Bibliography of Archaeological Survey & Mitigation Reports: Massachusetts

William Francis Galvin
Secretary of the Commonwealth
Chair, Massachusetts Historical Commission

BIBLIOGRAPHY OF

ARCHAEOLOGICAL SURVEY AND MITIGATION REPORTS:

MASSACHUSETTS

2014 SUPPLEMENT

William Francis Galvin
Secretary of the Commonwealth and Chair
Massachusetts Historical Commission
220 Morrissey Boulevard
Boston, MA 02125
2014

The 2014 supplement of the *Bibliography of Archaeological Survey and Mitigation Reports: Massachusetts* has been financed in part with Federal funds from the National Park Service, U.S. Department of the Interior. However, the contents and opinions do not necessarily reflect the views or policies of the Department of the Interior. This program receives Federal financial assistance for identification and protection of historic properties. Under Title VI of the Civil Rights Act of 1964, Section 504 of the Rehabilitation Act of 1973, and the Age Discrimination Act of 1975, as amended, the U.S. Department of the Interior prohibits discrimination on the basis of race, color, national origin, disability or age in its federally assisted programs. If you believe you have been discriminated against in any program, activity or facility as described above, or if you desire further information please write to: Office of Equal Opportunity, National Park Service, 1849 C Street, N.W., Washington, D.C., 20240.

REGIONAL (STUDY UNIT) INDEX
2014 Supplement

25-1 Anuskiewcz, Richard, and Patrice Teltser

1977 Cultural Resource Reconnaissance for Review of a Permit Application: Hyannis. 5 pages.

This survey dealt with the impact of roadway construction on the banks of Lewis Bay. No significant resources were encountered, and it was established that extensive stratigraphic disturbances in the area precluded any undisturbed cultural material being present.

25-2 Mueller, James

1977 Archeological Impact and Mitigation Procedures for the Routes 25 and 28 Environmental Impact Statement. 73 pages.

This survey employed a stratified random sample to supplement background data in assessing the sensitivity of the area. Several sites were located, as well as other high potential areas, and Phase II investigation was recommended.

25-3 Mulholland, Mitchell, and Steven Ross

1977 Phase I/Reconnaissance Cultural Impact Study: Proposed WPC Projects; Lee, MA. 122 pages.

Based on ecological/locational analysis and an overview of regional prehistoric site representation, it was recommended that the area was sensitive, and that Phase II investigation should be conducted.

25-4 Pretola, John

1975 Washington Mountain Brook Watershed Archeological Survey Report. 131 pages.

Potential for prehistoric resources appeared to be minimal, but historical resources were abundant, and it was recommended that two mid l9th century house/barn cellar hole loci be subjected to Phase III investigation.

25-5 Casjens, Laurel; Steven Ross, and Joseph Zorzin

1977 A Sensitivity Model for Cultural Resources in the Corridor for a Natural Gas Pipeline to be Constructed Through a Portion of Massachusetts. 155 pages.

This extensive Phase I dealt primarily with above-ground investigation, but did discuss paleo-environmental factors and regional prehistory. Most of the route was considered to be highly sensitive, and Phase II recommendations were specified in the report.

25-6 Parrish, James

1977 A Phase I Archeological Survey of the Proposed Williamstown, MA. – Housing for the Elderly Project. 16 pages.

Historical and locational criteria demonstrated minimal potential for cultural resource presence, and the report, therefore, recommends a “no effect” evaluation of impact.

25-7 Thomson, Charlotte

1977 Phase II Cultural Resource Survey: Lee, MA. 33 pages.

A heavy emphasis on soil sample/phosphate test indications served as the primary determinant in

recommending a “no effect” evaluation of impact. A high degree of disturbance in some of the areas allowed them to be written off as well.

25-8 Mulholland, Mitchell

1977 Phase I/Reconnaissance Cultural Impact Study: Proposed WPC Project; Weymouth, MA. 83 pages.

Using historical references and prehistoric locational criteria as assessment tools, 12 sensitive areas were identified in the survey. These areas included a sawmill, gristmill, “freight house” and other historical features as well as 7 prehistorically sensitive areas. Phase II investigation was recommended for all sensitive areas.

25-9 Lauro, James

1976 Archeological/Historical Impact Statement: Dartmouth Sewer Project. 23 pages.

Minimal background information but intensive subsurface testing established that the pipeline route was culturally sterile. A recommendation of “no effect” was submitted.

25-10 Lauro, James

1976 Archeological/Historical Impact Statement: Fairhaven Sewer Project. 13 pages.

Minimal background information, but intensive subsurface testing established that the area was not archeologically sensitive. A “no effect” evaluation of impact was submitted.

25-11 Loparto, Leonard, and Stephen Mrozowski

1976 Archeological Survey for Fall River Community Development Agency: Waterfront Park Development. 21 pages.

Surface and subsurface testing corroborated historic records showing little or no activity in the area. Despite high potential for prehistoric resources, the subsurface testing did not encounter these resources either. A “no effect” evaluation of impact was submitted.

25-12 Stachiw, Myron, Geoffrey Moran, and Peter Thorbahn

1977 Archeological Evaluation of the School Street Site: Mansfield, Bristol County, MA. 56 pages.

This Phase II investigation of an early 18th century domestic unit recommended partial salvage of the site; nomination to the National Register, and avoidance by the construction project. Final form of the mitigation was referred to the SHPO and IAS. The site represents one of the few undisturbed inland 18th century foundations to be encountered in Massachusetts.

25-13 Robinson, Jeannie

1977 Investigation of Archeological Resources in the Impact Area of New Bedford’s Local Public Works Project No. 01-51-20476. 5 pages.

Land records and historical maps indicated no occupation or industrial activity in the area. Surficial characteristics do not indicate potential for prehistoric occupation. It was recommended that the possibility of impacting archeological resources was minimal, and that the project should proceed as planned.

25-14 Thomson, Charlotte

1977 Phase I Archeological Survey: North Attleborough, MA. 18 pages.

Historical documentation demonstrated no significant activity in the area. Although prehistoric sites were reported in the general area, extensive disturbances in the pipeline route precluded the existence of undisturbed aboriginal resources. It was recommended that the project proceed as planned.

25-15 Parrish, James

1977 Archeological Survey of the Richards Estate. 8 pages.

Historical documentation and local informants established the nature of outbuildings to be impacted by a housing project on the Richards Estate. Project plans were to avoid these features. Prehistoric resource potential was not discussed.

25-16 Ritchie, Duncan

1976 An Archeological Survey of the Norton Elementary School Site. 22 pages.

Well-known collecting ground for both prehistoric and historic artifacts, this area was scheduled for the construction of a public school. Highly sensitive areas for archeological resources were identified. Impact mitigation took the form of avoidance.

25-17 Lauro, James

1975 Roadway Project: Taunton, MA. 21 pages.

Historical literature and a regional overview of prehistory did not reveal any specific or potential site locations. Selective subsurface testing revealed extensive disturbance, and culturally sterile horizons in the undisturbed zones.

25-18 Lauro, James

1976 Archeological/Historical Impact Statement: New Sewerage Facilities; Town of Somerset, MA. 53 pages.

Potential in much of the project area was deemed to be negligible due to disturbed, submerged or otherwise inaccessible areas. Walkover and subsurface testing revealed only a scattering of historic material and lithic debris. It was deemed to be insignificant material, and it was recommended that the project proceed.

25-19 Clough, R.E.

1975 Archeological Survey of I-495 ROW and Relocated Route 140. 15 pages.

Five significant archeological site areas—one historic mill and 4 prehistoric sites—were located in surface and subsurface testing. It was recommended that the impact be subject to some—unspecified—mitigation alternative to preserve the sites' integrity.

25-20 Robinson, Jeannie

1977 Investigation of Archeological Resources in the Impact Area of New Bedford's Local Pub-

lic Works Project No. 01-51-29031. 10 pages.

Locational analysis indicated high prehistoric site potential for the area, but surface and subsurface testing revealed an equally high degree of disturbance. Recommendations were to allow the project to proceed.

25-21 Talmage, Valerie

1977 South Essex Sewer District Phase I Archeological Survey. 37 pages.

Walkover reconnaissance, limited subsurface testing and general locational criteria reflected a minimal potential for archeological resources. It was recommended that the project proceed as planned.

25-22 Bawden, Garth

1977 Cultural Resource Survey Report—Cape Ann Well Development: Gloucester, MA. 20 pages.

Historical background and an overview of regional prehistory preceded subsurface testing. A mid-l9th century house foundation was encountered and is to be avoided.

25-23 Casjens, Laurel

1977 Phase II/Intensive Survey Cultural Impact Study: Dykes Meadow Reservoir and Related Construction Projects; Gloucester, MA.

Historical documentation, surface reconnaissance and subsurface testing did not reveal any cultural material other than the 19th century dam which is to be demolished and replaced. It was recommended that an historical or industrial archeologist be present to record the structural features of the dam as it is dismantled.

25-24 Casjens, Laurel

1977 Site Development Project at Railcut Hill: Gloucester, MA. 3 pages.

This was a quick survey to determine the possibility of a Paleo-Indian site as reported in the Massachusetts Archeological Society's site records, as the area was about to be impacted by construction. No evidence for occupation of any period was recovered.

25-25 Bawden, Garth

1977 Phase I/Reconnaissance Cultural Impact Study: Cemetery Brook--East Sewer Line Extension; Groveland, MA. 35 pages.

High potential for prehistoric sites—primarily due to the route's close proximity to the Merrimack River—was supplemented by surface and subsurface testing. It was recommended that approximately two-thirds of the project area be subject to Phase II investigation.

25-26 Talmage, Valerie

1977 Phase I/Reconnaissance Cultural Impact Study: Argilla Brook Sewer Line Extension; Groveland, MA. 38 pages.

Surface and subsurface testing, as well as phosphate sample analysis revealed, surprisingly, no cultural material, despite the project area's close proximity to the Merrimack River. It was rec-

ommended that the project proceed as planned.

25-27 Talmage, Valerie

1977 Phase I/Reconnaissance Cultural Impact Study: Kernwood Park; Salem, MA. 49 pages.

Partially disturbed prehistoric components were present in the project area. Culturally diagnostic artifacts ranged from Late Woodland to Historic Periods. It was recommended that, due to the light density of artifacts, and the general disturbance, an archeologist monitor construction, but that Phase II intensive investigation was not warranted.

25-28 Homer, George, and Charles Cittadino

1977 Phase I/Reconnaissance Cultural Impact Study: Salem Sewer Interceptor Project; Salem, MA. 19 pages.

Historical documentation and maps indicated no colonial activity in the area, but regional distribution of known prehistoric sites and locational evaluation of the area led to the conclusion that Phase II investigation was warranted.

25-29 Homer, George, and Charles Cittadino

1977 Phase II/Cultural Impact Study: Salem Sewer Interceptor Project; Salem, MA. 29 pages.

A zonally stratified subsurface testing operation revealed no culturally significant material. It was recommended that the project proceed as planned.

25-30 Rutsch, Edward, and Kim Peters

1977 Archeological Testing in Various Cellar Units of Parcels 6A & 6B; Market Square Historic District, Newburyport, MA. 29 pages.

This survey was conducted with the expressed purpose of determining the archeological significance of materials and/or features contained in the cellars of two 19th century commercial brick buildings. Significant material was recovered, and formed the basis of an N.R. nomination. The planned building renovation project essentially supplied its own impact mitigation by planning to seal the deposits over with a poured cement floor, thus protecting the area.

25-31 Mueller, James

1977 A Phase I Archeological Survey of the Methuen Wastewater Facilities. 9 pages.

Eight known and four previously unknown sites were identified through documentary sources, local interviews with collectors, and a walk-over reconnaissance. It was recommended that these sites be subject to intensive Phase II investigation, and that the rest of the pipeline be monitored during construction.

25-32 Luedtke, Barbara

1977 Archeological Investigation for Centennial Industrial Park, Peabody, MA. 28 pages.

Background research indicated low potential for historical resources, but, based on locational criteria, high potential for prehistoric resources. Subsurface testing recovered lithic scatter in one area. It was recommended that this sensitive area either be buried or avoided to mitigate the impact.

25-33 Mrozowski, Stephen

1977 Cultural Resource Reconnaissance in Erving, MA. 14 pages.

Historical documentation and subsurface testing revealed a post-1890 foundation, reputed to be a community center for the Village of Farley. Mitigation of impact was to be accomplished by burying the site.

25-34 Thomas, Peter

1977 A Phase I Assessment of Cultural Resources for a Proposed Wastewater Treatment System in the Riverside District (Gill). 81 pages.

This pipeline route cuts through the National Register Riverside Archeological District in Gill. As it is presumed that all periods of post-glacial human occupation in New England are represented within the District, it was strongly recommended that Phase II intensive investigation be required before any construction is undertaken.

25-35 Thomas, Peter

1975 Archeological and Historical Impact Statement (Part II): Archeological Field Investigation 1975; . . .Montague Nuclear Power Station. 50 pages.

Historical sources, surface and subsurface reconnaissance, and local informants, all reflected the paucity of historical resources, and moderately low potential for prehistoric material. The only known collecting area was on Wills Hill. This area was tested and subsequently excavated, revealing a transient, late-summer, Middle Woodland hunting-gathering camp. A good discussion of functional/spatial distribution of the artifacts is included.

25-36 Thomas, Peter

1974 Archeological and Historical Impact Statement; …Montague Nuclear Power Station (Part I). 148 pages.

This is the Phase I to #25-35 and as such recommends the intensive Phase II investigation reported in the above entry.

25-37 Thomas, Peter

1977 An Assessment of Cultural Resources for a Portion of the North-field Wastewater Treatment System: East Street to Mill Street. 26 pages.

Poor drainage, adverse locational factors, the disturbed nature of the area, and nonsignificant phosphate readings led to the conclusion that the area did not warrant further testing.

25-38 Weeks, Janice

1971 Archeological Survey: Route 2, MA; French King Bridge to west of Adams Street. 12 pages.

Locational analysis, previous excavation records, and interviews with residents and regional archeologists established that the area had been recurrently occupied for at least the last 7000 years. It was therefore recommended that intensive Phase II investigation be required.

25-39 Dincauze, Dena; Peter Thomas, John Wilson, and Mitchell Mulholland

1976 Cultural Resource Survey and Impact Evaluation...: Route 2 Extension: Corridor in Gill, Greenfield, Erving, Wendell and Orange, MA. 157 pages.

An extensive Phase II survey which includes a variety of ecological/locational discussions and extensive prehistoric and historic overviews. Numerous sites and districts were identified and evaluation of eligibility for the National Register was suggested for many. Mitigation alternatives for the adverse impact to the many sensitive areas were to be made pending final determination and designation of the project route.

25-40 Dincauze, Dena; James Moore, Dolores Root, Michael Roberts, and Laurel Casjens

1977 An Archeological Properties Study of the Pauchaug Meadow Boat Landing; Northfield, MA. 36 pages.

Ethnohistoric data and local collections reflected local aboriginal occupation for the last 8000 years. Surface and subsurface testing recovered only a scatter of historic debris and deep alluvial deposits. It was recommended that the project proceed under the stipulation that the impact did not exceed the proposed depth (i.e., tested depth) as prehistoric potential within and below the alluvium was high.

25-41 Thomas, Peter

1977 A Phase II Assessment of Cultural Resources for a Proposed Wastewater System in the Riverside District of Gill, MA. 74 pages.

Although already established as a highly sensitive area, a realignment of the pipeline project avoided significant undisturbed resources. This realignment was partially due to the earlier reports on the area which clearly established the adverse nature of the project's impact.

25-42 Gero, Joan

1977 Report on the Phase II Cultural Resource Survey of the Krupczak Garden Site; Threemile Brook Project Area, Agawam, MA. 73 pages.

This Phase II employed a random sample on a small, sensitive area in order to determine the significance of archeological resources known to exist in the area. Despite recovery of limited historic and prehistoric material, it was not possible to established long term occupancy or sequence due to extensive disturbances. It was recommended that the project proceed.

25-43 Drinkwater, Robert

1976 Cultural Resource Survey Report: North Street Deep Gutter (A-161-10) and Threemile Brook (A-162-10) Sanitary Sewer Projects. 61 pages.

Two Phase I surveys employing literature, surface reconnaissance and limited subsurface testing. The only area of sensitivity was recommended for Phase II: see #25-42.

25-44 Ulrich, Thomas

1977 Phase I/II Cultural Resource Impact Study of the Barnett Road Recreation Area. 41 pages.

This survey of a leveling and filling operation encountered only the remains of a late 19th century barn foundation. This was deemed to be non-unique and insignificant, and the project was allowed to proceed.

25-45 Ulrich, Thomas

1977 Phase III Salvage Work at Indian Crossing Site, Interstate I-391: Chicopee and Holyoke, MA. 25 pages.

Deals with the Indian Crossing Site. Evidence for the later stages of the Woodland Period were recovered in abundance at this undisturbed site. Important opportunity to study the transitional period of horticultural subsistence, and the nature of these changes in New England. Phase III (total) possible.

25-46 Ulrich, Thomas

1977 Prehistoric Archeological Surveys (Phase II) of Portions of the I-391 Corridor including Willimansett Bluffs. 25 pages.

Deals with the Willimansett Bluffs portion of the survey. Believed to be archeologically sensitive, the area was subjected to a series of transect/ subsurface tests. No evidence for occupation by any population was recovered.

25-47 Loparto, Leonard

1976 Phase I Archeological Survey: Smiths Ferry WPC Project; Holyoke, MA. 35 pages.

Good historical background material indicated low colonial resource potential, but somewhat higher potential for prehistoric resources due to locational and ethnohistoric factors, and evidence in local collections. Despite this potential, no significant resources were located at the Phase I level of intensity. It was recommended that paleontological study be done in one area before construction began.

25-48 Barber, Russell

1976 Report on a Cultural Resource Survey of the Area to be Disturbed by Higher Brook Interceptor and Street Sewer Project. 15 pages.

All historical resources were found to be outside the project area. Approximately one third of the area was determined to have high potential for prehistoric resources, and it was recommended that Phase II investigation be undertaken in these areas.

25-49 Mahlstedt, Thomas

1977 Archaeological Survey of the Proposed Sewage System and Appurtenant Works: Town of Monson, MA. 12 pages.

Moderate potential for both historic and prehistoric resources stimulated two walk-over reconnaissance surveys and selective subsurface testing. No evidence for occupation or activity from any period was encountered.

25-50 Ritchie, Duncan, and Geoffrey Moran

1977 Phase I Archeological Survey: Town of Palmer, MA; Water Pollution Control Project. 76 pages.

Transient aboriginal activity in the area was reflected in ethnohistoric reference, local collections and known Indian “paths”. Locational criteria determined the subsurface sample which followed a walkover and coring sample. Eleven areas were determined to be highly sensitive for prehistoric resources, and are to be subjected to Phase II investigation.

25-51 Thomson, Charlotte

1977 Cultural Resource Survey: Wilbraham, MA. 11 pages.

A combination of disturbed areas, wetlands, hardpan and historic and ethnohistoric sources indicating no activity in the area, resulted in a no effect" evaluation.

25-52 Paynter, Robert, and Peter Thorbahn

1975 Prehistoric Archeological Survey of the 1-391 Project Corridor. 24 pages.

This Phase I used locational/settlement pattern criteria, related land-use and site organization factors, and limited subsurface testing in recommending the Phase II investigation presented in #25-45 and 46.

25-53 Carter, Wilbert, and Russell Barber

1976 Archeological and Historical Survey for Route 10 Location Study (Southwick-Westfield-Southampton, MA). 34 pages.

Historical documentation, previous records, a walk-over and limited subsurface testing encountered one possible prehistoric and one historic site of significance. Final mitigation alternative pending definitive route designation by the construction firm.

25-54 Thomas, Peter

1976 Archeological and Historic Impact Statement: West Branch of the Westfield River Watershed. 81 pages.

Despite locational evaluation indicating high potential for prehistoric, small hunter-gatherer sites, none were encountered. Historical resources were abundant however, and 11 sites were identified. A variety of recommendations were made for mitigation of the adverse impact to these sites.

25-55 Thorbahn, Peter; Robert Paynter, and Thomas Ulrich

1975 Archeological and Historical Impact Statement; West Branch of the Westfield River Watershed. 89 pages.

This report complements #25-54. Similar locational, distributional and site potential conclusions were reached. No prehistoric material was recovered, but several historic sites were encountered. Only two of these sites were considered to be undisturbed and significant. Phase II investigation and determination of eligibility to the National Register were recommended.

25-56 Salwen, Bert

1966 Report on the Archeological Survey of Six Water Control Areas in Connecticut and Massachusetts.

No sites or features were encountered in the Massachusetts portions of this survey, which included extensive background material and on-site inspection.

25-57 Jordan, Douglas

1965 An Archeological Reconnaissance of Seven Flood Control Reservoir Areas in New Hamp-

shire, Massachusetts and Connecticut. 24 pages.

The areas within Massachusetts were subjected to an onsite inspection and subjective subsurface sample following background research. No archeological resources were encountered in any of the project areas.

25-58 Salwen, Bert

1969 The Archeological Resources of the Connecticut River Basin: Preliminary Survey. 46 pages.

Extensive literature research and known site distribution analysis resulted in an itemization of known sites by tributary drainage for the whole of the Connecticut River Valley. Over 600 sites are reported.

25-59 Barber, Russell

1977 Final Report/Phase I/Reconnaissance: Westfield Local Protection Project. 51 pages.

One historic and nine prehistoric site areas were confirmed as undisturbed and uninvestigated resources subject to adverse impact from the project. Phase II investigations of varying intensity were recommended for these sites.

25-60 Anuskiewicz, Richard, and Patrice Teltser

1977 Cultural Resource Reconnaissance for the Construction of Recreation Facilities at Indian Hollow Campgrounds: Huntington, MA. 15 pages.

A paucity of local historical and archeological literary sources created a need for on-site surface and subsurface inspection of the project area. This approach produced no evidence for occupation from any period, and it was recommended that the project proceed with the stipulation that it be monitored by an archeologist at specified points.

25-61 Drinkwater, Robert

1976 Cultural Resource Survey Report: Crafts Avenue—Gas Company "Roundhouse" Project Area; Northampton, MA. 65 pages.

An urban setting for the installation of sewer pipelines, the project area bordered a National Register Historical District, and constituted a unique and well preserved aspect of mid-l9th century technological development. It was recommended that the Gas Company properties be avoided or salvaged before construction activity was undertaken.

25-62 Young, William

1976 Archeological Survey Report: South Hadley Sewage Project; Federal Project #C50-298-01. 5 pages.

Numerous prehistoric and historic sites along the Connecticut River (including the South Hadley Canal) were identified. It was recommended that Phase II investigation be required for many features within the project/ impact area before construction began.

25-63 Loparto, Leonard, and Geoffrey Moran

1977 Archeological Investigation to mitigate impact to the South Hadley Canal, South Hadley,

MA. 91 pages.

Documentary and locational data collection preceded a limited subsurface test pit sample, used to determine the sensitivity of the proposed sewer line route. It was established that the general area was indeed sensitive, but that this particular easement avoided all resources except for the historically significant South Hadley Canal. It was recommended that the canal either be avoided, or subject to Phase III investigation before construction begins.

25-64 Wilson, John

1976 The Upper Factory Brook Sawmill Site: An Industrial Site in Middlefield, MA. 99 pages.

This Phase III investigation of the early 19th century "up-and-down" sawmill was designed as a study of the industrial/mechanical design irregularities present in early technological projects as a result of "folk" engineering and the lack of efficient/sufficient communications to provide explicit design reference.

25-65 Ulrich, Thomas

1977 Phase I/Reconnaissance – Phase II/Intensive Cultural Resource Survey: Three Pumping Stations; North Hadley, MA. 37 pages.

Surface and subsurface testing, warranted by documentary and locational data, encountered only restricted scatters of lithic material in disturbed areas. It was determined to be insignificant and incapable of generating useful data.

25-66 Elliott, Suzanne

1977 Phase I/Reconnaissance Archeological Survey: Town of Williamsburg Sewage Project C250518. 50 pages.

It was determined through documentary sources that both historic and prehistoric potential was high. Field testing encountered four sensitive areas (historic). It was recommended that two of the areas be avoided, and two be subject to Phase II intensive investigation.

25-67 Moir, Randall

1976 Archeological Survey of Job Lane Farm: Bedford, MA. 21 pages.

This survey was designed to assess the remains on the property of National Register Property "Job Lane Farm" in anticipation of installation of a sewage system. "Several thousand" artifacts were recovered. This excavation activity provided sufficient impact mitigation through data recovery and analysis, and the project was allowed to proceed.

25-68 Thomson, Charlotte

1977 Phase I Archeological Survey: Bedford, MA. 17 pages.

Minimal background research, a walk-over, and the predominance of adverse topographical features, led to a recommendation of "no effect" and the project was allowed to proceed.

25-69 Bawden, Garth

1976 Chelmsford Sewer Facility Plan: Phase I. 64 pages.

Documentation and literature indicated high potential for both prehistoric and historic resources.

Walk-over survey identified several obviously disturbed areas. It was recommended that Phase II investigation be pursued for all undisturbed areas to be impacted by the project.

25-70 Bawden, Garth, and Eugene Winter

1977 Phase I/Reconnaissance—Phase II/Intensive Survey: Sewer Line Project; Dracut, MA. 46 pages.

Documentation, local informants and regional site distributions and settlement patterns contributed to the general hypothesis generation in this project. Historical resources were identified and found to be outside the project area. A walk-over inspection and subsurface testing recovered no prehistoric material. It was concluded that the project area was not archeologically sensitive.

25-71 Moeller, Roger

1977 Cultural Resource Reconnaissance of the Saxonville Local Protection Project: Framingham, MA. 21 pages.

Historical and local data, engineers' drawings, and a walk-over inspection reflected moderate potential for cultural resources, but none were recovered or encountered in a selective subsurface sample. It was recommended that the project proceed as planned.

25-72 Winter, Eugene

1976 Report of an Archeological Survey of the Proposed Middle School Site off Hollis Street, Pepperell, MA. 31 pages.

Historical land use of the area was restricted to marginal farming activity. Subsurface testing did not encounter material remains from any cultural period, as predicted in the literature sources, and it was concluded that this was not an archaeologically sensitive area.

25-73 Thomson, Charlotte

1977 Phase I Archeological Survey: Tewksbury. 20 pages.

Extensive consultation of historical sources and regional archeologists and local informants, reflected a high potential for prehistoric resources, but a low probability for historic resources. A walk-over reconnaissance established areas of high disturbance and/or locational potential for sites. One terraced area was recommended to be subject to Phase II investigation/excavation operation.

25-74 Thomson, Charlotte

1977 Phase II Archeological Survey: Tewksbury, MA. 39 pages.

This Phase II was revised to include four areas, rather than the one as recommended in #25-73. Considerable amounts of chippage, flakes and two nondiagnostic projectile points were recovered in one area. It was determined that this site area should either be avoided by the project route, or subject to a Phase III investigation/excavation operation.

25-75 Winter, Eugene

1976 Report of an Archeological Survey of Townsend School Property: Dudley Road Location. 28 pages.

Historical sources and a walk-over survey did not indicate particularly high potential. Nonetheless, 46 subjectively placed test pits were employed, recovering no significant material from any period. The project was allowed to proceed as planned.

25-76 Thomson, Charlotte

1976 Phase I Archeological Survey: Wilmington, MA. 20 pages.

Historical sources and literature, primarily Bullen's (1949) survey of the area, indicated high potential for prehistoric sites. The only historical resources known or encountered consisted of the Middlesex Canal. Disturbed areas and fill precluded the preservation of other resources in the ROW, and it was recommended that the project proceed if the canal is avoided.

25-77 Elia, Ricardo

1977 Report on the Phase I Archeological Survey of the Proposed "Olde Sylvanus Wood Village" in Woburn, MA. 13 pages.

Documentation demonstrated the land use—marginal farming and pasturing—and ownership of the property through the last two centuries. Generally little agricultural importance to the land presently, and presumably through time. This was one of the factors in considering prehistoric potential to be low. Surface and subsurface reconnaissance recovered only limited historic scatter and no prehistoric material at all. It was recommended that the project proceed.

25-78 Sabloff, Jeremy, and Steven Cox

1976 Route 2: Acton, Concord, Lincoln, Lexington, MA. 4 pages.

Minimal historical literature search and a walk-over inspection led to the conclusion that the areas in close proximity to the Sudbury River, Sandy Pond and Smith's Hill should be subject to Phase II investigation.

25-79 Mahlstedt, Thomas

1977 Phase I Archeological Survey of the Proposed Market Street Parking Lot: City of Lowell, MA. 8 pages.

Under normal conditions, prehistoric potential would have been high, but the site area was occupied for the last two centuries by several different manufacturing concerns, and has been disturbed to levels below the depth of planned project impact. The leveling of the existing historic building in 1959 also destroyed the integrity of the industrial/historic aspects of the site. It was recommended that the project proceed as planned.

25-80 Talmage, Valerie

1977 Phase I/Cultural Resource Reconnaissance Study and Phase II/Intensive Survey: Nantucket Teen Center. 61 pages.

Despite high potential, particularly for prehistoric resources, as reflected in the historical documentation and, especially, local collectors/ collections, only 3 clusters (general) of recent/ historic debris were encountered in subsurface testing. This scatter was deemed to be insignificant and it was determined that the project impact would have "no effect" on any resources.

25-81 Elia, Ricardo

1977 Report on the Archeological Survey (Phase I) of the Proposed Lateral Sewers for Mine Brook Interceptor: Franklin, MA. 10 pages.

Historical sources indicated negligible potential for these resources, but locational criteria and the close proximity of known, aboriginal sites in the area led to the recommendation of Phase II investigation in order to determine the nature of prehistoric material.

25-82 Elia, Ricardo

1977 Report on the Phase II Archeological Survey of the Proposed Lateral Sewers: the Mine Brook Interceptor: Franklin, MA. 12 pages.

This Phase II—as recommended in #25-81—consisted of a systematic subsurface sample. No archeologically significant material was recovered and it was recommended that the project proceed as planned.

25-83 Elia, Ricardo

1977 Archeological Assessment of the Proposed Holbrook Sewers—Contract 4. 12 pages.

Historic potential was considered to be low. Prehistoric potential, however, was considered to be moderately high. A subsequent surface reconnaissance and subsurface sample did not recover any archeologically significant material, and it was recommended that the project proceed.

25-84 (Void)

25-85 Elia, Ricardo, and Thomas Mahlstedt

1977 Report on the Archeological Survey of the CRPCD Water Pollution Abatement Facilities and Pipeline: Medway/Franklin. 16 pages.

Prehistoric potential appeared to be minimal, but an historic district--"Factory Village"—was within the project area. It was recommended that the construction be monitored by an archeologist in order that this material could be salvaged and/or recorded if encountered. The survey's subsurface sample did not encounter any significant material.

25-86 Elia, Ricardo

1977 Report on the Phase I Archeological Survey of the Proposed Sewage Works Improvements, Plainville, MA. 14 pages.

Historical documentation indicated minimal potential for these resources, and reported or known sites within the project area were negligible. Phase II investigation, oriented toward prehistoric data recovery, was recommended on the basis of general locational criteria and the assumption that the paucity of known sites was due primarily to regional sample bias.

25-87 Luedtke, Barbara

1977 Report on a Survey for Cultural Resources along a Proposed MDC Water Pipeline: Blue Hills Reservation. 20 pages.

Background research and analysis indicated that this area would have been suitable for hunting, fishing and gathering through time. No sites were reported in the project area, but several were in close proximity to it. Walk-over reconnaissance and a limited subsurface sample—subjectively placed pits—encountered eight sensitive areas, all but one of which were either disturbed or insig-

nificant. It was recommended that the project avoid the one, Late Archaic site retaining its integrity, in order to satisfy mitigation needs.

25-88 Barber, Russell, and Patricia Essenpreis

1976 Report of a Cultural Resource Survey of the Furnace Brook Flood Control Project: Quincy/ Milton, MA. 24 pages.

Despite high potential for historic and prehistoric resources, based on documentation and locational factors, surface reconnaissance and selective subsurface testing did not recover any archeologically significant material. This was partially due to the large amount of fill and disturbance down to the level of project impact. It was recommended that an archeologist monitor ca. ¼ of the project route during construction.

25-89 Claassen, Cheryl

1976 Archeological Assessment of the Project Area for the Randolph Sewer line. 6 pages.

Local documentation and informants indicated minimal potential for either prehistoric or historic resources. A walkover and auger sample encountered only an historic demarcation stone wall. It was recommended that the wall be photographed, mapped and recorded before construction began.

25-90 Thomson, Charlotte

1977 Cultural Resource Survey: Westwood, MA. 15 pages.

Background research indicated minimal potential for any cultural resources, and in conjunction with a walk-over reconnaissance, indicating extensive disturbance, led to a recommendation of "no effect" for project impact.

25-91 Zeitlin, Robert, and Judith Zeitlin

1977 Archeological Resource Survey in Connection with DWPC Project No. C250418, Stoughton, MA. 17 pages.

Documentation, locational analysis and the close proximity of known sites led to systematic subsurface sample based on a high prehistoric potential evaluation. Two modern dumping areas and a 19th century granite quarry were encountered. It was recommended that if the quarry was avoided, the project could proceed as planned.

25-92 Barber, Russell, and Patricia Essenpreis

1976 Report of a Cultural Resource Survey of the Town Brook Flood Control Area. 37 pages.

Based on historical sources and locational criteria, 12 areas were subjected to surface reconnaissance and selective subsurface testing. Three areas were determined to require further, Phase II investigation; 3 were to be monitored during construction, and one—the Quincy Canal and Tide mill structural remains—is to be avoided.

25-93 Dincauze, Dena

1968 A Preliminary Report on the Charles River Archeological Survey. 121 pages.

This survey represents one of the few regional overviews available in the state, and probably the only valid one for the Charles River Watershed. It incorporates most of the recognized sources and

authors consulted by the archeological community interested in Eastern Massachusetts. Conclusions show a generally greater potential for historic resources in the area, but reflect moderate potential for all cultural periods.

25-94 Dincauze, Dena, and Judith Meyer

1977 Prehistoric Resources of East-Central New England: A Preliminary Study. Cultural Resource Management Studies. Interagency Archeological Services, Office of Archeology and Historic Preservation, Washington, D.C. 55 pages.

This report was designed to gauge the resource base in terms of existing data, and in regard to the present, and expanding, urban nature of much of the area. Most of the material is the end result of tremendous sample/collection bias, as acknowledged by the authors, but is nonetheless interesting and reflective of the state of the art in Massachusetts. Discussions revolve around the need for enforcement of existing regulations, and the need to organize and centralize within the archeological community as soon as possible.

25-95 Ritchie, Duncan

1977 Cultural Resource Survey: Town of Medfield, MA. 49 pages.

Local literature and informants, and the study of local collections preceded the initial walk-over, which noted and evaluated locational factors. A second walk-over and subjective subsurface sample encountered four prehistoric sites. It was recommended that these sites be subjected to Phase II investigation before construction began.

25-96 Bawden, Garth

1977 Phase I/Reconnaissance and Phase II/Intensive Cultural Resource Survey of a Proposed WPC Project: Medfield, MA. 47 pages.

This Phase II – as recommended in #25-95 – dealt with some realigned areas as well. Background data on the newly designated areas. Subsurface testing encountered only a limited scatter of late 19th century debris, and it was recommended that the project proceed as planned.

25-97 Ross, Steven

1977 Phase I/Reconnaissance Cultural Resource Survey: WPC Project: Weymouth, MA. 77 pages.

Background literature, locational criteria and a walk-over identification of disturbed areas delimited areas of potential sensitivity. Ca. 11,000 feet of the pipeline was considered to be sensitive, and it was recommended that these areas be subject to Phase II intensive investigation.

25-98 Casjens, Laurel

1977 Phase I Cultural Resource Reconnaissance & Phase IIa Intensive Fieldwork Survey: Chicken Brook Interceptor; Medway, MA. 47 pages.

Background research and on-site inspection preceded a systematic subsurface testing sample. 19th century scatter was encountered but deemed to be insignificant. It was recommended that the project proceed when an area to which the author was denied access, had been surveyed.

25-99 Bawden, Garth

1977 Phase II/Intensive Survey Cultural Impact Study: Bridgewater State College: Building Extension. 41 pages.

Historical resource potential was minimal, but known site distribution, proximity and locational criteria indicated moderately high potential for prehistoric resources. Subsurface testing recovered only an isolated “discard” item—a broken projectile point—and was not deemed to be a representation of further significant deposits. It was recommended that the project proceed.

25-100 Homer, George

1977 Archeological Site Report: Fort Independence: Hull, MA. 48 pages.

This survey was designed to locate and assess the out-buildings, and particularly, a revolutionary period burial area, in association with Fort Independence. The report indicates that no sensitive areas were encountered in the surface and/or subsurface testing, and no discussion of aboriginal occupation potential is included despite an apparent high probability for it.

25-101 Casjens, Laurel

1976 Archeology of Peddock’s Island: Hull, MA. 25 pages.

Evaluation of the island’s archeological sensitivity was undertaken in anticipation of general commercial/residential development, and because of the known presence of at least two aboriginal sites. Surface reconnaissance and limited subsurface testing encountered two additional sites and a semi-articulated burial. It was recommended that these features be recorded and their locations made available to the appropriate engineers so that they may avoid the areas.

25-102 Bawden, Garth

1977 Phase I/Cultural Resource Impact Study: Wastewater Treatment Facilities: Marshfield, MA. 41 pages.

Historical sources indicated minimal potential for resources as the area was primarily employed as marginal grazing area; but the prehistoric potential was deemed to be high based on the variety of exploitable ecozones: marsh, estuarine and riverine zones. Surface survey and a subsurface sample established that only one area was sensitive through the depth of planned impact, and it was recommended that this area be subject to a Phase II investigation.

25-103 Plimoth Plantation/Brown University

1974 Regional Historic and National Landmarks. From the Boston Edison Environmental Impact Statement for “Pilgrim Station”. 9 pages.

This area was predetermined to be sensitive due to its relative proximity to both the ocean and the historic Plimoth Plantation area. Surface survey and a subjective subsurface sample encountered 25 “sites” of which 24 were 20th century cellar holes or dumping areas. The only aboriginal (Woodland) site was tested by the Massachusetts Archeology Society’s local chapter and was deemed to be archeologically insignificant.

25-104 Ross, Steven

1977 Phase I/Reconnaissance Cultural Sensitivity Study of a Proposed Water Pollution Control Project for the Town of Mattapoisett, MA. 66 pages.

Historic, ethnohistoric, and known site distribution data searches preceded a surface survey, locational evaluation and limited subsurface testing. Six site-sensitive areas were located, and it was

recommended that they be subject to Phase II investigation.

25-105 Thomson, Charlotte

1977 Cultural Resource Survey: Hull, MA. 10 pages.

Despite local historical and prehistoric resource potential, a walkover with the project engineer established that the project area consisted of either fill, wetland, disturbed soil, bedrock outcrops or otherwise locationally inappropriate terrain. It was recommended that the project proceed as planned.

25-106 Luedtke, Barbara

1976 Report of an Archeological Survey of Sales & Green Creek Area: Revere, MA. 7 pages.

Based on a limited amount of background material and a walk-over inspection, it was determined that the project area had negligible potential for cultural resources of any period due to the predominance of wetlands. It was recommended that the project proceed as planned with the stipulation that project impact not exceed 30 feet in depth.

25-107 Luedtke, Barbara

1975 Final Report on the Archeological and Paleobotanical Resources on Twelve Islands in Boston Harbor. 136 pages.

This survey covered twelve of the Boston Harbor islands in anticipation of a general park/recreation development orientation by the MDC. Each island was subject to historical, surface and subsurface investigation. 16 sites deemed to be significant were encountered, but only 2 were determined to be in immediate danger. It was recommended that these two sites—one Archaic, one Woodland—be salvaged (Phase III) due to the imminence of erosional destruction. Good discussions of related paleoethnography, – - botany and exploitation alternatives are appendicized.

25-108 Ritchie, Duncan, and Geoffrey Moran

1976 Archeological Investigations at Fort Independence—Phase I. 120 pages.

This survey was conducted in anticipation of an MDC program to renovate and restore components of the Fort Independence complex. Recommendations include avoidance and stabilization (vs. “restoration”) of significant architectural features.

25-109 Dincauze, Dena

1973 Archeological Reconnaissance in the Greater Boston Area: 1969-1972. 70 pages.

This survey was designed to assess the research potential of the Greater Boston area, and determine which potential research questions could, or need to be answered. It was not intended to be comprehensive, but a “highlighting” of available resources. The most clearly defined resource presence was the l7th-l8th century potential along the Boston Harbor shore and islands. It concludes with a discussion of the possible geographic and theoretical directions research in the area could/ should take in the future.

25-110 Fahey, James

1977 Archeological~ Investigation of Fort Warren, George’s Island: Boston Harbor. 51 pages.

Conducted in anticipation and support of an MDC Park and recreation project, this was also an opportunity for the author to demonstrate the utility of metal detection devices in historical archeology. Considerable amounts of historic material were recovered, and recommendations regarding the mitigation of potential impact, and preservation of significant archeological/architectural features were presented.

25-111 Williams, Stephen, and Patricia Essenpreis

1976 A Cultural Impact Study of the Cottage Street Site, Athol, MA. 199 pages.

Historic documentation and prehistoric locational criteria established that historic resources were more likely to be recovered. Surface and subsurface inspection encountered only late 19th and 20th century artifacts, and it was therefore recommended that the project proceed as planned.

25-112 Davis, Dave

1976 Archeological Survey of the Dark Brook Valley: Auburn, MA. 8 pages.

A stratification into zones of "desirability" for habitation through time preceded the subsurface sample. Differentially intensive testing did not recover any culturally significant material. It was concluded that there would be no adverse impact if the project proceeded as planned.

25-113 Lauro, James

1976 Archeological Survey of the Proposed Sewer System: Auburn, MA. 10 pages.

This report is a short supplement to report #25-112 and consisted of a systematic subsurface survey within realigned segments of the sewer route. No cultural material was recovered and it was recommended that the project proceed as planned.

25-114 Rose, Richard

1977 Archeological Survey Report of the Municipal Garage Site in the Town of Barre. 8 pages.

This small site for the proposed municipal garage appeared to have high potential for historical resources, but a surface survey and subsurface sample produced no cultural material. It was recommended that the project proceed as planned.

25-115 Mahlstedt, Thomas

1977 Archeological Survey of the Proposed Sewer System: Black-stone, MA. Phase I/Reconnaissance. 17 pages.

A good historical/industrial account and topographical/ecological discussions are presented, predicting minimal, if any, resource recovery potential. A surface reconnaissance supported this prediction, and the project was allowed to proceed as planned.

25-116 Rose, Richard

1976 Archeological Survey Report of the Sewage Treatment Works Site in the Town of Hardwick, MA. 10 pages.

Potential for both prehistoric and historic resources was assessed as being high due to the area's proximity to 19th century structures, and a large prehistoric occupation site on the opposite river bank. A systematic subsurface sample did not recover any culturally significant material, however,

and it was recommended that the project proceed.

25-117 Mahlstedt, Thomas

1976 Report on the Archeological Survey of the Proposed Jefferson Sewer Project: Holden, MA. 5 pages.

Potential for prehistoric and historic resources was high, as indicated by the historical record, state site files and relevant historical maps. Proximity to recorded historical sites proved not to be a valid indicator, however, as subsurface testing did not recover any culturally significant material. It was recommended that the project proceed.

25-118 Mahlstedt, Thomas

1976 Report on the Archeological Survey of the Initial Lancaster Sewer Project: Lancaster Sewer District, Lancaster, MA. 6 pages.

Documentation indicated low potential for historic resources, but proximity to the Nashua River indicated high potential for prehistoric resources. Surface reconnaissance and subsurface testing did not recover any culturally significant material, and it was therefore recommended that the project proceed as planned.

25-119 Wilson, John

1976 Archeological Survey Report—Shaw Site: Upper Quabog River Watershed: Spencer and Leicester, MA. 34 pages.

Prehistoric potential was determined to be minimal; this was confirmed by the subsurface test sample. Historic potential was considered to be high, however, and several significant features were identified. Only 2 of these were to be directly affected by the project impact. It was recommended that one domestic unit should be subject to a Phase III investigation and that the second, a grist mill and run, either be salvaged, or avoided by the project by redesigning the dam specifications as formal impact mitigation.

25-120 Bawden, Garth

1976 Phase I/Reconnaissance Cultural Impact Study: Monoosoc Brook and Lake Flood Protection Project: Leominster, MA. 45 pages.

It was established that European/colonial development took place outside the project area. State files did not indicate any known aboriginal sites in the area either, but local collectors and residents supplied information indicating that the state records were demonstrating the sample bias inherent in the methodology of collection of data in Massachusetts. A walk-over survey and auger sample did not reveal any cultural material, but favorable locational characteristics of two of the areas led to the recommendation that they be tested further at the Phase II level.

25-121 Mahlstedt, Thomas

1977 Archeological Survey of the Proposed Center Clean-up: Mill-bury, MA. 18 pages.

This Phase I was conducted in an area with at least eight known sites in relatively close proximity. Surface reconnaissance and limited subsurface testing encountered one sensitive area, and it was recommended that it be subject to a Phase II investigation.

25-122 Thomas, Peter

1974 Archeological and Historical Impact Statement: Meadow Site, Upper Quabog River Watershed; North Brookfield, MA. 29 pages.

Background research and locational/settlement pattern evaluation reflected minimal potential for prehistoric resources. Historical resources were abundant. Several 18th and 19th century house and mill foundations were encountered, and it was concluded that at least two of these were significant examples of engineering and economic development. It was recommended that either the sites be subject to salvage and recording operations, or that the dam specifications be altered to significantly lower the proposed water (artificial) level.

25-123 Thomson, Charlotte

1976 Phase I Archeological Study: Northbridge, MA. 23 pages.

Background information reflected high potential for prehistoric resources in the area. A walk-over inspection demonstrated the generally disturbed or wetland nature of the project area, however, and it was recommended that the project proceed.

25-124 Bawden, Garth

1976 Culture Resource Survey Report: Oxford-Rochedale Sewer District. 18 pages.

No prehistoric sites were known in the area and walk-over, and subsurface sample did not encounter any. Historical sources identified a blacksmith's shop (early 18th century) as a feature located somewhere in the area. Testing located this feature, but no others. It was recommended that the project proceed if the route were realigned to avoid this historical resource.

25-125 Mahlstedt, Thomas

1976 Report on the Archeological Survey of the North Quinsigamond Avenue Interceptor Sewer and Pumping Station: Shrewsbury, MA. 7 pages.

Historical sources indicated that European/colonial development took place outside the project area; but locational analysis allowed for high prehistoric potential. Quarrying operations (recent) had severely disturbed many portions of the route, and it was therefore recommended that the project could proceed if the route were altered so that it passed through the (abandoned) quarrying areas rather than the high potential zones.

25-126 Mahlstedt, Thomas, and Ricardo Elia

1977 Archeological Survey of the Proposed Sewer System, Sutton, MA: Phase I Reconnaissance. 21 pages.

This area was determined to be nonsensitive as the historical/ industrial development of the town was outside the project area, and the topographical/ locational factors indicated negligible amounts of recoverable prehistoric material.

25-127 Davis, Dave

1976 Archeological Survey in Upton, MA. 10 pages.

State site records and an initial walk-over reconnaissance did not indicate any site presence, but the topographical characteristics of the terrain suggested possible aboriginal occupation. On this basis subsurface testing was conducted, but did not recover any culturally significant material. It

was recommended that the project proceed.

25-128 Thomson, Charlotte

1976 Phase I Archeological Survey: Uxbridge, MA. 15 pages.

Background sources indicated that significant prehistoric resources were present in Uxbridge and the neighboring town of Mendon, but none were known in the project area. A surface survey and subsurface test sample failed to reveal any further cultural material other than the Blackstone Canal. It was recommended that the project proceed with the stipulations that caution be taken in the vicinity of the Canal, and in the upland/well-drained areas.

25-129 Davis, Dave

1976 Archeological Survey of the Narrows, Lake Chaubunagungamang: Webster, MA. 8 pages.

Historical background sources place all Colonial activity outside the project area. Despite ethnographic and locational support of prehistoric potential, the area has been filled to a depth greater than that of the project impact. No cultural impact anticipated.

25-130 Hoffman, Curtiss

1976 Worcester Airport Industrial Park Archeological Reconnaissance Survey. 13 pages.

Background sources indicated that this area had been generally undeveloped since the advent of European settlement, and state records could place only one tentative site within the project boundaries. A surface inspection and phosphate samples revealed several allegedly sensitive areas, and it was recommended that Phase II investigation be required: see #25-131.

25-131 Hoffman, Curtiss

1976 Worcester Airport Industrial Park Archeological Intensive Survey. 33 pages.

Subsurface testing failed to verify the cultural significance of any of the areas to be investigated, and it was therefore recommended that the proposed project proceed as planned.

25-132 Mahlstedt, Thomas, and Ricardo Elia

1976 Archeological Survey of the Proposed Sewer System: Hopedale, MA: Phase I/Reconnaissance. 9 pages.

Despite high potential indicated by the background material, the area was found to be culturally nonsensitive due to extensive modern landscaping. The only area to retain its cultural sensitivity was subsequently avoided by the contracting engineers.

25-133 Jordan, Douglas

1959 Archeological Survey of Certain Reservoir Areas to Determine the Location and Probable Character of Sites of Historical or Prehistoric Significance. 78 pages.

Consultation with local collectors and historical sources preceded a walk-over reconnaissance and limited subsurface sample in each of the project areas. All project areas within Massachusetts fell within the ethnographic “Nipmuc” territory. Only 3-5 sites of significance were encountered, and it was recommended that they be subject to further investigation.

25-134 Talmage, Valerie

1977 Phase I Cultural Resource Impact Study: Wastewater Treatment Facilities; Templeton, MA. 56 pages.

Background literature research complemented a walk-over reconnaissance, which noted surface features, and factors for locational analysis. Subsurface testing recovered only some recent/historical material from the Otter River Foundry area. This feature/site area had been previously disturbed and was considered to be insignificant. It was therefore recommended that the project proceed as planned.

25-135 Wilson, John S.

1975 Archeological Survey Report, Constance M. Fiske Site (Phase I), Baiting Brook Watershed, Framingham, MA. 18 pages.

Background literature search, walking of plowed cornfields, and subsurface testing revealed no cultural remains in the flood pool of the Baiting Brook watershed project. Recommended that work proceed without further archeological investigation.

25-136 Thomson, Charlotte W.

1977 Cultural Resource Survey (Phase I), Ashland, MA.

Minimal background research and a walkover of the project area are included in the project report. Supplemental information obtained from two additional trips to the field, including subsurface testing, indicated that the sewer lines would not impact historic resources described in John Wilson's scope of work for the project.

25-137 Mahlstedt, Thomas F., and Michael DeBlasi

1977 Phase I Archeological Survey, Ayer, MA. 59 pages.

Background literature search included both ethnohistoric and historic documents and interviews with local collectors and historians. Random core samples, test pits along linear transects, and a walk-over of the wastewater treatment area and proposed sewer lines revealed no cultural remains. No further work was recommended.

25-138 Thomson, Charlotte W.

1977 Orleans Park and Shellfish Dept. Building, Phase I report. 2 pages.

The building site was determined to be on filled land from discussions with town officials. No further work was recommended.

25-139 Vantangoli, Arthur

1977 Report on the Archeological Survey (Phase I) 65 Acres Industrial Park, Plymouth, MA. 16 pages.

Through background map research, conversations with local collectors, thorough walk-over and subsurface test-pitting and auger sampling, it was determined that no cultural properties would be impacted by the proposed project. No further work was recommended.

25-140 Homer, George R., and Charles L. Cittadino, Jr.

1977 Cultural Impact Study/Phase I, North High School Practice Field and Running Track, Framingham, MA. 39 pages.

Background literature search, limited field testing (later supplemented by additional core sampling and test pits) and a walk-over revealed that the area is wet most of the year and that no cultural debris was found in the project area. No further work was recommended.

25-141 Ulrich, Thomas

1977 Phase I/Reconnaissance Survey of Stony Brook Energy Center, Ludlow, MA. 82 pages.

The land area surveyed for the power generating facility was part of Westover AFB and was mostly disturbed by the Air Force. Background literature search, site walk-over of plant area and accessible parts of the transmission line route, including subsurface testing, located areas which were potentially sensitive and one historic site, a charcoal "tar" kiln. An intensive survey was recommended.

25-142 Talmage, Valerie

1977 Phase I/IIa Cultural Resource Survey for Proposed Sewer Interceptors, Gardner, MA. 70 pages.

Background literature search, thorough walk-over and limited subsurface testing located one historic site, the Bickford-Travers Mill-Dam, near or within the sewer route. No further work was recommended, conditional upon the engineers avoiding the mill-dam site.

25-143 Talmage, Valerie

1977 Phase I/IIa Cultural Resource Impact Statement for a Sewer Project, Shrewsbury, MA. 46 pages.

Background literature search, walk-over and subsurface testing revealed no cultural remains in the project, probably due to extensive wetness in the area both historically and prehistorically. No further work was recommended.

25-144 Talmage, Valerie

1977 Phase I/Cultural Reconnaissance Survey, North Trunk Sewer Extension, Marlborough, MA. 42 pages.

Background literature search, conversations with local collectors, walkover and subsurface testing revealed that no cultural properties were located in the project area. No further work was recommended.

25-145 Talmage, Valerie

1977 Phase I/IIa Archeological Properties Survey for a Wastewater Collection System, Northborough, MA. 67 pages.

Background literature search, interviews with local collectors, walk-over and subsurface testing located one 1800's site, the Davis/Chapin mill with head race in good condition and foundation in association. Recommended a Phase II intensive survey of the mill race and completion of Phase I in area which could not be walked over due to legal disputes over land ownership.

25-146 Mrozowski, Stephen

1977 Preliminary Archeological Survey, Scott Blvd., Bristol County, Norton, MA. 8 pages.

Walk-over and soil core testing was supplemented by irregularly-spaced test pits and one trench. No cultural properties were identified.

25-147 Kenyon, Victoria Bunker

1977 Archeological And Historical Impact Study of Pembroke, MA, Phase I, Pembroke Housing for the Elderly Project. 14 pages.

Thorough background literature search, walk-over, and subsurface testing located no cultural properties in the project area. No further work was recommended.

25-148 Lauro, James

1977 Phase I/II Berkley-Dighton Connector.

[no abstract]

25-149 Brooke, John, *et al.*

Phase I/Reconnaissance Archeological Survey Report of proposed Montague Wastewater Treatment System Expansion. 35 pages.

Thorough background research was supplemented by drive over, walk-over and selected subsurface testing in the vicinity of a proposed addition to the sewage treatment plant and 4.3 miles of sewer interceptors. One cluster of prehistoric material and a 1750's road were located; the latter will not be impacted by construction. A Phase II was recommended for the sewer treatment plant area and interceptors.

25-150 Luedtke, Barbara

1977 Archeological investigation for 121A Revere Beach Development Project (South Lot), Phase I. 15 pages.

Due to previous paving of the project area, thorough literature search of all ethnohistoric, archeological, historic and several geological references revealed high potential for Woodland habitation site and possibly burials in the project area. Phase II was recommended. Proposed that asphalt stripping to be done prior to subsurface testing.

25-151 Bawden, Garth

1978 Location, Identification, and Evaluation of Archeological Properties for the Mass. Avenue Industrial Park, North Adams, MA. 47 pages.

The industrial park area was previously a sewage treatment plant and was extensively disturbed. Background literature search, walk-over, shovel and backhoe testing located one historic sherd and a lens of ash; both were later found to isolated finds. The ash lens was probably a natural occurrence.

25-152 Thomson, Charlotte

1977 Wilmington Water System Improvements, Phase I survey. 2 pages.

Sewer pipe was to be laid in previously disturbed areas or in areas which the archeologist regarded as disturbed due to prior housing construction. The two previously known sites in the vicinity

were evidently not to be impacted by construction according to a field inspection.

25-153 Bawden, Garth

1977 Phase II/Intensive Survey to Identify and Assess the Significance of archeological properties of a proposed sewer line easement, Mattapoisett, MA. 41 pages.

Intensive subsurface testing revealed that the Goodspeed Island site to be impacted consisted of a plowed and mixed prehistoric hunting camp. Lithic scatter (e.g., debitage) occurred but no diagnostic artifacts present. A railroad bridge in the easement was thought by the archeologist to be architecturally significant but would not be significantly impacted by the construction of a culvert. No further work was recommended since the prehistoric site was essentially excavated by the testing.

25-154 Ulrich, Thomas

1978 Phase I Cultural Resource Survey, Town of Chicopee Sewage Project C250364-01, Fuller Brook Interceptor, Chicopee, MA. 48 pages.

The Phase I consisted of background literature search, discussion with local collectors, walk-over and selected subsurface testing. Based on the presence of a known prehistoric site, Bircham's Bend on locational factors, and background data, three areas were recommended for Phase II testing.

25-155 Barber, Russell J.

1977 Phase I/Assessment of Archeological Potential, Green River Relief and Replacement Interceptor Project, Greenfield, MA. 25 pages.

Background literature search, development of a prehistoric and a Euro-American settlement pattern model (based on locational geography) and use of the models located several areas of high archeological potential which were minimally disturbed. An intensive survey was recommended.

25-156 Bawden, Garth

1978 Phase II Historic Properties Survey, Lenox, MA. 6 pages.

Intensive subsurface testing consisting of systematic test pits along the proposed sewer route located neither artifacts nor sites. No further work was recommended.

25-157 Thomson, Charlotte W.

1978 Phase I Cultural Resource Survey, Metropolitan District Commission, Rep. Richard E. Landry Park Development, Waltham, MA. 29 pages.

Background literature search identified three properties previously nominated to the National Historic Landmarks; a granite wall to be impacted by landscaping and/or fill was found by MHC and MDC to be a 1900s structure not associated with historic buildings. No further work was recommended.

25-158 Thomson, Charlotte W.

1978 Phase I/Cultural Resource Survey, Proposed Sewerage Project, East Longmeadow, MA. 24 pages.

Background literature search, walk over, and subsurface testing located one charcoal lens in the project area. Due to weather conditions, no further testing of the lens was undertaken to determine whether or not the charcoal was part of a feature or was a natural occurrence. Further investigation of the charcoal deposit was recommended.

25-159 Chapin, R. Curtis

1976 Archaeological Field Survey for Route 129, Wilmington, MA. 49 pages.

One area of the proposed highway relocation was tested with shovel test pits placed at approximately 50-foot intervals. Charcoal, flakes, and potsherds were found in the vicinity of a reported prehistoric site. No analysis or recommendations for further work were included in the report.

25-160 Loparto, Leonard

1978 Archaeological Investigations of Wareham Industrial Park, Ware-ham, MA. 38 pages.

The area of the proposed industrial park was the subject of a combined reconnaissance and intensive archaeological survey. The area had been heavily disturbed in part by highway construction, cranberry bog and gravel-taking operations. Although one prehistoric and one, possibly two, historic sites were located, previous disturbance of the area had destroyed the context of the sites. No further work was recommended.

25-161 Bawden, Garth

1978 Phase II/Intensive Archaeological Survey, EPA Project, Palmer, MA. 129 pages.

Testing of sensitive areas was dictated by extreme time pressure and was restricted to those areas thought by the project archaeologist to be most likely to contain significant prehistoric sites. Three interceptor segments were found to be routed through prehistoric remains. Intensive test pitting and trenching of the prehistoric deposits located Late Archaic and Late Woodland materials on the lowest terrace of the Ware River, approximately 10 meters from the river edge. Fishing activity was hypothesized to be the primary function of the sites. None of the sites were considered to be eligible for the National Register. No further work was recommended.

25-162 Bower, Beth Anne, Dan Milauskas, and Ellen Rosebrock

1978 Phase I Assessment of the Metropolitan District Commission Water Improvement Project #17040, Saugus, MA. 24 pages.

Site record checking and historical literature search indicated that the proposed interceptor work might impact reported sites. Field survey indicated that recent house construction had severely impacted all potential areas for prehistoric sites. One test pit was dug and suggested that extreme mixing of the soil was present in the project area. No further work was recommended.

25-163 Mahlstedt, Thomas, and Ricardo Elia

1978 Report on the Phase I Archaeological Survey of the Proposed Tewksbury to Amesbury ROW 345 Kilovolt Transmission Line. 86 pages.

The authors argued that transmission line design considerations obviate impact on historic period resources since the lines typically avoid all areas of present human habitation. A background literature search, map check, field walkover located specific areas of construction that were likely to contain prehistoric resources; no historic sites were reported to have existed in the ROW. Intensive testing was recommended for those areas which would be impacted by pole placement and pas-

sage of equipment over previously undisturbed areas.

25-164 Elliot, Suzanne

1978 General Lawrence Bridge Project, Phase I Archaeological Reconnaissance Survey, Medford, MA. 53 pages.

A search of ethnohistoric and colonial literature suggested that prehistoric fishing stations might be impacted by the proposed highway realignment and bridge demolition. The bridge itself was thought to be potentially significant since it was the drawbridge farthest up the Mystic River. Additional information, including a site visit and recommendations regarding further work, was requested by the State Historic Preservation Officer from the project archaeologist.

25-165 Talmage, Valerie

1978 Boston Harbor Debris: A Cultural Resource Reconnaissance Survey. 127 pages.

A large combination of secondary sources related to the development and use of Boston Harbor were investigated to develop a model of activity areas and interaction throughout the harbor's history. Variables considered included trade, maintenance, shipbuilding, recreation, fishing, and transportation; sensitive areas were thus reflective of past processes/activities associated with these variables. Recommendations for intensive survey were based on Army Corps photographs, maps, the literature and map search, and the model of harbor activities.

25-166 Zeitlin, Robert N., and Judith Frances Zeitlin

1978 The Route 57 Improvement Project, Agawam, MA. A Report of Preliminary Archaeological Investigations. 131 pages.

An extensive background literature search and interview program was performed prior to walkover survey of the 25,000 by 300 foot Right-of-Way. The survey area was divided into quadrants in roughly continuous lines spaced 20 feet apart; all artifacts on the surface were collected and analyzed. Sensitive areas were pinpointed by combining the above with environmental factors. Approximately half of the survey area was recommended for subsurface testing.

25-167 Thorbahn, Peter

1974 Archaeological Survey Report, Allen Site, Diamond-Traphole Watershed, Norfolk County, Walpole, MA. 14 pages.

Background literature search, interview with local owners, walkover of both the watershed project area and an adjacent golf course indicated that the area was disturbed by previous earth-moving activity. Test pits and trenches located one charcoal concentration but no artifacts. No further work was recommended.

25-168 Robinson, Jeannie

1977 Investigation of Archaeological Resources in the Impact Area of West Springfield's Local Public Works Project No. 01-51-20775. 14 pages.

Excellent background literature research was supplemented by subsurface testing and a walkover of the areas to be subjected to earth-moving activities. While historic resources were located, none were to be impacted by the proposed activity. It was recommended that the project proceed as planned.

25-169 Thorbahn, Peter, et al.

1977 Archaeological Reconnaissance Survey of Interstate I-495 and Relocated Route 140, Mansfield, Norton, Taunton, Raynham, Bridge-water, Bristol County Massachusetts, Interim Report. 189 pages.

Since the report was meant for management purposes in order to design further survey work, only the actual fieldwork and site summaries of the ROW's were included. Three primary methods of site location were employed: complete walkover of the ROW, analysis of soil auger transect and test pit data, extensive interviewing of knowledgeable local people, deed checking, and site records checking. To ensure statistical reliability of the data, random walk transects were undertaken throughout the ROW, using a combination of systematic auger testing at 10 meter intervals and random compass designation for the direction of each walk across the ROW. Sites located were scored according to a variety of available data (documentary, site artifact and feature density, regional representativeness, stratigraphy, public resource potential, component analysis) and recommendations for further study were based on the scoring.

25-170 Thorbahn, Peter, et al.

1978 I-495 Phase II Archaeological Investigations. 600 pages.

A thorough summary of the Phase I data and methods (described in 25-169) was included along with site-specific reports and recommendations. 30 sites were recommended as being eligible for the National Register, including the Bay Street, Norton Reservoir, and Canoe River archaeological districts, the Wilbore House, Johnson Field House, School Street, Double P, Snake River East and West, Newcombe Street, and Rozenas I/II sites. Variation in sites ranged from 8000 years of continuous prehistoric occupation at Canoe River to circa 50 years of occupation at the Johnson Field historic site. Data recovery, avoidance, and filling were recommended as mitigation strategies.

25-171 Baker, Vernon

1977 Archaeological Investigations at Wright's Tavern, Concord, MA. 55 pages.

Drainage pipes to relieve a problem of moisture accumulation were to be installed around two sides of the tavern. Archaeological testing methods included soil auger coring every 50 cm over the entire impact area, placing both random and non-random test pits in trenches in the area to be impacted. Previous construction activity post 1820 and ca. early 1900s had destroyed most cultural remains and disturbed the area. Only isolated post 1820 ceramics and cobble linings were found. It was recommended that the project proceed.

25-172 Baker, Vernon

1977 Archaeological Investigations at the Francis Wyman House, Burlington, MA.

Drainage pipes to relieve moisture accumulation were to be installed on all sides of the house. The excavators dug a total of 11 test pits and trenches; both random and non-random placement of pits occurred. Although one prehistoric Atlantic Phase projectile point, c. 500 historic period sherds (dating from pre-1700 through mid 19th C.), and pipestem fragments were recovered, it was recommended that the project proceed as planned due to previous extensive disturbance around the house.

25-173 Turchon, Frederick

1978 Phase I/Reconnaissance Survey of Archaeological Properties, Springfield BOR Development Project, Springfield, MA. 62 pages.

A thorough background search of available ethnohistoric and historic resources suggested that the Blunt Park area was less likely to contain significant cultural resources due to the fact that the Blunt Park area was swampland. Both were regarded as potentially sensitive areas due to reported presence of Agawam Indians in the area in the 1600s. Walkover inspection revealed that Blunt Park had previously been filled in the project area to a depth of 6 feet; Green-field Park had been stripped of all topsoil and graded. No further work was recommended.

25-174 Bawden, Garth

1978 An Overview of the Cultural Resources of Agawam, MA. 17 pages.

Due to the large number of reported sites in the town, study was undertaken to provide a "broad brush" view of prehistoric and historic properties in the area so that town planners would be able to incorporate cultural resource management into town planning activities. Background literature search and interviews with knowledgeable avocational collectors resulted in the production of two maps which indicated relative sensitivity for historic properties in Agawam.

25-175 Senulis, John A.

1978 North Attleboro Industrial Park, Phase II Development; Reconnaissance/Phase I Archeological Survey. 6 pages.

[no abstract]

25-176 Dincauze, Dena F.

1978 Archaeological Survey in Northfield State Forest, 1977. 11 pages.

The report summarizes the 1977 field season of the U. of Massachusetts Department of Anthropology Field School and is not intended to be a conclusive statement on all cultural resources in Northfield State Forest. Four survey units of approximately four hectares each were surveyed. Background literature search, phosphate and soil testing, coring and subsurface testing at non-random intervals, varying from 20 to 50 meters per transect was undertaken. No prehistoric or historic deposits were located in the survey units.

25-177 Thomson, Charlotte

1978 Phase I Archaeological Survey, Cordaville Road District, Ashland, MA. 7 pages.

Three interceptor segments and a pumping station location were reviewed. Two segments were regarded as being unlikely to contain archaeological resources due to the prevailing soil conditions. A third segment was walked over; interviews with local landowners were conducted; test pits were randomly placed. No cultural remains were located and no further work was recommended.

25-178 Bawden, Garth

1978 Phase I Archaeological Reconnaissance of Wastewater Area, Agawam, MA. 50 pages.

Background literature search, interviews with local collectors and map research indicated high probability for prehistoric resources in the project area. Adjacent historic structures were found to be outside of the area of disturbance for the sewer extension construction. The ca. 6000-foot length was walked over and tested by coring with soil augers at 10-meter intervals, three test pits were also placed. No cultural remains were identified, and it was recommended that the project proceed.

25-179 Kenyon, Victoria Bunker

1978 Phase I Cultural Resources Survey of the Housing for the Elderly Project, Oxford, MA. 15 pages.

A background literature search, field walkover and intensive test pitting of the project area yielded only one small scatter of historic period debris. The debris was most probably of modern origin. No further survey work was recommended.

25-180 Ulrich, Thomas

1978 Phase I/II Cultural Resource Impact Study of the Burnett Road Recreation Area, Chicopee, MA. 38 pages.

Background literature research located one historic foundation, post 1850, in the project area. The survey area of 10 hectares was divided into three survey units: "A" was 5 acres of muck which was not systematically tested with the exception of one small gravel knoll; "B" contained one badly disturbed post-1850 outbuilding foundation which contained no associated artifacts which were definitely datable to pre-2Oth C times; "C" was tested by a combination of soil coring and test pits (as were A and B) but no artifacts or features were located. Due to previous disturbance, it was recommended that the project proceed.

25-181 Barber, Russell

1978 Merrimack Street Interceptor Project, Amesbury, MA. Archaeological Monitoring of Construction and Testing of Pumping Station. 38 pages.

Remains of a possible pre-1755 road, two late 19th C privies and the evidence of 19th C mudflat filling were encountered. The fill was regarded as being culturally significant as a physical representation of attitudes toward disease which prompted the initial filling of the mudflat. Monitoring was regarded as an unsatisfactory procedure due to the lack of field control over speed of interceptor placement. No cultural remains were identified in the pumping station area and it was recommended that the project proceed.

25-182 Barber, Russell

1978 A Quantitative Assessment of the Reliability of Archaeological Site Records in Massachusetts. Survey and Planning Project Completion Report. 75 pages.

The project's purpose was to assess the reliability of site records in Massachusetts, using theoretical concepts and analysis techniques from communication theory. A thorough records check of all available data sources, including museum records, state site files, informants, literature and local historical organizational records was combined with field testing of a representative sample of sites to verify their existence in the reported location. Time lag (that time from the initial recording to field checking) was the largest source of distortion (ca. 27%). Only ca. 55% of reported sites were able to be verified in the lower Merrimack River Valley.

25-183 Ulrich, Thomas

1978 Preliminary Report of a Cultural Resource Survey of the Deer-field Industrial Park, Phase I/IIa, Deerfield, MA. 15 pages.

The report contains summary information and explanation of the field-testing of 8 acres of the Deerfield Industrial Park in Deerfield and Whatley, MA. An intensive survey of the property, using random and non-random testing strategies located a Paleo-Indian habitation site with large

concentrations of exotic raw material debitage (similar to Reagen site in Vermont), concentrations of materials ("hot spots") and hearths. The site lies on a well-defined post-glacial sand dune; hence must postdate c. 12,000 B.P. To protect the site from the effects of looting, the site was buried under clean fill.

25-184 Mahlstedt, Thomas, and Michael DeBlasi

1978 Phase I Archaeological Reconnaissance for the Solid Waste Recovery Facility, North Andover, MA. 22 pages.

The site had been used previously as a landfill; due to prior filling, 14 acres of the site were not tested. The remaining ca. 10 acres of the site was stratified into 3 parts and tested by placing 2 foot square test pits at various intervals within each stratum. No cultural resources were located and it was recommended that no further survey be done.

25-185 McManamon, Francis P.

1978 Preliminary Investigation of Archaeological Potential: Areas of Proposed Development at Doane Rock, Coast Guard Beach and Nauset Light Beach, Eastham Unit, Cape Cod National Seashore. 15 pages.

A background literature search and walkover of the project areas was conducted. Four alternatives for further investigation were presented, including work and cost estimates, depending upon the degree of development within each area of moderate to high archaeological potential.

25-186 Winter, Eugene, and R. S. MacNeish

1978 A Cultural Resource Survey of the Proposed Salisbury Wastewater Treatment Plant Location, Phase I Reconnaissance, Salisbury, MA. 50 pages.

A background literature search and walkover of the 40 acres to be impacted by plant construction was combined with subsurface shovel test pitting of the area. No cultural remains were identified; it was argued that the lack of available freshwater was a probable explanation for the lack of habitation evidence. No further work was recommended.

25-187 Bawden, Garth

1978 Reconnaissance Survey of Riverside Park, Cambridge, MA. 10 pages.

The project area had previously been thoroughly researched by the Cambridge Historical Commission; a 19th C. almshouse had previously stood on the site and had then been incorporated into the Riverside Press structure. Demolition of the press structure had apparently done little subsurface damage. It was recommended that the landscaping of the park proceed as planned provided that the almshouse foundation was avoided.

25-188 Anthony, David

1978 Archaeological Survey of Transmission Line ROW 447 Walpole to Westwood, MA. 22 pages.

Due to flexibility of pole placement in the 9.2 mile long, 100 foot wide new pole placement right-of-way, the study was designed to define sensitive areas for cultural resources. A background literature search, records check, interviews with local avocational archaeologists and walkover identified 20 sensitive areas. It was recommended that these areas be spanned; otherwise, further work would be necessary to assess the potential of each area.

25-189 Pretola, John

1977 Washington Mountain Brook Watershed Project, Intensive Survey Report. 43 pages.

This supplemental report (to 25-4) supplied information on the subsurface testing of an agrarian village complex located in the October Mountain State Forest. Based on the result of the testing, it was recommended that the village district be nominated to the National Register and the project proceed as planned since the watershed project would not impact the village district.

25-190 Barfield, Thomas

1978 Phase II/III Archaeological Survey for the Proposed Arsenal Park Site, Watertown, MA. 30 pages.

Intensive testing of the proposed park site was undertaken in three areas. No cultural remains were located in Areas A and B due to previous disturbance. In Area C, a combination of systematically placed one-meter square test pits and power assisted post hole borings located a lithic scatter. Upon opening of further test pits, the site was identified as a Late Archaic Coburn Phase (c. 1200 B.C.) occupation site including living floors, pits and associated artifacts. It was recommended that a full scale excavation of the site be undertaken due to the difficulty of site protection in the proposed park and due to the research potential of the site to answer questions on prehistoric settlement and exploitation patterns in the Charles River basin.

25-191 Elliott, Suzanne

1978 Archaeological Phase II Study/Intensive Survey and Site Examination, General Lawrence Bridge, Medford, MA. 8 pages.

The report relies on information in report #25-164 for background and supplies data on the subsurface auger and test pit sampling used in the riverbank. One stray felsite knife blade and a scattering of historic period debris were found in the top 15 cm. of the bank soil. No evidence of an intact cultural deposit was identified; it was recommended that the project proceed.

25-192 Tracy, John

1978 Building Construction in Raynham, Massachusetts: Report. 3 pages.

A walkover of the project area for the housing development was conducted and an interview with the past land owner. No artifacts or cultural features were located. It was recommended that the project proceed.

25-193 Bawden, Garth, and Frederick Turchon

1978 Archaeological Historical Survey of the Mill Raceway and Completion of Phase I-IIa, Northborough, MA. 10 pages.

Access was granted to test in the remainder of the interceptor right of way (for background see 25-145) and to do intensive testing in the vicinity of the mill raceway. Burn barrels were used to thaw the ground; materials recovered were trowled and examined once thawing occurred. The test pits in the interceptor right of way did not locate any intact cultural materials. The raceway was positively identified as being part of the water control mechanism for the mill; however, the major intake mechanisms were hypothesized to be outside of the interceptor/pumping station right of way. No further work was recommended.

25-194 Bawden, Garth

1978 Phase II Archaeological Survey, Housing for the Elderly, Acton, MA. 13 pages.

A background document search was combined with walkover evaluation of the historic and prehistoric site potential. Historic site potential was low due to absence of any recorded features on historic maps. All areas above wetlands (defined for testing purposes as the 210' interval) were test pitted at 20 and 10-meter intervals along 13 transects. Bucket auger samples were randomly spaced throughout the project area. No cultural materials were recovered and no further work was recommended.

25-195 Jaffe, Jo Ann

1978 Phase I, Step I, Cultural Resource Reconnaissance Survey for the Central Artery, Charlestown, MA. 10 pages.

The report examined only the potential effects of a proposed trumpet interchange in the City Square area of Charlestown. Documentary sources were consulted and identified high potential for locating a 1629 "Great House", reputed to be the earliest wood frame house in Boston and for encountering Contact Period Indian and English artifacts due to proximity to a reported Contact Period village. Further archaeological work was recommended along with monitoring of any construction.

25-196 Thorbahn, Peter, et al.

1978 Archaeological Investigations, Smith Mills Elderly Housing, Dartmouth, MA. 22 pages.

Transects were laid out over those parts of the housing site which had not been subjected to gravel taking. Soil auger sampling occurred at 10 meter intervals along the transects and test pits were dug in anomalous areas. Random test pits were dug throughout the plowed field area. Nine features, including storage pits, a workshop and roasting pit were identified; the features contained Middle and Late Archaic artifacts. Due to the 30 cm. plowzone at the site it was recommended that mechanical assistance be obtained to bulldoze off the plowzone. Sampling was recommended for the site materials exposed by the stripping and also for selected areas of the site prior to stripping.

25-197 Thorbahn, Peter, Leonard Loparto, and Deborah Cox

1978 Archaeological Evaluation of the Housing for the Elderly Development, Marion, MA. 42 pages.

Background interviews and document consultation suggested very high probability for prehistoric sites due to previous collecting by avocational archaeologists. Random walk soil transects and placements of test pits in sensitive areas located historic period (19th C) ceramic and trash scatter; one prehistoric shell midden feature was also identified. Burial of the shell midden was recommended due to its possible association with a larger prehistoric activity area outside of the housing project site.

25-198 Wilson, John S., and Patrice A. Teltser

1978 Cultural Resource Reconnaissance for Construction of Recreation Facilities at Knightsfield Dam, Huntington and Chesterfield, MA: Report. 11 pages.

The area of the comfort stations was transected and tested at three-meter intervals with 40 cm soil probes. Test pits were dug in sensitive areas. No cultural materials were identified in the project area; historic period sites were located in the reservoir area. No further work was recommended.

25-199 Thorbahn, Peter, et al.

1978 Foxborough Mall Archaeological Survey, Foxborough, MA. 19 pages.

Seven historic sites from the 19th and 20th centuries and one possible prehistoric site were identified in the 116 acre shopping mall area by doing a thorough background literature search, random walk auger and test pitting of the site. Due to previous earthmoving and demolition in the area during the 1970s, it was recommended that a commemorative plaque be placed on the Warren Mansion site and that the project proceed as planned.

25-200 McBride, Kevin

1978 The Route 57 Improvement Project, Agawam, MA. Report. 40 pages.

The report relies on information supplied in the Phase I survey of the Route 57 R.O.W. (See. Report #25-166). A cluster of 5 to 10 test pits were placed at 60 foot intervals along transects within the quadrants recommended for further investigation. In areas where archaeological resources were recovered, additional test pits were placed in accordance with a systematic stratified sampling strategy. No additional materials were recovered by additional testing. It was recommended that, due to previous disturbance, no further archaeological assessment be undertaken.

25-201 Bower, Beth Ann, Dan Milauskas, and Ellen F. Rosebrock

1978 A Phase I Assessment of the New Bedford, Wastewater Relief Interceptor Project, New Bedford, MA. 24 pages.

Interviews with knowledgeable local individuals and a walkover survey of the interceptor routes were conducted. Two test pits were dug in potentially sensitive areas. Due to the absence of cultural materials, and the presence of fill and excavation in the project area, it was recommended that the project proceed as planned.

25-202 Anthony, David

1978 Management Summaries of Route 31 Project Alternatives, Ashby, MA. 54 pages.

Thirteen sensitive areas were identified by documentary and map research and testing of the highway ROW with a 2-person gasoline powered soil auger at intervals of not less than 30 meters on either side of the existing road. Additional archaeological work during an intensive survey of the sensitive areas revealed that two historic period sites, the Trapfall Brook Stone Arch Bridge and the Locke's Mill complex contained the qualities of significance and integrity. These were regarded as eligible for inclusion in the National Register. It was recommended that the sites be avoided if possible, if not, it was recommended that the Advisory Council procedures be implemented to mitigate the efforts on the historic sites by filling over or documenting the existing resources.

25-203 Rosebrock, Ellen Fletcher

1978 Phase I Archaeological Reconnaissance Study for the Red Line Extension, Northwest; Harvard Square to Arlington Heights, MA. 100 pages.

The report consisted solely of background literature research and informant interviews regarding the likelihood of encountering historic properties in the 6.34 mile long extension of the MBTA subway system. Summaries of geological, ecological, archaeological and historical data are included. Due to the high probability of encountering prehistoric resources and historic sites within the ROW, 34 areas were recommended for additional archaeological assessment. The assessment

techniques included subsurface sampling of sheet refuse, mapping, and feature excavation; all subsurface work was to coincide with various phases of subway construction.

25-204 Anthony, David, and Garth Bawden

1978 Cultural Resource Reconnaissance Survey, Fall River Harbor Maintenance Dredging Operation, Fall River, MA. 57 pages.

The survey report includes both background data and the result of preliminary and intensive testing of the dredge disposal site. Due to the prevailing winter conditions, all test pits except one were placed systematically by backhoe at 25 meter intervals along transects in the dredge disposal site. An intact Late Archaic occupation site with discrete activity areas, including a possible garden, was identified. It was recommended that the site be avoided and that if avoidance was not feasible, data recovery of the information should be undertaken.

25-205 Hoffman, Curtiss

1978 Houghton School Expansion Archaeological Survey, Sterling, MA. 6 pages.

The report summarizes the results of intensive field-testing of the school area. A stratified sampling design, combining both soil coring and test trenches, was used. A total of 13 test trenches were excavated. Due to the absence of cultural materials, no further work was recommended.

25-206 (void)

25-207 McBride, Kevin

1979 A Cultural Resources Study of the Proposed Agawam Bikeways Project Corridor. 8 pages.

Documentary research, discussion with informants, and test pitting failed to reveal any archaeological sites along this two-mile stretch which parallels the Connecticut River in Agawam, Mass. As no cultural resources would be impacted, it was judged that the project could proceed.

25-208 Davis, Dave, Michael Raber, and Robert Zeitlin

1979 Cultural Resource Survey for a Proposed Shopping Mall in Attleboro, Mass. 73 pages.

In a project area which consisted of forest swamp interspersed with small areas of higher ground, subsurface testing encountered a moderate amount of non-diagnostic prehistoric materials on two associated knolls. The researchers suggested that both areas be subject to an intensive survey. The report includes a fine regional historic and prehistoric overview which relates known sites within southeastern Massachusetts to cultural periods.

25-209 Huntington, Frederick

1978 Phase I Step I Archaeological Survey of South County Road, Barnstable, Massachusetts. 8 pages.

A walkover indicated that the potential for encountering prehistoric sites within the project area was high, as analogous environmental conditions exist at known sites in Barnstable. No evidence was found either in the field or among documentary sources for the presence of historic sites. Further archaeological investigation was recommended.

25-210 Moir, Randall

1978 Phase I Archaeological Reconnaissance Survey of the Proposed Recovery Plant Location in Beverly, Massachusetts. 26 pages.

Documentary materials, historic maps, and soil borings reports were the primary sources used to investigate the archaeological resources of this 5.5. acre tract bordering the Bass River. Most of the project area was found to contain substantial deposits of fill. It was recommended that construction occur on filled lands and that the single zone in which a high potential exists for encountering both prehistoric and historic activity areas be avoided.

25-211 Mahlstedt, Thomas F.

1979 Archaeological Survey of the Proposed Bourne Marina, Bourne, Massachusetts. 20 pages.

On a small inlet of Buzzards Bay, this marshland was considered a likely location of prehistoric activity. Conversation and a walkover with the current landowner revealed that a considerable amount of dredging and land filling had occurred on the property in the last thirty years. Subsurface testing within the project area confirmed this information. Due to the succession of land modifying activities on the site, it was judged that construction would not adversely affect archaeological resources. A good review of prehistoric and historic land use in the Cape Cod region is included with the report.

25-212 Depaoli, Neill

1979 Preliminary Archaeological Investigation of Gate 4 Charlestown Naval Yard, Charlestown, Massachusetts. 27 pages.

Documentary and cartographic sources were used to trace the physical development of this area, slated for redevelopment by the Boston Redevelopment Authority. Research indicated a number of 19th century buildings associated with the Navy Yard in this location, and suggested that prehistoric and early historic Indian resources might also exist. It was recommended that an intensive survey be carried out in the project area.

23-213 Bawden, Garth, and Randall Moir

1979 Phase II Archaeological Investigation of Chelsea-Water Street Connector Project, Charlestown, MA. 18 pages.

Areas identified in Phase I Step 2 excavations as containing archaeological features significant to the understanding of the Charlestown Navy Yard's physical development were investigated during this project. It was recommended that two loci associated with a 19th century storage structure be subject to archaeological monitoring during construction.

25-214 Bower, Beth, and Byron Rushing

1979 Archaeological Reconnaissance Survey of the Southwest Corridor Project Area (Part One). 48 pages.

This portion of the reconnaissance survey is an evaluation of the archaeological potential of the five-mile corridor based on considerable documentary research. Much of the proposed impact will occur within Roxbury's Stoney Brook Valley and research was structured so as to document the settlement, use, and alteration of the river valley through time. More than thirty sites were recommended for Phase II testing, the greater portion of which represent domestic or industrial occupation during the 18th and 19th centuries.

25-215 Bawden, Garth

1979 Final Report: Phase II, Task I, Archaeological Survey for Red Line Extension, Northwest--Davis Square to Alewife Station. 9 pages.

A large portion of the project corridor corresponds to the right-of-way of the Boston and Maine Railroad. Auger testing within this area indicated in all cases filling to a depth greater than 1.25 meters. The remaining section of the corridor was found to be disturbed or to contain no cultural material, after augering and shovel testing had taken place. The researchers suggested that archaeological monitoring occur during construction excavations along the railroad right-of-way, as prehistoric resources might be deeply buried there.

25-216 Moir, Randall

1978 Phase I Archaeological Study for the Proposed Lechmere Reconstruction Project, Cambridge, Mass. 44 pages.

The study focused upon a large area of land, reclaimed during the 19th century and fronting the Charles River Basin. Soil coring indicated both thick fills and relatively high artifact densities owing to reclamation and extensive 19th century development. Further work was recommended for much of the project area in the form of extensive coring and intensive documentary research.

25-217 Thomson, Charlotte, W.

1979 Phase II Archaeological Survey Fuller Brook Interceptor Sewer, City of Chicopee, Massachusetts. 14 pages.

Test excavations in three areas within the corridor considered to have prehistoric site potential based on a reconnaissance survey failed to locate any cultural materials. It was concluded that the project would have no effect on archaeological resources.

25-218 Ulrich, Thomas

1979 Phase I, Step I Archaeological Survey of the Montgomery Street Reconstruction Project, Chicopee, Massachusetts. 9 pages.

Environmental conditions indicated that prehistoric site potential existed within the project area. An inspection of the locale, however, indicated to the researcher that extensive recent development had destroyed the context of any prehistoric cultural remains. Documentary sources revealed that little activity had occurred there during most of the historic period. It was concluded that no further archaeological investigation is necessary in the Montgomery Street area.

25-219 Bawden, Garth L

1979 Preliminary Archaeological Survey, Clinton Industrial Park, Clinton, Massachusetts. 12 pages.

The site of the proposed industrial park fronts a pond and consists of woodland and open pasture. Ethnohistorical data indicated that aboriginals had fished seasonally at Clamshell Pond, while documentary cartographic sources indicated that the land had been used for agricultural purposes during the historic period. A site walkover located mid-l9th century retaining walls and culverts as well as a stone bridge. Archaeological testing revealed three areas containing prehistoric lithic debitage. The researcher recommended that the prehistoric and historic remains be preserved, but called for an intensive survey if impact was imminent.

25-220 Bragdon, Kathleen J.

1979 Excavations at the Cape Cod Tech Site, Harwich, Mass. 33 pages.

The report summarizes two seasons of field school excavation at a small lakeside site on Cape Cod. Despite historic period disturbance and a low artifact density, the researchers were able to date occupations to the Late Archaic and specifically, the Susquehanna Tradition.

25-221 Bawden, Garth L.

1979 Phase I Archaeological Survey: North Dartmouth Mall. 16 pages.

The physical characteristics of this property did not indicate that prehistoric occupation was likely, while documentary sources revealed that the land had been used for pasturage in the historic period. Subsurface testing near the single area considered potentially sensitive, a brook, unearthed a cluster of waste flakes. These remains, which the researcher considered evidence of temporary prehistoric occupation, were the only cultural materials recovered in the project area. It was concluded that no further archaeological investigation was required.

25-222 Bawden, Garth L.

1979 Archaeological Reconnaissance Survey: Downtown Common, Framingham. 8 pages.

This survey was carried out in an attempt to locate an aboriginal burial ground noted in a secondary source as having existed in the confines of this small park. Closely spaced excavation units, placed in areas to be impacted, revealed disturbance below grade. As disturbance was evident to a depth greater than would be impacted by the proposed improvements, it was determined that cultural resources would not be injured and that the project could proceed.

25-223 Curran, Mary Lou

1979 Phase III-Data Recovery: Wastewater Treatment System in the Riverside Archaeological District of Gill, Massachusetts. 165 pages.

Data recovery activities focused on two locations bordering the Connecticut River within the wastewater system corridor. Collectively, the sites represented occupation from Middle Archaic through Late Woodland; individually they indicated an activity area of undetermined nature and a midden. Information regarding floral identification and faunal analysis is included as are sections detailing project methodology and sampling strategy.

25-224 Dincauze, Dena F.

1979 Prehistoric Archaeological Resources in Hadley, Massachusetts: A 1978 Assessment with Recommendations for Protection. 58 pages.

In a text useful to both professional archaeologists and concerned laymen, the author recounts the history of archaeological research in Hadley, describes the town's past and present environment as well as Native American culture history within the region. Within later chapters, national and state preservation legislation is explained and optimum methods of land use planning which encourage the preservation of archaeological resources are suggested. The study concludes with recommendations toward the conservation of archaeological sites in Hadley, Mass.

22-225 Bragdon, Kathleen J., and Debra Frank

1978 Excavations at the Cedar Dell Pond Site: A Preliminary Report. 39 pages.

Researchers at the Southeastern Massachusetts University Field School found phosphate testing useful in locating areas of high cultural activity. Initial analysis has led to the conclusion that the site represents seasonal occupation during the Late Archaic. Future investigations at Cedar Dell Pond will be directed toward further defining the Late Archaic occupation and determining the site boundaries.

25-226 Thomson, Charlotte

1978 Phase I Archaeological Survey, Town of Lakeville, MA. Industrial Park Roadway. 17 pages.

This project was found to be within an area of southeastern Massachusetts with a high prehistoric site density representing most cultural periods. Extensive disturbance precluded testing in the southern portion of the proposed roadway, while the northern sector was subject to subsurface tests at an interval of fifty feet. No material cultural remains, either historic or prehistoric, were encountered and it was concluded that road construction would have no impact on archaeological resources.

25-227 Robbins, Roland Wells

1979 Historic Sites Survey of the Environmental Impact Report pertaining to the proposed Lakeville Industrial Park Site. 15 pages.

Surveying for historic sites only, the researcher supplemented study of cartographic and documentary sources with walkovers. One historic resource, a portion of the 19th through 20th century Fall River-Middleborough Railroad bed was suggested for preservation. The text is leavened with eight pages on travels in Middleborough and Lakeville from Thoreau's Journal.

25-228 Gramley, R. Michael

1978 Phase I Archaeological Survey for the Fall Brook Interceptor, Leominster, MA. 23 pages.

Within the context of a region in which the physiography indicated only light and temporary prehistoric occupation, this project was carried out on Fall Brook and near to the North Nashua River. Documentary sources indicated that the area had been at the fringe of early historic settlement, while test pitting turned up no historic or prehistoric remains. It was concluded that the project could proceed without impact to cultural resources.

25-229 Rosebrock, Ellen Fletcher, and Frederick Huntington

1979 Archaeological Services Conducted at Tremont Yard, Lowell Heritage State Park. 18 pages.

An assessment of the archaeological potential of a specific portion of the Lowell Heritage State Park, the study used as its base documentary sources. As a location of cotton manufacturing in the early 19th century, the site is expected to contain many features of a technological nature from that period. The potential for the presence of prehistoric archaeological sites, once considered very high because of the area's physiographic qualities is now considered only moderate due to historic period site use. Recommendations include further cartographic research to delineate least disturbed areas and test excavations to confirm levels of disturbance.

25-230 Ulrich, Thomas

1978 Intensive Survey and Site Examination/Phase II Archaeological Investigation of Stony Brook Energy Center. Ludlow, MA. 15 pages.

Subsurface investigation was focused on areas determined sensitive during a reconnaissance survey. Varied testing strategies appropriate to changing field conditions were utilized in the deciduous coniferous woodland. No historic material remains were encountered in the project area, and those prehistoric remains recovered were judged insufficient to warrant further investigation.

25-231 Solomon, Janet A., and Virginia H. Adams

1979 Phase I Archaeological Investigation, Mansfield Borrow Area, Mansfield, MA. 19 pages.

The areas surveyed consisted of forty acres of mixed hardwood and pine forest located on glacial outwash and gravel knolls near a river. Testing consisted of both random and systematic augering augmented by test pitting in potentially sensitive areas. A single locus within an advantageous environment in which prehistoric materials were found was recommended for further investigation.

25-232 Huntington, Frederick

1978 Phase I, Step II Archaeological Survey of the Marlborough Route 85 Connector, Marlborough, Mass. 16 pages.

A prehistoric site was located during the course of systematic subsurface testing within this upland region, containing bedrock outcrops. Intuition was used to locate three potential rock shelter sites within the road corridor. Testing proved that one shelter had been occupied in prehistoric times, yielding projectile points of the Squibnocket Complex and faunal remains. Archaeologists recommended site examination at the Flagg Swamp Rock Shelter (named for the wetland it overlooked) in order to determine size, age, and cultural affiliation.

25-233 Huntington, Frederick

1979 Phase II Archaeological Survey of the Marlborough Route 85 Connector, Marlborough, MA. 47 Pages.

Site examination was undertaken in order to deter-mine the spatial limits of the Flagg Swamp Rock Shelter, discovered in a reconnaissance survey, and to assess the significance of the site. Cultural deposits were found to extend to a depth of one meter, representing Late Archaic and Late Woodland occupation. This limited excavation also revealed that stratigraphic separation exists between occupation layers from distinct cultural periods. Research questions formulated for testing at Flagg Swamp Rock Shelter include the investigation of phases within the Small Stemmed Point tradition, subsistence changes among chronologically separate cultural groups, and seasonality of occupation. Appendices in the text include the analysis of recovered lithic, faunal, and molluscan remains. Researchers recommended that threats to the site be mitigated by either avoidance or total excavation.

25-234 Huntington, Frederick

1978 Phase I Step II Archaeological Survey For Highway Widening, Barnstable, Massachusetts. 11 pages.

A subsurface testing program failed to locate any cultural resources in an undisturbed area thought to have a high prehistoric site potential. No further archaeological investigation was deemed necessary.

25-235 Howry, Jeffrey

1979 Haverhill Resources Project: Historic and Archaeological Resources. 5 pages.

Documentary research combined with field-testing failed to locate significant historic or prehistoric cultural remains on a neck of land above the Merrimack River.

25-236 Thomson, Charlotte

1977 Preliminary Archaeological Survey, Hanson, MA. 1 page.

A walkover indicated to the researcher that the project area was composed of filled land and red maple swamp, hence construction activities would have no impact on cultural remains.

25-237 Anthony, David

1978 Phase I Step II Archaeological Report for the Chelsea-Water Street Connector Project, Charlestown, MA. 26 pages.

Subsurface testing was performed within the right-of-way of a road to be constructed at the Charlestown Navy Yard National Historic Park. The locations of former buildings documented in Phase I Step I of this project were tested in order to determine construction and function. The remainder of the project was sampled systematically. No prehistoric artifacts were recovered and most historic artifacts came from badly disturbed contexts. Additional investigation was suggested for three areas in which historic structural remains were encountered.

25-238 Anthony, David

1979 Phase I Step I Archaeological Study for the North River Bridge Reconstruction, Marshfield, MA. 42 pages.

The study focused upon land on the south side of the tidal North River near to the beginning of the river's extensive estuarine marshes. Documentary research indicated a considerable history of occupation during the prehistoric and historic periods, due to the favorable locational and environmental setting (a natural historical overview is included). Cultural evidence thought to remain may include the remains of seasonal encampments from the prehistoric period and domestic and shipbuilding activities in the historic period. It was suggested that subsurface testing occur within the project area.

25-239 [no entry]

25-240 Marti, John

1979 Phase I/Reconnaissance Archaeological Survey Report of Proposed Merrimac Waste Water Treatment System, Merrimac, MA. 13 pages.

The study contains local prehistoric and historic background information as well as environmental data for the extreme northeastern Massachusetts town of Merrimac. Limited testing indicated that previous disturbances had mitigated the impact of all future disturbances within the project area. Archaeological monitoring was suggested for the site of an early bridge and wharf landing.

25-241 Turchon, Frederick

1979 Report on the Archaeological Investigations Conducted on the University of Massachusetts Nantucket Field Station for the Proposed Field Station Sewage Disposal System. 72 pages.

Excavations at the Quaise Field Station revealed prehistoric occupation from Middle Archaic through Late Woodland times. Diverse faunal remains and ceramic types were recovered and

postmold features were in evidence. Combined, the data indicated to the archaeologists that the site was used for seasonal food processing. Considerable ecological information is included as well as faunal and physical anthropological data and an extensive bibliography. No further work was recommended for the project area, though the archaeological sensitivity of the entire field station was noted.

25-242 Huntington, Frederick

1979 Phase I Step I Archaeological Survey of the Millbury Urban Systems Project, Millbury, MA. 11 pages.

Street widening in the center of the industrial town of Millbury brought archaeologists in search of prehistoric and historic resources. Documentary research and site inspection indicated that 20th century land modification precluded further archaeological investigation. Research findings on local history and prehistory are contained in the report.

25-243 Mitchell, William W.

1979 Preliminary Archaeological Reconnaissance of the Coast Guard Beach Area, Cape Cod National Seashore, Massachusetts. 31 pages.

A reconnaissance level survey of Cape Cod National Seashore property in Eastham located two prehistoric sites to which cultural periods could not be attributed in the vicinity of areas of construction. Further work was recommended to determine the integrity and extent of each site, and zones of sensitivity within the Coast Guard Beach area were defined.

25-244 Faulkner, Alaric, Kim Mark Peters, David P. Sell, and Edwin S. Dethlefsen

1978 Port And Market, Archaeology of the Central Waterfront, Newburyport, MA. 259 pages.

Although pre-settlement remains apparently have been disturbed or obliterated along the Newburyport Central Waterfront, important historic structures and associated refuse are preserved intact. Of several former wharf side business complexes, the brick Merchant's Row, built in stages from 1770 to 1820, was best represented. Also identified were probable areas of Colonial goldsmithing, wig making, and comb and button manufacture, as well as 19th century foundry work and machining. Domestic refuse from an 18th century home and a 19th century boardinghouse provided a unique contrast of waterfront residential life in the Colonial and Industrial periods. Archaeological and historical information reveal a changing pattern of land use. Parcels allotted for 17th century port facilities on the Merrimack River were subdivided and developed in the 18th century as maritime commerce attained importance which surpassed that of shipbuilding. Profits from privateering and neutral trade, and destruction caused by the fire of 1811, all led to episodes of new construction. The unspecialized Colonial market area was replaced with a Federalist business district, functionally segregated by zone and floor. This district still stands. As maritime industries declined, wharf side properties were consolidated, and by 1876 were dominated by a railroad and coal pocket. Today, this property is vacant. Prepared for the National Park Service, Interagency Archaeological Services—Atlanta, the report is bound and available in soft-cover. A considerable number of historic landscape, archaeological, and material culture photographs are included in the publication.

25-245 Luedtke, Barbara

1978 Report on an Archaeological Survey of the University of Massachusetts Nantucket Field Station. 97 pages.

The University of Massachusetts, Boston, Field School conducted a survey of the Nantucket Field Station of Quaise, a 115 acre tract of scrub woodland and salt marsh bordering Nantucket Harbor.

Evidence of Middle Archaic through Late Woodland Period occupation was documented and seems to have occurred on a small scale. Prehistoric processing and activity areas were identified as were features such as storage pits and burials. Considerable environmental data on Nantucket's present and past environment is included as are suggestions about sampling for future archaeological surveys on Nantucket.

25-246 Starbuck, David, Ellen-Rose Savulis, David M. Lacy, and Victoria B. Kenyon

1979 Archaeological Survey of Ipswich, MA. 301 pages.

Due to its environmental setting and the historical conditions of its development, Ipswich contains an abundance of prehistoric sites and a substantial number of standing structures dating from the 17th century. The archaeological survey conducted by Boston University inventoried and evaluated known prehistoric and 17th century historic sites in detail, making the gathered data of considerable use in future surveys within the town. Accompanying environmental information, a regional prehistory and history, collections data, and a summary of present land use trends provide a context within which to view the site-specific findings. Printed in soft-cover, the study is available through the Publications Office of Boston University.

25-247 Starbuck, David, Carol Zurawski, and Lynn Whitney

1979 Seventeenth Century Survey of Dorchester. 217 pages.

This report attempts to inventory all known seventeenth century houses and lots in the city of Dorchester, to evaluate the status of surviving archaeological remains, and to pinpoint areas where other seventeenth century cultural resources, as yet undocumented, may still exist. Historical data and land evidence material collected are combined to form a study of settlement pattern in early colonial Dorchester, further informed by the use of considerable photographic and cartographic sources. Conclusions made regarding seventeenth century site survival in urban areas will be of use to other researchers. Printed in soft-cover by the Publications Office, Boston University.

25-248 Thomson, Charlotte W.

1978 Phase I Archaeological and Historical Survey Oxford-Rochedale Phase III Sewers, Oxford and Leicester, MA. 24 pages.

Data relating to the prehistory and history of the French River watershed was compiled during the project and limited subsurface testing occurred in the project area. A late 19th century dump was the single feature encountered during the survey; it was concluded that construction would not impact significant cultural resources and could proceed.

25-249 Institute for Conservation Archaeology

1979 Summary and Analysis of Cultural Resource Information on the Continental Shelf from the Bay of Fundy to Cape Hatteras.

Moir, Randall and Michael Roberts

Volume I – Physical Environment. 270 pages.

Barber, Russell and Michael Roberts

Volume II – Archaeology and Paleontology. 337 pages.

Borque, Bruce and Michael Roberts

Volume III – Historic Shipping. 76 pages.

Roberts, Michael

Volume IV – Management. 253 pages.

The purpose of the four volume study conducted for the Bureau of Land Management was to provide information about the existence of known or expected prehistoric sites and historically important sunken ships, as well as appropriate methods for locating the same, and planning recommendations for both offshore and onshore land use.

25-250 Talmage, Valerie

1977 Phase II/Archaeological Study and Site Examination, Weymouth, MA. 18 pages.

Fieldwork occurred in twelve areas along the course of the proposed sewerage system. Historic debris and four prehistoric artifacts were located in two separate areas. Neither artifact cluster was thought to be eligible for inclusion in the National Register of Historic Places. No further archaeological work was recommended.

25-251 Robbins, Maurice

1978 Nemasket Village. 30 pages.

Within this paper, Robbins attempts to identify the geographic location of the Late Woodland site thought to be located in the vicinity of Middleboro, MA, known as Nemasket. Research materials used in the locational reconstruction are largely drawn from early 17th century accounts of travels through southeastern Massachusetts by Standish, Winslow, and Bradford. A map of 17th century land purchases within Middleboro is included with the paper.

25-252 Lauro, James T.

1978 Archaeological/Historical Impact Statement. 117 Acre Impact Survey, City of Taunton, MA. 12 pages.

The results of a systematic testing program make up the bulk of information provided in this impact statement prepared for an upland, wooded parcel in Taunton, MA. Little regional or local data relating to prehistoric or historic period land use were compiled for this study. No archaeological remains were encountered during the survey and recommendation was made that the project proceed.

25-253 Huntington, Frederick

1979 Phase I Step I Archaeological Survey of Quaker Meeting House Road, Sandwich, MA. 10 pages.

Documentary research and environmental characteristics indicated to the researchers that the project area of scrub pine, sandy soil, and adjacent small ponds possessed a high potential for the presence of sites. Subsurface testing of the property was recommended.

25-254 Jaffe, Jo Ann

1979 Phase I Step 2 Archaeological Survey of Quaker Meeting House Road, Sandwich, MA. 4 pages.

Intensive subsurface testing within a project area previously determined to have moderate potential for prehistoric remains revealed an absence of any cultural material. The depositional pattern of soils in the area revealed a long history of either standing Water or waterlogging at the site. It

was concluded that the project should proceed.

25-255 Speiss, Arthur, ed.

1978 Conservation Archaeology in the Northeast: Toward a Research Orientation. Peabody Museum Bulletin 3, Harvard University. 122 pages.

The ideas presented in this collection of papers are divisible into what one may call practical advice for New England conservation archaeologists on one hand, and on the other, an appeal for the maintenance of a "scientific" or research orientation as conservation archaeology expands. Part One presents the reason for a research orientation in conservation archaeology and suggests the usage of subsistence/settlement models as the primary focal point of research in prehistoric archaeology in the Northeast. Part Two examines the background research and planning that must precede fieldwork if it is to be successful, cost-effective and significant. Part Three contains practical thoughts on field techniques based on experience and data.

25-256 Bawden, Garth

1977 Archaeological Survey for the Proposed Transportation Improvement Projects of a Section of Route 44 from Carver to Plymouth, MA. 66 pages.

