meditech Office Building, Freetown, Massachusetts. 106 pages.

A survey was conducted within a 24 acre area located in the Freetown and Fall River Archaeological District study area, also referred to as the Peace Haven area. The area includes 9 known Native American sites that were utilized repeatedly over the past 10,000 years. A total of 220, 50 x 50 cm test pits were excavated. The ancient assemblage consists of 480 artifacts, including chipping debris, projectile points, bifaces, scrapers, utilized flakes, cores, calcined bone, and fire-cracked rock fragments, as well as single examples of a preform blank, uniface, grinding stone, graphite, and pestle. Three ancient features that were identified are likely hearths and a storage pit. The ancient cultural deposits are fairly contiguous, likely associated with the previously identified sites in the area, and reflect Native American occupation during the Middle Archaic through the Transitional Archaic periods. Cultural materials were recovered from meaningful contexts and reflect in situ site activities during multiple occupations that were designated the Peace Haven 3 Site (19-BR-690). The historical cultural assemblage consists of 112 artifacts, including ceramics, glass, metal, ash, coal, and slag. The ceramic assemblage dates mostly from 1762 to 1830. The historical material consists of a low density scatter recovered from plowed field and fill contexts. (See also report #25-3157.)

25-3472 Décima, Elena B., and Martin G. Dudek
2014 Archeological Intensive Survey of the Charles River Crossing for the Framingham Extension Relief Gravity Sewer Project, Wellesley-Dover, Massachusetts, MWRA Contract #5322. 46 pages.

The archeological survey was conducted north of Cheney Bridge in Wellesley and Dover. Histori-

cally, Native American stone fishweirs were noted within the Charles River both upriver and downriver from the project area. A total of 11, 50 x 50 cm test pits were excavated, with five test pits on the east and west riverbanks, and six test pits excavated at the bottom of the Charles River following coffer dam installation and dewatering. No artifacts were recovered from the testing on the river banks, although a concentration of cobbles was noted in one test pit. Several historic 19th- or 20th-century ceramic, glass, and metal artifacts and a piece of rhyolite shatter of unclear cultural association were recovered from test pits on the river floor. Several metal and glass artifacts were recovered from the river bottom, as well as a shaped wood timber fragment with wrought or cut nails. Monitoring of machine-excavated trenches at the shore of the river bank identified a loose layer of stones within the upper stratum. Artifacts from the stratum included lead glazed redware, leather scraps, possibly from shoe-production upriver, and six stick fragments with cut-and-snap breaks suggestive of metal blade cuts. No cultural features were identified within the river, and the loose layer of stones on the river bank appears to date from historical times.

25-3473 Dudek, Martin G.
2014 Reconnaissance Survey for the NSTAR Electric Switching Station Facility, 63 Canton Street, Sharon, Massachusetts. 59 pages.

The project area is located adjacent to wetlands associated with Beaver Brook. The reconnaissance survey involved research and a field assessment, with 31 soil cores (0.75 in diameter) taken at 10 m intervals to ascertain whether the location has been disturbed or filled. Soil survey maps and coring reveal previous excavation and grading, with truncated substrata.

25-3474 Mrozowski, Stephen A., and John W. Kelley
1999 Archaeological Investigations at the Old Manse, Concord, Massachusetts. 108 pages.