This reconnaissance survey collected a good deal of information relating to the prehistory and history of the Plymouth-Carver area and identified known archaeological sites within the project area. As well, zones of archaeological sensitivity based on environmental characteristics were stratified within the project area. Further archaeological evaluation was recommended for the project.

25-257 Anthony, David

1979 Phase I Step 2 Archaeological Survey of Route 44 from Carver to Plymouth, MA. 61 pages.

Five alternate routes of the roadway passing through the towns of Plymouth, Carver, Kingston, and Plympton were subject to subsurface testing within an environment of conifer forest on sandy soils with numerous ponds and lakes. Collectively, the alternates yielded considerable evidence of prehistoric occupation, primarily representing the Middle and Late Archaic periods. Domestic historic archaeological sites dating to the early 19th century were also documented. Further investigation of one or all of the potential alternates was recommended by the researchers.

25-258 Little, Elizabeth A.

1979 An Inventory of Indian Sites on Nantucket. 23 pages.

The manuscript describes the means used in order to gather data on known prehistoric sites on Nantucket Island. Sources of inventoried site data are explicated as are the methods of evaluating collected information. Some ideas are also put forth regarding public education in archaeology.

25-259 Folsom, Michael B.

XXXX Draft Report, South Hadley Canal Archaeological Monitoring and Survey. 18 pages.

The report derives from the monitoring of sewer interceptor construction along a portion of the Late 18th century South Hadley Canal. The report consists of a historical sketch of the site, a description of the monitoring and survey method, an interpretive description of the features surveyed, a site map of the section of the canal affected by the construction project containing measured drawings of surviving canal features and suggestions about further survey and preservation

work that might be appropriate at this site.

25-260 Rutsch, Edward

1979 Data Recovery Operations at the Shaw Site, Upper Quaboag Watershed, MA. 32 pages.

The Shaw house site in Leicester, MA presented an archaeological problem: documentary evidence about the site was inconclusive concerning land ownership and function of the structure. The site appeared to have been undisturbed. Results of the archaeological investigation indicated that the house stood on the existing foundation for only a short period of time, and the original foundation appeared to have been removed. Artifacts recovered dated between 1820 and 1860, and do not indicate that the individual(s) occupying the house had an exceptionally high or low socio-economic status. Correlations between the artifact dates and reference to maps (1832, 1855, 1877) support the idea of a short occupation. Neither the archaeological record, nor historical documents indicate any relations between this house and the Shaw mill site located nearby.

25-261 Mulholland, Mitchell

1979 Phase IB/Archaeological Properties Survey for Unreported Sites. Westfield Local Flood Protection Project. 117 pages.

This report describes the Phase I/Reconnaissance Archaeological Properties Survey conducted on the site of the proposed local flood protection project in Westfield, Massachusetts. The study involved a search of historical documents to locate and evaluate historic sites within the project area, as well as an ecological analysis of the project area to assess the potential existence of prehistoric sites likely to be impacted. Persons knowledgeable in the history and prehistory of the area were consulted. The study concludes that there are twenty-one sites or potential sites in which archaeological properties are likely to be adversely affected by the project. In addition, two densely overgrown areas should be surveyed more intensively during the early spring or late fall when vegetation will be at a minimum. Survey access was denied in one area that should be surveyed in the next phase. Known cultural affiliations for the sites include the Middle and Late Archaic periods and the nineteenth century.

25-262 Barber, Russell J.

1979 A Quantitative Assessment of the Reliability of Archaeological Site Records in MA. 60 pages.

This report documents a study of the reliability of archaeological site records in Massachusetts, using the lower Merrimack Valley as representative of the state as a whole. Reliability, the ability to locate accurately in the field a site which had been documented in records, was tested by comparing site records with the results of the field-testing. The results are presented in quantitative form, the contributions of different factors to information distortion are assessed, and recommendations are made. In addition, descriptive sections on the physical environment, land use patterns, and archaeology of the survey areas are included to facilitate evaluation of the database.

25-263 Gramley, Richard M.

1979 Phase I Step 2 Archaeological Investigation for Peabody Task A, Peabody, MA. 20 pages.

Archaeological reconnaissance in sections of the proposed relocation route of Route 128 in the Town of Peabody, Massachusetts has revealed the existence of archaeological sites for which additional study is recommended. Among these are a rockshelter of unknown cultural affiliation, and a painted rock face, both of which are jeopardized by future construction operations. An historic 19th century farmstead rich in artifacts and lesser, but potentially interesting, sites will be destroyed or adversely affected.

25-264 Casjens, Laurel

1979 Archaeological Site Catchments and Settlement Patterns in the Concord River Watershed, MA. 297 pages.

A study of site locations and catchments was carried out in Concord in an effort to aid in the construction of a predictive model of settlement patterns. Concord was chosen as the focus of the study because of the high quality of the archaeological records from the town. The settlement pattern analysis, using the environmental setting as the basis showed that sites are near water on gentle slopes having arable soil. Sites are located on floodplains, flat uplands, knolls, ridges, and an island. Site catchments emphasized the importance of gentle terrain with arable soil, and also suggest that variety in the form of wetlands was sought. Research was also carried out regarding theoretical models relevant to developing a predictive model for prehistoric site location, with special consideration given to locating sites in the Northeast, into the ethnohistory of the Concord area, and into subsistence strategies relevant to the Concord area.

25-265 Stokinger, William, and Ann Davin

1978 Phase II Archaeological Investigations of Smith Mills Housing for the Elderly, Dartmouth, MA. 34 pages.

Identified as the location of a multi-component prehistoric site during reconnaissance level survey, this property bordering the Paskamanset River was subject to both hand and machine assisted intensive survey. The investigation indicated that the Middle Archaic and Late Archaic site had been heavily disturbed by agricultural land use. It was recommended that new construction avoid two areas which, although disturbed, remain archaeologically sensitive. No other loci will require further archaeological investigation.

25-266 Anthony, David

1978 The Archaeology of Worcester County: An Information Survey. 73 pages.

This report is intended to describe and evaluate the information sources and database for archaeology in Worcester County, Massachusetts. The study pools much of the archaeological information currently available on Worcester County, draws attention to the biases which exist in this database and suggests topics on which archaeological research might profitably be conducted within Worcester County.

25-267 Bawden, Garth

1979 Report of Archaeological Survey, Heritage Hills, Plymouth, MA. 10 pages.

This report describes the results of an archaeological reconnaissance over the 90 acre property included in the proposed Heritage Hills subdivision in Plymouth. Although the environmental engineers supported the archaeological study, no public funds supported the proposed development. Background research, surface survey, limited excavations, and an assessment of physical environmental probability allowed the author to make recommendations regarding the likelihood of archaeological impacts. Recommendations based on a local assessment within a comparative framework to southeastern Mass. archaeological data were made, outlining three areas of high archaeological potential. One recorded prehistoric site was examined. The recommendations were given to aid in minimizing impacts from the proposed housing development.

25-268 Bawden, Garth

1979 Phase I Step I Archaeological Survey of the Revere Beach Connector, Revere, MA. 10 pages.

This report describes background research conducted in order to assess the archaeological potential of the right-of-way for the proposed Revere Beach Connector in Revere. The investigation area lies wholly in a salt marsh. The study concluded that although the salt marsh would have provided a rich hunting and fishing source area, the impact area does not include locations which would have been suitable for human use or occupation. No further archaeological investigation was recommended.

25-269 Dincauze, Dena F., James Moore, and Dolores Root.

1979 Automated Data Retrieval Systems and Site Sensitivity Indices. 94 pages.

The report describes work completed to date on an automated data retrieval system, a test of the system using some Connecticut Valley site data, and a statement of approach toward a site sensitivity index which would complement the data file. The data file which this project was to have developed was intended to facilitate the planning and resource management responsibilities of the Massachusetts Historical Commission.

25-270 Huntington, Frederick

1979 Phase I Step I Archaeological Survey of Chestnut Street, Abington, MA. 18 pages.

The results of background research and walkover investigation of the proposed road reconstruction project of Chestnut Street in Abington are described. The presence of a variety of permanent water sources and well drained soils, as well as the recorded prehistoric exploitation of the general area are the basis for assessing the project area to have a moderate potential for containing prehistoric archaeological properties In addition, a mill and mill dam were located. The mill has been through a series of evolutions, starting in 1725 as a sawmill, and being converted to a box factory until it was abandoned in the early 1900's. Subsurface testing to locate prehistoric sites and to evaluate the significance of the mill site was recommended.

25-271 Ulrich, Thomas

1979 An Archaeological Survey of the Deerfield Industrial Park. 30 pages.

A reconnaissance and locational archaeological investigation was carried out for the proposed construction of the Deerfield Economic Development and Industrial Commission Industrial Park in South Deerfield and Whatley, Massachusetts. Background and field studies were carried out for the entire project area. An intensive survey was carried out for a selected portion of the industrial park which appeared to have a very high archaeological potential. The conclusions drawn from these surveys were that part of the eastern portion of the project area contain prehistoric cultural resources. The area on and about the prominent sand dune in the center of the project area contains prehistoric cultural resources which are terminally disturbed. The area to the south of the sand dune contains a Paleo Indian site of great significance. Recommendations based on these results are: that part of the project area be subjected to an intensive survey before any construction is conducted; that the area on and about the sand dune not be protected due to the excessive disturbances; and that the portion of the project area south of the sand dune which contains prehistoric cultural resources of great potential be preserved and protected by covering it with three to five feet of earth. The latter area is recommended as eligible for nomination to the National Register of Historic Places.

25-272 Huntington, Frederick

1979 Phase I Archaeological Survey of W. K. Webb State Park, Hingham, MA. 22 pages.

This report describes the results of background research and walkover investigation of the Lower Neck area in Weymouth. The archaeological investigation was conducted prior to the construction of Webb State Park by the Department of Environmental Management. The area was thought to have a low potential for containing historic period resources, and a high potential for containing prehistoric resources. During the walkover, lithic debitage, fire reddened rock and a red felsite hammerstone were discovered. However, the walkover also demonstrated that earthmoving activities had destroyed a large part of the project area. Subsurface testing in certain areas which had escaped destruction was recommended.

25-273 Hammer, John

1979 United States Army Reserve Center, Quincy Massachusetts. 2 pages.

Land modifications indicated to the researcher that the property, farmland until the early 20th century, had no potential for the location of significant archaeological resources.

25-274 Rempelakis, John, and Ellen F. Rosebrock

1979 Phase I Step I Archaeological Survey of the New Bedford Fairhaven Bridge Realignment Project, New Bedford and Fairhaven, MA. 22 pages.

The investigation area occupies a heavily disturbed stretch of urban land that possesses moderate potential for the location of historic sites but only minimal potential for the presence of prehistoric sites. Two factors--the absence of known prehistoric sites within or near the project area and the disturbance of much of the project area by urban construction--suggests that little or no prehistoric potential be attached to the area of investigation. However, the well-documented 19th century historic archaeological potential in the impact area argues for the necessity of conducting subsurface tests for historic sites in those apparently undisturbed or only partially disturbed segments of the project area.

25-275 Mulholland, Mitchell T., and Robert Drinkwater

1979 Phase I Step I Archaeological Survey of the Route 181 Realignment, Belchertown, MA. 28 pages.

This assessment concludes that there are 4 areas of prehistoric interest within the project area, 2 of which are apparently findspots of prehistoric material culture. All of these will be subject to direct impact from the proposed realignment. There are 3 historic sites that will require Phase II intensive subsurface examination and evaluation to determine their eligibility for inclusion in the National Register of Historic Places.

25-276 Huntington, Frederick

1979 Phase II Archaeological Survey of W.K. Webb State Park, Weymouth, MA. 87 pages.

Intensive subsurface investigations occurred within the project area which is situated between the mouth of the Weymouth Back River and the Fore River. Phase II investigation of Area A indicated that it had been repeatedly visited by prehistoric groups. The diagnostic artifacts recovered from Area A demonstrated that the Lower Neck Site had been exploited from at least the Late Archaic period until the Middle Woodland and possibly until the time of European contact. The presence of intact cultural features in Area A enhances the possibility of defining changes in the subsistence strategies and seasonality of occupation between the different prehistoric cultural groups which exploited the Lower Neck. These features, many of which contain datable charcoal samples, may also contain faunal and/or floral material which will help define some of the available resources which were being exploited at the time of the feature's construction. By comparing the material from cultural features of different time periods, it may be possible to define changes

in subsistence and seasonality of occupation.

25-277 Rutsch, Edward S., Suzanne Spencer-Wood, and Meredith Belding

1979 Data Recovery Operations at the Shaw (Moose Hill Reservoir) Site, Upper Quaboag Watershed, MA. 276 pages.

Data recovery operations were conducted at two sites in Leicester, central Massachusetts. The Shaw Reservoir gristmill site and the Shaw House site. These sites will be inundated by the construction of Moose Hill Reservoir. Documentary research into the history of these sites and their possible relationship as mill and miller's house is described, and a series of propositions regarding these sites' histories and places in local, regional, and national economic interaction are presented. Field investigation of these sites and subsequent analysis of structural and artifactual remains are described. The mill site was powered by a turbine, at least in its latest phase, and its structure is described in detail. The house site is approximately contemporary with the mill, but documentary and archaeological evidence argue against their ownership by a single individual. The dwelling on the house site appears to have been moved after a brief span of occupation. The various propositions are evaluated in light of research, and conclusions are drawn. Following the technical report, a brief popularized treatment of the project is presented for the lay public.

25-278 DePaoli, Neill

1979 Archaeological Investigation at the Gate 4 Area, Charlestown Naval Yard, Charlestown, MA. 12 pages.

Archaeological investigations within the Gate 4 through Fifth Street project area of the Charlestown Naval Shipyard revealed evidence of successive development of the property through time. Limited surface testing located the remains of a nineteenth century structural feature believed to be a breakwater/wharf and part of the granite foundation of the post-1861 commandant's house. Archaeological monitoring during construction was recommended as was comprehensive documentary research regarding the Naval Shipyard.

25-279 McKenzie-Pollack, Lorna

1979 Phase I Archaeological Survey of Burke Field Industrial Park, North Adams, MA. 23 pages.

An historic farming complex was the focus of this archaeological and architectural survey. Research indicated that the earliest structure dated from the second quarter of the 19th century and recovered ceramics confirmed this initial date of occupation. Further work was recommended in order to determine the relationships between archaeological deposits and standing structures.

25-280 Hoffman, Curtiss

1979 Astra Pharmaceutical Site Archaeological Survey. 22 pages.

Members of the Ekblaw Chapter of the Massachusetts Archaeological Society conducted salvage archaeology at a location undergoing industrial development within the flood plain of the Assabet River. Subsurface testing and surface collecting revealed hearth features and artifacts diagnostic of the Late Archaic Period.

25-281 Hammer, John

1979 The Report of the Archaeological and Historical Survey at Fort Devens, Massachusetts And its Off-Base Facilities. 283 pages.

Fort Devens Military Reservation encompasses approximately 10,000 acres west of Boston, MA in Middlesex and Worcester Counties along the Nashua River. Within the reservation boundaries are several areas of swamp and marsh, dry uplands, cantonment, and impact areas. The survey was based upon ecological reconstruction, documentary history, and field-testing. No evidence of prehistoric occupation was found in the course of testing and the evidence of historic occupation encountered was not considered significant. The author concludes that a major factor in the lack of cultural material found is the amount of disturbance which has occurred in the project area.

25-282 Bawden, Garth

1979 Phase I Step 2 Archaeological Survey for the Methuen Route 213-113 Connector Project, Methuen, MA. 9 pages.

This Phase I Step 2 report describes an archaeological survey on the proposed site of ramps associated with construction of the Rtes. 213-113 Connector in Methuen, Massachusetts. The investigation follows Phase I, Step I investigation which assessed the potential of the undisturbed portions of the project area for presence of prehistoric archaeological properties as high. The area is presently open woodland and contains a small brook and remnants of an old stone wall. Subsurface testing failed to indicate the presence of prehistoric cultural loci and no further investigation was judged necessary.

25-283 Thorbahn, Peter, Leonard Loparto, Deborah Cox, and Brona Simon

1980 Prehistoric Settlement Processes in Southern New England: A Unified Approach to Cultural Resource Management and Archaeological Research. 64 pages.

The goal of this research is to identify a body of research problems which can be shared by Cultural Resource Management and Research Archaeology. By stating this goal, the report does not mean to imply that resource managers are by nature insensitive to the needs of research; quite the opposite in fact. The thoughtful development of comprehensive state plans for resource conservation belies that notion (cf. Massachusetts Historical Commission 1979). The authors believe the sad truth is that research archaeologists have been relatively unresponsive to the needs of the managers by not adequately explaining “what kinds of research could be done using the information known or thought to be present in the (archaeological) property” (Federal Register 9/21/77, pg. 36). The body of the study is divided into five sections. Chapter Two contains a detailed discussion of data collection methods and an evaluation of the data based on archaeological sites, for this region. The next chapter presents the analysis of computer-generated maps which were used to develop a temporally aggregated model of density, dispersion, and complexity for the region. Chapter Four is an investigation into the utility of two kinds of predictive models of archaeological settlements. Chapter Five is an examination of several alternative hypotheses of settlement processes which may have been operating in the Coastal Lowland during different pre-historic periods. The study concludes with a series of specific recommendations for management policies and a discussion of implications of this study for further research.

25-284 Rosebrock, Ellen Fletcher

1980 Architectural and Archaeological Evaluation of the Lowell Medical Instrument Building. 41 pages.

The Lowell Medical Instrument Company Building is actually the much altered Lowell Card Company building, an industrial structure built by Ieasees in 1873 on land owned by the Proprietors of Locks and Canals on the Merrimack River. Archaeological promise exists in several areas. The cellars are full of cast-offs left behind by tenants. A crawl space near the canal, and the “fringes” behind the building near the canal and the railroad spur (outside its lot) may contain data in both disturbed and undisturbed contexts on prehistoric and historic period use.This report finds that the existence of a structure on the Lowell Card Company site is important to the appropriate

appearance of the Shattuck streetscape. Recommendations suggest first, the retention of the present structure (probably not feasible); and second, its replacement, after structural and archaeological study, by a carefully planned building that holds the street line on Shattuck and Market Streets.

25-285 Rosebrock, Ellen Fletcher

1979 Phase I Archaeological Reconnaissance for the Urban Site Heritage Park, Fall River, MA. 69 pages.

Part of Fall River's working harbor from the early nineteenth century through the mid-twentieth century, the land once contained cotton and iron industries, sail lofts, as well as steam mills and coal yards. The study recommends archaeological testing in order to determine the nature and extent of historic remains and further historical studies on industrial development within the area.

25-286 Simon, Brona G.

1980 Acushnet Wastewater Facilities Project: Archaeological Reconnaissance Survey. 50 pages.

Background research suggested that five project areas would be sensitive for prehistoric or historic sites. Walkover survey and some subsurface testing identified two prehistoric sites: the Blue Feather Site and the Swift Site; one historic site the Pine Lawn Sanitarium/ Nye Estate and one pre-historically sensitive area. The Blue Feather Site belongs to the Susquehanna Tradition of the Transitional Period and the Swift Site was occupied during the Late Woodland-Levanna Period and possibly during the Contact Period. The historic site was continuously occupied since before 1836 to the present by a variety of people including two prominent Acushnet merchants in the early 19th century, and health patients, doctors, and nurses, in the early twentieth century. The report recommends that both prehistoric sites be tested at a Phase II level in order to determine National Register eligibility; and that the historic site and prehistorically sensitive area be tested at a Phase I Level.

25-287 Mahlstedt, Thomas F.

1979 Archaeological Impact Assessment: Elisha Jones House, Minute Man National Historic Park, Concord, MA. 7 pages.

Archaeological testing occurred at the Elisha Jones House previous to modern landscaping. The date of construction of the house is unknown due to confusion in the documentary record and a lack of original fabric in the structure. Testing did not reveal a date of origin for the house, but indicated that considerable subsurface disturbance had occurred in the area, diminishing the utility of l8th-20th century artifacts recovered.

25-288 Ritchie, Duncan

1980 Cultural Resources Survey: Great Meadows National Wildlife Refuge, Massachusetts. 75 pages.

Background research and a locational survey were conducted for a 15 acre parcel within the Great Meadows National Refuge (formerly known as the Elbanobscot Center). The comprehensive report of background studies indicated the presence of the historic and six prehistoric sites within the 500 acre Elbanobscot tract. Field Survey of the 15 acre parcel discovered three additional prehistoric loci. Only one of these three loci is threatened by proposed refuge development plans. The author recommends that a site examination project be carried out prior to construction in order to assess the National Register eligibility of the site.

25-289 Bolian, Charles

1979 A Cultural Resource Survey of the Parker River National Wildlife Refuge, Massachusetts. October 1979. 88 pages.

This report describes a cultural resource reconnaissance of the Parker River National Wildlife Refuge in Newbury. Background research and field investigations centered on proposed impact areas (proposed new administrative buildings, road, parking and trail construction area, visitor parking facilities areas). Most of the archaeological sites encountered were small middens in the sand dunes which have been disturbed by both natural and human forces. One site, the Bluffs, will not be affected by immediate project development although a boat ramp which is planned in the future will impact the site. Another reported site on Nelsons Island is a tidally submerged site and has yielded large quantities of bone tools and faunal remains. The author recommends that additional archaeological investigations at the Parker River National Wildlife Refuge be conducted to investigate sites indicated in this report and those which are outside of the impact area. The whole of Plum Island and some adjoining areas may qualify as an archaeological district for the National Register of Historic Places.

25-290 Raber, Michael S., and Judith Francis Zeitlin

Intensive Cultural Resources Survey for Proposed Water Facilities in Townsend, MA. 36 pages.

Documentary research was combined with subsurface testing in order to investigate cultural resources within the project area. Historic period land use was confined to pastoral and agricultural activities, while evidence of prehistoric land use was not found, despite the presence of favorable environmental conditions. It was concluded that the project was unlikely to affect significant archaeological resources.

25-291 Howry, Jeffrey C.

1980 Cultural Resources Survey, Ward Hill Interceptor Extension, Haverhill, MA. 8 pages.

An intensive level cultural resource survey was conducted for a proposed 11,500 foot sewer line in the vicinity of Ward Neck Hill, Haverhill, Massachusetts. Limited prehistoric and historic evidence was disclosed by field investigation and from documentary sources. Recent alluvial deposition from exceptional flood conditions may have covered certain archaeological features, thereby limiting their identification. Selected construction monitoring is recommended.

25-292 Carranza, Carlos

1980 An Archaeological Survey of the Arm Brook Interceptor Corridor, Westfield, MA. 11 pages.

No cultural remains were encountered during an intensive survey of the Arm Brook Interceptor Corridor. As non-diagnostic prehistoric remains had been found near the project area in the past, the author recommended archaeological field investigation inspection during the course of the construction project.

25-293 Lacoste, Kenneth C., and Kathleen Fiero

1979 Draft Archaeological Resource Study, Lowell National Historic Park, Lowell, MA. 103 pages.

The purpose of this study was to identify, describe, and assess known and potential archaeological resources, in Lowell National Historical Park in Lowell, Massachusetts. Specific properties and buildings (generally of 19th century industrial origin) of interest to future plans were studied.

These properties were referred to as the Old City Hall (lot), Solomon Building (lot), Jade Pagoda Building (lot), Linus Child House (lot), Merrimack Canal Gatehouse (lot), Wannalancit Mill (lot), and Tremont Mill (lot). Lowell National Historical Park includes the canals, several mills and the old business core of Lowell. From this, the above properties were selected for detailed study because of their possible importance in future park development.

25-294 Thomson, Charlotte W.

1979 Cultural Resource Survey, Proposed Sewerage System, Whitman, MA. 18 pages.

Subsurface testing aimed at locating prehistoric material remains within the project area proved unsuccessful. Some information, including photographs and maps, is included regarding the 1745 Hobart canal and tunnel which lies in the area of study.

25-295 Mulholland, Mitchell T., and Eugene Ham

1980 Phase II Extension-Evaluation and Preliminary Data Recovery of Portions of Shea Site East – Route 181, Belchertown, MA. 103 pages.

Shea site east is a prehistoric Woodland Period site, probably Early Woodland with a potential for containing a later component. This report concludes that while the site has a relatively low artifact density, it is made primarily of intact features, consisting of fire hearths, fire-reddened soil deposits containing charcoal and fire-cracked rock, and black greasy midden deposits. Preserved organic materials from the site include bone, antler, seeds, and pollen. It was determined that the site, already having yielded significant data, was unlikely to yield additional data of importance. It was recommended that no further archaeological testing occur at the site.

25-296 Leveillee, Alan D., and David Goldsmith

1979 Archaeological Investigations of the Mansfield-Norton Wastewater Treatment Facilities. 32 pages.

An intensive archaeological survey of the Mansfield-Norton Wastewater Treatment Plant site and a reconnaissance survey of a Regional Interceptor was conducted in order to determine the presence or absence of archaeological remains from both the prehistoric and historic periods. At the treatment plant, a prehistoric site (White Crow) of unknown age and an historic site (Crane) occupied at least from 1830 to 1870, were located. Both sites are recommended for further testing in order to determine National Register eligibility. The route of the 11km. (6.9 miles) Regional Interceptor will be an abandoned railway bed. No indications of archaeological sites were seen during a walkover inspection. The method of railway bed construction would have destroyed any sites below grade. No further archaeological investigations are recommended.

25-297 McAllister, Mary Beth, and Charles Bolian

1980 A Phase I Archaeological Assessment of the Tyngsboro Elderly Housing Project. 25 pages.

The proposed construction area was the site of a large house with outbuildings, commonly known as the Brinley Mansion. This house was built in the mid – late 1700's, remodeled and enlarged in the late 1800's, and razed by the Academy of Notre Dame in 1978. Historical research, summarized below, also indicates there may be remains of an earlier house on the site. Based on historical records, conversations with Tyngsboro residents who believe the foundation to be intact under fill, and limited subsurface testing, further archaeological testing and research are recommended. The goal of such work would be to determine the significance of historic cultural remains on the site relative to National Register of Historic Places eligibility criteria.

25-298 McManamon, Francis D.

1980 Archaeological Survey of Cape Cod National Seashore. 42 pages.

The archaeological survey of Cape Cod National Seashore is a multi-year study designed to help manage and interpret prehistoric and historic archaeological resources. The present volume contains a brief description of 1979 work and some inferences based on the work covering such topics as assemblage and strata analysis. Other parts of the study describe the 1980 goals, strategy, organization, duties, procedures, and recording forms.

25-299 Thomson, Charlotte, W.

1978 Phase I Archaeological Survey, Gloucester (Lansville), Massachusetts. 14 pages.

Documentary evidence and existing environmental conditions indicated a potential for the presence of prehistoric sites in area where pumping station construction was planned, generally in Gloucester coves and along the shoreline. Subsurface testing revealed no prehistoric cultural remains within the project area.

25-300 Raber, Michael S

1980 Cultural Resource Reconnaissance Survey for a Proposed Sewerage Facility in Westminster, Massachusetts. 43 pages.

Considerable regional data relating to the history and prehistory of Westminster and the central Massachusetts uplands is included in this reconnaissance level report. This information combined with a walkover led the author to conclude that small prehistoric sites might exist in portions of the project area close to water sources and that subsurface testing ought to occur in areas where cross-country alignments are planned.

25-301 Starbuck, David, Ellen Rose Savulis, Myron Stachiw, Claire Dempsey, Bruce Fernald, and Victoria Kenyon.

1980 Seventeenth Century Historical Archaeology in Cambridge, Medford, and Dorchester. 475 pages.

The report documents historical research and archaeological excavations at three 17th-century properties in eastern Massachusetts, the Cooper-Frost-Austin Property, Cambridge, the Robert Pierce Property, Dorchester and the Peter Tufts Property, Medford. Aspects of intra-site trash disposal practices, and settlement patterning in the seventeenth and later centuries are demonstrated and factors which led either to survival or destruction of seventeenth century sites subsequently engulfed by 19th or 20th century urban expansion are discussed.

25-302 Mahlstedt, Thomas F.

1979 Archaeological Impact Assessment, Longfellow National Historic Site, Cambridge, MA. 9 pages.

Areas to be impacted by site work were tested for evidence of prehistoric or historic cultural resources. Historic materials recovered were of limited analytical value and not considered significant. Testing for prehistoric materials met with limited success due to substantial alluvial deposition. It was recommended that further testing focusing on the location of prehistoric materials occur previous to construction.

25-303 Huntington, Frederick

1980 Phase I Step I Archaeological Survey of the Mill Street Project, Lenox, MA. 14 pages.

The proximity of the project area to the Housatonic River suggests that it has a moderate potential for containing prehistoric archaeological properties. However, the on-site reconnaissance survey revealed that the project area had been extensively disturbed by the construction of the Lenoxdale Memorial Bridge, the railed of the Conrail railroad, an abandoned gravel roadway, and the paved roadway which leads to the Berkshire Gravel Company's gravel pits. Therefore, although the project area possessed a moderate potential for containing prehistoric archaeological properties, the high degree of surface disturbance negates this potential. This situation is also applicable to archaeological properties of the Historic Period. Therefore, further archaeological work within the project was deemed unnecessary.

25-304 Zeitlin, Judith F., Michael S. Raber, and Robert N. Zeitlin

1980 Holyoke Range Visitor's Center. A Report on Phase I and Phase II Cultural Resource Survey. 40 pages.

The proposed project area is a kame terrace, covered by a mixed stand of hardwoods and conifers, and is near outcrops of Triassic diabase. Background research led to the conclusions that the project area probably was not used for any permanent occupation in the prehistoric period, but may well have been traversed or camped on in that era in connection with north-south travel, exploitation of the diabase outcrops for stone tool manufacture, or seasonal hunting and gathering activities. It also appeared that until the twentieth century, historic period use of the North area was limited entirely to travel over the Holyoke Range. Field investigations did not uncover prehistoric or historic archaeological sites, or any prehistoric artifacts.

25-305 Leveillee, Alan

1980 An Intensive Archaeological Survey of the Proposed Mansfield-Norton Treatment Facilities Outfall Area and of the White Crow Prehistoric Site located in the Proposed Mansfield-Norton Wastewater Treatment Facilities Area. 34 pages.

Archaeological field-testing revealed the presence of a prehistoric site within woodland bordering the Three Mile River. Materials recovered indicate that the site was occupied during Transitional Archaic to Woodland times. Either alteration to construction plans or intensive excavation at the site was recommended. Investigations at the White Crow Site indicated a small camp/kill site associated with Transitional to Early Woodland Periods. Again, the options of construction redesign or the implementation of a data recovery program were recommended by the researcher.

25-306 Elia, Ricardo J.

1980 Report on the Phase I Archaeological Investigation of the Proposed Wastewater Facilities, Natick, MA. 31 pages.

Wastewater facilities proposed for Natick include that area known historically as the burial ground associated with a 17th century and 18th century Indian Settlement. John Elliot's mission town at South Natick is described as is the 18th century Indian settlement pattern within the same locale. A chronology of historic period Indian burials recovered in the past at South Natick is included. It is recommended by the researcher that the project avoid those known historically to have contained burials and that other portions of the project area be subject to further archaeological investigation.

25-307 Bawden, Garth

1979 Danvers-Beverly Relief Sewer Interceptor Phase III. 15 pages.

Although the project area is in close proximity to the Danvers and North Rivers as well as Beverly Harbor, most of the area to be impacted by the proposed project consists of ground which has already been deeply disturbed by residential and commercial construction activity. Several small areas of beach and inland woodland remain relatively undisturbed. These areas, when tested for the presence of prehistoric settlement, showed no evidence of such occupation. As a National Register Historic District in Beverly would potentially be impacted by an alternate route, it was recommended that an alternate be chosen which avoided impact to the archaeological mains in the District.

25-308 Graffam, Gray, and Ellen Fletcher Rosebrock

1980 Phase II Intensive Archaeological Survey of the Red Line Extension, Northwest, Harvard Square, Cambridge to Alewife Brook Parkway, MA. 155 pages.

The report details research and excavation at the mid-seventeenth century Olmstead-Goffe house site, the 18th century Wiswall's Den privy site, and at a nineteenth century meetinghouse site. Recommendations are made regarding further cultural resource investigation at these sites and in the larger project area.

25-309 Howry, Jeffrey C.

1981 Cultural Resources Survey, Alpha Street Interceptor, Haverhill, MA. 18 pages.

A reconnaissance cultural resource survey was performed along the proposed Alpha Street sewer interceptor route from Fletcher Avenue near the Methuen-Haverhill town line, downstream along the north bank of the Merrimack River to the terminus of an existing interceptor south of the intersection of River Street (Route 110) and Niagara Street. Documentary research combined with a terrestrial survey disclosed several sites of local historic value. Evidence of previously reported prehistoric sites was not found within the proposed right-of-way. Should the proposed interceptor be constructed, certain measures are recommended that would avoid or minimize the impact to identified resources.

25-310 Simon, Brona G., and Alan Leveillee

1980 Archaeological Reconnaissance Survey of Portions of the Proposed Wastewater Facilities Plan in Swansea, MA. 73 pages.

An archaeological reconnaissance survey of seventeen portions of the proposed wastewater facilities plan for the Town of Swansea, MA. Three areas are recommended to be avoided; eight areas are recommended for intensive archaeological survey, and six areas will require no additional archaeological research. Those areas of greatest archaeological sensitivity are located near to Narragansett Bay where, in the past forty years, a number of prehistoric and Contact Period aboriginal burials have been discovered.

25-311 Bawden, Garth

1980 Phase II Archaeological Survey, Green River Relief and Replacement Interceptor Project, Greenfield, MA. 8 pages.

The project area, a portion of river terrace, bordered the Green River, Greenfield, MA. Subsurface testing failed to locate cultural remains, a fact accounted for by a history of previous ground disturbance and periodic flooding in that locale. The author recommended that no further archaeological investigation be conducted.

25-312 Cheney, John

1981 Phase II Archaeological Reconnaissance for the North Area of the Central Artery Reconstruction Project, Boston, MA. 61 pages.

The report chronicles domestic, industrial and maritime activities from the 17th through the 19th centuries within the Charlestown, MA project area. Recommendations are made regarding archaeological research at a number of specific sites.

25-313 Pierce, Anne M.

1980 Phase I Reconnaissance Survey and Study: Proposed Wastewater Transmission Facilities, Nantucket, MA. 28 pages.

In a general manner, the collective known historic and prehistoric resources of Nantucket are presented and judged in relation to wastewater transmission alternatives. Walk over survey of the possible alternates occurred. An intensive survey along a portion of the recommended alternative was suggested.

25-314 Wilson, John S., Patrice Teltser, and Jeffrey Kao

1981 Cultural Resource Reconnaissance for Operation and Maintenance of Conant Brook Dam, Monson, MA. 21 pages.

A cultural resource reconnaissance of Conant Brook Dam was conducted during the summer of 1978, as the initial study in a program of cultural resource identification within the New England Division's properties. Background research and field investigation located no prehistoric resources within the project bounds. Eight historic period sites were identified during background investigations. Fieldwork determined that four of these had been totally obliterated during dam construction, while the remaining four were partially destroyed. The nature and condition of remaining resources indicates that present reservoir operation is not significantly affecting their preservation, and that proposed development plans are also unlikely to adversely affect any significant cultural resources.

25-315 Claassen, Cheryl P.

1980 Phase II Archaeological Survey for the Methuen Wastewater Project, Methuen, MA. 10 pages.

Sub-surface testing was conducted in this project area which borders the Merrimack River. No prehistoric or historic sites were located in the project area, which was accounted for by considerable ground disturbance in the area surveyed as well as the presence of the Gloucester series of soils, which were, apparently, rarely utilized in the lower Merrimack River region for prehistoric site location.

25-316 Luedtke, Barbara F.

1980 The Calf Island Site and the Late Prehistoric Period in Boston Harbor. 50 pages.

The Calf Island site in Boston Harbor is a small specialized procurement and processing station dating primarily to the Late Woodland. The seasonality of this site and the activities that took place there are discussed. The site also provides data relevant to the problem of settlement pattern change during the Late Woodland period in New England.

25-317 Mahlstedt, Thomas F.

1980 Archaeological Monitoring: Bunker Hill Monument Stabilization, Charlestown, MA. 120 pages.

The archaeological monitoring was designed to serve three primary goals: 1. to provide an archaeological record and evaluation of the grade, alignment, and fabric of sections of historic sidewalks and paths; 2. provide an archeological record and details of the method of construction, drainage, and alterations to the obelisk foundation and perimeter fence; and 3. provide an archaeological record and evaluation of other undocumented cultural resources which might be exposed during the rehabilitation of the Bunker Hill Monument.

25-318 Pierce, Anne M.

1980 Phase I – Archaeological/Historical Reconnaissance Survey Study, Proposed Wastewater Facilities, Oak Bluffs, MA. 16 pages.

General archaeological and historical information was compiled on the community of Oak Bluffs and a walk over subsurface testing survey was performed. No historic or prehistoric archaeological sites were encountered and the author determined that no cultural resources would be affected by the proposed wastewater facilities.

25-319 Raber, Michael S., Richard Morris, and Christopher Nagle.

1981 Reconnaissance Survey of Cultural Resources in Alternative Sewerage Project Areas, Falmouth, MA. 51 pages.

Considerable documentary research was conducted on historic development, prehistoric occupation in the region, and changes in Falmouth's physical landscape through time. Subsurface testing was conducted, and resulted in the location of four prehistoric loci which the authors suggest be subject to further archaeological investigation.

25-320 Hoffman, Curtiss

1981 Archaeological Reconnaissance Survey of the Walkup Flanders Road Property, Westborough, MA. 10 pages.

Historical and ethnohistoric information regarding this tract of land was collected previous to field-testing. Prehistoric remains were encountered in a portion of the property. The author has requested that provision for the protected archaeological remains be considered previous to its development.

25-321 Elia, Ricardo J.

1980 Archaeological Investigation of the Proposed Stage II Sewers in Grafton, MA. 28 pages.

Sub-surface testing revealed no archaeological remains in the project areas, located in Grafton, MA. Much documentary evidence is presented on Hassanamisitt, the 17th century settlement of Christian Indians which existed in Grafton.

25-322 Baker, Vernon G.

1980 Archaeological Overview and Evaluation: Minute Man National Historical Park, MA. 109 pages.

The present study of Minute Man Historical Park contains two major sections. First is a summary and analysis of previous archaeological work. This includes a description of each site and its artifactual material as well as a general synthesis of all the past work. Emphasis is placed on research

objectives and methods, particularly the ways in which documentary data have been utilized. Since none of the results of archaeological research has been published, the present study will make these data more accessible. The second section is an evaluation of the park's archaeological potential. This section discusses the relationships of past and future archaeological research to management and research objectives. It summarizes these objectives and needs, outlines the interpretive value of past research, and makes recommendations for future work. To date, all sites excavated within the Park have either predated the Battle of Lexington and Concord or been associated with its participants.

25-323 see 25-287.

25-324 Simon, Brona G., and Virginia H. Adams

1980 Intensive Archaeological Survey of Three Sludge Disposal Locations in Mansfield, MA. 35 pages.

The Public Archaeology Lab (PAL) conducted an intensive archaeological survey of three locations in Mansfield, Massachusetts. These areas are presently under consideration as sludge disposal sites for the proposed Mansfield-Norton Wastewater Facility by Camp, Dresser and McKee, Inc. The survey identified archaeological resources in two of the three project areas: the Treatment Plant Prehistoric Site at the existing Mansfield Wastewater Facility and the Brawn-Cobb Historic Site (PAL No. 80H3) east of the Mansfield Airport. Both sites warrant additional archaeological research. No archaeological sites were found at the Maple Street location.

25-325 Strauss, Alan E.

1980 Cultural Resource Reconnaissance Survey, Kingcrest Terrace, Randolph, MA. 27 pages.

Walkover survey and subsurface testing located two prehistoric sites, the previously unknown Electric Site and the previously known Mill Street Site and one historic site, the Mary Lee Brook Site. The age of the Electric Site could not be determined but the Mill Street Site belongs to the Middle Archaic Period. The Mary Lee Brook historic site may have been used during the 19th century but further testing is needed to determine this. Its is recommended that sites 80H2 and 80P9 be tested at a Phase II level (Site Examination) in order to determine National Register eligibility and that no further testing take place at the small portion of the Mill Street Site which lies inside the project area.

25-326 Ulrich, Thomas

1980 Archaeological Survey of the Elm Circle Housing Development, Deerfield, MA. 6 pages.

An investigation was made of the archaeological sensitivity, both historic and prehistoric, of a four acre housing development construction area in South Deerfield, Massachusetts. It was concluded that the only source of such sensitivity would be the relative proximity of the 1675 Battle of Bloody Brook, and that even this slight potential was rendered nil by the considerable impact of railroad construction and subsequent removal which occurred across most of the project area. No further archaeological surveys are required within the project area.

25-327 Drinkwater, Robert W., and Joan M. Gero

1980 Phase II Archaeological Survey of the Right-of-Way Proposed for the Relocation of Route 44, Carver, MA. Sites 57G and 57H, Historic Documentary Research. 30 pages.

In this report is presented documentary evidence concerning two historic period archaeological

sites along the proposed right-of-way of Massachusetts Route 44. Both sites contain the archaeological remains of 18th or early 19th century single-family residences. Designated Site 57G and Site 57H, both sites were detected during a survey conducted by I.C.A. (1979). Both sites are in the Town of Carver, Plymouth County. Further testing and site evaluation has been recommended.

25-328 Raber, Michael S., and Cara Tannenbaum

1980 Intensive Cultural Resources Survey for Proposed Water Treatment Facilities in Essex, MA. 41 pages.

The project areas are near the outlet of Chebacco Lake, one of several connected lakes on the Essex-Hamilton border which drain into the Essex River. Useful documentary research and subsurface testing were included in the project which identified prehistoric remains. Further testing to determine the extent, nature, function and significance of the remains was suggested by the authors.

25-329 Bleacher, Joan M.

1979 Archaeological Impact Assessment: Hartwell Tavern, Minute Man National Historical Park, Lincoln, MA. 6 pages.

During the week of June 4, an archaeological investigation was undertaken at the Hartwell Tavern, Minute Man National Historical Park. The investigation was performed in anticipation of proposed plans to construct underground utilities at the Tavern. The fieldwork consisted of excavating a limited number of test pits located within the confines of the right-of-way construction. The purpose of this limited program of investigation was to ensure that archaeological resources which were specifically associated with the Tavern would not be destroyed during the course of the construction. Although there exist cultural deposits within the proposed limits of construction, they are not sufficient in either form or quantity to add to the present knowledge concerning occupation at the Hartwell Tavern. Landscape modification and the nature of broadcast refuse disposal have previously disturbed the archaeological context within the areas tested. The proposed construction of utilities at the Hartwell Tavern will have no effect on important archaeological deposits at the site.

25-330 Raber, Michael S., Robert N. Zeitlin, and Richard B. Morris

1980 Intensive Cultural Resources Survey for Proposed Water Supply Facilities in Mansfield, MA. 43 pages.

In a project area near a small river and kettle hole ponds, subsurface testing was conducted. Two sites, thought to be temporally associated with the Late Archaic, were discovered and recommended for further investigation. Appropriate background information on aboriginal and Euro-American life-ways is included in the report.

25-331 Raber, Michael S.

1980 Cultural Resources Survey for Proposed Sewerage Facilities in Clarksburg, MA. 26 pages.

The project area lies in the upper and middle reaches of the Hoosac River north branch basin, surrounded by mountains to the east and west. The author concluded, after conducting subsurface testing “that there is hardly anything in the project alignments left to be impacted, let alone anything of significance.” Information on the prehistoric and historic use of the Clarksburg region is included for use by other researchers. It was recommended that the project proceed as planned.

25-332 Hoffman, Curtiss

1980 Intensive Archaeological Survey, Boston Edison Company Right-of-Way 447, Walpole to Westwood, MA. 82 pages.

The area surveyed lies largely in a hilly, upland zone which is a watershed between the Neponset and Charles River drainages in Walpole, Dover, and Westwood. The area is much disturbed by glacial activity, which has left it marked by drumlins, eskers, perched boulders, seasonal ponds and kame deposits. Fourteen prehistoric and historic loci were identified in the project area and recommendations were made which will ensure the survival of the sites or the information within them.

25-333 Bawden, Garth

1980 Phase I and II, Archaeological and Historical Surveys and Preparation of an Interpretive Plan for Moore State , Paxton, Massachusetts. 159 pages.

Moore State Park, in Paxton, Mass., was a small mill village during the 19th and early 20th centuries. It now consists of three standing structures as well as remnants of other buildings. This report uses largely documentary and library research to evaluate the Park's potential for research and to make suggestions regarding an interpretive program. Historical and documentary research indicates that the mills (largely sawmills and gristmills) served the needs of a local market. Because of the relative isolation of Paxton, these mills were not forced to compete with the larger industrial complexes and were able to operate into the present century, much longer than many other small mills. The report concludes that the Park possesses valuable field and literary research potential on industrial and economic changes at the local and regional levels, land use, and settlement pattern changes. These research topics are suggested as principal themes for an interpretive program.

25-334 Randall, Debra A.

1981 Phase II Archaeological Survey of the Dooge Site, Centennial Industrial Park, Peabody, Massachusetts. 9 pages.

The Dooge Site was located in a Phase I survey of the Centennial Industrial Park in Peabody, Massachusetts (Luedtke, 1977 #25-32). However, no cultural material was found in Phase II testing. It was concluded that the site was very small and may have been completely excavated during Phase I testing. The site was considered to be ineligible for the National Register and no further archaeological work was recommended.

25-335 Raber, Michael S.

1981 Essex, Massachusetts: Archaeological Site Examination of a Water Treatment Facility Project Area. 7 pages.

This Phase II testing was carried out in order to make a determination of National Register eligibility for prehistoric resources discovered during the previous Phase I survey (Raber & Tannenbaum 1980 #25-328). The project area consisted of an alignment approximately 925 feet long and 15 feet wide. Within this transect, scattered prehistoric lithic materials were unearthed, but there was no evidence of artifact concentrations, features, or long-term habitation. It was recommended that a determination of non-eligibility be made for the cultural resource in question and that the project proceed as planned.

25-336 Raber, Michael S.

1980 Management Summary: Cultural Resource Investigations for Proposed Sewerage Facilities in Hatfield, Massachusetts. 5 pages.

Test excavations were undertaken at the site of a proposed sewerage treatment facility near the bank of the Connecticut River in Hatfield. Cultural material, including lithic remains and prehistoric ceramics were recovered. In addition, a flexed burial had been previously exposed. This was subjected to some further examination and documentation, then covered again. It was recommended that proposed construction be designed so as to avoid the area that included the burial and areas of relatively high concentration of cultural material.

25-337 Raber, Michael S.

1981 Cultural Resource Investigations at Proposed Sewerage Facilities in Hatfield, Massachusetts. 31 pages.

An intensive survey was undertaken at the site of a proposed sewerage treatment plant near the banks of the Connecticut River and at three proposed pump station sites in Hatfield. At the treatment plant site, inspection of previously exposed cultural materials and testing of deeply buried strata were also undertaken. Only the treatment plant site was found to be archaeologically sensitive. Lithic remains, ceramics, and a flexed burial, tentatively assigned to the Woodland period were present. The treatment plant site was said to have probably been part of a larger complex of prehistoric sites in the area. It was recommended that an area of approximately 2/3 acre, including the burial and areas of high concentration of cultural materials, be avoided by construction, and that the burial site be protected by covering with additional fill.

25-338 Solomon, Janet, Alan Leveillee, and Peter Thorbahn

1981 Phase II Archaeological Site Examination Study of State Highway Route 146 (Contract No.1), Sutton, Massachusetts. 45 pages.

Four prehistoric archaeological sites were intensively examined in the northern section (Contract No.1) of the State Highway Route 146 construction project, Sutton, Massachusetts. Two of them, Hartford Turnpike Quarry and Hicks Pond were found not to meet the criteria of eligibility to the National Register of Historic Places. The other two were believed to be significant cultural resources eligible for the National Register. The Purgatory I Site may have been occupied during the early part of the Late Archaic, and although partially disturbed, it retains enough integrity to make it an important source for this critical, yet poorly understood time period. It would be destroyed by r-o-w cutting, and a preliminary set of mitigation plans were suggested. The last site, Purgatory II, was a very significant property, being the first undisturbed occupation site dating to the end of the Late Archaic identified in the upland region of southern New England. Because of design changes made since it was first discovered in 1978, it now lies outside the direct impact area and bounds of the construction project. However, it should be nominated to the National Register so that it may be afforded some degree of protection.

25-339 McManamon, Francis P., and Christopher L. Borstel

1981 Archaeological Remains, Significance and Potential Impacts Eastham Unit Development, Cape Cod National Seashore, Massachusetts. 32 pages.

From October to December, 1980, the NPS Division of Cultural Resources, North Atlantic Region, examined potential impacts on cultural resources of proposed visitor use facilities of the Eastham unit, Cape Cod National Seashore. Of five areas studied, two (the Three Sisters of Nauset and Doane Rock development) lacked cultural resources. Two additional areas, the Nauset Light and Little Creek Staging Area, had cultural resources but these seemed not to be eligible for the National Register. Testing at Coast Guard Beach revealed both historic and prehistoric artifacts. Only the prehistoric resources at Coast Guard seemed to be eligible for the National Register. This report outlined study procedures and results at each area and the significance of resources in each area. A mitigation plan was proposed for prehistoric remains in the Coast Guard Beach impact area.

25-340 Bolian, Charles E., R. Scott Dillon, and Eugene C. Winter

1981 A Cultural Resource Survey of the Great Meadows National Wildlife Refuge, Massachusetts. 61 pages.

A cultural resource survey of the Great Meadows National Wildlife Refuge was conducted in June and July of 1978 by Archaeological Research Services, University of New Hampshire, to determine the locations of historic and prehistoric cultural resources within the boundaries of the refuge. The survey primarily focused upon areas in which development was planned. Most of these areas contained no cultural resources which would be adversely affected by planned developments. However, the area which was to be the location for new headquarters and visitors center buildings contained both prehistoric archaeological remains and a Federalist farmhouse which may be significant. It was recommended that the farmhouse be preserved. Testing of the archaeological site was insufficient to determine significance. Additional testing is needed to more adequately determine the nature or the data contained in the site prior to any construction activity.

25-341 Randall, Debra

1981 Phase I and II Archaeological Survey of the Rutland-Holden Relief Trunk Sewer Project. 24 pages.

A combination Phase I and Phase II archaeological survey was conducted along the project area of the Rutland-Holden Relief Trunk Sewer Project. This survey was designed to locate archaeological properties, to assess their significance, and to make recommendations for their future management. Despite the proximity of prehistoric sites recorded in archives, no prehistoric properties were encountered. Two historic properties were located, one inside the project area but outside the impact zone, and the other just outside the project area, but in an area which might be disturbed by indirect project impacts. Neither of these sites was judged significant or eligible for the National Register of Historic Places, but it would be desirable that construction avoid disturbing them if possible. No further archaeological work was recommended.

25-342 Simon, Brona G., Peter F. Thorbahn, and Virginia Adams

1980 Taunton Borrow Area Phase I Intensive Archaeological Survey. 17 pages.

Two prehistoric sites, the White Rabbit and the Edwards Sites, were identified during the Public Archaeology Laboratory's intensive survey of a proposed borrow area in Taunton, Massachusetts. The White Rabbit Site was a very large multi-component site which was occupied 5000 to 2500 years ago during the Late and Transitional Archaic Periods. The Edwards Site was a small site which had probably been used by a small group of hunter-gatherers for a short period of time during the Late Archaic. The White Rabbit Site was highly significant and warranted additional archaeological research. No further research was necessary at the Edwards Site because of previous heavy disturbances to the site.

25-343 Andrus, Scott

1980 Management Summary Report: Phase I, Step 1 Archaeological Survey of the Construction of the Peabody-Salem Route 128 Connector (Task B). 23 pages.

Despite the conformity of the topology, geomorphology, and hydrology of the project area to aboriginal settlement patterns, the likelihood of any sites still existing in the area was considered to be extremely small. This estimation was based on literature research and inspection of historic maps, which indicated that intensive urban and industrial development accompanied by severe ground disturbance had occurred within the confines of the project area. No historic properties were found in the area. Therefore, no further archaeological work was deemed necessary.

25-344 Elia, Ricardo J.

1980 Archaeological Investigation of the Proposed Sewers (Contract Nos. 5-8), Holbrook, Massachusetts. 25 pages.

The project study involved construction of sewers and pump stations in the town of Holbrook. A background study of the prehistory and history of the area, consultation of archaeological reports, interviews with local collectors, and consideration of previous disturbances resulting from street construction and utility placement were used to delineate archaeologically sensitive areas. A great deal of the project area followed existing streets and was not field-tested. In those areas that were field tested, no historic or prehistoric remains were identified, and no further archaeological investigation was recommended.

25-345 Beaudry, Mary

1980 Phase I Historical and Archaeological Report, Boston Main and East Side Interceptor and Mt. Vernon Street Sewer, Boston, Massachusetts. 7 pages.

A limited amount of background research and field inspection of construction sites in the vicinity of the project area indicated that most of the project area had been disturbed by previous construction, or was filled land that had once been open water. The fill appeared to postdate the mid-l9th century. No further archaeological work was recommended. The possibility of encountering cultural features in buried shoreline areas during construction was admitted, and it was recommended that in such a case, they should be examined by a qualified archaeologist.

25-346 Raber, Michael S., and Ernest A. Wiegand, II

1981 Byfield, Massachusetts: Intensive Cultural Resources Survey for a Proposed Water Facilities Project. 26 pages.

Background research suggested the possibility of encountering significant Indian cultural resource sites in the project area, but did not suggest that significant Euroamerican sites or other cultural resources would be affected by the proposed water facilities. Very close interval testing conducted on the part of the project area with the greatest potential for Indian sites did not locate any such sites. Euro-American cultural materials which would be affected by the project include recent refuse and stone walls. Due to their common occurrence in New England, the latter are not usually significant and did not appear to be associated with any historic site in this instance. It was recommended that no further cultural resource investigation be conducted and that the project proceed as planned.

25-347 Raber, Michael S.

1981 Abington Massachusetts: Intensive Survey for Cultural Resources in a Proposed Sewerage Facilities Project. 23 pages.

Despite the possibility of locating Indian sites in survey areas, field research findings were entirely negative in this regard. Some project areas tested were disturbed by recent construction or grading; all undisturbed portions were culturally sterile except for a very small number of recent historic artifacts. While small Indian sites may remain in scattered locations in Abington, the researcher concluded that no significant prehistoric or historic cultural resources would be affected by the proposed sewerage project. It was recommended that the project proceed as planned.

25-348 Bower, Beth A.

1981 A Phase I Archaeological Reconnaissance of Three Wastewater Collection and Pumping Facilities in Beverly, Massachusetts. 26 ages.

The findings of this report were divided into two sections. One section was concerned with a research study and evaluation of literature and records, seeking to disclose any prehistoric or historic sites – or the potential for any such sites – within the boundaries of the proposed pumping station locations. The other section involved a field survey of the proposed locations. This included a surface exploration and sub-surface test pits in areas with questionable potential for prehistoric and historic occupation. The study's findings concluded that there was no reasonable potential for impact on either prehistoric or historic cultural resources at any of the proposed sites. The findings were based on the fact that the areas were either heavily disturbed or were in swampy and marshy areas, or showed no evidence of significant cultural remains. It was recommended that the project advance without further delay.

25-349 Ritchie, Duncan

1981 An Archaeological Survey of the Norwood Engineering Company, Inc. Property Near the Massachusett Hill Hornfels Braintree Slate Quarry, Milton, Massachusetts. 29 pages.

This report presents the results and preliminary conclusions of an archaeological survey conducted by the Public Archaeology Lab on property owned by Norwood Engineering Company, Inc. of Norwood, Massachusetts. Within a parcel of land containing approximately 25 acres located in the town of Milton, about 8.05 acres were intensively surveyed in order to locate any possible loci of prehistoric quarrying and lithic workshop activity associated with the nearby Massachusett Hill Hornfels/Braintree Slate Quarry. Extensive prehistoric quarry/workshop areas contained for the most part within the Massachusett Hill Hornfels/Braintree Slate National Register District are immediately adjacent to the eight acre project area. Proposed development of the 8.05 acre parcel consisted of 22 units of single-family housing and two roads. Two areas flanking the development have been designated as "common land" to be left as open, undeveloped property. The common land area includes a large concentration of prehistoric quarry features/workshops associated with Braintree Hornfels/Braintree Slate Quarry National Register District. In general, the archaeological survey located six areas of potentially significant prehistoric quarry/workshop activity. However, evidence of various levels of prehistoric lithic reduction activity was found over a large percentage of the proposed development. Recommendations for additional investigation have focused on the six areas and their significance in relation to the quarry/workshop areas located with the National Register District.

25-350 Bawden, Garth

1981 Phase I Archaeological, Spicket River Facilities Plan, Lawrence, Massachusetts. 19 pages.

An archaeological literature and field survey examined the area within 500 feet of the Spicket River along the whole length of its North Lawrence Course. It was found that construction and development have had a severe effect on the survey area. This development included ground grading and filling, continuous construction and the alteration of much of the Spicket River's course. During this period all prehistoric settlement sites were probably destroyed. Some exceptions may possibly be deeply covered with fill near the river mouth and near Stevens Pond. Potentially valuable historic remains consisted of bridge fragments associated with the Spicket bridges at Broadway, Hampshire, Lawrence, Jackson, East Haverhill and Haverhill Streets, and mill remnants dating to the mid-l9th century now incorporated into the Greater Lawrence Industrial Associates complex. It was recommended that these historic sites be avoided by the proposed construction or additional assessment of their value be undertaken by an industrial historian. If the proposed project plan of following the streets and avoiding standing architecture was adhered to, there would be no impact whatever on sites of historical value or prehistoric significance.

25-351 Raber, Michael S., and Ernest A. Wiegand, II

1981 Archaeological Site Examinations at Water Facility Project Areas in Mansfield, Massachusetts. 30 pages.

Site examinations were conducted at two loci identified in previous Phase I testing. These sites contained low densities of lithic debris and features, including hearths, pavement, and small lithic workshop areas. They appeared to represent short term occupation camps, probably from the Late Archaic. It was recommended that the sites be determined eligible for inclusion on the National Register of Historic Places, and that the project avoid the sites. It was indicated that avoidance was the preferred alternative, and it was recommended that the sites be afforded additional protection by covering them with fill, or by data recovery.

25-352 Raber, Michael S.

1981 Sandwich Massachusetts: Cultural Resource Reconnaissance of Sewerage Facility Alternatives. 32 pages.

A number of alternative sites for sewerage facilities were subjected to a reconnaissance survey. In many areas, soil horizons with potential for cultural resources were found to be covered with fill, and conventional archaeological testing was deemed impractical. Management recommendations included intensive archaeological testing at those locations where such was possible. At buried sites, it was recommended that once final designs were available, a program of test borings should be conducted in order to determine stratigraphy and to locate potentially sensitive horizons. It was recommended that any necessary programs of intensive archaeological testing be planned and conducted in conjunction with construction.

25-353 Bawden, Garth

1981 Phase I Archaeological Survey, New Dudley Street Phase II. 26 pages.

Documentary research was conducted for areas to be affected by a proposed road widening and relocation project. Research indicated that several extremely significant historic structures had existed in these areas, including the original Dudley family mansion, Revolutionary War structures, and an early Universalist Church. Recommendations included Phase II testing for archaeological remains, avoidance of some standing buildings, and documenting some surviving remnants of buildings.

25-354 Raber, Michael S.

1981 Attleboro, Massachusetts: Intensive Cultural Resources Survey of a Proposed Waste Disposal Site. 49 pages.

Prehistoric and historic cultural materials were recovered during the course of this intensive survey, but only the prehistoric sites were deemed potentially significant cultural resources. Minor modifications in original project plans were agreed to, in order to avoid affecting these sites, and it was recommended that the project proceed.

25-355 Barber, Russell I.

1981 Report on a Surface Survey of the McCune Site (#19-MD-440). 16 pages.

Based on a surface collection from a portion of the site that was located in a plowed field, and an examination of artifacts previously collected from the field (the McCune collection), it was concluded that the site was a single-component habitation site from the Watertown Phase of the Susquehanna Tradition of the Late Archaic period. It was recommended that the site not be subjected

to further plowing or harrowing, and that the McClune collection be further studied.

25-356 Rosebrock, Ellen Fletcher

1981 Phase I Archaeological Reconnaissance/Intensive Survey for the Urban Heritage State Park, Lynn, Massachusetts. Vol. I. 81 pages.

This study was undertaken as part of the planning for the Heritage State Park which will occupy part of the waterfront at Lynn. Volume I presented the first element of the Phase I reconnaissance survey: the historical background of the downtown harbor and the identification of possible archaeological sites within the park's boundaries, which may contain information significant to the history of the area. Documentary research identified six sites associated with the waterfront that were recommended for Phase I subsurface testing.

25-357 DeMarco, William M.

1981 Phase II Archaeological Reconnaissance of the Urban Heritage State Park, Gardner, Massachusetts: Modified Structures Report, Lake Street Firehouse. 28 pages.

This report presents the results of documentary, informant, and archaeological research on the Lake Street Firehouse. The property occupied by No. 2 Lake Street was first used as farm land, until the town of Gardner purchased it in 1883 to construct a firehouse on the site. From 1885 to 1978, the Lake Street Firehouse acted as headquarters to the community's fire department. The building remained unchanged until a 3-car bay was added in 1934. From 1978 to the present, the site has been occupied by several social service/youth activities groups. Their occupancy has not altered the characteristics of the site; it appears today as it did in 1934.

25-358 Huntington, Frederick, and John Cheney

1981 Phase I Archaeological Survey of the Gardner Heritage Park, Gardner, Massachusetts, Phase II Archaeological Survey of the Lake Street Firehouse Site, Gardner Heritage Park, Gardner, Massachusetts, Volume 2: Archaeological Testing. 51 pages.

On the basis of background documentary research, it was judged that archaeological survey or testing need be conducted around Dunn's and Stump Ponds and the Lake Street Firehouse. Other areas, required no archaeological testing. The Phase I archaeological survey conducted around Dunn's and Stump Ponds failed to locate any prehistoric cultural resources. However, one potentially significant historic period trash dump was found on the eastern bank of Stump Pond. It was recommended that this site be subject to Phase II testing. The Phase II archaeological investigation of the land area around the Lake Street Firehouse disclosed no significant subsurface archaeological remains around the historic property. Therefore no further subsurface archaeological work needs to be conducted at the Lake Street Firehouse site.

25-359 De Marco, William M.

1981 Phase I Archaeological Survey of the Gardner Heritage Park, Gardner, Massachusetts, Volume I: Historical research. 79 pages.

This report presents the results of background historical research on the City of Gardner and four proposed park sites. While documentary research indicated that all of the four impact areas were newer sites of historic importance, none of the four sites was historically significant in its own right.

25-360 Raber, Michael S., Robert W. Drinkwater, and William A. McIlvride

1981 Downtown Historic District, Northampton, Massachusetts: Cultural Resource Investigations of Sewerage Interceptor Alignments. 37 pages.

Background historical and geological research indicated that natural strata within much of the project area were likely to be buried under fill of unknown depths. Field investigation utilizing a drill rig and crew confirmed the existence of deep, post-1850 fill along the rail bed and roadway sections of the project area. This material was not deemed significant, and any pre-railroad material was expected to have been extensively disturbed by colluvial, alluvial, and cultural reworking. A coal shed and coal house, which were archaeological components of the partially intact site of the Northampton Gas Light Company, would be impacted by project construction. These were argued to be of limited importance in understanding the gas works site. It was recommended that the project proceed as planned, and that the standing gas works structures be avoided during construction.

25-361 Cole, John R.

1981 Western Massachusetts "Monk's Caves": 1979 University of Massachusetts Field Research. 29 pages.

A number of stone structures were investigated in the hill country of central Massachusetts. The object of this research was to test various hypotheses regarding the origins and functions of such structures. Results suggested that the "Monk's Caves" were aspects of early historic period vernacular architecture built for diverse reasons with only their dry stone masonry technique in common.

25-362 Zimmer, Edward F.

1981 Archaeological Survey of the Holyoke Heritage Park, Holyoke, Massachusetts. Volume I: Historical Research. 64 pages

This report chronicled the history of Holyoke in general, and of the Holyoke Heritage Park site in particular, including activities, structures, owners and tenants within the site, an industrial complex and railroad facility that developed during the 19th century. The report related developments at the site to regional and national economic and political patterns and events. A number of themes for an interpretive program based on the history of the Holyoke Heritage Park site were suggested, including the site's importance as a railroad yard, as a manufacturing center, as an example of the development and use of water power, and as an example of an early planned industrial complex.

25-363 Cheney, John

1981 Phase I Archaeological Survey of the Holyoke Heritage State Park, Holyoke, Massachusetts. Volume 2: Archaeological Testing. 34 pages.

Phase I archaeological testing was undertaken with the goal of evaluating integrity and significance of sites with the Holyoke Heritage Park. On the basis of substance testing certain sites and potential sites were eliminated from further consideration. Phase II testing was recommended at a domestic dump site, two railroad turntables and a garage. Monitoring by an archaeologist was recommended in the event that factory foundations were to be removed.

25-364 Leveillee, Man D.

1981 Site Examination of the G. B. Crane Prehistoric Site, Norton, Massachusetts. 52 pages.

Site examination was undertaken in order to evaluate the G. B. Crane site's integrity, significance and research potential for a determination of National Register eligibility. Field-testing revealed the presence of lithic materials and features, as well as the absence of any prior subsurface disturbance that would impede data recovery. Evidence also suggested that the site was a transient hunt-

ing camp occupied during the Transitional Archaic and Woodland periods. The site's potential to yield information relating to the economic systems employed by Terminal Archaic through Woodland occupations of the area made it highly significant, and it was recommended that a determination of National Register eligibility be sought. Proposed construction of an outfall pipeline would adversely affect the southern section of the site area. Three mitigation alternatives were recommended, in the following order of preference: avoidance; alteration of construction plans so that a less dense area of the site would be impacted; or a data recovery program along the proposed project route.

25-265 Ritchie, Duncan

1981 An Intensive Archaeological Survey of The Riverboat Village Housing Project, South Hadley, Massachusetts. 37 pages.

An intensive archaeological survey including close interval subsurface testing did not identify any significant prehistoric or historic period cultural resources in the proposed Riverboat Village project area. Based on available soils information, a previous archaeological survey in the immediate area, and soil conditions observed during the current survey, the project area appeared to have a low potential for prehistoric cultural resources. The proximity of several known prehistoric sites had initially suggested that some evidence of prehistoric activity would be encountered. Existing shed outbuildings, a well/pump house complex and a concrete dam in the project area represented the most recent episode of historic land use and were not considered to be significant cultural resources. The results of this archaeological survey indicated that construction of the proposed Riverboat Village housing project would not adversely affect any cultural resources.

25-366 Sykes, Clark M.

1981 Phase I/IIa Archaeological Investigations at the Proposed Sludge Handling Site, Webster, Massachusetts. 41 pages.

Prehistoric and historical literature review, historical documentary research, prehistoric and historic site file check, and interviews with persons knowledgeable of the Webster locality failed to disclose the presence of structures or sites on the project property. During subsurface field investigations however, one archaeological site was discovered within the impact area. The site appeared to be prehistoric, although lack of diagnostic materials precluded cultural or temporal attribution. Additional testing was recommended in order to determine the sites potential eligibility to the National Register of Historic Places.

25-367 Leveillee, Alan D., Bruce I. Lutz, and Duncan Ritchie

1981 An Archaeological Assessment of Historic Cemeteries on the Grounds of the Massachusetts Correctional Institution, Bridgewater. 42 pages.

The purpose of this report was to provide the Massachusetts Correctional Institution with information on the locations of cemeteries on the grounds of the institution. Need for such information was precipitated when human remains were unexpectedly encountered during excavation of a utility trench. Documentary research, subsurface testing, and consultation with informants suggested that the remains were those of former inmates who had been reburied there when an exercise yard was constructed over a former burial ground at the turn of the century. The documentary research showed changes in burial areas and burial patterns throughout the facility's existence. Based on this data, it was recommended that known burial areas be avoided, and that future construction be preceded by additional archaeological work in areas suspected of containing burials.

25-368 Booth, Anne

1981 Phase II Modified Structures Report, North Adams Heritage Park, North Adams, Massachusetts. 10 pages.

Documentary research turned up little information about the six buildings described in this report other than what could be gleaned from maps, atlases, and first-hand observation. All were utilitarian frame structures of the type one would expect to find in a railroad freight yard setting. They were built and altered as need dictated, unnoticed by the local press and seldom, apparently, with a building permit.

25-369 Pratt, Marjorie K.

1981. Archaeological Survey at the Hartwell Tavern Site, Minute Man National Historic Park, Lincoln, Massachusetts. 137 pages.

Archaeological excavations at the site of the Hartwell Tavern revealed the locations of several cultural features, which were mapped and tested. While some disturbance had occurred, it appeared that intact cultural materials and features still remained. Testing in areas that were thought to be sensitive based on the results of an earlier resistivity study at the Tavern revealed little or no correlation between suspected and actual subsurface contents.

25-370 Sykes, Clark M.

1981 Phase I, Step 2 Archaeological Investigations at Three Wastewater Properties, North Dighton, Massachusetts. 43 pages.

An intensive archaeological survey was undertaken at three pump/ejector stations. Background research indicated the probable presence of several early industrial structures on or near the site of the proposed Spring Street Ejector Station. Limited field-testing confirmed the presence of remains of one or more of these early structures. Collection of additional data in order to permit a determination of National Register eligibility was recommended.

25-371 McArdle, Alan

1981 Phase II Archaeological Survey of the Holyoke Heritage Park, Holyoke, Massachusetts. 28 pages.

Phase II excavations were conducted at three locations suggested by earlier background research and reconnaissance testing. Of particular interest was a dump which was determined to contain domestic refuse from construction or factory workers of the early industrial period. Although interesting as an example of urban, working-class material culture and discard patterns, the dump could not be documented well enough to justify a National Register recommendation. Because current development plans did not seem to require extensive excavations around areas where the dump was found, no further action was recommended. If significant excavations were planned, it was recommended that monitoring or limited data recovery be considered.

25-372 Shaw, Leslie C.

1981 Phase I, Step 2, Archaeological Reconnaissance of the Proposed I-93-River Road Interchange, Andover, Massachusetts. 16 pages.

One prehistoric site was located within the project boundaries. Indications of historic use of the area were observed, but no potentially significant historic sites were discovered. The proximity of the prehistoric site to the proposed route of the exit ramp did not allow for an avoidance strategy to be employed. The actual significance of the prehistoric site could not be assessed at the time, and it was recommended that Phase II investigations be conducted.

25-373 Huntington, Frederick

1979 Phase I, Step 1 Archaeological Survey of Hobart Street, Hingham, Massachusetts. 11 pages.

Background research and a walkover indicated that the project area had a high potential for containing prehistoric archaeological properties, but little or no historic site potential. Phase I, Step 2 subsurface testing was recommended.

25-374 Barfield, Thomas J.

1981 Phase I, Step 2, Archaeological Survey of a Portion of Otis Street, Westborough, Massachusetts. 15 pages.

Phase I, Step 2 archaeological testing along selected segments of Otis Street indicated that the proposed road-widening project would have no impact on prehistoric cultural remains in the area tested. One other segment that was excluded from Step 2 testing by the Phase I, Step 1 report was argued to be sufficiently archaeologically sensitive to warrant subsurface testing. It was also suggested that an historic wall running alongside Otis Street may be the remains of a seventeenth century boundary marker for the Marlborough land grant. A determination of the wall's historic significance by an historic archaeologist was recommended.

25-375 Anthony, David

1979 Phase I, Step 2 Archaeological Survey of Hobart, Hingham, Massachusetts. 7 pages.

Shovel test pits were dug within the right-of-way at 50 foot intervals where slope and previous disturbance did not preclude the likelihood of finding an intact site. Prehistoric artifacts were retrieved on the surface at one location, near station 8 of the proposed new road. However, this area had been severely disturbed by blasting, and the artifacts were definitely out of context. In the opinion of the project archaeologist there were no intact archaeological deposits surviving within the right-of-way, and construction could go ahead as planned.

25-376 Ulrich, Thomas, and Robert Drinkwater

1981 Phase I, Step 2 Archaeological Survey, Phase I, Step 1 Historical Survey, Route 8-A Reconstruction and Realignment Project, Windsor and Savoy, Massachusetts. 31 pages.

The area of the proposed Route 8-A highway reconstruction and realignment project in the towns of Windsor and Savoy, Massachusetts was archaeologically surveyed within the limits of the recommendations of the Phase I, Step 1 report. Most of the proposed project corridor was not archaeologically sensitive as regards prehistoric cultural activities. The lone exception was a 200 m. (700 ft.) portion in the town of Windsor, near the Savoy line. It was concluded that a Phase II investigation should be carried out for this small portion of the proposed project. Regarding historic period findings and recommendations, the remains of two barn complexes and of a house foundation were considered to warrant a Phase II investigation. Four historic period sites of considerable local and regional interest located in the hamlet of Windsor Hill were within the impact zone of the proposed project. All four of these sites required a Phase II investigation. In addition, the outbuildings associated with the Williams/Francis/Estes ... Skrocki farmstead warranted a Phase II investigation.

25-377 Andrus, Scott J.

1981 Phase I, Step 2 Archaeological Survey of the Watertown Bike Path, Watertown, Massachusetts. 12 pages.

Background research field testing and interviewing with knowledgeable individuals all indicated that the project area had been severely disturbed in all the areas tested by the Phase, Step 2 survey. It was recommended that the project proceed as planned.

25-378 Mulholland, Mitchell T.

1981 Phase I, Step 2 Archaeological Survey, Phase I, Step 2 Historical Survey, Proposed Pond Brook Road (Route 66) Realignment Huntington, Massachusetts. 32 pages.

Prehistoric and historic background research, preliminary on-site visual reconnaissance, and subsurface examination identified one area of potential prehistoric significance and seven historic sites. It was recommended that Phase II subsurface examination and evaluation be conducted at these areas in order to determine their eligibility to the National Register of Historic Places.

25-379 Ham, Eugene J.

1981 Phase I, Step 2 Archaeological Survey of the Proposed Zoar Road Modification Charlemont, Massachusetts. 51 pages.

Prehistoric and historic background and on-site reconnaissance findings indicated that two historic properties subject to direct impact from the proposed road modifications activities would require Phase II survey. Two other areas were recommended for Phase I, Step 2 study since the background research indicated a high potential for the presence of historic period properties. No evidence of prehistoric occupation was encountered within the areas tested.

25-380 Huntington, Frederick W.

1981 Phase I, Step 2 Archaeological Survey of the Proposed Route 3A-North River Bridge, Marshfield, Massachusetts. 15 pages.

The intensive subsurface investigation of the project area failed to locate any evidence of prehistoric period archaeological resources. Two potentially significant historic period archaeological properties were located during the walkover reconnaissance task of the Phase I, Step 2 survey. The first of these consisted of three stone jetties, believed to be the remains of a dry dock or launching ramp associated with the Taylor-Carver shipyard. The second historic property consisted of the remains of a dry-laid fieldstone foundation built upon a raised earthen platform. This foundation may have supported the original North River Ferry tollhouse or it may have been associated with John Rogers or his descendants who originally owned the property. It was recommended that a Phase II archaeological survey be conducted to ascertain the function, temporal range, and archaeological significance of these two historic properties.

25-381 Sykes, Clark M.

1981 Phase IIb Archaeological Investigations at the Proposed Sludge Handling Site, Webster, Massachusetts. 42 pages

Results of site examination demonstrated that the Webster sludge property did not qualify for nomination to the National Register of Historic Places. Cultural deposits were found to be restricted in both formal and functional variability and apparently did not pertain to any particular occupational locus. Moreover, they were found entirely within a disturbed context. It was recommended that no additional work be conducted, and that the project proceed as planned.

25-382 Graffam, Gray

1981 Phase II Red Line Extension Northwest: Excavation of the Olmsted-Goffe House Site at the

Wadsworth Gate, Ca. 1632-1674. 146 pages.

The results of the archaeological data recovery program for the backyard area of the Olmstead-Goffe House Site were discussed. The area was excavated by l x lm units in a systematic grid. Seventeen cultural features including a stone well were excavated. Domestic trash, ceramics, glass, architectural materials, bone (including a fully articulated sheep), and other artifacts were collected and analyzed. Inferences concerning seventeenth century trade networks, student life and foodways were made.

25-383 Klein, Terry H.

1981 Interim Report of an Archaeological Survey of Additional Tennessee Gas Transmission Company Natural Gas Pipelines in New Jersey, Pennsylvania, New York, Massachusetts and New Hampshire. 31 pages.

This interim report describes the results of a locational survey of sections of a proposed natural gas pipeline in several northeastern states. The survey identified three historic sites in the project area in Massachusetts: a section of the Hampden and Hampshire County Canal in Southwick; a possible springhouse in Methuen; and an abandoned railroad bed in Mendon and Blackstone. No prehistoric cultural material or sites were found. No additional research was recommended.

25-384 Bolian, Charles E., Eugene Winter, Thomas Trombley, and Mark McDonnell

1981 A Cultural Resource Survey of the Parker River National Wildlife Refuge, Massachusetts. 61 pages.

Background research and field investigation revealed the presence of three prehistoric and four historic archaeological sites in the sand dunes which have been disturbed by both natural and human forces. One site, the Bluffs, may be affected by future development plans. Another reported site on Nelson's Island outside the project area has been reported as a tidally submerged site and has yielded large quantities of bone tools and faunal remains. The report recommended that additional archaeological investigations be conducted since Plum Island and some adjoining areas may qualify for nomination to the National Register as an archaeological district.

25-385 Leveillee, Alan D., and Duncan Ritchie

1981 Site Examination of Site #16 within the Hale Reservation, Dover, Massachusetts. 43 pages.

Archaeological testing of this site determined the site boundaries and provided information concerning its internal configuration. This small upland site was utilized during the Middle-Late Woodland Period, evidenced by the presence of the base of Fox Creek-like biface, grit-tempered pottery and an ungrooved adze. Chipping debris was predominately of felsite and hornfels. The report recommended that the site be determined eligible to the National Register of Historic Places and that construction plans be modified in order to avoid adverse effect to the site. If construction designs could not be altered, it was recommended that a data recovery program be pursued.

25-386 Cox, Deborah C.

1981 Archaeological Reconnaissance Survey of Westover Air Force Base, Massachusetts. 62 pages.

Background research and a walkover reconnaissance survey with soil auger coring were conducted in order to stratify the Westover Air Force Base into ranked areas of archaeological sensitivity. One prehistoric and one historic site were identified through surface inspection. Sensitivity was measured by evaluating several environmental factors and the degree of prior disturbance. Additional field-testing which would utilize the results of the sensitivity study was recommended.

25-387 Blancke, Shirley B.

1980 An Assessment of the Archaeological and Historical Impact of the Concord, Massachusetts, Facilities Plan. 13 pages.

An archaeological reconnaissance investigation was performed in order to evaluate the possible impacts of the proposed sewer project to prehistoric and historic sites. Review of the MHC site files was supplemented by additional site information gleaned from Ben Smith's collection and notes. It was determined that most of the project would probably not affect significant cultural resources. One project area was recommended for further testing.

25-388 Gero, Joan M., Debra Randall, Russell J. Barber, and Robert W. Drinkwater.

1981 Phase II, Archaeological Testing of the Right-of-Way Proposed for the Relocation of Route 44, Carver, Massachusetts: Prehistoric Sites. 74 pages.

Originally considered to be a single site, the Annasnappet Pond loci of prehistoric and historic archaeological deposits were tested through a site examination program. The results of these test excavations indicated that Annasnappet Pond was the location of several discrete sites which included Middle Archaic, Late Archaic, Transitional and possible Early Woodland occupations. Lithic materials and botanical remains suggest varied seasonal use and site function(s). The report recommended that a determination of eligibility to the National Register be sought for the Annasnappet Pond Archaeological District.

25-389 Randall, Debra

1981 Phase I, Step 2 Archaeological Survey of the Proposed Relocation of Route 44 in Plymouth and Carver, Massachusetts, 4M5 Alignment and Ramps. 13 pages.

An intensive field survey was conducted along an additional alternate route for the Route 44 relocation project. Two prehistoric sites and four isolated prehistoric artifact findspots were identified through test pit excavations. An Orient Fishtail, Squibnocket Triangle and Meadowood-like points were recovered from a locus area at Annasnappet Pond and another locus of prehistoric activity was identified at Maple Marsh. The report recommended that both sites be included within the proposed Annasnappet Pond Archaeological District for consideration of eligibility to the National Register.

25-390 Roberts, Michael (editor)

1981 Proposed Interpretive Program Moore State Park, Paxton, Massachusetts. 22 pages.

A program for research and exhibition was developed for Moore State Park. The programmatic themes included the natural and cultural development of the park, and emphasized changing prehistoric and historic (particularly industrial) land use patterns through time. Intensive archaeological survey and site examination were recommended, as well as documentary research, exhibits and possible restoration projects.

25-391 Shaw, Leslie C., and H. James Merrick

1982 Phase I, Step 1 Archaeological Reconnaissance for the Route 25 and Route 28 Ingersoll Alignment, Plymouth and Barnstable Counties, Massachusetts. 21 pages.

A Phase I, Step 1 reconnaissance survey included a background study and walkover inspection of the Ingersoll Alignment in Plymouth and Bourne. The literature search revealed the presence of a prehistoric and possibly historic Indian rock shelter, Wampsett Rock, near the project area. The

walkover survey identified a locus of fire-cracked rock within the proposed alignment to the southeast of Wampsett Rock. Subsurface testing was recommended for the entire project area. The northern half of the project was ranked higher in archaeological sensitivity for historic and prehistoric sites.

25-392 Laden, Greg

1982 Phase II Archaeological Site Examination of the Urban Heritage State Park Fall River, Massachusetts. 87 pages.

Machine-assisted and hand test excavations were performed within the proposed Urban Heritage State Park to evaluate the potential significance of its archaeological resources. The excavation results were correlated with documentary evidence for site-specific and general industrial and commercial development of Fall River. Significant fills and occupational debris were identified throughout most of the park area. Since these archaeological deposits were widespread and homogeneous, and project impacts were localized, it was determined that the proposed construction would not result in the loss of important information. No further investigation was recommended.

25-393 Howry, Jeffrey C.

1981 Cultural Resources Survey Tewksbury Interceptor, Tewksbury, Massachusetts. 36 pages.

A cultural resources survey was conducted in order to identify any historic or prehistoric properties that may be affected by the proposed construction of the Tewksbury interceptor. The investigation included review of documents and subsurface testing directed toward verifying the presence of any archaeological materials. The survey did not disclose any historic or prehistoric resources that could potentially be affected by the construction of the proposed interceptor. In addition, the survey could not confirm the presence of MHC-45, a prehistoric occupation area previously recorded on the lower terraces of the Merrimack River and located in the vicinity of the proposed interceptor. Archaeological monitoring of the construction was recommended.

25-394 Rosebrock, Ellen Fletcher

1981 Phase II Archaeological Reconnaissance for the Urban Heritage State Park, Lynn, Massachusetts, Modified Historic Structures Report, S.N. Breed Building No. 2, 252-258 Broad Street. 11 pages.

This report presents the results of extensive documentary research on the S. N. Breed Building Number 2, historically an important commercial structure situated in Lynn's waterfront district. The report covers the property history including associated events and individuals, original construction of, and subsequent alterations to the structure.

25-395 Laden, Greg

1982 Phase I Archaeological Reconnaissance/Intensive Survey for the Urban State Heritage Park, Lawrence, Massachusetts. Volume 2: Archaeological Testing. 35 pages.

An intensive survey was conducted on four acres of the proposed Lawrence Heritage State Park: The Campagnone Common, The North Canal Island Site, the Greenway area, and the Boarding House area. Analysis of geological bore data and the excavation backhoe trenches provided information on the park's stratigraphy and use through time. Small test pits were also dug by hand to collect samples of cultural materials. No further investigation was recommended for the Campagnone Common, North Canal Site and Greenway areas. Monitoring and profile recording was recommended for DEM's proposed backhoe trenches along the foundation of the Boarding House.

25-396 Graffam, Gray, and David A. Singer

1982 Phase I Archaeological Reconnaissance/Intensive Survey for the Urban Heritage State Park Lynn, Massachusetts. Volume 2: Archaeological testing. 15 pages.

Geological bores and hand-excavated test pits were utilized to investigate several 19th century wharf areas and the Breed Building Site within the proposed Heritage State Park in Lynn. No significant historic or prehistoric resources were identified within the project impact areas. The proposed park construction was recommended to proceed as planned.

25-397 Cox, Deborah, Joan Gallagher, Alan Leveillee, and Duncan Ritchie

1982 Site Examination of the Bear Hollow, Black Bear, Cracker, Dead Dog and Hartford Avenue Rock Shelter Sites: State Highway Route 146, Sutton to Uxbridge, Massachusetts, Construction Contract 2. 79 pages.

Of five prehistoric sites examined by intensive subsurface testing, four were considered significant and eligible for nomination to the National Register. These sites were: The Hartford Avenue Quarry Rock Shelter, a small single-deposition Woodland site; The Cracker Site, containing occupations dating to the Middle or Late Archaic (Laurentian Tradition) and Terminal Archaic/Early Woodland periods; The Bear Hollow Site, a Late Woodland campsite; and the Black Bear Site, a field camp of unknown temporal association. The Dead Dog Site was recommended for National Register nomination, pending the results of site examinations in contract 3. As it was determined that the project would adversely affect the Hartford Avenue Quarry Rock Shelter, Bear Hollow and Black Bear Sites, data recovery programs were recommended for these sites. The report stated there would be “no adverse effect” to the Dead Dog Site and “no effect” to the Cracker Site.

25-398 Thorbahn, Peter F., et al.

1978 Phase I Reconnaissance Survey of Route 146. 203 pages.

A total of 43 archaeological properties were located within the ROW and interchange of both northern and southern sections of the Route 146 project in Douglas. These were identified by background research and field-testing. In addition, 41 properties were identified outside the ROW. These were either within the broad study area of the southern section or clearly associated with resources in the ROW. They were inventoried in an appendix to this report for inclusion in state inventory files. The 43 properties in the ROW included 25 from the prehistoric period and 18 historic properties. The report recommended that 25 properties with the ROW receive Phase II testing in order to determine eligibility for the National Register. These included 23 prehistoric and two historic sites.

25-399 Hasenstab, Robert John

1982 Archaeological Background, Reconnaissance, and Intensive Survey for the Proposed Buckley Nursing Home in the Town of Greenfield, Franklin County, Massachusetts. 35 pages.

Background research and reconnaissance and intensive archaeological survey activities did not locate or identify any prehistoric sites or cultural material within the area of proposed construction. An historic ditch/embankment feature recognized in the project area was hypothesized to have been constructed at the end of the nineteenth century as a pasture fence. This feature was not considered to be historically significant. Historic cultural material collected from test pits were 20th century in origin.

25-400 Thomas, Peter, John Brooke, John Marti, and James Parrish

1977 Phase I Reconnaissance Archaeological Survey Report of Pittsfield Area Route 7 Bypass.

82 pages.

Three construction alternatives for the Route 7 bypass project were investigated at the reconnaissance level through documentary research, informant interviews, use of predictive site locational models, surface inspection, limited subsurface testing, and soil analysis. Numerous National Register and National Register eligible properties, historic structures, sites, and areas of high archaeological potential were identified. The alternatives were ranked from highest to lowest possible impacts to cultural resources in this order: eastern, western and Street improvements. Recommendations for Phase II testing were made in light of the preliminary findings.

25-401 Booth, Anne, and Robert Drinkwater

1982 Phase I Archaeological Survey of the Proposed Site of Western Gateway Urban Heritage State Park North Adams, Massachusetts. Volume I: Historical Research. 145 pages.

This volume contains the results of historic background research of the Western Gateway Urban Heritage State Park. Historic documents have chronicled the park's use from early Colonial times when it was principally farmland to the nineteenth and twentieth centuries when it was a central regional train yard, serving several railroad lines which utilized the Hoosac Tunnel. The Hoosac Tunnel and Freight Yard Historic District are listed on the National Register.

25-402 Booth, Anne, and Robert Drinkwater

1982 Phase II Western Gateway Urban Heritage State Park, North Adams, Massachusetts Modified Structures Report. (Revised Final Report). 15 pages.

This report is a revised and expanded version of a modified structures reported previously submitted in 1981 (#25-368). The six buildings described in this report are components of the Freight Yard Historic District, a National Register property, about which the heritage state park has been planned.

25-403 Brenner, Elise M.

1982 Sociopolitical Change in Seventeenth Century Massachusetts: Archaeology and Ethnohistory. 59 pages.

An ethnographic study and archaeological field survey were undertaken to test certain hypotheses about the cultural system of an Indian Praying Town. Small test pits were excavated at 10 meter intervals in four sections of Natick. Although prehistoric and later historic cultural materials were collected, no 17th century historic material or features were encountered. The author concluded that the Natick praying Indians had maintained aboriginal settlement and subsistence patterns and had not been as acculturated as John Eliot's writings have implied.

25-404 Ritchie, Duncan

1982 An Intensive Archaeological Survey of the Proposed Wastewater Conveyance System Improvements, Nantucket, Massachusetts. 48 pages.

Three sections of a proposed force main sewer easement were archaeologically investigated through a literature search and subsurface testing. The survey identified one area of historic/recent dumping activity within the project area and a prehistoric site immediately adjacent to the easement. The historic dumps, dating to the late 19th and 20th centuries, were not considered to be significant. The Austin Site, associated with the Terminal Late Archaic Period, was considered to be highly significant in association with surrounding prehistoric sites. The report recommended that construction activity near the Austin Site be monitored.

25-405 Mrozowski, Stephen A., and Steven R. White

1982 An Intensive Survey of the North Andover Technical Park, North Andover, Massachusetts. 32 pages.

Background research and subsurface testing located an early 19th century site associated with the residence of Cato Freeman, a freed slave who had settled in North Andover. Deposits of cultural material dating to that time period were found in the form of sheet refuse in the southern portion of the project area. No structural features associated with Freeman's house, however, were found. It was recommended that the project development avoid impacting the Cato Freeman Site, a potentially significant historic site. Prehistoric flakes were found in some test pits elsewhere in the project area, but in disturbed context.

25-406 Marie, Audrey R.

1981 Archaeological Salvage Front Street Salem Maritime National Historic Site, Salem Massachusetts, 1977. 167 pages.

Two buildings located at 31 and 33 Front Street were given to the National Park Service by the Salem Redevelopment Authority. The structures were moved to Derby and Central Wharves and were restored as c.1800 waterfront warehouses. Archaeological investigations were conducted along and within the foundations of the original site of the buildings. Test trenches were excavated in order to determine the construction date and historic use of the buildings. This final report indicates that the Front Street buildings originated as urban commercial stores in the early 1800s.

25-407 Pratt, Marjorie K.

1981 Archaeological Survey at the Adams Birthplaces Quincy, Massachusetts. 53 pages.

An archaeological survey of the grounds of the Adams Birthplace was undertaken for the National Park Service in order to locate and identify archaeological deposits and features. The results of the background literature research, intensive subsurface testing, and radar and resistivity studies were incorporated into the report. A number of subsurface features were discovered, including traces of several former outbuildings.

25-408 Mahlstedt, Thomas F.

1982 Phase I archaeological Survey for the Riverina Road Pumping Station Replacement, Interceptors and Force Mains, Andover and Lawrence Massachusetts. 45 pages.

Historic and prehistoric background research, informant interviews and walkover inspection identified less than 400 meters of proposed easement which appeared to be undisturbed. These areas were tested by small test pits, from which only modern cultural materials were recovered. The former topsoil was found in only a few test pits, under recent landfill. If archaeological resources were present within the project area, they are covered with thick deposits of fill, and may not be affected by sewer construction. No additional research was recommended.

25-409 Raber, Michael S.

1982 Holden, Massachusetts: Intensive Cultural Resource Survey for Proposed Sewerage Facilities. 21 pages.

Intensive survey activities which included background research and subsurface testing, failed to identify any significant cultural properties within the proposed project area. A major portion of the project area was found to be covered with the remains of late 19th century industrial structures.

These buildings had been demolished after suffering from a destructive fire almost 100 years ago. Since the industrial site has seriously been disturbed, it is not considered eligible to the National Register. No further investigation was recommended.

25-410 Lutz, Bruce J., and Patricia E. Rubertone

1982 Archaeological Investigations Relating to Cemeteries within the bounds of the Perimeter Fence, Massachusetts Correctional Institution, Bridgewater. 16 pages.

Archaeological testing was conducted along the course of the proposed perimeter fence which will surround the MCI treatment facility. Randomly oriented Gradall trenches were excavated along the proposed fence. Badly decomposed wood and human bones were encountered in one project area. Systematic Gradall trenches were placed in this area to delimit the boundaries of the historic cemetery, which was staked out in the field. It was recommended that the final alignment of the perimeter fence be designed to avoid impacts to the cemetery.

25-411 Towle, Linda A.

1982 Intensive Archaeological Survey of the Proposed Shrewsbury Sewer Line Extension, Westborough, Massachusetts. 11 pages.

An intensive archaeological survey was conducted in the project area of a proposed sewer line extension in Westborough. No prehistoric or historic sites were located, and no additional archaeological work within the project area was recommended. However, an examination of borrow areas of fill to be used for a temporary access road was recommended when the borrow areas have been selected.

25-412 Graffam, Gray

1982 Phase I, Step I (Reconnaissance) Cultural Resources Survey of the Proposed Alternate IIIE (Water Street) Sewerage Relief Interceptor Beverly, Massachusetts. 50 pages.

Historic maps, deeds and other documents were researched as part of a reconnaissance survey of the Water Street interceptor, which is planned in an area adjacent to Fish Flake Historic District, a National Register property (see report #25-307). The background research indicated that at least eight historic wharves may be located under Water Street. It was recommended that an intensive survey and data recovery program be conducted simultaneously by a cooperative effort between the archaeologists and engineers.

25-413 Mahlstedt, Thomas F.

1982 Phase I Archaeological Survey for the Proposed Southwick Brook Sewer Extensions, Douglas, Massachusetts. 18 pages.

The intensive survey of the proposed Southwick Brook sewer extensions combined a thorough background study with a program of subsurface testing. At one time in the past, the Douglas Axe Manufacturing Company had operated within a building located just behind the project area, on the opposite side of Southwick Brook. Considerable industrial waste had been dumped along the brook, which itself had been artificially channeled. The project area thus demonstrably disturbed. No significant prehistoric or historic resources were identified; no further research was recommended.

25-414 Mahlstedt, Thomas F.

1981 Historical Archaeology at Bunker Hill Monument, Boston National Park, Massachusetts. 96

pages.

This final report, a blend of architectural and historical data with archaeological interpretation, describes the results of archaeological monitoring of the rehabilitation activities at Bunker Hill. The monitoring study provided archaeological data concerning the historic construction of the monument and the configuration of its alterations, drainage, sidewalk, perimeter fence, and undocumented cultural deposits.

25-415 Fiero, Kathleen W.

1982 Archaeological Survey of a Proposed Electrical Line Corridor, Springfield, Massachusetts. 41 pages.

An archaeological survey was carried out at the Springfield Armory along a proposed electrical line corridor. Analysis of cultural material and stratigraphic profiles of 23 shovel test pits along the easement indicated that 18th and 19th century materials were brought onto the site with loam used to cover the sandy base soil. Documentary evidence revealed that commanding officers had fill brought to the Armory to improve the soils for planting. It was determined that the proposed utility line would not affect significant cultural resources.

25-416 Cox, Deborah C., Duncan Ritchie, and Patricia E. Rubertone

1982 Archaeological Investigations at the Tewksbury Water Treatment Facilities Location. 30 pages.

A combined intensive survey and site examination was conducted on, respectively, the upland section of the project and the area near the Merrimack River which was identified to be archaeologically sensitive in a previous survey (report #25-393). The intensive survey located scattered historic field track and no prehistoric materials in the upland area. The site exam revealed that the previously identified hearth feature was historic and was not considered to be significant. Since no significant cultural resources were identified in the project areas, it was recommended that the project proceed as planned.

25-417 Rosebrock, Ellen Fletcher

1981 Tremont Yard Lowell Heritage State Park: A Response to a Proposal for a Parking Lot. 6 pages.

The historic significance and research potential of the Tremont Yard Mill Site were discussed in relation to a surface parking lot proposed for the site. Recommendations were made to reflect two central concerns: 1) the archaeological potential of the yard; and 2) its power as a public interpretive site.

25-418 Rosebrock, Ellen Fletcher, Theodore Z. Penn, Scott J. Andrus, and John E. Rempelakis

1982 Phase I Archaeological Reconnaissance/Intensive survey for the Heritage Park Blackstone Canal, Massachusetts. 119 pages.

Documentary research and a walkover survey of the Blackstone Canal area were conducted to provide the Department of Environmental Management with information concerning known and expected cultural resources on either side of the Canal, as well as descriptions of properties which were historically related to the Canal. Fifteen historic sites were described in detail. An assessment of the prehistory of the Blackstone Valley and a model predicting the existence of prehistoric sites were presented. Recommendations were made for future work needed to proceed with physical improvements and public interpretive programs for the park.

25-419 George, Douglas C., and Gray C. Graffam

1982 Phase I, Step 2 (Intensive) Cultural Resources Survey of the Proposed Longmeadow Brook/South Interceptor Sewer, Longmeadow, Massachusetts. 63 pages.

Background literature research surface inspection and subsurface testing were conducted for a proposed sewer easement located primarily along Longmeadow Brook. The survey failed to identify any prehistoric cultural materials, but did locate one historic mill site. Historic records have referred to late l8th-19th century grist and saw mills as well as a late 19th century knitting mill in the project vicinity near Shaker Road. One test pit revealed the presence of brick and nail fragments at this location. The report recommended that either the mill site be avoided by redesigning the project, or that a site examination be performed to evaluate the mill site's potential eligibility for National Register nomination.

25-420 Wilson, John S., and Marie L. Bourassa

1982 Archaeological and Historical Resources Reconnaissance Colebrook River Lake, Colebrook, Connecticut and Sandisfield and Tolland, Massachusetts.

Thorough research of historic maps and documents, coupled with walkover surface inspection, revealed numerous historic sites within the project area. Topography and soils were studied in order to divide the project into ranked areas of prehistoric archaeological potential. It was determined that current development plans for the lake would not affect significant historic or archaeological properties.

25-421 Elia, Ricardo J.

1982 Archaeological Reconnaissance/Intensive Survey of the Proposed Improvements to the Wastewater Collection Facilities for the Town of Saugus in Saugus and Lynn, Massachusetts. 30 pages.

The archaeological survey did not detect the presence of significant historic or prehistoric properties within the proposed project area. Instead, the survey documented that extensive disturbance had occurred by prior construction filling and excavation in the project area. Only one project section was essentially undisturbed, but subsurface testing in this area did not identify any significant sites. It was recommended that the proposed project proceed as planned without further archaeological investigation.

25-422 Thorbahn, Peter F.

1982 The Prehistoric Settlement Systems of Southern New England, 8,000 B.C. to 1,500 B.C. Final Report of the Interstate Highway 495 Archaeological Data Recovery Program, Volume I (Draft). 263 pages.

This report has endeavored to reconstruct and explain prehistoric settlement systems in the Narragansett Basin through analysis of the results of the data recovery program for 19 sites within the Route I-495 project area. Conventional approaches to the study of inter-and intrasite patterning in terms of "components" and site "types" were found to be inadequate for this study. Instead, two previously published explanatory models of changes in foraging territories and logistic organization were combined with a newly developed operational model of artifact deposition in order to observe the demographic and behavioral aspects of the prehistoric settlement systems. Several major findings concerning paleoenvironmental change, territory size, population growth, seasonal availability of resources, and the rate of modern destruction of sites were discussed.

25-423 Thorbahn, Peter F. (editor)

1982 The Prehistoric Site Summaries. Final Report of the Interstate Highway 495 Archaeological Data Recovery Program, Volume II (Draft). 226 pages.

This edited volume, companion to Volume I of the series (report # 25-422) has compiled individual site summaries for the 19 prehistoric sites which were excavated in the data recovery program for Route I-495. Field operations and results have been described briefly; some interpretations concerning on-site activities have been made for each of the sites. Tables of recovered cultural materials and site maps were also included.

25-424 Thorbahn, Peter F. (editor)

1982 Methodological and Analytical Studies on the Prehistoric Sites in the I-495 Project. Final Report of the Interstate Highway 495 Archaeological Data Recovery Program, Volume III (Draft). 229 pages.

Eight papers by several authors on varied research topics associated with the Route I-495 data recovery program have been assembled in this volume. They include: a description of the computer-based data management system utilized in the project; method and evaluation of the flotation recovery technique and results; paleoecological interpretations through a synthesis of archaeological and palynological data; implications for reconstructing depositional histories and site activities through feature analysis; multiple strategies for the analysis of lithics; paleoecological reconstruction in the Taunton Quadrangle; upland and wetland and vegetational changes through palynological analysis; and identification of prehistoric and historic vertebrate remains.

25-425 Gallagher, Joan and Patricia E. Rubertone

1982 Final Report of the Interstate Highway 495 Archaeological Data Recovery Program, Volume IV. Part I, Patterns of Rural Migration: Evidence from the Historic Sites; Part II, Site Summaries, edited by Patricia E. Rubertone (Draft). 195 pages.

This volume presents the results of excavation and documentary research on the historic sites within the Route I-495 project. Part I includes discussions of rural economics, households, patterns of local exchange, and the evidence from one historic district for economic interaction and regional markets. In Part II, site summaries for four individual sites and one district have been assembled to include discussion of research objectives, field strategies, documentary sources, archaeological results (structures, features, cultural material), documented site histories, and analysis and summary.

25-426 Lewis, Scott, Paul , Nancy S. Seasholes and Greg Laden

1982 Archaeological Survey of the Third Harbor Tunnel Crossing Boston, Massachusetts (Draft Final Report). 77 pages.

This report presents the results of a reconnaissance level survey of the proposed Third Harbor Tunnel project area, including sections of South Bay, South Cove, Fort Point Channel, and Fort Hill subdivisions of Boston to the south of the Harbor, and East Boston including the airport to the north of the Harbor. The information presented in this report has indicated that there is a high probability of locating significant historic archaeological resources in all of these areas and significant prehistoric archaeological resources in only selected areas (primarily South Bay). Recommendations presented in this report have called for systematic backhoe trenching in several areas of the proposed right-of-way for the purpose of locating both historic and prehistoric cultural resources. Several of the sites expected in the project area have been located through historic documentation, and testing was recommended specifically for those sites. Other resources not likely to be located through historic documentation (such as prehistoric sites or early trade sites), are also expected in the proposed testing areas.

25-427 Simon, Brona G.

1981 Cultural Resources Reconnaissance Survey New England Energy Park Fall River, Massachusetts. 54 pages.

A cultural resource reconnaissance assessment of the proposed New England Energy Park coal gasification plant site in Fall River, Freetown, and Dartmouth was accomplished through a background and literature search with a windshield survey/walkover inspection. The project area was divided into three zones on the basis of their overall ecological diversity which could be assessed through background research. It was recommended that these zones later be inspected with a field reconnaissance survey to establish their validity, followed by an intensive (locational) survey of the proposed development site. Additionally, a number of historic sites were identified within and on the periphery of the project area. Those proven to be within the project boundaries should be intensively surveyed.

25-428 Pendery, Steven R., et al

1982 Phase II Archaeological Site Examination of the Project Area for the Central Artery, North Area, Charlestown, Massachusetts. 178 pages.

This site examination revealed the presence of a wide variety of historic archaeological resources and a limited occurrence of prehistoric archaeological resources within the urban site context of downtown Charlestown. Backhoe and other machinery were utilized in the testing program; documentary research was conducted. Approximately 100 archaeological sites related to 17th, 18th and 19th century domestic, commercial, waterfront, and industrial activities were identified. Twenty-one sites were recommended for listing on the National Register of Historic Places; these included one prehistoric, nine residential, one tavern, five waterfront, and five manufacturing sites. The manufacturing sites included one distillery and four pottery sites. These sites were distributed among five recommended districts, two recommended thematic groups, and two individual sites. Data recovery programs were recommended for scientific and historic value. The results of this study have clearly indicated a high potential for the preservation of archaeological resources in intensively developed urban contexts.

25-429 Kerber, Jordan E. and Peter F. Thorbahn

1982 Archaeological Reconnaissance Survey, Rumford River, Mansfield, Massachusetts. 44 pages.

An intensive survey was conducted on a parcel of land along the Rumford River which is proposed to be excavated for the construction of a small pond. The survey located two loci of prehistoric activity known as the Willis I and Willis II Sites, which were located on the west and east sides of the river, respectively. Scattered flakes of quartz and burnt rock were found in low densities at both sites. It was assumed that the majority of both sites lie outside the project impact area. Since it appeared that only fringe areas of the sites would be affected, it was recommended that the project proceed without further testing.

25-430 Mrozowski, Stephen

1982 An Intensive Survey of the Riverview Street Boat Ramp Project Parcel, North Andover, Massachusetts. 31 pages.

Backhoe-assisted test trenches were utilized in the intensive survey of the proposed boat ramp parcel on the east bank of the Merrimack River in North Andover. Trench profiles revealed the presence of deep alluvial deposits (nearly 3 meters in thickness) and evidence of late 19th and early 20th century fill layers above a stratum of river cobbles. No prehistoric materials or land sur-

faces were identified; no significant historic deposits were encountered.

25-431 Rempelakis, John

1982 Phase I, Step I Survey of the Proposed Winter Street Improvements Waltham, Massachusetts. 19 pages.

The environmental characteristics of the project area and the presence of a nearby water source, together with the results of documentary research and historic map inspection, have indicated that moderate to high potential exists within the project area for locating both prehistoric and historic properties. It was recommended that an intensive survey be conducted in order to determine if archaeological deposits related to 18th and 19th century homesteads or prehistoric land use lie within the proposed construction areas.

25-432 Rempelakis, John and Greg Laden.

1982 Archaeological Intensive Survey of the Lowell Sewers Right-of-Way Lowell, Massachusetts. 30 pages.

Even though background research identified several project areas of high archaeological sensitivity, field-testing produced no tangible evidence for intact prehistoric or historic cultural resources of significance. Flakes and Woodland Period Pottery were recovered from a single test pit on one project area, but they were mixed with 20th century fill materials. The project is planned to traverse the route of the Middlesex Canal, a National Register property; however, it was determined that there would be "no effect" to the canal since the project impacts appear to be limited to a previously disturbed portion of the canal route. No further research was recommended.

25-433 Elia, Ricardo J. and Thomas F. Mahlstedt

1982 Report on the Phase II Archaeological Survey of the proposed Tewksbury to Amesbury Right-of-Way 345kV Transmission Line. 80 pages.

Archeological test excavations took place at the proposed locations of new transmission line poles for the Tewksbury to Amesbury transmission line. Eight "non-sites," i.e., locations of diffuse, low-density prehistoric cultural material or stray finds were identified. One prehistoric campsite (Old Ferry Road Site, Haverhill) was encountered and tested more intensively than the "non-sites" in order to recover archeological data from the proposed project impact areas within the site. It was recommended that no additional archaeological research be conducted, and that construction activities avoid subsurface disturbances outside the immediate areas of the pole locations in several project areas where low-density archeological resources had been found.

25-434 George, Douglas C.

1982 Phase I, Step 2 (Intensive) Cultural Resources Survey of the Proposed Temporary Bridge over the Merrimack River at Lowell, Massachusetts. 53 pages.

Prehistoric and historical background research disclosed only the presence of a modern industrial period railroad round house the foundation of which is still visible. Information provided by recent geological borings suggested that most of the project area is composed of fill with a depth of up to twenty feet. A walkover survey followed by subsurface test excavations demonstrated that most, if not all, of the project area was covered by fill materials to at least the depth of one meter. No significant archeological sites were identified or discovered in the project zone. It was determined that the proposed construction of the temporary bridge would not affect significant cultural resources. No additional research was recommended.

25-435 Cheney, John, et al.

1982 Site Excavations and Analysis of the Pearl Street Dump Site Gardner, Massachusetts. 118 pages.

The site examination delineated the spatial boundaries, depth of deposits and integrity of the Pearl Street Dump Site. A representative sample of cultural material was collected. Historical documentation helped tighten site dating and provided information on site formation and on the community which generated the site. Intensive analysis of the material culture was undertaken to address specific research questions concerning the date and patterning. Additionally, questions concerning bottle recycling, economics, income, market, and intra- and inter-regional comparisons were addressed through the analysis.

25-436 Loparto, Leonard and Beth Anne Bower

1982 An Intensive Archaeological Survey of the Proposed Site of the Wastewater/Septage Treatment Facilities Orleans, Massachusetts. 32 pages.

During an intensive archaeological survey of the proposed location of a wastewater treatment facility in Orleans, three archaeological sites were discovered. The Freeman Site, a 19th to early 20th century surface midden, was not considered to be of strong cultural or historical significance. The Oak Ridge and Nemskaket Sites were considered to be potentially significant prehistoric sites associated with the backwaters of Namskaket Creek. It was recommended that both prehistoric sites be the subject of further investigation to determine their spatial extent and evaluate their National Register eligibility.

25-437 Rempelakis, John

1982 Phase I, Step 1 Archaeological Survey of the Wisdom Way and River, Mill and Meade Streets Relocation and Reconstruction Project Greenfield, Massachusetts. 17 pages.

Documentary evidence, visible historic features and the physical attributes of the project area indicate that certain areas possess high archaeological potential for historic and prehistoric sites. The Sconce Mill Factory Site, especially, might contain archaeological deposits relating to early Industries. Further investigation was recommended.

25-438 Graffam, Gray

1982 Final Report of Phase II/III Cultural Resource Investigations at the Proposed Spring Street Ejector Station, North Dighton, Massachusetts. 36 pages.

Results of intensive historical research through documentary sources and Informant interviews were presented for the project area on Stephens Island. The location and potential disturbance of possible historic resources were discussed; a framework for additional archaeological research was presented. No further investigation was recommended since the site has been disturbed by more recent industrial development.

25-439 Bower, Beth Anne, Claire Dempsey and Leonard Loparto

1982 An Intensive Archaeological Survey of the Wastewater Treatment Facilities Planning Project, Spencer, Massachusetts. 17 pages.

During an intensive archaeological survey of the Spencer wastewater treatment facilities planning project, one archaeological site was discovered. The Seven Mile River Site, located on a small, undisturbed knoll, is a site of unknown prehistoric cultural affiliation. It was recommended that this site be tested further to determine its size, cultural affiliation, internal configuration, and po-

tential eligibility for nomination to the National Register.

25-440 Zimmer, Edward F. and Alan McArdle

1982 Phase I Archaeological Survey of the Springfield Heritage State Park Springfield, Massachusetts. 103 pages.

The report is organized into two sections, one concerning historical documentary research, the other concerning archaeological testing of four urban areas. The study units consist of the Riverfront, Court Square, Court House, and Quadrangle areas within the central portion of Springfield. Historical research provided information on the deposition and disturbance of cultural remains as well as a context for the evaluation of archaeological resources. Archaeological testing indicated that the Court Square, Court House and Quadrangle areas possessed a strong likelihood for the presence of significant historic archaeological deposits. Further field investigation was recommended for these areas.

25-441 Williss, G. Frank

1982 The West India Goods Store in Maritime Salem: An Essay Salem Maritime National Historic Site, Massachusetts. 35 pages.

The essay focused on the use of the West India Goods Store at 104 Derby Street during the twilight years of Salem's overseas commerce (ca. 1837-53). Exhaustive documentary research was conducted on the building, its function through time, its first owner Henry Prince and subsequent owners. Types of trade goods sold at the building were hypothesized. Results of the research presented information useful to park interpreters.

25-442 Kerber, Jordan E. and Peter F. Thorbahn

1982 Intensive Archaeological Survey of the Clinton Wastewater Treatment Facility and Landfill. 40 pages.

The survey of the Clinton wastewater project areas did not reveal any significant cultural resources. The historic trash deposits discovered in the field south of the present treatment plant, were of minimal importance since they had been previously disturbed. The remains of a recent structure, possibly an outbuilding associated with a dairy, unearthed in one test pit, have no particular significance. The remainder of the project that was tested contained no cultural resources. No further research was recommended.

25-443 Gallagher, Joan and Leonard W. Loparto

1982 Intensive Survey, the Village at Fawcetts Pond Hyannis, Massachusetts. 34 pages.

The testing program indicated that no significant archaeological resources were located within the project area. Historic period features were found within a narrow corridor between West Main Street and the main project area. These features were not associated with any known historic structure and were thought to be quite recent in origin. The recovered cultural material dated, with a single exception, to the late 19th and early 20th centuries. Testing within the project area yielded no evidence of prehistoric occupation. No further testing was recommended.

25-444 Cheney, John F.

1982 Phase I, Step 2 Intensive Archaeological Survey for the Route 25 Ingersoll Alignment Bourne, Massachusetts. 18 pages.

An intensive survey was conducted on the Ingersoll (Upland) Alignment right-of-way for the relocation of Route 25 in Bourne. The survey included the digging of shovel test pits at regular intervals and in locations selected judgmentally. No potentially significant historic period sites were located. Two prehistoric sites were located and were recommended for site examination: Wampsett Rock, a rock shelter; and the Hearth Site, consisting of a possible hearth of unclear cultural origin. A further occurrence of a prehistoric flake proved to be merely a stray find, and no further investigation of that area was recommended.

25-445 Collamer, Jeanette

1982 Intensive Survey for the Route 7 Street, Berkshire County, Pittsfield,

Realignment, Upper North Massachusetts. 20 pages.

Test pit excavations and background research were conducted for the proposed realignment project. Three potentially significant cultural properties were identified in or near the project area: (1) "The Pines," a ca. 1850 Italianate home and barnyard; (2) a prehistoric site containing chert debitage; and (3) a fieldstone foundation, possibly dating to the late 18th or 19th centuries. It was recommended that the road be redesigned an additional distance away from "The Pines" to avoid indirect impacts to the structure. A site examination was recommended for the prehistoric site, and construction monitoring was recommended for the historic foundation.

25-446 Shaw, Leslie C.

1982 Phase I, Step 1 Archaeological Reconnaissance of the Barre Road Project Templeton, Massachusetts. 13 pages.

Through documentary background research and visual inspection of the project area, it was determined that the project had the potential for the presence of historic and prehistoric properties. An intensive field survey of the project's impact areas was recommended.

25-447 Ham, Eugene J.

1982 Phase I, Step 2 Archaeological Survey of the Proposed Warren Street Modification Palmer, Massachusetts. 49 pages.

Subsurface testing, surface inspection, documentary research, and informant interviews were conducted during the intensive survey of the Warren Street project. Fourteen historic sites and one isolated projectile point surface find were identified in or adjacent to the project area. The proposed road reconstruction may affect six of the historic sites. Five historic sites were recommended for site examination: the Theodore Ferrel farmstead; the Ed Madura residence; a schoolhouse foundation; a wood-chopper's hut; and the Noone residence.

25-448 Shaw, Leslie C.

1982 Phase I, Step 1 Archaeological Reconnaissance of the Williamsville-Templeton Road Project Hubbardston, Massachusetts. 12 pages.

The background reconnaissance study of the Williamsville-Templeton Road project did not find any documentation of historic or prehistoric sites. However, the project area was determined to possess a good potential for the location of sites, especially prehistoric sites. An intensive archaeological survey was recommended.

25-449 Laden, Greg

1982 Archaeological Reconnaissance of the Wellesley Extension Sewer Facilities Wellesley, Massachusetts. 27 pages.

The proposed sewer extension facilities include two major segments: the Upper Neponset and Wellesley sections. It became clear through documentary research and field inspection that only the Wellesley extension section along the Charles River was likely to have potential impact on archaeological resources. Therefore, detailed site location modeling focused on that alignment. The alignment was divided into sub areas ranked by their degree of archaeological sensitivity. Highly and moderately sensitive project sub areas were recommended for further testing.

25-450 Shaw, Leslie C.

1982 Phase I, Step 1 Archaeological Reconnaissance of Pleasant Street (Route 113), Dunstable, Massachusetts. 12 pages.

Background research and visual inspection indicated that the project area has potential for historic and prehistoric archaeological properties. Cultural deposits associated with an early 19th century sawmill and two historic farmsteads may exist. Prehistoric archaeological deposits relating to the exploitation of adjacent brooks and wetlands were also expected. An intensive survey was recommended.

25-451 Thorbahn, Peter F. and Jordan E. Kerber

1982 Archaeological Investigations at the Plymouth Elderly Housing Project, High Cliff, Plymouth, Massachusetts. 53 pages.

The intensive survey recovered archaeological materials from a number of locations within the project area. Only one locus of prehistoric cultural material was considered to be potentially eligible for National Register nomination. This site, known as High Cliff II, was tested more intensively. Although no diagnostic artifacts were found, it was hypothesized that High Cliff II had been occupied briefly, or by a small number of people during the Late Woodland period. The report recommended that the High Cliff II Site be preserved through avoidance.

25-452 Gallagher, Joan and Jordan E. Kerber

1982 Intensive Survey of Proposed Sanitary Landfill Expansion Pembroke, Massachusetts. Volumes 1 and 2. 68 pages.

Volume 1 contains the results of extensive background research; volume 2 contains a description of field strategies and their results. Background information demonstrated a moderate to high expectation for the presence of historic and prehistoric sites within the project. The intensive survey failed to locate any historic sites in addition to the 19th century dam on Herring Brook, but did identify three areas of prehistoric activity. Two of these areas were characterized by localized, low-density lithic scatters, while the third area contained a wide distribution of debitage and burned rock. It was recommended that further testing take place at the latter site.

25-453 George, Douglas

1982 Final Report on the Phase I, Step 1 Cultural Resources Survey of the Montague Road Reconstruction Project in Montague, Massachusetts. 54 pages.

The background study and walkover survey identified two previously undisturbed portions of the project area which possessed a likelihood for the presence of prehistoric archaeological resources. A total of 1600 feet on the west side of Montague Road and a proposed drain pipe location were recommended for further testing.

25-454 Barber, Russell J.

1982 Phase I, Step 2 Intensive Archaeological Survey for Proposed Modifications to Winter Street Waltham, Massachusetts. 9 pages.

A Phase I, Step 2 intensive archaeological survey was conducted on portions of the impact area of proposed road modifications to Winter Street in Waltham. Subsurface testing failed to identify any evidence for potentially significant archaeological resources. It was recommended that no further archaeological study be devoted to this area.

25-455 Graffam, Gray

1982 Final Report of Phase I, Step 1 Cultural Resources Survey of the Proposed NE and NW Highway Ramps, Routes 88 and 177, in Westport, Massachusetts. 43 pages.

The project area was considered to be moderately sensitive for the presence of prehistoric sites, and unlikely to contain historic sites. It was recommended that an intensive survey be conducted in order to determine if small-scale prehistoric sites (e.g., temporary camps, flaking stations) were indeed located within the project.

25-456 Casjens, Laurel, Eugene Winter, William Lamb, and Stephen Williams

1977 Phase I/Reconnaissance--Phase II/Intensive Cultural Resource Survey for the Lawrence Hydroelectric Project Lawrence, Massachusetts. 60 pages.

An archaeological/historic resources investigation was conducted for the Lawrence hydro project relevant to a proposed excavation area between the Merrimack River and South Canal. Background research indicated that no prehistoric or pre-industrial sites would be affected by the project. However, the South Canal and Gatehouse would be affected. The report describes these structures, evaluates their significance, and presents mitigation options.

25-457 Raber, Michael S. and William A. McIlvride

1982 Falmouth Massachusetts: Geological Investigations of Cultural Resources Potential at Three Sewerage Facility Sites. 26 pages.

Three proposed pumping station locations were tested by split-spoon borings and auger cores to evaluate the possible presence of buried land surfaces and their archaeological potential. Analysis of the cores revealed that the project was unlikely to affect significant archaeological resources.

25-458 Raber, Michael S.

1981 North Attleboro, Massachusetts: Cultural Resource Reconnaissance of Sewerage Facility Project Areas. 25 pages.

Background research and a walkover surface inspection were conducted during the reconnaissance survey of the proposed wastewater project. Some potential for archaeological cultural resources, both historic and prehistoric, was identified in project areas totaling almost three miles. Intensive subsurface testing was recommended within the sensitive areas.

25-459 Raber, Michael S.

1982 Hopkinton, Massachusetts: Cultural Resources Reconnaissance for Sewerage Facilities Alternatives. 20 pages.

Background research, field inspection and evaluation of soil, drainage and disturbance factors indicated that a number of project areas appeared to be sensitive for the presence of prehistoric cultural resources. These areas were recommended for further testing. Photo documentation was recommended for a 19th century bridge abutment, also found within the project area

25-460 Gallagher, Joan

1982 Intensive Survey Site D Yarmouth, Massachusetts. 34 pages.

An intensive survey was conducted within the project area of a proposed wastewater treatment facility in Yarmouth. Search of the state inventory files indicated that a prehistoric site had been recorded within the project area. Intensive subsurface testing with small test pits and auger cores failed to verify the presence of this site. Since no archaeological materials were recovered, no further investigation was recommended.

25-461 Cushman, David W.

1982 Phase I, Step 2 Intensive Archaeological Survey for the Barre Road Project Area Templeton, Massachusetts. 16 pages.

Included in this report are the results of historic research, informant interviews and shovel testing of six areas along the project right-of-way. No evidence of prehistoric sites was encountered. Of the historic materials recovered, one site, known as the Wheeler/Leland Mill Complex, was considered to be potentially significant and was recommended for further testing.

25-462 Cheney, John

1982 Phase II Archaeological Site Examination for the Proposed Route 66 Realignment, Huntington, Massachusetts. 24 pages.

Seven historic sites were tested and evaluated for their potential significance. The field-testing of a subsurface feature previously believed to be prehistoric revealed that it was actually historic in origin. The Hannum axe factory, which appeared to be of particular interest, was found to lie outside the area of direct project impact. No further research was recommended, as no National Register eligible properties were identified within the project.

25-463 Wamsley, J. Cooper

1982 Final Report of Phase I, Step 2 (Intensive) Cultural Resources Survey of the Proposed Construction Improvements to Old Westport Road/Old County Road in Dartmouth and Westport, Massachusetts. 80 pages.

Literature review, historical documentary research, site files search, and informant interviews failed to identify any sites within the project zone. The results of the walkover survey and subsurface testing indicated that most of the project area had been previously disturbed. Since no significant cultural resources were identified, no further research was recommended.

25-464 Bower, Beth Anne, Claire Dempsey and Leonard Loparto

1982 A Historical Summary and Archaeological Reconnaissance Survey of Chelmsford, Massachusetts. 45 pages.

The reconnaissance survey of the town of Chelmsford identified known and expected prehistoric and historic sites. Although few prehistoric sites have been recorded, these sites exhibit occupations from the Middle Archaic through the Contact Period. The town contains a number of historic

structures relating to its early agricultural period, early industrial period and industrial expansion. Chelmsford Center is a National Register Historic District. The report recommends that specific areas of known or potential sites be avoided through project design.

25-465 Towle, Linda A.

1982 Intensive Archaeological Survey of the Proposed Millham Reservoir Water Treatment Plant Marlborough, Massachusetts. 9 pages.

An intensive survey was conducted through background studies and field-testing. No prehistoric or historic sites were identified. No further investigation was recommended.

25-466 Elia, Ricardo J.

1983 Final Report of the Phase I, Step 2 Archaeological Testing of the Proposed Montague Road Reconstruction Project in Montague, Massachusetts. 8 pages.

Two segments of the Montague Road reconstruction area were intensively surveyed. No significant archaeological resources were encountered.

25-467 George, Douglas, Gray Graffam and Ricardo J. Elia

1983 Report on the Phase I, Step 2 Archaeological Survey of the Proposed Pond Meadow Bicycle Path in Braintree, Massachusetts. 31 pages.

The report includes the results of a background study and field-testing of the project area. Historic documents revealed a number of historic activities which occurred in the area, including surface quarrying, agriculture and pig raising. Ninety-three test pits were excavated, but no significant archaeological sites were encountered.

25-468 Elia, Ricardo J.

1983 Final Report of Phase I, Step 2 Archaeological Testing of the Proposed NE and NW Highway Ramps, Routes 88 and 177, in Westport, Massachusetts. 14 pages.

The excavation of shovel test pits failed to detect the presence of prehistoric cultural material within the project area.

25-469 Mulholland, Mitchell T.

1981 Phase I, Step 2 Archaeological Field Survey of the Proposed Henderson Road Realignment, Williamstown, Massachusetts. 13 pages.

The results of the intensive survey indicated that although the project area exhibited environmental characteristics typical of areas of high prehistoric potential, no prehistoric sites were found. Additionally, no significant historic sites were identified.

25-470 Elia, Ricardo 3.

1983 Report on the Phase II Archaeological Testing of the Ward Hill Interceptor in Haverhill, Massachusetts. 28 pages.

The Phase II survey studied two cross-country segments of the proposed Ward Hill interceptor project. Previous archaeological research in the area indicated that prehistoric archaeological resources might be impacted by the proposed construction. A total of 84 shovel test pits was exca-

vated in the Phase II study. No evidence of prehistoric activity was encountered in the south segment. In the north segment, a portion of the impact area is located along the margin of a prehistoric site (Walker Camp Site). Preliminary analysis of collections from the site (illustrated in the report) indicated Middle Archaic to Late Woodland activities, with Late Archaic Small Stemmed materials predominating. Since field-testing revealed only minimal evidence of prehistoric material in the project area, it was recommended that the project proceed as planned.

25-471 Towle, Linda A.

1982 Intensive Archaeological Survey of the Westborough Office Park Development Westborough, Massachusetts. 18 pages.

The intensive survey was performed within the impact areas of a proposed office park development. Field-testing failed to identify any archaeological deposits within the impact areas. One site with historic (and possibly prehistoric) significance known locally as “Devil’s Cave” was identified outside the proposed development. The report recommended that the project impact area boundaries be drawn to buffer against possible project effects stemming from the construction of offices and parking areas, or that an intensive archaeological investigation be undertaken in the area of the cave.

25-472 Shaw, Leslie C.

1982 Phase I Intensive Archaeological Survey of the North Shore Community College Project Area Beverly, Massachusetts. 42 pages.

The survey located two prehistoric sites, two isolated artifact findspots (prehistoric), and two historic sites. The isolated artifacts and historic sites were not considered to be significant. Phase II investigation was recommended for the two prehistoric sites, although only one site appeared to lie within the project impact area. The Norwood Dam Site contained a Late Archaic (Susquehanna) component and Site #3 was characterized as a small lithic scatter.

25-473 Bower, Beth Anne and Myron Stachiw

1983 An Intensive Archaeological Survey of the Bass River Interceptor and Pumping Station Beverly, Massachusetts. 35 pages.

Field and background investigations identified the presence of prehistoric archaeological deposits in three areas of the overall project. The prehistoric site located within the golf course near the Bass River contained quartz and felsite chipping debris, quartz biface fragments, and fire-cracked rock. The McKay School Site contained a few felsite flakes in disturbed contexts. The New Balch Street deposit of quartz, quartzite and felsite flakes may be part of the USMC Garden Site. Further testing or avoidance was recommended for the golf club and New Balch Street sites. No significant historic resources were identified.

25-474 Collamer, Jeanette

1983 Stage lB Archaeological Survey Site Examination 19BK99 Upper North Street, U.S. Route 7 Realignment Pittsfield, Massachusetts. 14 pages.

The site examination identified the horizontal boundaries of “The Pines” prehistoric site and gathered additional information on its internal configuration. Artifacts and chipping waste consisted principally of gray Onondaga chert; Diagnostic tools included “Lamoka” (small stemmed) and possibly Vosburg projectile points. The author suggested that the site had been occupied during fall or winter as a hunting station. The author recommended that the site be nominated to the National Register, and, furthermore, that the site be either avoided, buried, or be subject to a data recovery program.

25-475 Laden, Greg

1982 Archaeological Investigation Proposed Lowell Hilton Inn Lowell, Massachusetts. 21 pages.

Historic documents and archaeological research identified several 19th and 20th century industrial resources in the vicinity of the proposed project. Examination of the results of engineers' test trenches and soil borings, surface inspection, and five archaeological test trenches showed that the remains of structures dating to 1831, 1832, 1880, and 1934 existed within the impact zone. However, these remains had been heavily disturbed and were not associated with significant deposits of artifacts. It was determined that the hotel construction would not affect significant cultural resources. The report suggested that significant archaeological deposits might exist to the south of the project, in other areas of Middlesex Yard.

25-476 Raber, Michael S. and Jeffrey V. Kahn

1982 North Attleborough, Massachusetts: Intensive Survey of Cultural Resources in Sewerage Facility Project Areas. 43 pages.

Cross-country sewer easements were tested intensively with shovel test pits. Two prehistoric site areas were identified: the Railroad Grade Site, a campsite and workshop north of Mendon Road; and a scatter of lithic material in between Washington Street and Old Post Road, south of Allen Avenue. It was recommended that the Railroad Grade Site be avoided and that the second site be tested further. It was also recommended that an intensive survey be conducted within project areas where permission had not previously been granted. No significant historic resources were discovered.

25-477 Davin, Ann and Peter Thorbahn

1983 Intensive Survey of the Proposed Orr's Pond Rehabilitation Project Attleboro, Massachusetts. 38 pages.

Three areas of prehistoric activity were identified on the borders of Orr's Pond: the Island, Well House and Knoll 1 Sites. Because of low artifact densities and prior disturbances, the Island and Well House Sites were not recommended for further study. The Knoll 1 Site, however, appeared to be largely intact and potentially significant. A heavy concentration of Attleboro red felsite chipping debris, a few flakes of quartz and a broken argillite point (Neville?) suggested that the site had been utilized during the Middle and Terminal Late Archaic periods. Since a water treatment plant is proposed for Knoll 1, it was recommended that a determination of eligibility be sought for the site, and that a data recovery program be initiated.

25-478 Hoffman, Curtiss

1982 Westborough Archaeological Survey, Training and Excavation

Project 1982 Summative Report Excavation Operations. 35 pages.

Five prehistoric site areas were systematically sampled in order to obtain information on the prehistoric utilization of the upland zone of Westborough. Test excavations revealed that the five site areas were internally quite diverse in density of cultural remains, site size, site complexity, and emphasis of local vs. non-local lithics. Most of the diagnostic artifacts were ascribed to the Late Archaic period. The site occupations appeared to the author to be separate and probably chronologically distinct. Further analysis was recommended to determine if the sites represent different seasonal use instead.

25-479 Mulholland, Mitchell T., Alan S. McArdle, Robert J. Hasenstab, and David M. Lacy

1982 A Phase I Archaeological Survey of the Deerfield River Gorge Stillwater Bridge Hydroelectric Project. 285 pages.

The report describes the results of a background and field survey conducted on the site of a proposed hydroelectric project on 5.5 miles along the Deerfield River in Conway, Deerfield and Shelburne. The study concluded that the area is highly sensitive both prehistorically and historically, having been occupied for at least 6000 years. The area may be eligible for nomination to the National Register as a prehistoric district, and portions as historic districts. In all, 43 clusters of prehistoric material were found within the project area, of which 33 were recommended for site examination. In addition, 21 low-density prehistoric findspots requiring no further study were found. Historic sites numbered 24, of which seven were recommended for site examination.

25-480 Thorbahn, Peter F. and Jordan E. Kerber

1983 Emerson Brook Reservoir, Middleton, Massachusetts: Intensive Archaeological Survey. 63 pages.

Three historic sites were found within the project area during the intensive survey. These included two mill complexes (19th and possibly 18th centuries) and a stock pen. Testing within these sites failed to identify any significant cultural deposits. Although no prehistoric cultural materials were discovered within the Impact zone, many adjacent areas, especially the Harold Parker State Forest, were considered to be highly sensitive. No further study was recommended for the project.

25-481 Raber, Michael S. and Leonard W. Loparto

1983 Eagle Pond Nursing Home, Dennis, Massachusetts: Intensive Cultural Resources Survey. 20 pages.

A five acre parcel adjacent to a cranberry bog which empties into Eagle Pond was archaeologically surveyed. Survey activities included background research, informant interviews, walkover, and subsurface testing. Eighty-seven test pits were excavated at 20 meter intervals. No cultural materials were recovered in any of the tests; no sites were identified in the project area.

25-482 Gallagher, Joan

1982 The Prowse Farm: Its History and Archaeology. 51 pages.

Documentary research and archaeological testing were performed on the Codex property known as the Prowse Farm in Canton. The archaeological evidence revealed an almost exclusive appearance of a single chronological component across the property, dating to the late 19th and early 20th centuries. A small trash deposit containing 18th century artifacts was discovered in one portion of the property, and evidence of a structural fire was found in the vicinity of the expected location of the Doty Tavern (outside Codex's property). Further investigation was recommended for the bottle dump and trash deposit should future development be planned in these areas. The importance and preservation of the Doty Tavern site were emphasized. It was determined that the presently proposed Codex construction would not affect significant archaeological deposits.

25-483 Wilson, John S. and Meredith Weiss Belding

1979 Cultural Resource Reconnaissance for a Streambank Erosion Control Evaluation and Demonstration Project, Northfield, Massachusetts. 21 pages.

A cultural resource reconnaissance was conducted in May 1979 for proposed riverbank stabilization along 2000 feet of frontage along the Connecticut River. Historical, archaeological

and environmental background data, coupled with a field survey of the project, located no prehistoric or historic cultural resources within the impact area. A recommendation was made that the project proceed as planned. Due to the close proximity of a recorded prehistoric site, it was recommended that the Army Corps of Engineers' cultural resource staff monitor groundbreaking activities.

25-484 Little, Elizabeth

1983 Locus Q-6, Site M52/65, Quidnet, Nantucket, Massachusetts. 52 pages.

Locus Q-6, at Quidnet, Nantucket Island, excavated in 1976 and 1977 by the Nantucket Historical Association, is a small sample of a large Woodland site which has been extensively excavated by Nantucket collectors. Locus Q-6 included part of a structure defined by an arc of postmolds, and part of an adjacent shell midden. Two radiocarbon dates have been obtained for the site.

25-485 Huntington, Frederick W. et al.

1982 Preliminary Report on the Excavation of Flagg Swamp Rock Shelter. 162 pages.

The data recovery program of the Flagg Swamp Rock shelter provided important classes of archaeological data useful for studying settlement patterns, subsistence systems and social organizations of the Late Archaic and Woodland periods. The data from the rock shelter suggest that the site had been a winter camp repeatedly inhabited by small, complete social/economic groups, probably nuclear or small extended families. The report includes description and analysis of features, artifacts, faunal remains (including mammals, fish, bird, turtle, and mollusc), floral remains, and radiocarbon dates.

25-486 Cheney, John

1983 Phase II Archaeological Site Examination of the Proposed North River Bridge Replacement Project Marshfield, Massachusetts. 51 pages.

Archaeological testing proved that significant remains of the Taylor and Carver shipyard site (1848-1860) still exist. These include two wharves, discrete work areas within the yard, remains of a shipsmith shop, well-preserved woodworking debris, and the shipyard dump. The site is considered eligible for nomination to the National Register as it contains information important to understanding the shipbuilding industry for which the North River is particularly noted. Since avoidance of the site does not appear feasible, a data recovery program was recommended. Additionally, a prehistoric site was found within the project area, but was not sufficiently tested to evaluate its potential significance. A site examination was recommended for the prehistoric site. The "Little Bridge Tollhouse" proved to be a barn foundation associated with the shipyard.

25-487 Bower, Beth Anne, Elizabeth Krase and Leonard Loparto

1983 An Intensive Survey of the Lunenburg Municipal Wastewater Facilities Plan. 22 pages.

An intensive survey was completed on two proposed project areas. No evidence of prehistoric or historic cultural materials or features were identified. A third project area was not tested because of its poorly drained soils.

25-488 Strauss, Alan E.

1983 Report on the Phase I, Step 1 Archaeological Survey of the Plantation-Belmont Parcel in Worcester, Massachusetts. 20 pages.

A reconnaissance survey was undertaken for a 105 acre tract of the former Worcester State Lunatic Hospital, (now Worcester State Hospital) along Plantation and Belmont Streets. The hospital complex is listed on the National Register. Standing structures on the parcel include a mid-l9th century wood cottage, later reused by the State Hospital, and a large brick structure that was built to accommodate workers at the hospital. Historical research documented the agricultural use of the parcel during the 18th and 19th centuries, and identified a number of historic farmhouses which formerly stood along the streets. Although no prehistoric sites are recorded within the project area, three potentially sensitive areas were identified on the basis of locational criteria. An intensive survey was recommended.

25-489 Cushman, David W.

1983 Final Report, Phase I Additional Intensive Archaeological Survey of the Route 25 Modified Upland Alignment, Bourne, Massachusetts. 8 pages.

Field-testing failed to identify any cultural resources within the project area of the proposed modified upland alignment for Route 25. It was determined that the project would have no effect on Wampsett Rock, a prehistoric site which lies outside the proposed right-of-way.

25-490 Elia, Ricardo

1981 Archaeological Investigation of the Proposed Riddle Brook Housing for the Elderly In Douglas, Mass. 24 pages.

The archaeological survey of the proposed Riddle Brook Housing for the Elderly combined a background study of the impact area with subsurface testing. The results of these studies proved to be negative; no significant prehistoric or historic resources were found to exist within the impact area.

25-491 McCarty, Tom

1983 Phase II Archaeological Examination of the Proposed Warren Street Modification Palmer, Massachusetts. 14 pages.

Based on the results of this investigation, it was determined that the Madura site, the schoolhouse locus and the Noone residence were not associated with cultural remains of potential significance. It was therefore recommended that further archaeological considerations were unnecessary. Archaeological and historical investigation of the Ferrel site revealed that this resource contained material remains of probable scientific value and was of potential importance with respect to local and regional historical development. However, special provisions were inserted into the construction plans to avoid the significant areas of the site.

25-492 Mahlstedt, Thomas F. and Eric S. Johnson

1983 The Intensive Archaeological Survey of the Sutton Sewer Facilities in the Towns of Douglas and Sutton, Massachusetts. 27 pages.

The survey investigated two cross-country segments of the proposed sewer facilities in the towns of Douglas and Sutton (Manchaug). Past research of the vicinity had identified the existence of prehistoric activities in the general area, and the project location, adjacent to the Mumford River, was considered to be archaeologically sensitive. Evidence for prehistoric activity was encountered at two separate locations within the Douglas segment. Additional testing at these locations proved that these sites, “non-sites,” or portions of sites contained only sparse distributions of chipping debris in low frequencies and appeared to be of limited extent and significance. No further testing was recommended.

25-493 Towle, Linda and Greg Laden

1983 Archaeological Survey of Wisdom Way and River, Mill, and Meade Streets Relocation and Reconstruction Projects Greenfield, Massachusetts. 8 pages.

A Phase I, Step 2 intensive survey was conducted in two areas adjacent to Mill and Meade Streets. Visible remains of historic structures near Mill Street were determined to have been extensively disturbed by previous construction. Testing of the riverbank adjacent to Meade Street indicated that it was a 19th and 20th century dumping area and was not considered to be significant. No further archaeological investigation was recommended.

25-494 Shaw, Leslie

1983 Phase I, Step 2 Archaeological Survey of the Williamsville-Templeton Road Project Hubbardston, Massachusetts. 14 pages.

The field survey and background review identified six historic but no prehistoric sites within the survey boundaries. The historic cultural resources of the project were comprised of the Williamsville Chapel, the Felton Store, a wagon shed, a black jack tar factory, the Williams family mansion foundation, and a 20th century bottle and can dump. Three of these sites would not be impacted significantly by the proposed roadwork; the remaining three sites were not considered to be historically significant because of their recent origin. No further research was recommended.

25-495 Blancke, Shirley

1981 Survey of Pre-Contact Sites and Collections in Concord. 18 pages.

This report describes the results of a MHC survey and planning grant project to update and improve MHC's inventory of prehistoric sites in Concord, and to record artifacts from various private collection in the area. Inventoried sites were field checked to evaluate their present condition, land use and possible threats; collections were inventoried and integrated into MHC's computer files; and conclusions were drawn concerning temporal settlement patterning exhibited in Concord sites.

25-496 Hasenstab, Robert J. and Robert W. Drinkwater

1983 Archaeological Background and Reconnaissance Survey for the Proposed Line Place Apartments Housing Project in the Town of Southampton, Hampshire Co., Massachusetts. 40 pages.

Due to its environmental setting, the project area was determined to have limited archaeological potential for the historic period and most of prehistory. Geological information was extrapolated to suggest that the project area had formerly been a bluff above the stable shoreline of Glacial Lake Hitchcock. Two small gullies nearby may have been springs. The author recommended further testing of a portion (0.7 acres) of the impact area for the presence of Paleo-Indian sites. The results of the testing would help to support or negate current models of Paleo settlement which suppose that Paleo occupation of the Connecticut Valley was not contemporary with the glacial lake.

25-497 Gallagher, Joan and Ann Davin

1983 Intensive Survey of the New England Energy Park and Access Corridor, Fall River, Massachusetts. 125 pages.

The survey identified prehistoric and historic cultural resources within the project area and evaluated their potential significance within the context of settlement and land use models postulated

for the region. Both prehistoric and historic land use of the project area were found to be closely paralleled in the documentary and archaeological records. The results of the survey indicated that the interior of Fall River has apparently always been the location of extraction activities for the benefit of larger settlements in the coastal zone. Six prehistoric sites and one historic site (a granite quarry) were recommended for further study.

25-498 Thorbahn, Peter F.

1983 Archaeological Reconnaissance Survey of the Barnet Boulevard Extension, Dartmouth and New Bedford, Massachusetts. 30 pages.

Although the background studies failed to identify any recorded sites within the project, three project segments were found to be highly sensitive on the basis of observed surface remains and environmental characteristics. The surface remains include stone mounds and a semi-circular ditch of unknown origin. These areas were recommended for further study.

25-499 Thorbahn, Peter F.

1983 Intensive Archaeological Survey of the Barnet Boulevard Extension, Dartmouth and New Bedford, Massachusetts. 18 pages.

Three project areas were tested. The survey found the remains of stone wall construction and charcoal burning activities, probably dating to the 19th century; these historic resources were not considered to be significant. Although no prehistoric sites were found, areas to the north and south of the project area were considered to be sensitive. It was recommended that the project proceed as planned.

25-500 Thorbahn, Peter F. and Deborah C. Cox

1983 Extended Phase II Testing and Analysis of Six Prehistoric Sites in the Northern Section of the Route 146 Project, Sutton and Uxbridge, Massachusetts. 135 pages.

The Purgatory I and II, Black Bear, Bear Hollow, Dead Dog, and Cracker Sites were subjected to additional testing and analysis within the framework of three alternate regional settlement/subsistence models. Radiocarbon dates, descriptions of artifacts and features, and identification of internal depositional units and concentration clusters assisted in the interpretation of the occupations and functions of these upland sites. Comparisons were made with the results of the I-495 data recovery program (lowland sites). Management considerations were also presented for small, upland sites.

25-501 Thorbahn, Peter F., Deborah C. Cox and Duncan Ritchie

1983 Archaeological Investigations at the G.B. Crane Site, Norton, Massachusetts: The Data Recovery Program. 165 pages.

A portion of the G.B. Crane Site to be impacted by sewer construction was the subject of a data recovery program. Descriptions of the research design, methodological and theoretical issues, archaeological findings, and the results the analysis of depositional units, features, tools, lithic materials, and palynological, flotation and radiocarbon samples were presented. The report concluded that the site had been occupied during the Early/Middle Archaic, Late Archaic and Late Woodland periods for varying lengths of time and purposes. The findings were discussed within the context of a regional logistical settlement model.

25-502 Ritchie, Duncan

1983 Final Report of an Archaeological Reconnaissance Survey of Hopping Brook Park, Holliston, Massachusetts. 66 pages.

Background research and walkover inspection helped to divide the project into five zones of decreasing archaeological sensitivity. Limited subsurface testing identified six prehistoric sites in zones 1 and 2; two historic quarries were identified in zone 3, and an historic dam in zone 1. It was recommended that proposed office park development be designed to avoid impacts to the known sites and zones 1 and 2. If avoidance would not possible, further archaeological investigation would be required in these areas.

25-503 Raber, Michael S.

1983 Cultural Resources Reconnaissance of Kingston, Massachusetts Sewerage Facilities. 30 pages.

Background research, informant interviews and walkover survey were conducted for several locations in Kingston which were proposed for sewer facilities. A number of project areas were highlighted for further study. Recommendations were made for testing methodologies in these areas.

25-504 Raber, Michael S. and Leonard W. Loparto

1983 Intensive Cultural Resources Survey for Walpole, Massachusetts Sewerage Facilities. 52 pages.

Background research, walkover inspections and intensive subsurface testing revealed two potentially significant cultural resource sites which may be impacted by the proposed project: a prehistoric site of undetermined age and size in South Walpole; and an earthen core mill dam at Stetson's Pond dating to the 19th, and possibly 18th, century. Additional archaeological investigation was recommended for these two sites and a newly proposed cross-country easement.

25-505 Raber, Michael S. and Leonard W. Loparto

1983 Archaeological Site Examination for Walpole, Massachusetts Sewerage Facilities. 8 pages.

A small quantity of felsite and quartz chipping debris was recovered from disturbed and undisturbed contexts within the Domenica Street Site. The site was determined not to possess sufficient integrity or significance to be considered eligible for nomination to the National Register.

25-506 Shaw, Leslie C. and Gregory Laden

1981 Phase I Archaeological Field Survey Report of the North Andover Elderly Housing Project North Andover, Massachusetts. 30 pages.

The field survey identified one prehistoric and one historic site within the project boundaries near the Shawsheen River. The prehistoric site contained various lithic materials of unknown cultural affiliation; the Hayes Farmstead historic site contained deposits of occupation debris dating from the 18th through 20th centuries. Since the prehistoric site would be avoided, no further testing was recommended. Additional archaeological and documentary research was recommended for the historic site, which would be directly impacted by the proposed construction.

25-507 McBride, Kevin A. and Mary G. Soulsby

1982 Feasibility Study Mount Tom Coal Reconversion Project Holyoke, Massachusetts. 10 pages.

Examination of site files, walkover survey and subsurface testing were conducted in order to com-

plete a limited assessment of the archaeological sensitivity of the project area under feasibility study. The fieldwork confirmed the presence of two inventoried prehistoric sites and identified archaeologically sensitive areas. Recommendations were made in light of these findings.

25-508 Hoffman, Curtiss

1983 The Johnson #1 Site Final Report. 128 pages.

From 1979 to 1981, Bridgewater State College sponsored an archaeological field school at the Johnson #1 Site, a small multi-component site adjacent to the Route I-495 right-of-way in Taunton. This report presents and discusses the methods of excavation, excavation results, and the interpretation of culture history and process at the site. It both supports and suggests modifications to the findings and analysis included in the data recovery report by the Public Archaeology Laboratory for the Route I—495 project.

25-509 Bower, Beth Anne, Claire Dempsey and Leonard Loparto

1983 An Intensive Archaeological Survey of the Proposed Treatment Plant and Sewer Line in Stockbridge, Massachusetts. 21 pages.

Background literature research and archaeological test excavations were conducted for the locations of a proposed new treatment plant and the Beachwood interceptor sewer. Both areas were found to have a combination of disturbed and poorly drained soils. No significant cultural materials or features were found.

25-510 Bower, Beth Anne and Claire Dempsey

1983 An Archaeological Survey of the Reading Pumping Station Facilities Plan. 12 pages.

A reconnaissance survey was completed for three portions of the facilities plan within the towns of Wakefield and Stoneham. Only the Brook Street section was subjected to an intensive survey. Subsurface testing did not recover any cultural materials or features. No further research was recommended.

25-511 Towle, Linda A.

1983 Intensive Archaeological Survey of the Proposed Widening of Route 2A Lexington, Massachusetts. 5 pages.

An intensive survey was conducted on the Minute Man National Historical Park land which would be impacted by the proposed widening of Route 2A (Marrett Road) in Lexington. No prehistoric or significant historic resources were encountered. No further archaeological investigation was recommended for the project area as presently defined.

25-512 Stokinger, William A. and Geoffrey P. Moran

1978 A Final Report of Archaeological Investigations at Fort Independence: 1976-1977. Volumes I and II.

Archaeological testing, excavation and construction monitoring were performed in conjunction with the Metropolitan District Commission’s first phase of restoration work at Fort Independence on Castle Island in South Boston. The results of documentary research, archaeological activities and laboratory analysis have provided important detail concerning the internal and external structural elements of the existing and previous forts and fortifications. Numerous subsurface features were identified and excavated, resulting in the collection of significant historic archaeological data

and cultural materials. Illustrations of the artifacts, historic plans and architectural profiles, archaeological features and stratigraphic profiles, as well as descriptions of the findings provide a wealth of information useful for developing interpretive programs for the public.

25-513 Strauss, Alan E. and Neill DePaoli

1983 Report on the Phase I, Step 2 Archaeological Survey of the Proposed Benton Drive Construction Project in East Longmeadow, Massachusetts. 26 pages.

A prehistoric site was identified in an agricultural field in the northern section of the project area. Although a number of shovel test pits and one l x l m test unit were excavated in the site area, the majority of artifactual material was collected from the surface. Cultural materials were exclusively lithic, but highly varied; the discovery of an unfinished stemmed point, a steatite bowl fragment and an atl-atl weight fragment suggests the presence of Late Archaic, Transitional and/or Early Woodland components. A site examination was recommended.

25-514 Strauss, Alan E.

1983 Cultural Resources Survey of the Proposed Black Swamp Interceptor in Medway, Massachusetts. 14 pages.

Background research, literature and site file review, interviews with informants, field reconnaissance, and subsurface testing were undertaken for the proposed sewer along the Black Swamp in Medway. No evidence of cultural resources was encountered within the project area. No further research was recommended.

25-515 Mrozowski, Stephen and Peter Thorbahn

1983 Intensive Archaeological Survey of the Shamray Property, Raynham, Massachusetts. 38 pages.

Documentary research, walkover survey and subsurface testing identified an historic site and the possibility for the presence of an early historic family burying ground within the project area of a proposed housing development. The historic site, characterized by field stone foundations and a wide scatter of cultural materials, and believed to have been occupied by artisans in the late 18th through 19th centuries, was not considered to be of particular importance. Documentary records have suggested that the area may contain the remains of a small burial plot used by the locally renowned Leonard family until at least 1858. Since no physical evidence of the cemetery was identified during the intensive survey, further testing was recommended.

25-516 Bower, Beth Anne and Leonard Loparto

1983 A Site Examination of the Golf Course Site Beverly, Massachusetts. 24 pages.

Additional subsurface testing at the Golf Course Site and along Balch Street near the USMC Garden Site revealed that neither location contained archaeological remains considered eligible for nomination to the National Register. Chipping debris (mostly felsite), biface fragments, a portion of a possible Levanna point (chert), a possible Meadowood point (felsite), a pottery sherd, and calcined bone were found scattered throughout the Golf Course Site. However, as the site was too disturbed to possess sufficient integrity, no further study was recommended for the project.

25-517 Ritchie, Duncan

1983 A Site Examination of the Meadowlands Trust Property, Canton, Massachusetts. 45 pages.

The Meadowlands Site and East Branch Workshop were found to be eligible for nomination to the National Register. The Meadowlands Site contains evidence of use during the Middle and Late Archaic and the Middle or Late Woodland periods. Associated features, artifacts, faunal and botanical materials, and cultural material concentration areas imply varied site usage. Further study of the site will help to address regional research questions concerning Middle Archaic territories; Late Archaic settlement and subsistence systems (Laurentian, Small Stemmed, Squibnocket, and Susquehanna traditions); and Middle/Late Woodland economic and exchange systems. The East Branch Workshop is a primary lithic extraction location centering on an exposed vein of quartz on a large boulder. Important information concerning quartz lithic technology can be obtained from further investigation at the East Branch site.

25-518 Mahlstedt, Thomas F.

1983 The Intensive Archaeological Survey of the Sewer Extensions and Appurtenant Works, Pepperell, Massachusetts. 20 pages.

Approximately 3500 feet of proposed cross-country sewer easements were intensively surveyed. No historic period remains were encountered during subsurface testing. Evidence of potentially significant prehistoric activity was encountered at one location on the south side of the Nashua River, at the confluence of Reedy Meadow Brook. Although no diagnostic artifacts were recovered, the wide variety of lithic materials (chert, hornfels, felsite, jasper, argillite) hinted towards a Woodland period affiliation. A data recovery program was recommended since the project could not be redesigned to avoid the site.

25-519 Mrozowski, Stephen

1983 An Intensive Examination of the Proposed Oxford Industrial Park Roadway, Oxford, Massachusetts. 28 pages.

Background research, walkover survey, soil auger sampling, and the excavation of test pits were performed. A small quartz flake scatter was identified within the proposed roadway, but because of the low density of cultural materials, the site was not considered to be significant. No historic period sites were discovered within the proposed right-of-way. No further investigation was recommended.

25-520 Shaw, Leslie C., Nancy S. Seasholes and Stephen Loring

1983 Phase I Intensive Archaeological Survey of the Route 213 Merrimack River Crossing Lowell, Dracut, and Chelmsford, Massachusetts. 68 pages.

The survey consisted of documentary research, walkover inspection of the entire project area to delimit zones of disturbance and to confirm or deny the presence of historic sites identified in the documentary records, and the excavation of over 270 test pits along the project right-of-way. The results of the survey indicate that two sites warrant further archaeological site examination: (1) the Gumpus Road prehistoric site; and (2) the Bowers house historic site.

25-521 Mulholland, Mitchell I., Robert W. Drinkwater and Shelley Hight

1983 Archaeological Locational Survey of the Riverdale Area, West Springfield, Massachusetts. 54 pages.

The Riverdale project area was predicted to have high prehistoric site potential based on environmental characteristics and the proximity of sites in the immediate vicinity. Historical background research showed that the area may have contained one of the first three settlements in West Springfield, and that the area had been used primarily for agricultural purposes since the 17th century. Subsurface field examination disclosed that in spite of the potential of the area, the project

had an unusually low prehistoric artifact and feature density, and contained no evidence of the early historic settlement. It was recommended that no further site evaluation be made, and that the contractor minimize further disturbance to two small prehistoric features which were encountered.

25-522 Gallagher, Joan

1983 The South Cape Beach, Mashpee, Massachusetts. An Intensive Survey of the Proposed Parking Area Phase 1(A). 31 pages.

The intensive survey of the 435 acre South Cape Beach parcel was divided into two phases of work (see report #25-523). This report describes the research activities and results of the intensive survey of a proposed parking area within the property. Subsurface testing failed to recover any cultural materials. Background research revealed an absence of recorded archaeological sites within the Beach parcel, and indicated that the historic Native American use of the area had been for resource procurement rather than dense residential occupation.

25-523 Gallagher, Joan

1983 The South Cape Beach, Mashpee, Massachusetts. An Intensive Survey of the Balance of the Park Phase I(B). 75 pages.

The results of the intensive survey of the majority of the South Cape Beach parcel are analytically discussed, with strong emphasis on a regional framework of environmental and cultural development. Expected classes of archaeological data are proposed. Subsurface testing by means of auger core sampling and shovel test pits failed to identify any potentially significant cultural resources. Only relatively recent historic resources were encountered. No further investigation was recommended.

25-524 Marti, John et al.

1979 Phase II/Intensive Archeological Survey Report of Proposed Montague Wastewater Treatment System Expansion, Montague, Massachusetts. 20 pages.

The field investigation recovered a few lithic flakes in two project areas. Neither area produced enough culturally datable material to determine the period of site occupation, but Middle Woodland affiliation has been suggested. Neither site was considered significant or eligible for nomination to the National Register.

25-525 Randall, Debra

1981 Archaeological Survey of the Proposed MDC Sludge Management Plant Deer Island, Massachusetts. 20 pages.

The survey was conducted on two specific areas proposed for sludge management facilities near the existing sewer plant and Fort Dawes. No significant archaeological properties were identified, as most of the project areas have been disturbed. Historic building remains associated with Fort Dawes were encountered but were not considered to be significant.

25-526 Barber, Russell

1983 Intensive Archaeological Survey of the Engelhard Property, Concord, Massachusetts. 14 pages.

The Intensive survey of the Engelhard property consisted of both documentary research and field-testing of areas to be disturbed by proposed construction. No archaeological sites of potential sig-

nificance were found. No further study was recommended.

25-527 Cushman, David W.

1983 Phase I, Step 1 Archaeological Reconnaissance of the Highland Acres Project Area, Salem, Massachusetts. 20 pages.

Background research and walkover survey confirmed the project area to be archaeologically sensitive. The project area is adjacent to a freshwater meadow with prehistoric sites reported in its vicinity. A known Colonial path and possibly former Indian trail bisects the eastern half of the impact zone. The project area was stratified into probability zones of site location and an intensive survey was recommended.

25-528 Cushman, David W.

1983 Phase I, Step 2 Archaeological Survey of the Highland Acres Project Area, Salem, Massachusetts. 21 pages.

Two flake scatters were discovered in eroding contexts outside the project impact area. A stone-lined trail believed to be a remnant of the "Ancient Way," a Colonial period footpath was observed across a portion of the project. Test trenches provided information on the internal construction of the path and documentary evidence suggested its Colonial origin. Further testing was recommended to determine whether the path is eligible for nomination to the National Register.

25-529 DePaoli, Neill and Alan E. Strauss

1983 Report on the Phase I, Step 2 Archaeological Survey of the Route 116 Reconstruction Project In Amherst, Massachusetts. 25 pages.

Background research, field reconnaissance and subsurface testing revealed no evidence of significant cultural resources in the project area.

25-530 DePaoli, Neill, Ricardo J. Elia and Alan E. Strauss

1983 Report on the Phase I, Step 2 Archaeological Survey of the Greenfield Road Reconstruction Project in Colrain, Massachusetts. 36 pages.

Background research, interviews with local informants, field reconnaissance, and subsurface testing resulted in the identification of five historic sites adjacent to the project's impact area. Testing within the impact area adjacent to these 19th and 20th century sites produced no significant archaeological remains. No further research was recommended.

25-531 Strauss, Alan E. and Neill DePaoli

1983 Report on the Phase I, Step 2 Archaeological Survey of the Greenfield Road Reconstruction Project in Montague, Massachusetts. 33 pages.

Background research and field reconnaissance resulted in the discovery of three prehistoric sites adjacent to the project impact area. Subsurface testing identified a fourth prehistoric site and scattered evidence of prehistoric activity in three areas within the impact area. Artifacts were recovered from the plowzone or from contexts of questionable integrity. The finds suggest that the proposed project will only impact the already disturbed margins of sites. No further investigation was recommended.

25-532 George, Douglas

1983 Report on the Phase I, Step 2 Archaeological Survey of the Main Street Reconstruction Project in Northbridge, Massachusetts. 50 pages.

The survey identified three historic sites: a l9th-20th century house site; a 19th century trip-hammer mill site; and a l9th-20th century sawmill site. Subsurface testing revealed that the three sites had been disturbed in later periods. Surface remains of the mill sites, however, were found to be well preserved and should be avoided by construction activities.

25-533 Thorbahn, Peter F.

1983 Archaeological Examination of the Swift Sites, Acushnet, Massachusetts. 32 pages.

Subsurface testing indicated that two separate site loci, the Swift I and II Sites, were located within the impact area of a proposed sewer line. Both sites were small, with relatively low densities of artifacts and features. A total of 169 prehistoric artifacts were recovered, chiefly lithic debitage of a variety of materials, three bifaces, a possible Levanna point, and two sherds of aboriginal pottery. It is hypothesized that the Swift sites were occupied during the Middle or Late Woodland period. Because the site examination yielded sufficient archaeological data to address current research questions, and the sites were not considered to be eligible for nomination to the National Register as individual properties, no further investigation was recommended.

25-534 Huntington, Frederick and Debra Randall

1981 Phase II Archaeological Survey of the Proposed Shopping Mall in Attleboro, Massachusetts. 47 pages.

Shovel test pits were used to determine the horizontal and vertical extent of the four archaeological sites within the project area. Larger excavation units were also excavated. The Knoll C Site was considered to be eligible for nomination to the National Register for its significant prehistoric archaeolo$_9$ical deposits. The range of lithic debitage at the Knoll C Site indicated that felsite raw material was brought to the site as quarry blanks which were most likely reduced to preforms rather than finished tools. A charcoal feature, possibly used in food preparation, was radiocarbon dated to the Early Woodland period. Coarse grit-tempered pottery confirmed the existence an Early Woodland component at the site. The report suggests that the association of a Late Archaic Squibnocket triangle with Early Woodland material may indicate that Squibnocket points were utilized by prehistoric groups for a longer period of time than currently believed. The report recommends that the Knoll C Site be avoided through project redesign or that a data recovery program be conducted.

25-535 Bower, Beth and Claire Dempsey

1982 Historical Summary of the Town of Bellingham, Massachusetts. 22 pages.

This report describes the origins and development of Bellingham from its 17th century settlement through nearly the present day. The roles of religion, industry, and agriculture are detailed. All historic properties in Bellingham are listed. Although the town contains no National Register listed properties at present, the report provides a list of historically significant buildings and sites potentially eligible for inclusion in the National Register to be used by planners of a proposed sewer project. (See also report #25-544.)

25-536 Drinkwater, Robert, et al.

1982 Interim Report Archaeological Survey of the Western Gateway Urban Heritage State Park, North Adams, Massachusetts. 33 pages.

The historical development of North Adams is described. A table outlines archaeological sites expected on the basis of historical research and field observations, including documented subsurface intrusions or disturbance that may have affected the integrity of archaeological remains. Specific impacts due to park construction plans are described. The report concludes that little significant data can be revealed through archaeological investigation at this site and that the proposed construction will not affect cultural resources.

25-537 Cheney, John, et al.

1983 Phase II Archaeological Site Examination: Weston Farmstead and Nichols Blacksmith Shop, Windsor, Massachusetts. 43 pages.

A detailed history of Windsor establishes the context for archaeological considerations of two sites within the Route 8A project. The Weston Farmstead was investigated by surface collection and hand excavation of 50 cm and 1 meter test pits. Testing found that the critical elements of the farmstead, including the dump, the earliest barn, and the spruce distillery, are located outside the project area. Examination of the Nichols Blacksmith Shop discovered remains dating only to a later tenant farmer occupation (1891-1919) of the site. Both sites were determined to lack sufficient archaeological integrity or research potential to warrant nomination to the National Register or additional archaeological investigation. Appendices of artifact and faunal remains are included in the report.

25-538 Gallagher, Joan

1983 Intensive Survey of the Amesbury Water Treatment Plant, Amesbury, Massachusetts. 36 pages.

Background research and field investigation, including walkover, auger testing, and subsurface excavation, located no prehistoric or historic cultural resources within the project area. The report recommends that the proposed construction proceed without further archaeological investigation. The results of extensive documentary research detail the archaeological significance of the Lake Attitash/Powwow River area, and provide a useful framework for future archaeological investigations in Amesbury.

25-539 Towle, Linda and Dick Ping Hsu

1983 Archaeological Monitoring at Adams, Birthplaces, Quincy, Massachusetts. 9 pages.

The report describes the monitoring of drain installation at the site of the birthplaces of John and John Quincy Adams. A stone feature examined in one of the excavation units was found to be part of the wall of a cellar that last served as a domestic refuse dump. The report concludes that future investigations of this nature would be profitable for gathering information on the domestic economics of historic properties.

25-540 Thorbahn, Peter F.

1984 Intensive Survey of the Lake Attitash Sewer Project, Amesbury, Massachusetts. 35 pages.

No cultural materials were recovered during the walkover or intensive survey of the project area. The report hypothesizes that although the environment was a positive factor, the sloping topography of the area rendered it unsuitable for settlement. Clearance for project construction was recommended. However, it was noted that the general area of Amesbury around Lake Attitash and the Powwow River is likely to contain both prehistoric and historic sites, and that this archaeological sensitivity should be considered in future project planning in the area.

25-541 Wamsley, J. Cooper

1983 Final Report on the Intensive Archaeological Reconnaissance of the Hodges Village Low Flow Augmentation Project in Oxford, Massachusetts. 44 pages.

The report describes the results of historic and prehistoric extensive background research and a field survey of the Hodges Village project area. Subsurface testing produced a thin scatter of historical artifacts. No evidence of prehistoric activity was encountered, perhaps due to the poor natural drainage of the surveyed area. The report concludes that no significant resources will be impacted by the project.

25-542 Bower Beth and Leonard Loparto

1983 A Reconnaissance Survey of Three Alternatives for the New Neponset Valley Relief Sewer. 30 pages.

Physical description of the Neponset River area and prehistoric and historical summaries of the Canton, Milton, Boston, Norwood, and Stoughton areas are provided. The results of a walkover survey are presented in outline form. The three sewer construction alternatives are evaluated for potential impacts to cultural resources. The report concludes that the Central Alternative is preferable, followed by the Western Alternative. The Eastern Alternative was least preferable, as it is likely to affect significant archaeological sites. The report notes that all project alternatives pass through the Blue Hills Multiple Resource Area, which is listed in the National Register.

25-543 Beaudry, Mary C.

1984 Excavations at the Wilkinson Backlot Site, Boston, Massachusetts: A Preliminary Report. 42 pages.

The report describes the features of this urban excavation project. All significant cultural resources in the construction impact area were thoroughly explored or sampled through excavation. The backlot contained a high density of deep 17th century and later historic deposits. The report recommends that the proposed construction proceed with archaeological monitoring of the initial construction stages to insure that no significant cultural resources are destroyed and to note any supplementary archaeological data.

25-544 Bower, Beth and Leonard Loparto

1984 Prehistoric Reconnaissance Survey, Bellingham, Massachusetts. 16 pages.

The physical description and prehistoric summary of the area indicate a high potential for the presence of significant archaeological sites, although none are presently recognized. The report recommends that more intensive archaeological research be conducted within the proposed Bellingham sewer project in Bellingham and Franklin, including all cross-country sewer easements. (See also report # 25-535).

25-545 Cushman, David

1984 The Shattuck Street Dump Site: Patterns of Domestic Consumption in a Late 19th Century Working Class Community. 81pages.

The report describes the results of archaeological investigations conducted within an area proposed for land modification relating to the Lawrence hydroelectric project in South Lawrence. A

Phase I archaeological testing survey located the Shattuck Street dump site within the project area. Phase II/III salvage excavations further identified the site as a short-term land filling operation, deposited between ca. 1893-1896, containing cultural materials associated with a working class community. The report includes a detailed history of labor in Lawrence. Analysis of glass bottles and ceramics focuses on use and recycling patterns related to economics and cultural preferences. Comparisons are made to a similar site, the Pearl Street Dump in Gardner (see report #25-435).

25-546 Davin, Ann, Peter F. Thorbahn and Duncan Ritchie

1983 Archaeological Investigations of the Robin Hill Development, Marlborough, Massachusetts. 58 pages.

Background research, walkover, soil auger transects, and limited subsurface testing identified six prehistoric sites and one historic period site within the 130 acre project area along the Assabet River. Of the six prehistoric sites, four were recommended for site examination: the Robin Hill, Howe, Cook, and Ironwood sites. These sites possess high densities of cultural material, while the other two sites, Wilder and Bombard, are small, low-density scatters of limited research value. The Robin Hill Site appears to have been occupied during the Transitional Archaic period, given the presence of steatite fragments. No other diagnostic artifacts were encountered during the field survey. The Gershom Bigelow farmstead, occupied between 1787 and 1922, was also recommended for further study.

25-547 Gallagher, Joan

1983 An Intensive Archaeological Survey of the Wordell Farm/Riverview Corporate Park. 69 pages.

Following descriptions of the project's physical environment and regional settlement patterns through time, the report provides an assessment of the archaeological sensitivity of the proposed project area near the Taunton River in Fall River. Site walkover, soil auger transects and test pits were utilized to locate sites which were also subjected to additional excavations to assess the density of cultural materials, integrity, spatial limits, and internal site configuration. Four prehistoric sites were discovered within the former Wordell Farm, including a corner of the well-known Tan Pond Brook Site. Three additional isolated findspots were also encountered. The significance of these sites were discussed in relation to the prehistory of the Taunton Basin; recommendations for the management of these resources were presented.

25-548 Synenki, Alan T. and Sheila Charles

1983 Archeological Collections Management at Salem Maritime National Historic Site, Massachusetts. 54 pages.

The report describes the procedures used by the National Park Service in the Archeological Collections Management Project to reclassify, catalogue and curate the archaeological collections from three sites: the Narbonne House, Central Wharf, and the Derby House. The project objective was to make artifacts and associated documentary materials accessible for management, educational, and research purposes. The report includes a list and description of artifact types, as well as summary of suggestions for classification improvement.

25-549 Bower, Beth Anne and Leonard Loparto

1984 A Reconnaissance Survey of Proposed Sewer Easements and Pumping Stations in Canton, Massachusetts. 20 pages.

An overview of the prehistory and history of the Canton area and an assessment of the archaeological sensitivity of the proposed sewer project areas are presented. While sites identified in the survey probably represent only a small portion of the total number of sites present, they do cover a wide temporal span for both the prehistoric and historic periods. Prehistoric sites include evidence of settlement during the Middle and possibly Early Archaic through Contact Periods. Numerous historic period sites have been identified in the Canton area as well. These sites date to Contact or early historic period settlement through the mid- to late-l9th century. At present, known prehistoric and historic period properties are located outside of the proposed sewer routes. However, it is likely that sites of National Register significance do exist within the proposed project because of environmental attributes and proximity to other important cultural resources. Recommendations include avoidance of gently sloping, well-drained areas, and confining construction to existing roadways. A list of areas recommended for further testing is presented.

25-550 Bower, Beth Anne and Leonard Loparto

1984 An Intensive Archaeological Survey of the Groton, Massachusetts Facilities Plan. 20 pages.

Background research, walkover surface inspection and subsurface archaeological testing failed to locate significant cultural resources within project areas. It was recommended that sewer construction proceed as planned.

25-551 Cheney, John and Stephen Mrozowski

1984 Archaeological Investigations for the Town Hill Condominium Project. 116 pages.

Intensive subsurface site examination determined that no significant archaeological sites will be impacted by the planned condominium development on Town Hill in Charlestown. A series of lot grading sequences in the 19th century and subsequent activities and construction had destroyed almost all traces of 17th, 18th, and early 19th century occupation. The meager remnants of earlier occupations discovered on the lot were either redeposited without known provenience, or so badly impacted by subsequent activities that they lack archaeological integrity and significance. The report concludes that, while it is possible that portions of discrete subsurface features, such as well shafts or deep cellars, may have survived subsequent impacts, the probability is too low to warrant further archaeological investigations at this site. Although the excavations on this block have not located any significant archaeological sites, they have provided information important to archaeologists for assessing historic documentation, examining urban land modification processes, and evaluating the relative value of other archaeological sites in Charlestown.

25-552 Davin, Ann and Joan Gallagher

1984 Intensive Survey of the Holden Sewer Improvement Project Areas, Holden, Massachusetts. 55 pages.

The report includes descriptions of the prehistoric and historic development of Holden, including specific references to the project areas. Walkover survey, soil auger coring and test pit excavations did not identify any significant archaeological resources within the proposed sewer easements. No further testing was recommended.

25-553 Gallagher, Joan

1984 Intensive Survey and Historic Landscape Report, Worcester State Hospital, Worcester, Massachusetts. 64 pages.

The intensive survey of three previously identified sensitive areas (see report #25-488) did not locate any potentially significant archaeological resources. After the excavation of forty 50-cm units, cultural material was found to be limited to structural and domestic debris commonly recov-

ered from the plowzone. No additional archaeological investigation was recommended. The historic landscape survey indicated that while the hospital grounds generally retain their original mix of open field and artificially spaced trees, the elaborate landscaping detail of the late 19th and early 20th century has been lost due to both natural and cultural factors. The cultivated fields have been converted to mown grass slopes, elms have been replaced by maples, and formal flowerbeds have been abandoned for lack of manpower. The grounds, however, remain as one of the few open spaces in what was once a rural agricultural section of the city of Worcester. The proposed development should make every effort to preserve as much as possible of this green space. Special attention should be paid to preservation of the avenues of trees and specimen plantings on the drives leading from Plantation and Belmont Streets to the main building.

25-554 Raber, Michael S.

1984 Lowell, Massachusetts: Cultural Resource Reconnaissance of Combined Sewer Overflow Facilities. 40 pages.

Following a discussion of the known prehistoric and historic occupation of the project areas, the report makes recommendations based on documentary evidence, interviews, and walkover surveys. Three areas likely to contain prehistoric sites are recommended for project avoidance. Recorded historical resources, a mill and dam complex, and the site of the Livingstone woolen mills are recommended for avoidance or further investigation. Cooperation between the project planners and the National Park Service in Lowell is encouraged, so that damage to the stone walls of the Pawtucket Canal adjacent to a project locus be avoided. The report provides detailed steps for the implementation of further investigation at project areas thought to contain cultural resources.

25-555 Raber, Michael S.

1984 Cultural Resources Reconnaissance for Possible Sewerage Facilities in Plymouth, Massachusetts. 34 pages.

Through informant interviews, prehistoric and historic background research and walkover survey of the proposed project, specific areas likely to contain archaeological sites were identified. The report recommends that certain project areas be intensively surveyed. No further investigation is recommended in assessing possible underwater sites, as present limitations in research techniques prevent cost-effective strategies.

25-556 Raber, Michael S.

1984 Tyngsborough, Massachusetts: Cultural Resource Reconnaissance of Proposed Sewerage Facilities. 13 pages.

The report contains summaries of the prehistoric and historic background of the Tyngsborough area. Visual walkover inspections of project planning areas were made where access was possible. All but two of the project areas were found likely to contain potentially significant cultural resources. An intensive archaeological survey was recommended, and suggestions for field methodology were presented.

25-557 Strauss, Alan E.

1984 Report on the Phase I (Intensive) Archaeological Survey of the Proposed Wastewater Treatment Facilities for the City of Westfield, Massachusetts. 17 pages.

The Phase I intensive survey of the proposed Westfield wastewater facilities included background research, field reconnaissance, and subsurface testing. One locus of prehistoric activity containing a small amount of chipping debris was encountered within the impact area of the Westfield River interceptor. Additional testing in this area failed to produce other evidence of prehistoric activity.

It is possible that the recovered artifacts derive from a larger prehistoric locus on the knoll situated above the impact area adjacent to Stratfield Avenue. No other prehistoric remains were discovered during the intensive survey. Several of the test pits in the project impact areas contained small amounts of historical field scatter, including coal, glass, and some ceramics. Apart from these remains, no historical sites were discovered during the survey. The report concluded that the construction of the proposed wastewater treatment facilities would not adversely impact significant cultural resources. It was therefore recommended that no further archaeological work be conducted on the project.

25-558 Wilson, John S. and Meredith Weiss Belding

1979 An Archaeological Resource Reconnaissance of Government Property on Palmers Island, New Bedford, Massachusetts. 13 pages.

Background research, walkover and subsurface testing of the U.S. Government land on Palmers Island revealed that the only significant historical property located within this area is the mid-l9th century lighthouse. A draft National Register nomination form was prepared for the lighthouse. No significant archaeological resources were identified.

25-559 Thorbahn, Peter F. and Alan Leveillee

1984 Intensive Survey of the Lakeside Corporate Center, Bridgewater, Massachusetts. 50 pages.

Fieldwork for this project involved walkover surface inspection, soil auger testing, and the excavation of test pits. The report describes the prehistory and the history of the area and the results of the field work. Fourteen areas of archaeological sensitivity were identified. Site examinations were recommended for the only two undisturbed prehistoric sites discovered within the project area. A modified testing program of plowing and controlled surface collection was suggested for the partially disturbed, formerly plowed prehistoric site area. The remaining sites were found to lack sufficient importance for further investigation. The report suggests using additional site test excavations as an opportunity for public education and participation, including an artifact display and a popular report.

25-560 Blades, Brooke S.

1984 The Meadows Survey, Longmeadow, Massachusetts. 15 pages.

The report presents a brief history of Longmeadow, particularly relating to the project area, the possible 17th century homelot of Ensign Benjamin Cooley. Documentary evidence revealed little about the Cooley house, but a contemporary Springfield house provides a comparative description. Although some historic and prehistoric materials were recovered in test excavations, the thick Connecticut River flood deposition limited the usefulness of shovel test pits. The report concludes that a more extensive archaeological survey would more likely yield early historic period cultural remains.

25-561 Cole, John R. and Mitchell T. Mulholland

1983 Historic and Prehistoric Patterns of Water Use in the Connecticut River Valley: Implications for Water Resources Planning. 143 pages.

This study examines historical and archaeological data in evaluating the use of historic and prehistoric climatic cycles as models for water resources planning in the Northeast. A climatic history of prehistoric, historic, and regional settlement and resource use in the Amherst region is followed by research results, including tree ring and groundwater analyses. This research project suggests that although past long-term data are poorly documented, historians tend to both downgrade the importance of such records and to overuse and misuse them. The authors found no clear statistical pat-

terns or cyclicity in climatological records for the Amherst area. Furthermore, instrumented data do not support 19th century newspaper and diary accounts or archaeological reports. Nevertheless, climatologists, archaeologists and historians seem to overrate climatological factors while, at the same time, downgrading historical data beyond the recent past and failing to employ tests of statistical significance. The humid Northeast would seem to have broader stress tolerances than popularly assumed by some environmental activists, but greater limits than assumed by many developers and planning optimists.

25-562 Cushman, David W. and John F. Cheney

1983 Phase II Archaeological Site Examination of the Gumpus Road Site and the Bowers Farmstead, Lowell, Massachusetts. 25 pages.

This report presents the results of an archaeological site examination of the Bowers farmstead historic site and the Gumpus Road prehistoric site within the proposed Route 213 right-of-way. These are the only two sites located during the intensive survey that required further study, because of their potential importance and the anticipated impact of the proposed road construction. The report describes the history of each site as well as the testing strategy and results. The Gumpus Road prehistoric site was identified as a small temporary hunting camp, possibly dating to the Late Archaic period. Prior plowing has limited the research value of the site; no further research was recommended. No potentially significant archaeological remains were located in the portion of the Bowers farmstead site that will be impacted by the proposed construction. However, the Bowers House itself and the upper terrace area around the house are believed to be significant and should be avoided.

25-563 Davin, Ann K. and Joan Gallagher

1984 Phase II Testing and Analysis of Three Prehistoric Sites and One Historic Site in the Southern Section of the Route 146 Project, Uxbridge, Massachusetts. 114 pages.

The general research objective of the project was to try to understand how these small upland sites fit into a larger regional system or systems of prehistoric settlement and land use. A secondary goal was to examine the value of limited site testing as a method for gathering a sufficient body of research data, as well as to evaluate National Register eligibility of sites. The report includes a discussion of the results of the archaeological investigation in relation to several abstract models of prehistoric settlement systems. Specific site reports are presented for the Pine Grove, Emerson Brook I and Copperhead prehistoric sites, and the Leakey Dam historic site. Extensive documentary research places the historic site within a coherent cultural framework. However, the historic site did not contain sufficient archaeological material to warrant further investigation. The report suggests that preliminary management decisions be made prior to committing the total block of available effort, in order to ensure more flexibility for project planners, cultural resource managers, and consulting archaeologists.

25-564 Davin, Ann and Duncan Ritchie

1984 An Intensive Archaeological Survey of the Town of Bedford Water Treatment Facilities, Bedford, Massachusetts. 47 pages.

Background research for this report included a summary of previous cultural resource management research in the project area, as well as description of the area's prehistory and history. Archaeological investigation was conducted by using soil auger cores and test pits along random transects. No significant archaeological resources were encountered. The report recommended that project construction proceed as planned.

25-565 Davin, Ann K. and Peter F. Thorbahn

1984 Site Examination of the Tomb Road and Bassett Prehistoric Sites, Lakeside Corporation Center, Bridgewater, Massachusetts. 74 pages.

Results of the archaeological investigation indicate that the Tomb Road site was repeatedly occupied by small groups of hunter-gatherers, probably from the Early to Late Archaic periods (10,000 to 5,000 years ago). Since most of the Tomb Road Area A archaeological resources are contained in thinly scattered deposits, the report suggests a mitigation plan which includes the use of power equipment in coordination with the construction schedule. The nomination to the National Register of the intact Tomb Road Area B site is recommended. National Register listing is also recommended for the Bassett site, a probable Archaic/Woodland specialized field camp. Bulldozing has destroyed the integrity of areas to the west of the Bassett site, and therefore the report suggests that development in this section proceed as planned.

25-566 Gorman, F.J.E. and Greg Laden

1984 Intensive Archaeological Survey of the Haverhill Technology Park, Haverhill, Massachusetts. 72 pages.

This report provides a background of the physical environment, ecology, prehistory, and history of Haverhill. Intensive archaeological survey consisting of walkover inspection and subsurface testing identified one area, the north knoll, which was recommended for further investigation because of the integrity and potential importance of its Middle Woodland archaeological remains. The report recommends that construction avoid this site. If avoidance is impossible, further archaeological research is necessary to establish the site's significance.

25-567 Johnson, Ronald W., Marguerite Reinke, David M. Lacy, and Richard Holmes

1984 Archaeological Locational Survey for the Proposed Wastewater Treatment Facility, Charlemont, Massachusetts. 41 pages.

A summary of Charlemont's historic and prehistoric resources sets the background for the archaeological field investigation of the project area. Walkover, test pits, the use of hand-held and bucket augers, and backhoe trenches were the techniques employed. One prehistoric cluster was identified. The construction engineers shifted design plans, avoiding adverse impacts to the site. Historic features include a wood-turning mill and a foundation within the Charlemont Cemetery. The report recommends that construction be limited to within 4 meters of the street to avoid disturbing the foundation. The report concludes that no further archaeological treatment is necessary.

25-568 Johnson, Ronald W. and Ellen R. Savulis

1984 Archaeological Locational Survey for the Proposed Rosemont Nursing Home, South Hadley, Massachusetts. 39 pages.

Background research indicated that the project area possessed a high potential for containing prehistoric archaeological properties. Walkover surface inspection, soil corings and test pits recovered no prehistoric material. However, an historic dump deposit was identified containing bottles from the late l800s to early l900s. A representative sample of dump materials was curated for future research. In addition, two articulated pig skeletons were identified. These bones probably were associated with a mid-20th century piggery. The report concludes that no further archaeological investigation is warranted.

25-569 Jones, Donald G.

1984 Archaeological Reconnaissance of the Boston Edison "Impact 2000 House" Parcel In Brookline, Massachusetts. 40 pages.

The archaeological survey of the Boston Edison "Impact 2000 House" parcel resulted in the identification of three historic archaeological site areas. A dry-laid stone foundation was determined to be in good, stable condition. Documentary research calls into question whether this foundation is in fact the remains of the home site of Erosamon Drew (17th century); artifactual evidence does not permit a conclusive date to be assigned to the structural remains. Further archival research could possibly clarify the ownership, construction date, and life-span of the house that once stood upon this substantial foundation. The foundation is at present protected by 4-5 feet of fill and by a gunnite collecting pool placed directly over the foundation. Two other areas produced artifactual or structural remains associated with two former mills. Mill Area (1) has been greatly disturbed by previous activity at the site, particularly by the 1908 rechannelling of Sawmill Brook and the concurrent widening of Newton Street. It is, therefore, of little research value as an archaeological site. Although moderately disturbed, Mill Area (2) was found to have archaeological potential due to the presence of structural remains. This area lies outside of the proposed location for the construction of a gravel parking lot and thus is not threatened with further destruction. Future development plans for the parcel that might impact the Mill Area (2) should take into account the possibility that significant archaeological remains may be present.

25-570 Klein, Joel I., Sydne B. Marshall and Elise Brenner

1984 An Archaeological Overview and Management Plan for the Army Materials and Mechanics Research Center. 65 pages.

This archaeological overview and management plan provides a tool which can be used by DARCOM and decision-makers at the Army Materials and Mechanics Research Center in Watertown to assist in complying with existing regulations and procedures relating to historic presentation. This document summarizes data relating to the area's environmental history; cultural chronology; historic and modern ground disturbances; previous archaeological surveys; presently identified archaeological resources; known artifact, ecofact, and/or documentary collections relating to archaeological resources; potentially identifiable but not presently recorded archaeological resources; significant archaeological resources, ongoing and planned activities that could affect archaeological resources; locational data of known archaeological resources; and locational data of potential archaeological resources. No significant archaeological remains are known to be extant on the Watertown property. One prehistoric archaeological site is reported to have been present, but is believed to have been destroyed by construction activities. Additional prehistoric archaeological remains have been recovered in immediately adjacent areas, and the possibility exists that previously unrecorded prehistoric remains may exist within undisturbed portions of this property. A literature review has indicated that at least 28 potential historic period archaeological sites may exist. These fall into two broad categories: those associated with Watertown Arsenal and those associated with civilian occupation of the area prior to government ownership. The physical integrity of these sites is unknown. Only a few are believed to be potentially significant. Additional studies recommended include: 1) gathering more data relating to non-extant arsenal-related structures; 2) an archaeological survey of wooded and paved areas in the southeast portion of the property; and 3) an evaluation of the area south of North Beacon Street presently used for recreational purposes by the Metropolitan District Commission.

25-571 Klein, Joel I., Elise Brenner and Sydne B. Marshall

1984 An Archaeological Overview and Management Plan for the U.S. Army Natick Research and Development Laboratories. 59 pages.

A complete inspection of all information sources likely to have data relating to the archaeology of the site occupied by the U.S. Army Natick Research and Development Laboratories was conducted. Although numerous prehistoric sites have been reported in the Lake Cochituate vicinity and the Sudbury River drainage, none are known to exist on the Natick Lab property and its affiliated housing areas. In addition, though the area is rich in history, no known historic archaeological sites of potential significance could be identified. Site visits and an examination of original con-

struction plans, photographs, and the installation's Basic Information Maps has indicated that most of the property has been disturbed to varying degrees, precluding the existence of extant archaeological sites in these areas. However, relatively undisturbed areas currently being used for recreational purposes and winter snow stockpiling are likely to contain previously unrecorded prehistoric archaeological sites. Archaeological surveys of these areas are recommended. Future activities described In the Installation's Master Plan are unlikely to affect archaeological resources. The Sudbury Housing Area contains approximately 10-15 acres of land which might contain prehistoric archaeological sites. An archaeological survey of this area should be conducted prior to any future ground disturbance or transfer of the property from federal control. The Wayland and Needham housing areas are not believed to have any potential for the presence of archaeological sites because of prior ground disturbance and/or the physiographic characteristics of undisturbed areas.

25-572 Loparto, Leonard

1984, Phase II Archaeological Site Examination of the Oak Ridge and Nemskaket Sites, Orleans, Massachusetts. 40 pages.

Test pit excavations were conducted on two prehistoric sites located within the proposed wastewater treatment plant project area near Nemskaket Creek in Orleans. While the Nemskaket site revealed no significant archaeological resources, cultural materials recovered from the Oak Ridge site suggest that this site was a specialized site of several Susquehanna lithic workshops associated with the Coburn and Oriental phases (or complexes) during the Transitional Late Archaic period. The Oak Ridge site is considered to be highly significant and eligible for nomination to the National Register because of its potential to address important research questions concerning the technology, production, distribution, use, and interrelationship of Coburn blades and Orient Fishtail points. The present understanding of functional site types of the Susquehanna tradition in Massachusetts is chiefly confined to cremation cemeteries. The report recommends that the Oak Ridge Site be avoided or subjected to a data recovery program.

25-573 Reinke, Marguerite and Robert Paynter

1984 Archaeological Excavation of the Surroundings of the E.H. Williams House, Deerfield, Massachusetts. 38 pages.

This study reports an excavation in areas of the E.H. Williams property that were to be affected by an historic restoration project. The project's goals included reconstructing historical New England lifeways and contributing to archaeological method and theory of domestic sites. The report describes the results and possible interpretations from each area of excavation. Soil phosphate tests aided in interpreting past land use. The report concludes that although this project helped in refining the sequence of house construction, further archaeological investigations of the parcel hold great potential for knowledge that would be both helpful to Historic Deerfield's restoration plans and of interest in the study of micro-land use in New England history.

25-574 Ritchie, Duncan and Joan Gallagher

1984 Intensive Level Archaeological Survey of the Harju Cranberry Bog, Plympton, Massachusetts. 45 pages.

This report contains a discussion of background research and its implication for prehistoric and historic land use within the project area. Although walkover inspection, auger testing, and test pit excavation identified four small prehistoric sites, none were determined to be significant enough to meet National Register criteria. The report recommends that the development proceed as planned, avoiding the more sensitive southern half of the knoll if possible.

25-575 Strauss, Alan E.

1984 Intensive Archaeological Survey of the West Street – Spring Street Interception in Mansfield, Massachusetts. 12 pages.

The intensive archaeological survey of the proposed West Street – Spring Street Interceptor consisted of documentary research, literature and site file review, interviews with local informants, field reconnaissance, and subsurface testing.

Background research determined that no recorded prehistoric or historic sites are located within the impact area of the project. Field reconnaissance and a consideration of known prehistoric site locations suggested, however, that the level plain of the project area might be sensitive for the presence of prehistoric sites. Subsurface testing within the project area encountered no prehistoric cultural remains. Historical artifacts recovered from the topsoil do not present significant cultural resources, nor is further testing likely to produce significant archaeological remains. The report concluded that the construction of the cross-country section of the West Street – Spring Street Interceptor is unlikely to adversely affect cultural resources.

25-576 Towle, Linda A.

1984 An Archaeological Survey of Four Massachusetts Audubon Society Sanctuaries. 55 pages.

This report presents the results of an archaeological survey conducted at four sanctuaries of the Massachusetts Audubon Society: Canoe Meadows in Pittsfield, Arcadia in Northampton, Wellfleet Bay in Wellfleet, and Wachusett Meadow in Princeton. The objective of this survey was to identify prehistoric sites on Audubon property, and develop an awareness within the Audubon Society for protecting and conserving these non-renewable resources. Two previously unknown prehistoric sites were located during this survey, one each at the Arcadia and Wellfleet Bay sanctuaries. Both of these sites are flake scatters which require further testing before their significance can be determined. However, the newly discovered site at Wellfleet Bay may actually be part of a larger site, encompassing three other known sites on the property. These three sites contain Fox Creek phase components dating to the Middle Woodland period (c. 1800-1200 B.P.). Fox Creek sites are rare in eastern Massachusetts, and the relatively undisturbed Audubon sites should be nominated to the National Register of Historic Places. Although the primary focus of this survey was on prehistoric activity, two historic sites of possible significance were identified during the background research. An 18th century house, which served as an inn on the Barre to Boston stagecoach route during the 19th century, still stands at the Wachusett Meadow sanctuary. A turn-of-the-century amusement park, known as Marshall's Grove, is located on Arcadia property.

25-577 Towle, Linda A.

1984 Quartz Flakes and Turtle Bones: The North Bridge Site at Minute Man Historic Park. 96 pages.

This report presents background research and detailed descriptions of fieldwork (test pit) results, including photographs of significant artifacts. Although a multi-component (Middle Archaic, Lake Archaic, and Late Woodland) site was identified, the site was determined to lack sufficient integrity to be eligible for inclusion in the

National Register. This project highlights the need for a thorough understanding of the Park's prehistoric, as well as historic, resources as essential in the maintenance and preservation of archaeological remains, as well as in the planning of future park developments.

25-578 Wamsley, J. Cooper

1983 Final Report on the Intensive Survey and Limited Site Examination of Huguenot Sites in Oxford, Massachusetts. 63 pages.

Documentary research of primary and secondary sources, as well as interviews with local informants, provides the background for this study of four sites in Oxford: the Johnson Massacre (Tavern), the Fort, the Settlement Area, and the Grist Mill. Fieldwork involved walkover survey and subsurface test pits. Only the Fort Site was found to retain a high degree of archaeological integrity relating to the Huguenot occupation. The report recommends that the Fort Site be nominated to the National Register. Testing of the Settlement Area Site, Orcutt's Field, recovered prehistoric material suggestive of a fairly extensive site. It is recommended that this area be further investigated for information regarding Archaic/Woodland transitional adaptations.

25-579 Savulis, Ellen, Lee Ann Beauchamp, Shelley Hight, Robert Paynter, and Hugh Davis

1984 The Impact of the Decline in Tobacco Production on Cultural Resources in the Connecticut Valley. 195 pages.

This study investigates known and potential cultural resources located on tobacco parcels in the Connecticut River Valley towns of Hadley, Deerfield, Whately, and Southwick. The prehistoric and historic sensitivity of these parcels is assessed. A predictive model for the recognition of prehistoric sites examines available water capacity, soil drainage, slope, soil texture, geomorphology, elevation, aspect, and distance to contemporary water sources. Historical maps provide the primary basis for the identification historically sensitive areas. In addition, the Visual Resource Management Program was developed to help minimize the visual impact of future development on the landscape. Landscapes were rated on criteria of scenic quality, sensitivity levels and distance zones. The report suggests that identifying landscapes of high visual quality is the first step toward preserving them. A section on development pressures on tobacco lands identifies parcels that require preservation attention because they are under significant development pressure. The report includes general management recommendations for tobacco lands, and some specific recommendations for certain areas. The report cautiously recommends the use of a Geographic Information System (GIS) called METLAND to aid in monitoring cultural resources at the local level. The town of Hatfield was suggested as a possible future case study of the role of agriculture in Massachusetts.

25-580 Thorbahn, Peter F.

1984 Survey and Planning Project Completion Report, Prehistoric Land Use Zones Along the Taunton River Basin. 29 pages.

This report utilizes the MHC's core-periphery-corridor model to examine the prehistoric settlement of the Taunton River Basin in conjunction with a survey of the Sakonnet River in Rhode Island. Research was completed in three phases: inventory data collection, field survey and model testing. Computerized maps and statistical tables indicate environmental and topographical characteristics, site locations, dates of site occupations, and indices of prehistoric activities. These data were used to distinguish observable prehistoric land use patterns, which were compared with patterns derived from the settlement model. The report concludes with a confirmation of the model in the identification of sites clustered in the Taunton River Basin, indicating the value of surveys of large, interrelated clusters of cultural resources. The study also suggests that decisions about the research potential and significance of sites must consider cultural patterns operating at a broad geographical scale.

25-581 Laden, Greg

1983 Phase I Historic Documentation and Phase II Archaeological Site Examination of the Dorchester Milton Lower Mills Heritage State Park, Dorchester/Milton, Massachusetts. 79 pages.

This report describes the results of historic documentary research and archaeological field work. Although several early mills have been destroyed by later construction, significant archaeological remains may still exist. The report recommends that areas that will be damaged in park construc-

tion receive additional archaeological investigation.

25-582 Cheney, John et al.

1983 Supplement to the Draft Environmental Impact Statement/Report, Third Harbor Tunnel, Interstate 90/Central Artery, Interstate 93, Boston, Massachusetts. 371 pages.

This report presents the results of a reconnaissance level survey of the proposed Third Harbor Tunnel Alternatives 6 and 3A, which include the area of the present Central Artery from North Station to South Station and its associated impact corridor. Extensive documentary research indicates that there is a high probability for the presence of significant historic archaeological resources along the entire impact corridor of all alternative routes within this area. There is also a probability of locating significant inundated prehistoric sites in the area that once comprised the Mill Pond. Site specific background documentation and testing recommendations have been confined to those areas that are: (1) within the direct impact corridor of the Third Harbor Tunnel alternatives; (2) presently accessible to subsurface testing; and (3) not within the area covered in the previous Third Harbor Tunnel Crossing report (report #25—426). Also presented are overviews of the area's geological history and prehistory, from which are derived a set of geological horizons that are likely to contain remains of prehistoric sites. These horizons were identified through inspection of bore logs. Report recommendations call for systematic backhoe trenching along much of the proposed right-of-way(s) to locate and assess both historic and prehistoric cultural resources.

25-583 Mulholland, Mitchell, David Lacy, Ronald Johnson, and Richard Holmes

1983 Archaeological Locational Survey of the Proposed Greenfield Industrial Park, Greenfield, Massachusetts. 64 pages.

Archaeological field survey operations consisted of the investigation of two historic sites: (1) the Peleg Adams farm complex, which includes a bulldozed house foundation and yard, and foundations of a barn and a sheep shed; and (2) a cement wall used a military target in the l950s and l960s. Two prehistoric lithic scatters were found, as were seven lithic findspots. This report concludes that the Adams farmstead has limited potential for contributing data to the archaeology of the region that could not be better obtained elsewhere (e.g., Quabbin Reservoir). Had the subsurface remains been in better condition, the site would have had greater archaeological value, given the importance of the Adams Family in the growth and development of Greenfield. The extensive disturbance of the house foundations reduces the historical and archaeological value of this site. No further survey is recommended.

25-584 Strauss, Alan E

1984 Report on Phase II Archaeological Survey of the Goddard Road Construction Project in Northborough, Massachusetts. 15 pages.

This archaeological survey was undertaken after prehistoric flakes were found on the surface of the project area during an initial field inspection by Massachusetts Historical Commission staff. The site examination included background research, field reconnaissance, and subsurface testing. Additional prehistoric flakes were recovered from the surface during the field reconnaissance. An intensive program of subsurface testing produced one small locus of prehistoric activity represented by the discovery of five quartz artifacts. No other cultural materials were recovered. In view of the limited and isolated nature of the prehistoric finds, it is concluded that no significant archaeological remains will be impacted by project construction. No further archaeological testing is recommended.

25-585 Bower, Beth Anne and Leonard Loparto

1984 An Intensive Archaeological Survey in Bridgewater, Massachusetts. 29 pages.

During an intensive archaeological survey of the proposed sites for flood storage areas and cross-country sewer easements near the Town River in Bridgewater, two archaeological sites were discovered. One site in flood storage area Alternate Site B was found to be a dumping area for brick "wasters" from the Bridgewater Brick Company, and was not considered to have cultural significance. However, in the area of the cross-country easement indications of a prehistoric site are present. This site, tentatively called the Town River Site, is of unknown prehistoric cultural affiliation. The report recommends further testing be conducted at the site, to determine its size, cultural affiliation, internal configuration, and to determine whether the site meets National Register criteria.

25-586 Bower, Beth Anne, Claire Dempsey and Stephen Mrozowski

1983 Long Wharf: Archaeological Testing at Parcel D-l0, Boston, Massachusetts. 53 pages.

The testing program confirmed that significant archaeological remains of Long Wharf exist within the bounds of Parcel D-l0 in downtown Boston. Two test trenches uncovered intact portions of the 1763 section of Long Wharf at 12 feet below present ground surface. The archaeologist's retrieved 391 artifacts, many of which predate the American Revolution, faunal and floral remains and samples. It is probable that a portion of the original wharf exists in the easternmost 10 feet of Parcel D-l0 along State Street. The boring results indicate that 1826 portions of Long Wharf exist seven feet below the surface of former Commerce Street. As the focal point of Boston 18th century waterfront activities, the archaeological remains within the Parcel D-l0 are significant because they can provide information on: colonial wharf building technology; early Boston foodways; colonial crafts, such as pottery making, glass manufacture and ship building; and colonial and federal trade. The remains can also provide information on Long Wharf's functional changes through time. The report recommends that archaeologists be allowed to record the wharf structures uncovered during construction excavation and sample the material remains.

25-587 Hammer, John

1983 An Archaeological Survey at Fort Devens, Massachusetts and its Off-Base Facilities. 273 pages.

A cultural research survey was conducted at Fort Devens Military Reservation in Ayer, Massachusetts, and 67 off-base support facilities in five New England states. The data gathered from documentary research and surface and subsurface testing was used to test two preliminary models of site prediction based on environmental data. Although the report recommends further study of historic properties in area L at Fort Devens, the majority of the areas surveyed exhibited extensive disturbance due to prior land use and modification. No prehistoric cultural materials which would limit the potential use of the surveyed areas were found.

25-588 Moran, Geoffrey P.

1976 Preliminary Report of Test Excavations at the Saugus Ironworks National Historic Site. 22 pages.

The report describes the results of a soil resistivity survey and test excavations near the site of the ironmaster's house at Saugus. Additional excavation, and documentary research were recommended.

25-589 Ritchie, Duncan

1983 An Archaeological Reconnaissance and Site Verification Survey of the Shick Farm Tract, Wayland, Massachusetts. 148 pages.

The results of a comprehensive literature search and a walkover survey were used to stratify the 250 acre project area into zones of expected archaeological sensitivity. Previous investigations on the Shick Farm had concentrated on three prehistoric sites with components ranging from the Early Archaic to Middle Woodland periods. It was expected that high densities of prehistoric sites would be represented within this project area. Limited subsurface testing was used to verify the location and estimate the size and contents of the three previously known sites and any sites encountered during this survey. Six prehistoric sites were identified during the survey, containing primarily Middle and Late Archaic components. One of the previously known site locations was determined to be outside the Shick Farm project area, leaving a total of eight prehistoric sites within the locus. Historic period cultural resources include a small house foundation of unknown date, a late 18th-century farmhouse (standing structure), and a probable 17th century road. On the basis of the available data, at least one prehistoric site (Watertown Dairy, l9-MD-378) is considered potentially eligible to the National Register of Historic Places. Recommendations for managing these cultural resources include development of a disposition or sale option which will not constitute a threat to any of the identified sites or archaeologically sensitive areas within the Shick Farm tract.

25-590 Ritchie, Duncan, Deborah C. Cox and Ann Davin

1984 Archaeological Site Examinations on the Robin Hill, Cook and Howe Sites, Marlborough, Massachusetts. 64 pages.

Archaeological investigations were carried out on three prehistoric sites within the proposed Robin Hill development. These sites (Robin Hill, Cook and Howe) were identified during the intensive survey of the 130 acre project area (see report #25-546). Subsurface testing of the three sites indicated that they were small, with estimated areas of less than 500 square meters. Fragments of steatite (soapstone) previously recovered from the Robin Hill Site suggested a Terminal Archaic period affiliation for that site. Recovery of a Mansion Inn type bifacial preform verified the presence of a Late/Terminal Archaic (Susquehanna Tradition) deposition on the Robin Hill site. An older Late Archaic occupation on this site was also identified from two Brewerton type projectile points. In-depth examination of the Cook and Howe sites did not yield any diagnostic cultural materials, but was able to define the horizontal/vertical extent and internal structure of these sites. Several low/moderate density scatters of chipping debris (felsite, quartzite) and two hearth features were excavated. Based on these results, the Robin Hill, Cook, and Howe sites are not considered to contain sufficient categories of information to be eligible for nomination to the National Register of Historic Places. However, the sites can be profitably placed within a general prehistoric land use pattern. The report recommended that the Cook and Howe sites be preserved since they are outside proposed areas of direct project impact, and that the Robin Hill development proceed as currently planned.

25-591 Brown, Marley III

1975 Saugus Ironworks National Historic Site: An Evaluation of Roland Wells Robbins Archaeology. 34 pages.

This report presents an evaluation of the archaeological testing and landscape reconstruction project directed by Robbins from 1948-1953, focusing on two general problems: (1) the relationship between the features identified by Robbins and the restored buildings on the site; and (2) the effects of Robbins' excavation on the site's present-day archaeological potential.

25-592 Synenki, Alan T. and Sheila Charles

1984 Archaeological Collections Management of the Great Island Tavern Site, Cape Cod National Seashore, Massachusetts. 89 pages.

The purpose of this manuscript is to describe the procedures used by the Archaeological Collections Management Project of the National Park Service to process, conserve, and curate the arti-

facts from four historic sites located on Great Island, particularly the Great Island Tavern Site in Wellfleet. This document provides Cape Cod National Seashore personnel with critical information for efficient and effective management of the collections. It also indicates to archaeological researchers the kinds of quantitative data available. Problems and bias inherent in the data also are identified and discussed in detail

25-593 Towle, Linda A.

1984 Jackstraw Hill: An Archaeological Survey, Westborough, Massachusetts. 17 pages.

Walkover and limited test pit survey of Jackstraw Hill failed to reveal any archaeological evidence to substantiate local folklore that the Indian known as Jack Straw had lived on this hill in the 17th century. The report concludes that the construction of the planned private development will not affect significant archaeological resources.

25-594 Towle, Linda A.

1985 Archaeological Monitoring at the Daniel Webster Wildlife Sanctuary, Marshfield, Massachusetts. 18 pages.

Percolation tests, limited test pits, and the examination of debris from one large bulldozed pit revealed no evidence of significant prehistoric or historical archaeological sites. The report concludes that planned site improvements, such as the installation of a septic system, will have not affect significant cultural resources.

25-595 Dunford, Frederick and Ellen Savulis

1984 Archaeological Locational Survey of the Little River Great Brook Area of Westfield, Massachusetts. 30 pages.

Background research indicated each of the four survey units within the sewer project area to be sensitive for prehistoric archaeological sites because of their placement on well-drained soils near streams or stream confluences. Although no specific evidence for historic resources was found, Westfield's rapid 19th century expansion suggested that the project locus might contain such resources. Field investigation, however, yielded no prehistoric material and minimal historic period material. The report recommends no further survey or site examination.

25-596 Mulholland, Mitchell T.

1985 Archaeological Locational Survey at the Deerfield and Cold River Confluence, Charlemont, Massachusetts. 24 pages.

This report includes descriptions of the topography and land use of the area, and the general methodology of the archaeological survey. Walkover and subsurface testing revealed no evidence of prehistoric activity. The report concludes that historic and modern development have destroyed prehistoric site integrity. Historic deposits which were identified may be associated with a possible 19th century schoolhouse and charcoal manufacture. However, given the disturbance caused by recent construction activities, no further archaeological investigation was recommended.

25-597 Raber, Michael S. and Leonard W. Loparto

1985 Intensive Survey of Cultural Resources for Proposed Sludge Disposal Facilities: City of Gardner, Worcester County, Massachusetts. 18 pages.

Background research suggested that the project area was sensitive for very small, seasonal camp

sites, most likely dating from Middle/Late Archaic times to Early/Middle Woodland times. As most prehistoric sites occur on fairly well-drained and level surfaces, the hollows and slopes characterizing much of the project area appeared to limit site possibilities to a relatively small percentage of the undisturbed portions of the tract, which were intensively surveyed. Subsurface testing revealed no cultural material. The report concludes that the project will not impact any archaeological resources, and recommends that construction proceed as planned.

25-598 Nassaney, Michael

1985, Phase I, Step 1 Field Assessment Report for the Lotuff Parcel, Ware, Massachusetts. 6 pages.

Inspection of soil profiles and interviews with local informants indicated that this parcel in Ware, MA is undisturbed with the exception of plowing. Its well-drained location near the confluence of Muddy Brook and the Wall River has the potential for archaeological sites. This report recommends that a Phase I field survey be undertaken prior to further development.

25-599 Davin, Ann K.

1985 Intensive Archaeological Investigations of the Salisbury Wastewater Project Area, Salisbury, Massachusetts. 37 pages.

The report summarizes prehistoric and historic land use patterns in the Salisbury area. Despite the positive aspects of the project's location, such as its proximity to known prehistoric sites, the Merrimack River and wetlands, more immediate negative factors greatly reduce the area's archaeological sensitivity. Extensive sections with standing water in existing wetlands or partially drained areas, bedrock outcrops in the vicinity of the treatment plant, and areas disturbed by recent construction activity were not tested. Historic maps and records reveal that the project area was not intensively utilized during the colonial and subsequent periods. It appears that the project area was only marginally used during both the historic and prehistoric periods, largely because of unfavorable environmental factors. The report recommends no further archaeological testing.

25-600 DePaoli, Neill

1985 Intensive Archaeological Survey of the Proposed Nantucket Electric Company Generating Plant. 37 pages.

Background research, walkover survey, and subsurface testing failed to reveal evidence of significant prehistoric or historic archaeological resources. The report notes that the site location on Nantucket's outwash plain suggests that the area was more suited to hunting, gathering, and burial activities that to agriculture and settlement. No further investigation of the project area is recommended, with the exception of possible archaeological monitoring in the event that any burials are encountered during construction.

25-601 Johnson, Ronald W. and Ellen Savulis

1985 Archaeological Locational Survey of the Proposed Route 148 Reconstruction Project, Brookfield, Massachusetts. 53 pages.

The report presents the details of the prehistory and history of the Brookfield area. Shovel test pits revealed both prehistoric flake scatters and evidence of an 18th century garrison. The report provides recommendations for further archaeological investigation of these cultural resources.

25-602 Ritchie, Duncan, Joan Gallagher and Barbara Luedtke

1984 An Intensive Level Archaeological Survey on Deer and Long Islands, Boston Harbor, Massachusetts. 102 pages.

Wastewater treatment project planning areas ranging from about 60 acres on Deer Island to between 20 and 115 acres on Long Island were stratified into zones of expected archaeological sensitivity on the basis of a comprehensive literature search and walkover survey. Limited subsurface testing verified that both the Deer and Long Island project areas had been extensively modified during the construction of recent (World War I and II) military installations (Fort Dawes and Fort Strong, respectively). No significant archaeological resources were identified on Deer Island. Areas with high archaeological sensitivity located on Long Island include several historic cemetery areas associated with Long Island Hospital and undisturbed prehistoric sites on the southern half of Long Island. The prehistoric sites show evidence of important occupations during the Terminal Archaic, and Middle and Late Woodland periods. One site may have been used during the Early Archaic period. Long Island is considered to be a significant complex of prehistoric and historic period cultural resources. All of the identified sites may be eligible for inclusion in the National Register of Historic Places as elements of a Multiple Resource Area. The cluster of prehistoric sites on Long Island may be one of the most intact in the harbor district and the integrity of their physical setting is an integral part of their research value and significance. It was recommended that plans for any development on Long Island consider the relative costs of the large scale data recovery program that would be necessary to mitigate impacts to the cultural resources on that island versus the feasibility of alternative project locations.

25-603 Bower, Beth, John Cheney, and Joan Gallagher

1984 Intensive Survey of St. Mary's Housing for Elderly Project Area. 61 pages.

As a result of background research, subsurface testing was conducted to determine the presence of intact archaeological deposits within the proposed housing area in Charlestown. Using a backhoe, four units were excavated within the parcel in areas that had potential for the recovery of such data. Results of the subsurface testing indicate that the prior grading, construction and demolition on the parcel had so severely affected the project area that no significant archaeological resources were found. While the parcel was a heavily utilized block from the mld-l9th century until recent years, there was no evidence of intact significant archaeological deposits. No further testing was recommended for the project area.

25-604 Stokinger, William A.

1984 Castle Island Seawall Renovation Project, Maritime Work, South Boston, Massachusetts. 110 pages.

Detailed historical research, site walkover, and evaluation of the engineer's test pits and boring data indicate that the most archaeologically sensitive areas within the project are the Royal Battery area and the Civil War outbuilding complex. Field testing confirmed the location of the existing 1830's seawall as generally situated seaward of the historic island. One test pit exposed a section of abandoned seawall with apparently Revolutionary War association. The report recommends that additional archaeological investigation be conducted.

25-605 Gorman, F.J.E., Debra A. Randall and John Cheney

1984 Intensive Archaeological Survey of the Avon Industrial Park-West, Avon, Massachusetts. 53 pages.

Background research, walkover survey and subsurface testing revealed no significant prehistoric or historic archaeological resources within the project area. No further archaeological research was recommended.