This report presents the results of archaeological investigations conducted at the Old Manse in Concord between 1994 and 1998. A total of seven 1 x 1 m excavation units were placed in the yard area. They revealed concentrations of 18th- and 19th-century cultural materials including pit-like features and post-holes, and evidence of 18th-century landscape and architectural changes. Ancient artifacts included lithic debitage found across the site, and a Levanna point associated with the Late Woodland period. Also discovered in this area were the remains of an ancient hearth with a radiocarbon date of 1400 ± 90 B.P. (Beta 89263), indicating a Middle Woodland occupation. Excavations at three corners of the Old Manse for dry-well/drainage upgrades produced domestic debris, such as glassware and ceramics, as well as structural materials, such as window glass nails, and fragments of plaster, that are likely associated with the 1780-1810 renovations. Excavations were also conducted at the hay shed that abutted the western side of the Old Manse. These investigations unearthed cultural materials from the late 18th and 19th centuries. A total of two 6 x 6 m excavation units were used to examine the area below the hay shed and a separate, small foundation that was thought to be an earlier privy. The excavation within the foundation is suggestive not of a privy, but rather a small kitchen dairy or root cellar, filled with secondary construction deposits. The hay shed area was used as a secondary domestic refuse disposal site for most of the 19th century, containing ceramics and charred structural debris. Finally, excavations in the area of the former barn uncovered artifacts that represented fill from the 1920s and 1930s. A nearby outbuilding was identified as a tool and tack storage area. Site folklore indicated a “cherished cow” was buried on the property, and the recovery of a cowbell, crucifix, green glazed redware, and a harness in the shape of a cross lends credibility to that story. (See also report #25-2091.)

25-3475 Beranek, Christa M.
2014 Site Examination of the Durant-Kendrick House, Newton, Massachusetts. 228 pages.

A ground penetrating radar survey and a site examination excavation were conducted. The 1734 house sits on a roughly two acre parcel that was once the core of a larger farm. The radar survey and subsurface testing showed that archaeological features on the property are well preserved.

Buried 18th-century ground surfaces were found on all sides of the house, consisting primarily of rubble associated with the construction of the house. Many of the test excavations encountered concentrations of historical artifacts in intact soil layers, with most dating from the mid-18th through the 20th centuries. One unit encountered a 1770s sheet midden behind the house; much more of this deposit might be preserved below the current yard surface. Features that were identified include a sunken, brick floored dairy (1830s to 1875), a well, cobble edging along the driveway, a structural posthole, possibly from an earlier barn, and several trash deposits originating from different households acrossthe late 18th to late 19th centuries. The most significant feature, the dairy, was built in the house's ell during the tenure of the Kendrick family, and was filled after a structure fire. Its remains consisted of a 1.9 x 3.2 m, sunken, dry-laid brick floor surrounded by fieldstone walls. It is similar to dairies excavated at the Narbonne House in Salem and the Paine-Dodge House in Ipswich. Fragments of packaged and preserved food containers in the fill provide evidence of the shift away from home production as the area changed from agricultural to suburban in nature. The excavations also provided information about the landscape around the house and changes to the house itself.

2013 Archaeological Site Examination and Data Recovery Program, Orchard Cove Site (19-NF-265), Canton, Massachusetts. 376 pages.

The project area encompassed 38 acres. A total of 164, 50 x 50 cm test pits and 20, 1 x 1 m units were excavated during the site examination, which resulted in the identification of four major areas of Native American activity. Diagnostic material included Middle and Late Archaic projectile points and several Woodland period ceramic fragments. Data recovery focused on the four activity areas. Approximately five percent of the site area was investigated overall. The lithic assemblage included 8,165 artifacts, the majority of which were chipping debris, and 160 items consisted of bifacially chipped tools, tool fragments, ground and rough stone tools, and unifacial tools. Diagnostic projectile points include 3 Neville, 1 Stark, 1 Brewerton, 3 Squibnocket Triangle, 19 Small Stemmed, 2 Orient Fishtail, and 1 Mansion Inn blade. Twenty-four features were identified as storage pits, fire hearths, living surfaces, postmolds, and stone concentrations indicating possible structures. Of particular interest was a concentration of cobbles that formed a rectangular to oval outline. A concentration of smaller courses of stone and faire-cracked rock yielded a radiocarbon date of 5130±100 B.P. (Beta 49837). That feature was identified as a possible sweat lodge or habitation structure. Nine other radiocarbon dates obtained from charcoal associated with features range from 3800±80 B.P. (Beta 50660) to 490 ± 80 B.P. (Beta 50755). The latter date was obtained from a shallow pit containing redware, whiteware, brick, glass, and charcoal, as well as two pieces of chipping debris, and was possibly associated with an early occupation of the nearby Ponkapoag "Praying Indian" plantation. Trace element analysis performed on lithic material confirmed a preliminary visual analysis of the lithic materials, indicating that they were volcanic in origin with source areas in the Blue Hills area and the Lynn-Mattapan formations. Results of palynological analysis of the soil under the stone feature were consistent with the agricultural use of the property since at least the late 18th century. The combined archaeological data indicated the area was occupied by Native Americans during the Middle Archaic Period, intensely re-utilized during the Late Archaic Period, for short term utilization during the Early and Middle Woodland periods, and again during the historical period. (See also report #25-1053.)