25-606 McBride, Kevin A.

1985 Archaeological Reconnaissance Survey, Proposed Riprap Project, Gill, Massachusetts. 26 pages.

The project area is located within the Riverside Archaeological District which is listed in the National Register of Historic Places. Surface walkover, interviews with local residents, and subsurface testing revealed that a large amount of filling and prior disturbance had occurred in the project area. It was recommended that no additional investigation was necessary, and that the riprap construction proceed as planned.

25-607 Shaw, Leslie C. and Patricia Mangan

1984 Archaeological Locational Survey of Historic Rice's End Area of Framingham and Natick, Massachusetts. A Locational Survey of the Proposed Shopper's World Expansion Project. 66 pages.

This report provides a review of prehistoric activity in the project vicinity, indicating that the area was probably used by aboriginal populations for short term activities. Although a description of the area's historic background revealed no evidence of a house foundation, it was believed that a 17th century dwelling once stood at the northern boundary of the project area. Walkover and subsurface testing identified four low-density Woodland sites, as well as a possible Late Archaic Squibnocket association. Although-this information is significant in the understanding of regional prehistoric settlement patterns, the sites did not meet National Register criteria due to their low artifact density and poor integrity.

The report concludes that the proposed shopping mall project is unlikely to affect significant historic or archaeological properties.

25-608 Wilson, Merrill and Geoffrey P. Moran

1980 Historic Structure Report: Architectural Data and Archaeological Data. Salem Maritime National Historic Site, Central Wharf, Salem, Massachusetts. 221 pages.

Because of its serious deterioration, Central Wharf will be repaired and rehabilitated as a "visitor relaxation area." This report consists of two separate studies: reconstruction of architectural history; and completion of archaeological investigations at Central Wharf. The first section includes an inspection of historic wood structures at the site, as well as an evaluation of the present conditions, rehabilitation plans and additional design considerations. It was recommended that the wharf be repaired and rebuilt with the least intrusive method of construction. The second study presents the results of archaeological excavations and monitoring conducted during previous reconstruction. Various artifacts and features, dating to the nineteenth and twentieth centuries and associated with the Wharf, were identified.

25-609 Kudlik, John J. and C.C. Lamberg-Karlovsky

1980 Phase I, Step 2 Archaeological Survey of the New Bedford – Fairhaven Bridge Realignment Project, New Bedford and Fairhaven, Massachusetts. 16 pages.

This report presents the results of investigations along zones previously identified in the Step I survey as possessing high potential for containing historic sites and lesser potential for prehistoric sites. Additional sections not anticipated by the Step I operation to have been within the project impact zones were added to the study area. Walkover survey and subsurface testing by hand and machine recovered only historic artifacts post-dating the mid-nineteenth century from Pope's Island. These remains were not considered to be significant, and no further archaeological investigation was recommended since the remainder of the project area was highly unlikely to contain undamaged or significant archaeological resources.

25-610 Towle, Linda A. and Dick Ping Hsu

1980 Archaeological Investigations at Captain William Smith House. 9 pages.

Archaeological investigations were conducted at the Captain-William Smith House at Minute Man National Historical Park in Lexington as part of a preservation and restoration project. Three separate projects were performed: excavation along the back (north) wall of the original Ca. 1692 house, and outside the east wall of the Ca. 1730 lean-to; monitoring of the excavation of a trench to bury utility pipes and wires; and subsurface testing to determine the impact of a proposed septic system on any archaeological resources. Over 2300 artifacts were recovered from all three projects, two-thirds of which came from the area outside the ca. 1730 lean-to. Ceramics dating to the eighteenth and nineteenth centuries were recovered from the area along the east wall of the ca. 1730 lean-to which had been previously disturbed. No artifacts dating to the 17th century were found in the area adjacent to the original back door of the Smith house which was also disturbed. Two postmolds were encountered along the east wall of the original house and ca. 1730 lean-to; they may have been part of a porch, doorway or fence posts. Only two prehistoric lithics were recovered during the investigations of all three projects. Archaeological monitoring determined that there was no adverse impact from the excavation of trenches in which the utility pipes and wires could be buried.

25-611 Dincauze, Dena F. and Stuart Eldridge

1984 Prehistoric Cultural Resources in Northfield: A Conservation Handbook. 59 pages.

This report attempts to increase community awareness of Northfield's rich archaeological heritage and strong research potential by discussing the fragile and endangered nature of the database and providing recommendations for its effective management. Reconstruction of the town's environmental and cultural history are presented to establish a context for understanding the various recovered archaeological resources. The results of the 1976 University of Massachusetts at Amherst field school in archaeological survey techniques and an additional archaeological survey in 1977 are emphasized, demonstrating that information from local history and folklore could not be verified; specifically, no evidence was recovered of a major Squakeag village or of several "granary sites" mentioned in Temple and Sheldon's history of the town (1875). Instead, an 8,000-year occupation span of settlement was revealed, as well as the remains of the second settlement on King Philip's Hill and possibly the first settlement on the east side of the Connecticut River. The report concludes by outlining means for preserving Northfield's archaeological resources through education, curation, planning and legislation.

25-612 Little, Elizabeth A.

1984 A Portfolio of Papers 1976-1984, Volumes 1 and 2.

A portfolio of 21 research papers, published or accepted for publication, pertaining to Nantucket Island is assembled in two volumes. The papers all based on primary source material, are organized chronologically in three groups: archaeology; ethnohistory; and linguistics. Volume I contains reproductions of articles and manuscripts concerning archaeological investigations, artifact collections research, site prediction modeling,; and Nantucket Indian history and ethnohistory. Volume II includes Numbers 1-8 of the Nantucket Historical Association. These papers reflect intensive and highly productive research into the documentary history of Nantucket Indians, focusing on the writings, vital records, economy and lifestyle of Nantucket Indians in the early historic periods.

25-613 Gorman, F.J.E., Debra A. Randall and John Cheney

1984 Archaeological Reconnaissance of the Cherry Valley Interceptor Sewer, Leicester, Massa-

chusetts. 51 pages.

Background research and walkover survey were performed as part of a reconnaissance along approximately 7,500 linear feet. Although no previously reported prehistoric or historic archaeological sites were known to exist within the project area, several late nineteenth and early twentieth century historic resources were located on the surface of the corridor and vicinity; no prehistoric sites were observed. Further archaeological investigation was not recommended for the majority of the historic sites, since they were not considered to be significant. Industrial ruins of a late nineteenth or early twentieth century mill and an abandoned bridge, together with an industrial dump site and foundation remains of a late nineteenth or early twentieth century shop of unknown function, will not be adversely affected, and no further archaeological investigation was recommended. The report concludes by recommending two intensive (locational) archaeological surveys: (1) a Late Industrial dump site, on the east side of Auburn Street, in order to assess its potential significance; and (2) certain segments of the sewer line corridor in order to locate previously unreported prehistoric sites.

25-614 Bower, Beth and John Cheney

1984 A Phase I Intensive Archaeological Survey of the Watertown Sewer Project Area. 28 pages.

Background research and subsurface testing revealed no prehistoric resources and only twentieth century historic materials within the project area. The historic resources were not considered to be significant, and no further archaeological research was recommended.

25-615 Kelley, Jeffrey A.

1984 Skeletal Remains from Chelsea: The U.S. Marine Hospital. 46 pages.

This report is an analysis of historic secondary burials discovered in 1981 behind the U.S. Marine Hospital chapel during construction in the Admiralty Hill area of Chelsea. The skeletal remains, recovered from three wooden coffins, were probably of early-middle nineteenth century sailors that had been reinterred in the course of relocation of the hospital on several occasions in the past.

25-616 McManamon, Francis P. (Editor)

1984 Chapters in the Archaeology of Cape Cod, I: Results of the Cape Cod National Seashore Archaeological Survey, 1979-1981, Volumes 1 and 2. 734 pages.

A summary and synthesis of the Cape Cod National Seashore Archaeological Survey is contained in two volumes with contributions from seven authors. Volume I describes the survey history and goals, as well as other background material; Volume II focuses on the analysis of specific types of recovered archaeological remains. The survey included National Seashore property in the towns of Eastham, Wellfleet, Truro and Provincetown.

25-617 Leveillee, Alan and Joan Gallagher

1985 Archaeological Investigations, Intensive Survey and Site Examination within the Stone Ridge Development Area, Norwood, Massachusetts. 109 pages.

Background research, walkover survey and subsurface testing were performed as part of an intensive survey and site examination. The intensive survey was unable to verify the presence of the sole previously reported site (19-NF-126), and no historic sites were located. The area of the reported site had undergone severe ground disturbances, thus destroying the site. Two significant

prehistoric sites, the Red Leaf and Oak Terrace sites, were discovered by the survey, and site examination of both sites was conducted in order to consider their potential eligibility to the State and National Registers of Historic Places. Diagnostic artifacts from the Red Leaf site suggest a Transitional Archaic Period occupation, inconsistent with the radiocarbon date of 1030 + 140 BP from the site. The Oak Terrace site contained diagnostics indicative of Middle and Late Archaic and Middle Woodland periods and yielded two radiocarbon dates, 3990 + 120 BP and 3530 + 80 BP. The report concludes by recommending that both sites be considered for nomination to the State and National Registers and that proposed construction avoid both sites. If avoidance is not possible, a data recovery program is recommended for both sites in order to mitigate the adverse effects of the construction.

25-618 Turchon, Frederick H.

1978 Archaeological Assessment for the Proposed Park and Playground Facilities, Farm Pond Park, Framingham, Massachusetts. 13 pages.

Examination of mechanical auger excavations for footings to secure picnic tables and subsurface testing of an area designated for a playground facility were conducted. No significant archaeological resources were encountered in the auger pits, and construction and placement of the picnic table footings may proceed as planned. A prehistoric site, Middle to Late Woodland periods, was discovered within the proposed playground area. Since construction will have an adverse impact on this significant site, it was recommended that the playground facility be relocated to an area that is not archaeologically sensitive.

25-619 Shaw, Leslie C., Greg Laden and David Cushman

1984 The Water Street Site: A Study in Prehistoric Adaptions to an Estuarine Environment. 93 pages.

A Phase III data recovery excavation was conducted at the Water Street site near the mouth of the Charles River in Charlestown in order to mitigate adverse effects of the proposed Central Artery Project. The site, which was excavated by machinery and hand, contains 50 square meters of preserved prehistoric deposits representing three occupations during the Late Archaic through the Initial Woodland periods. It is hypothesized that the Water Street site was used intermittently as a seasonal base camp by three cultural groups for approximately 2,500 years. The detailed results of the study have strong potential for contributing to models of human adaptation and cultural change in southern New England.

25-620 Pendery, Steven R., Russell Barber, Peter Bogucki, Penelope Lie, and David Singer

1984 Phase III, Chelsea-Water Streets Connector Project, Charlestown, Massachusetts: Excavations at the Wapping Street and Maudlin Street Archaeological Districts. 320 pages.

A phase III data recovery program was performed on four historic archaeological sites included within two archaeological districts that were threatened by construction of the Chelsea-Water Street Connector Project. Data recovered by machine and manual excavation provided insight into the standards of living and material lifestyle of representative Colonial-period households of craftsmen, ship captains and merchants. The comparative study of the Charlestown archaeological sites argues both for the presence of well-preserved historic period sites in the urbanized greater Boston area, and the necessity of approaching this study within a comparative, multi-disciplinary framework.

25-621 Bell, Edward L.

1985 “Our Homestead and Field”: Documentary Research on the Balch House, Beverly, Essex

County, Massachusetts. 60 pages.

This report presents an historical narrative documenting activities that have occurred over the past 350 years on the Balch House property and surrounding lot. The information was used to address the archaeological potential of this significant site, one of the earliest surviving first-period frame houses in New England occupied almost constantly since its construction in the seventeenth-century. In addition to background research, a walkover reconnaissance was conducted to determine the extent of disturbance to the property. Despite the effects of extensive construction on all sides of the lot, the property possessed strong potential for containing remains of various features including barns, sheds, fences and trash pits dating from the early seventeenth-century to the present day. Plans were made to conduct a remote sensing survey of the property using an electrical resistivity meter.

25-622 Rowlett, Gregory L.

1985 An Intensive Inventory for a New Shop Complex on the Weir Hill- Elbanobscott Tract, Great Meadows National Wildlife Refuge, Massachusetts. 20 pages.

An intensive archaeological inventory was conducted of approximately 10 acres in Sudbury involving walkover survey subsurface testing. Testing recovered a low density of historic artifacts associated with a nineteenth-century farmstead located about 100 feet from the survey area. Only two prehistoric cultural materials were identified, a triangular projectile point and a scraper. These sites not considered significant, and it was recommended that proposed project proceed as planned.

25-623 Gorman, F.J.E., John Cheney, Michael B. Folsom and Greg I. Laden

1985 Intensive Archaeological Survey of Post Office Square Garage, Lowell, Massachusetts. 65 pages.

Background research and machine-excavated test trenches were conducted as part of an intensive archaeological survey of a 2.5 acre lot for the proposed Post Office Square Garage in Lowell. The project area was the site of the Merrimack Manufacturing Company, the earliest major industry in Lowell originating in 1822, and associated workers' housing. While the remains of this industrial complex and other structures were encountered, late nineteenth and early twentieth century development by the mill company destroyed the earlier historic remains which are not considered to be significant. No further archaeological testing was recommended.

25-624 Seasholes, Nancy S.

1985 Report on the Intensive and Reconnaissance Archaeological Survey of the Hooper-Lee-Nichols Houselot, Cambridge, Massachusetts. 114 pages.

This project is the second phase of a two-year plan to produce an in-depth understanding of the Hooper-Lee-Nichols house (built ca. 1685), its grounds and its occupants. The reconnaissance phase of the study involved documentary research and electrical resistivity sensing, while the intensive survey phase was based on subsurface testing. Archaeological features and artifacts associated with the early Colonial occupation of the houselot by the Lees, a prominent Tory Family, were discovered. The report concludes by offering management recommendations for the Cambridge Historical Society's maintenance and interpretation of this significant property.

25-625 Elia, Ricardo J. and Alan E. Strauss

1985 Intensive Archaeological Survey of the Shepards Brook Interceptor in Franklin, Massachusetts. 31 pages.

Background research and subsurface testing were conducted as part of an Intensive archaeological survey of a proposed sewer easement more than 11,000 linear feet in length along Shepards Brook. Background research indicated a high sensitivity for prehistoric sites, as well as one recorded prehistoric site within the project area. Field investigations determined that the previously known prehistoric site was destroyed by recent soil-removal activities. In addition, two prehistoric site areas, Shepards-Charles Site and Calnan Site, were identified. A Late Archaic association was suggested for the Shepards-Charles Site. No historic resources were encountered. It was recommended that a Phase II archaeological site examination be conducted at each site in order to determine each site's significance and potential eligibility for nomination to the National Register.

25-626 Bower, Beth Ann, Claire Dempsey and Leonard Loparto

1985 A Phase I Archaeological Survey of Proposed Wastewater/Septage Facilities in Orange, Massachusetts. 19 pages.

Background research and subsurface testing of two proposed site areas for wastewater/septage facilities failed to locate historic or archaeological resources. Both locations were found to contain areas of poorly drained soils and disturbance. No further archaeological investigations were recommended, and the proposed project may proceed as planned.

25-627 Dolan, Judith

1985 Phase I, Step 2 Archaeological Survey of the Route I Reconstruction Project in Sharon, Walpole, and Norwood, Massachusetts. 28 pages.

Background research and subsurface testing were conducted as part of an intensive archaeological survey of approximately 3.7 miles proposed for reconstruction along Route I in Sharon, Walpole, and Norwood. Background research indicated that no recorded prehistoric or historic sites were located within the project area, although several prehistoric sites were located within the general area. Subsurface testing of 8,766 linear feet within the project area failed to locate prehistoric or historic sites. It was likely that no significant sites escaped detection during the survey. No further archaeological investigations were recommended.

25-628 Gorman, F.J.E., Debra A. Randall and John Cheney

1985 Intensive Archaeological Survey of Office Park One-Fourteen, Danvers, Massachusetts. 64 pages.

Background research and subsurface testing were unable to locate any significant prehistoric or historic archaeological resources within the 55 acre project area proposed for an office park. The few prehistoric artifacts that were recovered were not considered to be significant because of their scattered distribution and low density. The potentially most significant prehistoric site area, located in the southwestern corner of the parcel, had undergone disturbance resulting from gravel pit operations. The recovered resources lacked either integrity, complexity or age to be considered significant. No further archaeological investigations were recommended.

25-629 Davin, Ann K.

1985 An Intensive Level Archaeological Survey of the Emerson Hospital Project Area, Concord, Massachusetts. 36 pages.

Background research and subsurface testing were conducted as part of an intensive archaeological survey to identify any significant prehistoric or historic archaeological sites which might be affected by planned hospital improvements. Although two previously reported prehistoric sites were located within the project area, neither site retained integrity nor significance as a result of disturbance activities. No further archaeological investigations were recommended.

25-630 Mahlstedt, Thomas F.

1985 The Intensive Archaeological Survey of the Water Treatment Plant, North Andover, Massachusetts. 21 pages.

This report discusses the results of a combined reconnaissance and intensive level survey of a 2.24 acre project area proposed for the new Water Treatment Plant in North Andover. A prehistoric site was previously reported within the project area at the southeastern end of Lake Cochichewick. Although subsurface testing recovered prehistoric artifacts, they were all in severely disturbed contexts. No part of the site was left unaffected by prior impacts to the property over the past 87 years. No further archaeological investigation was recommended.

25-631 Kerber, Jordan E.

1985 Wayland Prehistoric Site Survey Phase II: Final Report. 62 pages.

This project is a continuation of a systematic study of the town of Wayland's prehistory. The survey concentrated on the investigation of inland-upland areas of the town, away from the Sudbury River floodplain, which has traditionally been the focus of archaeological attention. Background research walkover survey and subsurface testing resulted in the discovery of 13 prehistoric sites indicating that the interior portion of Wayland was certainly utilized throughout prehistory, most likely for small-term seasonal camps. The report concludes by providing recommendations for further activities which would help to identify and protect the town's archaeological resources.

25-632 Davin, Ann K. and Marsha King

1985 Intensive Survey of the Chelmsford Center and North Chelmsford Project Areas, Chelmsford, Massachusetts. 77 pages.

Background research, walkover survey and subsurface testing were conducted as part of an intensive survey of the proposed cross-country interceptor routes and pump stations for the Chelmsford Center and North Chelmsford wastewater treatment facilities. A prehistoric archaeological site, River Meadow Site, was identified within the Chelmsford Center project area but was not considered to be significant because of its small size, low density and disturbed context. The portion of the Chelmsford Center project area which borders to the south the Chelmsford Center Historic District, listed on the National and State Registers, was composed primarily of fill. A low density of historic artifacts, dating from the nineteenth and twentieth centuries, was encountered in both the Chelmsford Center and North Chelmsford project areas. These materials were not considered to be significant. No further archaeological investigation was recommended for both project areas.

25-633 Raber, Michael S. and Leonard W. Loparto

1985 Intensive Cultural Resource Survey for the Proposed Wellesley Extension Sewer: Towns of Dedham and Needham, Massachusetts. 17 pages.

As a result of background research, walkover survey and subsurface testing, two prehistoric archaeological sites, the Lyman and Chick Estate Sites, were located within the proposed Wellesley extension sewer project area. Both sites also contained historic materials dating to the nineteenth and twentieth centuries. Although disturbance had affected some portions of both sites, they were both considered to be potentially significant. Project construction will adversely affect these two sites. Additional archaeological investigations were recommended in order to determine the significance of both sites, and to develop recommendations for avoidance or mitigation in the event either site is significant.

25-634 Synenki, Alan I.

1984 Archaeological Investigations of Nelson Road. 26 pages.

Limited archaeological investigations involving background research and subsurface testing by hand and machine were conducted within Nelson Road, part of Minute Man National Park in Lincoln. The goal of the research was to identify portions of the eighteenth century roadway so that this information could be taken in consideration for the resurfacing of the existing roadway. Excavations uncovered the remains of one road surface dating between ca. 1750 and 1908. The integrity of this roadway was determined to be good to excellent. Possible evidence of earlier roadbeds was also encountered.

25-635 MacMahon, Darcie A.

1985 Excavations at the Samuel Hartwell Site. 80 pages.

Background research and subsurface testing were performed at the Samuel Hartwell site within Minute Man National Park in Lincoln. The house, which dates to the late seventeenth-early eighteenth centuries, was destroyed by fire in 1968, and only the central chimney and stone cellar remain today. Excavations located the general level of the eighteenth century ground surface. This information was helpful to Park officials in their plan to restore the landscape of the site to its eighteenth century appearance. The report concludes by offering management recommendations for the protection of this significant resource.

25-636 Bower, Beth Anne and Michael Roberts

1985 Reconnaissance Archaeological Study for 99 State Street Project. 38 pages.

This study describes background research and analysis leading to an evaluation of the archaeological potential of a 1.37 acre project area at 99 State Street, Boston. Intact, significant cultural resources were predicted to exist beneath the present land surface within portions of the project area. The report concludes by presenting a work plan designed to confirm the integrity of locations expected to contain significant resources and to locate any intact archaeological features.

25-637 Davin, Ann K.

1985 Intensive Archaeological Investigations of the Ipswich Water Treatment Facilities, Ipswich, Massachusetts. 42 pages.

Background research, walkover survey and subsurface testing were performed as part of an Intensive archaeological survey of the Ipswich water treatment facilities project area. The remains of a prehistoric site, Linebrook Parish Site, were recovered and considered to be significant due to the sites proximity to the Bull Brook I and II Paleo-Indian sites. At least part of the site will be impacted by the proposed project, and a site examination was recommended because of the site's potential significance and impending impacts. None of the recovered historic materials, dating from the late nineteenth to twentieth centuries were considered to be significant, and no further archaeological investigations were recommended for the remainder of the project area.

25-638 Mrozowski, Stephen A.

1985 Archaeological Survey of the Neponset River in Hyde Park. 19 pages.

This report provides the results of a preliminary archaeological survey of the section of the Neponset River in Hyde Park In Boston. Background research, walkover survey and subsurface testing were conducted in order to identify archaeological sites with the Neponset River Valley in Hyde Park that might be threatened and/or are eligible for listing the National Register. Destruc-

tion of sites within the project area had been extensive, and the remains of only one prehistoric site, Border site, were located. Further testing was recommended for this site in order to determine its potential eligibility for nomination to the National Register. It was also recommended that the original community of Fairmont be inventoried as part of the architectural survey conducted by the Boston Landmarks Commission.

25-639 King, Marsha K. and Joan Gallagher

1985 99 State Street Intensive Survey Report. 38 pages.

The results of background research and subsurface testing by hand and machine of the 1.37 acre project area indicated that previous construction activities on the 99 State Street block in Boston had effectively eliminated or severely impacted the potential for archaeological resource recovery. Only a small amount of historic material was encountered and not considered to be significant due to a disturbed context. No further archaeological investigation was recommended for areas already tested. However, archaeological monitoring was recommended for additional units scheduled to be excavated by the construction contractor, engineers, and/or geologists, since those areas could retain some potential for less disturbed remains.

25-640 Ritchie, Duncan

1985 Archaeological Investigations at the Hartford Avenue Rockshelter, Uxbridge, Massachusetts: The Data Recovery Program. 198 pages.

A data recovery program was conducted at the Hartford Avenue Rockshelter in order to mitigate the adverse effect of proposed construction along Route 146 which will destroy the site. The data recovery program was the final step in a series of archaeological investigations at the site and others within the Route 146 right-of-way extending from Millville to Sutton. Four hypotheses placing the rockshelter within broader environmental and cultural systems were tested. Excellent preservation conditions aided in the recovery of various categories of information. Radiocarbon dates and lithic assemblages indicate separate occupations during the Middle Archaic, Terminal Archaic/Early Woodland and Late Woodland periods. The data recovered from this small, but internally complex, upland zone rockshelter have great potential for contributing to a better understanding of prehistoric settlement and resource use in the elevated, interior section of southern New England.

25-641 Davin, Ann K. and Marsha K. King

1985 Olmsted Historic Landscape Preservation Program, Archaeological Reconnaissance Survey, Kennedy Park, Fall River, Massachusetts. 70 pages.

The reconnaissance survey of Kennedy Park, which is one aspect of an overall Master Plan designed by DEM to rehabilitate a number of Olmsted Parks, involved background research, walkover survey and limited subsurface testing. Although most of Kennedy Park had been disturbed by construction and landscaping activities, archaeological remains were located. Prehistoric materials were recovered from only one area, called the Chace site, and historic resources, ranging in age from the nineteenth and twentieth centuries, were dispersed over a large area within the park. It was recommended that additional testing be conducted at the Chace site in order to determine its size, periods of occupation, activities, and significance.

25-642 Davin, Ann K. and Marsha King

1986 Olmsted Historic Landscape Preservation Program, Archaeological Reconnaissance Survey, Buttonwood Park, New Bedford, Massachusetts. 70 pages.

Background research, walkover survey and limited subsurface testing were conducted in order to

identify archaeological sites within Buttonwood Park. Subsurface testing determined that most of the park had been previously disturbed by landscaping and construction activities. The only recovered cultural resources consisted of late nineteenth-twentieth-century field trash which was not considered to be significant. No further archaeological testing was recommended given the park's low archaeological sensitivity and extensive amount of disturbance.

25-643 Davin, Ann K. and Marsha K. King

1986 Olmsted Historical Landscape Preservation Program, Archaeological Reconnaissance Survey, D.W. Field Park, Brockton, Massachusetts. 65 pages.

The reconnaissance survey of D.W. Field Park, located in Brockton and Avon, Included background research, walkover survey and limited subsurface testing. Fieldwork identified four prehistoric sites and four findspots in which prehistoric cultural material was recovered. The D.W. Field site was considered to be the most significant site discovered during the survey. Further testing was recommended for both the four discovered sites (in order to determine their significance, site size, periods of occupation and types of activities performed) and the four findspots (in order to determine whether they are isolated occurrences or parts of larger sites).

25-644 Raber, Michael S. and Leonard W. Loparto

1986 Intensive Survey of Cultural Resources for Proposed Fall Brook Reservoir Water Treatment Facilities: City of Leominster, Worcester County, Massachusetts. 18 pages.

Background research, surface inspection and subsurface testing were conducted as part of an intensive survey in order to locate any potentially significant cultural resources within a small project area. Excavation of shovel test pits revealed disturbed soil contexts. No archaeological or historic resources were recovered. It was recommended that no further archaeological work was warranted, and that the proposed project proceed as planned.

25-645 Gorman, F.J.E., Alan Strauss and John Cheney

1985 Archaeological Reconnaissance of Newton Sewer Facilities, Newton, Massachusetts. 59 pages.

Background research, surface survey and limited subsurface testing were performed within an area proposed for the construction of a sewer and pump station along the Charles River in Newton. Three prehistoric cultural remains, recovered in the vicinity of a prehistoric site (l9-MD-182) previously recorded as being within the project area, were not considered to be significant due to prior disturbance. Historic artifacts, dating to the late nineteenth to mid-twentieth centuries, identified during the survey, also were not considered to be significant. No further archaeological investigation was recommended.

25-646 Gorman F.J. E., Scott Andrus, Scott Lewis and John Cheney

1985 Archaeological Reconnaissance of the French River Quality Improvement District, Buffumville, Massachusetts to North Grosvenor Dale, Connecticut. 79 pages.

Background research and surface reconnaissance identified the locations of several historic cultural resources and potential locations of prehistoric archaeological sites. Within the Massachusetts portion of the project area (Oxford, Dudley, Charlton, and Webster) two historic sites, consisting of a segment of a possible Contact Period road and a possible Federal Period millpond levee or breakwater, as well as two previously reported prehistoric sites, were considered to be potentially significant. An intensive archaeological survey was recommended for each of these four sites if project construction could not avoid these resources. In addition, an intensive archaeological survey was recommended for 25 locations that might be adversely affected by the project al-

ternatives and that possess potential for containing prehistoric sites in the Massachusetts portion of the project area.

25-647 Leveillee, Alan and Duncan Ritchie

1985 An Intensive Level Archaeological Survey of the High Ridge Development Area, Dover and Westwood, Massachusetts. 41 pages.

Background research, walkover survey and subsurface testing identified a prehistoric felsite quarry site, two potential rockshelters and one potential felsite quarry site. The prehistoric quarry consisted of a granite outcrop which contained a small vein of gray porphyritic felsite. Subsurface testing at this locus recovered 67 pieces of prehistoric cultural material, none of which was temporally diagnostic. It was recommended that each of these four areas be avoided and that a preservation restriction be placed on the prehistoric quarry site.

25-648 Leveillee, Alan

1986 An Intensive Archaeological Survey of Forge Hill Corporate Park, Franklin, Massachusetts. 69 pages.

As a result of background research, walkover survey and subsurface testing, eleven areas of archaeological deposits and/or structural evidence of sites were located. Four of these deposits are prehistoric and the remaining seven historic. Since prehistoric site # 2 (Split Rock Site), which tentatively dates to the Late Archaic period, and historic site # 3 (Ray's Pond Industrial Complex), which may date to the nineteenth century, and site # 5 (an eighteenth century domestic site) were considered to be significant, it was recommended that additional archaeological investigations be conducted at these three sites. The remaining eight sites were not considered to be significant, and no further testing was warranted at these sites.

25-649 Gorman, F. J. E., Scott Andrus Scott Lewis and John Cheney

1985 Intensive Archaeological Survey of the United Parcel Service Regional Distribution Center, Chelmsford, Massachusetts. 64 pages.

Background research, walkover survey and subsurface testing failed to locate remains of prehistoric archaeological sites. Extensive gravel operations have destroyed all of the prehistoric sites which might have existed in either the most sensitive or least sensitive zones of the project area. Two mid-nineteenth century domestic sites and the Middlesex Canal, which dates to the Federal period (1775-1830), were identified. While the two domestic sites were not considered to be significant, the Middlesex Canal is listed on the National and State Registers of Historic Places, and the section identified within the project area is only partly disturbed. It was recommended that no further archaeological investigations be conducted at the two domestic sites and that future project activity avoid the remains of the significant transportation channel.

25-650 Ritchie, Duncan

1985 Archaeological Investigations of a Maintenance Building Site, Weir Hill Tract, Great Meadows National Wildlife Refuge, Sudbury, Massachusetts. 83 pages.

Inspection of machine stripped sections and open utility trenches, as well as subsurface testing, were conducted on the open construction of a maintenance building within the Weir Hill Tract, Great Meadows National Wildlife Refuge in Sudbury. Surface inspection revealed six features: four prehistoric hearths or pits and one historic period horse burial. A radiocarbon date of 2,950 + 100 B.P. was obtained from charcoal from one feature relating to an occupational episode on the Weir Hill # 1 Site, which is partly located within the project area and contains archaeological materials from the Middle Archaic to Terminal Archaic periods. The remnants of a small prehistoric

activity area (lithic workshop) were identified in an area disturbed by construction activities. Subsurface testing recovered low densities of prehistoric and historic materials. Although no further archaeological investigations were warranted at any of the discovered sites given the extent of previous disturbance, it was recommended that the undisturbed remainder of the Weir Hill # 1 Site and nine other prehistoric sites within the Weir Hill tract be evaluated as an archaeological district for nomination to the National Register, and that a cultural resource management plan be developed for the rest of the Great Meadows National Wildlife Refuge.

25-651 Loparto, Leonard W.

1985 A Preliminary Observation on Behalf of a Revised View of the Expansion of the Susquehanna Tradition into Southeastern New England and the Coexistence of the Coburn and Orient Phases. 114 pages.

This report, which represents an M.A. research paper in the Department of Anthropology, Brown University, presents the results of background research and an archaeological site examination of the Oak Ridge and Nemskaket sites in Orleans. The relation of the Susquehanna and local lithic conditions in southeastern New England is discussed. It is argued that the Coburn and Orient phases were coexistent and possibility of the same culture. The research for this project was used to develop a National Register eligibility determination for the Oak Ridge site and a subsequent data recovery proposal if this site cannot be avoided by impacts resulting from the proposed wastewater treatment facilities.

25-652 Rosenzweig, Mark S. and Carmine A. Tronolone

1985 Cultural Resource Reconnaissance Survey, Algonquin Gas Transmission Company Facilities Expansion for Additional Firm Sales Service, DCQ Project, Bristol and Plymouth Counties, Massachusetts. 34 pages.

A cultural resource reconnaissance survey was conducted for two proposed natural gas pipeline loops: a 2.5 mile pipeline loop Berkley, Bristol County and a 4.4 mile pipeline loop Rochester, Carver, Wareham and Plymouth, Plymouth County. Background research and walkover survey of both proposed pipeline alignments were performed. The proposed loop in Berkley will pass through two reported prehistoric sites (Bear Swamp No. 1 and No. 2). The remains of a foundation of undetermined age were identified during the walkover of the Bristol County loop, and no archaeological or historic properties were encountered within the proposed construction area of the Plymouth County Loop. Since the reconnaissance survey identified a number of archaeological sensitive areas within the project right-of-way, further archaeological investigations involving subsurface testing was recommended.

25-653 Bawden, Garth and C.C. Lamberg-Karlovsky

1979 Archaeological Evaluation of Cole's Mill, Carver, Massachusetts. 13 pages.

Based upon background research and surface inspection, the Cole's Mill site, used for a variety of industrial purposes between 1707-1947, was determined to be significant on three levels – archaeological value, history of local industrial development, and evaluation of the cultural environment. The site's building foundations and water channeling abutments were judged to be in an excellent state of preservation, and the site was expected to contain intact deposits associated with the various uses and building stages of the site. Recommendations regarding protection of the property and utilization of its resources for public education and recreation were submitted.

25-654 Mahlstedt, Thomas F.

1985 Report on the Data Recovery Program of the Reedy Meadow Brook Site, Pepperell, Massa-

chusetts. 150 pages.

A data recovery program performed at the Reedy Meadow Brook Site recovered a wide variety of prehistoric archaeological materials spanning several periods of occupation. Three radiocarbon dates, 4415 + 205 B.P., 2190 + 165B.P. and 765 + 150 B.P., indicate site utilization during the Late Archaic Early Woodland and Late Woodland periods. Diagnostic artifacts suggest that the most intensive period of occupation was during the Middle Woodland. A total of 10 features, several activity loci and a high percentage of exotic lithics were found at this dense and complex site, the first systematically excavated prehistoric site in the Nashua River Drainage in Massachusetts.

25-655 Gallagher, Joan, Duncan Ritchie and Ann K. Davin

1985 An Intensive Archaeological Survey of the Sudbury Training Annex, Sudbury, Massachusetts. 321 pages.

A cultural resource inventory survey was conducted of the Fort Devens, Sudbury Training Annex, total area of 2,290 acres, within Sudbury, Maynard and Hudson, Massachusetts. The survey consisted of two tasks: definition of known cultural resources and development and implementation of a predictive model for previously unknown resources. Background research and subsurface testing of 500 acres resulted in the discovery of 25 prehistoric and 28 historic site areas. The site areas were evaluated for significance and potential National Register eligibility. The report concludes by offering recommendations for additional inventory survey and for the maintenance and preservation of cultural resources on the Annex property.

25-656 Raber, Michael S. and Matthew W. Roth

1981 Boston Naval Shipyard: A Plan for Cultural Resource Management in the Buy Parcel Area. 58 pages.

A reconnaissance level archaeological survey involving background research and surface inspection was performed for the Buy Parcel Area, approximately 50 acres of land and water within the Boston Naval Shipyard in Charlestown. The shipyard is a National Historic Landmark listed on the National Register of Historic Places. Objectives of the study were to locate and evaluate the potential significance of all known and potential cultural resources in the Buy Parcel Area, and to develop recommendations for protecting significant resources. Several classes of prehistoric and historic cultural resources were identified as existing or possibly existing in some form within the project area. Recommendations were made in three areas: additional structural, architectural and photographic documentation within the Buy Parcel Area prior to any further removal of visible structures; additional documentary study; and, if appropriate, limited archaeological testing of three potentially significant shipways buried in fill, and retention of wooden ship parts if uncovered.

25-657 Leveillee, Alan

1986 An Intensive Archaeological Survey of the Quail Ridge/Cannon Forge Development Area, Sharon and Foxborough, Massachusetts. 83 pages.

Background research, walkover survey and subsurface testing identified six archaeological sites within the project area, three prehistoric and three historic. A fourth historic site, Stoughtonham Furnace, which dates to the eighteenth century, is located within the project area and is listed on the National and State Registers of Historic Places. Prehistoric sites #1 and #2 and historic site #4 (a solitary well) were not considered significant and did not warrant additional archaeological investigations. The following four sites were considered to be potentially significant: Prehistoric Site #3 (Creeden site), which dates to the Late Archaic and possibly the Terminal Archaic periods; Historic Sites #1 (Stoughtonham Furnace); #2 (Fairbanks Complex), which includes an eighteenth to twentieth century farmstead; and #3 (Billings Brook Complex), which includes an eighteenth cen-

tury industrial complex and dwelling. It was recommended that these four significant sites be avoided from the project impacts, and if avoidance is not feasible, additional archaeological testing should be performed.

25-658 Davin, Ann

1986 An Intensive Archaeological Survey of the Ocean Spray Cranberries, Inc. Corporate Headquarters Project Area, Lakeville/Middleborough, Massachusetts. 57 pages.

Background research, walkover survey and subsurface testing revealed 12 areas containing prehistoric cultural materials; five areas were designated as sites and seven areas, in which one or two pieces of prehistoric cultural material were recovered in only one shovel test pit, were termed loci. The five sites contained relatively low densities of archaeological remains and were believed to have resulted from short-term occupations by a few individuals for specialized resource procuring and/or processing activities. Scattered deposits of historic field trash dating to the late nineteenth-early twentieth centuries were also identified during the survey. None of the recovered cultural materials was considered to be potentially eligible for inclusion in the National Register of Historic Places, and no further testing was recommended for any of the sites or loci.

25-659 Gorman, F. J. E. and John Cheney

1986 Intensive Archaeological Survey of the Westpark Office Park, Framingham-Natick, Massachusetts. 76 pages.

As a result of background research, walkover survey and subsurface testing, seven prehistoric activity areas and seven prehistoric activity spots were identified, all of which contained nondiagnostic lithic debris and/or burnt rock. In addition, historic materials dating to the eighteenth-twentieth centuries were recovered from the project area. No definite archaeological evidence was recovered from the Tom's Hill site, partially located in the project area and believed to be a refuge site occupied by Praying Indians in 1675. None of the recovered prehistoric or historic remains was considered to be significant, and no additional archaeological investigation was recommended.

25-660 Gorman, F.J.E., John Pendergast, Diana Doucette, Virginia Ross and Charles Panagiotakos

1985 Intensive Archaeological Survey of Druid Hill, LeBlanc Park, Lowell, Massachusetts. 161 pages.

An intensive archaeological survey involving background research, walkover inspection and subsurface testing was conducted at Druid Hill, a megalith mound. Remains of one prehistoric artifact, projectile point fragment tentatively dating to the Late Archaic or Transitional Periods and found in a disturbed context, as well as cultural material from the mid nineteenth-mid twentieth centuries were identified. The recovered archaeological evidence supports an hypothesis that the mound was built, probably around 1925, in conjunction with the adjacent development of the Isolation Hospital complex. None of the recovered remains was considered to be potentially eligible for nomination to either the State or National Register of Historic Places, and no further archaeological testing was warranted.

25-661 Strauss, Alan E.

1985 Intensive Archaeological Survey of the Proposed Pump Stations and Lateral Sewers in Concord, Massachusetts. 18 pages.

An intensive archaeological survey of four proposed pump stations and cross-country lateral sewers was conducted for the proposed Concord Lateral Sewers project. Although background research indicated the presence of two prehistoric sites adjacent to the project area, no significant cultural resources were found during the surface walkover or subsurface testing. No further ar-

chaeological investigation was recommended.

25-662 Boros, Laurie and Stephen Mrozowski

1986 Archaeological Investigations of the Sanborn Site, Boston, Massachusetts. 56 pages.

Four backhoe trenches were excavated in the basement of the former Sanborn Fish Building in Boston. Portions of original eighteenth century shoreline area were discovered in all trenches. Only one trench contained historic period cultural resources – three features dating to the eighteenth century. Analysis of artifacts and pollen recovered from the features suggests that the deposits were partially destroyed by disturbance from the construction of the Sanborn building in the nineteenth century; background research did not locate original construction records. None of the features was considered significant enough to warrant further archaeological investigation, and it was recommended that the project proceed as planned.

25-663 Savulis, Ellen-Rose, Dorothy Scholtthauer and Edward Hood

1986 Intensive Archaeological Reconnaissance Study of Elm Park, Worcester, Massachusetts. 69 pages.

An archaeological reconnaissance survey was conducted of Elm Park in Worcester as part of the planning process for the rehabilitation of Frederick Law Olmstead parks. Background research identified the location of a nineteenth century domestic site in the project area which may date as early as the 1720's. Subsurface testing revealed historic materials dating to the mid-nineteenth to early-twentieth centuries, all of which were discovered within intrusive layers of fill. No prehistoric archaeological resources were recovered. However, the possibility that prehistoric and additional historic period materials exist below the fill, at a depth greater than the tested, could not be eliminated.

25-664 Ritchie, Duncan and Ann K. Davin

1986 Intensive Archaeological Survey of the Raytheon Equipment Division Laboratory Project Area, Marlborough, Massachusetts. 45 pages.

Background research, walkover survey and subsurface testing were conducted as part of an intensive archaeological survey restricted to two archaeologically sensitive areas totaling about eight acres. A single piece of chipping debris, historic field trash and a late-nineteenth-twentieth century dump were the only cultural materials found. The piece of chipping debris may represent the perimeter of a small prehistoric site inundated by the construction of Hager Millpond in the nineteenth century. None of the recovered archaeological remains was considered to be significant, and no additional archaeological testing was recommended.

25-665 Leveillee, Alan

1986 A Management Summary of Archaeological Investigations of a Suspected Burial Ground on Indian Road, Dudley, Massachusetts. 14 pages.

Documentary research and subsurface testing by machinery were conducted for a proposed garage construction site in Dudley. While no evidence of burials within the area of proposed construction was found, a knoll located to the east of the proposed construction site contains several burials with unmarked granite stones. No further archaeological testing was recommended for the building zone due to previous topsoil removal and lack of evidence for burials. It was recommended that the erosion surrounding the knoll which contains burials be stabilized and that this burial ground be documented in municipal records.

25-666 Leveillee, Alan

1986 An Intensive Archaeological Survey of the Meadow Woods Development Area, Longmeadow, Massachusetts. 37 pages.

Background research, walkover survey and subsurface testing of 21 acres failed to recover any prehistoric or historic archaeological resources. No further archaeological investigations were recommended. One previously unrecorded prehistoric site on property adjacent to the project area, however, was identified through an informant interview.

25-667 Davin, Ann

1986 Intensive Archaeological Survey of the Bellingham Sewer Project Area, Bellingham, Massachusetts. 41 pages.

Background research, walkover survey and subsurface testing of an 8,220 foot cross-country interceptor route in North Bellingham and Franklin failed to recover any prehistoric archaeological resources. A low density of modern historic field trash was recovered in one section of the project area. No further archaeological testing was recommended.

25-668 Ritchie, Duncan

1986 An Intensive Level Archaeological Survey of the Burlington Arboretum Development, Burlington, Massachusetts. 61 pages.

Four prehistoric and one historic archaeological sites were identified as a result of background research, walkover survey and subsurface testing of 63.5 acres in Burlington. A prehistoric component of unknown cultural affiliation was discovered at the historic site (Peach Orchard/Arboretum # 4), the remains of a small house/farmstead, which dates to the early/mid eighteenth century. The three other prehistoric sites contained a low density of chipping debris with unknown cultural affiliations. These three prehistoric sites appeared to contain limited information and were not considered to be potentially significant. The Peach Orchard/Arboretum #4 site may be significant and recommendations include planning the proposed development so that this site can be avoided. If avoidance is not possible, additional archaeological investigations at this site may be necessary in order to evaluate the site's significance for listing on the National Register of Historic Places.

25-669 Hoffman, Curtiss

1986 Archaeological Intensive Survey, Stepping Stones Condominiums, Holbrook, Massachusetts. 63 pages.

Background research, walkover survey and subsurface testing were conducted during archaeological investigations of the project area in Holbrook. Fire pits and soil stains were observed in a disturbed context within zone 2. Subsurface testing in zone 3 revealed non-diagnostic prehistoric cultural materials and recent historic field trash. A radiocarbon date of 400 + 150 B.P. was obtained from a charcoal sample. None of the recovered archaeological resources was considered to be significant, and no further archaeological testing was warranted.

25-670 Hoffman, Curtiss

1986 North River Archaeological Project, Transect V. Operations on Public Lands in Hanover and Norwell. (2 reports). 33 pages.

The two reports describe archaeological investigations undertaken as part of the North River Archaeological Project during the 1985 season. Areas containing both prehistoric and historic cul-

tural resources were identified along Transect V in both Hanover and Norwell. The reports conclude by presenting suggestions to town and state planners for the management of the identified site areas.

25-671 Wallace, David A., Blythe E. Roveland and J. Edward Hood

1986 Archaeological Locational Survey for the Pawtucket Boulevard Reconstruction Project, Lowell, Massachusetts. 69 pages.

Background research, walkover survey and subsurface testing revealed two prehistoric sites (l9-MD-556 and 557) an isolated prehistoric flake, two historic foundations which date to the late nineteenth century and scattered late nineteenth and twentieth century historic debris. Prehistoric site 19-MD-556 contains a high-density lithic flake scatter and 19-MD-557, a medium density lithic flake scatter. Although temporarily diagnostic artifacts were not found at either prehistoric site, site evaluations were recommended for both sites since they appear to be eligible for inclusion on the National Register. The historic sites are disturbed and of recent origin, and thus no further testing was recommended at these sites.

25-672 Borstel, Christopher L.

1985 The 1983 Excavations at 19BN281. Chapters in the Archaeology of Cape Cod, II. Cultural Resources Management Study No. 12. 186 pages.

This report contains the results of excavation and analysis of site l9-BN-28l near High Head (Pilgrim Heights) in North Truro. The site was discovered and tested as part of the Cape Cod National Seashore Archaeological Survey performed by the National Park Service. The site is virtually a single component Late Archaic small-stemmed point tradition (Squibnocket complex) manifestation. Also present at this site are remains of a Middle – Late Woodland component, dating to ca. 1500 – 500 B.P. The report concludes by offering recommendations for conducting further studies on site sediments, lithic analysis and horizontal distribution of artifacts.

25-673 Towle, Linda A.

1986 Final Report on the 1985 Wellfleet Bay Archaeological Field School. 40 pages.

This report contains the results of a one-week archaeological field school at the Massachusetts Audubon Society's Wellfleet Bay Wildlife Sanctuary in South Wellfleet. Subsurface testing was conducted in four portions of the sanctuary which would be impacted by the alternative construction proposals for a new nature center. More intensive level excavation was performed at a reported site area (19-BN-87) which had been previously investigated by Howard Torrey, an avocational collector. Prehistoric and historic materials were recovered from all five areas tested. It was recommended that further testing be performed within Areas B and C, as well as the old asparagus field (l9-BN-87), by twelve participants of a 1986 archaeological field school.

25-674 Rosenzweig, Mark S. et al.

1986 Intensive Cultural Resource Survey for the Algonquin Gas Transmission Company Facilities Project, Bristol and Plymouth Counties, Massachusetts. 88 pages.

Background research, walkover survey and subsurface testing were conducted along two natural gas pipeline loops: 2.5 miles in Berkley, Bristol County, and 4.4 mile in Rochester, Carver, Wareham and Plymouth, Plymouth County. No cultural resources were recovered in the Plymouth loop, while three prehistoric sites and one historic site were identified in the Bristol County loop. None of the archaeological remains is temporally diagnostic except the historic site which consists of a late nineteenth century icehouse facility. The historic site (AL-H1) and one prehistoric site (AL-4) were not considered to be significant, and no further archaeological testing was recommended at

these two sites. The remaining three prehistoric sites (AL-l, AL-2 and AL-3) were considered to be potentially eligible for inclusion on the National Register of Historic Places, and a Phase II Site Examination was recommended for each of these three sites.

25-675 Davin, Ann

1986 An Intensive Archaeological Survey of the Ipswich Country Club Project Area, Ipswich, Massachusetts. 76 Pages

Background research, walkover survey and subsurface testing were conducted as part of an intensive archaeological survey of a 350 acre parcel. Four previously reported prehistoric sites (MHC Nos. 19-ES-142, 143,144 and 145) are located within the project area, however, only l9-ES-l45 (Dow Brook VI) was found to be relatively intact. One possible feature and a lithic workshop were recovered from this site which did not contain any diagnostic artifacts. Two small areas (Locus 1 and 2) contained isolated pieces of prehistoric materials; one quartz chipping debris from Locus 1 and one felsite flake and three pieces of grit-tempered aboriginal ceramics, possibly dating to the Early Woodland period, from Locus 2. Plans were made to avoid impacting the Dow Brook VI site and to incorporate the site area within a conservation easement with the Town of Ipswich. No further archaeological testing was recommended for the Dow Brook VI site in view of the plans to avoid the site from project impacts. Also, no further testing was recommended for both Locus 1 and 2 since both loci were not considered to be significant.

25-676 Savulis, Ellen-Rose, Ronald W. Johnson and Joannah Whitney

1986 Archaeological Locational Survey of Forest Park, Springfield, Massachusetts. 88 pages.

Background research, walkover survey and subsurface testing were conducted as part of a locational survey for the Olmstead Historic Landscape Preservation Program. Background research identified the location of seven potential historic archaeological sites including mid-to-late nineteenth century dwellings, mills and a brickyard. Field investigations confirmed the presence of two historic sites which appear to be eligible for listing on the National Register: Coomes homestead (ca. 1850) and J. Madden Brickyard (ca. 1830-1870). Five prehistoric sites were located, however, no diagnostic artifacts were recovered. Recommendations include further archaeological testing for one prehistoric site (Unit A) and the implementation of measures to prevent the erosion of the prehistoric site in Unit B. Further, if impact from construction becomes likely in the future, all sites encountered during the survey, as well as areas with similar environmental characteristics, will require additional survey.

25-677 Ritchie, Duncan

1986 An Intensive Archaeological Survey of the Appleton Estates Project Area, Methuen, Massachusetts. 43 pages.

Background research, walkover survey and subsurface testing failed to recover any prehistoric archaeological resources despite the reported location of a prehistoric site (Old Lippard property site) within the project area. Subsurface testing revealed historic period materials consisting of ceramics dating between the mid-nineteenth- early-twentieth centuries. It was concluded that the Old Lippard property site may have been destroyed by previous development and that the recovered historic resources are not significant. No further archaeological investigation was recommended.

25-678 Boulding, Mark E.

1986 Archaeological Investigations at the Jason Russell House, Arlington, Massachusetts. 34 pages.

An archaeological survey and limited excavation of the Jason Russell House property were con-

ducted as part of the 350th anniversary celebration of Arlington. The research objectives of the project focused on the supposed relocation of the building originally constructed in 1684, and the spatial organization of the New England houselot. The results of soil resistivity analysis and subsurface testing revealed that the project area had been substantially disturbed by previous activities. The report concludes by recommending that a complete deed evaluation be conducted of the early phases of Arlington's settlement to provide more precise locational information on the houselots within the project area.

25-679 Bowers, Martha H. and Edward Mann

1986 Overview and Management Plan for Cultural Resources of the Metropolitan Park System. 103 pages.

In the 93 years since it's founding, the metropolitan park system has grown to encompass some 14,700 acres of properties extending from Boston Harbor to beyond Route 128 and from Saugus to Canton. This report represents a cultural resource management study, commissioned by the Metropolitan District Commission, to assist the MDC in developing programs for the care and

conservation of cultural resources located in its parks. Background research was conducted in order to identify the range of historic property types known or likely to exist in the park system and to develop historic contexts for evaluating the significance and integrity of any historic property. The report concludes by making several recommendations for the management of cultural resources within the metropolitan park system.

25-680 Davin, Ann K. and Elizabeth Holstein

1986 An Intensive Archaeological Survey of the Seekonk Mall/Galleria Project Area, Seekonk, Massachusetts. 49 pages.

Background research, walkover survey and subsurface testing were conducted as part of an Intensive archaeological survey of 40 acres in Seekonk. Subsurface testing revealed that the project area primarily consists of fill which contains a large quantity of historic cultural material dating to the nineteenth and twentieth centuries, as well as one piece of argillite chipping debris. Areas surrounding the fill were either wetlands or under pavement. Since no significant archaeological or historic resources were identified, no further archaeological investigations were recommended.

25-681 Loparto, Leonard

1986 Intensive Archaeological Survey of the Somerset Wastewater Treatment Facilities. 37 pages.

Background research, walkover survey and subsurface testing revealed that most of the project area had been previously stripped or filled as a result of past treatment plant construction and dredging operations along the Taunton River and Fall River Harbor. No cultural materials were recovered, and no further archaeological investigations were recommended.

25-682 Hoffman, Curtiss

1986 Final Report and Supplemental Report: Archeological Intensive Survey, Hopkinton-Westborough Interceptor, Westborough, Massachusetts. 60 and 39 pages.

An intensive archaeological survey is discussed in two reports. Background research, walkover survey and subsurface testing, discussed in the Final Report, identified five area which contained prehistoric materials. Diagnostic artifacts suggests occupations during the Late Archaic through Early Woodland periods. Historic period cultural resources, dating between the late 19th through 20 centuries, were scattered in portions of the project area. It was recommended that a site examination be conducted within a revised alignment in Area 4 and that an additional 50x50 cm. test pit

be completed within the permanent easement of Area 2. The remaining areas of the project did not contain significant resources, and no further existing testing was recommended for these areas. The supplemental report presents the results of additional testing of the project realignment within Area 4b and a portion of the project area (Area 3) in which previous disturbance revealed archaeological materials. Area 4b (Cedar Swamp-9 site) contained potentially significant prehistoric remains dating to the Late Archaic or Transitional Archaic Period. A well and foundation dating to the mid-to-late nineteenth century was also identified within Area 4b. It was recommended that the prehistoric site and two historic features be subjected to a site examination in order to determine the significance. A small prehistoric site (Cedar Swamp – 35), located within Area 3, primarily consisted of non-diagnostic chipping debris and a red earth feature. Additional testing of this site was recommended in order to determine its significance.

25-683 Ritchie, Duncan and Ann K. Davin

1986 Intensive Archaeological Survey of the Milton-Houghton's Pond Project Area, Milton, Massachusetts. 50 pages.

Background research, walkover survey and subsurface testing located two prehistoric sites, Hillside and Paddock Sites. Both sites consisted of low densities of chipping debris of unknown cultural/temporal affiliation Historic period field trash, dating to the nineteenth century, was distributed throughout most of the project area. Since none of the archaeological sites was considered to be potentially significant, no further archaeological research was recommended.

25-684 Nassaney, Michael S. and Ellen-Rose Savulis

1985 Archaeological Locational Survey in the Northeast Section of Richmond, Massachusetts. 22 pages.

Background research, walkover survey and subsurface testing were conducted for the locational survey for the proposed Summit Road Bridge Replacement Project. Evidence of historic domestic and industrial activities was encountered, including a stone foundation associated with a late nineteenth century occupation, and an early twentieth century support facility associated with the Richmond Line Company. No prehistoric cultural remains were identified. Since the historic period materials were not considered to be significant, no further archaeological work was recommended.

25-685 Gorman, F.J.E. and Nancy Seasholes

1986 Intensive Archaeological Survey of the Concord Commons Complex, Concord, Massachusetts. 70 pages.

Background research, walkover survey and subsurface testing identified prehistoric surface finds and findspots as well as historic period materials. A stem fragment of a Small-Stemmed projectile point and a spade stem were recovered from two surface finds. The historic resources date to between the late eighteenth to early twentieth centuries. None of the cultural resources was considered to be significant, and no further archaeological testing was recommended.

25-686 Johnson, Ronald W. and Richard Holmes

1986 Archaeological Locational Survey of the Fifth Massachusetts Turnpike, Fitchburg, Massachusetts. 31 pages.

Background research identified the location of a nineteenth or possibly eighteenth century farmhouse in the project area, as well as a nineteenth century barn foundation. Walkover survey and subsurface testing recovered historic materials, mostly in three clusters and dating from the mid nineteenth to twentieth centuries, as well as two non-diagnostic prehistoric materials. Most of the

project area had been previously disturbed by highway construction and gravel extraction. None of the archaeological material was significant, and no further testing was recommended.

25-687 Elia, Ricardo, J., Douglas C. George, Candace Jenkins, Thomas F. Mahlstedt and Peter Stott

1986 New England/Hydro-Quebec II Transmission Facilities, Cultural Resources Survey, Volume Two: Massachusetts. 286 pages.

Background research, walkover and architectural surveys and limited subsurface testing were conducted within a project area covering 64.3 miles of rights-of-way in the following 16 towns: Tyngsborough, Dunstable, Shrewsbury, Grafton, Shirley, Lancaster, Leominster, Sterling, West Boylston, Boylston, Millbury, Sutton, Upton, Milford, Medway, and Groton. 113 archaeologically sensitive areas were identified, and a total of 27 archaeological sites (12 prehistoric and 15 historic) were discovered. None of the archaeological sites was sites was determined to be eligible for inclusion in the National Register. Ten of the 27 sites were not significant, and no additional testing or protective measures were recommended there. Recommendations were made to protect the remaining 17 sites from project impacts. The architectural survey inventoried 465 individual properties and 17 districts or areas; of these, 70 properties and 5 districts were determined to be eligible for National Register listing. Two properties were already listed in National Register. Evaluation of the project's effects to the eligible or listed National Register properties and districts were made as were recommendations to minimize impacts to the above properties and districts.

25-688 Raber, Michael S. and Leonard W. Loparto

1986 Intensive Cultural Resources Survey for Proposed Algonquin Gas Transmission Company Facilities Expansion in Taunton, Berkley and Dartmouth, Bristol County, Massachusetts. 46 pages.

Background research, walkover surface and subsurface testing were conducted along two natural gas pipeline loops: 1.4 miles in Taunton and Berkley and 2.5 miles in Dartmouth. Both corridors contained historic cultural resources dating to the nineteenth and twentieth centuries. None of these resources, however, was significant. While no prehistoric resources were identified in the Taunton-Berkley loop, the Dartmouth loop contained a potentially significant prehistoric site, Colebrook Swamp site, in which a non-diagnostic projectile point (perhaps dating to the Middle Woodland period), low-density chipping debris, burned rock and an ash feature were recovered. No other significant prehistoric material was identified in the Dartmouth loop. It was recommended that a site examination be conducted at the Colebrook Swamp site in order to determine site boundaries, function and configuration. No further archaeological testing was recommended for the Taunton-Berkley loop.

25-689 Roberts, Michael and Beth Bower

1986 Archaeological Survey and Analysis for Delaney Hydroelectric Project, West Townsend, Massachusetts. 19 pages.

This report was completed to determine whether any historic or archaeological properties might be impacted by the proposed hydroelectric project, to evaluate project impacts on these resources and the West Townsend Local Historic District and to offer recommendations for mitigation if necessary. The results of background and surface survey indicate that no intact prehistoric resources, and only the right leg of the existing dam structure, dating to the nineteenth century, will be impacted. The study concludes by recommending two measures for mitigation of project impacts: (1) photo documentation of the right leg of the dam structure, as well as footings of the original eighteenth century bridge that may be revealed, and (2) the creation of an exhibit describing the early industrial history of West Townsend.

25-690 Little, Elizabeth A. (editor)

1986 Background Essays for an Archaeological Study of the Jethro Coffin Houselot.

This report consists of a collection of four papers published by the Nantucket Archaeological Studies, No. 7, which are concerned with various historical topics surrounding the Jethro Coffin Houselot in Nantucket. Some of the topics include an inventory of artifacts from the 1975-1976 excavation at the site, resistivity study and title search.

25-691 Chase, Helen Winslow

1986 Jethro Coffin House. Chronology, 1686-1986. 163 pages.

This study contains a 300-year chronology detailing the major events and individuals connected with the Jethro Coffin House in Nantucket. In addition, several deeds, genealogies and transcribed oral tradition are included. The information provided in the report establishes an important context with which to interpret the history of this significant site.

25-692 Mahlstedt, Thomas F.

1986 Intensive Archaeological Survey for the Proposed Construction and Renovation of Riverside Park, Haverhill, Massachusetts. 58 pages.

Background research, walkover survey and subsurface testing failed to identify prehistoric or significant historic cultural resources. The historic materials dated to the twentieth century and were encountered in disturbed contexts. The entire project area was previously disturbed over the past 200 years by soil removal, landfill and grading activities. No further archaeological investigation was recommended.

25-693 Loparto, Leonard W.

1986 Intensive Archaeological Survey of the Brightman Street Bridge Replacement and Taunton River Dredging Disposal Area. 43 pages.

Background research, walkover survey and subsurface testing failed to identify prehistoric or historic cultural resources in either of the two project areas in Somerset. Much of the project area for the Brightman Street Bridge replacement was previously disturbed, particularly east of Brayton Avenue. Most of the proposed disposal area was disturbed by previous disposal activities, and part of this area was formerly wetlands. No further archaeological investigation was recommended.

25-694 George, Douglas C. and Thomas F. Mahlstedt

1986 Intensive Archaeological Survey of the Proposed Bradley Brook Sewer Interceptor in Haverhill, Massachusetts. 40 pages.

Background research, walkover survey and subsurface testing identified both prehistoric and historic cultural material. Diagnostic prehistoric artifacts included a small-stemmed projectile point (Late Archaic period) and grit-tempered, dentate-impressed pottery (Middle Woodland period). Historical ceramics, scattered throughout the project area, ranged in age from the late seventeenth to twentieth centuries. Since both the recovered prehistoric and historic resources were found in disturbed contexts, they were not significant. No further archaeological testing was recommended.

25-695 Strauss, Alan E.

1986 Intensive Archaeological Survey of the Route 67 Reconstruction Project in North Brookfield, New Braintree and Barre, Massachusetts. 51 pages.

Background research, walkover survey and subsurface testing identified three acres containing prehistoric cultural materials. One area in North Brookfield and one area in New Braintree both contained single, non-diagnostic artifacts. Numerous nineteenth and twentieth century materials were recovered within the project, but none was considered significant. None of the prehistoric sites was considered significant, and no further archaeological work was recommended. It was suggested, however, that the area adjacent to the Howland Spring Knoll Site be protected from secondary construction impacts.

25-696 Ritchie, Duncan and Ann K. Davin

1986 Intensive Level Archaeological Survey, Gristmill Estates IV, Marlborough, Massachusetts. 63 pages.

Background research, surface walkover and subsurface testing located the remains of five prehistoric sites (Loci 1-5) and an historic farmstead. Locus 1 contained high densities of quartz chipping debris and an un-typed triangular projectile point. Loci 4 and 5 yielded moderate densities of chipping debris, and loci 2 and 3 consisted of low densities of chipping debris; temporal affiliation of the five prehistoric sites is unknown. The historic site consisted of the remains of a house and barn, as well as limited cultural material indicating construction in the early to mid-nineteenth century. Due to previous disturbance and/or limited assemblages of cultural material, none of the six recovered archaeological sites was significant. No further archaeological testing was recommended, although effort should be made to preserve the sites where feasible.

25-697 Raber, Michael S. and Leonard W. Loparto

1986 Archaeological Site Examination for Proposed Algonquin Gas Transmission Company Facilities in the Town of Berkley, Bristol County, Massachusetts. 20 pages.

A site examination was performed at two prehistoric sites (Flint Site-AL-2 and McClintic Site-AL-3) located within the 2.5 mile natural gas pipeline loop in Berkley. The Flint Site contains a low diversity and low density of artifacts; no temporally diagnostic tools and no features were encountered. It is assumed that this small site functioned as a seasonal foraging site. Given the site's excellent integrity and the potential for yielding significant new data on prehistoric settlement patterns and inter-site relationships, the Flint Site was considered eligible for National Register listing by the authors. The McClintic Site contains a very low density and low diversity of artifacts; no temporally diagnostic tools and no features were encountered. It is hypothesized that the site may have been a kind of way station which also included casually exploited hunting resources. The McClintic Site does not appear to be eligible for National Register listing largely because of the lack of potential for recovery of significant new information. It was concluded that since the MHC ruled that neither site is eligible for National Register listing, no further archaeological testing was warranted.

25-698 Seasholes, Nancy S.

1986 Intensive Archaeological Survey of the Parson Barnard Houselot, North Andover, Massachusetts. 30 pages.

The report summarizes the results of an intensive archaeological survey in an area of the Parson Barnard House scheduled for an historic preservation project. Subsurface testing, documentary research and laboratory analysis identified potentially significant archaeological remains. Monitoring conducted during construction indicated most of the identified features were either destroyed or seriously disturbed. Remaining areas around the house not disturbed by the preservation work and not within the intensive survey project area were still expected to have archaeological potential.

25-699 Loparto, Leonard, W.

1986 An Intensive Archaeological Survey of the Knollwood Estates Sewage System, Norton, Massachusetts. 43 pages.

This report summarizes the results of an intensive survey of two easements and a pump station site in Norton, Massachusetts. Background research, a walkover survey and excavation failed to locate prehistoric or historic cultural resources within any of the proposed project areas. One easement locale near wetlands appeared to be favorable site location. However, rocky subsurface strata was offered as an explanation for the lack of cultural materials in this area. No further archaeological investigation was recommended.

25-700 Gorman, F.J.E.

1986 Intensive Archaeological Survey of the Cargo Transfer Facility Belchertown, Massachusetts. 52 pages.

The report represents the results of an intensive (locational) survey of the proposed 126 acre Central Vermont railroad cargo transfer facility. Background research, a walkover survey and subsurface testing revealed several recent historic period resources, all of which had little potential significance to warrant further investigation. Two areas of prehistoric activity were found on a knoll at the northern end of the parcel. Both areas contained chipping waste in a disturbed plowzone. Because the chipping waste had low density, disturbed spatial integrity and was not culturally diagnostic, both prehistoric sites were also determined to have little potential significance. No further archaeological research was recommended.

25-701 Keith, Margaret, Ellen Rose Savulis and Michael Nassaney

1986 Archaeological Locational Survey of the Lotuff Parcel, Ware, Massachusetts. 33 pages.

This report presents the results of an archaeological locational survey at the site of a planned housing development. Walkover survey and subsurface testing failed to produce significant prehistoric or historic cultural resources. No further archaeological research was recommended.

25-702 Strauss, Alan E.

1986 Intensive Archaeological Survey of the Digital Equipment Corporation Facilities on Dascomb Road in Andover, Massachusetts. 39 pages.

Background research indicated no prehistoric sites were recorded in the area of the project. However, a walkover reconnaissance and extensive excavations produced three loci of prehistoric activity. Felsite flakes and prehistoric pottery suggested a Woodland Period association for the site. Bracketed test pits around areas where prehistoric cultural materials were found failed to produce additional significant artifacts. The cultural remains were subsequently thought to represent “non-sites,” or isolated episodes of limited prehistoric activity. No further archaeological research was recommended.

25-703 Elia, Ricardo and Nancy S. Seasholes

1986 Archaeological Investigation of Parcel 7 in Boston, Massachusetts. 32 pages.

The report summarizes the results of archaeological investigations at a proposed hotel and office complex in downtown Boston. Documentary research revealed that most of the project area is located on land originally settled in the 1640s. Most notably, the Green Dragon Tavern formerly stood in the project area during the eighteenth century. A study of existing surface and subsurface conditions on the property and limited subsurface testing failed to locate significant archaeological

resources on the proposed site, possibly due to extensive modern land use and disturbances. No further archaeological research was recommended.

25-704 Towle, Linda A. and Darcie A. MacMahon (Editors)

Archaeological Collections Management at Minute Man National Historic Park, Massachusetts. Volume 3, Archaeological Collections Management Project Series No. 4. 332 pages.

This report represents Volume 3 of a 4-volume study conducted by the Eastern Archaeological Field Laboratory of the National Park Service. The project organized reinventoried and reanalyzed 121,000 historic period artifacts in collections from 19 sites at the park. Volume 3 presents a reanalysis of 4 historic sites in the Virginia Road and Wayside areas of the park in Lincoln and Concord, Massachusetts. The provenience and artifact coding systems used are discussed, as well as mapping and data problems stemming from collections made by several individuals over many years. Site interpretations are based on a synthesis of a historical background study, past reports and the present analysis. Potential future research topics were identified for each site.

25-705 Towle, Linda A. and Darcie A. MacMahon (Editors)

1986 Archaeological Collections Management at Minute Man National Historical Park, Massachusetts, Volume 4, Archaeological Collections Management Project Series No. 4. 387 pages.

This report represents Volume 4 of a 4-volume study conducted at Minute Man Park in Concord and Lincoln by the Eastern Archaeological Laboratory of the National Park Service. The total project organized reinventoried and reanalyzed 121 ,000 artifacts in collections from 19 sites at the park. Volume 4 presents a reanalysis of 5 historic sites the (Ephraim and Willard Buttkick Sites, the Road, west of the North Bridge, the Pond Brown Site, the Elisha Jones Site, and the John Flint Site) in the North Bridge area of Concord, Massachusetts. The provenience and coding systems used are discussed, as well as mapping and data problems which resulted from a re-study of earlier work. Site interpretations are based on a synthesis of an historical background study, past reports and the present analysis. Recommendations are made regarding topics for future archaeological research at each site.

25-706 Mulholland, Mitchell T. and Robert Drinkwater

1980 Phase I, Step I Archaeological Survey of the Proposed Henderson Road Realignment, Williamstown, Massachusetts. 31 pages.

Background research and preliminary reconnaissance was conducted for the realignment of approximately 530 meters of Henderson Road, 76 meters along Brook Road and 80 meters of a small brook northeast of the Henderson Road/Brook Road intersection. Three areas of prehistoric sensitivity were found within the project impact area. A quartzite flake was found on the surface in one of the areas. All three locations were recommended for further intensive survey. Three potentially significant historic sites/structures were also found but were not recommended for further testing.

25-707 Raber, Michael S. and Leonard W. Loparto

1986 Intensive Cultural Resources Survey for Proposed Student Residences, Southeastern Massachusetts University, Town of Dartmouth, Bristol County, Massachusetts.

The report presents the results of a background study and field research conducted on the SMU campus. The results indicated the presence of a prehistoric and historic site within the project limits. The Cedar Dell Pond Site was determined to be a partly intact, multi-component, prehistoric site with over an acre remaining essentially undisturbed. Previous research at the site identified Early, Middle and Late Archaic, as well as Middle and Late Woodland components, all of which were regarded as questionable and unconfirmed by the authors. The intensive survey yielded a

considerable amount of lithic debitage but did not define components. A site examination was recommended to determine the boundaries and internal configuration of the site in order to evaluate its National Register eligibility. The Szala Farm, also identified within the project limits, contains a number of existing structures and building remains occupied during the late 19th and 20th centuries, and possibly earlier. Recommendations were made to retain existing structures as part of the university. In the event the buildings should be demolished, the significance of the historic property should be assessed through additional documentary and informant research.

25-708 Mahlstedt, Thomas F.

1986 Final Report: Archaeological Reconnaissance Survey of the Soil Conservation Service Soils Workshop, Blue Hills Reservation, Ponkapoag Golf Course, Canton, Massachusetts. 12 pages.

This report presents the results of a reconnaissance survey which included background research, subsurface testing and auger samples in areas to be impacted by backhoe testing for the SCS soils workshop. No cultural materials were found, and no further archaeological testing was recommended.

25-709 McArdle, Alan H.

1986 Archaeological Locational Survey in Wareham Massachusetts: A Locational Survey for the Proposed Main Street Bridge Replacement Project. 28 pages.

Background research, a walkover survey and subsurface testing were conducted as part of a locational survey in an area 60 feet (20m) wide and 1,360 feet (415m) long. Excavations produced a small quantity of historical archaeological material (19th-century) but no prehistoric materials. Background research identified the site of a former street railway station which walkover and subsurface testing failed to corroborate. No sites were found eligible for inclusion in either the state or National Register of Historic Places. No further survey was recommended.

25-710 Ritchie, Duncan and Marsha King

1986 An Archaeological Reconnaissance Survey of Deer Island, Boston Harbor, Massachusetts. 66 pages.

Background research and limited subsurface testing (augering) were employed as part of a reconnaissance-level survey of about 100 acres on Deer Island, Boston. Most of the area surveyed was found to be altered by various land use activities. Remaining open areas were also found to be disturbed and thus possessed low to moderate archaeological sensitivity. One area, an historic cemetery (mid-to-late 19th century) and mausoleum associated with the prison complex, was determined to be of high archaeological sensitivity. An intensive level survey was recommended for the cemetery/mausoleum area.

25-711 Raber, Michael S. and Leonard W. Loparto

1986 Intensive Cultural Resources Survey for the Proposed East Side Interceptor Sewer, North Attleboro, Massachusetts. 6 pages.

Soil augers and test pits were used to intensively test 1015 feet of a sewer interceptor within a 40-foot-wide construction easement. The results of previous reconnaissance and intensive level surveys of the East Side Interceptor immediately east of the present location were summarized. The survey area did not contain cultural resources and was found to be extensively disturbed. No further archaeological studies were recommended.

25-712 Mulholland, Mitchell T. and Ellen Rose Savulis

1986 Archaeological Locational Survey of Stockbridge Road and Vicinity, Hadley, Massachusetts. 80 pages.

Background research and walkover survey were used to stratify a project area approximately 2000 ft. (600 m) in length and 20 ft. (6 m) on each side of the existing road, as well as two intersections. Systematic shovel test pits were then used in areas predicted to have moderate to high potential for containing archaeological properties not encountered during the background survey. Three prehistoric sites were found, all of which have been substantially altered by development and agricultural activities. The Zasky I site contained undiagnostic flakes and nineteenth century historic material. The Zasky II site contained flakes, small-stemmed points (Late Archaic), Levanna points (Mid-to-Late Woodland) and nineteenth century historic material. The Fils site contained Late Woodland ceramics, flakes and nineteenth century historic material. Each of the prehistoric sites was considered as ineligible for listing in the National Register of Historic Places. No historic period sites were found within the impact area. Further archaeological studies were not recommended.

25-713 Raber, Michael S. and Leonard W. Loparto

1986 Intensive Cultural Resources Survey for Proposed Sewerage Facility in Hopkinton, Massachusetts. 6 pages.

Background research, walkover survey and subsurface testing failed to recover prehistoric period cultural resources in any project areas. Approximately 6500 ft. of sewer easement, identified as sensitive alignments, was tested within 50 foot permanent and temporary easements. No further studies were recommended.

21-714 Raber, Michael S. and Leonard W. Loparto

1987 Archaeological Site Examination for Proposed Algonquin Gas Transmission Company Facilities in the Town of Dartmouth, Bristol County, Massachusetts: The Colebrook Swamp Site. 14 pages.

Subsurface testing and further background research was used to determine the site's boundaries and internal configuration. Lithic debitage and several tools were found in a basically undisturbed context covering approximately 250 square meters. Conclusive indications of age or cultural affiliation were not recovered, although the authors suggest the site dates to the Woodland period, especially the Middle or Late Woodland. Since the site appeared to be a significant resource, recommendations were made to avoid the site during construction. In the event the site cannot be avoided, mitigation in the form of data recovery was recommended.

25-715 Mulholland, Mitchell T.

1979 Phase I, Step 2 Archaeological Field Survey of the Route 181 Realignment, Belchertown, Massachusetts. 12 pages.

Walkover survey and subsurface testing were used to recover cultural resources not encountered during Phase I, Step 1 background reconnaissance research. Three areas (Area 1, 2, and 4) were determined to require intensive subsurface testing and site evaluation. Areas 1 and 2 are suspected to contain both historic and prehistoric material. Area 4 contains Woodland ceramic sherds, lithics and nineteenth century historic material. A determination of eligibility for inclusion in the National Register of Historic Places was requested for Area 2 of these sites. One site contains prehistoric lithics of unknown age. The second site contains 18th and 19th century historic ceramics and possible prehistoric activity represented by charcoal fragments.

25-716 Mulholland, Mitchell T. and Frederick Huntington

1979 Phase II Evaluation of Archaeological Resources for the Proposed Realignment of Route 181, Belchertown, Massachusetts. 34 pages.

This report presents the results of subsurface testing conducted in the vicinity of five sites located during the Phase I, steps 1 and 2 assessments for the Route 181 project. The sites included a combined historic/prehistoric site, (Prehistoric area 1/Historic Site B), an area of high prehistoric potential (Prehistoric Area 2), one prehistoric site (Prehistoric Area 1), and 2 probable historic sites (Historic sites D and E). Only the Shea Site was recommended as eligible for nomination to the National Register of Historic Places. Temporally diagnostic artifacts at this site clearly define an Early Woodland component, though the site may have been periodically occupied from the Late Archaic through the Late Woodland. No further studies were recommended at the remaining sites.

25-717 Strauss, Alan E.

1986 Archaeological Investigations at a Proposed Leach Field at Coast Guard Beach, Eastham, Massachusetts. 35 pages.

This report summarizes the results of excavations conducted as a data recovery program at a prehistoric site located within a proposed leach field. Background research, excavation and analysis revealed a low density of artifacts in this area of the site and one broken Levanna Triangle projectile point indicating a possible Late Woodland component. These factors, in addition to evidence that all cultural materials were recovered from a mixed plowzone indicated further excavations would yield little additional valuable data. No further archaeological research was recommended.

25-718 McManamon, Francis P., James W. Bradley and Ann L. Magennis

1986 The Indian Neck Discovery. Chapters in the Archaeology of Cape Cod, V, National Park Service Cultural Resources Management Study No. 17. 168 pages.

This volume presents results from the salvage excavation of an ossuary on Indian Neck, Wellfleet, Massachusetts. The research is summarized in two sections: the first interpreting the function and meaning of the ossuary in terms of the late prehistoric period, and the second a detailed description, analysis and interpretation of the physical anthropological evidence found in the burial feature. The Late Woodland ossuary skeletal population may represent the largest, most thoroughly provenienced, excavated and researched collection of its type found in New England.

25-719 McManamon, Francis P., Patricia E. Rubertone, and S. Terry Childs

1985 Chapters in the Archaeology of Cape Cod, III: The Historic Period and Historic Period Archaeology, National Park Service Cultural Resources Management Study No. 13. 157 pages.

A summary and synthesis of historical research and historical archaeology is presented in three parts. Most of the study represents documentary research in the Cape Cod National Seashore area comprising the towns of Provincetown, Truro, Wellfleet and Eastham. Part I is a summary of NPS historical archaeological research for the seashore and the archaeological survey. Part II focuses on ecologically based interpretations for historical land use patterns on the Outer Cape. In Part III, an analysis of archaeological data arising from historic land use and settlement on the Outer Cape is presented.

25-720 Davin, Ann K.

1986 Intensive Archaeological Survey of the Middleborough Crossing Project Area, Middleborough, Massachusetts. 53 pages.

Background research and subsurface testing located one prehistoric site (Clark Site) within the 28.2 acre project area. The site lacked diagnostic artifacts and integrity and thus was considered not to be significant. Recovered historic cultural material also was considered not to be significant. No further research was recommended.

25-721 Nassaney, Michael S. and Alan McArdle

1986 Archaeological Locational Survey in Raynham and Taunton, Massachusetts: A Locational Survey for the Proposed Church Street Bridge Replacement Project. 48 pages.

Background research and subsurface testing failed to locate significant cultural resources within the 1720 foot long project area. Recovered historic cultural materials were not considered to be significant. No further archaeological work was recommended.

25-722 Bower, Beth Anne

1986 Massachusetts Mills Redevelopment / Public Parks Eastern Canals Plaza Project, Phase I Archaeological Reconnaissance Survey, Lowell, Massachusetts. 15 pages.

Background research and walkover survey were used to complete an archaeological reconnaissance of two parcels along the western edge of the historic Massachusetts Cotton Mills complex. Several types of archaeological resources possessed potential to occur at the site. These resources include Early Archaic through Contact Period cultural remains and the remains of several 19th century mills and related components. It was recommended that during construction, excavations should not exceed seven feet in depth and that all plans and construction should be reviewed by a professional archaeologist.

25-723 Gorman, F.J.E.

1986 Intensive Archaeological Survey of the Raynham Sewer Facility Raynham, Massachusetts. 59 pages.

Background research, a walkover survey and subsurface testing were unable to locate any significant prehistoric or historic archaeological resources within 1.6 miles of cross-country easement. A few shovel test pits contained 19th or 20th century field trash. The sewer line corridor was determined to have low potential to contain prehistoric sites. Historic resources in the project area lacked both age and research value to warrant further investigation.

25-724 Gallagher, Joan

1986 Intensive Survey, Capron Park: A Component of the Blackstone Heritage Park, Uxbridge, Massachusetts. 44 pages.

Background research, a preliminary walkover/surface inspection and subsurface testing failed to locate significant cultural resources within the .35 acre project area to be developed as a park. Subsurface testing revealed that the entire project area had been filled in the 19th century. Subsurface testing found the probable remains of a small 19th century water-powered sawmill. Since impacts to this resource were determined to be minimal during park improvement, and since the remains were not considered to be significant, further archaeological research was not warranted.

25-725 Davin, Ann K.

1987 Intensive Archaeological Survey Littleton Corporate Center, Littleton, Massachusetts. 41 pages.

Background research, a walkover and subsurface testing failed to locate significant cultural resources within the 87 acre project area. The remains of an abandoned, late nineteenth and twentieth century farmstead were located along with historic field trash. The farm was not considered a significant historic site. No further archaeological testing was recommended.

25-726 Sardelli, Louis A.

1987 Reconnaissance and Intensive Archaeological Surveys of the Proposed Holyoke High School, Holyoke, Massachusetts. 31 pages.

Background research, a walkover survey and subsurface testing failed to locate significant cultural resources within the proposed Holyoke High School construction site. Although a potentially significant area was identified during the reconnaissance survey, it was not corroborated during the intensive survey. No further archaeological studies were recommended.

25-727 Krass, Dorothy Schlotthauer and Alan Estes

1986 Archaeological Locational Survey of Mill Valley Amherst, Massachusetts. A survey for the proposed Mill Valley Estates Project. 50 pages.

Background research and subsurface testing failed to locate significant cultural resources within the 45 acre project area. Although historic archaeological materials were found dating from the eighteenth to twentieth centuries, they were not considered to be significant. No further studies were recommended.

25-728 Nassaney, Michael and Alan H. McArdle

1986 Archaeological Locational Survey for the Forest View Nursing Home, Wareham, Massachusetts. 37 pages.

Background research and subsurface testing were used as part of a locational survey of a 7 acre parcel. A small surface scatter of late nineteenth and twentieth century historic debris was found which did not constitute a significant site. No further studies were recommended.

25-729 Shaw, Leslie C. and Alan H. McArdle

1986 Archaeological Locational Survey in Kingston, Massachusetts. A Locational Survey for the proposed Grove Street Bridge Replacement Project. 46 pages.

Background research and subsurface testing failed to locate significant cultural resources within a 2,500 foot long and 60 foot wide roadway project area scheduled for realignment and bridge construction. A small quantity of twentieth century material was observed on the surface, but no materials were recovered during excavation. No further studies were recommended.

25-730 Ritchie, Duncan and Elizabeth Holstein

1987 An Intensive Level Archaeological Survey of the Acorn Park Development, Acton, Massachusetts. 53 pages.

Background research and a walkover inspection were used to stratify a 67.2 acre parcel of land for subsequent subsurface testing. The walkover identified several historic period granite quarries throughout the project. Subsurface testing identified two small prehistoric sites (Nagog Brook and Crow Head Sites). The Nagog Brook Site contained a bifacial tool blank/preform, which may date to the Late/Terminal Archaic Period, and chipping debris of unknown age. The Crow Head Site contained only chipping debris of unknown age. The prehistoric sites were not considered to be

significant, and additional archaeological investigations were not recommended. Avoidance was recommended, however, for the granite quarries.

25-731 Johnson, Ronald W.

1986 Archaeological Site Examination of the Fiskdale Road Site, Feature 1, Brookfield, Massachusetts. 50 pages.

Subsurface testing and radiocarbon dating were used to delineate site boundaries and collect information on cultural and temporal affiliations of the site in order to determine its eligibility to the National Register of Historic Places. Forty-five lithic artifacts including mostly flakes and a broken biface were recovered from a site area covering approximately 1020 square meters. The site is presumably a very small, temporary site, radiocarbon dated (320 $\pm$ 80 B.P.) to the Contact Period. Diagnostic artifacts from this period, however, were not recovered. Since most of the site was destroyed during earlier road construction, it was not eligible for inclusion on the National Register. No further archaeological work was recommended.

25-732 Strauss, Alan E.

1987 Intensive Archaeological Survey of the Proposed Elementary School Project in Sunderland, Massachusetts. 41 pages.

Background research, walkover inspection and excavation were used to test a 22.6 acre parcel. Five prehistoric waste flakes and a Late Woodland pottery rim sherd were scattered within a deep plowzone. Several historic artifacts typical of plowzone refuse were also recovered throughout the project area. Based on the low density of material, their scattered distribution within the deep plowzone, no further archaeological studies were recommended.

25-733 Blancke, Shirley

1987 Archaeological Site examination of the Bedford Street Housing, Asparagus Farm Area, Concord, Massachusetts. 34 pages.

Background research, walkover inspection and subsurface testing were used to test a 6 acre parcel. General research goals included the initiation of a comprehensive survey of prehistoric sites in Concord and supplying information to town boards responsible for land-use management and planning to minimize impacts on archaeological sites. Specific goals of the survey focused on defining the extent, significance and integrity of site #l9-MD-99. Although artifact collections from the site date to the Middle Archaic through Woodland Periods, excavations produced chipping flakes, all found within the plowzone. Two Late Archaic Small Stemmed points were found during the walkover. Historic field trash was also found on the surface and in the plowzone. The remains of two nineteenth century trash pits were also identified. Avoidance strategies and further studies in the housing area were not recommended since site #l9-MD-99 was not considered to be significant. It was recommended that a further examination should be conducted west of the building site in the area of site #19-MD-l00 if development is planned there. It was also recommended that in the event of cemetery expansion, the woods behind the project should be tested since undisturbed archaeological remains are expected in that area.

25-734 Gorman, F.J.E. and Nancy Seasholes

1986 Intensive Archaeological Survey of the Elderly, Handicapped and Family Housing Project, Nantucket, Massachusetts. 110 pages.

Background research, surface walkover and subsurface testing were conducted as part of an intensive archaeological survey in a 6.05 acre area, which may contain the remains associated with the Miacomet Praying Indian village and cemetery. A hornfels flake found in one test pit was the only

prehistoric resource recovered. Historic period resources dated from the late nineteenth and twentieth centuries were also identified. No burials were identified. None of the recovered archaeological remains was considered to be significant, and no additional archaeological testing was recommended.

25-735 Jones, Donald G. and Nancy S. Seasholes

1986 Intensive Archaeological Survey of an Electrical Pipe-Cable Corridor Through a Portion of Boston Common in Boston, Massachusetts. 88 pages.

Background research, field reconnaissance and subsurface testing were used to examine a 20 foot wide utility corridor extending across the southern end of Boston Common from Tremont to Charles Streets. Background research indicated the project area was located along the shoreline of Shawmut Peninsula on the Charles River, a locationally favorable area for prehistoric sites. During the historic period numerous activities have been documented on the common since the settlement of the town. A total of 5,901 prehistoric and historic artifacts were recovered, including nine non-diagnostic prehistoric artifacts all from disturbed contexts. Historic period artifacts included mostly ceramics dating to the eighteenth century but recovered in association with materials dating to the mid to late nineteenth and twentieth century. None of the recovered archaeological remains was considered significant, and no additional archaeological testing was recommended.

25-736 Johnson, Eric

1986 Archaeological Site Examination of #l9-MD-556 and #l9-MD-557 Lowell, Massachusetts. 87 pages.

Subsurface testing was conducted as part of an archaeological site examination of two National Register eligible sites which will be adversely impacted by the reconstruction and widening of Pawtucket Boulevard. At site #19-MD-556 historic remains were recovered which included mostly construction materials and household refuse dating from the mid to late nineteenth century through mostly the twentieth century. One historic feature, the probable remains of an historic house foundation was found. Prehistoric artifacts included fire-cracked rock and 288 stone artifacts comprised of mostly flakes, some with retouch or utilization (2), 5 bifaces, bifacially worked fragments and one stemmed projectile point. Three prehistoric features were recovered containing mostly reddened patches of soil associated with fire-cracked rock. Feature 3 was radiocarbon dated to 3670 $\pm$ B.P. Site size ranged from 280 to 360 square meters. Its function was apparently as a small, short-term hunting-gathering camp or resting place where activities were limited. At site l9-MD-557 late nineteenth and twentieth century historic materials were also recovered. All historic artifacts were recovered in fill probably associated with the construction and landscaping of Pawtucket Boulevard. No prehistoric artifacts were recovered during the site examination. Based on the locational survey, site size ranges from one to four meters in diameter. Site l9-MD-557 was interpreted as a small flake scatter probably from a simple isolated event. Both sites, l9-MD-556 and l9-MD-557 were determined to offer little potential for research beyond the site examination. No further work was recommended for either site.

25-737 Ritchie, Duncan

1987 An Intensive Archaeological Survey of the Nantucket Public School Nantucket, Massachusetts. 58 pages.

Background research, a walkover inspection and subsurface testing failed to locate burials or other prehistoric cultural materials at the high school or elementary school sites, both of which totaled 15 acres. Each area was considered to be archaeologically sensitive as a result of several previous discoveries of cremation burials on the high school grounds and in the general vicinity. A small amount of nineteenth century historic material was found on high school property in a disturbed context and was not considered significant. No further archaeological testing was recommended.

25-738 Nassaney, Michael S. and Alan McArdle

1987 Archaeological Locational Survey of the Russell Harrington Cutlery Site, Turners Falls, Massachusetts. 50 pages.

Background research, a walkover and subsurface testing, including backhoe-assisted excavation, were used as part of a locational survey of a two acre project area in Montague. No evidence of prehistoric period sites was found. Historic period materials recovered included relatively intact architectural remains of the late nineteenth century Russell Cutlery, along with associated artifacts. The cutlery was reported to have potential to yield information about local, regional and national industrial history. Further evaluation of the site was recommended to determine whether the site is eligible for inclusion in the State and National Register of Historic Places.

25-739 Holstein, Elizabeth and Ann K. Davin

1987 An Intensive Archaeological Survey of the Proposed Attleboro Wastewater Treatment Facilities Project Area, Attleboro, Massachusetts. 46 pages.

Background research, walkover survey and subsurface testing were conducted as part of an intensive archaeological survey. Prehistoric cultural materials were recovered in two areas. Locus 1 and the Roy Avenue Site both contained undiagnostic chipping debris only. Both sites were determined to be significant and were not recommended for further testing. The remains of a historic period mill were recovered, probably dating to 1830 or earlier. An archaeological site examination of the mill was recommended if avoidance is not a feasible alternative.

25-740 King, Marsha K.

1987 Historic Document Report: An Historic Cemetery Site at the Deer Island House of Corrections, Boston, Massachusetts. 49 pages.

Documentary research was conducted as the first of two stages of an intensive survey in a 200 acre area planned for wastewater treatment facilities on Deer Island. This stage of research focused on the history of cemeteries related to the various institutions that have been located on Deer Island. A focal point of this research was a cemetery noted in a 1985 archaeological survey of the area on the northeast slope behind the Hill Prison building. Research indicated the cemetery, known as the "New Rest Haven Cemetery," was created in 1908 with the reinterment of 4,160 bodies from the Old Rest House Cemetery in the military reservation at the southern end of the island. It is expected some 4,160 to 4,500 bodies, mostly remain interred in the cemetery. Additional archaeological testing was recommended, including remote sensing techniques such as soil resistance and electron magnetometry, as well as, machine testing and hand excavation. Recommendations were made for the research to focus on determining the horizontal extent of the cemetery and collecting sufficient data to reconstruct the internal configuration or plan of the cemetery and method of burial.

25-741 Leveillee, Alan

1987 An Intensive Archaeological Survey of the Andover Office Park Project Area, Andover, Massachusetts. 44 pages.

Background research, a walkover and subsurface testing failed to locate significant cultural resources within the 45 acre project area to be developed as an office park. One prehistoric site, the South Bend Site, was found, probably belonging to the Woodland period. However, its presence in a generally disturbed context and the recovered data indicated that the site was not a significant cultural resource. Remnants of a probable nineteenth century farm complex were also located within the study area. However, these materials were also disturbed and not considered to be of

potential significance. No additional archaeological investigations were recommended.

25-742 Leveillee, Alan

1987 An Intensive Archaeological Survey of the Deer View Estates Project Area, Franklin, Massachusetts. 41 pages.

Background research, a walkover and subsurface testing failed to locate significant cultural resources within the 62 acre project area. Four loci of prehistoric cultural material were recovered, all of which contained undiagnostic low-density lithic scatters. These remains did not constitute potentially significant sites, and no further investigations were recommended. The remains of a mid-nineteenth century farm complex were also found. The surviving elements of this resource were determined not to be potentially significant, and no further investigations were recommended.

25-743 Beaudry, Mary C.

1987 Limited Archaeological Reconnaissance of the Spencer-Pierce-Little House Property, Newbury, Massachusetts. 74 pages.

The limited archaeological reconnaissance of the Spencer-Pierce-Little House Property was the first step in a long term archaeological investigation of land-use at the 300 acre property. This phase of research focused on excavation and analysis in advance of ground disturbance during restoration work. Excavation of 12 test trenches revealed information about landscaping and outbuildings (dairies, butteries, etc.) in the farmyard area. Archaeological deposits were found to be well preserved and rich in cultural material. Probable seventeenth century artifact remains were found though most materials were from the eighteenth and nineteenth centuries and included structural remains, building debris, ceramics, floral and faunal remains. The restoration work is not believed to have a negative effect on significant cultural resources. Elsewhere on the property rich archaeological deposits are believed to exist. Recommendations are made for a comprehensive study of the Spencer-Pierce-Little farm which would incorporate the continued use of archival and oral sources with field data and also to incorporate prehistoric land-use and resource exploitation into the study.

25-744 Johnson, Ronald W and Alan H. McArdle

1986 Archaeological Locational Survey of Cabot Woods, Turners Falls, Massachusetts. 71 pages.

Background research, a walkover reconnaissance and field-testing which included shovel test pits and soil cores, were employed as part of a locational survey for a proposed 42 acre anadromous fish research facility. A total of 1,219 lithic artifacts, excluding fire-cracked rock, were recovered from nine sites. Thirty-two prehistoric ceramic sherds were also found, predominately from site F1, and a possible pipe bowl dating the Late Woodland/Contact Period from Site A1. Lithic artifacts included unmodified flakes, utilized flakes and bifaces. Bifaces were undiagnostic though they were reported to resemble Late Archaic Squibnocket triangles, small stem points, as well as Late Woodland Levanna triangles. Most sites appear as single component deposits except Site F1 which is apparently a series of multi-component artifact clusters from the Late Archaic to Late Woodland Periods. Construction of the facility buildings, parking lots and streams will not directly affect significant archaeological sites. However, a fence around the facility may disturb the edges of nine sites (A1, C1, C2, E1, E2, E3, F1, H1, H2). Only two prehistoric sites (C2, E3) were not considered eligible for inclusion on the National Register. The remaining seven sites were recommended for site evaluation. Two loci of historic period material were also found, a bone concentration and nineteenth century historic pit. The pit remains contained glass, bone and ceramics which were not considered significant. No further archaeological treatment was recommended for this feature. The bone concentration contained sesamoid bones which were recommended for site evaluation in conjunction with prehistoric site C1.

25-745 Gallagher, Joan

1986 Site Examination of the Nello Site Central Artery Reconstruction Project, Charlestown, Massachusetts. 64 pages.

Historical background research, machine grading and hand excavation were used to establish the location, extent (96 square meters) integrity and internal composition of the site's features and strata. The site represents an early component of the Henley Distillery and remnant of the Smith House (ca. 1644-1707). Seventeenth and eighteenth century site components lie sealed beneath a nineteenth century fill layer. Eighteen features of varying types and numerous historic period artifacts were recovered. Structural materials were the most common artifact group found followed by ceramics, bone and shell and smaller amounts of glass, metal and clay pipe fragments. The site's integrity is good to fair with sealed strata providing unusual preservation of organic materials. The site possesses research potential relevant to studies of urban land-use and economic organization and was considered to be potentially eligible to the National Register of Historic Places. Because the site would be totally destroyed by construction, it was recommended for an archaeological data recovery.

25-746 Luedtke, Barbara E.

1987 Results of Geophysical Testing at the Hill Site, l5-SU-56. 7 pages.

Magnetometer and resistivity testing were used to search for prehistoric features at the Hill Site on Long Island. A main goal of this research was to test the hypothesis that a Late Woodland agricultural hamlet was present at the site. Excavation was later used to test anomalies located by the above testing methods. Although both prehistoric (Late Woodland) and historic (middle and late nineteenth century) artifacts were found, no prehistoric features were encountered. Geophysical testing could neither support nor refute the project research hypothesis.

25-747 Davin, Ann K.

1987 Intensive Archaeological Survey of the Locust Valley Country Club, Attleboro, Massachusetts. 73 pages.

Background research, walkover survey and subsurface testing were used as part of an intensive archaeological survey of a 325 acre housing development. Subsurface testing indicated the area was intensively utilized during both the prehistoric and historic periods. Three prehistoric sites, Speedway Brook, Locust Valley, Oak Hill, and eight loci or small low-density scatters of prehistoric lithic materials were found. Two prehistoric sites, #l9-BR-23 and #19-BR-8, were previously reported within the project area. The former site was impacted by construction of the existing golf course, while the latter appears to lie primarily northwest of the project area. Chipping debris was recovered in all prehistoric areas except Locus 3 where a Woodland Period Meadowood projectile point was found. Archaeological site examinations were recommended for the three prehistoric sites. Historic period resources were also found. Three residential structures, A. Goff, A. Tucker and Deacon Peter Thatcher Houses were identified. Modern (20th century) cultural materials were found at the Sweet/Tucker house. Cultural materials were not recovered from the Thatcher/Geoff House. Eighteenth century and later materials were recovered from the Thatcher House. Since little or no integrity exists for the first two houses, they were not recommended for further study. Avoidance was recommended for the Deacon Thatcher historic site.

25-748 Raber, Michael S. and Leonard W. Loparto

1987 Archaeological Site Examination for Proposed Student Residences, Southeastern Massachusetts University, Town of Dartmouth, Bristol County, Massachusetts: The Cedar Dell Pond Site. 27 pages.

The site examination objectives included definition of the Cedar Dell Pond Site boundaries and approximate internal configuration, as well as the determination of the site's significance. The site was reported to cover approximately two acres. Although the north and perhaps south sides of the site were found to be disturbed by previous campus construction and historic farmstead activity, the site's condition was generally good in the wooded area where most cultural materials were recovered. Lithic debitage comprised the largest category of recovered material. Tool types (scrapers, projectile points) representative of the Middle to Late Woodland and possibly Late Archaic Periods were also recovered. The site was hypothesized to be a large, multi-component deposit with moderate artifact density and diversity. Site function was probably a variant of a small, usually single component, seasonal foraging/temporary site. The site was recommended as eligible for inclusion on the State and National Registers of Historic Places. An archaeological data recovery program was recommended in the event project impacts could not avoid the significant areas of the site.

25-749 Strauss, Alan E.

1987 Intensive Archaeological Survey of the Proposed Digital Equipment Corporation Facilities in Lancaster, Massachusetts. 55 pages.

Background research, walkover survey and subsurface testing were used as part of an intensive testing strategy of a 227 acre area to be developed as an office facility, associated water supply and sewage disposal facility. Five nineteenth century sites were identified in the project area although none was determined to be significant. No prehistoric cultural material was recovered, and no further archaeological testing was recommended.

25-750 Towle, Linda A. and Darcie A. MacMahon (Editors)

1986 Archaeological Collections Management at Minute Man National Historical Park, Massachusetts. Volume 2, Archaeological Collection, Management Project Series No. 4. 356 pages.

This report represents Volume 2 of a four-volume study conducted by the Eastern Archaeological Field Laboratory of the National Park Service. The project organized, reinventoried and reanalyzed 121,000 historic period artifacts in collections from 19 sites at the park. Volume 2 presents a reanalysis of 8 archaeological sites (The Bull Tavern Site, the Jacob Whittemore Site, the Tabitha Nelson Site, the Thomas Nelson Jr. Site, Site 24, the Josiah Nelson Site and Sites 22 and 23) in the Nelson Road area of the Park in Lincoln and Lexington. The provenience and coding systems used are discussed, as well as limitations of the data. Site interpretations are based on a synthesis of an historical background study, past reports and the present analysis. Recommendations are made on such topics as areas of the sites to be avoided and future archaeological survey and research at each site.

25-751 Leveillee, Alan and Ann Davin

1987 An Intensive Archaeological Survey of the Milford-Bellingham Technology Park Milford, Bellingham, Massachusetts. 57 pages.

Background research, walkover survey and subsurface testing were conducted as part of an intensive archaeological survey of 300 acres in Milford and Bellingham. Five loci of prehistoric activity were found during the survey. Sites MB I and Transect 1, Pit 1 both produced undiagnostic chipping debris, and calcined bone was discovered at MB I. Both sites were not considered potentially significant. The remaining three sites, MB II, the Windy Shore Site and Andrew's Knoll Site, also produced undiagnostic chipping debris and calcined bone (Windy Shore). Hornfels chipping debris, found at the Andrew's Knoll Site was believed to represent the Middle Woodland Period. All cultural material recovered from the latter three sites were found in good context and considered potentially significant. Further archaeological investigations were recommended at these three sites in order to establish site limits, temporal/cultural affiliations and to determine

State and National Register eligibility.

25-752 Hoffman, Curtiss

1987 North River Archaeological Project, 1986-1987 Field Season, Preliminary Report, Transect V--Pembroke. 39 pages.

This report presents the results of archaeological testing along Transect V, one of seven Transects investigated for the North River Archaeological Project. Each transect was divided into 100 meter quadrants within which test units were selected. Nine sites were located (H49-50PE, H47-48PE, 645-46PE, B38PE, 37-38PE, D35-36PE, G29-30PE, G26-28PE, A1PE), most of which contained historic materials undiagnostic chipping debris and fire cracked rock. Diagnostic late Archaic cultural were recovered at four sites, G45-46PE, C/D 37-38PE, G26-28PE, and A1 PE. A total of 14,993 artifacts were recovered (9,244 historic and 2,397 prehistoric) from an excavated area totaling 52-S square meters. A high concentration of prehistoric sites for the area was identified from the Transect V sample, even in those areas at long distances from water sources. The overall conclusion was that while correlations between the proximity to roads and density of historic remains continues to be confirmed by the transect V results, prehistoric hypothesis such as those which predict site locations/settlement areas do not. The author concluded that the distribution of prehistoric remains as a function of environmental contrast (distance to water, elevation, drainage) can no longer be maintained.

25-753 Holstein, Elizabeth, Denise Mowchan and Duncan Ritchie.

1986 An Intensive Archaeological Survey of the West Bridgewater Industrial Park, West Bridgewater, Massachusetts. 63 pages.

Background research, walkover and subsurface testing were used to test a 75 acre parcel on which seven buildings and a road will be built. Four sites (Loci 1,2,3,4) contain low densities of historic and prehistoric cultural material. Historic cultural materials were mainly ceramics, glass and bricks ranging from the eighteenth century to present. Prehistoric material included undiagnostic chipping debris and calcined bone. Locus 3 contained an untyped triangular projectile point. Each of the loci was found to have limited information or was damaged by previous construction. Further archaeological investigations were not recommended.

25-754 Strauss, Alan E.

1987 Intensive Archaeological Survey of the Proposed Hartford Avenue Reconstruction in Uxbridge and Mendon, Massachusetts. 48 pages.

Background research, walkover and subsurface testing were used as part of an intensive survey of a highway reconstruction project approximately 2 miles long and 40 feet wide. The survey identified four historic sites and no prehistoric materials. A nineteenth century barn and mid-nineteenth century school house foundation were not considered significant, and no mitigation of these two sites was recommended. However, an 1845-built tomb (Mowry's Tomb) and ca. 1835 Mendon Town Pound were considered potentially significant. Avoidance was recommended for these two resources, and no further archaeological work was recommended.

25-755 Pretola, John P.

1987 Reconnaissance Survey of the Robinson Park School, Agawam, Massachusetts. 33 pages.

Background research, walkover survey and subsurface testing were used to test a 5800 square meter area of which approximately 100 square meters would be used for the excavation of an artificially created archaeological site for educational purposes. Subsurface testing recovered two flakes in disturbed contexts at locus 1. A walkover of locus 2 produced 35 artifacts including flakes, fire-

cracked rock, and a probable Orient Fish-Tail preform. The site location, on a sand dune near an intermittent stream cutting into the Agawam glacial delta front, was used to generate locale. The finding suggested that large areas along the front of the Agawam glacial delta are archaeologically sensitive despite the lack of reported sites. It was recommended that future cultural resource management activities consider this model. The location of the artificial site was selected to avoid disturbance of the actual prehistoric site.

25-756 Johnson, Ronald, et al.

1986 Archaeological Locational Survey of Greylock Glen, Adams, Massachusetts. 60 pages.

Background research, a walkover and subsurface testing (test pits and soil cores) were used as part of the locational survey of the 1,040 acre Greylock Glen project area and the 135 acre Thiel Farm. Little evidence of prehistoric activity (i.e., isolated artifacts) was found in any test areas. Nineteenth century historic resources encountered during the survey included one historic foundation, the Thiel Farm, a stone tunnel and a springhouse. Only the springhouse and tunnel were considered potentially eligible for the State or National Registers. In the event these resources were directly impacted, further examination was recommended. Otherwise, no further archaeological work was recommended for the project.

25-757 Hasenstab, Robert J. and Alan H. McArdle

1987 Archaeological Locational Survey at River Road, Florida, Massachusetts. 56 pages.

Background research, a walkover and subsurface testing failed to locate either prehistoric or historic resources within an approximately 9.5 acre project area. Significant historic or archaeological resources were not expected in the area because of its rugged topography. Further studies were not recommended within the project area. Two prehistoric archaeologically sensitive areas were identified north and south of the area surveyed. Should these locations be needed for staging areas, it was recommended the Massachusetts Department of Public Works archaeologist be notified immediately.

25-758 Krass, Dorothy Schlotthauer and Ellen-Rose Savulis

1986 Archaeological Locational Survey of the Medical West Facility Agawam, Massachusetts. 48 pages

Background research, a walkover and subsurface testing failed to locate significant prehistoric or historic resources within an approximately 10 acre project area. Although documentary evidence exists for prehistoric burials and other use activities on property near the Medical West Facility, no indications of prehistoric remains were found on the property. Historic period artifacts represented by ceramics ranging from 1740 to the 20th century were found but not considered eligible for listing on the National Register of Historic Places. No further archaeological survey was recommended.

25-759 Strauss, Alan E. and Lauren J. Cook

1987 Intensive Archaeological Survey of the Proposed Route 3 Reconstruction from Weymouth to Duxbury, Massachusetts and of the Proposed Upgrading of the Bald Hill Rest Areas in Norwell, Massachusetts. 64 pages.

Background research, a walkover and subsurface testing were used as part of an intense survey covering a ca. 50 acre project area in the towns of Duxbury, Hanover, Hingham, Marshfield, Norwell, Pembroke and Rockland. Significant historic or prehistoric sites were not identified in the median strip area of the highway. However, moderate to high densities of prehistoric cultural remains were recovered from both rest area locations in Norwell. In the southbound rest area chip-

ping debris and a Late Archaic small triangular projectile point was recovered; a previously recorded site (l9-PL-50) is listed in this area. In the northbound rest area three artifact clusters containing undiagnostic chipping debris were found. MHC site l9-PL-49 was previously recorded in this area. Both sites appeared to be important and were recommended for a Phase II site examination in order to define the site's horizontal and vertical boundaries and access their potential significance and National Register eligibility.

25-760 Strauss, Alan E. and Lauren J. Cook

1987 Archaeological Investigations of Tennessee Gas Pipeline's Interim Natural Gas Service Facilities in Massachusetts. 176 pages.

Background research, a walkover reconnaissance and subsurface testing were used to test intensively approximately 17.2 miles (145 acres) of gas pipeline loops and 5 meter stations. Eleven towns in 5 counties were tested including Oxford, Charlton and Wilmington (Worcester County), Monson and Wales (Hampden County), Burlington and Reading (Middlesex County), Northampton (Hampshire County), and Lynnfield and Haverhill (Essex County). Four small prehistoric sites were found in Monson (Section 5): Calkins Pond, Brook Sites I and II; the Alden Thatcher Site; and the Temple Brook Pond Site. Undiagnostic chipping waste flakes were recovered at most sites except at the Calkins Pond Brook Site I where a Late Woodland component was identified (Levanna Triangle projectile point). Further testing revealed little vertical integrity and low artifact density at each site. Historic period materials were also recovered including several historical dumps dating to the 20th century in Oxford, and a late l9th-century/20th-century feature, possibly a shed or similar out building in Burlington. No archaeological sites identified during the survey, were considered likely to contain significant information and were therefore not considered eligible to the National Register of Historic Places. It was recommended that if the Section 6A-Extension, (the alternate route), is selected for construction, subsurface testing should proceed in the 4 archaeologically sensitive zones. It was noted that a mitigation plan should be developed in coordination with the SHPO for Zone 3 on this section which contains the Middlesex Canal.

25-761 Leveillee, Alan

1986 Nook Farm Revisited: Archaeological Investigations of Portions of the Leeland Estates Development Area, Plymouth, Massachusetts. 71 pages.

Background research, a walkover and subsurface testing were used as part of an archaeological assessment survey of lot 16A, comprising about 4 acres, within the proposed Leeland Development. Prior to the survey, several sources of evidence indicated that a prehistoric site and possibly burials were located within the lot. Present research identified 5,326 pieces of culturally modified lithic material, mostly flakes, as well as 46 projectile points and 36 bifaces. Diagnostic lithics ranged from the Middle Archaic through Late Woodland including styles identified ad Neville, Orient, Small Stem, Squibnocket, Susquehanna, Vosberg, and Levanna. Steatite bowl fragments and ceramics were also recovered. Faunal materials were present including large quantities of bone (1,409 fragments) and shell (5,348 fragments).

In total, over 12,000 pieces of culturally related material were recovered. Prehistoric feature remains at the site included midden deposits, postmolds, small shell pits and deep pit features. Shell from pit W-l and TT1 was radiocarbon dated to 810 $\pm$ 70 years B.D. (Beta #18103) and 780 $\pm$ 60 years B.D. (Beta #18104) respectively. Historic materials were recovered, none of which predated the eighteenth century. These materials were considered to be field trash consistent with the area's utilization as a farm. Actual burials were not recovered; however, the author does cite considerable circumstantial evidence that they are present. Nook Farm is a complex prehistoric site, possibly representing a "village" of the Late Woodland period. Despite a plowzone and intense past collector activity, overall integrity at the site is reported good to fair. Recommendations were made that this site should be considered for eligibility to the State and National Registers of Historic Places and avoided during construction. Preservation in place was also recommended. If impacts to the

site cannot be avoided, further archaeological work was recommended.

25-762 Leveillee, Alan

1987 An Intensive Archaeological Survey of the East Meddowe Development Area, East Longmeadow, Massachusetts. 34 pages.

Background research, a walkover survey and subsurface testing failed to locate potentially significant prehistoric or historic resources within the 60 acre project. Only remnants of charred tobacco barns and recent dump sites were found. No cultural material predated the mid 20th century, and no further archaeological investigations were recommended.

25-763 Shaw, Leslie C. and Alan McArdle

1987 Archaeological Locational Survey in Mashpee and Barnstable. A Locational Survey for the Proposed Fox Fun Housing Development Project. 129 pages.

Background research, a walkover and subsurface testing were used as part of a locational survey in a 380 acre project area. Five prehistoric sites, five historic sites and two standing structures were found. Two prehistoric sites, Fox-l and Fox-2 did not contain any diagnostic artifacts. Site Fox-3, which contains a shell midden, dates to the Late Archaic and Woodland periods as indicated by ceramics and a Squibnocket Triangle projectile point. Site Fox-4 may contain a Middle Archaic component represented by a biface similar to a Stark projectile point. The Fox-5 site contains a Late Archaic and probable Middle Woodland component represented by ceramics and a Squibnocket Triangle projectile point. The Fox-2 and Fox-4 sites both potentially eligible to the National Register of Historic Places are located in areas where no construction activity is planned. Providing these plans do not change the sites will not be impacted and no further testing is recommended. The remaining prehistoric sites Fox-l, Fox-3, and Fox-5 are all located within construction impact areas. If avoidance for these sites is ruled out then additional archaeological testing was recommended to determine their eligibility to the National Register of Historic Places. Three of the five sites located, (Sampson's Mill site, Quippish house site, Simmons house site) are potentially eligible for the National Register of Historic Places. The Sampson's Mill site (18th century) is located outside the proposed construction and no further work was recommended. The Quippish and Simmons house sites, both 19th century Native American residences are located within construction impact areas and will be adversely impacted. Additional deed research and possible archaeological testing was recommended for these sites. The last two historic sites were the cellar hole like features associated with 20th century recreational cottages and were not recommended as eligible to the National Register of Historic Places. One of the two standing structures on the property is a 20th century cottage and will be removed by the developer. The second standing structure is a barn associated with the cranberry bogs and will not be disturbed by the proposed development.

25-764 McArdle, Alan H. and Joannah Whitney

1987 Archaeological Locational Survey, Royalston, Massachusetts and Site Examination of the Kingsley Tavern and Blanding/Forristal House Route 32 Highway Modification Project. 204 pages.

Background research, a walkover and subsurface testing were used as part of a locational survey and site examination within a 6.4 mile road widening project totaling approximately 13 acres. No intact prehistoric sites were found. Several flakes were recovered in fill of local origin. Background research indicated 21 potential historic sites in the area of the project. Most of these sites will not be impacted by the proposed project. Two sites (Blanding/Forristal House Site and Kingsley Tavern) were recommended for site examination because of their potential eligibility for inclusion in the National Register of Historic Places. Testing at the Kingsley Tavern site produced ceramics and building debris dating to the 19th and 20th centuries. Kitchen refuse and features,

such as privies and trash pits were notably lacking. The Kingsley Tavern was not recommended as eligible for inclusion in the National Register of Historic Places. Excavations at the Blanding/Forristal House also produced 19th and 20th century ceramics as well as other domestic and structural debris. Since evidence of features associated with trash disposal, privies or other domestic uses were not recovered at the Blanding/Forristal House, the site was not recommended as eligible for inclusion in the National Register of Historic Places. No further archaeological testing was recommended.

25-765 Leveillee, Alan

1987 An Assessment of Recent Impacts to the Nook Farm Prehistoric Site, Plymouth, Massachusetts. 71 pages.

Extensive mapping and excavation of selected features were used to determine the degree of impact to the Nook Farm Site caused by construction machinery. The site was previously recognized as a significant resource and potentially eligible to the National Register of Historic Places. However, approximately 2,500 square meters of topsoil, including most of the Nook Farm Site, had been removed, exposing or truncating thirty-four features. In addition, concentrations of lithic debitage, steatite, ceramic sherds, bone and bone tool fragments, burnt rock and fragments of ground and chipped stone tools were also disturbed. It was concluded that the spatial relationship of the majority of the site and its contents were irretrievably lost and that the site now lacked integrity needed for a consideration of eligibility for nomination to the National Register of Historic Places and is no longer significant in an archaeological sense. The loss of this site to the regional database is substantial.

25-766 Raber, Michael S

1987 Intensive Cultural Resources Survey for the Proposed Wardwell Road Pump Station, Town of Canton, Massachusetts. 4 pages.

Background research, a walkover and subsurface testing were used as part of an intense survey of a thirty foot square project area. No significant cultural resources were recovered. It was recommended that construction proceed as planned.

25-767 Rempelakis, John

1987 Route 2 Bridge (#C-l9-20) Replacement, Concord Intensive Archaeological Survey. 12 pages.

Background research and subsurface testing were used as part of an intensive survey along 3,500 feet of Route 2 widening and a projected bridge replacement. No prehistoric or historic cultural materials were recovered. Recommendations were made that no further archaeological survey be performed and that the project proceed as planned.

25-768 Gorman, F.J.E. and Ron Dalton

1986 Reconnaissance Survey River's Edge Estates, Middleborough, Massachusetts. 108 pages.

Background research, a walkover survey and subsurface testing were conducted as part of a reconnaissance survey encompassing 75 acres of land. Five prehistoric loci and historic period resources are reported in the project area. In nearly every instance, prehistoric loci were identified by the presence of one or two fragments of quartz shatter or trimming flakes. One loci in sector 1 contained a quartzite hammer-stone while another loci in the same sector was reported as Contact Period Trail along Plymouth Street. In instances where cultural materials were recovered, the sites were interpreted as limited activity stations of unknown prehistoric age. Historic period cultural resources spanning the as Plantation to Early Modern or more recent periods were also identified

throughout the project area. These remains included hay fields, stone walls, cart paths, foot paths and 19th and 20th century trash dumps. None of the prehistoric or historic cultural resources in the project area was determined potentially significant to warrant further archaeological investigation.

25-769 Elia, Ricardo J. and Alan E. Strauss

1987 Cultural Resources Survey of the Relocated Structure Locations for the Hydro-Quebec (Phase II) Project. Volume 2: Massachusetts. 20 pages.

A walkover reconnaissance and subsurface testing were conducted part of an intensive archaeological survey of 12 relocated structure locations in the towns of Tyngsborough, Dunstable, Groton, West Boylston, Boylston, Shrewsbury and Millbury. Each structure location impact area measured 100 x 100 feet or, about .23 acres. Two prehistoric site areas were located. The Flint Pond South site (19-WR-440) was found within the impact area of structure 147 (115). Subsurface testing at this location produced cultural materials of Late Archaic and possible Middle Archaic origin including 1 quartz flake, 1 piece of quartz shatter and 2 ulu fragments. A quartz Small Stem point, quartz biface and 142 pieces of quartz debitage were also found on the surface adjacent to this area. The Thomas Basin Site was found within the impact area of relocated structure 64. Excavations in this are produced 15 undiagnostic green-gray quartzite flakes and several 19th century domestic and structural artifacts. Bracketed test pits at both sites in areas where excavated materials were found failed to produce additional artifacts. Soil profiles indicated extensive land disturbance at each site, probably from past construction activities. In site prehistoric or significant historic remains were not recovered at either site. No further archaeological work was recommended for the project areas.

25-770 Carlson, Catherine C.

1987 Archival and Archaeological Research Report on the Configuration of the Seven Original 17th Century Praying Indian Towns of the Massachusetts Bay Colony. 201 pages.

Documentary research, an archaeological field survey and subsurface testing were included as part of a MHC Survey and Planning grant focusing on Praying Indian Towns in the modern Massachusetts townships of Natick, Canton, Grafton, Lowell, Littleton, Ashland, and Marlborough. The original goals of the project were to a) define the location of the original Praying Towns based on historical and cartographic sources as well as previous archaeological fieldwork; b) identify, through field testing, the surviving components of these towns, with an emphasis or site definition, boundaries and integrity; and c) complete a Thematic Resources nomination for the surviving components, with the assistance of the MHC staff. In practice, these goal proved ambitious with the bulk of the study focusing on background documentary research. Boundaries of all but three Plantations (Hassanamessitt, Magunquog, Ockacoganset) can be reconstructed with accuracy and plotted on modern maps. Beyond this, however, historical documentation or archaeological evidence provide little information regarding the surviving components of these towns. A Thematic Resources nomination was not possible since the results of historical documentary and field research obtained during the survey did not satisfy National Register criteria for boundary definition. The author states that the strength of the report lies in its collection of documentary data, archaeological data and informed interviews into a single resource.

25-771 Bower, Beth Anne, Sheila Charles, John Cheney and Woodard Openo

l986 The “Stone Jail” Site (SWC-31), Roxbury, Massachusetts Report on the Phase III Excavation. 76 pages.

A historical background study and excavation were included as part of a data recovery program in the Roxbury section of Boston. Documentary research enabled a reconstruction of the site’s formation, however, intense site occupation combined with several grading sequences have destroyed much of the pre-1930 occupation surfaces. Most of the site is composed of stratified fill episodes

that cannot reliably be tied to site occupation. Reliable archaeological data was recovered of an undocumented dual domestic occupation unit and contemporaneous pre-industrial craft component dating between 1780 and 1815. Following this occupation, the site appears empty and unused with its occupation by the building of the Pudding Stone Jail in 1834. Excavations produced domestic and industrial related artifacts dating from the 18th century to the modern period. Prehistoric materials consisting of undiagnostic lithic debitage were also recovered from both the in situ and disturbed contexts, but were not considered significant. Phase III analysis of the historical natural remains found at the SWC-3l site have provided valuable data for interpreting the parcel on a site-specific level. The data and results may provide information for comparative, larger-scale studies of urbanization, settlement dynamics, and land use in Roxbury.

25-772 Little, Elizabeth A.

1987 Bibliography for Historic and Prehistoric Nantucket Indian Studies. 11 pages.

This volume brings together a variety of resources which should be of great use for archaeologists working on Nantucket and in southern New England. Contents include Ethnohistory References, Archaeology References, General, Northeastern, Coastal, Nantucket Archaeology References, Background Studies for Nantucket Archaeology, Publications Containing Studies of Massachusetts Prehistory, and Organizations Sponsoring Prehistoric Studies in Massachusetts.

25-773 Hoffman, Dr. Curtiss

1987 Draft Report Site Examination Westborough-Hopkington Interceptor. 115 pages.

Background research, soil coring and excavation were included as part of a site examination of the Cedar Swamp-9 site in Westborough, Massachusetts. Prehistoric artifacts recovered included lithic debitage and various historical tools and projectile points. Diagnostic points included Neville (Middle Archaic) and Squibnocket Triangles (Late Archaic). Several prehistoric features were recovered, some containing burnt rock and paleobotanical remains. Historic period artifacts included coal/cinder, 19th century ceramics and building debris. Despite materials and man-made disturbances, the site was reported to retain considerable integrity and significant prehistoric cultural remains. It was strongly recommended that the site not be destroyed in the course of sewer construction. Three alternatives to site destruction were offered including total site avoidance, mitigation and site destruction and partial avoidance.

25-774 Weiss-Belding, Meredith

1987 Archaeological Explorations at Quinsigamond Community College, Worcester, Massachusetts. Summer 1987. 17 pages.

An excavator training period followed by background research, a walkover survey, coring and excavation were included in a field school for children (ages 6 to 12), part of a summer program at Quinsigamond Community College in Worcester. Twentieth century artifacts, mostly building debris, and structural remains were recovered from two buildings, probably associated with the original Assumption College. Both buildings were destroyed by tornado and subsequently bulldozed in 1953. The project and site allowed learning and archaeology to take place without the destruction of a significant site.

25-775 Gumaer, D. Richard, Ronald Johnson and Alan H. McArdle

1987 Archaeological Locational and Remote Sensing Survey of an Unmarked Historic Cemetery and Vicinity, Mashpee, Massachusetts. 30 pages.

Background research, a walkover survey, resistivity testing and excavation were used as part of an locational survey in a projected 15 acre residential development. The electrical resistivity survey

was included to determine the existence and boundaries of a reported cemetery. The Native American Hicks family cemetery was verified and delineated. It was recommended that the cemetery be avoided. Two prehistoric sites and two prehistoric findspots were also recovered. The Ashumet Pond Knoll site (19-BN-608) and both isolated findspots (19-BN-64, l9-BN-610) contained undiagnostic chipping debris. The Ashumet Pond Knoll Site also contained fire-cracked rock and recent historic materials in association with prehistoric material. Neither the findspots nor the Ashumet Pond Knoll was listed above were recommended as eligible for inclusion in the National Register of Historic Places. At the Ashumet Beach site (19-BN-609), a dense artifact concentration was recovered containing lithic flakes, a biface, core, hammer-stone and fire-cracked rocks. The site was estimated to be approximately 20 square meters, consisting of a tool processing occupation associated with the beach of a fresh water pond, and was likely to be eligible for inclusion to the National Register of Historic Places. The two recommendations were made for the site included a preservation restriction which would protect the site or a site examination to verify National Register eligibility.

25-776 Holstein, Elizabeth

1987 An Intensive Archaeological Survey of the Proposed Danvers Wastewater Facilities Improvements Project Area, Danvers, Massachusetts. 44 pages.

Background research, a walkover survey and subsurface testing were used as part of an intensive survey of two sewer alignments totaling approximately 8,000 feet. No prehistoric resources were recovered; however, remains of the 19th century Bernard, Friedman and Company Tannery were found. Artifacts including structural materials, ceramics and leather were recovered dating to the 19th century use of the tannery and later 20th century dumping. Although the tannery site represented an important industry in Danvers, it was determined that sufficient information was available on this particular tannery and tanneries in general in the Danvers area. No further archaeological studies were recommended.

25-777 Roveland, Blythe E., David A. Wallace and J. Edward Hood

1986 Archaeological Locational Survey at the Shores at Silver Lake, Bellingham, Massachusetts. 140 pages.

Background research, a walkover, soil coring and excavation were used as part of a locational survey of 141 acres of undeveloped land proposed for residential housing. Three historic period sites were found, including a 20th century barn foundation and two historic dumps dating to the 19th and 20th centuries. Additional 20th century historic debris were recovered at several test pit locations. All historic period sites did not appear eligible to the State or National Register of Historic Places because of their recent origin. Five prehistoric sites and 14 findspots were also located. In general findspots were low density, occasionally disturbed and contained lithics of an ambiguous nature and thus did not meet the criteria for listing in the National Register. Each prehistoric site was identified as a low-to-medium density lithic scatter and a multi-component site. Only one site, H-1 contained diagnostic cultural materials represented by a Late Archaic Brewerton eared-notched projectile point. Most sites also contained fire-cracked rock. Sites A-1, H-1 and S-1 contained assorted features. Given their high integrity and potential scientific value, sites A-2, E-l, H-1, and 5-1 were recommended for additional testing to determine their eligibility to the State or National Register of Historic Places. The fifth site, A-2 was not recommended for further testing since the bulk of the site is inundated by Crystal Lake and will not be altered by the project.

25-778 Bower, Beth Anne

1987 Report on Feature B7, African Meeting House, Boston, Massachusetts. 12 pages.

Documentary research and excavation were used to analyze a pit in the first floor of the African Meeting House. An extensive array of construction debris, faunal and floral remains, and house-

hold trash were recovered predating the construction of the church. The household trash, particularly ceramics date to the late 17th and early 18th centuries and was probably associated with the house at 44 Joy Street occupied by hairdresser Auguston Raillion from 1799-1806. The function of the pit is still undetermined although is bears similarities (fill, dimensions, etc.) to privies excavated elsewhere in Boston. Analysis of the fill contents from Feature B7 was not completed due to lack of funding. Thus, recommendations were made for additional types of research and analysis so that this feature could be compared to materials recovered at the main African Meeting House site and other sites excavated in the Boston area.

25-779 Bower, Beth Anne, Sheila Charles, Constance Crosby and Woodard Openo

1986 Massachusetts Bay Transportation Authority Southwest Corridor Project. The Metropolitan Railroad Company Complex Site at Roxbury Crossing, Roxbury,

Massachusetts. 118 pages.

Historical research and excavation were conducted as part of a data-recovery program at the Metropolitan railroad Company Complex Site in the Roxbury area of Boston. The data-recovery was accomplished using both hand and machine assisted excavation. Excavations focused in six areas within the site including the Southern Car House, the Blacksmith/Marline Shop, the Cobblestone Yard, Leather Deposit, Stable area, and the Northern Car House. Artifact deposits were extensive and functionally related to the six areas listed above. Some materials were date to the 18th century though most dated to the period of occupation of the Metropolitan Railroad Company, and later structures in the 19th and early 20th centuries. The data-recovery program also produced valuable information on typographical changes in Roxbury, most of which were not recorded in official city documents. While the industrial revolution in the early-to-mid nineteenth century changed the use of the land, topography did not change until the early 20th century. This square is reflected at the Metropolitan Railroad Company Complex Site beginning with its construction in the 19th century. Expectations that this site was the location of an earlier milldam and complex proved false. Further research potential were identified with the leather harness collection, metal harnesses in the collection and the point collection.

25-780 Raber, Michael S. and Leonard W. Loparto

1987 Intensive Cultural Resources for Proposed Sewerage Facilities in the Town of Whitman, Massachusetts. 17 pages.

Background research, a walkover inspection of all project alignments and subsurface testing failed to locate significant cultural resources within four cross country easements, totaling 4,915 long by 50 feet wide. No further archaeological work was recommended.

25-781 Davin, Ann K. and Karen Shemet

1987 Reconnaissance Archaeological Survey, Lancaster Technology Park Lancaster, Massachusetts. 30 pages.

Background research, a walkover inspection and limited subsurface testing were used as part of a reconnaissance survey of a 130± acre parcel located in the northwest section of Lancaster. A small section of the project also lies in Leominster. The walkover inspection located an untyped quartz stemmed projectile point and indicated much of the project area exhibited high/moderate archaeological sensitivity. Limited subsurface testing failed to locate additional prehistoric or historic materials. Intensive level testing was recommended to determine more fully the location and extent of any prehistoric depositions or other cultural resources within the project area. Environmental potential and the quartz projectile point indicate a strong likelihood that other archaeological resources are present.

25-782 Raber, Michael S. and Leonard W. Loparto

1987 Intensive Survey of Cultural Resources for the Proposed Searstown Interceptor, City of Leominster, Worcester County, Massachusetts. 16 pages.

Background research, a walkover inspection and subsurface testing were used as part of an intensive survey of 5000 feet of sewer interceptor, 50 feet wide running along the North Nashua River and its tributary, Monoosnoc Brook, at the confluence of the two streams. All but about 500 feet of the project area had been disturbed by stripping or construction in the floodplain. The project area was reported to lack cultural resources of any kind or significance. Project planning and construction were recommended to proceed as planned without further cultural resource investi$_{9}$ations.

25-783 O'Steen, Lisa D.

1987 Literature and Research Review for the Proposed Champlain Gas Pipeline Corridor: Vermont, New Hampshire, and Massachusetts. 155 pages.

This report presents the results of a cultural resource literature survey aimed at locating any previously known prehistoric or historic sites within, and in close proximity to, the proposed pipeline or the proposed pipeline right-of-way. The pipeline corridor extends south from the Vermont-Canadian border 250 miles to central Massachusetts. The construction right-of-way will be 75 feet wide. In Massachusetts, the pipeline passes through the towns of Medway, Milford, Upton, Grafton, Shrewsbury, Westborough, Northborough, Berlin, Bolton, Lancaster, Sterling, Leominster, Fitchburg, Westminster, Ashburnham, and Winchendon. Two known historic sites and three prehistoric sites were recorded in the proposed pipeline corridor in Massachusetts. The prehistoric sites, located in Upton, contained unidentified components. Historic sites included the Old Settlers cemetery in Lancaster and several historic structures in Leominster. The literature review and archaeological site files were used to identify sensitive prehistoric and historic area within the corridor. The most sensitive areas included: 1) riverside environments, 2) upland environments with a water source, 3) environmental ecotones, and 4) raw material sources. A summary of methods that will be proposed for an intensive survey of the pipeline was provided as an appendix in the report

25-784 Rosenzweig, Mark S. and Carolyn A. Pierce

1987 Cultural Resource Reconnaissance Survey for Proposed Facilities for the Marathon Project No. CP87-492. 24 pages.

Background research and a walkover inspection were completed as part of a reconnaissance survey of an 8.0 mile pipeline alignment, 50 feet wide, in the towns of Hopkinton, Holliston and Medway. One prehistoric site (19-MD-484) and two historic sites, Hopping Brook Quarry No. 2 (HLS-HA-2) and Hopping Brook Dam (HLS-HA-3) were identified which may lie within the project area. The archaeological sensitivity of the entire pipeline route was also calculated indicating several areas had potential for containing prehistoric and, to a lesser degree, historic resources. Recommendations were made for further field investigations including subsurface testing along the 8.0 mile route. No additional cultural resource investigations were recommended for a 0.4 mile route. No additional cultural resources investigations were recommended for a 0.4 mile pipeline replacement which calls for in situ replacement of existing pipe.

25-785 Towle, Linda A.

1987 Final Report of the 1986 Wellfleet Bay Archaeological Field School. 30 pages.

Classroom, field and laboratory instruction were included as part of a Massachusetts Audubon Society archaeological field school which focused on three objectives: 1) to test locations of the sanctuary which would be impacted by the construction of a nature center; 2) to test further a known archaeological site; and 3) to educate the general public about prehistoric resources and the

importance of conserving and protecting them. In total, four areas were tested (Areas B, F, G, and Joe Brown's asparagus field), two of which (Area F and G) had not been previously investigated. Area F contained the greatest concentration of lithics and ceramics at the sanctuary as well as two Late Archaic Brewerton points (ca. 5,500-4,000 B.P.) and two possible Woodland period points (ca. 1,800-400 B.P.). Area G, Little Island, contained chipping debris, surface collected from along the beach and a possible prehistoric shell midden. Area B was tested to determine the extent of a chipping concentration first discovered during testing in 1984 and 1985, when a Fox Creek point was recovered. Testing in Joe Brown's asparagus field (19-BN-87) produced prehistoric chipping debris, and ceramic sherds and a Late Woodland Levanna triangle (1,300-400 B.P.). Recommendations were made that further archaeological research, including field-testing be conducted at Area F, B and Joe Brown's asparagus field since these areas will be impacted by future construction. Further research was not recommended at Little Island (Area G) where no construction is planned.

25-786 Raber, Michael S.

1987 Cultural Resources Reconnaissance Survey for the Proposed Foxridge Development, City of Worcester, Massachusetts. 16 pages.

Background research, a walkover survey and limited subsurface testing were used as part of a reconnaissance survey in an 85 acre residential development. Six sensitive areas were identified, two of which were tested, producing no cultural material. The property was reported to have no apparent sensitivity for significant post-contact period historic resources, but has limited sensitivity for sma11 prehistoric archaeological sites. Recommendations were made to conduct subsurface tests in three areas not tested during this phase of study.

25-787 Leveillee, Alan and Ann Davin

1987 Archaeological Investigations at the Oak Terrace and Red Leaf Sites, The Stone Ridge Development, Norwood, Massachusetts, Volume I. 131 pages.

This report summarizes the results of a data recovery program at two sites along the Neponset River in Norwood, Massachusetts. Volume I presents background information for the project, the site and New England prehistory. Methodologies used for various segments of the project are discussed as well as the environmental setting for the sites. A chapter on cultural material describes 11,802 pieces of culturally resulted lithics including Neville, Small Stemmed, Squibnocket Triangle and Susquehanna point types. A discussion of excavated features and a floral and faunal analysis are also presented. An analysis explaining the depositional process which produced the sites is offered in place of the more traditional culture history approach. This chapter is followed by the sites' depositional history and interpretations. Dated deposits document site utilization from the Middle Archaic (5,100 B.P) through Woodland periods (ca. 700 B.P.) during which cache, field camp and field station site types are represented. Summary and conclusions are presented at the end of the volume.

25-788 Leveillee, Alan, Tanya Largy, Paige Newby and Edward Barry

1987 Archaeological Investigations at the Oak Terrace and Red Leaf Sites, The Stone Ridge Development, Norwood, Massachusetts, Volume II. 122 pages.

This volume presents the results of specialized analyses by consultants for the data recovery program at the Oak Terrace and Red Leaf Sites. Chapter I includes the final report for pollen and sediment records from Houghtons Pond in Milton, Massachusetts. Paleoenvironmental information was also recovered from a hollow located near the site in Norwood and an oxbow of the Neponset River also located in Norwood. Archaeological interpretations are offered for each coring location. Chapter II presents the results of floral and faunal studies of materials recovered from the sites. A discussion of the finds and speculations regarding seasonality was also included. Chapter

III presents a debitage analysis of the sites. Selected physical characteristics of a debitage sample are presented as well as statistical data. Chapter IV includes a petrographic examination of lithic samples from the site. Conclusions pertaining to physical characteristics which might distinguish rocks from other local, similar types are made as well as recommendations for future research.

25-789 Bowers, Martha H., R. Michael Stewart and Edward N. Norm

1986 Preliminary Cultural Resource Assessment, Quabbin, Ware and Wachusett Watershed Lands. 177 pages.

This report was designed to provide an initial framework for development of a plan for management of cultural resources in the Metropolitan District Commission's Quabbin, Ware and Wachusett watershed lands, in the towns of Athol, Belchertown, Boylston, West Boylston, Clinton, Oakham and Ware. The Quabbin watershed is located in Worcester, Franklin and Hampshire Counties. The Ware and Wachusett watersheds lie completely within Worcester County. Background research was used to develop contexts for prehistoric and historic cultural resources in the watershed area after which research designs were formulated with evaluation considerations for cultural resources. The potential impacts of current management activities on cultural resources are also discussed. The concluding chapter focuses on recommendations which include survey priorities for development of a management plan, interim management recommendations for forestry operations, long-term management issues and other recommendations. An appendix to the report, included in a separate volume, is a predictive locational model for prehistoric and historic resources within the region and on a project-specific level. The model was developed using MHC site files and historical maps.

25-790 Johnson, Ronald W. and Patricia Mangan

1986 Archaeological Locational Survey, FmHA Reynolds Farm on Wine Road, New Braintree, Massachusetts. 125 pages.

Historical background research identified the location of the possible site of a Contact Period Native American village within the project area. In addition, six major loci of prehistoric activity were detected. The spatial distribution of artifacts across the project area suggests patterns of differential site use along cultural/temporal lines. A total of 121 shovel test pits was excavated to locate both prehistoric and historic sites within the project boundaries. Although some of the project area has been disturbed by plowing and building construction, undisturbed areas exist, especially on elevated knolls and terraces, and below shallow plowzones. On the basis of this survey, seven prehistoric sites and the Reynolds farmhouse may be subject to adverse impact from changes in land-use or intensification of present land-use resulting from the sale of the property by the Farmers Home Administration. If adverse impact becomes imminent then site examinations are recommended for seven prehistoric sites. Alternatively, it was recommended that the parcel be placed under an agricultural restriction in order to insure the preservation of the seven prehistoric sites and the Reynolds farmhouse.

25-791 Johnson, Ronald W. and Patricia Mangan

1986 Archaeological Locational Survey, FmHA Divoll Farm on Oakham Road, New Braintree, Massachusetts. 116 pages.

Historical background research identified the location of a Native American Contact Period trail along Worcester Road which passes through the project area, and the site of a seventeenth century Colonial/Native American skirmish, as well as a possible contact period village two and one half miles west. In addition, four major loci of prehistoric activity were uncovered, as well as two prehistoric findspots. The spatial distribution of artifacts across the project area suggests patterns of differential site use along cultural/temporal lines. A total of 180 shovel test pits was excavated to locate both prehistoric and historic sites within the project boundaries. Although some of the pro-

ject area has been disturbed by plowing and building construction, undisturbed areas exist, especially on elevated knolls and terraces, and below shallow plowzones. On the basis of this survey, four prehistoric sites may be subject to adverse impact from changes in land-use or intensification of present land-use resulting from the sale of the property by the Farmers Home Administration. If adverse impact becomes imminent then site examinations are recommended for the four prehistoric sites. Alternatively, the four prehistoric sites could be protected through an Agricultural Preservation Restriction placed on the property.

25-792 Davin, Ann K.

1987 Intensive Archaeological Survey Meadow-Wood Condominium project Area, Bellingham, Massachusetts. 58 pages.

Background research determined that no archaeological sites were recorded in Bellingham, but that prehistoric archaeological sites were likely to be present. Fieldwork located prehistoric cultural material (quartz and felsite) in three areas. Two of these were not considered significant and no further testing was recommended; the third site will not be directly impacted by the proposed project.

25-793 Jones, Donald G.

1987 Results of an Archaeological Reconnaissance Survey of Lynn Woods, Lynn, Massachusetts. 177 pages.

An archaeological reconnaissance was conducted of Lynn Woods as part of the Olmsted Historic Landscape Rehabilitation Program. The survey was designed to identify the range of activities that have taken place within the bounds of the present-day park and to identify how these activities are reflected in the archaeological record. Nine archaeological sites were identified and an additional four were documented during background research but were not located in the field. No diagnostic materials were found at the three locations that yielded prehistoric lithic debitage. Six historic sites with visible structural remains were recorded. Two stone-lined pits, reported to be 17th century wolf traps, were tested but no evidence of function or date was recovered. Several stone foundations were recorded in the park but not tested. The Dungeon Rock Complex, associated with a 19th century treasure hunter was also recorded along with a number of water-resource facilities dating from the 19th century. A Phase II archaeological survey was recommended to evaluate the parks' rehabilitation plan and site avoidance was recommended.

25-794 Raber, Michael S. and Leonard W. Loparto

1987 Intensive Cultural Resources Survey for the Fair, Town of Lakeville, Massachusetts. 24 pages.

Background research identified one prehistoric site, 19-PL-192, the Bridge Street Site, within the project area of 60 acres, of which 28.5 acres are to be developed. A 20th century farm, partially demolished, was not considered significant. Subsurface testing yielded an Atlantic projectile point fragment along with quartz, quartzite and felsite debitage and a piece of burnt rock. As the site is within an area of direct impact, avoidance or a site examination was recommended.

25-795 Shaw, Leslie, Ronald Johnson and Alan McArdle

1987 Archaeological Survey of Route 3 North, Northeastern Massachusetts, Middlesex County, Massachusetts. 218 pages.

An archaeological locational survey of the 21 mile long Route 3 North Add-a-lane project area has been completed in the towns of Bedford, Billerica, Burlington, Chelmsford, Lowell, Tyngsborough and Westford. Over most of this area subsurface survey was not required because of exten-

sive destruction by early construction of Route 3. Twenty-two survey units which contained intermittent undisturbed areas were surveyed. Twelve prehistoric sites, including two prehistoric findspots were encountered. The sites consisted of flake scatters, cores, fire-cracked rock, and calcined bone; only one diagnostic artifact, a small stemmed Late Archaic projectile point was found. Six of these sites may be eligible for inclusion in the National Register of Historic Places and are recommended for site examination. Three sites appear to be eligible, but according to current project plans will not be directly impacted by the proposed project. The two prehistoric findspots, and one small prehistoric site do not appear to be eligible because of a low density of cultural material. Sixteen historic resources were encountered during the project. These include a 17th century gristmill, the Middlesex Canal, twelve crossings of historic roads and one railroad. A portion of the Middlesex Canal, an historic National Register site, will be impacted by the reconstruction of an entry/exit ramp. This construction will not affect the qualities that make the canal eligible for the Register. Therefore, there will be no adverse impact on this National Register site. The impact area should be thoroughly photographed and mapped before construction begins. None of the other historic sites that were found during this survey are likely to be eligible for the National Register.

25-796 Thorbahn, Peter F.

1987 The Oxford Crossing Project: A Preliminary Archaeological and Historic Investigation. 22 pages.

This reconnaissance-level survey included background research, a walkover reconnaissance, and an interview with a member of the Oxford Historical Commission. While snow covered the ground, soil conditions were observed at several locations of open engineering test pits. A barn foundation was observed on the parcel, and prehistoric materials are likely to be found given the proximity to known sites and favorable environmental conditions.

25-797 Pagoulatos, Peter

1987 An Intensive Archaeological Survey of the Hunnewell Development, Natick, Massachusetts. 46 pages.

Background research, a walkover reconnaissance, and subsurface testing identified two loci of prehistoric activity. A Meadowood projectile point and a quartz chip were recovered from one location; three quartz flakes were located at another. Historic period field trash was also observed. Further testing failed to locate any further material and no further investigation was recommended.

25-798 Hasenstab, Robert J. and Alan H. McArdle

1987 Archaeological Locational Survey of the Whately Municipal Water System, Whately, Massachusetts. 59 pages.

Background and documentary research, a walkover, and subsurface testing found one argillite flake and a fragment of fire-cracked rock with a problematic provenience (A/B soil horizon). While historic period artifacts were observed during the subsurface testing, some was field trash, and some was recent fill, and none appeared to be related to identified foundations. None of the archaeological material was associated with sites eligible to the National Register of Historic Places and no further archaeological work was recommended.

25-799 Bell, Edward L.

1983 The Potash Hill Chimney: An Historical Archaeological Investigation of a Stone Structure in Tyngsborough, Massachusetts. 46 pages.

A well-preserved stone chimney, built of uncut, dry-laid stone against a massive glacial erratic, was the subject of historical, documentary and archaeological research. To assess the possibility that the structure may have been a potash kiln, a charcoal kiln, or a chimney for a small domicile, comparative information on formal attributes of these features was collected and test implications were developed. Soil analyses were inconclusive to determine the function of the structure, but did indicate cultural activities by disturbance and nutrient enrichment. Limited excavation at the structure recovered a cut nail, a clear glass fragment, and charcoal. The report concluded that the Potash Hill Chimney was likely the location of a small, 19th century domicile and an interesting example of vernacular architecture. A recommendation was made to avoid impacting the structure.

25-800 Leveillee, Alan and Ann K. Davin

1987 Reconnaissance and Intensive Archaeological Investigations at the New England Country Club, Bellingham, Massachusetts. 67 pages.

Two phases of archaeological work, reconnaissance and intensive surveys, were conducted at a 300 acre parcel. Following the reconnaissance survey, recommendations were made to test sensitive areas. Background research and a walkover were conducted, followed by subsurface testing. Prehistoric materials were encountered in nine units (out of 420 total units), representing low-density sites. A 19th century cellar foundation was identified as a house site but not considered significant. No further archaeological investigations were recommended.

25-801 Pagoulatos, Peter

1987 Intensive Archaeological Survey, Campanelli Industrial Park, Middleborough, Massachusetts. 38 pages.

Background research and a walkover reconnaissance were used to stratify the 193 acre tract into archaeologically sensitive zones. An historic period family burial ground, the Drake Cemetery, was identified. The cemetery was in use from 1760 to 1860 and contains the remains of ca. 20 people. No archaeological testing was conducted within the cemetery. Recommendations were that a permanent fence be erected around the Drake Cemetery, and that the area be included in a buffer zone, no less than 100 feet from any project impacts.

25-802 Jones, Donald G.

1987 Intensive Archaeological Survey of the Proposed Bridge Replacement on Loudville Road in Easthampton, Massachusetts. 20 pages.

Background research indicated that no recorded prehistoric or historical sites were located within the project area. A field reconnaissance indicated that the project area was truncated by road construction disturbance on the east and by a former or intermittent streambed. Traces of a cart path were noted along the eastern edge of the project area. No other historical remains, with the exception of modern trash and road construction debris, were identified on the surface. It was determined that the cart path probably once led to a mill, whose remains are located outside of the project area to the south. Ground disturbance, which resulted from road construction and intermittent flooding of the North Branch, severely limited the testable areas. While a number of 19th to 20th century artifacts were recovered during the subsurface testing phase of the project, it was determined that these deposits probably were the result of road construction activities and flood wash as well. No significant prehistoric or historical archaeological remains were identified during the survey. No additional archaeological testing was recommended for the project.

25-803 Johnson, Ronald W. and Alan H. McArdle

1987 Archaeological Locational Survey of G Street Extension, Turners Falls, Massachusetts. An

Additional Survey for the Cabot Woods Fish Research Facility. 75 pages.

An additional intensive survey was conducted at the site of the proposed Fish Research Facility at Cabot Woods, Turners Falls, in Montague. Background research and subsurface testing within the ca. two acre area encountered historic period field trash within the plowzone. No significant archaeological properties were identified and no further archaeological work was recommended.

25-804 Hoffman, Curtiss

1987 Final Report and Supplemental Report: Reconnaissance Survey, Haskell Street Sewer Extension, Westborough, Massachusetts. 42 and 33 pages.

Historical and background research and a walkover reconnaissance stratified two segments (I and II) of sewer line; the length of Segment I was ca. 516.5 meters and that of Segment II was ca. 458.75 meters. Subsurface test pits were placed in sensitive area at intervals of from 20 to 50 meters depending on previous disturbance and slope. Prehistoric debitage was recovered in five units of Segment I, apparently representing two distinct loci. While 19th century and later materials were encountered, none of these were considered significant. Recommendations were made for an intensive survey of Segment I and no further work in Segment II. In the Supplemental Report, project plans were altered to avoid the prehistoric site identified earlier; a new proposed route that had not been archaeologically surveyed was subjected to subsurface testing. Two units yielded prehistoric debitage and additional bracketing test pits encountered more material in two loci (Haskell I and Haskell II sites). Haskell I was interpreted at as a Late Woodland agricultural site and considered significant to warrant site avoidance or a site examination. Haskell II, the site of a single flake, was not recommended for further work.

25-805 Nicholas, George P. and Edward Hood

1987 Archaeological Locational Survey for the Proposed Water Treatment Facility Montague, Massachusetts. 58 pages.

Background and historical research were combined with subsurface testing at this ca. 1.4 acre site. Evidence of a mid to late 19th century brickyard was located, but field testing indicated that the site had been subject to filling and plowing subsequent to the destruction of the brickyard. An intact, feature was thought to be related to a brick kiln. No prehistoric material was found within the project boundaries, but a prehistoric site, evidenced by quartz flakes, was located immediately south of the project area. Recommendations were made to avoid the prehistoric site outside the project area, while no further investigation of the brickyard was recommended. The Montague Brick Company brickyard was a site type common in the area, and no intact structural remains (other than the possible kiln) were encountered. Due to filling and plowing, it was believed that the site lacked clarity and integrity and not considered eligible for listing to the National Register of Historic Places.

25-806 Towle, Linda A. and Darcie MacMahon (Editors)

1987 Archaeological Collections Management at Minute Man National Historic Park, Massachusetts. Volume 1, Archaeological Collections Management Project, Series No. 4. 344 pages.

This report is the first volume of 4-volume study conducted at Minute Man National Historic Park in Concord, Lexington and Lincoln (see reports #25-704, -705, and -750). Volume 1 contains an introduction to the project and its methodology, an overview of archaeological collections management issues, a history of archaeology at the park, a glossary of artifact definitions, and recommendations for future research with the collections. The report also includes a reanalysis of three archaeological sites in the Fiske Hill area in Lexington, including the Ebenezer Fiske, David Fiske, and Battle Road sites. A summary of new data and documentation for six sites discussed in Volumes 2, 3 and 4 is appended.

25-807 Holstein, Elizabeth and Alan Leveillee

1989 A Reconnaissance Level Archaeological Survey of the Proposed Providence Gas Project Corridor, Hampden and Worcester Counties, Massachusetts. 129 pages.

The pipeline corridor included 2.6 miles through the towns of Agawam, Hampden, and Monson and 11 miles through Sutton, Northbridge, Douglas and Uxbridge. Background research was conducted and a walkover survey of the corridor was undertaken. Auger cores were placed within the easement to determine disturbance and soil type. All areas of the corridor were ranked for archaeological sensitivity, and highly sensitive areas were shovel tested with judgmental units placed every 10 to 20 meters. Six prehistoric sites or loci were discovered, none with culturally or temporally diagnostic materials. Three sites were eliminated from further consideration based on a lack of integrity; the Brook Site and Locus 2 in Douglas and Feature 1 in Sutton had intact evidence of fire-related and quarrying activities; these sites were recommended for further examination. Four historical sites were recommended for examinations if impact avoidance is not feasible. The historical sites in Sutton, Northbridge, and Uxbridge included remains of 19th century structures including a sawmill, a dam, an outbuilding, and a large family farm.

25-808 Bower, Beth Anne and Leonard W. Loparto

1987 Archaeological Reconnaissance Survey of the Riverfront Urban renewal Project, Lawrence, Massachusetts. 25 pages.

Background research, a walkover reconnaissance and attempts to auger portions of the area established that extensive land filling has occurred in the project area since the late 19th century. Five prehistoric sites (19-ES-191, -192, -193, and -195) and a late 19th century city dump are located within the project area and other archaeologically sensitive areas were identified. Expected impacts from the Emerson College campus and Riverfront Park projects include grading and deep excavation, so an intensive archaeological survey was recommended for the parcel.

25-809 Dunford, Frederick J.

1989 Intensive Archaeological Survey of the Proposed Mid-Cape Church Homes Development, John Nelson Way, Harwich, Massachusetts. 42 pages.

This report details the investigation of a 20 acre area. Background research was gathered and the area was stratified for archeological sensitivity. Subsurface testing was conducted. Only minimal evidence of activities was found, including a cart path, cranberry borrow pits, and a small surface dump. No further archaeological work was recommended.

25-810 Decima, Elena and Joyce Fitzgerald

1988 Final Report, Intensive Survey, Hall-Haskell House. 80 pages.

This report was prepared in advance of sewer line work between the Ipswich Town Hall and the Hall-Haskell House. Historical research was gathered that indicated that a 17th century structure once stood on the site now occupied by a ca. 1819-1825 house. The goal of the survey was to document the sequent history of the site and to locate foundations and artifacts related to the episodic use of the property. Soil cores were taken during a walkover reconnaissance; the area of direct impact was filled from ca. 20 to 30 cm in depth. Five test pits were placed and various features noted. Fill levels reached over 90 cm in depth and seem to date after 1840. No further archaeological work was recommended in this area.

25-811 Gorman, F.J.E. and Ron Dalton

1987 Intensive Archaeological Survey at the Executive Center, Boxboro, Massachusetts. 131 pages.

Background and documentary research and a walkover survey stratified the area for archaeological sensitivity. The 57 acre parcel was the site of the 18th century Abel Witcomb farmhouse and archaeological testing located cellar walls of an earlier portion of the Witcomb house, and a recommendation was made to document this feature before the house was removed from the property.

25-812 Shaw, Leslie C., Ellen-Rose Savulis, Mitchell T. Mulholland and George P. Nicholas

1987 Archaeological Locational Survey in the Central Berkshires, Pittsfield, Massachusetts. A Locational Survey for the Route 7 Bypass Project. 370 pages.

An archaeological locational survey was conducted of the Route 7 Bypass Project in Pittsfield and Lanesborough. Historical research identified the location of eight potential archaeological sites including dwellings from as early as the late 18th century, mills and mill-workers' housing, railroad bridges and a freight house. Field investigations confirmed the presence of two historic sites that appear to meet the criteria for inclusion in the National Register of Historic Places (the Sprague House and the Jonathan Smith Site). Both sites have the potential to contribute to a better understanding of the transition of the Pittsfield community from a frontier village to a modern industrial center. Four railroad bridges were encountered. Three of the bridges may be impacted by the bypass. One bridge appears to be eligible for inclusion in the National Register. A total of 580 shovel test pits was excavated in thirteen survey units to locate both prehistoric and historic sites within the project boundaries. Nine areas of prehistoric activity were identified, chiefly by the presence of lithic flakes. An incised pottery sherd diagnostic of the Woodland Period was found at the Pontoosuc 2 Site; the Cadwell Site is reported to have been occupied during the Contact Period. Two additional undisturbed prehistoric activity areas of unknown age were identified: the Woodleigh Site and the Oak Hill Site. Six archaeological sites are recommended for site examination because they appear to meet the requirements for inclusion in the National Register. Standing structures to be evaluated by an architectural historian include possibly four railroad bridges (depending upon final project plans), a freight house, and three 19th century dwellings.

25-813 Finamore, Daniel R.

1988 Intensive Archaeological Survey of the Proposed Cross-Country Sewerage Facilities in Holbrook, Massachusetts. 38 pages.

An intensive archaeological survey was conducted of nine proposed cross-country sewer extensions and five proposed pump stations. Background research indicated that no recorded prehistoric or historical sites were located within the project area, but that many prehistoric sites are known to exist in the region. Surface evidence of an historical dump was located on the east side of Weymouth Street, at the site of a proposed pump station. Subsurface testing consisted of the excavation of 55 shovel test pits within eight archaeologically sensitive areas. Testing in the vicinity of the dump indicated that the deposit was shallow and dated to the mid-20th century, and therefore, is not considered to be eligible for the National Register of Historic Places. Prehistoric artifacts, namely one felsite flake and one blocky fragment, were recovered; an early 19th century button was recovered from the same level. Bracketing of this unit with four additional test pits yielded no associated cultural material. No significant or potentially significant cultural resources were identified during the survey, and no additional archaeological testing was recommended.

25-814 Pagoulatos, Peter, and Alan Leveillee

1988 Intensive Archaeological Survey, Independence Mall, Kingston, Massachusetts. 51 pages.

Background and subsurface testing on a 150 acre parcel identified one area of prehistoric activity, a lithic scatter, of a reddish-brown, fine-grained stone of possible volcanic origin, likely represent-

ing a single depositional event. No further archaeological work was recommended.

25-815 Pagoulatos, Peter

1987 Site Examination, Maple Knoll and Franklin Farms Sites, Franklin Farms, Franklin, Massachusetts. 58 pages.

A previous intensive survey (see report #25-826) identified six prehistoric and one historic archaeological site. Examinations were made at two prehistoric sites using shovel test pits and 1 meter excavation units. The Maple Knoll site yielded chipping debris, retouched tools and a Small Stemmed point (4,500-1,000 B.P.). Artifacts recovered from the Franklin Farms site included flake debris, unifaces, bifaces, and burnt rock. Projectile point types included Susquehanna Broad, Meadowood, and Small Stemmed points, reflecting episodes of site re-use, including occupation from the Late Archaic Transitional (3,600-2,500 B.P.), Early Woodland (2,700-2,000 B.P.) and Middle Woodland (2,000-1,000 B.P.) Periods. Sufficient data have been recovered to determine the range of activities and occupations at the sites and no further archaeological work was recommended.

25-816 Pagoulatos, Peter and Alan Leveillee

1987 Intensive Archaeological Survey, Dianna Estate, Franklin, Massachusetts. 46 pages.

This report focuses on a 250 acre project area. Background research, informant interviews, and subsurface testing (290 shovel test pits and 27 auger core samples) located late 19th and early 20th century field trash, but no significant cultural resources were identified.

25-817 Raber, Michael S. and Leonard W. Loparto

1988 Final Report: Intensive Survey of Cultural Resources for the Proposed Westerly Wastewater Treatment Plant, City of Marlborough, Middlesex County, Massachusetts. 20 pages.

Background research (provided as an overview of the prehistory and history of the area) and a walkover of the project area indicated extensive disturbance and poorly drained soils, obviating the need for subsurface test pits. Instead, four soil samples were taken with a 3.5" diameter bucket auger that confirmed the surface inspection. No further archaeological work was recommended.

25-818 Beaudry, Mary. C and Stephen A. Mrozowski (Editors)

1987 Interdisciplinary Investigations of the Boott Mills, Lowell, Massachusetts. Volume II: The Kirk Street Agents' House. 166 pages.

This report, the second volume of a multi-volume study of the Boott Mills (see report #25-820), focuses on the domestic lives of 19th century middle class mill managers, their families, and their domestic staffs. The research context of the mill managers' (or "agents'") house site (Chapter 1) is placed in contrast to the boardinghouse site (reported in Volume I) occupied by the rank-and-file. Topics considered include the technological, functional, and ideological components of the built environment and the urban landscape as material evidence of corporate paternalism. The historical context of the site (Chapter 2) was established through documentary and comparative research, providing data on the composition of households (including servants), the timing of changes in household membership, and the nature of the 19th century middle-class, urban lifestyle. The architectural history of the agents' house (Chapter 3) recommended a conservative approach to any restoration work. A descriptive chapter (4) on the archaeological deposits included results from systematic excavations in the rear yard, an auger survey in a side yard, and monitoring of a backhoe-excavated utility trench between these two areas. These efforts documented deep artifact bearing strata, and the artifacts are described and analyzed in Chapter 5. A palynological investigation and analysis of plant macrofossils (Chapter 6) were used in an innovative manner to explore site for-

mation processes. Faunal remains (Chapter 7) were found in poor preservation, but are surprisingly similar to those associated with the mill workers' boarding houses. The faunal remains serve as a reminder of sampling biases in and representational difficulties of archaeological contexts, and an integrated historical approach to urban foodways was one recommendation. A summary chapter (8) brings together the findings that the backyard of the Agents' house served as a utilitarian service area in contrast to the more formal, display aspects of the side and front yards. Layers of domestic refuse and objects were related to specific households. Various filling (landscaping) sequences were observed in the strata and, combined with floral analyses, document the use and eventual abandonment of the area to a weedy lot in the early 20th century when the last of the middle-class residents moved out. The implications of the project for six research issues (the timing of industrialization and its effects on 19th century urban life; landscaping and land use; archaeology and the household; site formation processes; gender roles; and socioeconomic status and consumer behavior) conclude the report.

25-819 Gorman, F.J.E. and R.L. Dalton

1988 Archaeological Resources of the Andrew-Safford Barnyard, Essex Institute, Salem, Massachusetts. 18 pages.

A set of expectations was developed using a secondary site-specific history publication on a 19th century house and barn. No other documentary or background research was conducted. Three backhoe trenches were excavated to remove an oil tank and to install a drywell, and these trenches were monitored by archaeologists. Deep cultural deposits (ca. l m) were observed. A 19th century well (later converted to a cistern or drywell) was documented; a recommendation was made to preserve and restore the well to its original function.

25-820 Beaudry, Mary C. and Stephen A. Mrozowski (Editors)

1987 Interdisciplinary Investigations of the Boott Mills, Lowell, Massachusetts. Volume I: Life at the Boardinghouses. 254 pages.

This report, the first volume of a multi-volume study of the Boott Mills (see report #25-818), sets out the research design for a multidisciplinary study of the Boott Mills' housing for workers, overseers and managers. Research and investigative methods included documentary research, oral history interviews, exploratory archaeological trenching, zooarchaeology, archaeobotany, and palynology. Architecture, demography, health and sanitation, and foodways were four research topics explored to elicit information on the relationship of corporate ideology to the overall working and living conditions of mill workers. Archaeological testing encountered the well-preserved foundations of the boardinghouses, remains of waste and water facilities (drains, water pipes, a well), and evidence of backyard activities. The study established the rich potential of the documentary and archaeological contexts, and continuing research was recommended.

25-821 Shaw, Leslie, and Ellen-Rose Savulis

1988 Archaeological Site Examinations at the Prehistoric and Historic Sites at Willowbend (Fox Run), Mashpee, Massachusetts. 194 pages.

Background research and test excavations were used to conduct site examinations and additional locational testing on five prehistoric and two historic sites within the Fox Run (Willowbend) residential development project in Mashpee and Barnstable. The five prehistoric sites (Fox-1 through Fox-5) represent various levels of intensity of prehistoric Indian occupation and land use dating between the Middle Archaic and Late Woodland periods. The historic sites include the Simons House Complex, a post-Contact Native American domestic site dating to the 17th and 18th centuries, and the Quippish House Site, dating from circa 1840 through the 20th century. The results of the archaeological investigation indicated that the Fox-2, Fox-3, Fox-4, Fox-5, and Simons House Complex contained sufficient integrity and significance to meet the criteria of eligibility for listing

in the National Register of Historic Places. The Fox-1 and Quippish House Sites were not considered eligible for listing in the National Register. The Fox-2 Site is characterized as principally a stone tool-manufacturing site, possibly dating to the Late Archaic period. The Fox-3 Site is an extensive shell midden site containing a wide diversity of artifacts, cultural materials and floral and faunal remains, suggestive of a winter base camp utilized during the Late Archaic and Woodland periods. The Fox-4 Site appears to be short-term, seasonal campsite which was used during perhaps the Middle Archaic, Late Archaic and Middle-Late Woodland periods. The Fox-5 Site is a large multi-component site dating to between the Middle Archaic and Middle Woodland periods; a portion of the Fox-5 Site was destroyed by the construction of a golf green. The Simons House Complex was identified through historic documentary evidence and contains domestic refuse deposits associated with an historic period Native American family. The report recommended that the National Register eligible sites be protected and preserved. The site boundaries provided by the site examinations were used for the placement of preservation restrictions on the deeds to Fox-2, Fox-3, Fox-4, Fox-5 Sites and the Simons House Complex, thus listing the sites in the State Register of Historic Places.

25-822 Williams, Stephen, Laurel Casjens, Stephen Ross and Joseph Zorzin

1976 Preliminary Report, Cultural Resources in the Corridor for a National Gas Pipeline to be Constructed through a Portion of Massachusetts. Tennessee Gas Pipeline. 92 pages.

Background research was conducted as part of a preliminary study of cultural resources along an eight mile wide and fifty mile long right of way for a gas pipeline to be placed through northwestern Massachusetts in the towns of Hancock, Lanesborough, Cheshire, Dalton, Windsor, Hinsdale, Peru, Plainfield, Ashfield, Conway, Shelburne, Colrain, Greenfield, Gill, Bernardston, Charlemont, and Northfield. Cultural and environmental data are presented in the report for future correlation towards a model of prehistoric and historic land use to be generated in a final report.

25-823 Casjens, Laurel

1977 Reconnaissance Survey (Background and Field Test) of the Massachusetts Portion of the Tenneco Pipeline through New England. 221 pages.

Background research and a partial walkover were conducted as part of a partial reconnaissance/historical properties survey for the Massachusetts alternate route of the proposed TAPCO Pipeline in the towns of Hancock, Lanesborough, Cheshire, Dalton, Windsor, Hinsdale, Peru, Plainfield, Ashfield, Conway, Shelburne, Colrain, Greenfield, Gill, Bernardston, and Northfield. A model based on environmental variables and known settlement patterns was used to determine the archaeological potential of the corridor after which only those areas having public access were field surveyed. A synopsis is presented for each town describing (1) archaeological potential based on the environmental model; (2) potential shown by the field survey; (3) known prehistoric and ethnohistoric sites and trails; and (4) historic sites.

25-824 Fitzhugh, William W.

1970 Archaeological Surveys and Excavations at Fife Brook on the Upper Deerfield River. 17 pages.

Background research, a reconnaissance survey and excavation were used as part of a five mile survey of the Deerfield River and Bear Swamp in the townships of Rowe and Florida scheduled for hydroelectric development. Three site areas were discovered, all located on small Pleistocene or post-Pleistocene river terraces and near rapids at the confluence of small streams and the Deerfield River. All sites appeared to be single component sites of short-term occupation. The Hemlock Site contained chipping debris, features, fire-cracked rock, knives, scrapers, biface fragments, and a hammerstone, but no cultural diagnostics. The Smith Brook Site contained only undiagnostic chipping debris. The Fife Brook Site contained four find locations possibly belonging to a sin-

gle extended site. Fife Brook 2 contained chipping debris, several forms of bifaces and fragments, utilized flakes and a drill. Fife Brook 3 contained chipping debris and a biface. Fife Brook 4 contained a single utilized flake. Fife Brook 1 contained features, chipping debris and 104 tools dominated by finished tools (gouges, fishing weights, knives), preforms and utilized scrapers. Archaic components are speculated based on the absence of pottery and presence of bifaces; however, a single radiocarbon date of 2305 ± 85 B.P. (355 B.C., GX 1961) indicates an Early Woodland, possibly Meadowland component.

25-825 Strauss, Alan E.

1989 Intensive Archaeological Survey of the Proposed French's Crossing Residential Development in Rockland, Massachusetts. 35 pages.

Background research and a walkover reconnaissance indicated that no known sites were located within the project area, although the area was considered to have a high sensitivity for prehistoric cultural resources. Sixty-eight shovel test pits were excavated, but no significant cultural material was recovered. No further archaeological testing was recommended.

25-826 Pagoulatos, Peter and Alan Leveillee

1987 Intensive Archaeological Survey Franklin Farms, Franklin, Massachusetts. 52 pages

Background research, a walkover inspection and subsurface testing were used as part of an intensive survey for a 200 acre residential development in Franklin, Massachusetts. Six prehistoric and one historic sites were found. Prehistoric sites 1, 2, 5, and 6 contained chipping debris and, at Site 1, uniface fragments. Each of these sites most likely functioned as a task specific location of unknown cultural affiliation. Prehistoric site #3 (Maple Knoll site) contained primary quartz chipping debris and biface tool fragments. A Small Stemmed point and untyped Broad Stemmed point were also present. The site was reported to represent an occupation of the Small Stemmed Tradition (4,500-1,000 B.P.) where tool making and possibly hunting related activities occurred. Prehistoric Site #4 contained mostly chipping debris, uniface and biface tools. This site also contained a Small Stemmed point and represented an occupation of the Small Stemmed Tradition (4,500-1,000 B.P.) where tool making and possibly hunting related activities occurred. Prehistoric Site #4 contained mostly chipping debris, uniface and biface tools. This site also contained a Small Stemmed point and represented an occupation of the Small Stemmed Tradition (4,500-1,000 B.P.) where tool making/maintenance and possible hunting activities were performed. A historic site (historic site #1) consisting of a stone pile made from field clearing was also found. Historic field trash (ceramics, glass, nails) was recovered throughout most of the project area. Prehistoric sites 1, 2, 5, and 6 were not considered to represent potentially significant archaeological deposits. No additional archaeological work was recommended at these sites. Prehistoric sites 3 and 4 were considered potentially significant and recommended for either avoidance during project development or, further testing to determine eligibility to the National and State Registers of Historic Places. Historic site 1 was not considered potentially significant and not recommended for further study.

25-827 Pagoulatos, Peter and Alan Leveillee

1988 Intensive Archaeological Survey, Fountainhead Office Park, Westborough, Massachusetts. 33 pages.

Background research, a walkover survey and excavation were used as part of a 22 acre intensive archaeological survey. One prehistoric site (prehistoric site area #1) containing chipping debris was found. Cultural affiliation could not be determined. One historic site (historic site area #1) was also found, consisting of two abandoned structures, probably representing a late nineteenth to early twentieth century farm complex. Historic field trash was recovered from the southern portion of the projection. Both sites were not considered significant resources and were not recommended for further study.

25-828 Davin, Ann K., and Karen Shemet

1987 Reconnaissance Archaeological Survey, Massachusetts Turnpike Authority Barrier Toll Project Area, Westborough and Southborough, Massachusetts. 33 pages.

Background research, a walkover and excavation were used as part of a 17 acre reconnaissance survey. The study confirmed that no archaeological or historic cultural material was present in the project area. No further archaeological studies were recommended.

25-829 Leveillee, Alan

1988 An Intensive Archaeological Survey of the Proposed Essex Bay Development Area Gloucester, Massachusetts. 61 pages.

Background research, a walkover inspection and subsurface testing were used as part of a 200 acre intensive survey in the Cape Ann area. One prehistoric site and two loci of prehistoric debitage were identified. The Cole's Island prehistoric site contained chipping debris, a Levanna projectile point, burnt rock, aboriginal ceramics, and shell midden including non-calcined mammal bone. A Late Woodland date is associated with the site based on the Levanna point and a radiocarbon date of 1,010 $\pm$ 70 years B.P. (Beta 23497) taken from shell samples. The site was identified as a shellfish procurement/processing activity site. Loci #1 and #2 identified on the basis of chipping debris were also found in the development area. Historic period cultural resources included three sites. The Azor Cole site contained evidence of a structure and 19th century artifacts (ceramics, bone, brick, iron, shell). A stone, brick and cement well was also found associated with the 1928 Merrill House. A historic period shell midden was also found. The midden lacked prehistoric cultural material and was radiocarbon dated from shell at 130 $\pm$ 70 years B.P. (Beta 23496). Both the Cole's Island prehistoric site and Azor Cole historic site were recommended to be avoided during future development. Site examination level testing was recommended for both sites should avoidance prove unfeasible. The possibility of encountering human burials within the Cole's Island site was noted based on the occurrence of burials in similar sites in the greater project area. No further work was recommended at the two prehistoric loci, historic well or historic shell midden.

25-830 Weiss-Belding, Meredith

1988 Archaeological Explorations At Quinsigamond Community College, Worcester, Massachusetts. 10 pages.

An orientation period followed by literature search and subsurface investigation were included in a field school for children (ages 6 to 12) as part of a summer program at Quinsigamond Community College in Worcester. Twentieth-century artifacts, mostly building debris, were recovered although no features or artifacts could be associated with specific structures or functionally associated with a convent which previously occupied the site. The convent was destroyed by a tornado and subsequently bulldozed in 1953. The project and site allowed students to develop a strong sensitivity to the nature of archaeological work and importance of cultural resource preservation without the destruction of a significant site.

25-831 Mowchan, Denise, and Ann K. Davin

1988 An Intensive Archaeological Survey of the Proposed Water's Edge Development, Mashpee, Massachusetts. 48 pages.

Background research, a walkover survey and test excavations were employed as part of an intensive survey for a 25 acre residential development. Two isolated pieces of quartz chipping debris were recovered at two separate locations during the walkover survey. Chipping debris was also found during test excavation. All prehistoric finds were characterized as low-density findspots rep-

resenting temporary use by relatively few individuals. Diagnostic materials were not recovered. Miscellaneous historic period cultural materials commonly referred to as field trash were also recovered. None of the archaeological deposits were considered to be significant. No further archaeological studies were recommend for the project area.

25-832 Leveillee, Alan, Elizabeth Holstein, and Robert Goodby

1988 An Intensive Archaeological Survey of the Proposed Fitchburg Industrial Park Project Area, Fitchburg, Massachusetts. 58 pages.

Background and documentary research, and subsurface testing on four parcels (ca. 160 acres) located one quartz flake and a mid-19th century farmhouse and complex. The farmhouse is to be relocated and no further archaeological work was recommended.

25-833 King, Marsha K. and Denise Mowchan

1988 Archaeological Site Examination of the Fairbanks Complex and Extended Testing in Proximity to the Stoughtonham Furnace Site in Sharon, Massachusetts. 101 pages.

Background research, a walkover survey and test excavations were used as part of a site examination of the Fairbanks Complex and extended testing around the Stoughtonham Furnace, a National Register property. Both sites are located within the Quail Ridge/Cannon Forge Development in Foxboro and Sharon. Structural (nails, window glass, brick fragments) and domestic (ceramics, bottles, faunal remains, etc.) remains dating to the eighteenth and nineteenth centuries were recovered in and around the Fairbanks house cellar hole and ground-level foundation remains, the central features of the site. Several zones of domestic activity or disposal were identified around the house, well and outbuildings. Testing along the old road connecting the Fairbanks Complex and Stoughtonham Furnace also yielded structural and domestic remains and two depressions thought to be remains of the Kollock House. Three pieces of prehistoric chipping debris were also recovered. Damage since 1900 by demolition, pot hunting and archaeological excavations during the 1980s have affected the site's integrity to the point where it was not considered eligible for nomination to the National Register of Historic Places. Testing in the vicinity of the Stoughtonham Furnace extended around the current National Register boundaries to look for structural remains of furnace related outbuildings. It was recommended to extend the Stoughtonham Furnace boundaries to include the probable Kollock house site and to avoid and preserve this National Register property.

25-834 Mowchan, Denise and Ann K. Davin

1988 An Intensive Archeological Survey of the Proposed Stratford Pond Development, Mashpee, Massachusetts. 49 pages.

Background research, a preliminary walkover inspection and subsurface testing were included in an intensive survey of a projected 70 acre residential development. The walkover produced a quartz projectile point base on Amos Road at Locus 1. The point was identified as either a Brewerton Eared Triangle point or part of an unfinished Squibnocket Triangle, which would suggest a Late Archaic presence in the project area. Subsurface testing around the Locus 1 findspot failed to produce additional prehistoric cultural material. A Wading River projectile point and quahog shell fragment were found in Locus 2. At Locus 3, a quartz Small Stemmed projectile point and two pieces of quahog shell were recovered. The point types discovered at Locus 2 and 3 are representative of the Late Archaic Period in general but are known to range into Transitional Archaic and Early Woodland contexts as well. Testing at Locus 4 revealed a thick layer of historic fill above the subsoil. Eighteenth to 19th century historic ceramics were recovered as well as quahog shell fragments, a quartz untyped bifacial tool fragment and an unidentifiable quartz projectile point tip. Field trash including 18th to 19th century ceramics, quahog shell fragments and building debris were found elsewhere in the project. The prehistoric cultural materials were reported to represent

hunting activities with no evidence for temporary or long-term occupation. Historic materials are believed to be associated with the Naomi Amos House, located on the adjoining parcel. Neither the prehistoric nor historic depositions were reported to have potential for producing additional significant archaeological information. No further archaeological studies were recommended for the project area.

25-835 Strauss, Alan E.

1987 Phase II Site Examination of the River Road Site in Andover, Massachusetts. 48 pages.

A preliminary field reconnaissance and excavation were used as part of a site examination designed to evaluate the site's eligibility to the National Register of Historic Places. Chipping debris, burnt rock, prehistoric tool fragments and a prehistoric feature were recovered. Tool fragments included two Orient-like projectile point fragments, two Small Stemmed points and a unidentified point tip and basal fragment. One prehistoric feature, containing fire-cracked rock, charcoal and calcined bone, was also found. Micro screening of soils produced charcoal, flakes, calcined bone and carbonized seeds. The site reportedly functioned mainly as a hunting camp, probably used repeatedly for short periods of time over many years. The site was reported as potentially eligible to the National Register and capable of providing significant data about the general and specific prehistory of the region. It was recommended that the site be avoided during the proposed construction. If avoidance is not possible, a data recovery was recommended.

25-836 Raber, Michael S. and Leonard W. Loparto

1988 Intensive Cultural Resources Survey For The Proposed King James Estate In Taunton, Massachusetts. 15 pages.

Background research, a walkover and subsurface testing were used as part of an intensive survey of five locales within a planned 250 acre residential development. A single test pit produced several pieces of quartz debitage reported to represent an extremely isolated and small-scale episode of tool manufacture. This location and the remainder of the proposed development did not contain significant cultural resources. It was recommended that the proposed construction proceed as planned.

25-837 Pagoulatos, Peter and Alan Leveillee

1988 Intensive Archaeological Survey, Middleborough Powerline, Middleborough, Massachusetts. 80 pages.

Background research, a walkover and subsurface testing were used as part of a 6.75 km intensive survey of a proposed transmission line corridor. Three prehistoric sites were located in proximity to poles 6, 9 and 40. Prehistoric site #1, the Powerline site and prehistoric site #3, the Foye site contained chipping debris only. Prehistoric site #2, the Pine site contained chipping debris and burnt rock. Cultural affiliation and site type could not be determined for any of the sites. Loci or isolated findspots were also identified. All contained chipping debris only except for Locus #2 which also contained a quartz biface fragment. Historic field trash (ceramics, coal, glass and nails) was recovered throughout much of the study area. None of the prehistoric loci or historic field deposits were determined to represent significant archaeological resources. Additional archaeological studies were not recommended for these areas. Avoidance during powerline construction was recommended at each of the prehistoric sites. Alternative pole locations which produced negative results were tested for each of the site areas. If avoidance is not possible, additional testing to determine the site's eligibility to the National and State Registers of Historic Places was recommended.

25-838 Raber, Michael S. and Leonard W. Loparto

1988 Intensive Cultural Resources Survey For Proposed Water Facilities in the Town of Chatham, Massachusetts. 18 pages.

Background research, a walkover and subsurface testing were used as part of an intensive survey of 1,720 feet (524.26 meters) of water main easement and a storage tank location. No cultural resources were recovered. It was recommended that construction proceed as planned.

25-8 39 Raber, Michael S. and Leonard W. Loparto

1988 Intensive Cultural Resources Survey For The Proposed Marathon Gas Pipeline, Medway, Holliston, and Hopkinton, Massachusetts. 27 pages.

Background research, a walkover and subsurface testing were used as part of an intensive survey along 8.0 miles of new gas pipeline easement approximately 50 feet wide. One prehistoric site containing only chipping debris was located. This site, the Marathon 1 site, lacked cultural affiliation and possibly represents a small, single component temporary occupation. A similar site, the Marathon 2 site, was also originally located within the proposed gas line easement but changes in project plans have since moved the proposed construction away from the site. Both sites were regarded as potentially eligible for listing in the National Register pending further investigation. Historic field trash and two historic features were also located. Field trash was found in several areas and was not considered a significant resource. One historic feature, a depressed railroad grade, was determined typical of 19th and 20th century railroad construction in New England. This feature will be minimally affected by proposed construction and lacks significance. A raised embankment built for the Hopkinton Railroad ca. 1872 was also located. The feature is representative of a very local railroad construction project and may have some significance for local historical associations. The feature was regarded as potentially significant pending further review. Recommendations were made for a site examination at the Marathon 1 site to determine the site's eligibility to the National Register. Site boundaries, determined during the process would also help towards possible avoidance. No further cultural resources studies were recommended for the Hopkinton embankment, however, restoration of the embankment to its present condition following construction was advised.

25-840 Strauss, Alan E.

1988 Intensive Archeological Survey of the Proposed Town Crossing (Devon Wood) Roadway and Residential Development in Braintree, Massachusetts. 42 pages.

Documentary research, a field reconnaissance and subsurface testing were used as part of intensive survey for a 350 acre development. Three prehistoric activity areas or loci were identified. Each of the loci contained chipping debris and lacked diagnostic artifacts which indicated temporal periods or cultural affiliation. Phase II site examinations were recommended for Loci A, B, and C in order to determine National Register eligibility for each of the loci. No further work was recommended for other areas of the project.

25-841 Strauss, Alan E.

1988 Phase II Archaeological Site Examinations for the Town Crossing (Devon Wood) Residential Development in Braintree, Massachusetts. 48 pages.

Excavation and analysis were included as part of site examinations of three prehistoric activity areas or loci identified during a previous intensive survey (see report #25-840). Locus B failed to produce additional artifacts during the site examination phase. The area was reported to represent a very limited low-density scatter of chipping debris. Loci B and C consisted of small, tightly clustered felsic volcanic workshops. At Locus B, chipping debris, biface fragments, a core fragment and a uniface fragment were recovered. Locus C contained chipping debris, one large bifacially worked flake and a possible stone feature. Diagnostic materials were absent from both loci. Loci B

and C are reported to represent isolated, short term, lithic reduction stations. No further work was recommended at either Locus A, B or C, since they do not meet Criterion D of the National Register of Historic Places.

25-842 Holstein, Elizabeth

1988 An Intensive Archaeological Survey of the Proposed Fall Brook Condominiums, Middleborough, Massachusetts. 51 pages.

Background research, a walkover and subsurface testing were used as part of an intensive survey at a projected 12 acre residential development on the north side of Fall Brook. One site, the Orange Cart site was located containing chipping debris, a quartz biface fragment and calcined bone. Tool manufacture and resource procurement activities characterized the site. Most of the Orange Cart site has been impacted by cranberry bogs and construction of a 20th century house. As a result, no further archaeological investigations were recommended.

25-843 Jones, Donald G.

1988 Results of an Archaeological Reconnaissance Survey of High Rock in Lynn, Massachusetts. 54 pages.

Background research, a field reconnaissance and subsurface testing were used as part of a reconnaissance survey of the 4.5 acre Olmsted Park near the center of downtown Lynn. Prehistoric chipping debris was recovered from levels also containing historic artifacts indicating the finds did not represent undisturbed prehistoric deposits, but, rather, contexts where prehistoric artifacts originally deposited at the site were later disturbed and displaced by landscaping activities. It is also possible these artifacts were brought in with fills used for landscaping activities. No historic artifacts were found which predated the construction of the park. No significant or potentially significant archaeological resources were located during the reconnaissance survey. Further archaeological studies were not recommended. While a portion of High Rock including High Rock Tower are National Register properties, they date to the park-era and were reported outside the scope of this survey.

25-844 Strauss, Alan E.

1988 Intensive Archaeological Survey of the Proposed Sewerage Facilities in the Charles River Pollution Control District in Franklin, Massachusetts. 32 pages.

Background research, a walkover survey and subsurface testing were used as part of an intensive survey for 2,400 linear feet (70 feet wide) of wastewater pipeline and a pump station. Prehistoric chipping debris and 20th century historical artifacts were found together in a deeply plowed topsoil. No diagnostic artifacts or features were recovered. Because of the low density of prehistoric artifacts primarily restricted to plowed topsoil, the site was not recommended as eligible for nomination to the National Register of Historic Places. No further archaeological studies were recommended.

25-845 Holstein, Elizabeth

1988 An Intensive Level Archaeological Survey of the Huckins Farm Planned Residential Development, Bedford, Massachusetts. 33 pages.

Background research, a walkover and subsurface testing were used as part of an intensive survey for 294 acre development. Single prehistoric flakes were recovered from two areas of the project. Expansion units around these finds were sterile. Historic field trash (glass, coal, ceramics) dating to the 19th and 20th centuries was also recovered. Several 19th and 20th century structures, all retaining their original rural attributes were recorded within the project limits. None of the prehis-

toric or historic archaeological resources recovered were considered potentially significant. No further archaeological testing was recommended for the project area.

25-846 Mrozowski, Stephen A., Leslie Shaw, Martha Holland and Janet M. Zisk

1988 Salem, Massachusetts: An Archaeological Survey of the City. 85 pages.

Documentary research and field visits were used to conduct an archaeological survey of Salem under a MHC Survey and Planning grant. The intent of the survey was to collect data which could be used to develop an archaeological plan for the city, detailing survey information and offering recommendations for site protection and long-term management. Several topics and areas of interest are discussed including urban archaeology and the modern city (Chapter 2), the city's environment and its prehistory (Chapters 3, 4, 5 and 6), Salem's history (Chapter 7), historic period preservation priority areas (Chapter 8), and conclusions and recommendations (Chapter 9).

25-847 Robinson, Barbara

1988 Native American Sourcebook. A Teacher's Resource on New England Native Peoples. 222 pages.

Documentary research was used to compile a source book for educators who want to learn and teach about the history and present status of New England Native Peoples. A major aim of the book was to provide a historical perspective of Native Americans which promotes an understanding of their condition today. The book includes background studies of New England prehistory, archaeological methods and discoveries, basic needs, relationships and creative expressions of Native Americans and discussion of Native Americans today. A listing of resource materials and relevant individuals, public offices and organizations is also provided.

25-848 Davin, Ann K., Denise Mowchan and Joan Gallagher

1988 An Intensive Archaeological Survey, Brookside Development, Bourne, Massachusetts. 48 pages.

Background research, a walkover inspection and subsurface testing were used as parts of an intensive survey for a planned residential development. Three loci of quartz chipping debris (a total of four pieces) were found during the initial testing. Further test units in these areas failed to produce additional results. Historic field trash (ceramics, bricks, nails) was found in the western half of Parcel B. The fragmentary remains of a concrete mill foundation were found adjacent to Mill Pond. Many of the prehistoric or historic resources located during the survey were reported to represent significant depositions. No further archaeological investigations were recommended.

25-849 Strauss, Alan E.

1989 Phase II Archaeological Site Examination of the Shepards-Charles Prehistoric Site in Franklin, Massachusetts. 46 pages.

An archaeological site examination was conducted at the Shepards-Charles prehistoric site in July of 1985. The site was identified during an intensive archaeological survey of the Shepards Brook Interceptor (see report 25-625). The site's vertical and horizontal boundaries were determined as a result of the site examination. Numerous prehistoric artifacts, including chipping debris and broken projectile points, were recovered. Based upon typological comparison it has been determined that the site represents at least two chronological periods: Middle Archaic (ca. 8,000-7,000 B.P.) and Late Archaic (ca. 5,000-3,000 B.P.) periods. Because the site lacked internal complexity, prehistoric features, and extensive non-plowzone cultural deposits, it was determined that little significant information would be gained through further excavations. The site was consequently not considered eligible for nomination to the National Register of Historic Places, and no further ar-

chaeological work was recommended.

25-850 Bower, Beth Anne

1977 Archaeological Investigations at the Fairbanks House, October 1976-June 1977. 20 pages.

Archaeological salvage excavations were undertaken at the Fairbanks House located in Dedham, reportedly the oldest frame structure in America. The research design focused on archaeological results would aid in interpreting the building itself and locate artifacts which could be traced to the building's inhabitants. Socio-economic information would hopefully be gained from the latter information. Ceramics and construction debris were recovered from the 1760-1815 period, associated with the occupation of Ebeneezer Fairbanks who owned the west end after 1764. Ceramics and glassware from Features 1 and 5 were reported as one of the better collections of reconstructible vessels available. Further work on this collection was recommended as funds become available.

25-851 Hasenstab, Robert J.

1987 Archaeological Locational Survey at the Turners Falls Airport, Franklin County, Massachusetts. 122 pages.

Background research, a walkover and subsurface testing including power-auger probes were used to complete a locational (intensive) survey of 5 discrete project segments in Montague totaling 75 acres. Two prehistoric sites, Turners Falls 1 and 2 were found. The Turners Falls 1 site contained chipping debris and fire-cracked rock. A Middle or Late Archaic component is speculated based on the type of material recovered and cultural materials found by amateur archaeologists to the west of the site. The Turners Falls Airport 2 site contained chipping debris, a core, and charcoal. Both prehistoric sites were thought to be low-density, short-term campsites probably occupied during the Archaic period. The sites are potentially eligible for inclusion in the National Register of Historic Places. Background research revealed that the early 20th century White Coal Farm complex was situated within the project area, however, grading for an existing runway in 1960 apparently obliterated any structural or archaeological remains. A site examination survey and/or protective filling was recommended for the Turners Falls 1 site. It was also recommended that no heavy equipment should be permitted on the nearby Hannemann Paleo-Indian site. A site examination study and/or filling was also recommended for the Turners Falls 2 site.

25-852 Strauss, Alan E.

1988 Intensive Archaeological Survey of the Proposed Evanswood Center Development in Kingston, Massachusetts. 56 pages.

Documentary research, a field reconnaissance and subsurface testing were included in an intensive survey for a 48 acre residential development. A total of 431 prehistoric artifacts were found throughout most of the study area indicating the project locale as a broad area of prehistoric utilization. Chipping debris was recovered as well as two Small Stemmed points, a projectile point tip, two core fragments, two biface fragments, a tool fragment, a uniface, and a bifacially worked quartz cobble. A site examination was recommended for recovered prehistoric resources to determine the project area's potential eligibility for nomination to the National Register of Historic Places. Two 18th century houses were recorded within the project area. Archaeological testing failed to locate significant deposits near these houses. Accordingly, no further archaeological testing was recommended for the historic resources.

25-853 Gorman, F.J.E. and Ron Dalton

1988 Intensive Archaeological Survey, Westfield Sewer Collection System, South Meadow Road and Hundred Acres Road. 69 pages.

Background research, a surface walkover and subsurface testing were included as part of an intensive survey of a two mile-long sewer route. A single piece of chipping debris was found within the project right-of-way. The find was reported to lack contextual integrity, behavioral complexity and research value to be potentially significant. Historic period roads, a Federal period canal, four Early Industrial Period residences, and historic resources of the Late Industrial through Modern Period were also discovered abutting the project corridor. All of the resources were reported to lack criteria which would make them potentially significant. No further archaeological studies were recommended.

25-854 Mulholland, Mitchell T. and George Stillson

1988 Archaeological Site Examination of Six Prehistoric Sites in Middlesex County, Northeastern Massachusetts. A Site Examination for the Route 3 Add-A-Line Project. 170 pages.

Test excavations, photographic documentation and analysis were used as part of site examinations at six prehistoric sites and recording of one historic site in the towns of Bedford, Billerica and Chelmsford. Sites D1 and L1 failed to produce cultural material during the site examination. Site F3 produced 11 prehistoric flakes. Each of these sites, D1, L1 and F3 were considered ineligible to the National Register of Historic Places due to a lack of data. No further work was recommended at these sites. At site C-1, 555 lithic flakes, 10 fire cracked rocks, 7 mica fragments and two features were recovered indicating that varied stages of tool manufacture and processing occurred at the site. A radiocarbon date of 5,200 $\pm$ 90 B.P. was obtained from feature M13.1 which had a C13 correction date of 5,180 $\pm$ 90 (Beta 25884). Evidence gathered at the site indicates site C-1 as an undisturbed specialized single component site occupied for a short period of time. Sites F-1 and F-2 were considered as two separate sites during the locational survey but during the site examination were treated as one site with two distinct loci. Recovered cultural materials included 1,076 lithic flakes, five tools, ten fire-cracked rocks and a feature at locus F-1, and 544 lithic flakes, 12 lithic tools and two features at locus F-2. The site is reported to contain at least two components occupied during the Middle and Late Woodland Periods. Radiocarbon dates separate the two loci by 820 years (2100 B.P. in the northeast and 1200-1280 B.P. in the southwest). The site is undisturbed and characterized by primary biface reduction. Both sites C-1 and F-1/F-2 were considered eligible for listing in the National Register and recommended to be avoided, or subjected to a data recovery program if avoidance is not possible.

25-855 Gorman, F.J.E. and Ron Dalton

1988 Intensive Archaeological Survey, Lateral Sewers, Subarea 3, Walpole, Massachusetts. 56 pages.

Background research, a surface walkover and subsurface testing were used as part of an intensive survey for a one kilometer long sewer route containing three cross-country segments. No prehistoric materials were located during the survey. Historic materials found included a Colonial Period doorstone, Federal Period ceramic sherd, Late Industrial Period stone wall, and Modern Period residential materials. None of these resources were considered potentially significant to the National Register of Historic Places. No further investigation was recommended for the project area.

25-856 Bunker, Victoria

1988 Archaeological Reconnaissance Report and Assessment of Archaeological Sensitivity for Four Alternative GWEN Parcels in Acushnet, Massachusetts. 28 pages.

Four alternative U.S. Air Force Ground Wave Emergency Network (GWEN) tower construction sites (Gilmore, St. Armand, David White, and Landfill construction sites) were assessed for im-

pact to cultural resources. Methodology included documentary research, interviews with local landowners and collectors, a walkover reconnaissance, and the hand excavation of five (5) 45 cm square test pits. No cultural materials were recovered from the excavations, but historical features (stone walls, foundations) were observed outside the impact areas. Further subsurface testing was recommended at the White and Gilmore sites and in the access road to the Landfill site. A study of historical land use was recommended at the St. Armand site.

25-857 Decima, Elena, James Rudolph, Brenda Bowser, and Victoria Bunker

1988 Archaeological Reconnaissance Report and Assessment of Archaeological Sensitivity for Two Alternative GWEN Parcels in Westport, Massachusetts. 33 pages.

This report presents the results of an archaeological reconnaissance survey of two alternative U.S. Air Force Ground Wave Emergency Network (GWEN) relay node construction sites (Nisby and Nardelli sites). Methodology included background and documentary research, interviews with property owners, a walkover reconnaissance, and limited shovel test pit excavations. No cultural material was recovered from the test pits but a number of (probably 20th century) historical features (stone walls, trash dumps, foundations) were observed in the vicinity of the project. A possible burial site may be present in the vicinity of the Nardelli site; further subsurface testing was recommended in both parcels based on the low to moderate potential for prehistoric material.

25-858 Raber, Michael S.

1988 Intensive Survey of Cultural Resources for the Proposed High Meadow Development, City of Worcester, Massachusetts (Revised Version). 14 pages.

An intensive survey assessed six areas deemed sensitive for prehistoric remains, including examination of the possible quarrying site 19-WR-489. Methodology included limited background research, interviews with local informants, walkover reconnaissance, and the placement of shovel test pits. Other than an asphalt shingle fragment, no cultural materials were found in any of the test pits. Quartz fragments found by local collectors at 19-WR-489 were not considered by the author to be definitive prehistoric artifacts. No further archaeological work was recommended.

25-859 Mowchan, Denise

1988 An Intensive Archaeological Survey, Valentine Residential Subdivision, Nantucket, Massachusetts. 73 pages.

An intensive survey was undertaken to locate possible prehistoric burials and artifacts associated with site #19-NT-127. Background and historical research and a walkover reconnaissance of the site was performed. Two projectile points diagnostic of the Middle/Late Archaic and Late Woodland were found on soil heaps created by construction activities. The area had been previously impacted by a gravel pit, and subsurface testing (shovel test pits and machine testing) focused on the undisturbed margins of the gravel pit. Two small prehistoric loci were identified by low densities of lithic debris, but were judged to be insignificant and no further archaeological investigation was recommended.

25-860 Bunker, Victoria and Brenda Bowser

1988 Archaeological Reconnaissance Report and Assessment of Archaeological Sensitivity for Six Alternative GWEN Parcels in North Central Massachusetts. 28 pages.

Six alternative U.S. Air Force Ground Wave Emergency Network (GWEN) radio tower construction sites in Hardwick, Hubbardston, and North Brookfield were the subject of a reconnaissance survey. Background research and a walkover reconnaissance indicated an adjacent prehistoric site (l9-WR-465) in North Brookfield and limited historic activity (stone walls and a foundation). The

sites were ranked for their potential to contain prehistoric and historical resources; subsurface testing was recommended at two sites in North Brookfield and Burton.

25-861 Gumaer, D. Richard

1986 Archaeological Remote Sensing Survey of the First Congregational Church Cemetery Expansion Project in Paxton, Massachusetts. 23 pages.

An electrical resistivity survey and shovel trenching were conducted to assess the impact of a proposed church building addition to marked and unmarked human burials located in the historic town cemetery. The cemetery includes the graves of early colonial families and others and dates between the 18th to 19th centuries. Test trenches were excavated in areas shown by electrical resistivity to be likely to contain graves and where project impacts were considered. One test pit was excavated to verify the existence of human burials and encountered nails, iron and wood from a coffin. The proposed church addition will have a concrete slab foundation supported by concrete piers. The results of the archaeological testing were utilized by project planners to place the concrete piers in areas which do not contain graves, thus avoiding direct impacts on burials.

25-862 Mulholland, Mitchell T.

1985 Archaeological Locational Survey of the Laramee Parcel in Indian Orchard, Springfield, Massachusetts. 51 pages.

An electrical resistivity survey and shovel excavations were undertaken to locate Native American burials reported to exist in a 6.5 acre parcel proposed for a residential development. Background research, a walkover reconnaissance to stratify the area, interviews with local collectors, historians, and prehistorians were conducted. Dense roots, brush and trees required modifications to the field methodology from trenching to clustered shovel test pits. While no burials were located, non-diagnostic prehistoric debris were found in a section of the project and recommendations were made that this section remain undisturbed since it is the likeliest area to contain human burials.

25-863 Davin Ann K. and Elizabeth Holstein

1988 Intensive Archaeological Survey, Bishop Farm Development, Attleboro, Massachusetts. 55 pages.

Extensive background research, a walkover reconnaissance, and subsurface shovel testing identified non-diagnostic, low-density, deposits of prehistoric lithic debris. No additional archaeological work was recommended, as the thin lithic scatters were not considered unique or significant in a local or regional framework.

25-864 Gorman, F.J.E. and Ron Dalton

1988 Intensive Archaeological Survey, Salem State College-south Campus, Salem, Massachusetts. 87 pages.

Background research and a description of historical land use identified areas likely to contain cultural resources including three known prehistoric sites (19-ES-359-378, and -440). Systematic soil coring was undertaken to observe plowzones. A walkover reconnaissance and shovel testing uncovered prehistoric lithic debris, and a perforator in the plowzone and a possible truncated postmold at the junction of the plowzone and the B horizon. Nineteenth and 20th century cultural remains included field trash, a dump, a stone fence and a cart path. No further archaeological testing was recommended for the parcel due to the lack of integrity and the low research value of the observed remains.

25-865 Landon, David B.

1988 Intensive Archaeological Survey of the Jacobs Farm Property, Norwell, Massachusetts. 48 pages.

Intensive subsurface testing was initiated at the site of an 18th to 19th century farmhouse and barn in advance of construction to improve drainage. Four test trench transects were placed in the impact areas and five test trenches were excavated around the barn. A stone and mortar-foundation for a stone outbuilding and a cobble ramp to the barn were located through the subsurface testing. Yard alterations (grading) during 19th century construction activities were inferred from the absence of 18th century artifacts and quantities of clean fill deposited over the building foundation. No further archaeological investigations were recommended for the drainage project.

25-866 Elia, Ricardo J. and Alan E. Strauss

1988 Intensive Archaeological Survey of The Proposed Duguay Farm Residential Development in Gardner, Massachusetts. 51 pages.

Background research indicated that no recorded prehistoric or historical sites existed within the project area. Field investigations for the project included a 100% walkover reconnaissance followed by shovel testing in all areas determined to be archaeologically sensitive. A total of 160 shovel test pits was excavated during the subsurface testing phase of the project. One prehistoric site, consisting of three pieces of quartz debitage recovered from three shovel test pits, was identified in the central portion of the project area. Two of the three artifacts were recovered from a deep plowzone. Additional testing within the area failed to produce any additional cultural remains. Based upon the results of the intensive archaeological survey, it is believed that the prehistoric site identified is not potentially eligible for nomination to the National Register of Historic Places because of its low artifact density. Consequently, no further archaeological work is recommended for the proposed Duguay Farm Residential Development.

25-867 Ulrich, Thomas

1977 Reconnaissance Location/Identification of Cultural Resources, Electric Park Interceptor and Lateral Sewers – CEM 2929, Ludlow, Massachusetts. 59 pages.

This report evaluates areas subject to both primary and secondary impacts by the construction of the Electric Park interceptor, force main, street sewer, and pumping station. Background research and a walkover reconnaissance were utilized to delineate archaeologically sensitive portions of the project area. Six areas were identified to have a high potential for prehistoric remains and a Phase II/Intensive Survey was recommended for these portions of the project area.

25-868 Bower, Beth A. and Byron Rushing

1982 Analysis of the Excavations at the African Meeting House. 6 pages.

This concise summation was a Final Performance Report to the National Endowment for the Humanities reporting on the activities and findings of analyses conducted on artifacts recovered from the 1978 excavations at the African Meeting House on Beacon Hill in Boston. Artifact processing and analysis procedures were described; counts by artifact type were presented. Conclusions were drawn on site use, stratigraphic associations, artifact and faunal patterns, related to the use of the site in the first half of the 19th century. Recommendations were made for more detailed faunal analysis, and excavation of selected areas of the site.

25-869 Bower, Beth Anne, John Cheney, and Byron Rushing

1984 Report on the Archaeological Testing Program in the African Meeting House Basement. 52

pages.

Test excavations were conducted in the basement of the African Meeting House in Boston in advance of major architectural restoration work to the building including lowering the floor level by one foot and installing an interior and exterior drainage system. Testing was designed to identify and describe the historic appearance of the basement, entrances, heating systems, and support systems for the sanctuary floor based on findings of an historic structures report. Three significant discoveries made during testing include a circa 1790-1806 privy, the 1806 builder's trench for the south wall, and evidence of an 1806 filling episode to level the ground surface at the time the meeting house was constructed. Mitigation recommendations included excavation and recording of the privy and builder's trench; that the basement floor level be lowered by archaeologists; and that further excavations be made to determine the depth of fill and the locations of other pre-1806 features.

25-870 Bower, Beth Anne and Constance A. Crosby

1985 Summary of Field Excavations at the African Meeting House, September 23, 1985 to October 31, 1985. 11 pages.

During a preliminary phase of a data recovery program at the African Meeting House in Boston, archaeological remains (meeting house builder's trench, trash deposits, drains, shed footing, and cobble pavement) thought to have been destroyed by exterior reconstruction work were found intact. Previously unidentified resources (1803 builder's trench and foundation) dating to the earliest black occupation of the site were also located. The resources and their significance are individually described. The significance of the features relates to one of the oldest black-owned and constructed buildings in Massachusetts; lifeways and construction practices; historic landscapes; private verses public activities; and changes to the meeting house structure and yard.

25-871 Bower, Beth Anne and Sheila Charles

1986 Summary of Laboratory Processing and Analysis for the 1985 African Meeting House Excavations. 36 pages.

This report describes laboratory methodology (cleaning, stabilization, labeling, cataloguing, and packaging), conservation efforts, and flotation procedures for processing artifacts and samples recovered from the African Meeting House in Boston. Quantitative artifact summaries were provided by object material, decoration, and functional types. A brief statement bears on the interpretation of the assemblage, concluding that it resulted from activities occurring on and adjacent to the site, including church functions, a catering business, private school, Masonic meetings, and domestic activities.

25-872 Gorman, F.J.E. and Ron Dalton

1987 Reconnaissance Survey of the Howard Street Cemetery, West Bridgewater, Massachusetts. 53 pages.

This report offers predictions of the likely location of an unmarked 17th century municipal cemetery reported in the vicinity of Howard Street. Background and documentary research of landscape history were combined with a walkover reconnaissance. Three predictive models of cemetery location were developed, based on: 1) the cultural/geomorphological settings of 17th century cemeteries in other Southeastern Massachusetts towns; 2) replication by colonial settlers of the town plan of West Bridgewater's parent town (Duxbury); and 3) reconstruction of land parcels to locate the cemetery area documented in deeds. A number of alternative locations for the cemetery were discussed. Recommendations for further locational surveys recommended test excavations as well as broader preservation and protection of West Bridgewater's 17th century cultural resources.

25-873 Strauss, Alan E.

1987 Phase II Archaeological Site Examinations of the Northbound and Southbound Bald Hill Rest Areas in Norwell, Massachusetts. 73 pages

Two prehistoric sites previously discovered during an intensive archaeological survey (see report #25-759) were subjected to test excavations. In the northbound area, three prehistoric loci were identified; two of these loci were small and isolated lithic working activity areas and not considered significant to warrant further work. Locus A, a lithic workshop measuring 40 meters square, was considered significant. In the southbound rest area, prehistoric materials were widely distributed over the entire project area, tending to cluster in a 37 meter square. Discrete activity areas include a lithic workshop/pottery cluster with subsurface features (radiocarbon dated to 3,886 $\pm$ 93 B.P. (GX 13678, GX 13679), an argillite workshop, and a Late Archaic quartz workshop. Diagnostic artifacts placed activities from the Late Archaic to the Middle Woodland. Both Locus A and the southbound rest area were considered possibly eligible for listing in the National Register of Historic Places; data recovery was recommended if site avoidance was not possible.

25-874 Mowchan, Denise, Faline Schneiderman, and Duncan Ritchie

1987 Reconnaissance and Intensive Archaeological Survey of the Lincoln Meadows/Lincoln North Project Area, Lincoln, Massachusetts. 86 pages.

A reconnaissance survey was conducted on the proposed location of the Lincoln Meadows/Lincoln North commercial and residential development. Background research and fieldwork at the proposed 47 acre project area resulted in a recommendation for an intensive survey. Data obtained during the initial survey were used to stratify the area into zones of expected archaeological sensitivity. Systematic subsurface testing of high and medium sensitivity areas resulted in the identification of three prehistoric and one historic site. Of the three prehistoric sites, only one was considered significant, the Black Rabbit Site, characterized as a campsite dating to the Terminal Archaic (Susquehanna Tradition), and was recommended for further testing. The other two sites either yielded a low density of cultural material or were too disturbed to be of archaeological significance. The historic site is a mid-l9th century house, cottage and barn which has been altered and disturbed rendering it not potentially significant. The debris from a 20th century piggery was also observed but the remains were of no significant archaeological value. The recommendation for the prehistoric sites include a discussion of their relevance to the reconstruction of prehistoric land use/settlement patterns in the Concord/Assabet/Sudbury river drainages.

25-875 Gorman, F.J.E. and Ron Dalton

1988 Archaeological Reconnaissance Survey, Escape Estates, East Brookfield, Massachusetts. 63 pages.

Background research, a walkover reconnaissance, soil coring, and subsurface testing were used as part of a survey of four houselots and two cul-de-sacs. One prehistoric site (19-WR-91) was believed to be located in the project area, and the property was the subject of several amateur archaeological investigations from 1939 to the 1960s. Background research concluded that 19-WR-91 was probably a designation for three separate sites. The project area was divided into four sectors. Testing in sector 1 yielded two prehistoric activity loci or clusters; Cluster 1, ca. 70 m x 30 m, consisted of burned clay-pit lining, fire-cracked rock, lithic debris, and Early or Middle Woodland pottery. Cluster 2, ca. 60 m x 15 m, contained only lithics. In Sectors 2 and 3, similar prehistoric materials were found. No further work was recommended for the prehistoric sites due to lack of integrity and generally low research potential. The research value of the historic resources (a farm complex and a rock alignment) suggested that archaeological testing of the historic resources might be considered.

25-876 Bourassa, Marie Lynn and Kathleen A. Atwood

1988 Historic Properties Reconnaissance for Archaeological Potential of Selected Fort Devens Off-Base Facilities in Connecticut, Massachusetts, Rhode Island, and Vermont. 470 pages.

In response to SHPO comments on an earlier report (see report #25-587) a reconnaissance survey addressed the archeological potential of 22 facilities (13 in Massachusetts, including family housing, reserve centers, a naval annex, and a training facility in Bedford, Beverly, Brockton, Burlington, Chicopee, Granby, Hingham, Hull, Nahant, Randolph, Topsfield, Wakefield, Westover, and Woburn) which were not adequately studied in the previous survey. Background research, walkover reconnaissance, and limited subsurface testing in undisturbed areas were used to evaluate the properties for archaeological sensitivity. Because of prior disturbance to all but one facility, only the Hingham Naval Annex was considered to have a potential for containing significant archaeological sites. Activities at the Hingham facility, however, were unlikely to affect cultural resources and no further archaeological work was recommended.

25-877 Decima, Elena and Jane Carolan

1988 The History and Archaeology of the Canton Arboretum Development Site. 143 pages.

Background research, a walkover reconnaissance, and shovel testing identified one prehistoric site, a small lithic workshop. This locus was examined by further test excavations with negative results, and no further archaeological excavation was recommended for the project as currently planned.

25-878 Mulholland, Mitchell T. and Ellen Rose Savulis

1985 Rough Draft. Archaeological Locational Survey in Natick, Dover, and Wellesley, Massachusetts. A Locational Survey for the Framingham Extension Sewer Relief Project. 76 pages.

This preliminary draft report combined documentary and background research, a walkover reconnaissance and field-testing (including electrical resistivity work and shovel excavations) to identify significant cultural resources in the project area. Both prehistoric and artifactual material was found in mixed contexts in survey areas in Natick and Dover. One small prehistoric activity area, the Murphy site, in Wellesley, was identified through fire-cracked rock and chert flakes in an undisturbed area. A site was recommended for the Murphy site.

25-879 Dunford, Frederick J.

1988 An Archaeological Reconnaissance Survey of Kent's Point, Orleans, Massachusetts. 38 pages.

Background research, interviews, and a site visit were combined to establish the archaeological sensitivity of Kent's Point. Prehistoric and historic artifacts and features (shell middens, lithic scatters, historic refuse pits) were widely distributed in the study area. Recommendations were made for an intensive survey and continued monitoring of eroding sites and to discourage vandalism.

25-880 Jones, Donald G.

1988 Intensive Archaeological Survey of the Proposed Reconstruction of River Road and Old River Road in Andover, Massachusetts. 25 pages.

Background research indicated that no recorded prehistoric or historical sites were located within the project area. A field reconnaissance indicated that the majority of the project area was unsuitable for testing due to either topographical variables or to the amount of disturbance. One wooded area approximately 300 feet in length was selected for subsurface testing; this area was bounded on two sides by a fieldstone wall and contained a possible cellar hole located approximately 50 feet outside of the impact area. Ten shovel test pits, placed at 5 to 10 meter intervals were exca-

vated along a single transect. A variety of 19th and 20th century artifacts were recovered, however, these materials are not considered to be significant, and no further testing was recommended.