2013 Archaeological Reconnaissance and Intensive (Locational) Surveys for the Removal of the Barstow's Pond Dam, Taunton, Massachusetts. 100 pages.

A total of 30 shovel test pits were excavated. The testing recorded one ancient site, designated the Cotley River Site (29-BR-693), that consisted of one quartz core, quartz chipping debris, and one possible argillite Rossville projectile point. The Barstow's Pond dam and the visible remains of an historic sawmill associated with the dam were also mapped, and designated the Barstow's Pond Mill Site (TAU-HA-67). The mill complex includes stone foundations, an earthen and timber dam, tail race, wheel pit, and wooden mill wheel. The sawmill dates to at least the end of the 18th cen-

tury, when it was owned by Joseph Dean. Dean was a direct descendant of Walter Dean, one of the original settlers of Taunton in 1638. Archaeological resources associated with the historic industry and complex may be intact underground within a portion of the project area.

2013 Archaeological Investigations, Hanover Marketplace Project Area, Area 1 Site (19-PL-749) and Area 2 Site (19-PL-750), Hanover, Massachusetts. 280 pages.

Archaeological site examinations of the Area 1 (19-PL-749) and Area 2 (19-PL-750) sites and archaeological data recovery at the Area 1 Site were conducted within the Hanover Marketplace. Archaeological excavation recovered a range of Early Archaic, Middle Archaic, Late Archaic, Transitional Archaic, and Middle Woodland period Native American cultural materials that included lithic chipping debris, a stone pestle, drills, atlatl weights, a stone weight, bifaces and bifacial tools and tool fragments, clay pot sherds, paintstone, and various projectile points including bifurcate based, Neville, Stark, Brewerton Eared, Small Stemmed, Susquehanna Broad/Wayland notched, Orient Fishtails, and a Jack's Reef Corner Notched point. Numerous Native American cultural features were identified, including refuse pits, stone platforms/hearths, and lithic workshops. Cultural features were radiocarbon dated to the Middle Archaic (7740 ± 150 B.P. [Beta 60199]) and Late Archaic (4600 ± 90 B.P. [Beta 63082], 3540 ± 80 B.P. [Beta 55006], 3510 ± 90 B.P. [Beta 67934], and 3290 ± 80 B.P. [Beta 55004]) periods. Specialized laboratory analyses included petrographic thin sectioning and trace element analysis of selected lithic specimens using x-ray fluorescence spectroscopy. Lithic materials were variable, consisting mainly of felsites (Hingham Red, Sally Rock, Saugus "jasper," Mattapan, Attleboro Red, Blue Hills, and Lynn Volcanic) and quartz, with lesser amounts of argillite, quartzite, slate (Braintree slate, arkose, slate), chert, chalcedony, jasper, and unidentified materials. The correlation of locally derived lithic materials and Small Stemmed lithic tradition artifacts suggest that the Late Archaic occupants of the site engaged in a central based wandering settlement system that extended from Hanover northward to Boston Harbor. Early and Middle Archaic projectile points and lithic materials indicate that the territorial range of the Early and Middle Archaic occupants of the site extended from the Boston Basin to Northshore Massachusetts. Transitional Archaic period projectile points were manufactured out of several varieties of felsite. The recovery of several felsite varieties is suggestive of a generally mobile settlement system.