25-881 Davin, Ann K., Elizabeth Holstein, and Marsha King

1988 Intensive Archaeological Survey of the Chelmsford Phase IIA Sewer Project Area. 47 pages.

Background research, a walkover reconnaissance, and limited testing were used to assess the archaeological sensitivity of four cross-country routes and a pumping station comprising a total of 4,300 feet. The project area had been extensively altered by previous construction activities. No cultural material was recovered, and no further archaeological testing was recommended.

25-882 Jones, Donald G.

1988 Intensive Archaeological Survey of the Proposed Reconstruction of Route 116 (Main Street) in Plainfield, Massachusetts. 45 pages.

Background research indicated that no prehistoric sites were recorded for the project area, however, research also indicated that a cellar hole complex lies within the impact area of the proposed project and that one standing structure is slated for demolition. A walkover reconnaissance did not locate any surface evidence of prehistoric activity. The remains of two historical structures were located during the field reconnaissance: the cellar hole complex identified during the background research and the remains of 'the abutments of a stone bridge at the North Branch of the Swift River. The field reconnaissance also indicated that the majority of the impact area was unsuitable for subsurface testing, due to topographical variables, particularly steep slope, and disturbance. Subsurface testing was conducted at seven areas that were determined to be archaeologically sensitive. No prehistoric artifacts were recovered and only historical artifacts dating to the late 19th to 20th century were recovered. These materials are not considered significant. Additional background research on the cellar hole complex and the stone bridge abutments was conducted to aid in a determination of the potential significance of the remains. Neither of these two historical remains is considered to be potentially significant. An architectural inventory form was completed for the standing structure that is slated for demolition. Based on the results of this survey, this structure is not considered to be eligible for inclusion in the National Register of Historic Places. No additional testing is recommended for the project.

25-883 Raber, Michael S. and Leonard W. Loparto

1988 Cultural Resource Investigations, Including Archaeological Examination of the Chick Estate Site, for the Proposed Wellesley Extension Relief Sewer, Towns of

Needham and Dedham, Massachusetts. 26 pages.

Site examination at the Chick Estate Site (see reports #25-449, 25-633) consisted of excavation, revealing a high density of lithic manufacturing debris with an associated radiocarbon date of 3,920 $\pm$ 60 B.P. (Beta 22013), placing it in the Late Archaic. Only the presence of certain lithic types (hornfels, Pennsylvania jasper, New York flints and cherts, etc.) suggested to the researchers a Middle to Late Woodland presence as well. A 19th and 20th century historic component to the site was also explored. The Chick Estate Site was considered to be possibly eligible for listing in the National Register of Historic Places. The project location was changed to avoid the site, and recommendations were made for a preservation restriction to protect this privately owned site. An intensive survey began at 18th and 19th century mill remains at the Charles River Village (or Cochrane) Dam. Documentary and background research were presented and two machine-assisted cores were made that confirmed the potential for intact features below recent fill. Project design plans changed before the testing was completed, rendering the intensive investigation unnecessary, and at the direction of project engineers, research ceased.

25-884 Blancke, Shirley B.

1988 Bedford Street Survey, Concord, Massachusetts. 9 pages.

An intensive survey was conducted as part of a field school to extend an investigation of site #19-MD-100 (see report #25-733). Background research, interviews and shovel testing identified prehistoric lithic debris and a projectile point midsection mixed with historical field trash all within the plowzone. Undisturbed land north of the project area was recommended for further testing.

25-885 Sheehan, Nora, Joyce Clements, and Stephen Mrozowski

1988 Archaeological Investigation, Pembroke Quaker Meeting House, Pembroke, Massachusetts. 36 pages.

Archaeological testing of the site preceded renovation work. Documentary and background research and interviews were combined with an auger survey, the placement of shovel pits and 1 m excavation units. Artifacts recovered were primarily structural debris, likely associated with 19th century renovations to the building. Materials associated with a carriage house were also located, and recommendations were made to avoid this feature. Unmarked graves may exist in certain sections of the sites and should also be avoided. It was recommended that the proposed placement of a drain and two drywells be allowed to proceed without further archaeological work.

25-886 Holmes, Richard Douglas, Mitchell T. Mulholland, and Patricia Mangan

1988 Archaeological Locational Survey for the Proposed State Correctional Facility, New Braintree, Massachusetts. 113 pages.

Documentary and background research was conducted on the project area of 782 acres. For the locational survey, the parcel was reduced to a direct construction impact area of 92 acres, and shovel test pits were excavated. No prehistoric materials were recovered and no historic sites with integrity were located. Known and suspected sites (including site #19-WR-292, -298, -299 and -477) are located elsewhere on the property outside of the currently planned direct impact area. Archaeological testing is recommended if any design changes occur that could affect untested areas.

25-887 Pierce, Carolyn A.

1988 Cultural Resource Reconnaissance Survey for the Proposed PSS-T Pipeline, Rhode Island and Massachusetts. 41 pages.

This report examines proposed natural gas transmission facilities in the Massachusetts towns of Seekonk, Plymouth, and Westwood. Background research and a partial walkover reconnaissance were conducted. No recorded sites were found within the impact areas, but the Plymouth section has a high probability for containing prehistoric materials. Archaeological testing will likely be required at some of the facilities.

25-888 Raber, Michael S. and Leonard W. Loparto

1988 Intensive Cultural Resources Survey for Proposed Phase II and III Sewerage Facilities in Hopkinton, Massachusetts. 8 pages.

Background research, a walkover reconnaissance, and shovel testing located no cultural resources.

25-889 Pretola, John and Elizabeth A. Little

1988 Nantucket: An Archaeological Record from the Far Island. 22 pages.

An overview of prehistoric and Contact Period archaeology on Nantucket Island is presented though a survey of excavated sites and artifact collections. The Marshall Midden, a Contact Period component of the Marshall site is a focus of the article. This shell midden was interpreted to contain three strata, including an upper Early Contact Period stratum and lower strata reflecting Early and Middle Woodland activity that suggest an occupation predating the formation of the shell midden. The report concludes that many collections, from Nantucket sites offer valuable data for studying prehistory from the Paleo-Indian period to early Contact.

25-890 MacMahon, Darcie A.

1988 Archeological Collections Management at the Saugus Iron Works Historic Site, Massachusetts. Archeological Collections Management Project Series No. 5. 235 pages.

This report presents information on artifacts and archaeological records largely associated with the 1976 excavated at the "Ironmasters' House," now called the Iron Works House, built circa 1682-83, following the cessation of industrial operations at the ironworks site. Collections management methodology is described; maps and diagrams were compiled from field notes; biases and problems with the collections were explained. Much of the site data is reinterpreted and evaluated in light of advances in historical material culture studies. Recommendations were made for further archaeological work, with an emphasis on strict vertical and horizontal controls, in undisturbed areas to address questions of both prehistoric and historic resources.

25-891 Glover, Suzanne and Duncan Ritchie

1988 An Intensive Archaeological Survey of the Hilltop Estates Development, Ashland, Massachusetts. 79 pages.

An intensive archaeological survey was conducted at the site of a proposed residential subdivision; 97 housing units, a roadway, and associated utility facilities were planned within an approximately 76 acre parcel. During the intensive survey, preliminary background research and a walk-over/surface inspection were used to stratify the project area into zones of expected archaeological sensitivity. The initial assessment indicated that the project area included some archeologically sensitive locations. Two areas of prehistoric and/or historic activity were located during the walk-over inspection. The areas of higher sensitivity received intensive subsurface testing at 5 m and 10 m intervals. Lower sensitivity areas were tested at 20 m intervals. The results of the subsurface testing were consistent with the results of the surface inspection. Surface evidence of an historic period railroad easement and small-scale quarrying activities was found during the survey. One prehistoric site was discovered, and low densities of prehistoric cultural material were recovered at three other locations (Loci 1, 2, and 3). Locus 4 represented a possible prehistoric or historic hearth/pit feature. The temporal/culture affiliation of the prehistoric site as well as Loci 1, 2, 3, and 4 is unknown. Prehistoric period use of the site and loci appears to have been limited to short-term occupations of these small temporary camps. The site and four loci investigated during the intensive survey were found to have limited informational content or had been damaged by previous construction related activity (perc tests). Additional archaeological investigation was not recommended.

25-892 Strauss, Alan E.

1988 Phase II Archaeological Investigations at the Hales Meadow Prehistoric Site in East Longmeadow, Massachusetts. 44 pages.

The Hales Meadow prehistoric site was first identified during a reconnaissance survey conducted in 1983 (see report #25-513). The site examination was conducted in order to define the site's vertical and horizontal boundaries, to assess the site's integrity, to determine its chronological and cultural affinities, and to evaluate its potential for nomination to the National Register of Historic Places. A 66% systematic surface sample was collected to understand the nature of the site and to

identify any spatial patterns that might exist. Following the systematic surface collection, test pits were excavated in areas of relatively high artifact density, at the edges of the site area, and within the wooded margin of an open field. All prehistoric cultural remains that were recovered were restricted to the uppermost portion of the plowzone. An examination of both the surface and subsurface spatial distributions of artifacts revealed a small cluster of artifacts in an area approximately 60 x 70 feet in size. Recovered diagnostic artifacts indicate that the site was utilized during the Late Archaic (Transitional), Early Woodland, and Late Woodland periods. It is not known if the utilization of the site was continuous throughout these time periods. The low density of artifacts, the location of all remains in the plowzone, and the absence of cultural features suggest that further archaeological testing at the site would not provide any additional significant data. The site was not considered potentially eligible for nomination to the National Register and no further archaeological work was recommended.

25-893 Bunker, Victoria, Elena Decima, Jane Potter, Michael Roberts, and Traci Roberts

1988 History and Archaeological of the Griffin Way Development, Tewksbury, Massachusetts. 133 pages.

An intensive survey was conducted on a 29.7 acre parcel containing a known prehistoric site (19-MD-19). Background and documentary research, a walkover reconnaissance, and shovel test pits found that only the margins of 19-MD-19, lacking integrity, were represented in the project area. Elsewhere, in Area D, a small Late Archaic site was identified, measuring ca. 10 m to 15 m in diameter. A site examination was conducted in this area with the excavation of 1 m units. Materials recovered include a felsite Squibnocket Triangle, a possible shell- fragment, and felsite and quartz debitage; a radiocarbon date of 3,080 $\pm$ 60 B.P. (Beta 27609) was obtained from charcoal in a small fire pit. No further archaeological work was recommended at the site because all significant data had been recovered.

25-894 Glover, Suzanne and Ann K. Davin

1988 Intensive Archaeological Survey, Central Abington Wastewater Facility, Abington, Massachusetts. 49 pages.

An intensive archaeological survey was conducted at projected locations of cross-country lines and pump stations for the proposed Abington town sewer system. These new facilities are being constructed in four phases, including six pump stations and seven cross-country routes located throughout the town. The intensive archaeological survey was conducted at the Step 2 design phase of project planning to allow for possible alternative project alignments had significant sites been identified. During the survey it was determined that the majority of the project area locations were either wetland, bordering wetlands, or disturbed by previous impacts. No prehistoric cultural material was recovered during the intensive survey. Historic materials recovered consisted of twentieth-century trash. One historically important area, a nineteenth-century cemetery and artificial pond/reservoir adjacent to the third part of the Pearl to Central Street cross-country route, was avoided by previous changes in the route's alignment. No further archaeological investigations were recommended for these sewer system locations.

25-895 Leveillee, Alan

1988 An Intensive Level Archaeological Survey of the Proposed Cordage Interceptor Route and Pump Station Location, Plymouth, Massachusetts. 55 pages.

Documentary and background research indicated that prehistoric sites were located in the project area. Subsurface testing revealed that the interceptor and pump station construction will take place within previously disturbed ground. No additional archaeological investigations were proposed for the project as currently planned.

25-896 Northern Middlesex Area Commission

1980 Draft. Middlesex Canal Park Feasibility Study in the Northern Middlesex Region. 60 pages.

This document puts historical information and preservation recommendations on the 19th-century canal in Billerica, Chelmsford, and Lowell in a regional perspective. The report is particularly helpful as it examines individual sections of the canal on a town-by-town basis, describes its present conditions, access, and extant canal and nearly historical features. General recommendations included marking the route and features with signs, maintenance and stabilization, designation of local historic districts in towns through which the canal passes, purchasing sections or easements, and placing recreational ways next to the canal.

25-897 Jones, Donald G.

1988 Intensive Archaeological Survey of Spectacle Island in Boston Harbor. 190 pages.

Spectacle Island is listed in the National Register of Historic Places as part of the Boston Harbor Islands Archaeological District for its known and potential prehistoric archaeological resources. Background research indicated that one prehistoric site (19-SU-38) was recorded for the island, and may contain other prehistoric sites as well. Documentary and cartographic research also indicated that Spectacle Island had been the location of a number of historical activities and enterprises from the 17th century to the present. Large-scale refuse dumping on the island during this century, however, has buried much of the island and rendered any cultural resources that may have been located in those areas inaccessible. Areas of the island that have not been buried, which include the northern edge of the north drumlin and the majority of the south drumlin, were investigated in order to determine if they contain significant cultural resources. Site 19-SU-38, a prehistoric shell midden, was identified and tested during the survey. The site produced a large quantity of soft shell clamshells, several fragments of bone, charcoal, seeds and a Neville-Variant projectile point. A Small Stemmed projectile point was recovered at the southwestern end of the terrace that contained the shell midden, but further testing showed the vicinity to have been heavily disturbed. The field reconnaissance identified the remains of five 19th century wharves, a late 19th century animal rendering plant, a 1904 range lights complex, a 20th century garbage disposal plant, diamond-shaped range markers, a possible wooden range marker, and two beached barges. No subsurface testing was conducted at these areas, but the remains visible on the surface were measured and photographed. A Phase III data recovery program was recommended for the 19-SU-38 site and the range lights were recommended for salvage or reuse.

25-898 Elia Ricardo J. and Nancy S. Seasholes

1988 Phase I Archaeological Report on the Central Artery/Third Harbor Tunnel Project in Boston, Massachusetts. 381 pages.

This report presents the results of intensive historical and existing conditions research on 90 study blocks along the approximately 7.5 mile long project corridor using a computerized map-digitizing program. Fifteen of the 90 study blocks were determined likely to contain potentially significant and intact archaeological resources. Current project plans indicate that eight of these study blocks will be impacted by the project. Phase I/II archaeological testing is recommended in these eight blocks. Seven of the 15 study blocks will not be impacted according to current plans; no testing is recommended for these areas. The remaining 75 study blocks were considered unlikely to contain significant and intact archaeological resources, and no testing is recommended for them. Part I of the report presents a description of the project and its likely impacts; the research design; methodology; and prehistoric and historical overviews of the Boston Area. Part II presents a summary of investigations of archaeological, historical, and existing conditions research for each of the 13 study areas that make up the project area. Part III contains a summary of the results of the Phase I

archaeological survey; a proposed testing methodology for the Phase I/II testing; and specific testing recommendations for the eight study blocks where archaeological testing is proposed. The study blocks recommended for testing comprise a wide variety of archaeological resources and site types of potential significance, including 17th – 18th century settlement and structures; 18th – 19th century wharf and wharf-related sites; 19th century development atop Mill Pond fill; a 19th century glassworks; and a late 19th century railroad engine house.

25-899 Hartgen, Karen S., and Elizabeth S. Pena

1988 Literature Review of the Archaeological Investigation of the Preferred Alternative of the New Neponset Valley Relief Sewer. 42 pages.

Background research and a windshield survey were used to assist the preferred alternative of a sewer system passing through the towns of Milton, Canton, Stoughton, Walpole, Norwood, Westwood, Dedham and Boston. This study augments an earlier reconnaissance report (see report #25-542). Many of the known historic and prehistoric sites in the project area have been partially or completely destroyed by development. Since the known sites lack integrity, it is unlikely that sewer construction will adversely impact any of the identified sites. Seven locations within the project area are sensitive given their proximity to known prehistoric sites, probable integrity, favorable environmental characteristics, and the presence of a National Register-listed site, Paul's Bridge in Milton.

25-900 Mowchan, Denise, and Joan Gallagher

1988 An Intensive Archaeological Survey of the Proposed Canalscape Land Development, Bourne, Massachusetts. 61 pages.

Background research and a walkover reconnaissance were conducted on a 120 acre parcel. Subsurface testing in archaeologically sensitive zones yielded two quartz flakes (locus 1) and a soil anomaly characterized by a layer of charcoal over an oxidized B soil horizon (locus 2). Neither of the loci could be associated with any cultural group or chronological period and were not considered significant. No further archaeological testing was recommended.

25-901 Dincauze, Dena F.

1988 Report of Cultural Resources Survey Along Lower Amethyst Brook, Amherst, Massachusetts. 16 pages.

As part of a university anthropology course, a limited archaeological survey was undertaken of town conservation land and a private parcel about to undergo development (see also report #25-987). Background research addressed paleoenvironmental conditions in the project area most likely to contain evidence of prehistoric cultural activity. Soil core transects were made, showing that the area had been plowed. Six, l m excavation units were placed within the project area, one of which yielded several flakes and a broken quartz biface tool from the plowzone. Late historical materials were found in one test pit and 19th century field trash was observed during the reconnaissance survey, as was a canal to supply an early 20th century ice pond. Recommendations included notifying town authorities of the likelihood of prehistoric sites in the conservation land and informing the developer of the project findings.

25-902 Strauss, Alan E.

1989 Phase II Archaeological Site Examination of the Herfco Knoll Prehistoric Site in Shirley, Massachusetts. 58 pages.

The Herfco Knoll Site was discovered during a Phase I reconnaissance of the access roads of the Hydro-Quebec Transmission Facilities, when a Late Woodland Levanna Point and several felsite

flakes were recovered. Subsequent testing during the Phase I survey recovered two projectile point fragments, a biface tip, 338 lithic flakes, and 19 pieces of shell-tempered pottery (see report #25-687). Ten shovel test pits and eight l m units were excavated during the Phase II site examination. Two loci of prehistoric activity were identified as a result of the archaeological investigations. Locus A is a high-density felsite workshop. The workshop area also included a Late Archaic Mansion Inn blade (ca. 3,000-3,100 B.P.) and a Wayland Notched point (ca. 3,600-3,000 B.P.), as well as a point tip, core, and a biface tip. Locus A probably dates to the end of the Late Archaic period and was utilized at least in part by people of the Susquehanna Tradition. Locus B yielded two projectile point fragments, 311 pieces of chipping debris, and 99 pieces of shell-tempered pottery. The Levanna point recovered from the surface during the Phase I survey is also probably associated with this locus. It is likely that Locus B represents a Late Woodland (ca. 1,300-400 B.P.) component of the site. Phase III data recovery operations are recommended for Locus A and Locus B if they cannot be avoided during the proposed construction, because they are considered to be potentially eligible for nomination to the National Register. In addition, it is recommended that the company remain on the existing access roads which have already been tested. Any new work proposed by the proponent at the Herfco Knoll site will require further archaeological investigations.

25-903 Davin, Ann K., and Denise Mowchan

1989 Intensive Archaeological Survey, Phase II Bellingham Sewer Project Area, Bellingham, Massachusetts. 57 pages.

Background and documentary research and subsurface testing were conducted in a project area with impacts that included four new pumping stations and 3,500 feet of cross-country routes. Much of the project area had previously been impacted. No prehistoric materials were found and only a limited amount of historical modern field trash was observed in plowed and filled areas. No further archaeological investigations were recommended.

25-904 Randall, Debra

1982 Phase I Archaeological Reconnaissance Survey, in Draft Environmental Impact Report, EOEA #4259, Washburn Island Preserve. 7 and 4 pages.

An archaeological reconnaissance survey was conducted on Washburn Island, located in Falmouth. Limited background and historical research were combined with a walkover inspection. Two loci of prehistoric lithic manufacturing debris were identified. Two cellar holes, a brick foundation, and a stone lined privy or well were observed, and are probably the structures indicated on mid 19th and early 20th century maps. Three other structures noted on these maps were not located during the walkover. Subsequently, an assessment was made of the ground disturbance to stratify the island's archaeological integrity in anticipation of an intensive survey. Thirty shovel test pits were excavated to confirm ground disturbances noted on the walkover. A possible prehistoric shell midden site was identified during the testing that produced three flakes and charcoal. An intensive survey was recommended to locate archaeological sites in areas not previously impacted.

25-905 Glover, Suzanne, and Alan Leveillee

1989 An Intensive Archaeological Survey of the Halifax Water Supply Facility, Halifax, Massachusetts. 62 pages.

Background research and a walkover inspection were used to stratify the locations of the proposed facilities into zones of expected archaeological sensitivity. The project area was considered to be archaeologically sensitive due to the presence of three known prehistoric sites (19-PL-446, -447, and -448) within or near the former YMCA campground. The walkover inspection failed to find surface evidence of the Ousanequin I (l9-PL-446) and Ousanequin II (l9-PL-447) sites that had previously been identified near proposed impact locations. No historic period cultural material was

discovered during the walkover, although numerous abandoned YMCA buildings dating to the mid 20th century were still standing on the property at the time of the survey. The proposed well, waterline easement, an pump station locations were tested at 5 m and l0 m intervals. The southern end of the waterline easement was not tested because of previous disturbance associated with the construction of the existing gravel road. A very low density of prehistoric cultural material (two pieces of quartz chipping debris) was recovered during subsurface testing. Historic cultural material found within the project area consisted of recent trash deposits most likely associated with YMCA camp activity. No additional archaeological investigations are recommended for the well, easement, or pump station areas. If future development is planned outside of the present impact areas, intensive subsurface testing is recommended.

25-906 Cook, Lauren J.

1989 Landscapes of Waste: The Industrial Archaeology of the Granite Railway Quarry. 67 pages.

Extensive site-specific documentary research on the Granite Railway Quarry in Quincy was gathered, tracing the business and technological history of the 19th century site. A walkover reconnaissance was conducted and descriptions of present day conditions of the site are provided at the end of the report. Recommendations include monitoring and assessment during any earth-moving activities.

25-907 Strauss, Alan E.

1989 Intensive Archaeological Survey of the proposed Holyoke Waterworks Transmission Main in Southampton and Holyoke, Massachusetts. 46 pages.

Background research indicated that the lowland sections of the project area contained a moderate to high sensitivity for prehistoric sites. Historical maps indicated that a canal was located in the immediate vicinity of the project area. Field investigations for the project included a walkover reconnaissance followed by the excavation of 61-shovel test pits in three areas that were determined to be archaeologically sensitive. Remnants of an embankment of the Hampshire and Hampden Canal (1826-1847) were identified in one section of the project area. The canal embankment had, however, been disturbed by recent housing development in the area. Subsurface testing was conducted near the Manhan River (Area 1), Moose Brook (Area 2), and Pequot Pond (Area 3). One translucent, buff-colored, microcrystalline flake was recovered from the plowzone on the west side of the Manhan River in Area 1. Additional testing in this area failed to produce additional prehistoric artifacts. The single flake suggests that tool sharpening or repair occurred but does not represent a potentially significant archaeological site. No further archaeological work was recommended.

25-908 Davin, Ann K.

1989 Intensive Archaeological Survey, Maravista Village, Falmouth, Massachusetts. 47 pages.

Background research indicated that the 5.7 acre project area was in the proximity of two prehistoric sites (l9-BN-498 and -499). After a walkover reconnaissance was conducted, shovel test pits were excavated, but no prehistoric materials were encountered. It was suggested that 19-BN-498, located northeast of the project area, had been previously impacted by construction and landscaping activities. Site 19-BN-499 was directly east, but outside the project area. No further archaeological testing was recommended.

25-909 Glover, Suzanne, and Ann K. Davin

1989 An Intensive Archaeological Survey of the Silo Marketplace Shopping Center, Carver, Massachusetts. 75 pages.

Background research and walkover reconnaissance stratified the project area into zones of sensitivity and identified an 18th century farmstead nearby and recent farm buildings on the site. Subsurface testing using shovel test pits located one prehistoric site (the Silo Market Site) and five loci of prehistoric activity. The Silo Market Site, measuring ca. 150 sq. meters and 30 cm deep, consisted of 42 pieces of quartz chipping debris. No diagnostics, tools or features were present, suggesting the manufacture and maintenance of bifacially chipped stone tools. At Loci 1 through 5, felsite and quartz debitage and the tip of an untyped triangular felsite projectile point were observed. Twentieth-century field trash was observed, but no evidence of earlier activities were located. Based on the low density and low diversity of materials at the prehistoric sites and the recent state of the historic-period activities, no further archaeological work was recommended.

25-910 Elia, Ricardo J.

1989 Archaeological Excavations at the East Ell of the Golden Ball Tavern in Weston, Massachusetts. 155 pages.

This report presents the results of archaeological excavations at the East Ell of the Golden Ball Tavern, which is listed on the State and National Registers of Historic Places. The purpose of the project was to investigate the remains of the original East Ell, dating as early as 1768 in advance of a planned expansion of the structure. The archaeological project was conducted in two phases: an exploratory testing program followed by the area excavation of the east foundation of the original ell. A total of 165 sq. ft. (18.25 sq. meters) was excavated, and 8,457 artifacts and organic samples were recovered. The principal contribution of the archaeological investigation was to establish a date of ca. 1780 for the construction of the original East Ell and to identify the ell with the "kitchen…adjoining" mentioned in a ca. 1803 inventory of the property. Previous researchers had concluded that the ell dated to the mid 19th century; instead, the structure is shown to have served as an adjunct to the main kitchen of Isaac Jones' tavern (1770-1793). The principal phases of construction and alteration for the East Ell are also defined on the basis of a synthesis of the archaeological, architectural, and documentary evidence. Among the thousand of recovered artifacts are many fragments of redware vessels. The redware can be associated with the redware pottery establishment of Abraham Hews I on the basis of both archaeological and architectural evidence.

25-911 Holmes, Richard D., Mitchell T. Mulholland, and D. Richard Gumaer

1989 Historic Background Research and Geophysical Survey of a Potential Quaker Burial Ground in Norwell, Massachusetts. 201 pages.

An historical background and archaeological remote sensing survey was conducted at a suspected unmarked Quaker cemetery. The survey was conducted to assess the potential impact of a planned residential development upon suspected burials. Historical documentary research supported the location of a 17th to 18th century burial ground in the project area. An electrical sensitivity survey was conducted on a plot of land on which two standing gravestones were noted. Subsurface testing of anomalies detected during the electrical resistivity survey did not result in the discovery of grave shafts. Several plots were not surveyed because they are within a 100 foot wetland buffer zone, protected from disturbance. Prehistoric chipping debris was observed in excavation units, but determination of site limits was not attempted during this phase of the survey. Evaluation of historical maps suggests that the cemetery will be impacted by construction. It was recommended that all level areas outside of the wetlands buffer zone be subject to systematic subsurface testing; additional background research should be conducted to further define the limits of the burial ground.

25-912 Holmes, Richard Douglas, Mitchell T. Mulholland, and Ellen-Rose Savulis

1989 Archaeological Site Location Survey at the Site of the Route 57 Relocation Project, Agawam and Southwick, Massachusetts. 124 pages.

An intensive archaeological survey was conducted and included documentary research, a walkover reconnaissance, and subsurface testing with shovel test pits. Three prehistoric sites were encountered during the survey. Two of the prehistoric sites (the Spear Cornfield Site and the Boglish Site) may be eligible for inclusion in the National Register of Historic Places. The Spear Cornfield Site contained Brewerton and Orient components. The Boglish Site contained black chert flakes and a non-diagnostic chert edge tool. Site examinations were recommended for both sites. The third prehistoric site (Spear's Pepper Field Site) contained such a low density of cultural material that it is probably not eligible for the National Register.

25-913 Gallagher, Joan, and Richard Rose

1989 Archaeological Reconnaissance Survey of the Roxbury Station Post Office, Parcel P-2C, Roxbury, Massachusetts. 84 pages.

The components of the survey were documentary research, walkover inspection, project area stratification, and subsurface testing. Research showed that the project area, in Boston, exhibited a pattern of residential and mixed residential-commercial land use during the historic period from the Colonial (1675-1775) to Early Modern (1915-1940) Periods, culminating in the occupation of the early site by up to fifteen individually-owned properties by the l960s. Along with walkover inspection, this information was used to define the site's zones of high, medium and low archaeological sensitivity. Subsurface testing by five machine-assisted and four hand-excavated units in zones of high and medium sensitivity, and seven monitored units in low sensitivity zones tested predictions made concerning the recovery of potentially significant archaeological resources. The results of subsurface testing were the failure to locate evidence of prehistoric occupation, and the observation of historic components of Colonial (1675-1775), Federal (1775-1830), and Early Industrial Period (1830-1870) material only in redeposited archaeological contexts of little integrity or significance, dating to the Late Industrial Period (1870-1915). No further archaeological investigation was recommended.

25-914 Gallagher, Joan, and Richard Rose

1989 Archaeological Reconnaissance Survey, Pavilion at Park Square, Boston, Massachusetts. 91 pages.

The proposed project area is within Boston's historic Park Square, bounded on the south by Stuart Street, on the east by Charles Street South, on the west by Broadway Street, and on the north by a line just south of Park Plaza. The planned structure will cover approximately 34,000 square feet, and will also impact the open, grassy park where the Emancipation Monument now stands. An archaeological reconnaissance survey of the project area consisted of review of primary documents, secondary sources, agency files, and geotechnical data. These data, along with a walkover inspection, provided enough information to define the area's archaeological sensitivity. Research showed that the site once lay near the western shore of the Shawmut Peninsula, and was occupied in turn by open agricultural fields, waterfront buildings, and, after the 1830s, residences and hotels associated with Park Square's major railroad terminals. After the terminals closed in 1900, the former street lines and structural density of the project area were greatly altered. The area was used as a bus depot and gasoline station with storage tanks, and a major transportation building was recently constructed. Due to this high degree of documented disturbance, there was little likelihood that intact, potentially significant resources would survive within the project area. No further archaeological investigation was recommended.

25-915 Gallagher, Joan

1989 Intensive Archaeological Survey, New Dudley Street, Roxbury, Massachusetts. 70 pages.

Reconfiguration of Roxbury, Washington, Dudley and Putnam Streets in the Roxbury neighborhood of Boston will impact three areas. The present study was conducted to stratify the project

area which was previously surveyed in 1981 (see report #25-353). The research framework considered the location of documented resources and subsequent impact that may have affected the integrity of buried remains. The greatest number of documented structures date to the Industrial (1830-1915) and Modern Periods (1915-1940). Revolutionary War Fortifications (1775 – ca. 1806), the Dudley Mansion (1639-1775), and the Universalist Church (1821-1895) were once present in the project area, but have been affected by subsequent disturbance. Machine-assisted testing was conducted in two areas to confirm the location of documented disturbance. A well and a cistern, probably constructed after 1854, were discovered, but lacked cultural material that could be associated with a specific household. A final task of the survey was the recording of the above-ground steps and foundation of the Municipal Court Building. No further testing was recommended due to the extensive degree of disturbance within the project area and the low research value of the located features.

25-916 Rosenzweig, Mark S.

1989 Cultural Resource Reconnaissance Survey, Braintree Electric Project Pipeline Extension, Norfolk County, Massachusetts. 27 pages.

A cultural resources reconnaissance was conducted for a 2.2 mile natural gas pipeline route in Braintree. The reconnaissance survey included background research and a walkover reconnaissance of the proposed route. No prehistoric or historical resources were identified within the proposed right-of-way although historical structures have been recorded in the area. Due to extensive modern development in the area and the alignment of the majority of the pipeline within existing roadways, the project right-of-way was assessed as having a low potential for containing extant cultural resources. No further research was recommended.

25-917 Raber, Michael S., and Leonard W. Loparto

1987 Intensive Cultural Resources Survey for Proposed Sewerage Facilities in Tyngsborough, Massachusetts. 9 pages.

Based on the results of a previous reconnaissance survey (see report #25-556), three cross-country pipeline routes totaling ca. 1,140 linear feet were subjected to intensive testing at 20 m intervals. Two soil auger tests were made to investigate subsurface disturbance in the area. Results of the testing found disturbed, filled and/or poorly drained soils and no significant cultural resources. It was recommended that construction proceed as planned.

25-918 Rainey, Mary Lynne

1989 A Cultural Resource Survey (Phases IA and IB) of the Proposed Algonquin Gas Pipeline Corridor: The Greater Northeast Pipeline Corporation (GNEPG) Project. 68 pages.

Background and documentary research, a walkover reconnaissance and judgmental soil coring were conducted for a portion of a 118.9 mile proposed pipeline right-of-way from Canajoharie, New York to Deerfield, Massachusetts. Massachusetts towns include Hancock, Lanesborough, Dalton, Hinsdale, Peru, Windsor, Plainfield, Ashfield, Cheshire, and Conway. The entire route was stratified in areas of high, moderate and low archaeological sensitivity based on environmental factors, proximity to known cultural resources, and prior disturbance. Three previously known archaeological sites were identified (a mill site, an historical domestic site, and a scatter of prehistoric quartzite biface fragments and lithic debris) in Plainfield. Data on the area are presented in a tabular format. No surface testing or further research was conducted for the project area since an alternative pipeline route was selected.

25-919 Glover, Suzanne

1989 An Intensive Archaeological Survey, Bradford Country Club, Bradford, Massachusetts. 92 pages.

Background research and a walkover reconnaissance were used to stratify the 105 acre Haverhill project area into zones of expected archaeological sensitivity. The initial assessment indicated that the project area included some archaeologically sensitive locations. One area of prehistoric activity was identified during the walkover inspection. No historic cultural remains were located, although sections of fieldstone walls still existed within the parcel. The areas of higher archaeological sensitivity received intensive subsurface testing at 5 m and l0 m intervals. Lower sensitivity areas were tested at 12.5 m intervals. The results of the subsurface testing were consistent with the expected archaeological sensitivity. One prehistoric site was discovered during the intensive survey, and low densities of prehistoric cultural material were recovered at two other locations (Loci 1 and 2). The temporal/cultural affiliation of Locus 1 is unknown due to a lack of features and diagnostic materials. The prehistoric deposition of Locus 2 has been attributed to the Late Woodland Period (1,000-450 B.P.) due to the presence of a Madison projectile point. The discovery of a Mansion Inn blade of the Watertown variety at the Country Club site indicates a Susquehanna cultural affiliation of the Transitional Period (3,600-2,500 B.P.). Prehistoric period use of Locus 1 appears to have been limited to a single depositional event. Cultural material was found within a relatively small area (l00 m), and no evidence of additional depositions was discovered. At the time of the intensive survey, the physical condition and integrity of the site was considered good. The Country Club site is potentially significant since single-component sites of the Susquehanna Tradition have not been widely documented in southeastern New England. Information obtained from the site could contribute to the existing database for this poorly understood cultural adaptation. Since specific project impacts to the site area were not known at the time of the survey, avoidance of this location during construction was strongly recommended. If impact to the site area could not be avoided, further archaeological investigation to determine the site's eligibility for listing on the State and National Registers of Historic Places was recommended.

25-920 Holstein, Elizabeth

1989 An Intensive Archaeological Survey of the Rocky Knolls Estate Project Area, Stoughton, Massachusetts. 54 pages.

Background research and a walkover reconnaissance were used to stratify the 42 acre project area into zones of expected archaeological sensitivity. The initial assessment indicated that the project area was being disturbed by ongoing road construction, clearing and blasting. Due to the obvious amount of disturbance, as well as the abundance of rock outcrops along with steep erratic slopes, the testing strategy was altered. The majority of the project area was tested by placing judgmental test pits between outcrops in areas with less erratic slopes. In the southeastern section of the project area, an absence of outcropping enabled two 30 m x 30 m blocks, each containing thirteen 50 cm x 50 cm test pits, to be excavated. Three felsite flakes and a felsite biface were recovered from Block 1. Two felsite flakes were recovered from Block 2. The loci of prehistoric activity have been altered due to historic gravelling activities. While prehistoric cultural material was recovered, no major concentrations existed. These materials, in generally poor context, did not represent a potentially significant site. A stone wall enclosure, likely an animal pen, was the only notable historical period feature in the project area. No further testing was recommended.

25-921 Bowser, Brenda, Rebecca Conard, Victoria Bunker, and Jamie Calhoun

1989 Cultural Resources Inventory and Evaluation at Two Alternative GWEN Sites in Acushnet, Massachusetts: The David White and Gilmore Sites. 24 pages.

Archaeological testing at alternative Ground Wave Emergency Network (GWEN) sites was undertaken at the David White and Gilmore Sites, following the recommendations of a previous reconnaissance survey (see report #25-856). Systematic subsurface testing found a plowzone scatter of mid 19th century and 20th century materials. This deposit was not considered to be significant and

no further testing was recommended.

25-922 Hoffman, Curtiss

1989 North River Archaeological Project, Transect VII--Hanson. 94 pages.

A reconnaissance survey, including documentary research and subsurface testing, was undertaken in the North River drainage in the Town of Hanson. Field methodology consisted of excavating 52 1 m square units and two .25 m square units within a linear transect with controlled random intervals between units. A total of 84 prehistoric artifacts were recovered from 8 loci, 45 from undisturbed soils and the remainder from disturbed soils. An Atlantic projectile point was the only diagnostic recovered, dating between the Late Archaic and Middle Woodland periods. Horizontal distribution of artifacts was clustered rather than randomly scattered. A brown earth pit and a fire rock scatter were the only recognizable features. Hammerstones, cores, and biface edge tools predominated. Quartz, diorite, and argillite were the lithic materials most frequently recovered. A total of 960 historical artifacts were recovered from 10 of the 13 loci, and included nails, vessel glass, iron fragments, whiteware, window glass, and bricks. Most of the historical artifacts dated to the late 19th and 20th centuries. A few of the artifacts dated to the late 18th to early 19th century. An intensive survey was recommended should the Town of Hanson plan any major construction in the area.

25-923 Glover, Suzanne and Duncan Ritchie

1989 An Intensive Archaeological Survey of the Chestnut Knoll Development, North Reading, Massachusetts. 68 pages.

Background research and a walkover reconnaissance were used to stratify the Chestnut Knoll project area into zones of expected archaeological sensitivity. The project area was considered to be archaeologically sensitive due to its close proximity to a major wetland (Cedar Swamp) of which approximately 20 acres are included within the Chestnut Knoll property. No prehistoric or historical period material was located during the walkover inspection. Moderate and high sensitivity areas received intensive subsurface testing at 5 m and l0 m intervals. Lower sensitivity areas were tested at 15 m intervals. A potential prehistoric site was located on the southern edge of the project area on a prominent ridge-like knoll where a concentration of burnt rock fragments had been exposed during percolation experiments. Subsurface testing in this area did not produce any positive evidence of prehistoric period occupation. Two pieces of prehistoric cultural material were recovered in the project area, as well as low densities of historic material scattered throughout the property. None of the prehistoric or historic period cultural materials discovered during the intensive survey was considered to be potentially significant. Additional archaeological investigations were not recommended.

25-924 Bowser, Brenda, Rebecca Conard, Victoria Bunker, and Louise Kelly

1989 Inventory and Evaluation of Cultural Resources at Six Alternative GWEN sites in North-Central Massachusetts: Towns of Hubbardston, Hardwick, and North Brookfield--Worcester County. 57 pages.

Background research and a walkover reconnaissance were conducted on each of the six alternative Ground Wave Emergency Network (GWEN) sites: the Wilbur, Burton, Girardi 1 and Girardi 2 Sites in Hubbardston, the Goodfield Site in Hardwick, and the Center Site in North Brookfield. Subsurface testing was undertaken at the Center and Burton Sites, where reconnaissance study identified a potential for buried prehistoric resources. No prehistoric artifacts were recovered. Field survey and mapping were completed at all sites, and documentary research was conducted to evaluate the historical significance of the stone walls. All stone walls on the Center, Girardi 1 and Girardi 2 Sites were not known to be associated with any important historical event or person. Any scientific or historical data potential that may have been represented by these walls was retained

through documentation. Construction at the Burton, Wilbur and Goodfield Sites was determined unlikely to result in direct, adverse effects on cultural resources, provided that certain potentially significant stone walls were avoided during construction. No further archaeological study was recommended.

25-925 Elia, Ricardo J., Donald G. Jones, and Nancy S. Seasholes

1989 Intensive Archaeological Survey of Site 1A, The Fort Rodman Military Reservation, New Bedford, Massachusetts. 133 pages.

Background research found no recorded prehistoric sites within the project area but many in the New Bedford vicinity. Historical research found that in the first half of the 19th century, the project area was the site of the Allen farmstead. In 1857, it was acquired by the U.S. Army. During the subsurface testing, a total of 13 test trenches and 95 test pits were excavated in five different areas that had been identified as having potential for prehistoric and historical resources. The results of the testing indicate that the Allen farmstead has high archaeological integrity and contains many features. The remainder of the project area was found to be largely disturbed or poorly drained. A site examination archaeological survey was recommended for the Allen farmstead and barn areas to evaluate their research potential and eligibility for listing on the State and National Registers of Historic Places.

25-926 Mowchan, Denise, Robert Goodby, and Duncan Ritchie

1989 An Intensive Archaeological Survey of the Proposed Monument Street Development, Concord, Massachusetts. 88 pages.

The intensive survey was conducted to locate and identify two archaeological sites (one prehistoric site and one Native American burial) believed to be within the project area. Five very small areas of prehistoric activity were discovered during subsurface testing. None of these locations were in the area suspected to contain prehistoric site #19-MD-68, which is described as large, multi-component site. The five loci had limited information potential and were, therefore, not recommended for additional archaeological investigation. Historic surface features encountered during the walkover consisted of stone walls, stone boundary markers, and a boundary ditch. No structural remains were located. The alleged burial site (l9-MD-395), marked by an upended stone, resembled a stone boundary marker in every detail. This stone marker, along with others, was mapped on the definitive subdivision plans as a pointed stone bound used to mark a change in the angle of property lines. Subsurface testing in close proximity to this stone marker failed to locate any cultural material or evidence for burials. The alleged grave marker was, therefore, determined to be a stone property marker. This marker, as well as the other markers which are located on the present Monument Street property lines, will not be impacted prior or subsequent to the proposed development. These markers, the stone walls, and the boundary ditch will be reserved within a 40 foot no-build buffer zone extending from the property lines inward to the parcel. Since the construction of the proposed Monument Street Development would not impact any significant prehistoric or historical archaeological resources, no further archaeological investigation was recommended.

25-927 Hamilton, Christopher E., James R. Reedy, Jr., Kenneth J. Kinkor, and D.A. Muncher

1989 The 1988 Annual Report of Archaeological Data Recovery--The Whydah Shipwreck Site, WLF-HA-1, Cape Cod, Massachusetts. 283 pages.

Underwater archaeological investigations were conducted at the 18th century Whydah Shipwreck Site, WLF-HA-1, located just off the coast of Wellfleet. During the 1988 field season, a total site area of 4,192 sq. ft. was excavated yielding 20,851 artifacts and concretions. The excavated area

consisted of approximately 17% of an estimated 24,000 sq. ft. artifact distribution. The total area of the site excavated since 1984 is approximately 6,976 sq. ft. or 29% of the main body of the site. The majority of the items recovered were lead shot (approximately 16,045); the second greatest number of items was 1,298 silver coins. Eight cannon, a bow anchor, and an intact barrel were found among the concretions and other artifacts retrieved from the site. Each of the large and medium sized items was mapped in situ and all items were provenienced to at least a 4 sq. ft. area. The concretions and artifacts were transferred to a laboratory for storage, conservation, and analysis. Field results continue to indicate that, while the site contained modern jetsam including expended rockets and bullets from World War II Camp Wellfleet located on shore near the site, no other shipwreck materials exist in the main body of the site. Excavations to the north and west of the site boundaries defined in previous seasons have revealed that the main site area is somewhat larger than previously estimated. The precise size of the main body of the Whydah Site, therefore, remains speculative. It should also be noted that due to the nature of the break-up of the vessel at the time of the wreck, and the subsequent scattering of materials by wave and current action, it is unlikely that exact site boundaries encompassing the total distribution of Whydah artifacts can ever be calculated. In order to assure sufficient funds for the conservation, analysis and reporting of artifacts already excavated, only remote sensing survey of the site area was anticipated. Further excavation of the Whydah site will depend upon the results of the remote sensing survey and the availability of funds.

25-928 Goodby, Robert G., Robert Fitts, and Duncan Ritchie

1989 Intensive Archaeological Survey of the Yankee Heights Project Area, Quincy, Massachusetts. 73 pages.

During the intensive survey, preliminary background research and a walkover reconnaissance were used to assist the extent of historic disturbance and the relative archaeological potential of various portions of the project area. The initial assessment indicated that much of the area had undergone significant disturbance from historic quarrying and landfill activity. Those areas not adversely impacted and considered sensitive for prehistoric remains were subject to intensive subsurface testing using 30 m square blocks. The results of subsurface testing yielded only two small loci of prehistoric activity, neither of which contained temporarily or culturally diagnostic material. Historical features noted during the survey included quarry pits, piles of waste rock (grout piles) and other remains (engine house, derrick base, granite workshop) of the intensive granite quarrying that took place in the 19th and early 20th centuries. The most historically significant location in the project area was the Granite Railway terminus, part of the first commercial railway in the United States and listed on the State and National Registers of Historic Places. This area has been well documented both historically and archaeologically, and will not be negatively impacted by the proposed development. No further archaeological investigation was recommended. The archaeologically sensitive areas (granite workshop complex, Granite Railway corridor and terminus) should be protected and preserved. Incorporation of these sensitive areas into proposed greenbelts or open spaces within the development was recommended.

25-929 Davin, Ann K., and Joan Gallagher

1987 Cultural Resource Reconnaissance of Camp Edwards Training Site. 245 pages.

A cultural resource reconnaissance of the Camp Edwards Training Site in Bourne, Falmouth, Sandwich, and Mashpee was conducted. Camp Edwards encompasses about 14,705 acres of the Massachusetts Military Reservation or approximately 16.5 square miles of western Cape Cod. The goal of the survey was to stratify the Training Site into zones of expected archaeological sensitivity and to locate historic and archaeological resources within Camp Edwards. The information gathered during the survey is to be used to make recommendations for future studies at the intensive survey level. Preliminary estimates were made concerning the significance of the resources and potential impacts that may occur as part of the planned renovations and construction. Extensive background research as well as a walkover reconnaissance and subsurface testing of selected

areas were conducted. The reconnaissance was designed to identify areas of high cultural resource potential within a sample area of 6,000 acres. A total of 330 acres, or a 5.5% sample of the 6,000 acres, was selected for subsurface testing. A total of 33 blocks, each 200 m square (10 acres), were placed within the project area, either in or close to areas of proposed facility construction and development. A total of 60 transects, with test pits located at 20 m intervals, were randomly or systematically placed within the blocks. A total of 675 test pits was excavated during the reconnaissance. Twenty of the 33 blocks contained no evidence of prehistoric or historic period activity. Twelve blocks contained areas of high sensitivity: six each with prehistoric sites; and an additional six with loci or isolated low density deposits of prehistoric cultural material. One block contained an isolated piece of felsite chipping debris. The only evidence of historic period activity was the presence of one stone wall and the isolated "Sal N Pry" rocks, a series of boulders with the words "Sal N Pry" inscribed on them located within the military reservation, northeast of Round Swamp. An intensive archaeological survey was recommended for those areas where construction would occur and which were determined to have moderate to high sensitivity.

25-930 Clements, Joyce A.

1989 The Maturation of the American Military: A Case Study from Fort Independence, Boston, 1800-1820. 122 pages.

Through an examination of documentary and archaeological evidence from the military garrison at Fort Independence during the period 1800-1820, a view of the early years of the U.S. Army is presented. Contemporary military and civilian documents were used to construct a history of the fort. Archaeological collections from Fort Independence were studied to reconstruct the material culture of the fort's inhabitants. The interpretation of these historical documents and archaeological remains indicates that the military establishment at Fort Independence had the potential to fulfill many of its subsistence requirements, to define and implement many legal procedures and rigidly separate its members according to rank. These characteristics are taken to represent maturity in a national military establishment because they demonstrate the independence of the army, its ability to withstand the changing tide of national opinion, and the obedience of its members to command. This suggests that the U.S. Army was a well-established and cohesive social institution, having passed its infancy by the early 19th century.

25-931 Strauss, Alan E.

1989 An Intensive Archaeological Survey of the Earl Caudill Houselot in Brewster, Massachusetts. 30 pages.

Background research indicated that no recorded prehistoric or historical sites existed within the project area. Field investigations for the project included a walkover reconnaissance followed by the excavation of ten shovel test pits in areas determined to possess the greatest archaeological potential. Two felsite flakes were found at the south edge of the proposed house foundation. Additional testing failed to produce additional cultural remains in this area. The prehistoric locus was not considered significant because of its low artifact density and limited distribution. No further archaeological investigation was recommended.

25-932 Ritchie, Duncan

1989 An Intensive Archaeological Survey of the Berkley/Dighton Bridge Replacement Project Area, Berkley/Dighton, Massachusetts. 174 pages.

The intensive survey involved three proposed alignments for the new bridge located on the east and west sides of the Taunton River in the towns of Berkley and Dighton. Background research indicated that the project area was archaeologically sensitive and had the potential to contain both prehistoric and historic period cultural resources. The three proposed alignments for the bridge replacement were within a zone of low floodplain terraces and wetlands bordering the lower Taun-

ton River estuary. This general zone was known to contain high densities of prehistoric sites ranging from large base camps to small, special activity loci. During the historic period, the area was a focal point of shipbuilding and other mercantile activity from the end of the 18th century to the late 19th century. The project area includes a group of historic period standing structures on both sides of the bridge (Bridge Village Historic District) that is considered to be eligible for listing on the National Register of Historic Places. The intensive survey identified one prehistoric site (northern alignment) consisting of a small, specialized activity area or locus containing non-diagnostic quartz chipping debris. This site was not considered to be potentially significant. Subsurface testing near two potentially significant historical structures (D. Standish, T.D. Standish Houses) along the proposed center and northern alignments in Dighton did not reveal any important archaeological components. A possible wharf site in Dighton and a stone bridge (Old Town Road) in Berkley were also identified along the route of the northern alignment. Two potentially significant historic period structures/sites found along the center alignment of the north side of Elm Street in Berkley were a late 19th century house and associated blacksmith shop (Babbitt House) and a foundation marking the former location of a small, early 19th century house (59 Elm Street). Two other historic standing structures, a late 18th/early 19th century house (Ashley House) and a small, early 19th century cottage (68 Elm Street) with potentially significant archaeological components were located within the center and southern alignment in Berkley. The historic period roadway identified in the northern alignment also crosses the center and southern alignment and includes the site of a stone bridge at the mouth of Chuckemucksitt Creek in the southern alignment. The existing Berkley/Dighton Bridge itself (constructed in 1896) is considered to be potentially significant based on the results of prior research. Recommendations include avoidance where possible for the historic standing structures (Standish House, Babbitt House and Blacksmith Shop, Hawkes property in the center and northern alignments and for the Old Town Landing north of the possible wharf site northern alignment). Additional evaluation at the site examination level and documentation are recommended for the stone bridge (Old Town Road), the Blacksmith Shop associated with the Babbitt House, the Ashley House, Goff property and cellar hole at 59 Elm Street in the southern and center alignments. No further archaeological evaluation or study is recommended for the prehistoric site (northern alignment), the yard areas of the Standish Houses, the Babbitt House and Blacksmith Shop, and the Chuckemucksitt Creek Bridge. It was unlikely that these site areas would contribute much additional information, or had not retained enough physical integrity, to warrant further investigation.

25-933 Strauss, Alan E.

1986 Archaeological Survey of the Proposed Silvertree Development Project in Taunton, Massachusetts. 95 pages.

Background research identified one unconfirmed prehistoric site (l9-BR-149) within the project area. Historical documents and maps indicated that a number of mid 19th and 20th century structures were located within or adjacent to the project area. A walkover reconnaissance identified prehistoric cultural remains on the ground surface in three locations. Recent standing structures associated with the ‘Shangri-La” health resort dating to the l960s were also identified. A standing Greek Revival cottage at 226 Scaddings Street was not considered eligible for listing on the State or National Registers of Historic Places, due to lack of integrity. A former 19th century house site was found to contain no significant archaeological resources. Subsurface testing, consisting of the excavation of 273 shovel test pits, revealed the presence of numerous buried prehistoric cultural remains. The majority consisted of isolated lithic materials in plowzone soils and consequently has limited research value. Four major areas were recommended for further archaeological investigations on the basis of the presence of apparently undisturbed prehistoric cultural remains. Diagnostic artifacts recovered, including a Squibnocket Triangle and a Neville-Variant projectile point from Area 1, indicate the presence of Middle Archaic (ca. 8,000-7,000 B.P.) and Late Archaic (ca. 5,000-3,000 B.P.) cultural resources.

25-934 Roberts, Michael (Editor)

1989 The Archaeology and Site History of 75 State Street. 75 pages.

Background research and an intensive archaeological survey indicated that much of the project area in downtown Boston had been significantly disturbed by 19th and 20th century cellar construction. With the encouragement and cooperation of the developer, however, archaeological monitoring was undertaken through the construction phase of the project. Circumstantial evidence of the Contact Period shoreline, Colonial Period wharves, and a 17th or 18th century well with a wooden water pipe were recorded. Dendrochronological samples of wharf timbers were analyzed and indicate a mid 18th century date. In addition to locating the vestigial remains, archaeological monitoring confirmed the high degree of disturbance, even in areas of the project anticipated to have relatively good integrity. Included with the report is a non-technical narrative of the project area that was used by the developer in marketing and advertising the new office building.

25-935 Ritchie, Duncan

1989 An Intensive Archaeological Survey of the Madaket Road Bicycle Path, Nantucket, Massachusetts. 84 pages.

An intensive archaeological survey was completed within the proposed easement for the construction of a bicycle path, six miles in length. The initial stratification of this easement into zones of expected archaeological sensitivity was based on the results of background research and a walkover inspection. This evaluation indicated that the project area contained extensive zones of moderate to high archaeological sensitivity. Several previously known prehistoric and early historical (17th century) archaeological sites were identified and environmental settings likely to contain other unknown sites were in close proximity to the project area. Two prehistoric sites were identified within the easement from cultural material found on the surface and in shovel test pits. The Lizard and Swain Hill sites yielded small amounts of chipping debris (rhyolite, porphyritic felsite), but the temporal/cultural affiliations of these loci are unknown. The only historic period cultural resource located within the easement was the probable site of a small house near Crooked Lane. Ceramic and glass sherds recovered from test pits indicate that the structure was constructed and occupied from the early to mid 19th century to the early 20th century. Due to previous disturbance, no distinct structural remains survived. None of the three archaeological sites identified during the intensive survey were considered to be potentially significant, and no further archaeological investigations were recommended.

25-936 Fitzgerald, Joyce, and Joan Gallagher

1989 Archaeological Reconnaissance Survey, One Lincoln Street Development, Boston, Massachusetts. 83 pages.

An archaeological reconnaissance survey was conducted of the One Lincoln Street project area in downtown Boston. Proposed plans include construction of a single structure, with a 35-38 story office tower in the southeast corner and 6-10 story sections on the remainder of the site. The reconnaissance survey consisted of documentary research, a review of geotechnical data, walkover inspection, and project area stratification. This resulted in the definition of the project area's archaeological sensitivity. The documented land use of the parcel shows a pattern of increasing complexity and structural density through time. Prior to the Revolution, it was part of the Old South End's open fields, with scattered houses and gardens. During the later Federal Period, it remained a residential area, with gradually increasing density and major landfilling events occurring in the tidal flats south of Essex Street. This pattern of increasing density continued into the later 19th century, with a shift from residential to commercial land use. This continued until the fire of 1872, which destroyed almost the entire central business district of Boston. While on the fringe of a burnt zone, the project area was affected by the massive post-fire rebuilding program. By the late 19th century, the shift to commercial use of the property was complete. This pattern continued until the loss of Boston's manufacturing base and the increasing automobile traffic in the city made it necessary to replace commercial structures with parking lots and garages after the 1940s. The con-

struction of these parking facilities was the latest phase of site land use. Due to a high level of documented 19th and 20th century disturbance, significant archaeological deposits were not expected to be present, and no further archaeological investigation was recommended.

25-937 Carlson, Catherine C., and Richard Douglas Holmes

1988 Archaeological Locational Survey for the Proposed Erving Industrial Park Site, Erving, Massachusetts. 70 pages.

Background research and subsurface testing were conducted on three parcels within a proposed industrial park. A fourth parcel included in the planned industrial park was not available for field inspection during this locational until permission for subsurface testing was received. Two hundred-twenty shovel test pits were excavated in the approximately 28 hectare (68 acre) project area. No prehistoric archaeological remains were found on the surveyed properties. Since no significant historical or archaeological properties were identified, no further investigation of the three parcels was recommended.

25-938 Holstein, Elizabeth

1988 Reconnaissance Level Archaeological Survey, Massachusetts Water Resources Authority Residuals Management Facilities Project. 148 pages.

A reconnaissance archaeological survey was conducted on seven proposed sites being considered for various Residuals Management Facilities, three in Walpole, and one each in Lynn, Wilmington, Stoughton, and Malden/Revere. The purpose of the survey was to assess the archaeological sensitivity through background research and environmental attributes as well as to locate cultural resources within each project area. A stone feature was located at the WLP-13/15 site in Walpole, but at this level of investigation the date or function of the feature could not be determined. Buildings eligible for the National Register of Historic Places were present at the MAL-0l site in Malden and the WLP-07 site in Walpole. Based on the results of this survey, it was recommended that existing cultural resources as well as moderate to high sensitivity areas be avoided. If avoidance was not feasible, additional archaeological investigations were recommended to locate and identify prehistoric and historic sites in the project areas and to determine the potential significance of the standing structures and features (see report #25-941)

25-939 Glover, Suzanne

1989 An Intensive Archaeological Survey Norton Family Housing. Norton, Massachusetts. 69 pages.

Background research and walkover inspection were used to stratify the project area into zones of expected archaeological sensitivity. Background research indicated that the project area possessed a strong likelihood for containing prehistoric resources, due to the presence of two known prehistoric sites, Newcomb Street Site (19-BR-188) and Terex Site, in the immediate vicinity. The gently sloping, well-drained terrace in close proximity to the Canoe River also contributed to the project's high archaeological sensitivity. No evidence of prehistoric activity was identified during the walkover inspection. Historic period remains visible on the property were limited to a probable cart path along the eastern boundary from Newcomb Street. This cart path could have been associated with an adjacent homestead dwelling that appears on historic maps as early as 1830. No structural evidence of this 19th century dwelling or outbuildings was found within the project area. Intensive subsurface testing consisted of six, 30 m x 30 m sampling blocks and five judgmental transects. The southeast corner of the parcel closest to the reported Terex site location was tested using 5 m intervals. Other sensitive areas were tested at l0 m intervals. No prehistoric cultural material was recovered during the intensive survey. No evidence of the previously identified Terex Site, situated on a small terrace adjacent to the southeastern project boundary, was found in test pits excavated within the project area. Small quantities of 18th through 20th century cultural material were

found scattered across the western two-thirds of the project area in a plowzone horizon. The historical artifacts were interpreted as field debris and were not considered to represent a potentially significant archaeological deposit. No further archaeological investigation was recommended.

25-940 Nassaney, Michael S.

1988 Reconnaissance Background Study and Archaeological Locational Survey for the Proposed Turners Falls Heritage State Park, Turner Falls, Massachusetts. 177 pages.

An intensive archaeological survey was conducted on the sites proposed for the Turners Falls State Heritage Park, in Montague. Fifteen shovel test pits and two backhoe trenches were excavated in the project area. The remains of a 19th century paper mill and a hotel were identified during the survey, both contributing elements of the Turners Falls National Register Historic District. The site of the oldest house in Turners Falls was also located during the survey. Portions of a 19th century blacksmith shop, partially visible on the surface, were exposed and drawn to scale. Although the forge and other architectural remains were identified, they are not considered eligible for the National Register of Historic Places. Prehistoric "relics" were reportedly found when the hotel was constructed in the l870s. Quartzite and chert chipping debris and a possible prehistoric feature (charcoal concentration) were found during the survey in four units excavated nearby. Management recommendations called for further investigations of the paper mill, hotel, oldest house, and prehistoric site, should impacts be planned in these areas.

25-941 Davin, Ann K., and Edna Feighner

1989 Intensive Archaeological Survey, MWRA Residuals Management Facilities and Landfill, Walpole MCI, Walpole, Massachusetts. 47 pages.

An intensive archaeological survey was conducted of the 94 acre proposed project area, involving background research and fieldwork. The stratification of the project area into zones of archaeological sensitivity had occurred during the reconnaissance survey (see report 25-938). Subsurface testing included both random and judgmental 30 m x 30 m blocks within areas ranked as high or moderate. Judgmental transects were also located in smaller areas with high sensitivity. A total of 308, 50 cm x 50 cm test pits were excavated during the intensive survey. Window glass fragments recovered from one test pit represented the only cultural material found during the subsurface testing. No evidence of prehistoric utilization of the project area was found. No further archaeological investigations were recommended.

25-942 Pendleton, Sally

1989 The Prince Hall Mystic Cemetery, Arlington, Massachusetts: A Geophysical Survey and Archival Study. 55 pages.

Background research and remote sensing for gravesites were conducted in the Prince Hall Mystic Cemetery in Arlington, a barren, urban lot that was the site of possibly the earliest African-American Masonic cemetery in the country. No grave markers were visible in the 9,491 square foot parcel. Electromagnetic conductivity meter readings were taken at 1 m intervals on a 20 m x 25 m grid and were recorded by hand on graph paper. Proton magnetometer readings were taken at 0.5 m intervals and were recorded on a floppy disk. Unexpected problems made it impossible to analyze the proton magnetometer data, and interference from power lines, fences, and machinery may have affected the electromagnetic conductivity meter readings. A large, roughly 4 sq. meters, anomaly was centrally located on the street side of the lot, and, a few other small isolated anomalies. A partially buried mass of concrete or cement embedded with bits of glass and transfer-printed ceramics was located in the northwestern quadrant of the lot. Documentation on only two burials was found, but other burials may be present. Since excavation was not permitted at the site, it was not possible to determine whether the anomalies detected were burials. It was recommended that further documentary research be conducted to locate and identify graves in the lot. A draft Na-

tional Register nomination for the cemetery was included as an appendix to the report.

25-943 Nassaney, Michael S.

1989 Archaeological Locational Survey for the Site of the Proposed Montague Industrial Park, Turners Falls, Massachusetts. 68 pages.

An intensive archaeological survey was conducted at the proposed Montague Industrial Park in Montague. Two hundred and thirty shovel test pits were excavated in the approximately 27 hectare (64 acre) project area. No prehistoric archaeological remains were found. Extremely few historical artifacts were found scattered on the property, and no significant artifact concentrations or historical features were encountered. Since no significant resources were identified, no further archaeological investigation was required.

25-944 Dunford, Frederick J.

1989 A Summary of Documentary Research Pertaining to the Question of Historic Period Burials Located in the Vicinity of the Proposed Elliott Road Subdivision, Centerville, Massachusetts. 51 pages.

Documentary research and a walkover reconnaissance were performed to evaluate the possibility that the proposed Elliott Road Subdivision, located on the former Perry Farm in Centerville, Barnstable, would impact a number of unmarked historic period burials. Neighborhood tradition suggested that the grave of a Native American named "John Long Fingers," and those of several Perry children who died during the late 19th century, were located in the vicinity of lots 9 and 20 of the proposed subdivision. Because cemetery records are no longer extant, extensive documentary research could not conclusively determine whether the Perry children were buried at the family plot at a nearby cemetery. According to documentary information, "John Finger," while not a Native American, did sell a parcel adjacent to the Perry Farm in 1873. His death was not recorded in Barnstable death records. It was recommended that the alleged gravesite of John Finger, located in lot 9, be examined archaeologically. An archaeologist should monitor the construction activities in lots 9 and 20, where, according to neighborhood tradition, the Perry children were buried. While there were no known prehistoric sites located within the bounds of the proposed subdivision, the area did possess several environmental and topographic attributes that may have been attractive to prehistoric populations. The wetland at the center of the project area may have provided desirable resources during the prehistoric period. It was suggested that an archaeologist monitor construction activities.

25-945 Strauss, Alan E.

1989 Intensive Archaeological Survey of the Proposed Mill Brook Residential Development in Rockland, Massachusetts. 54 pages.

Background research indicated that no recorded prehistoric or historical sites were located within the project area, although the property was used for the manufacture and storage of fireworks and ammunition during the mid-1900s. Field investigations for the project area included a surface inspection followed by the excavation of 53 shovel test pits in four areas that were determined to be archaeologically sensitive. Several historical features associated with the National Fireworks Company operations were identified during the reconnaissance survey; however, these were not considered to be significant due to a lack of integrity. One prehistoric argillite flake was recovered during the subsurface investigations; further testing revealed no additional cultural remains. No significant prehistoric or historical remains were recovered during the subsurface testing and, therefore, no further archaeological work was recommended.

25-946 Ritchie, Duncan, and Denise Mowchan

1989 An Intensive Archaeological Survey of the Watertown Dairy Project Area (Parcels C and D), Wayland, Massachusetts. 79 pages.

The results of a previous survey were used to develop a strategy for conducting intensive level subsurface testing in the Watertown Dairy project area. The initial assessment indicated that the project area contained some archaeologically sensitive locations. These high sensitivity areas received the most intensive testing at 10 m intervals. Lower sensitivity areas were tested at intervals ranging from l2.5 m to 20 m. One bifacial tool blade of felsite was recovered from the surface of Parcel C, but subsurface testing around this location failed to yield additional prehistoric material. Two other very small loci of prehistoric activity (chipping debris) were also found in Parcel C. Moderate densities of late 18th and 19th century field trash were recovered. These may be associated with 19th century occupations of the Dowey/Maynard House in Parcel D. No subsurface archaeological deposits with good integrity were found to be associated with this 19th century standing structure. An abandoned 17th/18th century road was also discovered in Parcel C of the project area. The small prehistoric loci in Parcel C and the archaeological component of the Dowey/Maynard House in Parcel D were not considered to be potentially significant. The 17th/18th century roadway was part of a system of early roads that could be important for reconstructing early historic period settlement patterns in Wayland. It was recommended that the roadway be avoided during any future construction activity. No further archaeological investigations were recommended for parcels C and D.

25-947 Jones, Donald G.

1989 Results of Intensive Archaeological Surveys of Sites 40 and 47, Alternative Proposed Sites for Solids Disposal Facilities, in New Bedford, Massachusetts. 68 pages.

Intensive archaeological surveys were conducted of Sites 40 and 47, two alternative proposed sites for solids disposal facilities in New Bedford. The intensive archaeological surveys consisted of background research, field reconnaissance, and subsurface testing. Background research indicated that no prehistoric sites were recorded for either project area, but that numerous sites were recorded in similar topographic regions in the area. Both Site 40 and 47 were located adjacent to the New Bedford/Dartmouth town line, away from the centers of historical activity. Both sites were considered to have high potential for prehistoric sites and low potential for historical ones. Level, well-drained portions of the sites were selected for subsurface testing. A fieldstone wall that possibly served as a pasture or boundary wall during the historical period was identified in the northeast portion of Site 40; no evidence of historical sites, with the exception of recent access roads and modern campfire hearths, were identified at Site 47. Subsurface testing at Site 40 consisted of the excavation of 186 shovel test pits in the northeastern portion of the site. A total of 87 artifacts, including both prehistoric and historical materials, were recovered from Site 40. The prehistoric materials consist of quartz angular waste, flakes, a blocky fragment and an angular cobble and an argillite Neville-Variant projectile point, dating to the Middle Archaic Period. The historical artifacts recovered consist primarily of late 19th and 20th century glass and corroded iron objects. Subsurface testing at Site 47 consisted of the excavation of 169 shovel test pits in the south central portion of the project area. A total of 75 artifacts, including both prehistoric and historical materials, were recovered from Site 47. The prehistoric materials consisted of quartz flakes, angular waste, and blocky fragments, a possible quartz biface fragment, a quartz projectile point midsection, argillite flakes, and a felsite biface fragment. The projectile point fragment may be a portion of a Small Stemmed or Orient point dating to the Late Archaic/Early Woodland Period. The historical materials consist primarily of late 19th and 20th century ceramic, glass, and metal fragments. The prehistoric materials recovered from Sites 40 and 47 were considered to represent potentially significant archaeological deposits. Historical deposits were not considered to be significant at either site. A Phase II site examination was recommended for the portions of Sites 40 and 47 where prehistoric materials were recovered.

25-948 Rainey, Mary Lynne

1989 A Cultural Resource Survey (Phases 1a and 1b) of the Proposed Algonquin Gas Pipeline Corridor: The Transportation Service for Cogenerators Project (TSCP). 50 pages.

A cultural resource survey of the proposed Transportation Service for Cogenerators Project (TSCP) was conducted. Modifications and/or major additions to a natural gas transmission system were included in the proposal. A phase 1a survey was completed for six proposed pipeline loops in Massachusetts (Avon, Brockton, Medway, Millis, Holliston, and Sherborn), Connecticut and New York; one proposed 25 acre compressor station in Connecticut; and one proposed meter station in Bellingham, Massachusetts. Phase 1 subsurface testing was completed on two of the Connecticut pipeline routes. The purpose of the phase 1a survey was to identify the presence of known cultural resources within or near the project areas, and to assess the potential for previously unidentified cultural resources to be present within the project area. The purpose of the phase 1b was to locate cultural resources through subsurface testing of those archaeologically sensitive areas identified during the phase 1a portion. Through background research, the survey resulted in the stratification of the proposed pipeline routes and facility sites into area of high, moderate and/or low archaeological sensitivity. Subsurface testing of the 7 mile proposed Oxford pipeline route, between Oxford and Southbury, CT resulted in the location of two prehistoric archaeological sites: a Late Archaic site along the Pomperaug River and a Late Archaic site on a small terrace of the South Branch Creek. During the survey, an alternative pipeline proposal was selected by the lead federal agency and the survey was cancelled. No further archaeological work was conducted.

25-949 Mowchan, Denise

1988 An Intensive Archaeological Survey of the Proposed Hayes Farm Subdivision Carlisle, Massachusetts. 73 pages.

An intensive archaeological survey was designed to locate a prehistoric site (19-MD-470) believed to be within the 60 acre project area, as well as other previously unidentified archaeological resources. The subsurface testing strategy focused on obtaining coverage of each lot to be developed as well as the proposed access road. Three very small areas of prehistoric activity (loci) were discovered during subsurface testing. These loci, consisting of four quartz flakes and a single piece of quartz chipping debris, were found in the wooded section of the project area, but not in the vicinity of the reported location of site 19-MD-470. The three loci had limited information potential and were therefore not recommended for additional archaeological investigation. Intensive subsurface testing did not produce any prehistoric cultural remains associated with site 19-MD-470, indicating that this site was not located within the project area. It is likely that the exact location of this site was north of the project area, and was overestimated in size when it was originally reported. No further archaeological investigation was recommended.

25-950 Fitch, Virginia A., and Denise Mowchan

1988 Intensive Archaeological Survey, Lyman Estate, “The Vale,” Waltham, Massachusetts. 91 pages.

An intensive archaeological survey was conducted at the Lyman Estate, “The Vale,” listed on the State and National Registers of Historic Places. The project which included both hand and machine-assisted excavation was undertaken as part of planning for landscaping improvements and new construction. Testing revealed the presence of scattered historic period cultural materials; a brick drain related to the house, and evidence of past landscaping and land use activities. No prehistoric cultural materials were recovered. It was recommended that the 19th century brick drain system be flagged for avoidance during construction.

25-951 Raber, Michael S.

1988 Cultural Resource Reconnaissance of the Proposed King James Estates in Taunton, Massachusetts. 23 pages.

Background research, a walkover inspection, and soil testing to assess drainage conditions were conducted for the proposed 150 acre project area. Four areas were identified as sensitive for potentially significant prehistoric resources, totaling about 41 acres. These areas could contain prehistoric sites with significant data for understanding regional and local Native American culture. Area C may also contain archaeological material associated with 19th or 20th century outbuildings, such as scattered remains of common domestic and rural activities (farming, hunting, etc.), which are presently well-documented and would probably not yield much additional information. Intensive subsurface testing was recommended for those areas identified as sensitive (see report #25-836).

25-952 Mulholland, Mitchell T., David Bernstein, Richard Douglas Holmes, and Ellen-Rose Savulis

1989 Archaeological Reconnaissance Survey for the Proposed Tennessee Gas Company Pipeline, Niagara Settlement Project, Central Massachusetts. 105 pages.

An archaeological and historical reconnaissance survey for an 11.9 km (7.4 mile) proposed pipeline was conducted. The linear project area passes through the towns of Longmeadow, East Longmeadow, and Agawam. The project consisted of documentary research, stratification of the area into high, moderate, low, and no potential to contain sites, and a walkover. In all, 5.1 km (3.2 miles) were determined to have a moderate to high potential to contain subsurface prehistoric or historical sites. Subsurface testing, including shovel test pits and backhoe trenches were recommended for sensitive areas.

25-953 Carlson, Claire C., Ricardo J. Ella, and Thomas F. Mahlstedt

1989 Intensive Archaeological Survey of the Proposed 69 kV Electrical Transmission Line in Pepperell and Dunstable, Massachusetts. 73 pages.

Background research for the project area indicated that although no known sites were recorded, portions of the project area were highly sensitive for prehistoric sites. The historical potential of the survey area was considered to be low. A systematic field reconnaissance identified two loci of prehistoric cultural resources and one locus of historical artifacts in two plowed fields adjacent to the Nashua River. Locus 1 contained two quartz Small Triangle projectile points, a quartz Small Stemmed projectile point, and a small amount of lithic debitage; Locus 2 consisted of a single prehistoric chert flake. Locus 3 contained historical artifacts, including ceramics dating from the early 19th through 20th centuries. The three loci identified on the surface were located adjacent to but outside the impact area for the project. Subsurface testing included the excavation of 189 shovel test pits at 47 proposed electrical structure locations. Twenty-nine structure locations were eliminated from testing on the basis of steep slope, disturbance, and standing water. Four test pits were excavated at each structure location; additional bracket units were dug around pits containing potentially significant cultural materials. Prehistoric artifacts were discovered at two structure locations, but supplemental testing indicated that these were low-density occurrences and not significant resources. Artifacts of the historical period consisted of a low-density scatter of mostly recent material. The cultural material discovered during the testing was not considered to be potentially significant, and no additional testing was recommended. It was recommended, however, that surface Locus 1 and Locus 3 be flagged for avoidance during the construction phase of the project.

25-954 Keene, Arthur S. (Compiler)

1989 Collected Papers from the 1985 Field Season at the Bark Wigwam Site, Northampton, Massachusetts. 130 pages.

A preliminary investigation was undertaken at the Bark Wigwam Site (19-HS-280, -281, -282), a late prehistoric and Early Contact Period occupation along the Connecticut River in Northampton. The purpose of the investigations was to establish the integrity of the site and to evaluate its potential for further research. Surface collection, aerial photography, soil chemistry, soil resistivity surveys and proton meter surveys were conducted at the site. These data were supplemented by the

excavation of a dozen shovel test pits. Two Native American burials were discovered and excavated, and geophysical surveys revealed a number of anomalies. The report consists of seven papers summarizing the work done by field school students. Topics include history (title search, land use, etc.) geophysical surveys, burials, geology, paleoethnobotany, and economic botany.

25-955 Gallagher, Joan

1989 Fieldwork Component of the Site Examination for the Roy Avenue Mill Complex, Attleboro, Massachusetts. 94 pages.

Background research and a walkover were completed for the Roy Avenue Mill Complex in Attleboro. Subsurface archaeological testing was undertaken, determining the horizontal and vertical boundaries, function, internal configuration, and integrity of the site. Demonstrative and predictive statements were systematically evaluated to identify the function of the site, initially interpreted as a possible mill following an intensive survey (see report #25-739). Structural elements and the cultural material assemblage show that the complex dates to the late 19th and early 20th century, and was used as agricultural outbuildings rather than as a mill. There were 2,016 historical artifacts recovered, including some diagnostic materials such as ceramic sherds, specific types of nails, bottle glass, and an impressed firebrick. Prehistoric artifacts were few, consisting of quartz, Attleboro red felsite, and other felsite lithic debris. Cultural resources in the project area were determined to be ineligible for the National Register of Historic Places due to their comparatively low research significance.

25-956 Raber, Michael S., and Leonard W. Loparto

1987 Cultural Resources Reconnaissance for the Proposed Berkley Middle School Addition, Town of Berkley, Bristol County, Massachusetts. 21 pages.

Background research, walkover inspection, and soil auger tests were conducted for a proposed 32,000 sq. ft. project area. Walkover and background results did not indicated any especially sensitive areas within the project site, but did confirm extensive disturbance within the cleared area around the existing school building. Undisturbed soil profiles in other tests were all culturally sterile. There was however, a relatively narrow band across the project area, proposed for filling to raise surfaces several feet above existing surfaces, which contained sandy, relatively well-drained and rock-free soils that could contain potentially significant prehistoric resources. In this area it was recommended that there be minimized tree up-rooting or other soil-removing activities, and filling over the area with as little disturbance as possible, so that at some future date it would be possible to test the area for the presence of prehistoric resources.

2 5-957 Morin, Edward, and Jonathan Lothrop

1989 Phase I Intensive Archaeological Survey of the Heath Brook Plaza Project, Town of Tewksbury, Middlesex County, Massachusetts. 22 pages.

An intensive locational archaeological investigation on a proposed expansion of a 15.4 acre shopping plaza was conducted. The investigation consisted of background research, a walkover reconnaissance with soil augering, and subsurface testing. The project area included the location of a recorded prehistoric site, the Heath Brook Site (19-MD-22), discovered in the l940s, and examined by Ripley Bullen. The walkover and soil augering identified two areas (Area A and Area B) where the ground was fairly undisturbed, totaling about 8.3 acres. Subsurface testing was conducted in these two areas. A total of 126 shovel test pits was placed in Area A, a 6 acre tract located to the north of the existing plaza. Nine of these shovel tests produced historical cultural material, consisting of undecorated whiteware, bottle glass, and window glass fragments. These historic artifacts were not considered significant, and no prehistoric artifacts were recovered in this area. In Area B, a 2.3 acre tract, a total of 26 shovel tests were initially placed along four transects. In five of these units, lithic material was found below the plowzone within a 15 m x 30 m area. An additional 16

test units were excavated, of which six yielded prehistoric materials. One quartz core or core fragments, 43 pieces of chipping debris (36 flakes and 7 shattered) and a fire-cracked rock were recovered at an average depth of 35 cm below the surface in a 40 m x 40 m area. Debitage raw material consisted of felsite, quartz, and quartzite. It was suggested that this portion of the Heath Brook Site was used as a workshop area during occupation of the site and may provide important information on prehistoric settlement and activities within the region. The site was considered potentially eligible for listing on the State and National Register of Historic Places, and a Phase II investigation was recommended.

25-958 Leveillee, Alan

1989 An Archaeological Approach to a Suspected 18th and 19th Century Graveyard, Investigations Along the North River, Norwell, Massachusetts. 111 pages.

Background research and subsurface testing was conducted to determine whether or not subdivision development of the 2.1 acre project area would have an impact on unmarked burials associated with the Wanton (Quaker) Cemetery. A total of 84, 0.5 m x l m hand-dug test pits were excavated in a staggered grid pattern at 7.5 m intervals across the project area, supplemented by a total of 21, 2 m x 8 m machine-assisted test trenches. No features which would indicate human burials were encountered. A total of 882 pieces of prehistoric cultural material were recovered, in the area designated the Blackthorne Site. Chronologically diagnostic artifacts (including one Neville point (ca. 5,000-3,000 B.P.) and four Squibnocket Triangles (ca. 5,000-3,000 B.P.)), associated lithic debitage, and several fire-related features were found. Over 2,400 late 17th century to mid-l8th century historical artifacts were recovered in the area designated the Wanton Site. The site appears to be associated with either a residence or buildings associated with the Wanton shipyard facilities along the North River. Locating the site of the Wanton dwelling would facilitate the search for the associated cemetery, believed to be located “a few rods northeast” according to documents. It was recommended that impacts to this site area be avoided during planned development. If it cannot be avoided, further archaeological investigations were recommended.

25-959 Loparto, Leonard W.

1990 Archaeological Intensive Survey for Unmarked Human Burials in Two Areas of the Beechbrook Apartments Project, Gloucester, Massachusetts. 55 pages.

An intensive (locational) archaeological survey was conducted on a proposed project area contiguous to a modern cemetery to determine whether or not any unmarked graves would be impacted by construction activities. The study focused on the possible presence of late 19th and 20th century unmarked human burials within the project area, although care was also taken to identify any prehistoric or other historical cultural material which may have been present. Two areas were investigated, both along the route of proposed access road. Area I included a parcel approximately 1,440 square feet (133.90 square meters) in size, Area II approximately 2,800 square feet in size (260.01 square meters). Background research, a walkover survey, hand excavation and subsequent stripping of soil by light equipment failed to locate any trace of human burials or other significant cultural resources in either test area. No further archaeological or historical studies were recommended.

25-960 Mulholland, Mitchell T., and Richard Douglas Holmes

1989 Archaeological Site Locational Survey at the Site of the Radiobeacon System, Hatfield, Massachusetts. 60 pages.

The study included documentary research, a walkover reconnaissance, and subsurface testing with 18, 6 m x 3.5 m backhoe trenches. The trenches were excavated to depths of approximately 2 m. One fire-cracked rock (possibly of cultural origin) was found during the survey. One small, burned feature of probable prehistoric origin was found at a depth of 115 to 135 cm below the surface in a

buried B-horizon. It was recommend that the feature be flagged before construction beings in order to avoid inadvertent impact. No further archaeological survey was recommended.

25-961 Nassaney, Michael S., Richard Douglas Holmes, and Carolyn Hertz

1989 Archaeological Locational Survey for the Site of the Proposed Deerfield Technology Park, Deerfield, Massachusetts. 102 pages.

A surface reconnaissance was conducted over plowed fields with good surface visibility and 202 shovel test pits were excavated in the approximately 43 ha (104 acre) project area. Three prehistoric artifacts (a quartz Levanna Triangle, a large jasper flake, and a possible quartz scraper) were found on the surface, but no subsurface prehistoric archaeological remains were recovered. Few historic artifacts such as broken window glass, clinkers, shell, brick, ceramics, and metal, were found scattered on the property, and no significant artifact concentrations or historic features were encountered. No significant historic archaeological properties were identified through background research. On the basis of the archaeological survey and background research no impact to significant archaeological resources was anticipated from construction activities. No further archaeological investigation was recommended for the project area.

25-962 Strauss, Alan E., and Brendan J. McDermott

1990 Intensive Archaeological Survey of the Proposed Access Roads, Laydown Areas, Relocated Structures, and Timber Clearing for the New England/Hydro-Quebec Phase II Transmission Line Facilities, Volume 2: Massachusetts. 128 pages.

An intensive archaeological survey was conducted of 45 access roads, one laydown area and one timber clearing area for the Hydro-Quebec (Phase II) project in Massachusetts. Massachusetts' towns include Tyngsborough, Dunstable, Groton, Ayer, Shirley, Lancaster, Leominster, Sterling, West Boylston, Boylston, Shrewsbury, Grafton, Millbury, Sutton, Upton, Milford, and Medway. Field investigations consisted of a surface reconnaissance of east area to be impacted followed by the excavation of 560 shovel test pits and 4, 1 m x 1 m excavation units in areas that were determined to be archaeologically sensitive. Ten prehistoric sites and two historical sites were examined during the survey. Five of the prehistoric sites were occupied during the Late Archaic Period (6,500-3,000 B.P.). These sites, located in Tyngsborough, Sterling (2), Shrewsbury, and Grafton, contained cultural materials such as quartz small Squibnocket Triangle points, a felsite Mansion Inn blade base fragment, quartz Small Stemmed points, quartz chipping debris, and flakes of quartz, quartzite, felsite and chert. One site, located in Sterling, was placed in the Middle Woodland Period (1,800-1,100 B.P.) based on the three pottery sherds that were recovered. One site in Shirley was determined to be occupied during the Middle to Late Woodland Periods (1,800-400 B.P.). A Levanna point, 19 pottery sherds, and felsite, volcanic, and quartz flakes were recovered at this site. The three remaining prehistoric sites in Shrewsbury (2) and Grafton contained no diagnostic materials, and, therefore, could not be dated. Both 19th century historical sites were located in Upton. The first contained a dry-laid stone foundation and two stone-lined wells. The second was a mill complex. Four of the ten prehistoric sites had been studied previously during a 1985 survey of the same project area (see report #25-769). Five of the prehistoric sites were considered unlikely to yield significant information and no further work was recommended. Recommendations were made to protect the remaining sites, including using specific access roads or spreading protective layers of crushed rock aggregate over sites on proposed access roads, as well as flagging specific sites for avoidance by construction crews. If these recommendations could not be followed, as in the case of the Herfco Knoll Site, then additional work was required. In the case of the Herfco Knoll Site, these recommendations could not be followed and a site examination was conducted (see report #25-902).

25-963 Elia, Ricardo J., and Al B. Wesolowsky (Editors)

1989 Archaeological Excavations at the Uxbridge Almshouse Burial Ground in Uxbridge, Massachusetts. 512 pages.

The Uxbridge Almshouse Burial Ground (ca. 1831-1872) was discovered in the right-of-way of the proposed Route 146A reconstruction project. As the highway was in the final stage of planning and avoidance of the cemetery was not possible, an archaeological data recovery was performed. Historical and documentary research, osteology of the skeletal remains, a study of the artifacts from the graves, and identification of coffin wood were performed. Archaeological methods included plotting deeded cemetery boundaries, the excavation of shovel trenches to locate graveshafts, backhoe trenches to confirm the cemetery limits, and hand excavation of grave contents. Documentary research established the socioeconomic context of poor relief in Almshouse, information on food and nutrition for Almshouse residents, death and burial of paupers, and an attempt to identify individuals buried in unmarked graves from documentary and osteological data. In contrast to what is generally expected for members of socioeconomically marginal classes, individuals who received economic relief from the town were often represented in records, due to the structure of the state and town bureaucracy. The osteology of the cemetery population identified the remains of 32 individuals in 31 graves, 24 adults and 8 children; one grave contained the remains of a young woman and a neonate. The mortality distribution of the institutional sample reinforced the documentary findings that residents at the Almshouse were mostly abandoned or orphaned children, or the elderly, disabled, or incapacitated with no other means of support. People who could work or found support with family or friends stayed out of the Almshouse. Historical, archaeological, and osteological information indicate that two African Americans and one Native American were present among the otherwise White cemetery population. Pathological conditions noted include arthritis, vertebral lesions that are indicative of strenuous work, osteitis (a general term for inflammation of the bone, possibly caused by minor injuries easily encountered from outdoor work, extensive walking, or adult scurvy), fractures, tumors, enamel hypoplasia (brought about from the effects of malnutrition or serious illness), and developmental and/or possibly congenital skeletal defects. The presence of an autopsied individual in the cemetery is discussed. Throughout the osteological study, comparative information from other archaeologically examined, 19th century cemeteries are provided. Artifacts from the cemetery consisted of grave markers, coffin hardware, clothing fasteners, textile fragments, and a few pieces of earthenware and brick. Sixteen of the 31 graves were marked with uninscribed fieldstone and quarry waste; one grave had a traditional, carved headstone. Assemblages from 17 of the graves consisted of wooden coffin fragments, cut nails (and sometimes half dozen or fewer screws), and often one or two common brass hinges. Fourteen graves contained stylistically specialized or otherwise unusual fittings including mass-produced coffin hardware (decorative, white metal coffin hinges, screws, and tacks), rectangular glass coffin view plates, and other kinds of tacks and fasteners. Comparative and documentary information suggests that the pine, chestnut, and yellow poplar coffins for the Uxbridge paupers were made by local carpenters using readily available and inexpensive materials. The appearance of mass-produced, decorative coffin hardware at this and other 19th century American cemeteries was a material reflection of a popular cultural movement called “the beautification of death.” The comparatively attenuated mortuary assemblages from the site are indicative of the minimal funerary treatment accorded to a marginal socioeconomic group. The report concludes with an overview of the project and the research findings. Recommendations were made to transfer the remains of the Native American to the Commission on Indian Affairs for reburial; to amend the then-in-effect Massachusetts statute on unmarked cemeteries to allow the other 31, non-Native individuals to be reburied; to undertake similar documentary and historical research during future cemetery investigations; and, to re-evaluate significance criteria (cited in determining whether historical cemeteries as eligible for listing of the National Register of Historic Places) in light of the Uxbridge findings, that archaeologically investigated cemeteries can contribute important historical information.

25-964 Mulholland, Mitchell T., and David Bernstein

1989 Archaeological Site Locational Survey for the Lenox Water Supply Improvements, Lee, Massachusetts. 49 pages.

The project included background research and a walkover inspection. One small area was determined to have a moderate potential to contain prehistoric archaeological sites. Ten shovel test pits were excavated in this area. No evidence of prehistoric sites was encountered. Two small rows of stones in the northern portion of this area were determined to be related to a small farm road, or possibly the supports for an outbuilding. No significant historic artifacts were encountered. No further survey was recommended.

25-965 Holmes, Richard Douglas, and Mitchell T. Mulholland

1990 Archaeological Locational Survey for the Route 143 Highway Reconstruction Project, Worthington and Chesterfield, Massachusetts. 213 pages.

The proposed project involved reconstruction, widening, and repaving of 4.5 km (2.8 miles) of the existing highway and approximately 183 m (600 ft.) of road realignments. Areas tested were within 300 m (984 ft.) of a brook or river, and most areas were within 30 m (98 ft.) of running water. Areas judged too steep or too wet for human habitation were not subjected to subsurface testing, while those areas to be cut or extensively filled were tested. During a walkover reconnaissance of the whole project area, a small mortar of probable prehistoric origin was found among other cobbles and boulders in a brook in Worthington. Several portions of the project area contained huge boulders which were evaluated as potential rockshelters. Subsurface testing consisted of a total of 226, 40 cm x 40 cm shovel test pits dug in clusters in any areas of moderate to high archaeological potential. Several quartz and quartzite flakes and fragments, a fragment of rock that appeared fire-cracked, and a quartzite stone that may have been used as a pounding stone were recovered. Potential rockshelters did not yield evidence of human occupation, nor were any sites located within the project area. Approximately 800 historical artifacts were recovered from several survey areas; no unusual or especially significant concentrations of historical material were found. The artifacts dated from the 1760s (plain creamware) to the present, with a heavy concentration of 19th century material. Two areas in which old foundations can be seen were examined. The first area consists of two dry-laid fieldstone foundations in Chesterfield. Glass, iron, ceramic, and brick were recovered there. The second area consists of a similarly constructed fieldstone foundation in Worthington. This foundation may be the remains of the home of Nehemiah Prouty, one of the early settlers of Worthington. An iron spike was the only artifact found in subsurface testing in the immediate area. Although neither of the two areas will be impacted directly by construction, care should be taken that they are not subjected to damage in the course of roadwork. Both have the potential to answer questions about 18th century life in upland western Massachusetts. No further archaeological or historical research was recommended.

25-966 Ritchie, Duncan, and Peter Pagoulatos

1989 Intensive Archaeological Survey of the Digital Equipment Corporation, Maynard, Massachusetts. 73 pages.

The construction of several buildings, access roads, and parking areas was planned within a 47 acre project area. Initial stratification of this project area into zones of expected archaeological sensitivity was based on the results of background research and walkover inspection. This preliminary evaluation indicated that the project area contained some relatively large areas of high and moderate archaeological sensitivity. Intensive subsurface testing using a 40 m block pattern containing 25, 50 cm x 50 cm test pits arranged on a systematic grid of bin intervals supplemented by short, judgmentally oriented test pit transects, sampled those portions of the project area considered to have high or moderate archaeological sensitivity. The intensive survey did not locate any prehistoric or historical cultural resources in the project area. No additional archaeological investigation was recommended.

25-967 Doucette, Diana, and Suzanne Glover

1989 An Intensive Archaeological Survey, River Crossing, Norton, Massachusetts. 75 pages.

An intensive level archaeological survey was conducted at the location of a proposed and partially completed residential development. Construction of approximately 60 residential units in a cluster zoned community of 30 duplex homes, associated parking, and access roads on 45.6 acres of land was planned. The intensive survey included background research, a walkover reconnaissance and subsurface testing. Background research revealed that a known prehistoric site, the Souza Farm Site (19-BR-320), existed within the project area, but was destroyed by construction activities conducted prior to the survey. Intensive subsurface testing consisted of 86, 50 cm x 50 cm test pits. A small scatter of prehistoric cultural material was recovered, including one diagnostic projectile point dating to the Late Woodland Period (1,000-450 B.P.). The absence of artifact concentrations and/or associated features indicates short-term utilization of the area by prehistoric groups. The prehistoric cultural materials have been designated as the River Crossing Site. A small scatter of historic/modern cultural material was recovered and cataloged as field debris. The historic/modern field trash is not considered to represent a potentially significant cultural deposition. The prehistoric cultural materials suggested a Late Woodland occupation, but are not considered to represent a significant cultural resource. No further archaeological investigation was recommended.

25-968 Riess, Warren C.

1989 Final Report, Marine Archaeological Investigation, Manchester Waste Water Outfall, Manchester, Massachusetts. 38 pages.

Background research and a remote sensing survey were conducted of the 120 foot wide swath along the proposed Manchester Waste Water outfall route. Three areas were identified as potentially significant archaeological targets. Nautical archaeologists inspected these targets, finding no significant cultural remains. Target A proved to be a bedrock outcrop protruding from the sand bottom. Target B appeared to be a natural sand ridge on either side of a trench aligned parallel to the shore. Target C was an old trap line, horizontally connecting numerous abandoned lobster traps. It was concluded that no significant cultural resources appear to exist within the proposed project boundary, and no further archaeological investigation was recommended.

25-969 Hoffman, Curtiss

1989 Wankinquoah Business Park, Archaeological Intensive Survey, Revised Final Report. 97 pages.

Background research and subsurface testing were conducted for the Middleborough project area. The excavation of 195, 50 cm x 50 cm test pits located 10 loci of prehistoric cultural activity within the project area. Prehistoric cultural material recovered included quartz, argillite, and felsite flakes, granite hammerstones, a quartz preform, a perforator, a flake scraper, cores, and a boulder used as an anvil. A large granite boulder with a vein of quartz showed signs of quarrying activity. The Read Company Site, a small charcoal scatter associated with a quartz locus, was radiocarbon dated to the Late Woodland Period (790 $\pm$ 65 B.P.) (Beta-32326/ETH-5670). Historic resources were recovered in two loci and included two pieces of redware, a vessel glass fragment, a piece of brick, and a piece of blue transfer-printed whiteware. The only locus considered potentially significant was the Read Company Site which contained information on Late Woodland quartz reduction technology. The increased intensity of sampling in the vicinity of this locus during the survey probably removed all or nearly all of the site. It was recommended that construction proceed without further archaeological study.

25-970 Holmes, Richard Douglas, and Mitchell T. Mulholland

1990 Archaeological Site Locational Survey in the Vicinity of West Cemetery and Porter Swamp Brook, Granby, Massachusetts. 75 pages.

An archaeological site locational survey was conducted for the sewer line project. Subsurface testing was conducted in areas of moderate to high archaeological potential, including an area believed to be the location of a pauper's burial ground. At the eastern end of the project area, a fragment of prehistoric pottery and a flake of Onondaga chert were recovered in a disturbed context. This portion of the project area is recorded with the Massachusetts Historical Commission as part of prehistoric site #l9-HS-73. No temporally diagnostic material is recorded for this site, but a local artifact collection, the Prentiss Collection, reputedly from the vicinity, was examined for this study. The collection suggests an occupation over an 8,000-year period. Much historic material was found on the surface and mixed in fill and dumped debris, especially at the eastern end of the project area. No structures or historic archaeological remains were identified. It was reported that an area in the vicinity of two cemetery storage sheds was used in the 1930s as a burial ground for paupers. Initial plans for the project indicated that the proposed sewer line would pass beneath the access road, but would bear to the east by the sheds. During subsurface testing, a small fragment of bone was found in artificial fill east of the sheds. The bone was analyzed, and it was determined that it could not identified positively as human or animal. Following the discovery of potential human remains, the route of the sewer was shifted approximately 30 m (100 feet) north to avoid the sheds. This area was tested and determined to contain large amounts of artificial fill and, therefore, a potential burial area. It was recommended that the proposed sewer route be shifted farther north to the end of the paved access road. Provided that the sewer follows the recommended route, no further survey of this area is recommended. Although the cemetery has been in use since 1768, the older section of the cemetery is to the south of the proposed sewer line and no pre-20th century graves are in danger of disturbance. It was reported that burials are very close to the paved and unpaved roadways in the cemetery, and records of burials could be inaccurate. However, in the most recent section of the cemetery, where the project area is located, burial records are more reliable. No further historical or archaeological research was recommend.

25-971 DePaoli, Neill

1989 Archaeological Investigations of the Golden Ball Tavern "Barn" Site, Weston, Massachusetts. 72 pages.

Archaeological investigations were conducted at a late 18th century tavern/farmstead, listed on the State and National Registers of Historic Places. The test area was thought to be the location of a late 18th century barn that serviced the tavern/farm along with a second barn, which still stands. Nine 2 m x 2 m and two 60 cm x 60 cm test pits were excavated. Large quantities of redware ceramic and glass containers, animal bones and shellfish remains, coal, coal ash, wire, nails, window glass, and brick were recovered. Features included postmolds and trash pits containing nearly complete skeletons of birds and other barnyard animals. No structural remains, such as stone foundation walls and/or piers and discrete concentrations of architectural and agricultural debris were found within the limited excavated area. It appeared that the test area was not the location of the barn, but rather part of a barnyard used during the 19th and early 20th centuries. It was recommended that excavation be undertaken farther north of the test site to locate the barn.

25-972 Loparto, Leonard W.

1990 Archaeological Reconnaissance Survey, Restoration of Commuter Rail Service to Newburyport, Massachusetts. 74 pages.

Eight miles of a proposed rebuilt rail line, two stations and five staging areas were surveyed in the communities of Ipswich, Rowley, Newbury, and Newburyport. Background research established that as many as 10 known archaeological sites, all prehistoric, have been reported in the project area. Historical maps and environmental conditions also suggested that additional locations which were favorable to prehistoric and historic settlement activities were historically present. Existing conditions and environmental data were reviewed, attempts were made to auger portions of the projects area, a walkover survey of all project locations and limited field-testing were conducted. Extensive excavation and filling were evident throughout the right-of-way from the mid-19th cen-

tury to the present. It was concluded that reported sites and potential sites in sensitive areas have been destroyed by these activities. A review of plans for rail reconstruction, station locations and staging areas indicated that proposed construction of these facilities would take place within previously disturbed areas. No known sites would be adversely affected by the proposed construction since sites in those areas had been destroyed. If construction activities are altered to extend beyond disturbed areas, particularly at the proposed Rowley Station Site, these activities may have an adverse effect on archaeological sites. No further archaeological investigations were recommended.

25-973 Carolan, Jane, Elena Decima, Chris Edens, Michael Roberts, and Leith Smith

1990 The History and Archaeology of the Palmer School Site, Palmer, Massachusetts. 96 pages.

An intensive archaeological survey was conducted of the 56 acre Palmer School Site. The project area contained one known prehistoric site (l9-HD-7). There were other known sites in the vicinity in similar environmental contexts, and diverse environmental characteristics indicated that there might be previously unknown sites within the project area. Five areas that were determined archaeologically sensitive were excavated with 167, 50 cm x 50 cm shovel test pits placed at 20 m intervals. The survey located four sites, one prehistoric and three historic, with only limited amounts of cultural debris encountered elsewhere. The prehistoric site, designated as P-1, was a relatively sparse scatter of lithics and soil stains that may indicate features related to the site. A Small Stemmed rose quartz projectile point, three flakes, a rose quartz core, and charcoal fragments were found at the site. Historic stone foundations of a small wooden structure and a barn cellar hole were found at the first historic site, H-1. Artifacts at this site included cut nails, asphalt roofing shingle fragments, brick, window glass, coal, and plain whiteware. The second historic site, H-2 consisted of a concentration of cut granite stones that may have been the remains of a foundation. The third historic site, H-3, was a concentration of historic artifacts dating to the mid to late 19th century. The artifacts included plain whiteware porcelain, lamp glass, a white glass button, window glass, cut nails, and lumps of coal and bone. No further archaeological work was recommended, due to the questionable integrity of the location and the likelihood that little or no significant information would be recovered with additional archaeological study.

25-974 Strauss, Alan, and Richard Douglas Holmes

1989 Archaeological Reconnaissance Survey of the Proposed Conservatory Park, Hingham, Massachusetts. 56 pages.

The reconnaissance survey included prehistoric and historic documentary research, a walkover reconnaissance and interviews. The study determined that the area has a moderate potential to contain small prehistoric sites and it is recommended that an intensive archaeological survey be conducted.

25-975 Mills, Peter R.

1990 Report of Archaeological Investigations of an Indian Burial Near Steam Mill Road, Deerfield, Massachusetts. 79 pages.

The burial of a Native American, encountered during construction of a house addition in Deerfield, consisted of a single flexed interment placed on its right side with its head to the south facing east. A ceramic sherd in the graveshaft fill and previous burial discoveries on the property suggest that the burial is contemporaneous with or post-dates the Late Woodland Period. Background research and subsurface testing was conducted for the area where the construction would take place. Three excavation units were opened to examine the burial and to search for any other burials that might be impacted. A very dark brown to black organic stain lined the walls of the burial pit and also covered the head and shoulders of the individual. It was suggested that the stain may have been caused by an organic mat or bark lining placed in the burial pit. Analysis determined that the individual was a 22-25 year-old Indian female. Comparative research on burial dis-

coveries in the region is presented. Based on the results of the research and investigation, future development of terraces adjacent to the Deerfield River should be considered to have high potential for impacting human burials.

25-976 Vogt, Christy, and Marsha King

1989 An Intensive Archaeological Survey of the Proposed Howe Farm Development, Concord, Massachusetts. 70 pages.

An intensive archaeological survey was completed at a portion of the 27.5 acre parcel. Documentary and background research and a walkover survey of the area identified stone wall boundaries and a wetlands area. The methodology behind the subsurface testing was designed to locate both large and small prehistoric and historic archaeological sites expected to be present. The focus of this subsurface testing was to obtain coverage of the area, since only one prehistoric site (19-MD-410) was known to exist near the actual project area, and historic research showed that the area had been sparsely settled. A total of 252, 50 cm x 50 cm test pits was excavated. No prehistoric cultural material was found during the testing of the Howe Farm project area. Historical cultural material found in the project area consisted of field trash and therefore retains little or no contextual significance. Since there were no prehistoric or historic archaeological sites located on the project area, no further archaeological investigations were recommended.

25-977 Fitch, Virginia A., Kirsten Hoffman, and Mary Lynne Rainey

1989 Archaeological Investigations and Management Plan, Huguenot Fort, Oxford, Massachusetts. 168 pages.

An intensive archaeological survey was conducted at the historic Huguenot Fort Site, a property listed on the State and National Registers of Historic Places (see also report #25-578). The findings of this project will aid in the interpretation of the fort, and resulted in the preparation of a plan for the preservation and management of the fort site. Background research was conducted and systematic subsurface archaeological testing was completed inside the walls of the Huguenot Fort in order to define features, activity areas, and the present condition of the fort site. A total of 39, 50 cm x 50 cm test pits was excavated along a grid, and eight judgmental units of varying sized were excavated to examine areas of visible or suspected features. Disturbance of the fort site and structures was kept to a minimum. Field investigations revealed that the foundations of the fort's structures were generally intact, and confirmed the presence of several reported features, particularly the well, powder magazine, dry sink, and watering trough. A total of 842 pieces of cultural material were collected, including charcoal samples, structural mortar samples, faunal remains, redware ceramics, iron items, glass fragments, and a small number of personal items. Prehistoric cultural material was limited to a few fragments of quartz and quartzite chipping debris. It was determined that no further archaeological work was necessary. Clearing and stabilizing the fort, new signage, and a variety of public education initiatives were recommended in the management plan.

25-978 Ritchie, Duncan, and Beth Miller

1990 Reconnaissance and Intensive Level Archaeological Survey of the Nawn Factory Site, Roxbury Heritage State Park, Roxbury, Massachusetts. 211 pages.

To provide management recommendations for the development of the Roxbury Heritage State Park in Boston, background research and a walkover inspection were conducted to stratify the half-acre Nawn Factory Site into areas of archaeological sensitivity. An intensive archaeological survey was then undertaken to test the four areas determined sensitive during the reconnaissance survey: the Nawn Factory building, Nawn Street (cobblestone driveway), the Cunningham and Doggett Houses, and Hunneman Court. Throughout the project area, 50 cm x 50 cm test pits were excavated on a 5 m systematic grid. These were supplemented by eight machine-excavated trenches of varying lengths and widths placed in archaeologically sensitive areas. No evidence of

prehistoric period occupation was found at the site. Brick and fieldstone foundations for the late 18th century Cunningham and Doggett Houses were found. A builders trench found in this area included deposits of structural materials (brick, window glass, nails, and plaster), ceramic sherds (whiteware, redware, domestic stoneware, pearlware, and porcelain), along with late 19th century to modern bottle glass. In the Nawn Factory area, two lines of stoneware and cast iron (water) pipe were discovered running in an east/west direction under Nawn Street. Late 19th century city atlases of Boston show water mains passing under the street in the same area. Foundations of tenement structures were uncovered facing Nawn Street and Hunneman Court, as well as deep fill deposits, cobblestone paving and utility lines associated with late 19th century development. Structural material, ceramics, and bottle glass were among the cultural materials recovered. Because the four areas tested during the intensive level survey possessed high integrity and research potential, they were recommended for further evaluation at the site examination level.

25-979 Jones, Donald G., and David E. Clayton

1990 Archaeological Reconnaissance Survey of the Proposed Yellow Freight Terminal in Abington, Massachusetts. 41 pages

Background research indicated that no prehistoric sites were recorded for the project area. The project area was considered to have the potential for prehistoric sites because numerous sites are recorded in the vicinity in areas of similar topographic and environmental characteristics. One recorded historical site was identified during the background research. A stone monument, placed at the northeast corner of the project area, marks the presumed intersection of the Satucket Path, a former Indian trail, and the Old Colony Line, the original boundary between the Massachusetts Bay and Plymouth colonies. Background research also indicated that a number of farmsteads were located in the vicinity from the 17th through the 19th century, although none were identified within the project area itself. The project area was associated with a nursery beginning around the turn of the 20th century. At least one building was located directly adjacent to the parcel. The field reconnaissance consisted of a reconnaissance and surveying and mapping of surface features. No surface evidence of prehistoric sites was identified during the walkover. The western portion of the project area is relatively level and well drained and is therefore considered to have potential for prehistoric sites. Two historical sites were identified during the walkover. The stone monument was identified in the northeast corner of the property adjacent to Adams Street. In addition, a stone foundation, which may have been associated with the nursery, was identified near the center of the property. The portion of the project area that lies above 155 feet in elevation was considered to have the potential for significant prehistoric and historical sites. An intensive archaeological survey was recommended (see report #25-980).

25-980 Glover, Suzanne

1990 Intensive Archaeological Survey, Yellow Freight Terminal, Abington, Massachusetts. 80 pages.

An intensive archaeological (locational) survey was conducted at the proposed approximate 10 acre project area. A reconnaissance survey (see report #25-979) identified the western two-thirds of the project area as possessing a moderate to high archaeological sensitivity for cultural resources, which included the presence of an undocumented stone foundation. A 1980 historical marker and part of the historic Satucket Path also lie in the northeast corner and eastern third of the project area. An intensive archaeological survey was recommended as a result of the reconnaissance survey to document the stone foundation and its possible archaeological component, as well as locate any other potentially significant prehistoric and/or historical cultural resources. Additional background research conducted during the intensive survey focused primarily on the documentation of the stone foundation. A review of documentary sources and local informant interviews identified the stone foundation as the remains of a “winter nursery” constructed ca. 1900 for use by the nursery business that operated on the property from 1893 to about 1968. Subsurface testing conducted within the project area identified a limited archaeological component associated

with the foundation. This component consists primarily of low-density structural debris. The foundation and archaeological cultural materials have been designated as the Wyman Site. This site did not represent a potentially significant cultural deposition. No prehistoric cultural materials were recovered during the survey. A recommendation concerning the preservation and possible enhancement of the historical marker in the northeast corner of the property was made. The design of this preservation plan should be developed in consultation with the appropriate local and state agencies. No further archaeological investigations were recommended.

25-981 Davin, Ann K., Marsha King, and Edna Feighner

1990 Intensive Archaeological Survey of the Chelmsford Phase IIB Sewer Project Area, Chelmsford, Massachusetts. 58 pages.

The proposed construction consisted of five pump stations (10,000 sq. ft.) and eleven cross-country routes (6,830 linear ft.). During the survey, it was determined that the project areas were within wetland areas. No prehistoric or historical cultural materials were recovered during the survey. No further archaeological testing was recommended.

25-982 Leveillee, Alan

1990 An Archaeological Sensitivity Survey of the Berkshire Gas Company, Tenneco Interconnect Project Area, Pittsfield, Massachusetts. 10 pages.

Results of an archaeological assessment survey of the proposed Berkshire Gas-Tenneco Interconnect area indicate that the expected likelihood of impacts to potentially significant prehistoric and/or historical period sites is low. The impact areas are dominated by previously disturbed sand and gravel beds covered by silty soil and flood deposits of sandy silt covered by silty loam which today support a wet meadow, swamp shrub vegetation. The subsurface context of any cultural materials encountered within such soil conditions would likely be a result of post depositional processes rather than in situ activity. Based upon existing conditions within the project area, the archaeological sensitivity was ranked as low. No additional archaeological investigations were recommended.

25-983 Mulholland, Mitchell T., Ellen-Rose Savulis, and D. Richard Gumaer

1986 Archaeological Remote Sensing and Historical Research Survey for the Yeadon Parcel at the Hassanomisco Indian Burying Ground, Grafton, Massachusetts. 124 pages.

An archaeological remote sensing survey was conducted to determine the boundaries of an historical Native American burial ground. Prior to conducting the survey, an extensive documentary search was completed in order to gather boundary information pertaining to the project area. Remote sensing techniques included proton magnetometry and electrical resistivity testing. Because of the stony, irregular content of the soil, only resistivity was effective in locating subsurface cultural features. Four burial shafts were found on the Yeadon parcel. In addition, a subsurface stone foundation of unknown origin was detected by the resistivity survey. This feature may be the remains of a 19th century grave monument, mentioned in historical documents. It could also conceivably be the remains of the original Hassanamisco meetinghouse, or a small building in existence in the late 19th century. Further field testing could verify these hypotheses. An area of 1,050 square meters of burial ground was delimited for the sponsor which encompasses known burials, burial shafts and the foundation. Any subsurface impact to this area should be avoided.

25-984 DeCesare, Louise M.

1990 Archaeological Collections Management at the Springfield Armory National Historic Site, Massachusetts. Archaeological Collections Management Project Series No. 6. 83 pages.

This report presents information on artifacts and archaeological records from the 1982 archaeological survey of a proposed electrical line corridor at the Springfield Armory (see report #25-415). Collections management methodology was described, and problems with documentation and classification were explained. The archaeological data predominantly reflected landscaping and gardening activities (grading and filling), rather than activities specific to the armory's function as either a weapons repository or a military training ground.

2S-985 Reinke, Rita, and Ed Hood

1990 Report on the Hadley Palisade Project. 78 pages.

Background research, a walkover reconnaissance and an intensive survey were conducted to discover whether remains of a 17th century defensive palisade constructed by English settlers still existed in Hadley. Guided by the documentary research and surface indicators, six properties on West Street were chosen for testing. Trenches of 50 cm wide and varying in length were excavated to intercept the presumed line of the palisade. Soil samples for phosphate testing were collected from the excavation units. Evidence of the fortification was recovered at the McQueston property showing one major construction period, and hints of the palisade were possibly recovered elsewhere. Subsurface evidence consisted of a ditch approximately three feet wide, and a series of postmolds to the west of the ditch, appearing to match the specification for the palisade ("3 fingers thick set two foot into the ground") stated in the town records in 1678. A ditch would have first been dug, and then the stakes would have been set in the mound of dirt removed from the ditch, thus adding to the overall height of the defensive structure. Apparently undisturbed remains of late 18th to early 19th century farm activities were found. At 19 West Street the remains of an outbuilding were recovered, and the survey data indicate that its integrity is high. It was recommended that an additional survey of the West Street area include the consultation of specific records for the 1936 flood, and its effect on the extent and integrity of the resources. Any future land use planning of this area should include the identification, evaluation and possible protection of the archaeological resources.

25-986 Luedtke, Barbara E.

1990 Report on an Archaeological Survey of World's End, Massachusetts. 73 pages.

Background research, a walkover reconnaissance, and subsurface testing were conducted at the World's End Reservation in Hingham. A total of 596 shovel test pits was excavated at l0 m, 20 m, and 30 m intervals along numerous transects, most of which paralleled the coastline and edges of the marsh. Ten prehistoric sites and two historical sites were encountered. Several of the sites were occupied during more than one cultural period. One site, the Dammed Meadow Site (19-PL-269), contained a Middle Archaic Neville point. Late Archaic projectile points, such as Small Stemmed points, Brewerton points and Squibnocket Triangles, were recovered from the Rocky Neck Site (l9-PL-566), Lincoln Rocks Site (l9-PL-567), Hermit's Cove Site (19-PL-568), and World's End Site (l9-PL-267). An Atlantic point from the Terminal Archaic Period was also found at the World's End Site. Unusually thick ceramic sherds and a possible Orient point suggest Early Woodland occupation at the Rocky Neck Site. A Jack's Reef Pentagonal point found at the World's End Site, and pottery sherds found at the Rocky Neck Site, Lincoln Rocks Site and Hermit's Cove Site indicate Middle Woodland occupation. Late Woodland pottery sherds and Levanna points were recovered from the Rocky Neck Site, World's End Site and Boulder Cove Site (l9-PL-570). These three sites and the Hermit's Cove Site and Boardwalk Site (l9-PL-569) all contained shell middens. Flakes of Braintree hornfels were also found at the Bumkin View Site (19-PL-57l). Only two sites could not be dated by the resources recovered. These were the Martin's Cove Site (l9-PL-573) and Site #2 (l9-PL-572). Historic sites consisted of a 19th century sheepfold foundation and a house foundation of unknown date. Near the house foundation is another small foundation, possibly a privy, connected to the house by what appears to be a concrete walkway. It was recommended that care be exercised whenever the ground surface is disturbed in any way, especially since many sites are lying just below the surface. Continuing to pile brush and rocks along

vulnerable areas of the shoreline to attempt to curb erosion was also recommended. It was recommended that site locations be kept confidential to discourage looting.

25-987 Dincauze, Dena F.

1990 Report of Cultural Resources Survey Along Lower Amethyst Brook, Amherst, Massachusetts – Second Year. 16 pages.

Background research, a walkover reconnaissance, and subsurface testing was conducted on a portion of the Amethyst Brook Reservation (see report #25-901). In close proximity to the project area is prehistoric site l9-HS-308. Sherds of white glazed pottery, red slipware, and green bottle glass were recovered during the walkover. Shovel test pits at western transects 1 and 2 indicated former use of the areas as plowed fields. Fragments of sheet iron, a cut nail, hand-wrought square nails, and charcoal were recovered. Shovel test pits in the eastern extension, north of Allen Mill Road, indicated that the plowzone along the high bank of the brook was discontinuous. Two flakes, some broken stones, and a contracting stemmed bifacial knife were recovered from a test pit of fine, sandy soil. A single quartzite biface-thinning flake was found on the surface at the base of the road cut. The bifacially flaked knife was not clearly diagnostic of any identifiable period of time. The only evidence of prehistoric resources clearly in situ were those recovered in the superficial sand sheet. Most of the artifacts seemed to have been disturbed by plowing and collecting. No further cultural materials were believed to still exist, at least in situ, within the project area.

25-988 Elia, Ricardo J., David B. Landon, and Nancy S. Seasholes

1989 Phase II Archaeological Investigations of the Central Artery/Third Harbor Tunnel Project in Boston, Massachusetts. (Two Volumes). 295 and 230 pages.

The goals of the Phase II archaeological survey were to conduct subsurface testing at the sites recommended by the Phase I survey (see report #25-898); to evaluate their integrity, characteristics, and boundaries; and to evaluate their eligibility for inclusion in the National Register of Historic Places. A total of six study blocks were tested during the Phase II study and eleven test trenches were excavated in these blocks. Three sites were determined to be potentially significant and undisturbed; they were considered eligible for inclusion to the National Register. These were 1) Mill Pond Wharf Site, where the well-preserved remains of a late 17th/early 18th century private wharf were found extending into the former Mill Pond; 2) Paddy's Alley Backlot Site, where undisturbed residential deposits from a late 17th/early 18th century houselot were discovered; and 3) Cross Street Backlot Site, an undeveloped portion of an historical backlot which contained two features, one dating to the late 17th/early 18th century, the other a privy-type feature dating to the early 19th century. Phase III data recovery excavations were recommended for the three sites listed above; no additional archaeological work was recommended for the other sites.

25-989 Macomber, Gerald M., Donald G. Jones, and Nancy S. Seasholes

1990 Intensive Archaeological Survey of Eight Proposed Pipeline's of Tennessee Gas Pipelines NOREX Project in Massachusetts. 311 pages.

An intensive archaeological survey, consisting of background research, field reconnaissance, subsurface testing and laboratory analysis, was conducted of eight pipelines across Massachusetts. Towns included in the survey were Pittsfield, Northampton, Easthampton, Southampton, Southwick, Agawam, East Longmeadow, Hampden, Oxford, Sutton, Lunenburg, Lancaster, Bolton, Wilmington, Burlington, Danvers, and Peabody. The background research included a study of the prehistory and history of the project area within a regional context. Known prehistoric and historical sites in and around the project areas were also documented. These data were evaluated in an attempt to identify areas of archaeological sensitivity within the various project areas. The field reconnaissance consisted of a walkover of each of the proposed pipeline routes in order to visually assess the nature of the impact areas. The field reconnaissance also permitted the assessment of the

suitability of the different portions of the project areas for subsurface testing on the basis of actual field conditions such as drainage, slope, terrain, proximity to water sources, and disturbance. Eighty areas of archaeological sensitivity were selected for subsurface testing within the eight pipeline sections. Subsurface testing consisted of the excavation of shovel test pits generally placed at l0 m intervals along single linear transects within the proposed pipeline routes. In certain portions of each pipeline section where additional working space was required, multiple parallel transects of shovel test pits were utilized. A total of 1,372 shovel test pits, including 45 bracket units and 8 judgmental units, was excavated. Prehistoric artifacts, recovered from 15 areas, consisted of quartzite, quartz crystal, and volcanic flakes, projectile point fragments of quartz, felsite and chert, a felsite Neville-like point, a quartzite "Westboro' point mid-section, a quartzite Large Triangular point (Late Woodland, 1,300-500 B.P.), a cord-wrapped stick impressed pottery fragment, and a broken stone adze. All of the artifacts were either surface finds or isolated finds in shovel test pits and are not considered to be archaeologically significant. Two prehistoric sites were identified (the first consisting of a quartz crystal flake, eight quartzite flakes, and a quartzite Large Triangular point suggesting Late Woodland occupation, and the second consisting of seven volcanic flakes) and were determined to be of low artifact density and localized within a small area. No further archaeological investigations were recommended for the areas with prehistoric finds. Two historical sites were identified in Sutton and portions of the towpath of the Hampshire and Hampden Canal were identified in Easthampton. The remains of the Hampshire and Hampden Canal were located outside of the area of construction impact for the proposed pipeline and no remains of the canal exist within this area. Phase II site examinations were recommended for the site for the former gristmill in Sutton (see report #25-993) and in Wilmington (see report #25-992).

25-990 Macomber, Gerald M., and Nancy S. Seasholes

1990 Intensive Archaeological Survey of Eight Proposed Pipelines of Tennessee Gas Pipelines NOREX Project in Massachusetts: Addendum, Proposed Realignment of a Portion of Section 11 (Peabody-Danvers) in Peabody, Massachusetts. 25 pages.

This report is an addendum to the final report entitled "Intensive Archaeological Survey of Eight Proposed Pipelines of Tennessee Gas Pipeline's NOREX Project in Massachusetts" (see report #25-989). Due to a change in alignment of a portion of the proposed Section 11 pipeline in Peabody, additional archaeological reconnaissance and testing was required of the proposed realignment. Background research indicated that no prehistoric sites are recorded in the immediate vicinity of the proposed realignment, but the project area was considered to have potential for unrecorded prehistoric sites. The proposed realignment now places the project corridor behind the John Upton House of the Upton Tavern, a lot that was part of a farm in the 17th and 18th centuries. Because the proposed realignment passes through the historical parcel of the Upton House, the project area was considered to have the potential for structural remains and archaeological deposits. Two sections along the proposed realignment were selected for subsurface testing, totaling approximately 300 linear feet. A total of 17 shovel test pits was excavated. No prehistoric sites were identified within the proposed construction impact area of the realignment. A limited amount of historical artifacts was associated with historical structures of features and were not considered to be archaeologically significant. No further archaeological investigations were recommended. Historical remains noted outside of the impact area should be avoided.

25-991 Macomber, Gerald M., Donald G. Jones, and Nancy S. Seasholes

1990 Intensive Archaeological Survey of Proposed Pipeyards for Tennessee Gas Pipeline's NOREX Project in Massachusetts. 104 pages.

The proposed pipeyards for the NOREX Project included one in Southwick and East Longmeadow and an alternate site in Hampden, Oxford, Dalton, Easthampton, Lunenburg, and Billerica. The Lunenburg pipeyard was evaluated during the intensive archaeological survey of the proposed NOREX pipelines; no subsurface testing was conducted due to the disturbance of the area by gravel operations. Each of the proposed pipeyards in Bolton, Hampden, and Billerica were lo-

cated in former or present-day gravel pits and all were considered to be disturbed. Therefore, no subsurface testing was conducted at these locations and no further archaeological investigations were recommended. Subsurface testing was conducted at the Southwick, East Longmeadow, Oxford, and Easthampton pipeyards. Prehistoric sites were discovered at the Southwick, East Longmeadow, and Easthampton pipeyards. Six quartz flakes and quartz angular waste were recovered in Southwick. Quartz flakes and angular waste, a sandstone abrader/scraper, and a quartz Small Stemmed projectile point, suggesting Late Archaic occupation (4,500-3,000 B.P.), were recovered in East Longmeadow. In Easthampton, a quartz flake and a Brewerton Side-Notched projectile point were found, also suggesting Late Archaic occupation. No prehistoric materials were recovered from the Oxford pipeyard. The prehistoric site at Southwick was determined to be a low-density site that has been disturbed. The prehistoric sites at the East Longmeadow and Easthampton pipeyards were determined to be potentially significant. A limited amount of historical materials, consisting of low-density field scatter, was recovered from each of these for pipeyards. No historical features or structures were identified at any of the pipeyards. The historical deposits were therefore no considered to be potentially significant. No further archaeological investigations were recommended for the Southwick and Oxford pipeyards. It was recommended that the prehistoric sites at the East Longmeadow and Westhampton pipeyards be avoided during construction. If avoidance was not possible, then a Phase II site examination should be conducted.

25-992 Elia, Ricardo J., and Nancy S. Seasholes

1990 Phase II Archaeological Investigation of a Section of the Middlesex Canal in Wilmington, Massachusetts. 41 pages.

The archaeological investigation consisted of background historical research and field investigations of the section of the canal located within the project area. The Middlesex Canal is listed on the National Register of Historic Places. The historical investigation, which included documentary, cartographic, and deed research, provided data on the history, construction, and operation of the Middlesex Canal. Original records pertaining to the construction and engineering technology of the canal were also obtained. The archaeological fieldwork consisted of a topographical survey of the site and the excavation of test units. Three backhoe trenches, measuring a combined length of 55 feet, were excavated across the canal in order to investigate the towpath embankment and canal bed and to determine if a berm had been built on the opposite side of the canal from the towpath. Two manual test units were also excavated; one beyond the limits of the canal, as a stratigraphic control unit, and the other in the area of the former canal bed. The test excavations revealed that the fabric of the towpath embankment was essentially intact. The canal bed was delineated along the line (probably leveled during construction) of the sandy subsoil. An analysis of the excavated profile in light or the documentary evidence indicates that the overall configuration of the canal closely corresponds to the original specifications as detailed in construction contracts. No evidence of a berm embankment was discovered on the west side of the canal, and an analysis of the topographical, historical, and archaeological data indicates the likelihood that there never was a berm in this section of the canal. Instead, a natural basin on the west side of the canal north of Butters Row was allowed to flood with the waters of the canal. No evidence was found for the presence of either of the two types of waterproofing described in the records (puddling of the canal bed or puddle gutters in the embankments). No additional archaeological work was recommended. It was recommended that work crews avoid disturbing the extant remains of the canal within the project area to the extent possible, and that any portion of the canal that is disturbed or destroyed be restored to its former condition.

25-993 Jones, Donald G., Nancy S. Seasholes, and Claire C. Carlson

1990 Results of a Phase II Site Examination of the Putnam Mill Site for Tennessee Gas Pipeline Company’s NOREX Project in Sutton, Massachusetts. 90 pages.

A Phase II site examination was conducted of the Putnam Mill Site in Sutton. The Phase I archaeological survey identified mill and fish culture system remains along the proposed route of the

Oxford-Sutton pipeline and a Phase II site examination was recommended (see report #25-989). The site examination consisted of documentary research, field survey and mapping, subsurface testing, and laboratory analysis. Documentary research indicated that the Putnam Mill was owned by Jonathan Putnam in 1797 and may have been constructed much earlier. In the third quarter of the 19th century, a sawmill may have been added to the gristmill. In 1867 the mill was bought for the operation of the Sutton Cranberry Company. The Commonwealth of Massachusetts eventually bought the mill and adjacent property to be utilized by the Division of Fisheries and Game for a fish culture system until the mid l970s. Based on the documentary research and field investigations it was determined that the former Putnam Mill wheel pit and millpond were utilized in the construction of the fish culture system. The wheel pit was used to house a series of catching basins and fish sorting and grading basins. Construction and redesign of the fish culture system destroyed portions of the original wheel pit, but the Division of Fisheries and Game made a concerted effort in all their construction to mimic historical construction techniques by utilizing dry-laid stones or stone facing whenever possible. Limited subsurface testing at the site did not reveal any evidence of the Stockwell Mill House, but did reveal substantial structural remains that were part of the wheel pit/fish sorting basin complex. The Putnam Mill Site, a part of a system of seven ponds of the Merrill State Pond System, was considered to be eligible for listing in the National Register of Historic Places. The site represents adaptations of landscape elements and structures for use and reuse by the three successive industries; a gristmill, a cranberry company, and fish culture system. The Merrill State Pond System was the first and only such enterprise of its kind in the country and the raising of several species of warm water fish in an extensive pond system represents significant advancements in aquaculture technology. It was recommended that the site be avoided during construction. If avoidance is not possible, then a mitigation plan should be developed.

25-994 Mulholland, Mitchell T., Richard Douglas Holmes, David Bernstein, and Carolyn Hertz

1989 Archaeological Reconnaissance Survey for the Proposed Tennessee Gas Company Pipeline, Northeast Settlement Project, Massachusetts and New York. 437 pages.

An archaeological and historical reconnaissance survey was conducted for the 82km (51 mile) Northeast Settlement Project corridor of the proposed pipeline, which passes through the Massachusetts towns of Richmond, Lee, Tyringham, Sutton, Northbridge, Grafton, Upton, Hopedale, Mendon, Haverhill, and Methuen. The project consisted of documentary research, stratification of the area into high, moderate, low and no potential to contain sites, and a walkover. In all, 26 km (16 miles) were determined to have a moderate to high potential to contain subsurface prehistoric or historic sites. It was recommended that 3,039 shovel test pits be excavated in areas of high and moderate potential.

25-995 Holmes, Richard Douglas, Mitchell T. Mulholland, and David Bernstein

1990 Archaeological Locational Survey of the Proposed Niagara Settlement Project, Tennessee Gas Pipeline Company: Agawam, Longmeadow and East Longmeadow, Massachusetts. 135 pages.

An archaeological site locational survey was conducted along a proposed pipeline route of the Niagara Settlement Project. The study included documentary research (see report #25-952), a walkover reconnaissance and subsurface testing with 596 shovel test pits. In two survey areas, backhoe trenches were excavated to extend beneath deep alluvium or artificial fill. Seven prehistoric archaeological sites or findspots were encountered. Five of the sites contained a very low density of prehistoric materials and no further survey was recommended. A small Woodland Period site designated the Longmeadow Brook Bluff Site, contained ceramic sherds, lithic flakes, a biface, fire-cracked rocks, and a marine shell fragment. Another small site, possibly dating to the Middle to Late Woodland Period (1,500-500 B.P.), was designated the Longmeadow Brook Terrace Site. It contained a broken vein-quartz projectile point tip, a small pentagonal vein-quartz projectile point, a vein-quartz flake, and fire-cracked rock fragments. Site examinations were recommended for two sites (the Longmeadow Brook Bluff and Terrace sites) to determine their eligibil-

ity for inclusion in the National Register of Historic Places.

25-996 Leveillee, Alan D.

1990 Supplemental Archaeological Investigations of Seven Sites Along the Proposed Providence Gas Corridor, Worcester County, Massachusetts. 45 pages.

A supplemental archaeological examination was conducted of six sites previously identified along the proposed Providence Gas Project Corridor (see report #25-807). In addition, a stone feature located on the Blair property in Uxbridge, and not previously recorded, was investigated. Three of the sites investigated, the Feature 1 Site (19-WR-508) in Sutton, and the Brook Site (l9-WR-509) and Locus 2 Site (19-WR-510), both in Douglas, were prehistoric, while the Stone Dam Site in Northbridge (see also report #25-997), the Smith Road Cellar Hole (SUT-HA-5) and School House Road Cellar Hole (SUT-HA-6) Sites in Sutton, and the Blair Property stone feature were historic period sites. Supplemental archaeological examinations were conducted on the seven sites to firmly establish spatial limits, consider internal site composition, determine chronological affiliations, establish site integrity and consider the potential significance of the sites. Based upon the results of the supplemental testing, none of the seven sites investigated appeared to meet criteria which would have classified any of them as significant. Documentation of the sites and submission of Massachusetts Historical Commission Site forms was recommended. No additional archaeological investigations were recommended.

25-997 Leveillee, Alan

1990 Historical Context—The Stone Dam/Causeway Site, Northbridge, Massachusetts. Supplemental Archaeological Investigations, The Proposed Providence Gas Corridor, Worcester County, Massachusetts. 19 pages.

Additional research was conducted at the Stone Dam/Causeway to provide a contextual framework to determine whether or not the site was eligible for listing on the State and national Registers of Historic Places. The site was identified during investigations for the Providence Gas Corridor Project (see reports #25-807 and #25-996). Town histories and relevant documents were examined, and several informants were consulted. The stone dam/causeway appears to be a component of a larger 19th century mill complex, which has lost much of its archaeological integrity due to road construction. Surviving 19th century mill complexes of comparable or better integrity than of this dam complex exist in Northbridge, Uxbridge and Sutton, limiting the significance of the complex on the local level. Due to lack of integrity, it was determined that the site was ineligible for listing on the National Register of Historic Places, and no further archaeological work was recommended.

25-998 Doucette, Diana, Alan Leveillee, and Virginia A. Fitch

1990 An Intensive Archaeological Survey, Silver City Galleria, Taunton, Massachusetts. 82 pages.

An intensive level archaeological survey was conducted of 110 acres of the total 126 acres contained within the proposed shopping center project area. The project area was considered to have high archaeological sensitivity due to the environmental setting as well as the density of known sites in the Taunton area. Also, the previous intensive survey of the 16 acre parcel confirmed the presence of prehistoric activity. The survey consisted of background research, field investigation, and laboratory processing and analysis of recovered cultural material. A total of 147, 50 cm x 50 cm test pits was excavated in the remaining 110 acres. A low density of cultural material was recovered from the project area, consisting of one Neville projectile point, an untyped rhyolite projectile point, a non-diagnostic quartzite point fragment, a complete quartz crystal, and chipping debris of quartz, argillite and felsite. The presence of the Neville point suggests Middle Archaic occupation (7,500-5,000 B.P.), and the Squibnocket Stemmed point indicates Late Archaic activity (5,000-3,000 B.P.). Two standing, 19th century houses, well-constructed, split-stone, stone

walls with a stone stile, and portions of a barn foundation were also located in the project area. The prehistoric materials collected were not considered to constitute a potentially significant site due to their low density and lack of integrity and further investigations were not recommended. Further investigation was recommended for the historic Pierce farmstead for an evaluation of its eligibility for listing on the National Register of Historic Places.

25-999 Davin, Ann K.

1990 An Intensive Archaeological Investigation of the Bufflehead Bay Project Area, Mashpee, Massachusetts. 88 pages.

The intensive survey of the 420 acre project area included a walkover, which stratified the project area into zones of archaeological sensitivity, and subsurface testing, during which 760, 50 cm x 50 cm test pits were excavated. Three isolated prehistoric find spots, containing a Late Archaic stemmed projectile point, a creamy chert, possible Early Archaic Hardaway-Dalton projectile point, and a dark-brown chert flake, were found. Subsurface testing also located the remains of the historic Native American Alves Homestead Site. Historical cultural materials indicate that the site was occupied from the early to late 19th century. It was recommended that the Alves Homestead Site be avoided during construction or that a site examination be performed. No further work was recommended for the three prehistoric find spots.

25-1000 Hasenstab, Robert J., and Richard Douglas Holmes

1990 Archaeological Site Locational Survey for the Proposed Randall Wood Housing Development, Montague, Massachusetts. 85 pages.

The study included documentary research, a walkover reconnaissance, surface collection, and subsurface testing with 164 shovel test pits. No structures, features, or artifacts of historical significance were identified. A single find spot of prehistoric activity consisting of a quartzite flake and a possible flake of argillite was identified on a promontory overlooking a wetland and hillside seep. Verification test pits at the find spot failed to yield any further evidence of prehistoric occupation. The find is interpreted as a location of ephemeral prehistoric activity, and no further survey was recommended.

25-1001 Ritchie, Duncan

1989 A Preliminary Analysis of Prehistoric Cultural Materials for the Signal Hill (Neponset/Wamsutta) Site (19-NF-70), Canton, Massachusetts. 45 pages.

A preliminary analysis was conducted of the sample of prehistoric cultural material recovered from earlier excavations at the Signal Hill Site (19-NF-70). The analysis included all of the chipped, rough and ground stone tools, ceramic sherds and faunal or floral remains and a 20% sample of the chipping debris recovered from the site. In addition, a sample of charcoal from a feature yielded a date of 4,410 $\pm$ 100 B.P. (Beta 23498). Diagnostic projectile points and other artifacts indicate site use from the Middle Archaic to the Late Woodland Periods. Recommendations were for site preservation or data recovery and curatorial management recommendations for artifacts and records.

25-1002 Holmes, Richard Douglas, and Mitchell T. Mulholland

1990 Archaeological Locational Survey at Arbor Way and Hedgerow Lane Subdivisions, Amherst, Massachusetts. 42 pages.

The project included documentary research, a walkover reconnaissance, and subsurface testing with a total of 122 shovel test pits. No materials definitively identified as prehistoric artifacts were recovered; historic material recovered was in accord with expectations of agricultural land use and

domestic artifacts of the 19th through 20th centuries. No sites of historical significance were found. No further archaeological or historical investigation was recommended.

25-1003 Strauss, Alan E.

1990 Intensive Archaeological Survey of Governor Winthrop Estates Residential Development in Bedford, Massachusetts. 72 pages.

The intensive archaeological survey consisted of background research, field reconnaissance, and subsurface testing. Background research indicated that no recorded prehistoric sites were located within the project area. Historical documents suggested the possibility of historic sites within the project area. An historical site, consisting of a stone-lined foundation, a well, and several surface depressions was identified during the field reconnaissance. An historical dump and a stone platform and earthen berm were also identified. Subsurface testing consisted of the excavation of 102 shovel test pits excavated in six areas determined to have archaeological potential. One prehistoric site, consisting of three prehistoric lithic flakes, was identified. The prehistoric site that was discovered during the survey was located within a wetland buffer zone where no development was proposed. It was recommended that this site be avoided. If avoidance was not possible, it was recommended that further archaeological work be conducted. Based upon documentary research, the historical site may have been the residence of Obed Abbott, one of Bedford's first settlers (ca. 1730s). Subsurface testing resulted in the recovery of late 18th century artifacts; the possibility exists that further excavations may reveal additional historical resources from the same period or earlier. It was recommended that a site examination be conducted at the historical site in order to determine its potential eligibility for nomination to the State and National Registers of Historic Places. No further archaeological work was recommended for the other historical features or the remaining portions of the project area.

25-1004 Raber, Michael S.

1984 Cultural Resources Reconnaissance, Proposed Chicopee River Bridge, City of Chicopee, Hampden County, Massachusetts. 27 pages.

Reconnaissance survey research for the proposed bridge construction included background research of the project area vicinity prehistory, history and environments, surface inspection, and interviews. Five areas were considered sensitive for prehistoric resources, and no areas were considered sensitive for historic resources. Subsurface field investigations were recommended to determine the presence of significant prehistoric remains if project planning proceeded for one of the bridge alternatives and associated road widening (see report #25-1005).

25-1005 Raber, Michael S., and Leonard W. Loparto

1985 Intensive Survey of Cultural Resources for the Proposed Chicopee River Bridge, City of Chicopee, Hampden County, Massachusetts. 13 pages.

An intensive survey was conducted of the sensitive areas identified in the reconnaissance survey for the proposed bridge construction (see report #25-1004). A total of 40, 50 cm x 50 cm test pits placed at intervals of 20 m or less was excavated. One piece of quartzite lithic debitage was the only prehistoric artifact recovered. Most of the project areas tested proved to be badly disturbed by highway and parking area construction and maintenance. No further archaeological work was recommended.

25-1006 Carlson, Catherine C., and Ellen-Rose Savulis

1988 Archaeological Site Locational Survey for the Proposed Liberty Ledge Residential Development, Sudbury, Massachusetts. 95 pages.

Background research, a walkover, and the excavation of 129, 40 cm x 40 cm test pits was conducted at the 104 acre project area. Eight prehistoric archaeological sites, one of which is part of a previously recorded prehistoric site (19-MD-507), were located. Liberty Ledge Site 1 was the only site from which a temporally diagnostic artifact was recovered; this was a Brewerton Notched projectile point dating to the Late Archaic Period (6,000 to 3,000 B.P.). It was recommended that the route of access roads be changed and the houselots modified to avoid the site. If this is not possible, it was recommended that a site examination be conducted at the site in order to determine its eligibility for listing on the National Register of Historic Places. Sites 2, 4 and 6 are to be impacted by house lots. It was recommended that the house lot plans be modified in a manner that would avoid the sites and a site preservation restriction be given to the Massachusetts Historical Commission to assure their protection in the future. One site, Liberty Ledge Site 3 was disturbed and no further survey was recommended. Three of the sites, Liberty Ledge Sites 5, 7 and 8, were technically regarded as a "findspots" as only one lithic flake was found at each. No further survey was recommended for these areas.

25-1007 Johnson, Eric S., Emily P. Gray, Daniel Hughes, Sioux McKinney, and Timothy Silva

1989 Report on the Fort Hill Site, Springfield, Massachusetts: Archaeological Site Examination by the University of Massachusetts Summer Field School, 1989. 81 pages.

The Fort Hill Site (19-HD-82/151) was a palisaded village inhabited by the Aqawam Indians from ca. 1666-1675. Excavations conducted during the construction of a house in 1895 located the palisade. Background research, surface inspection, remote sensing, and excavation of anomalies found were conducted to access the site's integrity and research potential. A total of 346 prehistoric or historic Native American artifacts were recovered, consisting mostly of lithic tools, waste products, and ceramics. A total of 1,338 historic artifacts were also recovered, most of which postdate the 18th century. The majority of these items were construction-related materials such as nails and flat glass with some domestic items such as ceramics and curved glass. The precise boundaries of the site were not determined, but it was recommended that excavation and/or remote sensing efforts be extended farther to the east to find site boundaries in the form of palisades. It was recommended that any future excavation should be conducted for the purposes of evaluating the utility of the remote-sensing data and tracing patterns of postmolds and other features.

25-1008 Davin, Ann K.

1990 Phase I Intensive Archaeological Survey, Shelburne Falls Road Bridge #C-20-18, Conway, Massachusetts. 43 pages.

Background research determined that there were no known prehistoric sites in close proximity to the project area. Historic period resources included stone walls and a small cellar hole six meters outside the project area. Subsurface testing did not locate any additional cultural resources. No cultural materials were located, even around the small foundation. Drainage within the area was found to be very poor. No further archaeological testing was recommended.

25-1009 Little, Elizabeth A.

1990 Nantucket Test Pit No. 1991 at the University of Massachusetts Field Station, Nantucket, Massachusetts. 42 pages.

A 30 x 30 cm test pit was excavated at the University of Massachusetts Field Station (MHC Site #19-NT-l66) as part of a public education program in archaeology offered by the Nantucket Historical Association. Excavated to a depth of 14 cm, the test pit unveiled the presence of prehistoric chipping debris, shell and botanical remains in the plowzone. Analysis of the botanical remains are included in an appendix to the report. The report also includes an outline of the public education program.

25-1010 Johnston, Paul F.

1988 Marine Archaeological Phase I Evaluation for the Deer Island Fixed Cable Crossing, Inner Boston Harbor Massachusetts Water Resources Authority Secondary Treatment Facilities Plan. 26 pages.

Documentary sources were consulted to determine the locations of known shipwrecks in inner Boston Harbor. Sources from the Army Corps of Engineers were reviewed to evaluate more recent disturbances to the harbor bottom from dredging and navigational improvement projects. Recommendations were made for field survey and/or careful analysis of remote sensing (magnetometer, sonar and sub-bottom profiling). See also report #25-1011.

25-1011 Johnston, Paul F.

1989 Archaeological Review of the Marine Geophysical Survey of Inner Boston Harbor for the Boston Harbor Submarine Cable Crossing. 10 pages.

Remote sensing geophysical survey data were analyzed in relation to potential submerged cultural resources within an area proposed for the installation of utility cables from the Reserved Channel in South Boston to Deer Island. One anomaly was discovered near Deer Island which might be indicative of an historic shipwreck. It was recommended that this anomaly be avoided. See also report #25-1010.

25-1012 Harrell, Pauline Chase, Victoria Bunker Kenyon, and Dina Freedman

1988 Documents Submitted for 106 Review of Washington Street Replacement Transit Study. 76 pages.

This reconnaissance-level study uses documentary research, visual inspection and interviews with archaeologists to identify properties listed or possibly eligible for listing in the National Register. The report then considers the potential impacts of the proposed alternatives for replacement transit on historic and archaeological resources along the Washington Street corridor in Boston from the Tremont Street Tunnel to Dudley Square. The report was not intended as complete background research. The widening of streets and construction of tunnels could have adverse impacts on both standing structures and archaeological sites in the form of demolition and deep excavations. It was recommended that a complete documentary review be undertaken for any project areas which will be affected by subsurface construction, followed by subsurface testing in selected areas. Street level improvements such as bus stop shelters and overhead wires may have an adverse visual impact on districts and structures listed or considered eligible for listing on the National Register by altering their setting; however, these improvements are expected to have little impact on archaeological resources.

25-1013 Pendery, Steven

1989 Archaeology at Chandler's Pond. 26 pages.

Chandler Pond/Gallagher Memorial Park in Brighton was investigated for the presence of prehistoric and historic archaeological resources. Historic documentary research noted the possible presence of sites associated with a "Praying Indian" settlement in the 17th century, as well as 18th and 19th century historic resources. The excavation of a number of shovel test pits revealed the possible remains of a 19th century icehouse. An appendix contains copies of a sample of project area land deeds.

25-1014 Jones, Donald G., Claire C. Carlson and Gerald M. Macomber

1990 Results of an Intensive Archaeological Survey of the Proposed North Attleborough Square Project in North Attleborough, Massachusetts. 40 pages.

The intensive archaeological survey consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. Background research indicated that the vicinity of the project area contains numerous recorded prehistoric sites and that one prehistoric site may be located in the eastern portion of the project area adjacent to the town line. Background research also indicated that European settlement in the region dates to the 17th century and one of the earliest settlement nodes in North Attleborough, "Old Town," was located just north of the project area. Historical activity in the project area, however, was probably limited to hunting and possibly pasturing of livestock. A field walkover of the 95 acre project area was conducted to identify surface evidence of sites and to select areas for subsurface testing. One quartz projectile point base fragment was recovered from the surface within the gas pipeline right-of-way. Several historical fieldstone walls were identified during the field walkover, and, in addition, two historical features were identified. These consist of a stone and mortar feature and a dilapidated wood and iron bridge or walkway across a wetland. Twelve areas were selected for subsurface testing on the basis of topographical criteria. A total of 184 test pits was excavated within these areas of archaeological sensitivity. One quartz Small Stemmed projectile point was recovered from the subsoil of TP 50 (Area 2). The excavation of bracket units around this test pit did not produce any additional prehistoric materials. Similarly, no additional prehistoric materials were recovered from test units excavated in the area of the quartz projectile point surface find in the pipeline right-of-way (Area 3). Two fragments of Attleborough red felsite were recovered from two shovel test pits in Area 6. Bracket units of these two pits did not recover any additional prehistoric material. All of these prehistoric artifacts, therefore, were considered to represent isolated finds and were not considered to represent potentially significant archaeological deposits. The two historical features noted during the field reconnaissance portion of the project were not considered significant due to their recent date and poor condition. No further archaeological investigations were recommended.

25-1015 Doucette, Dianna, and Ann Davin

1990 An Intensive Archaeological Survey Clearview Estates Residential Subdivision Taunton, Massachusetts. 68 pages.

An intensive archaeological survey was conducted in the 39 acre project area and included background research, a surface inspection, and subsurface testing. The background research revealed the existence of the Staples/Soper farmstead within the project area, parts of it standing until the early l980s. The walkover survey determined that two barn foundations and a standing structure are present within the project area as well as the gravestone for Deacon Seth Staples who died in 1778. Intensive subsurface testing consisted of 115, 50 x 50 cm test pits, and eight 70 x 200 cm trenches. No prehistoric cultural material was recovered. The historic/modern field trash is not considered to represent a potentially significant cultural deposition. The location of Seth Staples' body was not determined through testing around the gravestone, but a proposed 40 foot by 40 foot protective easement around the gravestone should protect the grave during construction activities.

25-1016 Holstein, Elizabeth, and Alan Leveillee

1990 Intensive Archaeological Survey of the Harrison Estates Subdivision Project Area, Canton, Massachusetts. 60 pages.

Preliminary background research and a surface inspection of the 20 acre parcel were used to stratify the project area into zones of expected archaeological sensitivity. Areas with a high sensitivity rating included those sections of the project area where prehistoric or historic cultural material and/or structural debris were observed. This included a grassy field in the southern portion of the project, directly across the street from a known "Praying Indian" burial ground. Intensive subsurface testing consisted of placing 13, 30 x 30 m square sampling blocks, each containing 13, 50 x 50 cm test pits, within the project limits. A total of 169 test pits (50 x 50 cm) was excavated dur-

ing the intensive survey. Additional testing was carried out in the form of 11, 2 m x 10 m machine trenches, placed in the field along Chapman Street in order to locate any possible evidence to indicate that burial features were present. Although 17 pieces of prehistoric chipping debris were recovered from test pits in the Harrison Estates project area, no major concentrations were located, and all of the chipping debris were found in the plowzone. No evidence of grave shafts was found in the 11 machine trenches. Investigations of two standing houses and 2 cellar holes resulted in the identification of a 19th century residential complex, consisting of a house, stable, barn, and outbuilding. A deed search was performed on the property. While prehistoric cultural material was recovered, no major concentrations exist. These materials, in a generally poor context, do not represent a potentially significant site. The standing structures are not eligible for listing in the National Register of Historic Places, due to the high degree of alterations that have taken place. No further testing is recommended.

25-1017 Bradley, James W., Neill DePaoli, Nancy Seasholes, Patricia McDowell, Gerald Kelso, and Johanna Schoss

1983 Archaeology of the Bostonian Hotel Site. 119 pages

The ca. 1675 downtown Boston waterfront area was archaeologically examined during the construction of the Bostonian Hotel, located in the Blackstone Block. A and landfill dating between the 17th and 18th centuries were exposed, documented and sampled. The report includes a description of the documentary history of the site, and the results of analyses of pollen, faunal remains, molluscs and mortar samples. Artifacts including ceramics, glass, smoking pipes, and shoes found in the fill strata are described and illustrated.

25-1018 Strauss, Alan E.

Intensive Archaeological Survey of the Old Derby Sewer Line in Hingham, Massachusetts. 30 pages.

An intensive archaeological survey was conducted for a proposed sewer line. Background research indicated that the project area was the location of Hingham's first meetinghouse (ca. 1635-1681), a fort (ca. 1645), and a burial ground. Graves in the burial ground were moved in 1831, but human remains were reportedly found nearby during earth-moving activities in the later 19th and in the 20th centuries. After a field evaluation of the condition of the existing sewer system, a new sewer system was not required and no activities that might impact graves were proposed. If excavation work is required in the project area, archaeological evaluation will be required.

25-1019 King, Marsha K.

1989 Intensive Archaeological Survey, South Pointe Corporate Center, Middleborough, Massachusetts. 71 pages

Background research and a walkover survey were conducted to evaluate the project area. During the walkover three historic period sites were located, an 1830s sawmill, the Richmond cellar hole, and a barn foundation. A quartz projectile point was also recovered on the ground surface in a recently disturbed area during the walkover. Subsurface testing consisted of the excavation of 251, 50 x 50 cm test pits in 30 x 30 m blocks and along judgmental transects in areas of relatively high archaeological sensitivity. One possible locus of prehistoric activity consisted of a quartz Small Stemmed projectile point, a quartz biface, a quartz projectile point fragment, quartz debitage and a piece of chalcedony. Prior disturbance had severely impacted the locus. Of the three historic resources, one was disturbed (cellar hole), one presently lies outside the project area (barn foundation), and the third (sawmill)' retained little cultural material and is similar to many other existing sites in the region. Avoidance of the sawmill site is recommended. The resources within the project area do not retain sufficient archaeological integrity to be recommended for further investigation.

25-1020 Rainey, Mary Lynne

1989 A Cultural Resource Survey (Phases 1A & 1B) of the Proposed Algonquin Gas Pipeline Corridor: The Algonquin New North Line (ANNL) Integrated Facilities Project. 64 pages.

The project area included 81 miles of pipeline right-of-way and facilities in the Massachusetts towns of Mendon, Leverett, Millville, Sunderland, Uxbridge, Deerfield, Northbridge, Conway, Sutton, Waltham, Millbury, Lexington, Auburn, Belmont, Leicester, Arlington, Spencer, Cambridge, East Brookfield, Somerville, North Brookfield, Medford, West Brookfield, Malden, Ware, Bellingham, Belchertown, Fall River, Pelham, and Shutesbury. Through background research, the survey resulted in the stratification of the proposed pipeline route into areas of high, moderate and low archaeological sensitivity. During the field inspection, archaeologically sensitive areas were verified and ten previously unknown historic archaeological sites were located. However, prior to the completion of the archaeological subsurface testing portion (phase Ib) of the survey, an alternative pipeline proposal was selected by the federal review agency. No further archaeological work was conducted.

25-1021 O'Steen Lisa D.

1989 Cultural Resource Literature and Research Review for the Nashua Branch of the Pelham Mainline Branch of the Champlain Gas Pipeline Corridor. 62 pages.

Background research was conducted for a five mile pipeline corridor in Dunstable. Review of MHC files and previous research were used to identify known sites and potentially sensitive project areas.

25-1022 see 25-783.

25-1023 O'Steen, Lisa D.

1988 Cultural Resource Literature and Research Review for the Pelham Mainline Branch for the Champlain Gas Pipeline Corridor: Vermont, New Hampshire, and Massachusetts. 114 pages.

Background research was conducted for a 36.1 mile pipeline corridor in the Massachusetts towns of Berlin, Clinton, Sterling, Bolton, Tyngsborough, Groton, Dunstable, Pepperell, Shirley, and Lancaster. Review of MHC files and previous research were used to identify known sites and potentially sensitive project areas.

25-1024 O'Steen, Lisa D.

1989 Cultural Resource Literature and Research Review for the Berkshire Mainline Branch of the Champlain Gas Pipeline Corridor: Vermont and Massachusetts. 92 pages.

Background research was conducted for a 55 mile pipeline corridor in the Massachusetts towns of Shelburne, Colrain, Deerfield, and Leyden. Review of MHC files and previous research results were used to identify known sites and potentially sensitive project areas.

25-1025 Zitzler, Paula A.

1985 Waterpower at Hancock Shaker Village: A Study in Industrial Archaeology. 65 pages.

Documentary research and a field reconnaissance were conducted for waterpower-related resources at the Shaker Village in Hancock, Massachusetts. Archaeological and historical research at other Shaker communities is discussed to provide comparative data with the Hancock community

emphasizing waterpower. Recommendations were made to incorporate the ruins at Hancock into an interpretive trail, stabilize the ruins, conduct additional testing, and to develop an archaeological research design for the entire village.

25-1026 Mahlstedt, Thomas F., Stephen J. Roper, and Michael Steinitz

1981 An Archaeological Survey and Documentary History of the Shattuck Farm, Andover, Massachusetts. 135 pages.

This report presents the results of three studies by the above authors. The archaeological survey presented by Mahlstedt included background research, a walkover and subsurface testing within a 110 acre study area. A total of 311 test pits was excavated; 71 tests revealed evidence of prehistoric tool types and diagnostic artifacts spanning the Middle Archaic through Late Woodland periods. The sites appeared to range in function from single occupation, special function sites to intensively occupied multiple, stratified sites. Recommendations were made to excavate specific archaeological sites during the following summer based on proposed land use of the project area and the fact that the four sites are in possible danger of destruction. The architectural analysis of surviving buildings at Shattuck Farm discusses 6 buildings including two owners' homes, a country store, farmworker's cottage, dairy barn and stock shed. Each building is discussed in detail including their architectural context and significance. The documentary research interprets the available documentary evidence relating to the history of the Shattuck Farm. The discussion is presented as a chronicle of changes which occurred at the farm through its 250-year continuous operation. See also report

#25-1051.

25-1027 King, Marsha K.

1987 Intensive Archaeological Survey of the New Rest Haven Historic Cemetery Site at the Deer Island House of Corrections, Boston, Massachusetts. 83 pages.

The combined resources of in-depth documentary research, geophysical/remote sensing survey, and archaeological subsurface testing were utilized. The cemetery site is located on the hillside east of the Hill Prison building and appears to contain the remains of burials which were removed and relocated from the Old Rest Haven Cemetery and burials of immigrants who had died at the Quarantine Hospital (see report #25-740). Burials were found restricted to the area above the mausoleum and extend northeast some 30 to 40 meters. Preservation of the burials within the cemetery is very poor. As the boundaries of the cemetery identified and will be preserved, no further archaeological work is recommended.

25-1028 Seasholes, Nancy S., Gerald M. Macomber, and Ricardo J. Elia

1990 Archaeological Reconnaissance Survey of Site A1 for the Massachusetts Water Resources Authority's Combined Sewer Overflow Project in Cambridge and Somerville, Massachusetts. 84 pages.

Background research, a field reconnaissance and limited subsurface testing were conducted as part of a reconnaissance archaeological survey of 9,450 feet of underground conduits, 12 diversion structures and a pump-out station. All areas were found to have been extensively graded. Artifactual materials recovered in tills were consistent with the late 19th/early 20th century, a period of extensive construction and grading in the project area. No significant archaeological remains were recovered. Further archaeological work was not recommended.

25-1029 Carlson, Claire

1990 Intensive Archaeological Survey of Tennessee Gas Pipeline Company's Proposed Niagara

Settlement Project in Hopkinton, Massachusetts. 51 pages.

Background research and a field reconnaissance of 3.2 miles of easement resulted in the identification of 11 archaeologically sensitive areas selected for intensive survey with excavation. A total of 108 shovel test pits was excavated which recovered prehistoric artifacts including a quartz decortication flake, a felsite biface fragment and piece of quartz angular waste. Historic artifacts considered to be field scatter were also recovered. Neither the prehistoric nor historic materials were considered to be potentially significant archaeological deposits. No further archaeological testing was recommended.

25-1030 Hoffman, Curtiss

1990 Relay Node Construction USAF GWEN Program Southern Massachusetts/Rhode Island. Interim Report on the Issue of a Possible Native American Grave Marker, Nardelli Site Westport, Massachusetts. 18 pages.

This report presents the results of a site visit to investigate claims that a Native American grave marker was located in or adjacent to the project area. Soil coring supplemented this field visit which indicated stone markers in the area were probably property bounds. In the end, it was recommended that a more intensive sampling design would be necessary to determine conclusively whether or not the project area was actually utilized by Native Americans, and if so for what purposes.

25-1031 Strauss, Alan E. and Ellen-Rose Savulis

1990 Archaeological Reconnaissance Survey of the Merrimack Cogeneration Plant in Lawrence, Massachusetts. 43 pages.

Background research and a surface inspection were used as part of an archaeological reconnaissance survey for a 1.4 acre project area. Documentary and field research indicated that the area, formerly a railroad yard for the Boston and Maine Railroad, was extensively disturbed and covered with fill. Railroad buildings were no longer extant. Because of the nature of railroad construction and extensive below ground disturbance, the likelihood of survival for significant prehistoric or historic resources was low. No further archaeological work was recommended.

25-1032 Dincauze, Dena F.

1990 Report of Cultural Resources Survey Near the Confluence of Hop Brook and Fort River, Amherst, Massachusetts, 1990. 15 pages.

Background research, a surface walkover, excavation, and coring were used as part of continuing reconnaissance and intensive study of archaeological resources in the Fort River drainage basin, a tributary of the Connecticut River. All work was performed as part of an undergraduate course at the University of Massachusetts, Amherst. No evidence of prehistoric resources were recovered, probably due to poorly drained soils in the project area. Historic period cultural remains were limited to plowzone debris typical of the late 19th and early 20th centuries. A dump of old construction materials was also identified. No further protection or management recommendations were made.

25-1033 Holmes, Richard Douglas

1990 Archaeological Locational Survey for the Proposed College Highway Apartments for the Elderly, Easthampton, Massachusetts. 52 pages.

Documentary research, a walkover reconnaissance, and subsurface testing with shovel test pits was employed as part of a site locational survey on 2.7 acres. No prehistoric artifacts or features were found. Historic material recovered consisted of ceramics dating from the late 18th century to

the present. No prehistoric or historic resources of significance were located in the project area. No further archaeological investigations were recommended.

25-1034 Davin, Ann K., and Valerie J. McCormack

1990 Intensive Archaeological Survey of the South Bellingham Interception Sewers Project Area, Bellingham, Massachusetts, and Woonsocket, Rhode Island. 54 pages.

Background research, a walkover survey and subsurface testing, including augering and shovel test pits, were used to survey a 6,900 linear foot project area. No prehistoric artifacts were recovered. Historic materials found included ceramics, charcoal, nails, and other items, all interpreted as field trash. Most of the project area was determined to be either extensively altered by previous construction activities or within wetland areas. No further archaeological investigations were recommended.

25-1035 Dalton, Ronald, and Suzanne Glover

1990 Archaeological Reconnaissance Survey, Quincy Relief Interceptor Sewers, Quincy, Massachusetts. 56 pages.

Background and documentary research followed by a surface inspection and limited subsurface testing was employed as part of a 2.3 mile reconnaissance survey in West Quincy. No prehistoric resources were recovered. Historic materials included glass, plastic and quahog shell interpreted as modern roadside trash. Sections of the project corridor were found to have moderate to severe below ground disturbances. All sections of the project corridor were found to either lack significant prehistoric and historic resources or possess a low likelihood for their recovery. No further archaeological investigations of the proposed project area were recommended.

25-1036 Mulholland, Mitchell T., Richard Douglas Holmes, and Carolyn Hertz

1990 Archaeological Site Locational Survey of Baxter Neck, Barnstable, Massachusetts. 101 pages.

Background research, a walkover survey and excavation were used to complete a site locational survey of seven lots within a 14 acre residential development. The results of the archeological investigations indicated that the project area contained a large shell midden, dating to the Woodland Period (ca. 2,000-400 years ago), and possibly used also during the Late Archaic (ca. 5,000-3,000 years ago). The archaeological site, which is relatively intact, contains archaeological materials (lithics, bone, shell, floral remains, and features [pits and a possible postmold]) that can provide important information on regional prehistory, including data on settlement and subsistence, lithic technology, adaptation, and chronology. Based on the results of the archaeological investigation, the Baxter Neck Site was recommended as eligible for listing in the State and National Registers of Historic Places. Two alternative recommendations were made which focus on lots 10 and 11: 1) avoid impacts to the site by defining areas which would not be impacted through preservation restrictions and conducting a data recovery for areas where impacts could not be avoided; or 2) conduct and archaeological data recovery over the entire site. No significant cultural materials were found in lots 2, 3 and 4 for which no further survey was recommended. Additional survey was recommended on lots 8 and 9 where low-density prehistoric materials were encountered.

25-1037 McCormack, Valerie

1991 Intensive Archaeological Survey Billerica Technology Park Project Area Billerica, Massachusetts. 51 pages.

Background research, a walkover surface inspection and subsurface testing were used to survey a 15 acre parcel of undeveloped land planned for an industrial park. No prehistoric materials were

recovered. Historic artifacts recovered included glass, redware, iron and plastic dating to the late 19th and 20th centuries. These materials were present in low-density deposits and did not represent potentially significant archaeological deposits. No further archeological investigations were recommended.

25-1038 Mrozowski, Stephen A.

1991 Intensive Archaeological Survey Nathan Fisher House Property, Westborough, Massachusetts. 40 pages.

Background and documentary research and subsurface testing including Hotter 40 cm augers and test pits were used to test portions of the yard immediately adjacent to the north, east and west foundation walls of the Nathan Fisher House. Testing revealed that the area immediately west of the house had been disturbed by earlier foundation stabilization work. Testing along the northern and eastern foundation walls recovered ceramics dating to the third quarter of the 19th century, tarpaper, plastics and wire nails dating to the 19th and 20th centuries, and a late 19th century coal chute. These materials were not considered significant cultural resources. Testing in the south yard recovered evidence of a feature containing ceramics dating from the 1820 to 1840 range, clearly associated with the Fisher period of occupation. Recommendations were made to avoid the well/feature area in the south yard during foundation stabilization. Otherwise, no other archaeological research was recommended.

25-1039 Raber, Michael S., Stephen P. Carini, Gifford Fogle, and Roger Moeller

1991 Archaeological Intensive Survey and Site Examinations for the Proposed Riverside Park Development, Lakeville, Massachusetts: The Bridge Street II and

Riverside Sites 1-8. 71 pages.

Intensive survey and site examination investigations at the proposed Riverside Park development in 1989 and 1990 assessed the boundaries and significance of nine prehistoric archaeological sites, designated Bridge Street II and Riverside Sites 1-8. All nine sites appear to have been used as temporary field camps and/or workstations for brief periods of ca. 9,000-500 years ago; a few sites may have been used for slightly longer seasonal occupations. One or more time periods have been identified for each site, through radiocarbon dating and/or the presence of temporally diagnostic artifacts, indicating repeated re-use of the same area, with the best-documented periods being ca. 3,700-500 years ago, during Terminal Archaic and Woodland eras. All nine sites have integrity and potential for additional temporal and cultural information. The most important research question which these sites can address is the changing role of prehistoric satellite camps or workstations over long periods of time, given the long-term occupation of this relatively small area. The presence of a large known base camp several miles away increases the potential of these sites to increase understanding of prehistoric settlement systems in southern New England. All nine archaeological sites at Riverside Park appear to be eligible for inclusion in the National and State Registers of Historic Places.

25-1040 Miller, Beth P.

1990 Intensive Archaeological Survey, Conservatory Park Project Area, Hingham, Massachusetts. 71 pages.

Background research, a surface inspection and subsurface testing were used to test nine sensitive areas within a 100 acre parcel. Low densities of prehistoric cultural material consisting of chipping debris and a base fragment of a Brewerton Eared projectile point were recovered. These scattered materials, found in a generally disturbed context, do not represent potentially significant sites. Historic materials recovered were sparsely re-deposited throughout the plowzone. These materials included ceramics, glass, nails, mammal bone, bird bone and other objects in concentrations which

did not represent significant archaeological deposits. No further archaeological investigations were recommended.

25-1041 Davin, Ann K.

1990 A Phase I Intensive Archaeological Survey of the Brodie Mountain Road Project Area, Hancock, Massachusetts. 62 pages.

Background research, a walkover survey and subsurface testing were used to test a 1.8 mile section of roadway between Route 43 and the Lanesborough town line. The walkover survey noted significant areas of disturbance and the partial remains of the town pound within the project area. The remains of a cheese factory and two charcoal kilns were found outside the project area. Subsurface testing recovered ceramics, glass, and nails indicative of late 19th and 20th century field trash. No significant prehistoric or historic cultural remains were located within the project area. No additional archaeological investigations were recommended.

25-1042 King, Marsha K., Beth P. Miller, and Christy Vogt

1991 Intensive (Locational) Archaeological Survey Henry Lord Middle School, Fall River, Massachusetts. 124 pages

Background research, a walkover survey, subsurface survey, limited machine testing and monitoring of general preparation and earth moving activities were used to locate potential prehistoric and/or historic sites and suspected graves within a 17.5 acre project area. Three pieces of prehistoric chipping debris were recovered. Due to the low density and disturbed context of these materials, no additional archaeological investigations were recommended. Historic artifacts were recovered in plowzone and trash dump contexts from most excavation units in the project area. These materials included butchered animal bone and domestic refuse including ceramic sherds and glass bottle fragments. A small stone enclosure was located in the southeast portion of the project area which appeared to be the most likely location to contain suspected graves. No evidence of human burials was found in the enclosure which was probably an animal pen later used as a trash disposal site. Monitoring of other project impact areas also failed to locate evidence of graves which may be located outside the present bounds of the project. No further archaeological investigations were recommended.

25-1043 Holmes, Richard Douglas, Mitchell T. Mulholland, David Bernstein, and Carolyn Hertz

1990 Archaeological Site Locational Survey of Segments 7 and 8, Niagara Settlement Project. 163 pages.

An archaeological site locational survey was conducted along the proposed pipeline route of Segments 7 (including Pipeyard 7B) and 8 of the Niagara Settlement Project. The survey took place in Agawam, Longmeadow and East Longmeadow, Hampden County, Massachusetts. The study included documentary research, a walkover reconnaissance and subsurface testing with 741 shovel test pits. In two survey areas, backhoe trenches were excavated to extend beneath deep alluvium or artificial fill. Eleven prehistoric archaeological sites or find spots were encountered: in Segment 7 Survey Area C, the Cornfield A Find Spot, where surface finds include chert flakes, a Small-Stemmed quartz projectile point, a chert biface and fire-cracked rock; in Survey Area C, Cornfield B Find Spot, where a Squibnocket Triangular point was found on the surface; in Survey Area D, the Route 75 Site, where chert flakes, a chert biface and fire-cracked rocks were found; in Survey Area E, Prehistoric Findspots El, E2 and E3; in Segment 8, Survey Area F, Prehistoric Findspot F and the West Road Prehistoric site, where chert, quartz and argillite flakes were found with prehistoric ceramics; in Survey Area G, the Longmeadow Brook Site, where fragments of grit tempered pottery, mineral tempered pottery and cord-marked pottery were found, along with fire-cracked rock, chert flakes, felsite flakes, quartzite flakes and fragments and a quartzite biface; in Survey Area H, the Longmeadow Brook Terrace site, where a quartz pentagonal projectile point and a tip,

quartz fragments, quartz flakes and fire-cracked rocks were found. Site examinations are recommended for the West Road site in Survey Area F (staging area), the Longmeadow Brook Bluff site in Survey Area G, and the Longmeadow Brook Terrace site in Survey Area H to determine their eligibility for inclusion in the National Register of Historic Places. The other sites and findspots contain very low densities of cultural material, or are disturbed and, as a result, no further survey is recommended. No significant historic sites were found. See also report #25-1055 and 25-1056.

25-1044 Decima, Elena, and Michael Roberts

1990 Myles Standish Village/Estates Archaeological Reconnaissance Survey Report, Carver, Massachusetts. 23 pages.

Background research, a preliminary walkover and soil coring were used as part of a reconnaissance survey which stratified a 181 acre project area into zones of high, medium and low archaeological potential. An intensive survey was recommended within those areas with archaeological potential. See also report #25-1045.

25-1045 Miller, Beth P., Ann K. Davin, and William Begley

1991 Intensive (Locational) Archaeological Survey, Myles Standish Estates/Village Project Area Carver, Massachusetts.

Background research, a walkover inspection and subsurface testing were used to intensively test approximately 40% of a 181 acre parcel identified as having a moderate to high potential to contain prehistoric sites during an earlier reconnaissance study. No cultural material was recovered from any test pits within the project area. No further archaeological investigations were recommended. See also report #25-1045.

25-1046 Hasenstab, Robert J., Mitchell T. Mulholland, and Richard Douglas Holmes

1990 Archaeological Investigations at Prehistoric Site 19-HD-109, Westfield, Massachusetts. 208 pages.

Archaeological site location, site examination and data recovery surveys were conducted at the site of the proposed Massachusetts Correctional Institution facilities. The project included background research, a walkover survey and excavation to achieve site identification, site boundary and content evaluation, and site data recovery excavation. Proposed impacts to prehistoric archaeological site l9-HD-109 were assessed and mitigated. The site was a seasonally occupied camp used by hunter-gatherers during the summer. Temporally diagnostic projectile points included Vosburg, Small Stem, Squibnocket and Susquehanna. Several grass-lined prehistoric pit features were encountered. Seeds recovered from the features included Chenopodium. Four clusters of occupation were identified. Radiocarbon dates for three of these clusters indicate occupation at 1720 B.P., 3480-3900 B.P. and 5960 B.P. No significant historic sites were found within the project area. The information that qualified the site for inclusion in the National Register has been recovered. No further survey is recommended.

25-1047 Strauss, Alan E., and Mitchell T. Mulholland

1991 Archaeological Data Recovery at the Fishkin-Wrightson Site, Wellesley, Massachusetts. 115 pages.

A data recovery excavation was conducted at the Fishkin-Wrightson site on the banks of the Charles River. The site contains a Wayland Notched component of the Susquehanna Tradition radiocarbon dated to 3,590 $\pm$ 90 B.P, and a Middle Woodland component dated to 2,080 $\pm$ 80 B.P. Results of the excavation indicate that subsistence activities that took place during late summer and fall. No evidence of fishing was recovered from the site, but given the proximity to the

Charles River and the known use of fishweirs in historic times, it is assumed that fish were an important ingredient in the subsistence mix. Locally available felsitic volcanics (the predominant raw material type), quartz, quartzite, and argillite were used for tool manufacture. Exotic cherts were obtained from New York State. Petrographic analysis indicates that most raw materials were derived from sources within a 2 to 25 mile radius (in Dover, Westwood and Attleborough), with most recovered from the Twin Pines Tuff outcrop some two miles from the site. The site is interpreted as a short-term encampment where exploitation of berries, nuts and river-related resources took place. No evidence was found for house floors or structures, pit or storage features, or scraping tools. The site does not appear to have been a permanent village or campsite. Data that made this small site eligible for inclusion in the National Register of Historic Places have been recovered. No further fieldwork is recommended. See also report #25-1078.

25-1048 Seasholes, Nancy S., David E. Clayton, and Donald G. Jones

1991 Results of a Cultural Resource Reconnaissance Survey of Ten Proposed Sites for a Secondary Sewage Treatment Plant and Solids Disposal Facility for the South Essex Sewage District in Essex County, Massachusetts. 125 pages.

A cultural resource reconnaissance survey was conducted of ten proposed sites for a secondary sewage treatment plant and solids disposal facility. Four of the proposed sites are in Salem, one is in Marblehead, two are in Peabody, one straddles the Peabody/Danvers city line, and two are in Beverly. The survey consisted of background research and field reconnaissance and included assessments of potential impacts both to archaeological sites and historic (architectural) resources. Based on the results of the background research and field reconnaissance, each site was rated as having a high, moderate, or low potential for impact to prehistoric and historical archaeological sites, for structural impact to historic (architectural) resources, and visual impact to historic (architectural) resources. For each proposed site that contained moderate or high ratings for either archaeological or historic resources, recommendations were developed for further cultural resource investigations that may be required should that site be selected. An intensive archaeological survey was recommended for undisturbed portions of nine of the proposed sites should that site be selected. Additional archaeological reconnaissance was recommended because access to part of it was restricted during the course of this survey. Additional architectural investigations were recommended for seven sites. If one site is selected, additional architectural investigations will be required. No further architectural investigations are recommended for two sites.

25-1049 Strauss, Alan E.

1991 Intensive Archaeological Survey of the Pagos Houselot in Brewster, Massachusetts. 32 pages.

Background research, a field reconnaissance and subsurface testing were used as part of an intensive survey on a .97 acre houselot. Documentary research indicated that no recorded prehistoric or historical sites were situated within the project area. One rim sherd of prehistoric pottery was recovered during the surface inspection. Prehistoric cultural remains, consisting of quartzite chipping debris, pottery, and the midsection of a projectile point were recovered from the shovel test pits. Fire-cracked rock, charcoal flecks, and two pieces of burned bone were also identified in one of the shovel test pits. All of the prehistoric artifacts were found within the context of an unplowed site. Because of the presence of pottery, stone tools, and possible subsurface features within the B-horizon soil, it was recommended that a limited Phase II archaeological site examination be conducted. See also report #25-1050.

25-1050 Strauss, Alan E.

1991 Report: Additional Archaeological Investigations at the Pagos Houselot in Brewster, Massachusetts. 52 pages.

Additional archaeological investigations at the Pagos Houselot (Slough Pond Site) in Brewster, Massachusetts were conducted as part of the Phase I intensive survey (see report #25-1049). Because prehistoric ceramics, chipping debris, and a potential feature were found, it was recommended that two m test units and 10 shovel test pits be excavated at the site to determine if a site examination or data recovery were warranted. Subsurface testing at the site resulted in the recovery of a projectile point tip, broken biface, and two Woodland stemmed points, as well as over 170 sherds of prehistoric pottery. The pottery represents four different vessels, one of which is Early Woodland and the others may be Middle Woodland. In addition, numerous fragments of calcined bone and charcoal were recovered from the cultural horizons. Charcoal from the occupation horizon has been dated to 2,435 $\pm$ 160 years B.P. (C-l3 corrected). Based on the diagnostic artifacts and radiocarbon date it appears that the site dates to the Early and Middle Woodland periods. A total of 19 shovel test pits has been excavated at the site. All of the cultural remains, with the exception of one flake, were restricted to the western edge of the proposed house foundation. Testing around the outlying flake produced no additional artifacts. The prehistoric site was therefore limited to an area about 5 x 5 m in size. Additional testing at the site coupled with the Phase I survey has most likely resulted in the recovery of the majority of cultural remains from the site. It was not believed that the site is eligible for nomination to the National Register of Historic Places, and no further archaeological work was recommended.

25-1051 Luedtke, Barbara E.

1985 The Camp at the Bend in the River. 428 pages.

This report presents the results of extensive background research, excavation and analysis conducted at the Shattuck Farm site in Andover, Massachusetts. Overall goals for the project include the definition and description of the site, the cultural-historical documentation of a large, complex riverine site occupied on a considerable period of time, and the demonstration of the usefulness of a nontypological approach to the analysis of the artifacts and features found. Results for the study are presented in eight chapters and three appendices which include contributions by V. Kenyon, Shattuck Farm Collections Survey; P. McDowell, report on the Geomorphic Investigations at the Shattuck Farm Site; and G. Kelso, Palynology and Historic Land-Use in Central New England: the Record from Shattuck Farm. Artifact remains including organic remains, ceramics, flaked stone tools, ground and pecked stone tools, debitage, features and other materials were recovered from seven loci across the site. Evidence suggests that Shattuck Farm was used as a base camp for people exploiting the resources of the area, perhaps during several seasons of the year. This function continued from the Middle through most of the Late Archaic periods. Possibly during the Late Archaic and surely by the Early Woodland Period, the reasons of occupation changed, now focusing on terrestrial rather than riverine resources. Larger base camps were located elsewhere. This pattern continued through the Middle Woodland Period. During the Early Late Woodland Period, Shattuck Farm was evidently used by larger groups of people for longer periods of time with a possible focus on spring fish runs. Later in the Late Woodland Period the site was again used by smaller groups who came for hunting, fishing and collecting. During the Contact Period Shattuck Farm was used primarily as a burial ground. Shattuck Farm was an important location for people living in the lower Merrimack River Valley annually throughout most of the prehistoric period. See also report #25-1026.

25-1052 Decima, Elena, Christopher Edens, Leith Smith, Jane Carolan, and Michael Roberts

1990 The Archaeology of the Wareham High School Site Wareham, Massachusetts. 183 pages.

This report presents the results of the field investigations including intensive survey, site examination and data recovery. As a result of the fieldwork and site analysis, the site was separated into two zones labeled “the main site” and “the secondary site”. The main site contains a series of Late Archaic, Terminal Archaic and probably Middle Archaic points. These materials, together with other lithic artifacts, features and a small faunal assemblage, form a series of spatial clusters identified as loci of prehistoric activities: lithic reduction chipping stations, domestic activities, or a

combination of domestic and lithic production. The secondary site presents a small series of points belonging to the Susquehanna Tradition plus a few additional Small Stemmed points and a Middle Archaic point; behavioral interpretations are limited here by the sparseness of the evidence and the relative lack of spatial structure. Four radiocarbon dates obtained from several of the features in the main site indicate that certain of the loci dated to 1,400-700 B.P., corresponding to the Woodland Period. The site as a whole is a composite of multiple occupations of indeterminate number, each of which seems to have been small in size and short in duration; these repeated occupations occurred during the Middle Archaic through the early Late Woodland periods.

25-1053 Edens, Christopher, and Michael Roberts

1991 Archaeological Intensive Survey, Orchard Cove Development, Canton, Massachusetts. 84 pages.

Background research, surface survey and excavation were used to intensively test 9 acres of construction and landscape impact within the 38 acre Orchard Cove property. One prehistoric site, the Orchard Cove Site, was found composed of multiple discrete clustering of chipped lithics and a shallow feature, set within a broad and very thin scatter of lithics that covers almost all of the project area. Diagnostic materials include a Neville-Variant Middle Archaic point and a small piece of Woodland pottery; other lithics may belong to the Late Archaic/Early Woodland periods. A site evaluation was recommended for the Orchard Cove site to determine its eligibility for inclusion in the State Register of Historic Places. A small body of 17th or 18th century ceramics were identified in the southern part of the property. These materials were reported to possibly reflect the extensive land-use patterns of the contact and early historic period Ponkapoag community. As a result, it was recommended that the possibility of an early historic Ponkapoag occupation be addressed as part of the recommended site evaluation of the prehistoric occupation. A later historic site consisting of a stratified cellar hole, several features and an extensive scatter of sheet refuse was also found in the northeastern part of the property. These remains were interpreted as part of a late 18th and 19th century farm which was also recommended for a site evaluation.

25-1054 Hamilton, Christopher E., D.A. Muncher, James R. Reedy, Jr., and Kenneth J. Kinkor

1990 The 1984 Annual Report of Archaeological Data Recovery, The Whydah Shipwreck Site WLF-HA-1, Cape Cod, Massachusetts, June 1990. 345 pages.

This report presented in 2 volumes summarizes the results of 1989 excavations. One volume presents the project goals, natural and historical background information, history of the Whydah, field results, laboratory conservations, research results and bibliography. The second volume, also referred to as the Primary Source Book (PSB), presents all of the available primary resources concerning the Whydah and the people associated with its activities.

25-1055 Holmes, Richard D., and Mitchell T. Mulholland

1991 Archaeological Site Examination of Two Prehistoric Sites on Longmeadow Brook, Niagara Settlement Project, Longmeadow, Massachusetts. 101 pages.

Background research, proton magnetometry and excavation were used to examine two small prehistoric sites. The Longmeadow Brook Bluff Site contained Middle/Late Woodland period ceramics, and a Middle Woodland lanceolate projectile point. Chert, from New York State, was the principal lithic material and the predominance of small flakes suggests tool repair rather than manufacture. The site was interpreted as a seasonal camp occupied to exploit the resources of the Longmeadow Brook wetland. An historic tree throw damaged an important part of the site. At the Longmeadow Brook Terrace Site (where a Jack's Reef variant point had been recovered during the site locational survey) no additional prehistoric materials were found. This site was interpreted as a small campsite, the main portion of which has been disturbed by an existing pipeline. Neither site contained evidence of prehistoric horticulture, long-term habitations, or historic structures.

Because of disturbance and low artifact density, neither site appeared to be eligible for the National or State Registers. No further survey was recommended. See also report #25-1043.

25-1056 Holmes, Richard D., and Mitchell T. Mulholland

1991 Archaeological Site Examination of the West Road Site, Niagara Settlement Project, Longmeadow, Massachusetts. 59 pages.

Background research, proton magnetometry and excavation were used to examine a small prehistoric site. The West Road Site contained a fragment of coarse mineral-tempered pottery that may date from the Middle Woodland Period (ca. 2,000 to 1,000 years ago). A quartzite Levanna point was also found between the plow zone and the B-horizon. Other artifacts include fire-cracked rock, and lithic flakes (predominantly chert, argillite, felsite, mudstone, quartz, and quartzite). Most artifacts came from the first 20 cm beneath the surface. No features or evidence of horticulture were found. No historic structures or their remains exist at the site. This site may have been occupied contemporaneously with the Longmeadow Brook sites, located within 1.6 km. This site represents a short-term occupation and because of the low artifact density and absence of features, does not appear to be eligible for the National or State Registers. No further work is recommended. See also report #25-1043.

25-1057 Filios, Elena L.

1990 Archaeological Site Examination of the Boglisch Site, Agawam, Massachusetts. 42 pages.

Background research and excavation were used as part of an archaeological site examination at a prehistoric site. The site, located in a field planted in hemlock seedlings, will be impacted by construction of the proposed realignment of Route 57. Subsurface testing was conducted to determine the eligibility of the site for the National Register. Eighty-two 50-by-50 cm shovel test pits and three .50-by-5 m slit trenches were excavated. Forty-five prehistoric artifacts were recovered primarily from the plow zone, and were concentrated within a 10-by-15 m area. Artifacts included a Small Stemmed quartz projectile point. Disturbance from the planting of nursery stock was evident throughout the site. While this small site has provided useful archaeological information, it is clearly disturbed, the artifact density is very low and no features were found. The site is interpreted as a small, interior hunting camp. It is unlikely that the site is eligible for inclusion in the National Register of Historic Places. As a result, no further excavation of the Boglisch site is recommended.

25-1058 King, Marsha K., and Beth P. Miller

1990 Site Examinations of the Ashley House, Booth/French House, and Briggs Cellarhole and Documentation of the Blacksmith Shop and Stone Bridge, Berkley/Dighton Bridge Replacement Project Area, Berkley, Massachusetts. 298 pages.

Background research, surface inspection and subsurface testing were conducted as part of site examinations and architectural evaluations. The project area lies on the east bank of the river within the National Register eligible Berkley/Dighton Bridge Village Historic District. Site examinations were conducted at three sites: the Ashley House Site, occupied ca. 1801—1807 to 1980s; the Booth/French Site, occupied ca. 1807-1823 to present; and the Briggs Cellarhole Site, built and occupied prior to 1812. Architectural evaluations were undertaken for the Ashley House, Booth/French House, and Blacksmith Shop associated with the Babbitt House. In addition, a small stone bridge over a tidal stream was evaluated and documented. Based on the results of the documentary, archaeological, and architectural research and analyses, no further archaeological investigations are recommended for the three house sites. It is unlikely that further archaeological investigations at the data recovery level would provide significant information that could contribute to a better understanding of these sites, the town, or the discipline. In addition to the three site examinations, the Stone Bridge was documented and an architectural evaluation was completed for

the Blacksmith Shop. Site examination research has indicated that both of these sites appear to be of a more modern date, and therefore, of less historical significance than originally believed. No further documentation or evaluation is recommended for either of these structures, nor are archaeological investigations considered necessary for these sites.

25-1059 Davin, Ann K., and Edna Feighner

1991 Intensive Archaeological Survey of the Communications Electronics Training Facility Stow, Massachusetts. 37 pages.

Background research, a walkover inspection and subsurface testing were conducted as part of an intensive archaeological survey of the proposed facility at Fort Devens. The project area encompasses a total of 31 acres, 12 of which will be impacted by the proposed construction. Archaeological investigations were conducted within the 12 acres to be impacted. A total of 104, 50 x 50 cm test pits were excavated within 30 x 30 m blocks. Two soil anomalies were identified and further investigated through test pit arrays placed at 2.5 m intervals from the original test pit; the soil anomalies were interpreted and natural, not cultural resources. No prehistoric cultural materials were recovered. Historical cultural material consisted of one modern bolt. No additional archaeological testing was recommended.

25-1060 Macomber, Gerald M., and Nicole A. Missio

1991 Archaeological Site Examinations of the Clayton Site (19-BR-339), at Proposed Site 47 for Solids Disposal Facilities in New Bedford, Massachusetts. 55 pages.

A total of 64 shovel test pits (50 cm^2) and 12 excavation units (1 m^2) was excavated within the area where prehistoric cultural remains were recovered in the Phase I testing to define the limits of the site and determine its integrity and significance. A low-density scatter of prehistoric cultural material was found throughout the southeast portion of the project are during the Phase I survey. Excavation of the shovel test pits and excavation units in the Phase II site examination determined that the main concentration and highest densities of artifacts were limited to an area approximately 70 x 53 m in the south-central and eastern portion of the area tested. No plow zone or other subsurface disturbance was noted during either phase of the investigations. A Late Woodland period quartz workshop and isolated diagnostic artifacts, including Middle Archaic and Late Archaic-Early Woodland projectile points, were identified during the site examination. No subsurface cultural features were identified during either phase of the investigations. Although the archaeological integrity of the site is good and a lithic workshop was identified in the south-central portion of the site, the low density scatter of artifacts and the lack of internal complexity suggest that this site does not meet the criteria for listing in the National Register of Historic Places. No further archaeological investigations were recommended. See also report #25-1093.

25-1061 Clements, Joyce M.

1991 Preliminary Report on Phase I Archaeological Survey of the Melone Landfill Extension Project, Hudson/Stow, Massachusetts. 51 pages.

Background research, a site walkover and subsurface testing were used to test two areas, Locus I and II, where a landfill is to be extended. No prehistoric or historic sites were found in Locus I where no further studies were recommended. At Locus II a late 19th century site including a well, foundation and cellar hole were found; however, since most of the site was destroyed by quarrying activities, it was determined that no structures of historical significance remained within the impact area. It was recommended that the landfill extend into Locus II as proposed. A recommendation was also made that since the potential exists for additional historical features or structures associated with the historic site, additional archaeological investigations should be conducted to the east of Locus II. It was further recommended that because of the prehistoric potential in areas adjacent to the Assabet River, archaeological investigations precede any landfill activities in the

northern portion of the site in Hudson.

25-1062 Lance, Martha, Valerie McCormack, and Stephen A. Mrozowski

1990 Intensive Level Archaeological Survey of the Manning Road/Bridge Street Bridge No. W-7-3 and Bridge No. W-7-l, Warren, Massachusetts. 66 pages.

The project area is an approximately 600 by 150 foot corridor. Documentary research identified that the project area lies within the Lower Mill Village, an early 18th century center of industrial activity which continued to be active into the early 20th century. Field-testing included 29 test pits (50 x 50 cm), three trenches (1 m x .5 m) and one machine trench (3.5 m x 5.2 m). Documentary research and field-testing focused on the collection of information for a National Register of Historic Places nomination for the proposed Lower Mill Village. Shovel testing confirmed a wide level of disturbance across the area. Structural remains from a late 19th century shoddy storehouse were exposed in the machine-assisted trenches. Several units produced small quantities of cultural materials from the late 18th, 19th, and 20th centuries. These were recovered from contexts which were disturbed by a combination of floods, fires, and construction activities during the 19th and 20th centuries. The construction of several buildings has disturbed the remains of the earlier economic and industrial activities within the Lower Mill Village. On the basis of the background research, archaeological subsurface testing, and laboratory analysis of the recovered cultural material, significant cultural resources were not located within the impact areas and no further archaeological testing was recommended.

25-1063 Dimmick, Frederica

1991 Archaeological Investigations Off the South Ell of the Golden Ball Tavern, Weston, Massachusetts. 110 pages

Archaeological investigations consisting of background research and excavation were conducted. The survey area had continuously served as the site for disposal of kitchen, household and human wastes from the early-19th to the mid-20th centuries. Recovered artifactual materials included many glass objects, particularly whole bottles. Techniques of foundation construction of the 19th century ell were observed. Recommendations were made that in the future, when funding becomes available, that bone remains from the South Ell test units be analyzed. Recommendations were also made that the rich collections of the Golden Ball Tavern, particularly the bottles recovered in 1990 be made available for the public to view and to researchers seeking comparative data on other 19th century New England sites.

25-1064 Fitch, Virginia A., and Suzanne Clover

1989 Historic and Prehistoric Reconnaissance Survey, Army Materials Technology Laboratory, Watertown, Massachusetts. 107 pages.

Background research was conducted and regional prehistoric and historic period contexts were developed for the Army Materials Technology Laboratory area, along with a national military context, in order to place archaeological and historic resources within an appropriate cultural and chronological framework. The AMTL facility encompasses 45 acres and 27 buildings of the historic Watertown Arsenal, founded in 1816, still under U.S. Army control. A driveover/visual inspection was used in conjunction with background research to update and expand information and identify information gaps on the known and potential cultural resource database. One prehistoric and no historic sites have been documented within AMTL. Background research, environmental attributes and ground disturbance were used to stratify AMTL into areas of high, moderate and low archaeological sensitivity. A total of 28 potential historic sites have been identified. Field and background data on historic buildings, structures and features was collected and reviewed. The AMTL contains one individual property (Building 111) listed in the State and National Registers. Previously identified potentially eligible buildings include two individual buildings (Building 311

and 100) and two building complexes, including an Olmsted landscape. Seven U.S. Army Category II and nine Category III properties are also located within AMTL. Information concerning these and other elements of the Arsenal dating from 1851 to the present is discussed.

25-1065 Riess, Warren C.

1990 Underwater Archaeological Evaluation, Boston Harbor, Massachusetts. 19 pages.

Background literature research was coordinated with remote sensing surveys in order to determine if any significant underwater archaeological resources will be affected by the proposed construction of effluent diffusers for a new sewage outfall system. The results of the archaeological and historical literature research indicated that no prehistoric sites would exist in the study area; however, significant historic shipwreck sites could exist within the construction impact zone. The analysis of the remote sensing data indicates the presence of 14 man-made ferrous objects and a side scan feature with no associated magnetic anomaly, within 500 feet of the diffuser centerline. None of the targets was readily recognizable as a shipwreck. It was recommended that these targets be inspected under favorable weather conditions in order to determine whether any shipwreck sites were located in the project area. If any historic shipwrecks were identified during the field survey, avoidance through project design or mitigation was recommended. See also report #25-1066.

25-1066 Johnston, Paul F.

1988 Marine Archaeological Phase I Evaluation [for the Massachusetts Water Resources Authority Secondary Treatment Facilities Plan]. 29 pages.

Documentary sources were consulted to determine the locations of known shipwrecks in Outer Broad Sound in Massachusetts Bay in order to avoid project impacts from the construction of a sewer outfall diffuser for the proposed Deer Island wastewater treatment facilities. A navigational chart of known shipwrecks is included in the report, as well as an analysis of bottom conditions in relation to potential preservation of shipwreck sites. Recommendations for the location of the outfall diffuser were made in conjunction with further study through remote sensing and field survey. See also report #25-1065.

25-1067 Bower, Beth Anne, Constance Crosby, and Byron Rushing

1984 Report on the Phase II Archaeological Subsurface Testing of the Southwest Corridor Project Area, Roxbury, Massachusetts. Part One – Management Summary. 34 pages.

A subsurface archaeological survey (Phase II) of 29 sites in the Southwest Corridor Project area uncovered significant historic archaeological remains at 9 locations. The Phase II report is divided into two parts. This report presents a brief summary of the research design for the survey, the findings corresponding to the research design, the methodology employed in the survey, evaluations of the methodological approach, and the results of the site testing during the survey. The report concludes that the following nine sites should be recommended as eligible for nomination to the National Register of Historic Places: Pierpont Homestead site (SWC-1B) (ca. 1700-1830); Tremont Street Housing site (SWC-11A) (ca. 18400—1880); Elmwood Street Housing and Mill site (SWC-11B) (ca. 1800-1880); “Stone Jail” site (SWC-31) (ca. 1830-1880); Highland Foundry site (SWC-25) (ca. 1845-1915); Guild Tannery site (SWC-29) (ca. 1840—1890); Metropolitan Horse Railroad Company Complex site (SWC 1A-22) (ca. 1855-1900); Elmwood Street Pumping Station site (SWC-33) (ca. 1868-1890); and the Williams Homestead (SWC-6) (18th century).

25-1068 Bower, Beth Anne, Constance Crosby and Bryon Rushing

1984 Report on the Phase II Archaeological Subsurface Testing of the Southwest Corridor Project Area, Roxbury, Massachusetts. Part Two – Site Reports. 438 pages.

A subsurface archaeological survey (Phase II) of 29 sites in the Southwest Corridor Project area uncovered significant historic archaeological remains at 9 locations. The Phase II report is divided into two parts. This report presents a full description of the research design for the survey, detailed findings corresponding to the research design, the methodology employed in the survey, evaluations of the methodological approach, and descriptions of the results of the testing of the 29 sites. The report concludes that the following nine sites should be recommended as eligible for nomination to the National Register of Historic Places: Pierpont Homestead site (SWC-1B) (ca. 1700-1830); Tremont Street Housing site (SWC-11A) (ca. 18400—1880); Elmwood Street Housing and Mill site (SWC-11B) (ca. 1800-1880); "Stone Jail" site (SWC-31) (ca. 1830-1880); Highland Foundry site (SWC-25) (ca. 1845-1915); Guild Tannery site (SWC-29) (ca. 1840-1890); Metropolitan Horse Railroad Company Complex site (SWC 1A-22) (ca. 1855-1900); Elmwood Street Pumping Station site (SWC-33) (ca. 1868-1890); and the Williams Homestead (SWC-6) (18th century).

25-1069 Bower, Beth Anne, Sheila Charles, Constance Crosby, Woodard Openo, and Byron Rushing

1986 Report on the Phase III Archaeological Data Recovery the Elmwood Street Pumping Station Site (SWC-33) Roxbury, Massachusetts. 42 pages.

A data recovery program was conducted at the Elmwood Street Pumping Station site to mitigate the effects of the Southwest Corridor (Orange Line) project. Constructed in 1869-1870, the Elmwood Street Pumping Station contained the boiler room and engine room for the Fort Hill Standpipe. The Standpipe, on Fort Avenue, Roxbury, is listed in the National Register of Historic Places. The Elmwood Street Pumping Station and the Standpipe were the first high-service facilities (besides reservoirs) in the City of Boston. Originally built to service only the Roxbury Highlands district, this system supplied most of Boston's high service until the construction of the Chestnut Hill Reservoir in 1886-88. A combination of documentary research and archaeological excavation enabled the researchers to reconstruct the original plan and subsequent alterations to the engine room portion of the Elmwood Street Pumping Station. The locations of two original engines oriented east to west on 31 foot granite platforms and of the base for the 23 to 24 foot Worthington Engine (added in 1877) were determined. The rapid obsolescence of the original Boston Machine Company engines is tied to the Boston Water Board's inability to foresee rapid population growth and increased consumption of free water, as well as ill-considered expansion of the area of service to fourteen times its original size.

25-1070 Bower, Beth Anne, Sheila Charles, and John Cheney

1987 The Guild and White Company Tannery Site, Roxbury, Massachusetts: Report on the Phase III Archaeological Data Recovery. 75 pages.

Phase III data recovery excavations at the Guild Tannery Site (SWC-29) were conducted to mitigate the effects of the Southwest Corridor (Orange Line) project. Excavation of the site revealed that two post-tannery building phases, one an undocumented ca. 1891 warehouse and the other the ca. 1925 construction, had seriously damaged the remains of the ca. 1847-1889 tannery. Structural remains of three tannery buildings, the leaching room, the boiler room and the bark house, were found. Caches of bottles from the Lerner occupation of the site from ca. 1915 to 1924 indicated use of the site as a bottle distribution warehouse.

25-1071 Bower, Beth Anne, and Sheila Charles

1988 The Highland Foundry Site, Roxbury, Massachusetts. Report on Phase III Archaeological Data Recovery. 50 pages.

An archaeological data recovery was conducted to mitigate the effects of the Southwest Corridor (Orange Line) project. Documentary research and archaeological excavation of portions of the Highland Stove Foundry site, in operation from 1845-1920, provided insight into the work environment of 19th century urban life. A visit to a working foundry, the Portland Stove Foundry in Portland, Maine, provided comparative information on foundry technology that helped in the evaluation of methods used at the Highland Foundry, as well as assisting in the identification of tools and of the location of furnaces. The archaeological investigation of the Highland Stove Foundry site primarily focused on the cupola furnace area and molding room. A substantial collection of artifacts was recovered, representing the wide range of foundry products, equipment and tools, and byproducts of the sand molding and foundry operations. Evidence of structural changes made to the foundry was also uncovered, along with much architectural material and construction hardware that reflected the fabric of the foundry structures. Background historic research included cartographic and documentary sources. These suggested that changes in the types of products produced were dictated by the needs of the community, and changes in the layout and structures of the foundry were made in order to adapt to its location and accommodate the changing urban environment.

25-1072 Bower, Beth Anne, Sheila Charles, John Cheney, and Stephen Mrozowski

1987 The Pierpont Homestead, Roxbury, Massachusetts. 98 pages.

An archaeological data recovery program was conducted at the Pierpont Homestead Site as mitigation for the effects of the Southwest Corridor (Orange Line) project. Expansion of Phase II test units revealed that twentieth century construction in landscaping destroyed the Pierpont-Bailey house sites and removed the majority of 17th through 19th century occupation levels. However, two trash deposits, one dating to the 1780s and the other circa 1807, were recovered. Analysis and historical research has linked these two deposits to two taverns. The trash deposits are believed to have resulted from the cleaning and closing of the Williams Tavern (1803-1807) and the Pierpont Tavern (1762-1788). Comparisons between the two trash deposits suggest that the Pierpont Tavern was oriented more toward the traditional tavern operations of providing food and lodging, while the Williams Tavern was oriented more toward drinking. These findings are correlated with the rapid historical changes in drinking customs and habits after the American Revolution.

25-1073 Charles, Sheila, and Woodard Openo

1987 The Tremont Street Housing site, Roxbury, Massachusetts Report on the Phase III Archaeological Data Recovery. 62 pages.

An archaeological data recovery was conducted at the Tremont Street Housing site in order to mitigate the effects of the Southwest Corridor (Orange Line) project. Three key features were investigated: a 19th century puddingstone building foundation and a 19th century trash deposit. Through cartographic and documentary research, it was determined that the building foundation was that of a residential house which appears on the 1856, 1873, 1884, 1889, and 1915 atlases. The proximity and contents of the trash pit suggests an association with the occupants of the house, believed to have been the family of Lawrence Concannon (1822-1900), an Irish immigrant who arrived in Boston in 1852. Analysis of the contents of the trash pit, which are described in the report, could provide information on the customs and lifestyle of a 19th century urban working class family.

25-1074 Charles, Sheila, Scott Lewis, and Woodard Openo

1988 The Williams Homestead Site, Roxbury, Massachusetts: Management Summary of the Phase III Archaeological Data Recovery. 91 pages.

An archaeological data recovery of the Williams Homestead Site was conducted in order to mitigate the effects of the Southwest Corridor (Orange Line) project. The site had been the homestead

of Colonel Joseph Williams II, a prominent Roxbury landowner during the 18th century. Archaeological excavations revealed that much of the site area had been severely impacted during the 19th and 20th centuries. A dry-laid fieldstone and puddingstone rubble wall was discovered and believed to be a remnant of the disturbed lower course of the northern cellar wall of the Williams house. The report contains thorough descriptions of the artifacts recovered from the investigation.

25-1075 Mrozowski, Stephen A.

1985 Boston's Archaeological Legacy. The City's Planning and Policy Document. 90 pages.

This report, prepared by the Boston Landmarks Commission, details the City of Boston's plan for identification and protection of significant resources. Through a search of background literature, a summary of the history of archaeological investigation in Boston is presented, as well as contexts for prehistoric and historic periods. A series of recommendations are made for the city's archaeological program concerning research and survey priorities, planning and policy.

25-1076 Bunker, Victoria, Alison Dwyer, Martha Pinello, and Alan Strauss

1991 Phase II Archaeological Site Examination of the Abbott Site, Bedford, Massachusetts. 47 pages.

The archaeological site examination of the Abbott Site consisted of an archival literature review and subsurface testing. Census, deed, tax and probate records were examined to determine the ownership and land use history of the property. Documents indicated that the site corresponded to the 18th century subdivision of the original Abbott homestead, divided between Obed Abbott and his son Moses Sr. Subsurface testing consisted of excavation of 14, 50 x 100 cm units and one 50 cm^2 shovel test pit. The recovered artifact assemblage was manufactured between the 1760s and 1840s. The structural remains of the site consist of two foundations, a barn and silo foundation, a stone ramp, an earthen causeway, two stone-lined wells, and a stone wall at the northern bound of the site. An intact yard surface, dating from the late 1700s to the 1840s was identified beneath a stratum of fill. Excavations were also conducted at a nearby dump site that contained an artifact assemblage unrelated to the Abbott site. Field results confirmed the archival analysis that the site and its artifacts date to the period of residency by Moses Abbott Sr. and his descendants. The site does not correspond to the original Abbott homestead. The Abbott Site represents one of the few intact single component 18th and 19th century sites in Massachusetts. The integrity of the site, its concise temporal affiliation (1760s-1840s), and its association with the Abbott family (among the town's first settlers) indicate the site is potentially eligible for inclusion on the National Register of Historic Places under Criteria A, B, and D. It is recommended that the site be preserved in place and avoided during project construction. If avoidance is not possible then development of a mitigation plan is recommended. See also report #25-1003.

25-1077 Doucette, Dianna

1991 Results of the Intensive Archaeological Survey of the North Shore Community College Project Area Danvers Campus Project #EJ89-5 STU, Danvers, Massachusetts. 54 pages.

An intensive archaeological survey was conducted. The project will be conducted in two phases and will involve expanding the existing facilities and constructing new ones. This survey covers 32 acres included in the Phase I plans of construction. During the intensive survey, background research and a surface inspection were used to stratify the project areas into zones of expected archaeological sensitivity. The area was considered to be archaeologically sensitive due to its proximity to a major water source (Ipswich River), wetlands within the project parcel, and known sites in close proximity. During the walkover inspection, two historic stone foundations were discovered. No prehistoric cultural material was located. However, several areas were noted as having moderate and high sensitivity for archaeological sites. These areas received intensive subsurface testing at 10 m and 15 m intervals. Subsurface testing in the southern portion of the project area

yielded historic structural material associated with the stone foundations. One isolated piece of prehistoric chipping debris was recovered in the northern section of the project area, as well as low densities of historic period cultural material. None of the prehistoric or historic period cultural material discovered during the intensive survey was considered to be potentially significant. Additional archaeological investigations were not recommended.

25-1078 Curran, Mary Lou, Mitchell T. Mulholland, and Richard Douglas Holmes

1989 Archaeological Site Examination of the Fishkin-Wrightson Site, Wellesley, Massachusetts. 57 pages.

In this Phase II site examination sufficient data were collected to assess site integrity, approximate age, and archaeological significance of the Fishkin-Wrightson site and to determine its boundaries. Culturally and temporally diagnostic artifacts were recovered, indicating the presence of a rare Coburn variant Wayland Notched point site component approximately 3,600-3,500 years old. The presence of a possible Normanskill-style point fragment is an unusual association which requires further definition. The material distributions suggest an emphasis on food processing activities, but the sample size may unfairly skew this observation. The site appears to be eligible for inclusion in the National Register. If avoidance of project impacts to the site is not feasible, then archaeological data recovery at the Fishkin-Wrightson site is recommended on the basis of the site's uniqueness and integrity. See also report #25-1047.

25-1079 Rainey, Mary Lynne

1991 Phase I Intensive Archaeological Survey for the Algonquin Gas Transmission Company Proposed 2.1 Mile 16-inch Pipeline Loop in Dartmouth and New Bedford, Massachusetts and Phase II Site Examination for the Apponagansett Swamp 1 Prehistoric Site (MHC #l9-BR-343). 72 pages.

A Phase I intensive archaeological survey was undertaken within a 2.1 mile pipeline route. The project area is located in the Bristol County communities of Dartmouth and New Bedford, and crosscuts the Apponagansett Swamp which feeds the Paskamanset River, eventually draining into Buzzards Bay. The purpose of the Phase I intensive archaeological survey was to determine the presence of historic or prehistoric cultural resources within the project area, and to make recommendations as to the need for further archaeological investigations of those resources. A total of 70 test pits (50 x 50 cm) was excavated along archaeologically sensitive portions of the project area. A prehistoric site containing a quartz Small Stemmed projectile point and a low density of chipping debris was discovered adjacent to Apponagansett Swamp wetlands (The Apponagansett swamp 1 Site, 19-BR-343). Phase II site examination fieldwork was conducted at the site in order to provide adequate data to evaluate the significance of the resource. The site examination archaeological investigations resulted in the discovery of three additional tools or tool fragments and additional lithic refuse. While the investigations provided evidence for a Small Stemmed Tradition site in the area, there was no indication of an intact prehistoric site beneath the disturbed plow zone soils. Due to the lack of cultural features, supplemental diagnostic artifacts, and site integrity, no further work was recommended.

25-1080 Strauss, Alan E.

1989 Intensive Archaeological Survey of the Proposed Chanticlair Residential Development in Framingham, Massachusetts. 66 pages.

Background research indicated the presence of one prehistoric site containing Neville points (19-MD-573, the Harold Bacon Site) and one historical site (the Hemenway Farmstead) within the project area. Historical maps and records documented the presence of a house within the project area from about 1830 to 1974. A walkover reconnaissance of the project area identified several historical features, including a stone foundation, a root cellar, and a cement barn foundation. Nu-

merous pieces of prehistoric chipping debris were also recovered from the surface from the dirt paths that bisect the project area. A total of 115 shovel test pits, consisting of 77 systematic pits, 6 judgmental units, and 32 bracket pits, was excavated. Although a general low density of prehistoric artifacts was found throughout the project area, two small high-density artifact loci were identified. The first locus contained a large quantity of quartzite flakes and a quartz core. The second locus contained numerous felsite and chert flakes as well as two untyped side-notched projectile point bases, a projectile point tip, and a point fragment. Numerous pieces of calcined mammal bone and charcoal were also recovered from this locus. Most of the artifacts were recovered from the B-horizon. A Phase II site examination is recommended for the prehistoric site in order to determine its horizontal and vertical boundaries, cultural and chronological affinities, and eligibility for nomination to the National Register of Historic Places. While a few prehistoric flakes were recovered from the historical site, no significant prehistoric or historical deposits were identified. No further archaeological work is recommended for the Hemenway Farmstead.

25-1081 Decima, Elena, Christopher Edens, and Leith Smith

1991 Intensive Archaeological Survey for Charles River Interceptor, Milford, Massachusetts. 43 pages.

The project area was found to contain several scattered pieces of prehistoric chipping debris, one Late Archaic/Early Woodland Small Stemmed point, and historic material, probably reflecting 19th century occupation of nearby residences. In addition, a Late Archaic/Early Woodland surface concentration consisting of a Small Stemmed point and chipping debris was discovered uphill and outside the project corridor. Out of the five prehistoric loci located during the survey, three sites (P1, P2 and P3) and two isolated finds (L1 and L2) were identified. P1, located 12 m from the Charles River associated wetlands, by a very small stream, yielded one Small Stemmed point and four flakes (some mixed with historic artifacts) all from different test pits. P3 is a surface scatter (one point, one uniface and 20 pieces of chipping debris) located 33 m uphill from the right-of-way on a historic dirt road. The three sites appear to represent foraging locations, i.e., short occupations by small groups of hunters and gatherers probably searching for seasonal and location-specific resources. The documentary research, field investigations, analysis of the finds and their research potential, do not reveal any significant historic and/or prehistoric site within the right-of-way. No further archaeological work was recommended.

25-1082 Jones, Donald C., and Nancy S. Seasholes

1991 Results of a Phase II Site Examination of the Allen/Howland Farmstead at the Fort Rodman Military Reservation in New Bedford, Massachusetts. 57 pages.

Field investigations for the project consisted of the excavation of 40 test trenches (1 m x 1 m) and 20 shovel test pits (1 m x 50 cm) in the areas of the farmhouse, rear wing, lean-to, outbuilding, north yard, west yard, and barn. The combined results of the Phase I and Phase II excavations at the site produced extensive evidence of construction, occupation, destruction, and subsequent landscaping of the farmstead area. Some areas of the farmstead, such as the foundations of the house and rear wing, were found to be intact, but most of the associated archaeological deposits were disturbed by later occupation and use of the site. Undisturbed deposits dating from the farmstead era through the early military use of the site were identified in the areas of the rear wing and the lean-to on the north side of the main house. These deposits, although undisturbed by later (i.e., Endicott-Taft period, World War I, and World War II eras) occupation and construction at the site, contain artifacts that span the time of domestic and early military occupation of the farmstead. Because most of the area investigated in the Phase II excavations was disturbed and because it was not possible to distinguish archaeologically between the farmstead and the early military eras in the undisturbed deposits, the Allen/Howland farmstead and barn site is not considered to be eligible for listing in the National Register of Historic Places. No further archaeological investigations were recommended for the site. See also reports #25-1093 and #25-1094.

25-1083 Cook, Lauren, and Thomas F. Mahlstedt

1990 Elm Bank, Dover, Massachusetts, Phase I Archaeological Reconnaissance Survey. 32 pages.

Documentary research and a walkover surface examination were conducted as a reconnaissance survey. Analysis of the history of land use indicates a strong probability for the presence of both historic and prehistoric archaeological resources. Zones of archaeological sensitivity were identified, with recommendations for subsurface testing. The report is a useful tool for planning and management of the Elm Bank property.

25-1084 DePaoli, Neill

1991 The Paine Estate "Barn" Site Dig: A Synthesis of Historical Archaeology and Public Education. 24 pages.

"Digging for Culture" was established in 1986 as a cooperative undertaking involving the Charles River Museum of Industry, Waltham Public Schools, Brandeis University, and Raytheon, with the goal of introducing students (grades 4-11) to historical archaeology. This report summarizes the results of field-testing at the Paine Estate in Waltham. The fieldwork entailed a small number of shallow test trenches at the supposed site of 19th century barn. The report assesses the selection criteria of an appropriate site for and the benefits of an archaeological educational program in public schools.

25-1085 Davin, Ann K.

1991 Phase I Intensive Archaeological Survey of the Plantation Street Reconstruction Project Area, Worcester, Massachusetts. 61 pages.

The project area began approximately 1,300 feet north of the intersection of Plantation and Belmont Street and continued for approximately 7,600 feet to Bowditch Road. This survey included background research, a walkover inspection, and subsurface testing of a project area that came in close proximity to Coal Mine Brook and Wigwam Hill. A total of 60, 50 x 50 cm test pits were excavated during the Phase I intensive survey. No evidence of prehistoric cultural material was recovered and historic cultural material consisted of low densities of late 19th century and 20th century field trash and roadside litter.

25-1086 Holmes, Richard Douglas, Mitchell T. Mulholland, Carolyn D. Hertz, and Ellen-Rose Savulis

1990 Archaeological Site Locational Survey at the Site of Alternative IV of the Route 57 Relocation Project, Agawam and Southwick, Massachusetts. 61 pages.

This project is located to the north of a survey conducted on the proposed Alternatives II and III of the Route 57 relocation project. The project area was broken into two areas to be subject to subsurface testing: 1) the 30-m-wide direct impact area, which includes the travel lanes, shoulder and breakdown lane; and, 2) the 60-m-wide buffer area, which includes a 30-m-wide strip on each side of the proposed highway. The project included documentary research, a walkover reconnaissance, and subsurface testing. During the site locational survey 254 shovel test pits (STPs) were excavated. One Small Stemmed projectile point was found in the A-horizon. No features or sites were located. No other artifacts or features were found in the vicinity of this isolated find. Given that only one artifact was recovered, it is unlikely that the site would be eligible for inclusion in the National or State Registers of Historic Places. The project area borders the north side of Leonard Pond in an area known to be a rich archaeological zone containing numerous prehistoric sites. At the outset of this project the area was predicted to have a high potential to contain prehistoric sites. Results of the study proved that most of the area has been disturbed from the Boglisch tree nursery operation and the Tuckahoe Turf Farm. Massive amounts of soil have been removed when the turf

and trees were harvested, taking with it the prehistoric remains which would have existed on the property. Recovered historic artifacts date to the 20th century and have no historical significance. The few artifacts are interpreted as sheet refuse, fragments of artifacts broadcast during the spreading of manure. No significant prehistoric or historic sites were found. No further survey was recommended

25-1087 Bernstein, David J., Mitchell T. Mulholland, Richard Douglas Holmes, and Carolyn D. Hertz

1990 Archaeological Site Locational Survey and Site Examination for the Proposed Water Pipeline, Northeast Anadromous Fish Research Lab, Turners Falls, Massachusetts. 175 pages.

Background research, walkover surveys and subsurface testing were used as part of a study to determine the impact of a proposed water pipeline on potential archaeological sites on the Cabot Woods peninsula in Turners Falls (Montague). Four prehistoric sites were found and subjected to site examinations. The sites consist of a high density of prehistoric artifacts and features in undisturbed contexts, that were occupied from at least 3,790 years ago. Artifact styles recovered include Small Stemmed, Susquehanna and Meadowood, and grit-tempered and incised ceramics. Combined with past projects conducted on the peninsula, eleven prehistoric sites have been documented. The study concludes that the four sites along the pipeline route will not be impacted appreciably by the construction of the line. The highest density of occupation is located to the north. It was recommended that the Cabot Woods peninsula be considered eligible for inclusion in the National Register of Historic Places as a district.

25-1088 Rainey, Mary Lynne

1990 Final Report Phase I Intensive Archaeological Surveys for the Algonquin Gas Transmission Company Proposed 1.9 Mile 36 Inch Pipeline Loop and Temporary Materials Storage Site in Medway, Massachusetts, FERC Docket No. CP90-643-000, and 1.8 Mile 10 Inch Pipeline Replacement in Milford and Medway, Massachusetts, FERC Docket No. CP8B-187-00l. 93 pages.

Intensive archaeological surveys were undertaken within three project areas. The three projects include a 1.9 mile 36” pipeline loop in Medway, a temporary materials storage site in Medway (3 acres), and 1.8 mile pipeline replacement project in Medway and Milford, all situated within the headwater uplands of the Charles River drainage basin. The surveys included background research, a walkover survey and subsurface testing. A total of 214 test pits (50 x 50 cm) were excavated along the temporary materials storage site; and 37 test pits were excavated along the 1.8 mile project area. As a result, five prehistoric sites were found within the 1.9 mile project area (the Medway 1 through 5 Sites). Single quartz bifaces (2), and low densities of chipping debris constituted four of the five sites. The Medway 3 site, in proximity to Chicken Brook wetlands, contained two rhyolite Levanna projectile points and three fragments of chipping debris. Due to the lack of cultural material and integrity, no further archaeological work was recommended for any of these sites. No prehistoric sites were located within the 1.8 mile project area or within the temporary materials storage site. Historic period artifacts were recovered from each of the three project areas. These artifacts constitute field trash. No historic sites exist within the project areas. Historic period stonewalls were encountered in the project areas. They represent one of the only surviving aspects of the Medway/Milford rural interior historic landscape within the project areas. Impacts to these walls during pipeline construction should be mitigated through their reconstruction where possible.

25-1089 Mulholland, Mitchell T., Richard Douglas Holmes, David J. Bernstein, and Elena Filios

1991 Archaeological Site Locational Survey of Segment 10S, Northeast Settlement Project, Worcester County, Massachusetts. 53 pages.

The field portion of an archaeological site locational survey was conducted on Segment l0S of the Tennessee Gas Pipeline Company's Northeast Settlement corridor in Upton, Hopedale, and Mendon. The survey consisted of the excavation of 392 shovel test pits in 14 survey areas and tour randomly selected survey areas. Five intact prehistoric sites, three low-density prehistoric findspots and the remains of a portion of the Milford and Uxbridge Street Railway were found. Site avoidance, or if this is not possible, site examinations were recommended for the five prehistoric sites to determine their eligibility for inclusion in the National Register of Historic Places.

25-1090 Mowchan, Denise, and Duncan Ritchie

1990 Intensive Archaeological Survey, Pump Station Access Road, Wayland, Massachusetts. 65 pages.

An intensive archaeological survey was conducted for a proposed 1,200 foot long access roadway and utility easement to provide access to a town well and pump station. The access road easement crosses a section of the Watertown Dairy Site (19-MD-378), a multi-component prehistoric site which is an element of the Watertown Dairy Archaeological District, which is considered to be eligible for listing on the National Register of Historic Places. Background research included a review of the available information from prior archaeological investigations of the Watertown Dairy Site. The results of a previous reconnaissance level survey was used to stratify the proposed access road into zones of expected archaeological sensitivity. Tasks completed during the fieldwork stage of the survey included a surface inspection of the access road easement. Within a large section of the access road easement considered to have moderate archaeological sensitivity, subsurface testing was done at 20 m intervals. The high sensitivity area (Watertown Dairy Site) was sampled with test pits placed at 10 m intervals on two parallel, offset transects. Test pit arrays (5 m intervals) were used to investigate findspots of prehistoric cultural material within the easement. An isolated piece of prehistoric cultural material (quartz shatter) was recovered from the southern end of the access road easement (Locus 1). The northern end of the access road easement crossing the Watertown Dairy Site was found to contain prehistoric cultural material (chipped and ground stone tools, ceramic sherds, chipping debris, etc.) associated with several different components associated with the Middle Archaic and Middle Woodland Periods. These deposits of cultural material are considered to be potentially significant sources of information for reconstructing the depositional history of the Watertown Dairy Site and patterns of prehistoric settlement and resources use within the Watertown Dairy Archaeological District. Recommendations include mitigation of the impact to the potentially significant deposits of cultural material in the northern end of the easement since avoidance of this area may not be possible

25-1091 Ritchie, Duncan

1990 Archaeological Investigations of the 1800 House, Nantucket, Massachusetts. 60 pages.

Background research and archaeological testing were conducted at the 1800 House, a property located on Mill Street in the center of town, which is owned by the Nantucket Historical Association. The archaeological investigation was conducted in the interior of the 1800 House and its yard areas in order to provide management recommendations for future stabilization efforts and landscaping. The testing strategy included judgmental and systematic transect testing. The interior, sub-floor areas of the kitchen and rear ell were found to contain cultural deposits ranging from the construction period (ca. 1800-1810) to the early 20th century. The yard areas exhibited some areas of previous disturbance, but intact archaeological deposits were found in the area of the former barn, the east side of the rear ell of the barn, and the south-central area of the backyard.

25-1092 Ritchie, Duncan

1990 A Preliminary Archaeological Survey of the Jethro Coffin House, Nantucket, Massachusetts. 94 pages.

A multi-disciplinary approach was undertaken to develop an understanding of the history of land use patterns and basic lifeways of the inhabitants of the historic Jethro Coffin House (originally built ca. 1686). Documentary research on the architecture and history of the site was coupled with folklore research, walkover reconnaissance, soil resistivity, archaeological testing and analysis of the cultural material, and faunal, floral and botanical remains recovered from the site. The 1.5 acre houselot was tested by the placement of shovel test pits at 5 m intervals on parallel transects in the yard areas deemed to be archaeologically sensitive. Certain features were tested with larger excavation units. This report describes the results of the archaeological testing and analysis and provides recommendations for site management and additional research and analysis. Appendices include reports on the soil resistivity study and paleobotanical analysis.

25-1093 Cook, Lauren J., and Nancy S. Seasholes

1988 Final Report of an Archaeological and Architectural Reconnaissance Survey of Six Proposed Sites for a Secondary Wastewater Treatment Plant and Solids Disposal Facilities in New Bedford, Massachusetts. 78 pages.

An archaeological and architectural reconnaissance survey was conducted at six proposed sites for a secondary wastewater treatment plant (Sites 1A, 4A, 7/8, and 47) and three sites being considered for the solids disposal facilities (20, 40 and 47); Site 47 is thus being considered for both the treatment plant and the disposal facilities. The archaeological and architectural reconnaissance survey was designed to determine the potential impact of proposed construction on cultural resources that may be located within or in close proximity to each of the proposed sites. The archaeological and architectural reconnaissance survey consisted of background research; a field walkover of each site (with the exception of Sites 20 and 40); architectural analysis of historic properties within or adjacent to Sites 1A, 4A, and 7/8; and report writing. The survey resulted in the identification of known and potential cultural resources that may be impacted by the proposed project. Recommendations were generated on a site-by-site basis concerning further investigations that may be required, should that site be selected. An intensive archaeological survey is recommended for each site, should that site be selected. The potential for prehistoric and historical archaeological resources, however, varies considerably from site to site. Sites 1A, 4A, and 7/8 also will require additional research to determine the architectural significance of properties that are located either within or adjacent to these sites. In particular, Site 1A is located adjacent to the Fort Taber National Register Historic District. Additional research is needed to determine whether structures located within the project area may be contributing to the district and therefore eligible for inclusion in it. See also report #25-1060 and #25-1094.

25-1094 Jones, Donald G., and Nancy S. Seasholes

1989 Documentary Evidence for Cultural Resources at Site 1A, the Fort Rodman Military Reservation in New Bedford, Massachusetts. 40 pages.

This report presents the results of documentary research on Site 1A, the Fort Rodman Military Reservation, an alternative site for a secondary wastewater treatment plant for the City of New Bedford. Site 1A is located adjacent to the Fort Taber National Register Historic District. A reconnaissance survey conducted of Site 1A in the fall of 1988 determined that the project area has the potential for significant archaeological deposits and that several standing structures within the project area may be potentially eligible for inclusion in the National Register district. The results of that survey included recommendations that additional research be conducted in the National Archives in Washington D.C., to evaluate further the known and potential archaeological and architectural resources in Site 1A. The results of the documentary research indicate that there are three portions of the project area that are considered to have potential for significant archaeological deposits. Portions of both the northwest corner of the project area, adjacent to Battery Milliken, and the northeast corner are considered to have the potential for prehistoric sites; the southern central portion of the project area is considered to have the potential for historical deposits associated with the Allen/Howland farmstead (1798-1857), and that area may also contain prehistoric depos-

its. Therefore, an intensive archaeological survey is recommended for Site 1A, should that site be selected for the proposed treatment plant. The architectural analysis identified a total of nine buildings that date to the Endicott-Taft Period (1896-ca.1912) which are considered to be potentially eligible for inclusion in the National Register district. Analysis also determined that Battery Milliken, built in 1940, is also potentially eligible for inclusion in the National Register district. The survey also identified 32 World War II structures that may or may not be potentially eligible for inclusion in the National Register district. See also reports #25-1082 and #25-1093.

25-1095 Dincauze, Dena F.

1991 Report of Cultural Resources Survey in Wildwood Section of Amherst, Massachusetts, 1991. 17 pages.

The survey methods included landform and soils interpretation, walkover, plowed field examination, coring, and STPs with screening. Limited documentary research done for a student term paper is summarized and historic land use is interpreted. Seven fragments of fine bifacial thinning flakes of Hudson-Champlain cherts were recovered from an old plowzone in a small area of town conservation land. Because no features were observed in situ with the flakes, the expectation is for a disturbed plowzone site of unknown age, small in size and limited in diversity. Protection of the area is recommended, without further investigation unless there is jeopardy.

25-1096 Beaudry, Mary C., and Stephen A. Mrozowski (Editors)

1989 Interdisciplinary Investigations of the Boott Mills Lowell, Massachusetts Volume III: The Boarding House System as a Way of Life. 310 pages.

This is the third and final volume on the archaeological investigations of the Boott Cotton Mills in Lowell (see also reports #25-818 and #25-820). This volume includes a series of papers by several authors on specific aspects of the interdisciplinary approach used to analyze the results of archaeological investigations of the back yards of workers' housing. Documentary research and technical analyses of artifacts and environmental data (pollen, soil chemistry, lives of macrofossils, parasitological, and phytolith studies) were drawn together to understand the lives of 19th and 20th century boardinghouse keepers and residents.

25-1097 Synenki, Alan T. (Editor)

1990 Archeological Investigations of Minute Man National Historical Park. Volume I: Farmers and Artisans of the Historical Period. 446 pages.

This report contains a series of papers by a number of authors which include the results of documentary and field investigations at the David Brown Homestead, Jonas Bateman Site, Joseph Mason Homestead, David Fiske Homestead, Daniel Brown Homestead, a supposed blacksmith shop, the site of the old hop house, and the Brooks Tanyard, all located within Minute Man National Historical Park in Lincoln, Lexington and Concord. Discussion of pollen analysis is also included.

25-1098 Ritchie, Duncan, Marsha K. King, Christy Voigt, and Patricia Fragola

1990 Archeological Investigations of Minute Man National Historical Park. Volume II: An Estimation Approach to Prehistoric Sites. 203 pages.

This report describes the results of an intensive archaeological survey of 745 acres within Minute Man National Historical Park in Concord, Lincoln and Lexington, which was conducted in order to identify prehistoric sites predicted within the national park. A total of 14 prehistoric sites were identified, ranging from find spots to temporary campsites. Only one site contained culturally diagnostic artifacts, which may be associated with the Middle Archaic period. Six historic period sites were also identified. Recommendations were made for further research and site management.

25-1099 Fitch, Virginia A., and Suzanne Glover

1989 Historic and Prehistoric Reconnaissance Survey Fort Devens (Main Post, North Post, South Post), Massachusetts. 169 pages.

Fort Devens encompasses 9,338 acres of well-drained uplands and valley lowlands bordering the Nashua River in Ayer, Harvard, Lancaster and Shirley. It consists of three adjacent sub-areas: Main Post, where buildings are concentrated; North Post, containing the airport and sewage plant; and South Post, used as a field training area. Founded in 1917 as Camp Devens, Fort Devens has historically functioned as a troop mobilization and training facility. Background research was conducted and regional prehistoric and historic contexts were developed and described in this report. A driveover/visual inspection was used to identify gaps on the known and potential cultural resources. Four prehistoric and six historic sites have been documented at Fort Devens. Background research, environmental attributes and previous ground disturbances were used to stratify Fort Devens into areas of high, moderate and low archaeological sensitivity. A total of 127 potential historic period sites have been identified. No comprehensive historic archaeological identification and evaluation studies exist for Fort Devens. One historic district has been proposed for listing in the National Register of Historic Places. Information and discussion is provided on the surviving buildings from all periods of the post's history, including one 19th century house.

25-1100 Ritchie, Duncan, and Christy Vogt

1990 An Intensive Archaeological Survey, Polpis Road Bicycle Path, Nantucket, Massachusetts. 179 pages.

An intensive archaeological survey was completed along the eight mile route. This proposed bicycle path easement crosses some archaeologically sensitive areas including the locations of seven previously recorded prehistoric period sites (19-NT-51, 19-NT-50, 19-NT-100, l9-NT-128, 19-NT-69, 19-NT-1138, and 19-NT-68). Through archaeological testing, the locations of six of the known prehistoric sites were verified, and five other previously unknown sites were identified. Seventeen find spots consisting of one or two pieces of prehistoric cultural material (chipping debris) were also found during the intensive survey. Four of the prehistoric sites (19-NT-50/100, 19-NT-128, 19-NT-68, and Folger's Marsh) and one find spot (#11) can be dated to a general temporal period (Late/Terminal Archaic, Middle/Late Woodland) based on cultural material (projectile points/ceramic sherd) or deposits (shell midden) found during the intensive survey. Two other previously unknown prehistoric sites (Roadkill, Norwood Farms Trust) did not yield diagnostic cultural material but are suspected to contain Woodland period components. One site (Martin) contained a shell midden deposit that could be either prehistoric or early historic period (historic Native American?) origin. Four prehistoric sites (19-NT-51, NCF, Lot 13, 19-NT-138, l9-NT-69) and most of the find spots yielded small amounts of non-diagnostic cultural materials and could not be placed in any temporal/cultural context. Five prehistoric period sites (19-NT-50/100, Roadkill, Norwood Farm Trust, 19-NT-128, and Folger's Marsh), one prehistoric find spot (find spot #11) and one site (Martin) of either prehistoric or historic period origin are considered to be potentially significant. Avoidance through redesign of the proposed bicycle path was recommended for these potentially significant sites. If avoidance is not possible then further evaluation at the site examination level was recommended for these cultural resources.

25-1101 McBride, Kevin A.

1991 Phase I Intensive Archaeological Survey Lifecare Facility Project, Springfield, Massachusetts. 42 pages.

The project area is a 23.4 acre parcel located approximately 1/3 mile east of the confluence of the north and south branches of the Mill River and approximately 3 miles east of the junction of the Mill River and the Connecticut River, near Dan Baker Cove. This proximity to major wetland and

riverine habitats, combined with well to excessively drained soils, probably made the project area a prime locale for prehistoric use and occupation. The archaeological survey combined background research, a walkover visual inspection, and systematic subsurface testing in an effort to locate possibly significant archaeological sites. The background research indicated that early 20th century structures, no longer standing, were located within the project area. In the walkover survey, several areas of extensive disturbance were observed in the area identified as the 20th century site. It appears that all remains of the structures and outbuildings were removed and bulldozed, probably during the mid-20th century. The subsurface archaeological testing recovered a wide range of historic period artifacts from the early, middle and late 20th century. The early 20th century artifacts are likely associated with the early 20th century structures, and the mid to late 20th century artifacts are likely associated with the use of the area by Springfield College, primarily the college's students. No prehistoric cultural material was recovered within the project area. No further archaeological studies were recommended.

25-1102 King, Marsha K., and Beth P. Miller

1991 Intensive Archaeological Survey 467 Milford Road Burial Ground Swansea, Massachusetts. 162 pages.

Intensive archaeological investigations were conducted after a small, unbounded burial ground located on the top of a small knoll within the project area was disturbed during the initial stages of the development of the parcel. Archaeological investigations were conducted in compliance with the Massachusetts burial laws. The goal of the survey was to locate the boundaries of the burial ground, salvage any human remains that had been previously disturbed, and assess if any burials remained intact. Extensive background and documentary research, excavation of both hand and machine trenches, and laboratory analyses of the recovered materials were completed. Background research included an overview of the historical development of Swansea, but focused on information specific to the ownership/occupation of the property, cemeteries and burial grounds in the area, and the potential identities of the individuals interred in the burial ground. Fieldwork was conducted in three steps: 1) excavation of sixteen hand trenches; 2) excavation of three machine-assisted trenches across the knoll; and 3) monitoring of the machine excavation and removal of the knoll. The cultural material recovered from the project area consisted of a small quantity of coffin-related hardware items (nails, coffin wood, a hinge, a hook-and-eye fastener, and fragments of a glass view plate). The recovered human skeletal material represented the remains of at least five, and possibly as many as seven, individuals. All of the remains recovered were from adult Caucasians, with four females and two males identified. There was no evidence of infectious disease, traumatic injury, or developmental pathologies. Several of the individuals suffered from degenerative disorders such as osteoporosis and/or arthritis. Tooth loss and associated atrophy of the mandibles and maxillae were problems, at least for the individuals for whom dental evidence was recovered. Based on the results of the extensive background research, archaeological fieldwork, and analysis of the recovered cultural material and human skeletal remains, the burial ground appears to have served as a small family burial plot during the mid-19th century for family members, relatives, or dependents of the Hicks family. Samuel Hicks owned the property from 1828 to 1945. He appears to have been buried in the family burial ground in 1856. Documentary evidence indicates that his body was later exhumed and reinterred in Mount Hope Cemetery at the time of his wife's death in 1894. Excavation impacts have negated the integrity of the small burial ground. No further archaeological investigations are recommended. It is recommended that the human remains recovered be reinterred in the Mount Hope Town Cemetery.

25-1103 Holmes, Richard Douglas, Mitchell T. Mulholland, and Carolyn D. Hertz

1991 Archaeological Reconnaissance Survey for the Connecticut River Erosion Control Study, Massachusetts, Vermont and New Hampshire. 135 pages.

An archaeological and historical reconnaissance survey was conducted along the banks of the Connecticut River extending from the Turners Falls dam to the Vernon dam. The project was lo-

cated in the towns of Gill, Montague, Erving and Northfield, Massachusetts; Vernon, Vermont and Hinsdale, New Hampshire. The study was conducted for the purpose of assessing the prehistoric and historic archaeological potential of areas considered prone to riverine erosion. Data recovered by this study will be used in the creation of a master plan for erosion control on the Connecticut River. The archaeological project consisted of background documentary research for all of the riverbank and a walkover of areas designated as erosion sites. All recorded prehistoric and historic sites for the entire length of the river were included in the report, whether or not they were erosion sites. Erosion sites, identified in another study, were evaluated for their potential to contain either prehistoric sites or historic sites. The results of the study show that the project area was the location of high site density in prehistoric times. In all, 52 prehistoric sites or findspots were located in the area (34 recorded sites and 18 previously unrecorded sites). In addition, 20 areas of high potential to contain prehistoric sites, three areas of moderate potential and 15 historic sites were found. Two historic bridges are on the National Register and the Riverside National Register Archaeological District borders the southern end of the project area. Three of the recorded sites are eligible for inclusion in the National Register. Many of the sites contain deep, intact archaeological resources that may be eligible for inclusion in the National Register. If construction associated with erosion control is planned, subsurface testing is recommended in many areas to assess the significance of the sites, or areas of moderate to high site potential. This study concludes that subsurface testing, or in some cases further historic research should be conducted in advance of any land-altering erosion control projects. Site preservation restrictions or a combined site examination/data recovery is recommended for Survey Unit G6, an area that was subject to a site locational survey in 1989. See also report #25-1104.

25-1104 Holmes, Richard Douglas, Mitchell T. Mulholland, and Carolyn D. Hertz

1990 Archaeological Locational Survey of the Proposed Connecticut River Bank Stabilization Project, Gill, Massachusetts. 42 pages.

An archaeological site locational survey was conducted on the west bank of the Connecticut River in the Town of Gill. The survey included documentary research, a walkover reconnaissance and subsurface testing with shovel test pits. Three prehistoric sites were found in the area: the Ashuela Brook site, the Otter Run Rockshelter and the Otter Run Field site. The sites were occupied from the Late Archaic to the Contact periods. Recommendations are made for site preservation restrictions on the three sites. A combined site examination/data recovery is recommended for the areas of direct impact. See also report #25-1103.

25-1105 Holmes, Richard Douglas, Mitchell T. Mulholland, and David Bernstein

1991 Archaeological Site Locational Survey of Segment 7, Northeast Settlement Project Columbia County, New York and Berkshire County, Massachusetts. 197 pages.

An archaeological site location survey was conducted for Segment 7 of the Tennessee Gas Pipeline Company's pipeline corridor in Columbia County, New York and the Berkshire County towns of Hancock, Richmond and Stockbridge, Massachusetts. The background research for this project is documented in report #25-994. The intensive survey included walkover reconnaissance and the excavation of 985 shovel test pits. Six intact prehistoric archaeological sites, seven prehistoric findspots and two historic sites were encountered. Site avoidance or, if this was not possible, site examinations were recommended for the six prehistoric sites and the two historic sites to determine their eligibility for inclusion in the National Register of Historic Places.

25-1106 McDermott, Brendan, and Nancy Seasholes

1991 Intensive Archaeological Survey of a Proposed Pipeyard for Segment 2X of Tennessee Gas Pipeline Company's Northeast Expansion Project – Phase 2 in Tyringham, Massachusetts. 53 pages.

The survey consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. The proposed pipeyard for Segment 2X will involve the use of approximately 5 acres of land within a 30 acre field. Background research indicated that, although no prehistoric sites were recorded for the project area, the proposed pipeyard was sensitive for prehistoric remains. Background research also indicated that the proposed pipeyard may have contained at least one and possibly several buildings dating as early as the mid-19th century. The field reconnaissance did not identify any surface evidence of sites. A total of 143 shovel test pits, consisting of 126 systematic and 17 bracket units, were excavated at 10 m intervals along linear transects placed 10 m apart. A total of seven prehistoric flakes of Hudson Valley chert was recovered from two test pits. These materials were associated with charcoal lenses but were also recovered from levels that contained historical artifacts. Historical artifacts dating from the mid/late 18th century to the early 20th century were recovered throughout the project area, but a particularly large quantity of historical materials was recovered from the south central portion of the parcel; in addition, possible foundation remains, consisting of stones, brick fragments, and associated architectural artifacts, such as nails and window glass, were identified in one test unit in the same area. These materials indicate that a structure that may date to the early settlement period of Tyringham may have been located in this field. The possible prehistoric site was identified in an area that has been substantially disturbed by historical activity. Therefore, this site is not considered to be significant. The historical site, however, may represent a building that dates to the first 50 years of settlement in Tyringham. Therefore, the historical site is considered to be potentially significant. It is recommended that the area of the historical site be avoided during construction. If avoidance of the site is not possible, then a site examination should be conducted.

25-1107 Laden, Greg

1991 Reconnaissance Survey Report Homart Development Millbury, Massachusetts. 5 3 pages.

A reconnaissance survey was conducted of a parcel containing about 105 acres near the Blackstone River. As a result of background research and walkover inspection, the project area was stratified into zones of no, low, medium, high, and very high potential. The sensitivity rankings were based on an assessment of present site conditions, areas containing possible rockshelters and a historic period trail identified during the walkover, and environmental variables commonly associated with site locations. Specific recommendations were made for further archaeological testing.

25-1108 Strauss, Alan E.

1991 Intensive Archaeological Survey of Marshview Drive Lot 74 in Brewster, Massachusetts. 29 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area. Field investigations for the project included a surface inspection, followed by the excavation of 18 shovel test pits within the houselot. A total of four prehistoric stone flakes were recovered during the subsurface investigations. The flakes were all recovered from what appeared to be an old plowzone. Bracketing in the vicinity of the cultural materials failed to produce substantial prehistoric deposits. No historical cultural remains were recovered. Because of the very low density of prehistoric remains, lack of subsurface features and internal site complexity, it was believed that the site discovered is not eligible for nomination to the National Register of Historic Places. No further archaeological work was recommended.

25-1109 Raber, Michael S.

1990 Intensive Archaeological Survey for Proposed Public Housing in Ipswich, Massachusetts. 20 pages.

An intensive archaeological survey on two acres located potentially significant evidence of prehistoric activity. The evidence consisted of 29 pieces of lithic debitage and one projectile point base

in a plowed area, with about a third of the artifacts found below the plowzone. These materials indicate one or more relatively intact sites of prehistoric use along Bull Brook in the Ipswich interior, possibly about 5,000 years ago. Although there are many other reported prehistoric sites in this general vicinity, most were destroyed prior to controlled collection of data. The prehistoric site in the project area may represent temporary collection of food resources, complementing more intensive or permanent prehistoric settlement nearer the Ipswich coast. Additional site examination is recommended to determine the significance and National Register eligibility of these finds. See report #25-1110.

25-1110 Loparto, Leonard W.

1991 A Site Examination at the Linebrook Road Site, 19-ES-659, Ipswich, Massachusetts. 82 pages.

An archaeological site examination was conducted on the Linebrook Road prehistoric site. The majority of the site area lies within an approximately 3.0 acre area planned for residential housing by the Ipswich Housing Authority. The site examination results presented in this report represent the results of documentary and archaeological field research of prehistoric cultural materials identified during an intensive survey (see report #25-1109). Archaeological research involved the controlled excavation of four 1 x 1 m units and one hundred and ten 50 x 50 cm test pits in the site area. Archaeological research also focused on gathering background information on local and regional prehistoric settlement systems. Site examination research at the Linebrook Road site recovered a total of 71 pieces of prehistoric cultural material which combined with Phase I intensive survey results in a total of 101 pieces for the site. These materials indicate the presence of a moderately large, low-density prehistoric site dating to the Early Woodland and probably Archaic periods. The site may actually represent a series of smaller, temporary low-density sites focusing on the exploitation of Bull Brook riverine resources. While the site has contributed useful archaeological information, the low site density, low tool variability, lack of features, and disturbances indicate the site is not eligible for inclusion in the National Register of Historic Places. No further archaeological research was recommended for the Linebrook Road site.

25-1111 Riess, Warren C.

1991 Possible Shipwreck and Aboriginal Sites on Submerged Land in Three Proposed Outfall Areas, South Essex Sewer District, Massachusetts. 18 pages.

A proposed new outfall system for the South Essex Sewer District might adversely affect significant underwater archaeological sites. Historical research indicates because of centuries of intense maritime activity in the bay and harbors, there were approximately 138 historically significant shipwrecks in the general proposed construction area in the submerged harbor lands of Salem, Beverly, Manchester-by-the-Sea and Marblehead. Any outfall construction in the area might disturb one or more of the shipwreck sites. It is recommended that prior to any disturbance of the sea bottom for the outfall siting, an archaeological remote sensing survey should be conducted to locate and identify by type, any significant underwater archaeological sites within disturbance range. Once any detectable sites have been located and identified by type, decisions can then be made for avoidance or mitigation.

25-1112 King, Marsha A., Martha B. Lance, and Denise Mowchan

1989 Archaeological Reconnaissance Survey of the Barre Falls Dam and Reservoir in Barre, Hubbardston, Oakham, and Rutland, Massachusetts. 259 pages.

The study involved a project area of 1,869 acres of flowage easement with 557 acres held by the Army Corps of Engineers, New England Division. The purpose of this reconnaissance level survey was to provide information on the archaeological sensitivity of the Barre Falls Dam project area and review the possible effects of current project operations on cultural resources. The re-

search design included two primary tasks, background research to review data on known cultural resources and formulation of a sensitivity ranking (predictive model) for the project area are outlined. Environmental data such as geomorphology, soils and hydrology/drainage patterns were used to develop the predictive model for the location of prehistoric cultural resources. Known patterns of prehistoric and historic settlement and land use near the Barre Falls Dam project area and the relationship of these patterns to local and regional developments were used to develop interpretive contexts for assessing the potential significance of identified sites. The reconnaissance survey also included field-testing of the predictive model for prehistoric resources through the application of limited subsurface sampling (shovel test pits). Historic cultural resources identified from documentary sources or the walkover inspection were also recorded during this fieldwork phase of the survey. During the field testing/recording phase of the survey, additional observations were made on the nature and extent of previous disturbance and effects of current project operations at the Barre Falls Dam. No prehistoric sites were located, but a number of areas of high prehistoric archaeological sensitivity were identified. An archaeological sensitivity map was prepared for the fee and flowage easement portions of the Barre Falls Dam project area. Seventy-five historic period cultural resources were identified during the reconnaissance survey, with seven of these located on or just outside the project area boundaries. A number of the historic sites are considered to be potentially significant based on the limited information collected during the survey. Recommendations of additional intensive level survey work include known sites and areas considered to be potential site locations. Other recommendations for maintenance and protection or preservation of cultural resources are offered, particularly in situations where archaeological sites occur in areas subject to regular public access. Supporting documentation for the reconnaissance survey, including detailed site descriptions, site maps, and photograph logs are provided in the appendices of this report.

25-1113 Ritchie, Duncan, and Marsha K. King

1988 Archaeological Reconnaissance Survey of the West Hill Dam and Reservoir in Uxbridge, Northbridge, Upton and Mendon. 277 pages.

The purpose of this reconnaissance survey of the 1,460 acre area was to provide information on the archaeological sensitivity of the West Hill Dam project area and review the possible effects of current project operations on cultural resources. The research design included two primary tasks, background research to review data on known cultural resources and formulation of a sensitivity ranking (predictive model) for the project area. Environmental data such as geomorphology, soils and hydrology/drainage patterns were used to develop the predictive model for the location of prehistoric cultural resources. Known patterns of prehistoric and historic settlement and land use near the West Hill Dam project area and the relationship of these patterns to local and regional developments were used to develop interpretive contexts for assessing the potential significance of identified sites. The West Hill Dam project area was stratified into zones of expected archaeological sensitivity. An important aspect of the reconnaissance survey was field-testing of the sensitivity map and predictive model for prehistoric resources through the application of limited subsurface sampling (shovel test pits). Historic cultural resources identified from documentary sources or the walkover inspection were also recorded during this fieldwork phase of the survey. During the field testing/recording phase of the survey additional observations were made on the nature and extent of previous disturbance and effects of current project operations at West Hill Dam. A total of 14 prehistoric and 22 historic period cultural resources were identified during the reconnaissance survey. A number of these sites are considered to be potentially significant based on the limited information collected during the survey. Recommendations of additional intensive level survey work include known sites and areas considered to be potential site locations. Other recommendations for maintenance and protection or preservation of cultural resources are offered, particularly in situations where archaeological sites occur in recreation areas or other places subject to regular public access. Supporting documentation for the reconnaissance survey including detailed site descriptions, site maps and recording forms are provided in the appendices of this report.

25-1114 Glover, Suzanne

1990 Intensive Archaeological Survey, Crescent Green Condominium Development, Grafton, Massachusetts. 126 pages.

An intensive level archaeological survey was conducted at the proposed 24.2 acre Crescent Green condominium development in Grafton. Background research and a walkover/surface inspection were used to stratify the project areas into zones of expected archaeological sensitivity. The parcel was initially assessed as possessing a high prehistoric and historic archaeological sensitivity, primarily due to the close proximity of a known Christian Indian cemetery associated with the 17th century Praying Indian town of Hassanomisco. Intensive subsurface testing conducted within the parcel located and identified one prehistoric site, the Eagle Rock Site. This site consists of a low-density scatter of lithic chipping debris recovered from the plowzone. Due to an absence of diagnostic artifacts and/or features, the site area could not be temporally or culturally defined. The low density of stone tool chipping debris was not considered to represent a potentially significant archaeological deposition. A 19th century wood-frame barn/stable structure was identified in poor structural condition and was evaluated as ineligible for listing in the National Register. A low to moderate density of historic/modern field debris, dating predominately from the late 19th and 20th centuries, was recovered from the plowzone. These historic/modern cultural remains were not considered significant. No archaeological deposits associated with the 17th century Indian burial ground or Hassanomisco town center were identified. No further archaeological investigations were recommended.

25-1115 Mowchan, Denise and Deborah Cox

1989 An Intensive Archaeological Survey of the Small Arms Range Parcel, Westover Air Force Base, Chicopee, Massachusetts. 54 pages.

An intensive level archaeological survey was conducted at the Small Arms Range on the Westover Air Force Base in Chicopee. The purpose of the survey was to locate and identify any archaeological resources within the Small Arms parcel, in order to provide information to assist in a determination of effect for the proposed expansion project. In 1981, an archaeological reconnaissance survey of the entire Westover Air Force Base was conducted (see Report #25-386). The area encompassing the Small Arms range (which includes the four to five acre parcel to be developed) was designated as highly sensitive for archaeological sites during the reconnaissance survey. The area received this rating due to the high frequency of sites found in similar environmental settings, minimal disturbances, and the presence of prehistoric cultural material. Quartz chipping debris was discovered eroding from the banks of several well-drained, sandy knolls. However, subsurface testing during this stage of investigation did not locate any significant cultural remains. Since no potentially significant prehistoric or historic period remains will be impacted by the proposed expansion, no further archaeological testing was recommended.

25-1116 Doucette, Diana, Ann Davin and Denise Mowchan

1990 An Intensive Archaeological Survey, Northbridge Industrial Park, Northbridge, Massachusetts. 58 pages.

The 40.3 acre parcel to be developed includes 22 lots, 2,380 feet of roadway with drainage, utilities, and sewer facilities. The intensive survey included background research, a walkover inspection, and subsurface testing. Background research determined that there were no known prehistoric or historical resources in the project area. The walkover determined that approximately 10 acres had been previously disturbed by extensive gravelling. Subsurface testing involved the placement of 128, 50 cm x 50 cm test pits in areas that had been ranked as having moderate and high archaeological testing. Three pieces of quartz chipping debris were found in widely scattered sections of the project area. A low density of historic field trash was also found. None of these resources were considered significant and no further archaeological investigations were recommended.

25-1117 Pagoulatos, Peter

1988 Intensive Archaeological Survey, Oakmont Farms, Grafton, Massachusetts. 48 pages.

Archaeological investigations within the project area have identified three archaeological deposits. Intensive level archaeological survey encountered one prehistoric site and two loci, or findspots. None of the three prehistoric archaeological deposits were considered to represent potentially significant cultural resources. No further archaeological investigations were recommended.

25-1118 Davin, Ann K. and Suzanne Glover

1988 Intensive Archaeological Survey, Proposed Barnstable Municipal Golf Course, Barnstable, Massachusetts. 57 pages.

An intensive archaeological survey of the proposed Municipal Golf Course in Barnstable was recently conducted which included an 18-hole golf course within a 155 acre parcel. A reconnaissance archaeological survey had been conducted by the Barnstable Historical Commission during which chipping debris (19-BN-295; Danforth #1 site) was recovered. Environmental characteristics within the project areas also indicated that there was a potential for archaeological sites. During the surface walkover, a single piece of felsite chipping debris was recovered from the site area within the old county fairgrounds. Subsurface testing did not recover any prehistoric cultural materials. No additional testing was recommended. A felsite flake was also recovered along the edge of the sand pit located south of the Aalto farmstead. In total, 310 test pits (50 cm x 50 cm) were excavated. Prehistorical cultural materials were located in six of the test pits. A total of nine pieces of quartz, quartzite, felsite and chert flakes was recovered. Testing around the historic farmstead recovered primarily 20th century cultural material and foundations. These all appear to be associated with the Aalto family occupation of the site. No further testing was recommended for this historic farmstead.

25-1119 Davin, Ann K. and Holly Herbster

1992 Technical Report, Phase I Intensive (Locational) Archaeological Survey, Route 6 Drainage Improvements, Truro, Massachusetts. 44 pages.

The project area measured 70 feet by 100 feet and was largely located between highway stations 287 and 288. A total of 8, 50 x 50 cm test pits were excavated at 10 m intervals. No prehistoric cultural materials were recovered. Low to moderate densities of historic period cultural materials were present in seven of the eight test pits. The project area was located within a small part of an apple orchard which continued west and south of the project limits. Historic period cultural materials were predominantly 19th century domestic items with lesser amounts of structural debris. These materials consisted of ceramics, kaolin pipe fragments, brick fragments, window glass, iron fragments and nails, wood fragments, coal as well as shell and mammal bones. No concentrated material deposits or structures were located. The orchard is part of a now abandoned farm with related structures still standing well west of the project limits, between the Route 6 and Route 6a intersection. The intensive survey determined that the proposed drainage improvements would not impact any significant prehistoric or historic sites or deposits. No additional investigations were recommended.

25-1120 Doucette, Diana, Edna Feighner and Ann K. Davin

1990 Intensive Archaeological Survey, Independence Park Project Area, Barnstable, Massachusetts. 97 pages.

A reconnaissance and an intensive archaeological survey of the proposed 445 acre Independence Park project area in Barnstable was conducted. The reconnaissance survey stratified the project

area into zones of expected archaeological sensitivity. Approximately 63 acres were ranked as having high potential, 334 as having moderate sensitivity, and 48 as having low sensitivity. Soil types, the presence of kettle hole ponds, and a Contact period trail were key sensitivity criteria. The survey located evidence of sporadic, low intensity use during both the prehistoric and historic periods. A total of 756, 50 cm x 50 cm test pits were excavated. One quartzite Stark projectile point, one quartz Small Stemmed projectile point and a scatter of felsite chipping debris were located in eight test pits. Scattered historic debris was also located. No additional archaeological investigations were recommended.

25-1121 Savulis, Ellen R. and Leslie C. Shaw

1985 Archaeological Locational Survey of Historic Workmen's Circle Area, Ashland, Massachusetts. 98 pages.

An archaeological locational survey was conducted for the Workmen's Circle Housing project in Ashland. Background research did not identify any previously recorded prehistoric sites in the project area, however, a number of historic foundations and features were identified. These included the general area of an 18th century homestead, a mid-19th century dwelling foundation, the site of a 19th century mill, a turn-of-the-century mansion, and the 20th century Workmen's Circle Camp consisting of over twenty structures. A total of 170 shovel test pits were excavated to locate both prehistoric and historic sites. The results of the prehistoric testing located two small, low-density sites and 10 isolated findspots, several of which may have actually been the result of historic activity. The majority of the lithic debitage from these sites was quartz. Historical testing confirmed the location and date of occupation of all historic sites except the 18th century homestead. An additional 19th century tin can factory was also identified. All sites were found to be extensively disturbed and no further archaeological testing was recommended.

25-1122 Gumaer, D. Richard and Richard D. Holmes

1986 Archaeological Locational Survey of the Proposed Raytheon Missile System Division Headquarters Building Bedford, Massachusetts. 36 pages.

The historical background research and field research indicated that no properties of historical significance were recorded in the project area. Historic land use was primarily for pasture and no buildings were recorded to have been constructed on the property. Eighty-seven shovel test pits were excavated to locate prehistoric and historic sites. No prehistoric sites were found. A large portion of the project area has been disturbed previously by bulldozing during the construction of a parking area, baseball field and tennis courts. Other parts of the project area have been bulldozed and filled during cleanup of 20th century garbage that had been dumped before the property was fenced in. On the basis of this survey, no significant historic or prehistoric archaeological resources will be impacted by the proposed construction. No sites were found that are eligible for inclusion in the National Register of Historic Places. No further survey was recommended.

25-1123 MacMahon, Darcie A.

1991 Archeological Collections Management at Adams National Historic Site, Quincy, Massachusetts. Archeological Collections Management Series No. 9. 175 pages.

Two archaeological projects have been conducted at the Adams Birthplaces. The first project was undertaken in 1980 following a geophysical survey of the property that attempted to locate cultural features that could be tested archaeologically. The second was designed to monitor the installation of a drainage system around two houses during NPS restorations in 1982. Neither of the collections that resulted from these projects had been accessioned or catalogued prior to the current Archeological Collections Management Project (ACMP). This resulted in a total of 7,667 catalog lots. The ACMP placed the artifact collections in archivally sound plastic bags and boxes and returned them to Adams NHS for permanent storage in the basement of the Adams Mansion

along with original field records. The ACMP also gave the Park the printed catalog cards and the computer files containing these records, with instructions on how to use the latter. Except for three prehistoric ceramic sherds, all of the artifacts were from the historical period. The ACMP reanalyzed the major archaeological features to better interpret their dates and functions. A total of three architectural features were located, all of which appear to reflect 19th century shed additions attached to the two houses. Two were located at the John Quincy Adams Birthplace. The first was along the north wall of the house and was partially excavated. It had a cellar wall of faced stones and a brick floor. This structure was constructed some time prior to 1828 and was destroyed after 1891. The second feature was located along the west wall of the house and was represented by a packed pebble footing with larger stone piers or foundation walls. It was constructed sometime after 1790. The third was located along the north wall of the John Adams Birthplace. Excavators found large, densely packed stones in this area, some of which exhibited cut faces. Excavators uncovered a small, cased well, which post-dates the Adams occupation of the site. The geophysical survey hypothesized the location of three additional wells. They remain unexcavated and could provide undisturbed features for future research. Artifacts from the 17th and 18th centuries were recovered. The ACMP also found that there was sparse evidence of the diverse profusion of activities that took place on the site. Shoemaking was the one activity that left its mark. Any additional archaeological work conducted on the property must take into account the range of known ground disturbances. Any utility installation, landscape changes, or other ground-disturbing activity at the site should be preceded by controlled excavations.

25-1124 McCormack, Valerie, Marsha K. King and Joyce Fitzgerald

1991 Draft Report of the Intensive Level Archaeological Survey, Hancock Woods Project Area, West Roxbury, Massachusetts. 54 pages.

An intensive level archaeological survey was conducted in the Hancock Woods project area in West Roxbury (Boston). Walkover investigations identified two historic cement and brick features. The features measuring 2 m x .6 m are believed to be 20th century barbecue pits. Subsurface testing located one loci containing moderate densities of prehistoric cultural materials as well as low-density material scattered throughout the project area. The Red Fox Site, a prehistoric site dating to the Middle and Late Archaic periods (7,500-2,000 years B.P.) was located. Recovered cultural materials include an argillite Stark projectile point, a quartz Small Stemmed projectile point, chipping debris, and a stone encircled hearth. Due to the location within Boston, the time periods represented, and undisturbed nature of the soil, the Red Fox Site contains potentially significant prehistoric cultural deposits. Further archaeological investigations were recommended for the Red Fox Site.

25-1125 Rainey, Mary Lynne and Ann K. Davin

1988 An Intensive Archaeological Survey of the Middleborough Corporate Park Project Area, Middleborough, Massachusetts. 38 pages.

An intensive archaeological survey was conducted within the site limits of the proposed Middleborough Corporate Park in Middleborough. This 29 acre site is located less than half a mile northwest of the intersection of I-44 and I-495. Subsurface testing provided no evidence for the existence of prehistoric sites. A small quantity of historic artifacts were recovered from within the plow zone. There was no indication, however, of the presence of potentially significant historical features or sites. No further archaeological testing was recommended.

25-1126 Savulis, Ellen-Rose and Dorothy Schlotthauer Krass

1987 Archaeological Locational Survey of the Route 2 Realignment Project, Erving, Wendell and Orange, Massachusetts. 171 pages.

This survey consisted of prehistoric and historic background research and the identification of

standing architecture in the right-of-way of the proposed realignment of Route 2 in Erving and Wendell. An intensive subsurface archaeological survey followed the background research and consisted of the excavation of 200 shovel test pits. The survey resulted in the location of four prehistoric sites, four prehistoric findspots, ten historic archaeological sites, and seventeen historic structures. Of these sites, four prehistoric sites, six historic archaeological sites and 13 structures require site examinations in order to determine if they are eligible for inclusion in the National Register of Historic Places.

25-1127 Dunford, Frederick and Edward Hood

1986 Archaeological Site Locational Survey for the Pond Street Bridge Replacement Project, Billerica, Massachusetts. 35 pages.

An archaeological locational survey was conducted in Billerica. The historical background research did not identify any specific historical resources. Background research of prehistoric site files also failed to produce evidence of any specific prehistoric resources. Seventy shovel test pits were excavated in seven test locations. Much of the project area has been disturbed by the development of a municipal landfill, immediately to the east. The existing bridge, road, railroad tracks and several houses also have seriously altered the landscape. The project is not likely to impact significant historical or archaeological resources. No sites were found that are eligible for inclusion in the National Register of Historic Places. No further survey was recommended.

25-1128 Nicholas, George P. and Mitchell T. Mulholland

1987 Archaeological Locational Survey of the Housatunnuk at Skatehook in Sheffield, Massachusetts. 104 pages.

A survey was conducted in Sheffield. This work was required by the Massachusetts Historical Commission on the basis of a previously reported prehistoric site and possibly human burials. This site is recorded as the possible location of Skatehook. A substantial body of literature is available on this early 18th century Housatonic Indian village which was occupied by four or five families during the early 1700s; it was abandoned about 1736 when these families moved to Stockbridge. The study demonstrated that a large, potentially significant prehistoric site exists in the northeast corner of the property and that proposed project plans will have a negative impact on the southern extreme of the site. The site has been the location of prehistoric activity for at least 5000 years, and possibly longer, and the location of various historic activities during the last several hundred years. While none of the artifacts recovered can be attributed directly to either the village of Skatehook or to the reported human burials, the presence of both in the vicinity has been documented. The following was recommended: 1) modify the orientation of the proposed storage facility to avoid the northern part of the site and place a preservation restriction on the site; or 2) if project plans cannot be modified, then a site examination is recommended.

25-1129 Gallagher, Joan, Joyce Fitzgerald and Beth Miller

1989 Reconnaissance Archaeological Survey, Commonwealth Center, Boston, Massachusetts. 66 pages.

The Commonwealth Center project area will be impacted by construction of a proposed mixed-use development. Prior to this development an archaeological reconnaissance survey was conducted, the goal of which was the assessment of the archaeological sensitivity of the area. The study area was generally defined as the area bounded by West, Boylston, Washington and Tremont Streets. Alternate construction plans are currently under consideration, but any proposed development will certainly affect the subsurface deposits. In this assessment of archaeological sensitivity, the portions that will be directly affected are those included within the area of the most extensive construction alternative. Those indirectly affected are on the periphery, but may receive secondary impact from machinery, utility connections, structural underpinning, and other ancillary activities.

The actual extent of further archaeological investigation is dependent upon the final project design. The project area's archaeological sensitivity was determined by assessment of its potential integrity and significance. Prior to environmental and structural testing, four areas were identified as possessing a high degree of sensitivity. An intensive archaeological survey was recommended, with subsurface testing in the areas of high sensitivity. After a review of newly acquired boring logs and monitoring of test trenches, it was found that these high sensitivity areas had been impacted by a series of undocumented disturbances. Due to prior disturbance, there was little likelihood of the recovery of potentially significant archaeological resources. No further archaeological investigation was recommended.

25-1130 Bower, Beth Anne

1986 The African Meeting House Boston, Massachusetts Summary Report of Archaeological Excavations 1975-1986. 272 pages.

Between 1975 and 1985, the Museum of Afro American History conducted an archaeological research and education program in and around the African Meeting House, the oldest extant black church building in the country (see Reports #25-778, 25-868-871, and 25-1225). It was built in 1805 by Boston's African-American community for use as a church, school, meeting place, and community center. Archaeological testing has uncovered resources dating from the later 18th century (before the meeting house was built) through the 20th century. The majority represent significant exterior remains of landscaping and yard features (drains, privies) from the earliest period of the building's history, 1806-1855, as well as features related to adjacent properties occupied by members of the African-American community. The fill in and around these features contains remains related to activities that took place at the Meeting House. Historical research and archaeological analysis of the features and artifacts uncovered during the excavations focused on four topics: the history of and changes to the structure, the reconstruction of the historic landscape and land use around the building, early 19th century foodways, and the historic use of the site. Evidence on the construction of the building and details relating to its appearance and furnishings were uncovered. A great deal of information relating to landscape was also uncovered, including data on original grade, location and appearance of the drainage system, and the types of flora present on the site. Documentary and archaeological research combined to provide information about foodways in Boston in the early 19th century. Specifically, information on preferences for specific types and cuts of meat, public dining, urban marketing, and the commercialization of husbandry was derived from careful analysis of documents and floral and faunal remains. The role of the African Meeting House as a community building, especially as the site of large public events that included preparation, serving, and consumption of food, was documented through the archaeological and documentary records.

25-1131 Holmes, Richard D., Mitchell T. Mulholland, David J. Bernstein and Carolyn D. Hertz

1992 Site Examination of Five Prehistoric Sites in Segment 12, Northeast Settlement Project, Haverhill, Massachusetts. 203 pages.

In 1990, an archaeological site examination of five prehistoric sites was conducted in Haverhill (see also Reports #25-994 and 25-1147). The Crystal Lake West, Crystal Lake Dam, Lake Street, and Fishin Brook Cornfield sites are small camps and lithic work areas, and Little River Quarry site is a quartz quarry. Diagnostic artifacts at the Crystal Lake West site included a Small Stemmed point and Squibnocket Triangle; at the Crystal Lake Dam site, a Susquehanna Broad point and a fragment of pottery. Site avoidance or data recovery was recommended for the Crystal Lake West site, the Crystal Lake Dam site and the Lake Street site. No further survey was recommended for the Fishin Brook Cornfield site and the Little River Quarry site.

25-1132 Mulholland, Mitchell T., Richard D. Holmes, Elena Filios and David Bernstein

1992 Archaeological Site Examination of Five Prehistoric Sites in Segment 105 Northeast Settlement Project, Worcester County, Massachusetts. 151 pages.

An archaeological site examination was conducted in Upton and Mendon. The study examined five prehistoric sites encountered during an earlier site locational survey (see Reports #25-994 and 25-1089). Three of the sites (the Hopkinton Road, Pratt Pond East and Muddy Brook Swamp sites) did not appear to be eligible for inclusion in the National Register because of low densities of cultural material or disturbance. The Pratt Pond Terrace and Varney Brothers/Mill River site both have integrity, have the potential to contribute information of importance to archaeology, and therefore, appear to be eligible for inclusion in the National Register. Site avoidance or data recovery were recommended.

25-1133 Loparto, Leonard W.

1991 An Archaeological Reconnaissance Survey of the Plimptonville Trust Property in Walpole, Massachusetts. 93 pages.

An archaeological reconnaissance survey of the Plimptonville Trust Property in Walpole, Massachusetts was conducted. The survey area included 143 $\pm$ acres. Background research, a walkover survey and limited field-testing (excavation) were used to identify five sensitive areas where a high potential exists for location of both prehistoric and historic sites. Locational characteristics of the property indicate favorable conditions throughout most of the area for prehistoric sites. At least two are reported on the property, the Neponset Reservation Sites 1 & 4. Potential exists for locating numerous historic sites as well beginning with the 1685 Neponset Indian Reservation, resources associated with 18th and 19th century farms and numerous industrial and residential sites associated with the 19th century growth of Plimptonville. Historic archaeological resources include waterpower related sites at the upper and lower Plimpton privilege dams, at least one millrace or canal, and an electric power plant. At least one industrial site is present at the lower privilege with two at the upper privilege. The sites of residential homes and mill related structures may be present along Plimpton Street. Subsurface testing in Sensitive Area II, Lot 3 was inconclusive. Prehistoric and historic resources may exist in that area. An intensive archaeological survey should precede plans to develop any of the five sensitive areas. Several locales characterized by wetlands, excessive slope and recent historic disturbances were not recommended for further archaeological testing (see Report #25-1153).

25-1134 Missio, Nicole A., Nancy S. Seasholes, David E. Clayton, Donald G. Jones and Ricardo J. Elia

1992 Results of an Intensive Survey of Four Proposed Sites for Secondary Sewage Treatment Plant and Solids Disposal Facilities for the South Essex Sewerage District in Essex County, Massachusetts. 219 pages.

An intensive archaeological survey was conducted of four proposed sites for secondary sewerage treatment plant and solids disposal facilities for the South Essex Sewerage District in Essex County. The area includes five towns: Beverly, Danvers, Peabody, Marblehead, and Salem. The four sites are the Marblehead Landfill site (Site 87), the Beverly Landfill Site (Site 4R), the SESD Expanded Plant site (Site 53R), and the Peabody Landfill site (Site 311). A cultural resources reconnaissance survey was previously conducted for ten proposed sites, including the four sites listed above (see Report #25-1048). The reconnaissance survey recommended that an intensive archaeological survey be conducted of all undisturbed portions of Sites 87, 4R, 53R, and 311, among others. At the Marblehead Landfill site (Site 87), the intensive archaeological survey identified no potentially significant prehistoric or historical archaeological sites. No further archaeological investigations were recommended for Site 87. At the Beverly Landfill site (Site 4R), no prehistoric sites were identified but one historical site, consisting of a concrete foundation and associated well and asphalt driveway, was identified. This was determined to be modern and not potentially significant. No further archaeological investigations are recommended for Site 4R. The

SESD Expanded Plant site (Site 53R) consists of three parcels at which subsurface testing was conducted: Site 53R-Winter Island (also Site 47, the Plummer Home site), Site 53R-Marine Lab, and Site 53R-SESD Existing Plant (also Site 53, Existing Plant site). Two other parcels that comprise Site 53R (Site 53R-NEPCO and Site 53R-Intertidal) were considered to be sufficiently disturbed to preclude the possibility of undisturbed archaeological resources and no subsurface testing was conducted at these parcels. At the Site 53R-Winter Island parcel, the intensive archaeological survey identified five prehistoric sites and one historical site: the Juniper Cove prehistoric site (l9-ES-406), the Plummer Farm School prehistoric site (l9-ES-457), a previously unrecorded prehistoric site, two isolated finds of prehistoric artifacts, and remains of historical buildings associated with the Plummer Home for Boys. The isolated prehistoric finds were not considered to be potentially significant and no further archaeological investigations are recommended for them. The three prehistoric sites (19-ES-406, 19-ES-467, and the unnamed site) were all considered to be potentially significant and should be avoided during construction. For any of these three prehistoric sites that cannot be avoided during construction, a site examination was recommended. The remains of the outbuildings and well associated with the Plummer Home are also considered to be potentially eligible as archaeological resources. Therefore, the historical remains associated with the Plummer Home should be avoided during construction. If avoidance is not possible, then a site examination should be conducted. At the Site 53R-Marine Lab parcel, five prehistoric sites and one historical site were identified: the Salem Neck Sewerage Plant prehistoric site (19-ES-471), the Smith Pool prehistoric site (19-ES-480), a previously unrecorded site, two isolated finds of prehistoric flakes, and remains of the historical Smith Pool facilities. The isolated prehistoric finds and Smith Pool are not considered to be potentially significant and no further archaeological investigations were recommended for them. The three prehistoric sites (19-ES-471, 19-ES-480, and the unnamed site) were all considered to be potentially significant and should be avoided during construction. A site examination should be conducted for any of these three prehistoric sites that cannot be avoided during construction (see Report #25-1203). At the Site 53R-SESD Existing Plant parcel, one archaeological site--the Salem Neck Sewerage Plant prehistoric site (19-ES-471)--was identified. This site, which extends into the Site 53R-Marine Lab parcel, is considered to be potentially significant and should be avoided during construction. If avoidance is not possible, then a site examination should be conducted. At the Peabody Landfill site (Site 311), one archaeological site – a previously unrecorded prehistoric site – was identified. This site was considered to be potentially significant and should be avoided during construction. If avoidance is not possible, then a site examination should be conducted.

25-1135 Holmes, Richard D., Mitchell T. Mulholland, David Bernstein and Patricia H. Mangan

1991 Archaeological Site Examination of Six Prehistoric Sites in Segment 7, Northeast Settlement Project, Berkshire County, Massachusetts, and Columbia County, New York. 290 pages.

A site examination survey was conducted in East Chatham, and New Lebanon, New York; and Stockbridge and Richmond, Massachusetts. The study examined six prehistoric sites encountered during an earlier site locational survey (see Reports #25-994, 1105, and 1190). Four of the sites did not appear to be eligible for inclusion in the National Register because of low densities of cultural material. As a result, no further survey was recommended for the New Britain Swamp site in New Lebanon, New York; the Sleepy Hollow Brook site in Richmond, Massachusetts; and the Lake Mahkeenak and Chassell 1 sites in Stockbridge, Massachusetts. The Chassell 2 and Kampoosa Bog sites, both located in Stockbridge contained high densities of prehistoric material, and organic features. The Chassell 2 Site (l9-BK-141) dates from the Late Archaic to Late Woodland periods, based on diagnostic projectile points (Small Stemmed, Sylvan, Orient Fishtail, and Greene-like) and ceramics (most grit-tempered, some with red Normanskill chert temper) with smooth, cord-marked, dentate-stamped or incised surface treatments. Two radiocarbon samples obtained dates of 1,950 $\pm$ 80 B.P. (Beta-469l3) and 280 $\pm$ 80 B.P. (Beta-46914). The latter sample might suggest a Contact period use of the site, as the feature from which the sample was obtained was associated with chert debitage. The Kampoosa Bog Site (19-BK-143) dates from the Late Archaic to the Woodland periods. Diagnostic materials include a Snook Kill/Atlantic point and base, a Squibnocket Triangle, a Lamoka-like point, and a few sherds of grit-tempered ceramic. One ra-

diocarbon sample dated 1,590 ± 70 B.P. (Beta-469l5) which is anomalous considering the Late Archaic projectile points, but in line with the chronology of the nearby Chassell 2 Site, and the findings of prehistoric ceramics elsewhere at the Kampoosa Bay Site. Both sites have integrity, have the potential to contribute information of importance to archaeology, and therefore appear to be eligible for inclusion in the National Register. Site avoidance or data recovery were recommended

25-1136 Holmes, Richard D., Ellen-Rose Savulis, Mitchell T. Mulholland, Carolyn D. Hertz and Patricia Mangan

1992 Archaeological Site Examination of Two Historic Sites in Segment 7 Northeast Settlement Project Richmond and Stockbridge, Berkshire County, Massachusetts. 176 pages.

A site examination was conducted for two historic sites in Richmond and Stockbridge (see also Reports #25-994 and 25-1105). The Richmond Pierson Historic Site (RIC-HA-1) consists of a single course of unmortared stones near the highway and a dump. No foundations, cellar excavations, or evidence of structures were found. The site was used as a dump by a relatively prosperous family, from the late 18th through the early 19th centuries. While a potential tavern was predicted to be at this location, no artifacts suggesting a tavern or other public facility were found. Pottery and brick making may have taken place nearby. Residue of these activities has been discarded at the site. The Lakeside Historic site (STO-HA-2) is a dependency of the Lakeside "cottage" built by the wealthy Bristed family in 1894. The structure probably was removed c. 1920. This structure was the home of domestic servants of the Lakeside estate. Both sites have been modified, and the Lakeside site has been partially destroyed. Neither site appears to have the integrity necessary for inclusion in the National Register. No further research was recommended.

25-1137 Leveillee, Alan

1990 A Supplemental Intensive Archaeological Survey of the Proposed Enterprise Drive Roadway and Two Well Locations Within the Independence Mall Project Area Plymouth and Kingston, Massachusetts. 41 pages.

Archaeological investigations within the proposed Enterprise Drive roadway and at the sites of the Grassy Hole and I-86 wells indicate that no potentially significant cultural resources exist in these areas. No additional archaeological investigations were recommended.

25-1138 Leveillee, Alan, Elizabeth Holstein and Robert Goodby

1990 A Reconnaissance and Intensive Archaeological Survey of the Mattapoisett Residential/Golf Community Project Area, Fairhaven and Mattapoisett, Massachusetts. 90 pages.

In July 1989, an intensive level archaeological survey was completed at the proposed Mattapoisett Residential/Golf Community project area in Mattapoisett and Fairhaven. Prior to the intensive survey, a walkover/surface inspection and preliminary background research were used to stratify the project area into zones of expected archaeological sensitivity. The project area was divided into high, medium and low sensitivity. Forty 30 x 30 m square testing blocks were placed randomly within the project area. Twenty additional blocks were placed within the high sensitivity portions of the project. Ten more blocks were placed judgmentally in different portions of the project area. Two 1 x 1 meter excavation units were also excavated to investigate areas where prehistoric cultural material were encountered. A total of 828, 50 x 50 cm shovel test pits were excavated in the project area. In addition, machine testing was employed in an attempt to identify a reported burial ground. Although cultural material was located, the results of the intensive survey indicate that no potentially significant concentrations of prehistoric or historic cultural material exist in the project area. Since it is unlikely that additional test pit excavations would provide additional classes of archaeological data, no further testing is recommended. Data collected to date indicate that the Shaw Cemetery (late 18th 19th century) is situated within the project area. The probable location of the

cemetery has been established as a result of the intensive survey. It was recommended that the immediate area of the cemetery be avoided during construction and that the suspected graveyard be maintained and preserved.

25-1139 Brown, Marley R. III and Harold D. Juli

1976 Archaeological Excavations at the Fairbanks Homestead, Dedham, Massachusetts 1973-1974. 69 pages.

An archaeological investigation was conducted as part of an integrated approach to the restoration of the Fairbanks House. The field investigation included the excavation of 13 test trenches of various size. Artifacts and features associated with historic period use of the site during the 18th and 19th centuries were identified, as well as evidence pertaining to modifications to the landscape. It was recommended that no additional archaeological investigation was necessary for the proposed restoration and drainage work near the house. The report concluded that a program of archaeological testing be initiated on the grounds surrounding the Fairbanks House, as there are indications that such work might uncover evidence of other structures which previously stood on the property, or features such as trash pits which might contain undisturbed artifactual material which can be correlated with specific Fairbanks families. See also Report #25-850.

25-1140 Bernstein, David and Ellen-Rose Savulis

1988 Archaeological Site Examinations of Four Prehistoric and Two Historic Sites in Pittsfield, Massachusetts. 182 pages.

Site examinations were conducted at two historic and four prehistoric sites in order to determine their eligibility for inclusion in the National Register of Historic Places. The sites are threatened by the proposed Route 7 Bypass Project in Pittsfield and Lanesborough. Site 4A-1 (Cadwell site) is the location of a number of relatively recent burning episodes and does not appear to have witnessed significant use in prehistoric times. No additional research is recommended at 4A-1. Site 5A-1 (Woodleigh site) is a prehistoric campsite or small village dating to the Late Archaic period. Though part of the site has been destroyed by residential construction and landscaping, much of it remains in excellent condition. Site 5A-1 has great potential for addressing a number of research questions important to archaeology. This site appears to be eligible for inclusion in the National Register and a data recovery phase is therefore recommended. Site 7-1 (Sprague House site) is the location for a late 18th through 20th century domestic occupation plus a standing dwelling. Extensive landscape modifications and a building addition in the 19th century destroyed the archaeological integrity of this site. The site does not appear to be eligible for inclusion in the National Register. No additional research is recommended for site 7-1. Site 11B-1 (Pontoosuc 2 site) is a small prehistoric campsite dating to the Early Woodland period. The site contains a diversity of prehistoric materials and is relatively undisturbed. Site 11A-1 has the potential for addressing a number of research questions important to archaeology. This site appears to be eligible for inclusion in the National Register and a data recovery phase is therefore recommended. No unequivocal cultural material was found at Site 12C-1 (Oak Hill site) during the site examination. No additional research is recommended at this location. Site 15A-1 (Smith site) is the location of a 19th through early 20th century domestic occupation. Extensive nineteenth century landscaping here also destroyed the archaeological integrity of this site. The site does not appear to be eligible for inclusion in the National Register. No additional research is recommended for site 15A-1. The railroad bridge P-10-5 appears to be eligible for inclusion in the National Register. It is recommended that final project plans be reviewed for possible effects on its historic character.

25-1141 Mrozowski, Stephen A.

1991 Intensive Archaeological Survey, Nathan Fisher House Property, Westborough, Massachusetts. 45 pages.

In July 1990, an intensive archaeological survey was completed of the property surrounding the Nathan Fisher House in Westborough. The project area included portions of the yard immediately adjacent to the south, east and west foundation walls. The intensive archaeological survey included background and documentary research followed by subsurface testing. The results of the testing revealed that the area immediately west of the Fisher House had been disturbed during earlier foundation stabilization work. Investigations along the northern and eastern foundation walls discovered little in the way of significant cultural resources. Testing in the north yard was successful in locating a small trash deposit dating to the period of the Fisher occupation. It was recommended that foundation stabilization work be allowed to proceed, but the area surrounding the well in the north yard should be avoided.

25-1142 Davin, Ann K. and Ron Dalton

1991 Results of the Phase I Intensive Archaeological Survey, Granby Road Reconstruction Project Area, Chicopee, Massachusetts. 55 pages.

A Phase I intensive level archaeological investigation of the proposed Granby Road reconstruction project area in Chicopee was completed. The project area, which lies between Davitt Bridge and Memorial Drive (Route 33), will be improved within the existing roadway. Three areas required archaeological investigations: Area 1 between highway stations 19 and 20, where William Ritter's Crystal Springs Brewery is located; Area 2 between highway stations 44 and 50, where a bend in the road may be straightened in proximity to the Bela Chapin House; and Area 3 between highway stations 92 and 96 just south of Route 90 and a Massachusetts Electric Company right-of-way. A total of 23, 50 x 50 cm test pits were excavated within the three designated areas. Cultural material recovered included late 19th and 20th century field and roadside trash. These materials included construction and domestic items. No evidence of historic structures or important historic activity was located during the subsurface testing. There was no evidence of any prehistoric activity in the three areas tested. No further archaeological testing was recommended.

25-1143 Holmes, Richard D., Mitchell T. Mulholland and Carolyn D. Hertz

1992 Archaeological Site Locational Survey of the Stonegate/San Souci Development Project, South Hadley, Massachusetts. 52 pages.

An archaeological site locational survey was conducted of the proposed Stonegate/San Souci development in South Hadley. Before fieldwork began, roadways had been constructed and some areas disturbed. As a result, only 60 percent of the 95 acres of the site was tested. Twelve acres were recommended for testing and actually tested. A tota1 of 168 shovel test pits was excavated. No prehistoric artifacts or features and few historic artifacts (mid-1700s to 1900) were recovered. Several dinosaur footprints were found in rock blasted for the road. Given the low density of artifacts and lack of historic structures, no further research was recommended.

25-1144 Elia, Ricardo J., Donald G. Jones, Gerald M. Macomber and Nancy S. Seasholes

1991 Intensive Archaeological Survey of the Proposed Coles Neck Road Wastewater/Septage Treatment Facilities in Wellfleet, Massachusetts. 29 pages.

This report presents the results of an intensive archaeological survey of the proposed Coles Neck Road wastewater/septage treatment facilities in Wellfleet. Background research indicated a moderate to high potential for prehistoric remains and low potential for historical sites within the project area. Based on the field reconnaissance, seven areas were selected for subsurface testing. Seventy-five shovel test pits were excavated in those areas. Significant cultural materials were not recovered. No further archaeological investigations were recommended.

25-1145 Glover, Suzanne and Edna Feighner

1991 Intensive (Locational) Archaeological Survey and Site Examination Investigations, Marine Resources Center, Woods Hole, Falmouth, Massachusetts. 204 pages.

An intensive (locational) survey and site examination were conducted in January 1991 at the Marine Resources Center project area in Woods Hole, Falmouth. The archaeological investigations were undertaken prior to the construction of a new Marine Resources Center and SCUBA building as part of the Marine Biological Laboratory. The project area was formerly the site of a 19th century whaling complex established by Elijah Swift (1774-1852). Extensive documentary research and subsurface testing (a combination of machine-assisted excavation and hand-testing) resulted in the location, identification, and assessment of five components, or activity loci, primarily associated with the Swift whaling industry-related occupation of the site. The whaling activities were conducted from the late 1820s to the early 1860s. The archaeological survey also recovered data relating to continued maritime-oriented commercial land use of the parcel by various owners and businesses. Twentieth-century MBL-related demolitions, reconstructions, and occupations were also documented within the project area. The archaeological data collected from the five site components have contributed to an understanding of the important socioeconomic role of the whaling industry and other maritime-related activities that occurred in Falmouth from the early 19th century to present day. These historical resources, however, are not considered eligible for listing in the National Register. This recommendation is based on an assessment of the resources as possessing generally poor physical integrity and/or lack of additional information content. The degree of previous 20th century disturbances throughout the project area also limits the archaeological potential of the site to have additional intact components. No further archaeological investigation of the historical archaeological resources within the project area is recommended.

25-1146 Holmes, Richard D., Carolyn D. Hertz, J. Edward Hood and Susan Denault

1992 Archaeological Site Locational Survey of the Proposed Water Treatment Facilities, North Adams, Massachusetts. 74 pages.

An archaeological site locational survey was conducted at the proposed water treatment facility and transmission mains along Pattison, Notch, and West Mountain Roads in North Adams. Construction is to be limited to the existing roadbed, except for: 1) a water treatment facility area; 2) the route of a sewer and a transmission main on the slope north of the water treatment facility to Phelps Avenue, parallel to an existing transmission main; and 3) a pumping station. The project area developed a distinct identity as "the Notch" during the 19th century. Standing structures were inventoried and three historic archaeological sites were described. Subsurface testing in three areas and a walkover of the entire project area did not reveal any prehistoric or other historic sites, but a single quartz flake was found. It is recommended that the historic archaeological sites not be used as storage or staging areas during construction. None of the sites appears to be eligible for the National Register, and no further research was recommended.

25-1147 Mulholland, Mitchell T., Richard Douglas Holmes and David Bernstein

1991 Archaeological Site Locational Survey of Segment 12, Northeast Settlement Project, Haverhill and Methuen, Massachusetts. 138 pages.

The field portion of an archaeological site locational survey was conducted on Segment 12 of the Tennessee Gas Pipeline Company's Northeast Settlement corridor in Methuen and Haverhill. The survey consisted of the excavation of 408 shovel test pits in 18 survey areas and three randomly selected survey areas. Five intact prehistoric sites were found. Site avoidance, or if this is not possible, site examinations were recommended for the five prehistoric sites to determine their eligibility for inclusion in the National Register (see Reports #25-994 and 25-1131).

25-1148 Ritchie, Duncan

1992 Intensive Archaeological Survey, Chelmsford Phase IIC Sewer Project Area, Chelmsford,

Massachusetts. 59 pages.

An intensive level archaeological survey was conducted within the Chelmsford Phase IIC Sewer project area in Chelmsford. An initial stratification of this project area into zones of expected archaeological sensitivity was based on the results of background research and a walkover inspection. This preliminary evaluation indicated that the project area contained many locations that had evidence of previous disturbance from commercial and residential development. The remainder of the project area was ranked as having moderate to low archaeological sensitivity. Intensive subsurface testing during the survey sampled those portions of the project area considered to have moderate to low archaeological sensitivity. No prehistoric or historic period archaeological sites were identified during the fieldwork aspect of the survey. A small amount of historic/modern period cultural material (structural materials, glass, ceramic sherds) was found in three sections of the project area. This material was not considered to represent potentially significant cultural resources. No additional archaeological investigations were recommended.

25-1149 King, Marsha K.

1992 Phase I Intensive Archaeological Investigation/Phase II Site Examination, Beverly-Salem Bridge Transportation Project, Beverly, Massachusetts Volume I and Volume II. 299 pages.

An intensive and site examination level archaeological investigation was conducted within the Beverly-Salem Bridge project area in Beverly. The MDPW is proposing to replace the existing Beverly-Salem Bridge and modify traffic access on the north end of the bridge in Beverly. Methods employed included extensive background research, archaeological field investigations, laboratory processing and analysis, and report writing. Five historic research contexts were developed to serve as a framework for the research and analysis. These included 1) Maritime Activities and Facilities in Massachusetts, 17th to 20th century; 2) Transportation Networks in Eastern Massachusetts, 17th to 20th century; 3) Trade and Commerce in Eastern Massachusetts, 17th to 20th century; 4) Environmental Modification in Coastal New England, 17th to 20th century; and 5) Urban Life and Core Area Services in New England, 18th to 20th century. Historic maps showing the project area were collected and map overlays were created showing locations of roads, buildings, other features, and changes in the wharves through time. Chains-of-title were prepared for each of the six parcels. Historic directories of Beverly were also examined for information concerning the owners and occupants of the properties, their occupations, and activities which may have occurred there. A total of 23 features and three fill deposits were identified in the 13 machine-assisted trenches and single hand excavated unit. A number of these features and fill deposits could be correlated with wharves, buildings, functions, activities, or landscape features indicated on historic maps, deeds, and/or directories. Seven feature complexes, groups of related or associated features and/or fills, were distinguished: Ellingwood's Wharf (18th c.), Safford/Ober/Quiner Wharf (early-mid 19th c.), Quiner/Gridler Coal Wharf (late 19th -20th c.), Ober/Rowe Wharf (mid-late 19th c.), Beverly Lot No. 88 Domestic and Commercial Occupations (19th – 20th c.), Beverly Lot No. 67 Domestic and Commercial Occupations (mid 19th – 20th c.), and Beverly Ferry landing (17th – 20th c.). The majority of the identified features and fills fit within one of the complexes. Based on the results of the background, field, and laboratory analyses, no further archaeological investigations were recommended.

25-1150 King, Marsha K.

1989 Intensive Archaeological Survey, Metropolitan Corporate Center Forest Street Parcels, Marlborough, Massachusetts. 83 pages.

An intensive archaeological survey was completed of the Metropolitan Corporate Center Forest Street Parcels project area in Marlborough. The survey included a review of prehistoric, historic, and environmental background data in order to define the archaeological potential of the project area. A walkover survey was also conducted to obtain a preliminary evaluation of the potential integrity of the project area and to document previous disturbance. During the walkover the project

area was stratified on the basis of the archaeological sensitivity, especially in regards to the potential for the presence of Native American burials to be present. Subsurface testing consisted of the excavation of 113, 50 x 50 cm test pits in 30 x 30 m blocks and as judgmental test pits in areas of relatively high archaeological sensitivity. The results of this testing included the determination that no evidence of a Native American burial ground was located, and the determination that the J. Nichols house area had been significantly disturbed and no longer retained sufficient archaeological integrity to warrant further testing. Avoidance of the bridge/causeway, in a wetland area where no development is planned, was recommended. Consultation with the Massachusetts Historical Commission resulted in additional fieldwork within the project area. The small rectangular mound or terrace feature noted in Block 6 in the northwest corner of the Faneuil (eastern) parcel was more closely examined. A 14 C .75 m trench was excavated across the feature into the C-horizon subsoil. No indication of Contact Period human interments were encountered. Two felsite flakes, a single piece of calcined bone, and a .22-caliber cartridge were recovered from the trench. Based on the recovery of the two flakes, this area was given the designation of Locus 1, and a MHC site form was completed. No further archaeological investigations of this feature were recommended. No significant cultural resources were located. No further documentary research or subsurface testing was recommended.

25-1151 Decima, Elena and Chris Edens

1992 Reconnaissance Survey Bournedale Village Farms Bourne, Massachusetts. 15 pages.

Background research and known site distribution in the area indicated the potential for small, temporary campsites for specific resource exploitation to exist within the project area. The presence of a small stream and wetlands, the existence of large rocks which could have offered temporary shelter, and the possibility that Native trails existed between Herring Pond and Buttermilk Bay reinforce the likelihood of the existence of short-term specialized camps, and/or small lithic workshops and processing stations for the many resources that this rich environment could have offered in the past.

25-1152 Loparto, Leonard W.

1992 An Intensive Archaeological Survey of Parcel 96 on Corn Hill Truro, Massachusetts. 60 pages.

An intensive (locational) archaeological survey was conducted of Parcel 96, Truro. The project area includes a 1.77 acre (.72 hectare) area in which a single-family residential unit is planned. The intensive survey focused on the location of prehistoric and historic cultural resources within the project area. The intensive survey results presented in this report represent the results of documentary and archaeological field research conducted for Parcel 96 and the surrounding locale. Historic research was directed at the identification of historic land use patterns within the project area. Archaeological research involved the systematic collection of 143 Hoffer (40 cm) auger samples over the project, the controlled excavation of 55, 50 x 50 cm test pits and extended auguring of 25 test pits to depths of 2.5 meters or more. Archaeological research also focused on gathering background information on local and regional prehistoric settlement systems. The overall goal of the archaeological research was aimed at the location of both prehistoric and historic resources within the study area. Intensive (locational) survey research failed to locate prehistoric resources of any kind. Historic resources were found dating from the late 19th to 20th century. These materials include glass, ceramics, metal, coal and shell, all materials consistent with what is commonly referred to as field trash or generally ephemeral use of the area. Historic period materials were not considered significant. More important than artifactual remains, however, is the fact that dune sand covers the entire Parcel 96 area. These soils have been documented to depths of 8.2 to 9.18 feet below surface in the house site area. It is unlikely house construction will impact any historic or prehistoric resources, if they exist. Future house construction can proceed as planned providing construction impacts are limited above the 96 ft. contour. In addition, the prospective buyer has agreed to allow the archaeologist to be present during foundation excavations to obtain auger sam-

ples which may document the depth of culture bearing strata and provide information on dune formation.

25-1153 Loparto, Leonard W.

1992 Archaeological Intensive Survey of Project Area I Phase I and proposed Sewer Easement at Lot 3 of the Plimptonville Trust Property, Walpole, Massachusetts. 85 pages.

An intensive (locational) archaeological survey was conducted for Project Area I Phase I and a proposed sewer easement, both contained within the Plimptonville Trust Lot 3 property in Walpole. The study focused on potential prehistoric and historic cultural resources identified during an earlier reconnaissance survey of the Plimptonville Trust property (see report #25-1133). The present study represents the first of three recommended archaeological surveys and three phases of development for the Lot 3 area. Background research, a walkover survey, and hand (shovel) excavation indicated the presence of two prehistoric sites on the property. The Creek site contained a Laurentian component indicated by a broken Otter Creek projectile point (6,000-4,500 BP) and a biface tip. The Heather Lane site contained 5 fragments of chipping debris. Both sites were determined to represent limited evidence of prehistoric activity and were not considered significant. Since both the prehistoric and historic activities encountered lacked National Register significance, no further archaeological or historic studies were recommended.

25-1154 Hoffman, Curtiss

1992 Westborough State Hospital Sewer Project Archaeological Intensive Survey Draft Final Report. 94 pages.

This survey has documented preliminary horizontal parameters for an area of maximal cultural significance. To the southeast and to the west of this area, it was recommended that the project may proceed without further archaeological investigation being necessary. This is primarily due to the degree of historic period disturbance of this area. Prehistoric cultural materials were recovered from most of the units in these areas, but they were limited to the topsoil, which has either been plowed or landscaped. No features or other subsoil materials were recovered from these areas. The above conclusions have established that the Chauncy Pond site delineated by these boundaries contains considerable research potential. It was the judgment of the Principal Investigator that the recoveries warrant further study at the level of site investigation, to determine whether or not the site was of sufficient significance to be nominated to the National Register. Consequently, it was recommended that the proposed sewer line be relocated away from the open field area so as to avoid adverse impact to this important and complex prehistoric site. Given the findings in both the northern and southern lines, no other alternatives to the present alignment would be likely to successfully avoid the site. In the event that avoidance was not possible, the Principal Investigator recommended that a site examination be undertaken in the 150 m of the transect which holds the highest potential for recovery of cultural resources. Evaluation of the results of the intensive survey by the MHC, however, determined that the site lacked integrity.

25-1155 Hamilton, Christopher E., James R. Reedy, Jr. and Kenneth J. Kinkor

1988 The Final Report of Archaeological Testing, Whydah Shipwreck Site WLF-HA-1, Cape Cod, Massachusetts. Volume 1, 419 pages, Volume 2, 39 pages, Volume 3, 123 pages.

Archaeological testing has been conducted on the pirate vessel Whydah wreck site. Twenty-three test units were either wholly or partially excavated to assess site boundaries, integrity, and significance. The results of the test excavations indicate the site's location. The site boundaries include an area of approximately 24,000 sq ft (2230 sq m) in a roughly trapezoidal shaped pattern. Site integrity was found to be good, given that the high energy coastal environment has caused the mixing and settling of heavy artifacts on a clay and cobble strata to depths up to 16 ft (5 m) or more below shifting sands. Lighter artifacts have been carried away and dispersed by these forces. Site

significance remains high. This is due to the type of artifacts remaining at the site, and their historic association with important individuals and events in American history. It was recommended to continue excavations following an approved data recovery program for the Whydah site.

25-1156 George, Douglas C.

1987 Interim Report on the Archaeological Survey of Plimoth Plantation Lands. 31 pages.

An intensive survey and preliminary site examination was conducted to determine if construction was possible in certain Plimoth Plantation land holdings. The results indicated that a scatter of both prehistoric and historic materials exist across the field proposed for parking. A preliminary site examination followed this survey and resulted in the identification of only a portion of the field as having undisturbed, subsurface remains. The remainder of the field produced only artifacts thinly scattered throughout the field and only from the plowzone. Testing also demonstrated that the R.M. site segment worked on by Hornblower and others in the 1940s has been completely excavated, and that few materials remain. Based upon the results of the survey and preliminary site examination it is recommended that plans for use of the western portion of the field for a parking lot be allowed to proceed. The portion of the site which appears to still have intact archaeological features lies to the east of the baseline, from about 15 m north to 70 m north. It was recommended that this portion of the field be clearly marked by a fence and that it be preserved as an archaeological site.

25-1157 Jones, Donald G. and Nancy S. Seasholes

1992 Phase II Site Examination of a Shaker Village Foundation in Segment 2X of Tennessee Gas Pipeline Company's Northeast Settlement Expansion Project in Tyringham, Massachusetts. 82 pages.

A site examination was conducted on the structural remains of a Shaker village building in Tyringham. A stone foundation and earthen berm were identified during a Phase I survey. The site examination was designed to evaluate the extent and integrity of the archaeological remains at the site and to establish the building's date of construction, function, and association with the Shaker settlement. The Tyringham Shaker settlement has been listed in the National Register since 1987; the archaeological potential of the Shaker settlement is considered to contribute to the significance of the district. Background research for the project indicated that the structure may have been a seed house that was built during the Shaker occupancy of the settlement, although there was no specific documentation of this structure. The field investigations, which consisted of field survey and mapping the excavation of 14 test units (shovel test pits and hand-excavated units), identified a brick floor on the interior of the structure under which lay a terracotta pipe and on the exterior evidence concerning the techniques employed in the construction of the foundation. No ancillary structures or associated archaeological deposits were identified in the hay field surrounding the site. Based on the results of the site examination, the structural remains are considered to be those of a facility for the drying or processing of agricultural products, such as dried sweet corn or seeds, both of which are known to have been undertaken by the Tyringham Shakers. The structure was probably built prior to 1860, although its exact date of construction could not be determined. It probably served the Tyringham Shakers until the settlement was closed in the 1870s. The structure was probably left to fall to ruin and by the l920s had reportedly fallen in. It was subsequently removed. The site is considered to have a high degree of archaeological integrity and is considered to be significant and eligible for inclusion in the Tyringham Shaker Settlement Historic District. Therefore, it is recommended that the site be avoided during construction. If avoidance is not possible, then a Phase III data recovery operation should be considered (see also Reports #25-1159, 1185-1187, 1192, and 1219).

25-1158 Cross, John R.

1992 Intensive (Locational) Survey of the Hamlet at South Natick, Natick, Massachusetts. 55 pages.

An intensive (locational) archaeological survey was conducted in Natick on a 36.44 hectare (90 acre) parcel of land for the Hamlet at South Natick, a 60-unit subdivision. No prehistoric or historic sites had been recorded for the project area which is located along Contact Period routes that connected Lake Cochituate and the Charles River, which were focal points of settlement for both the prehistoric and historic periods. Two hundred ninety-three 50 x 50 cm shovel test pit locations were proposed, although 34 units could not be excavated because of excessive slope or the presence of bedrock at the surface. The 259 excavated units were predominantly systematic units (transects or blocks), with smaller numbers of judgmental/random-cluster units and bracketing units. Two prehistoric sites were identified in the project area, one of which included flakes, a bifacially-worked core, and calcined bone fragments. The report includes the recommendation that further work be undertaken at this site. No subsurface historic artifacts or features were found in the project area that predated the mid 19th century. Undated surface features included stone walls, piles of stone, and three log frames of apparently recent construction.

25-1159 Macomber, Gerald M.

1992 Archaeological Site Examinations of Seven Prehistoric Sites in Proposed Segment 2X of Tennessee Gas Company's Northeast Settlement Project – Phase II in Lee and Tyringham, Massachusetts. 215 pages.

Archaeological site examinations were conducted at seven prehistoric sites in Lee and Tyringham. The Phase I survey of Segment 2X was conducted in 1990 and 1991 (see Report #25-1192). The Phase II site examination of the McDermott Site recovered a narrow side-notched projectile point suggesting that the site dates to the Late Archaic period and may have been a small, temporary, short-term occupation site with an undetermined function. No further archaeological investigations were recommended. The first of these, The Gully Site (19-BK-145) was comprised primarily of a low-density scatter of artifacts on the surface and in the plowzone. The archaeological integrity is, therefore, questionable and the site's function remains unclear. A narrow side-notched projectile point was recovered from the surface suggesting that it also dates to the Late Archaic period. No further archaeological investigations are recommended. The Turtle Site (19-BK-146) is situated on a knoll overlooking the floodplain of the Housatonic River and its confluence with Hop Brook in Lee. The site integrity of the Turtle Site is considered to be good since much less erosion has taken place here than at the Gully Site. Although the Turtle Site contained mostly lithic debitage, several in situ prehistoric cultural features, most likely hearths or roasting pits, were encountered. Charcoal samples obtained from three of the features were radiocarbon dated to between 3,480 ± 80 years B.P. (Beta-4671l) to 4,460 ± 100 years B.P. (Beta-467l0). It is possible that the Turtle and Gully sites are parts of a single, larger site but the disturbance of the Gully Site by plowing and erosion does not validate this conclusion. A Phase III data recovery is recommended if avoidance of the site is not possible. Hop Brook #1 (19-BK-l47) and Hop Brook #2 (l9-BK—148) are situated immediately southeast of the Turtle Site. The archaeological integrity of both sites is poor because of their low elevations which made them prone to periodic flooding. Three pieces of prehistoric pottery were found at the Hop Brook #1 Site, including a sherd similar to Cayadutta Incised pottery, which is associated with the Late Woodland period in eastern New York. No other prehistoric material was recovered. A low-density scatter of lithic debitage, mostly of gray to dark gray cherts, and prehistoric ceramic fragments were recovered from Hop Brook #2. It is possible that these two sites were contemporaneous but the lack of archaeological integrity and comparable diagnostic artifacts make this only an observation. No further archaeological investigations were recommended. The Hale's Terrace Site (19-BK-149) consists of a low-density, wide scatter of prehistoric material, in an area measuring approximately 750 square meters. Lithic flakes and angular waste predominate but implements of chert, argillite, and felsite suggest that the site served as a locus of the manufacture/modification of stone tools utilizing a variety of lithic materials. Most of the artifacts were recovered from the plowzone indicating archaeological integrity is poor. No diagnostic artifacts or cultural features were found and thus cultural/temporal associations are

unknown. No further archaeological investigations were recommended. Site 19-BK-151 appears to be a small site with two activity loci. A base fragment of a broad stemmed projectile point was recovered from one of the excavation units in Locus 1. The archaeological integrity of this locus was poor because of disturbance from past pipeline construction and subsurface animal and root action. Locus 2 contained a higher density of artifacts and several projectile points, drills, drill preforms, and two broad stemmed projectile points. The subsurface integrity of the site in Locus 2 was better than in Locus 1. The site examination indicated that the vertical boundary of the site does not extend much deeper than approximately 40 cm below the surface. The diagnostic projectile points suggest that the site probably dates to the later part of the Late Archaic period. The closest correlates are those characteristic of the Snook Kill phase (ca. 3,500-3,000 B.P.) of the Hudson Valley and Atlantic-like points of eastern Massachusetts. Site 19-BK-151 is considered to be a single component, Late Archaic site with two activity loci that may or may not be contemporaneous. Due to the disturbed conditions of Locus 1, it is unlikely that additional archaeological testing would contribute a significant amount of information relating to the site's function or time of occupation. Therefore, no additional archaeological testing was recommended. Further archaeological study at Locus 2, however, may provide information on a variety of topics related to the prehistoric occupation of Tyringham, specifically, and to the upper Housatonic River Valley in general. Therefore, a Phase III data recovery was recommended if avoidance was not possible. In summary, of the seven potentially significant prehistoric sites identified, two sites--the Turtle Site in Lee and Site 19-BK-151 (Locus 2) in Tyringham--were recommended for Phase III data recovery operations if they cannot be avoided (see also Reports #25-1157, 1185—1187, 1192 and 1219).

25-1160 Edens, Christopher, Leith Smith, Jane Carolan and Michael Roberts

1990 Intensive Archaeological Survey of the Proposed East Groton Village, Groton, Massachusetts. 33 pages.

The project area as a whole was judged as presenting a low potential for prehistoric sites. As a result of the walkover reconnaissance, several historic period charcoal kilns were identified. Archaeological testing provided a preliminary documentation of kiln structure, and also of the ancillary buildings that often accompany this activity. The artifacts found in the tested kilns and other features and structures were insufficient to date the sites. Should the project proceed, additional background and historical research and subsurface testing were recommended. A research design for the site examination was developed and outlined in the report.

25-1161 Bunker, Victoria and Brenda Bowser

1989 Cultural Resources Inventory and Evaluation at Two Alternative GWEN Sites in Westport, Massachusetts: The Nisby and Nardelli Sites. 17 pages.

An environmental assessment analyzing five alternative sites in southern Massachusetts and Rhode Island for construction and operation of a U.S. Air Force communication facility is being prepared. Two of the alternative sites are located in Massachusetts, the Nisby and Nardelli sites, both in the town of Westport. A reconnaissance study of the Nisby and Nardelli sites was conducted to determine the need for a Phase I intensive survey and Phase II evaluation of cultural resources at each site (see Reports #25-857 and 25-1030). Historic resources, including remnants of stone walls, old sheds, and small trash dumps were located and mapped. The reconnaissance study determined that most of these resources were not significant. The historic resources that were determined to be potentially significant would be avoided through project design. Therefore, no further inventory or evaluation of historic resources was recommended. The reconnaissance study determined that there was a low potential for buried prehistoric archaeological resources at the Nisby site and a moderate potential for prehistoric resources at the Nardelli site. Both sites were considered slightly sensitive because they were located on the east-facing slopes of ridges within 1/4 mile of wetlands. Prehistoric archaeological sites have been recorded in similar topographical situations in the region. Furthermore, a cemetery of possible Native American origin was reported to exist on the parcel adjacent to the Nardelli site, raising the possibility that an associated burial

or cemetery might be present on the Nardelli site. Therefore, subsurface testing was recommended to determine the presence or absence of prehistoric resources at each site.

25-1162 Holmes, Richard D., Elena L. Filios, Ellen-Rose Savulis, Mitchell T. Mulholland, Carolyn T. Hertz and David J. Bernstein

1992 Site Examination of Five Sites in Segment 8, Northeast Settlement Project, Worcester County, Massachusetts. 198 pages.

A site examination of one historic mill site (SUT-HA-l1) and four prehistoric sites in Sutton, Northbridge, and Upton was conducted. The sites are along a proposed pipeline route of Segment 8, Northeast Settlement Project. The King/Trudell/Metzger site (19-WR-520) is a small prehistoric work area. The Mahoney/Blackstone Terrace (19-WR-521) is a small prehistoric work area. The Fowler Street Rockshelter/Quarry (l9-WR-522) is a resource-extraction area. The Pratt Hill site (l9-WR-523) is a small prehistoric camp near an upland wetland. Brewerton points (5000 to 4000 B.P.) were found at l9-WR-522 and 523; Small Stemmed III point (5000 to 400 B.P.) was found at l9-WR-522. Except for the King/Trudell/Metzger and Pratt Hill sites, all may be eligible for listing in the National Register. Site avoidance was recommended for SUT-HA-11, 19-WR-520, at 19-WR-521 within the proposed work limits (see also Reports #25-1165 and 1195).

25-1163 Kennedy, Veronica, Chris Edens, Elena Decima and Cornelia Burr

1991 Reconnaissance Survey for Approximately 7.2 miles of Transmission Line Right-of-Way in the Towns of Carver, Middleborough, and Rochester, Massachusetts. 33 pages.

The presence of water bodies is a primary factor in determining site location, according to most of the locational models analyzed, and was so considered in the determination of archaeological potential for the project area. Slope is irrelevant in the study area, the topography being virtually flat. Soils, though important, were considered secondary factors. However, one of the aspects that was given close attention by the survey was soil typology and its association with sites, since it appears that the combination of soil type and proximity to water may actually act as a single variable in determining site location. Interwoven with the above-mentioned parameters is the presence of archaeological sites or archaeological find spots, which were also considered primary factors in the archaeological sensitivity ranking. With those assumptions in mind, an ordinal ranking was established for prehistoric sites: a) no potential, b) low potential, c) medium potential, d) high potential, e) very high potential. A similar stratified historic ranking was devised for the determination of intensity of testing in relation to the potential for locating historic sites. The criteria used to define this scale of intensity of testing corresponds to the presence or absence of historic finds, as well as to the known historic remains in the areas in question. On the basis of the above ranking, a stratified intensive survey for the COMElectric ROW was recommended.

25-1164 Glover, Suzanne and Kevin McBride

1991 Intensive (Locational) Archaeological Survey, Parcel 1, Tribal Trust Lands Gay Head, Massachusetts. 66 pages.

An intensive archaeological survey was conducted at the site of a proposed multipurpose building on tribal trust lands in Gay Head, Massachusetts. The project area encompasses an 8.77 acre plot of land situated within Parcel 1 (59.79 acres) of tribal trust lands. The archaeological investigations were conducted under contract with the Wampanoag Tribe of Gay Head (Aquinnah). The walkover survey and background research located and identified an historic structural complex immediately west of the project area within Parcel 1. The complex includes probable dwellings, animal pens, a barn, and stone walls. This complex may be related to a Gay Head Indian homestead identified on 19th and 20th century maps. The structures and associated field system are assessed as significant cultural resources with a strong likelihood for related significant archaeological deposits. In order to protect these resources from inadvertent disturbance during construction,

it is recommended that a temporary construction fence be erected along the western and northwestern boundaries of the project impact area prior to the start of construction. If future development in this section of Parcel 1 is planned, intensive survey and site examination investigations would be necessary to identify and evaluate the resources. The subsurface testing aspect of the survey conducted within the delineated 8.77 acre project area recovered a low-density scatter of chipping debris and a few historic/modern cultural materials, some of which came from a disturbed context. These cultural materials lack sufficient context and information to make the 8.77 acre section of Parcel 1 eligible for inclusion in the National Register. No additional investigations were recommended.

25-1165 Mulholland, Mitchell T., Richard Douglas Holmes, David J. Bernstein and Elena Filios

1991 Archaeological Site Locational Survey of Segment 8, Northeast Settlement Project, Worcester County, Massachusetts. 137 pages.

An archaeological site locational survey was conducted in Sutton, Northbridge and Upton, Massachusetts. The survey consisted of the excavation of 718 shovel test pits in 23 survey areas and four randomly selected survey areas. Four intact prehistoric sites, five low-density prehistoric findspots and three historic sites were found. Site avoidance, or if this was not possible, site examinations were recommended for the four prehistoric sites and the two historic sites to determine their eligibility for inclusion in the National Register (see also Reports #25-1162 and 1195).

25-1166 Leveillee, Alan

1983 Fieldwork Summary Report, Reconnaissance and Intensive Archaeological Survey of Proposed Road Corridors Within the Downing Parkway, Pittsfield, Massachusetts. 15 pages.

The reconnaissance survey fieldwork indicated that the project area has undergone some major disturbances in the recent past. Of a potential 297 stations to be tested only 63 were not radically altered. Of the 63 test pits that were excavated 20 had disturbed profiles and 7 were wetland, muck profiles. Considering the stations that were disturbed most of the proposed corridors have undergone severe alteration (including gravel pitting, existing roads, landfill and building activity). Among those stations that were not radically altered 14 were altered by agricultural activity. No cultural materials predating the mid-20th century were recovered from the excavated test pits. A surface investigation of the reported site area was conducted in an attempt to document its present condition. No surface evidence of the reported site existed. The sandy knoll where cultural material was recovered in 1977 continues to be affected by bulldozing and dumping activity. The area is wind blown with little vegetation present. Plastic parts, slag, and refuse associated with General Electric Facilities dominate the landscape. Based upon the information gathered during the reconnaissance stage of planned investigations, fieldwork did not progress to the intensive survey level. It was recommended that no further archaeological investigations be conducted within the proposed corridor locations.

25-1167 Pendery, Steven R.

1991 Archaeological Testing at Brook Farm. 87 pages.

Archaeological testing at Brook Farm (West Roxbury/Boston) indicated that the archaeological potential of the property is high for at least five of its most significant periods of use: 1) prehistory, 2) the colonial and federal period dairy farm, 3) the Brook Farm utopian period of the 1840s, the Roxbury almshouse of the early 1850s, and 4) the Martin Luther Orphanage period, from 1871 to 1948. The site potentially contains remains for its use as Camp Andrew in 1861, but no specific archaeological evidence for this was revealed during this survey. The parade ground and campground is today occupied by the site of the Gethsemane cemetery. The northwestern portion of the property was sampled by the excavation of 83 test pits. More than twenty test pits were excavated in other locations. One prehistoric site and eleven historic period sites were identified. Specific

recommendations have been made for intensive testing at each site to address specific research questions. More general recommendations include the following. First, that thematic sets of sites be identified and intensively tested which address significant research problems at Brook Farm. Secondly, the public significance of Brook Farm cannot be overemphasized. Public involvement in research activities has been essential in the past and inevitable in the future. In addition to the cost benefits to the MDC, public involvement means public support for the site and public awareness of the importance of the natural and cultural resources of the greater Boston area and the public agencies which protect them.

25-1168 Largy, Tonya

1982 Surface Collection vs. Excavation A Controlled Study at the Watertown Dairy Site. 28 pages.

This report outlines the land use history of the archaeological site, and compares the results of a controlled surface collection and limited excavations. It is possible that Woodland components of archaeological sites are underrepresented in surface collection because of problems with recognizing prehistoric ceramics during surface reconnaissance.

25-1169 Bower, Beth Ann, Jane Carolan, Herb Heidt and Leonard Loparto

1987 MBTA/Charles Connector Project Contract No. X2PS39, Boston, Massachusetts: Archaeological and Historic Resources Report. 77 pages.

The archaeological and historic resources survey examined the potential for significant, intact archaeological resources within the project limits and identified and inventoried the historic structures in and adjacent to the project area. The historic resources portion of the study concludes that while Cambridge Street has bordering it examples from each period of West Boston's growth, none of the newly inventoried buildings retain a necessary level of integrity to constitute a significant structure by federal, state, or local criteria. The project will cross the boundaries of the Charles River Basin Historic District and will significantly impact the existing Charles Station. This report determines that the Charles Station is not a contributing structure to the Charles River Basin Historic District, as it lacks integrity of design, setting, workmanship and feeling. It is recommended that further studies of the impact of project construction on the adjacent significant structures and districts listed above be undertaken in conjunction with geotechnical and engineering studies. The study of potential archaeological resources within the proposed Bowdoin/Charles Connector project limits concludes that significant archaeological resources could be associated with all periods of prehistoric occupation, the federal period West Boston community, the 19th century African-American community and the late 19th and early 20th century immigrant communities. A review of existing conditions, soil boring information, and historical data indicates that the construction of wharves, pile-supported buildings, sewers and other utilities, and the Blue Line tunnel has destroyed any potentially significant archaeological resources. No further archaeological testing is recommended for the project limits. However, the research indicated that the area of Lindall Place and the city park at the corner of North Anderson and Cambridge Streets may contain potentially significant archaeological resources such as 17th century wharf structures and 19th century African-American components. Any subsurface work in these areas should be preceded by an archaeological testing program. In addition, should work related to the identification or stabilization of adjacent standing historic structures be undertaken, these activities should be coordinated with additional archaeological research.

25-1170 Hoffman, Curtiss

1990 North River Archaeological Project, 1990 Season, Transect VI – Pembroke Preliminary Report. 60 pages.

A total of 35, 1 m units were opened, all but three of which were completed. Prehistoric cultural

materials were found in all but one of these. Historic cultural materials were found in 17 units, 12 of which were within 10 m of roads. Only two of the 18 units lacking historic materials were within 10 m of roads. Investigation of Transect VI has produced a body of information which should be useful to planning agencies in predicting site locations in pondside locations throughout the North River drainage and beyond. It was hoped that intensive study of the more productive loci in the future could be geared toward more specific research questions generated as a result of this research.

25-1171 Kenyon, Victoria

1987 Archaeological Resource Potential, Merrimac Hat Factory, Amesbury, Massachusetts. 15 pages.

Archaeological study has revealed that the Hat Factory location had a high likelihood for utilization by prehistoric peoples. Two areas within the proposed factory development plan may contain intact surfaces where remnants of earlier habitation could be found. These are the lawn in the east side of the parking lot and the terrace underneath Building 12. However, both locations offer certain restrictions for data collection. The lawn may have been landscaped or subject to fur felt dumping. Mercury contamination here makes field testing hazardous. The terrace beneath Building 12 may have been modified by building construction or filling as seen in Merrimac Street. Access to this surface is impossible as long as the building still stands. Study has also revealed the low probability for discovering historic period archaeological remains at the Hat Factory location. Only one area may have structural remains below ground. This is the location of a car shed beneath pavement. A shed, functioning as an ancillary building, is unlikely to contribute information on the operation of the factory or its role in local and regional history. Further, the car shed location appears to have been modified by filling and paving which restrict data collection. Because of the difficulty of conducting field testing at the Hat Factory, no subsurface archaeological sampling was recommended at this time. Construction monitoring of the lawn on the east side of the parking lot and the terrace beneath Building 12 might be considered. Monitoring would provide an opportunity to verify use of the locale during prehistory and test predictions made from background research, which would be useful for future surveys in similar areas. However, because of severe landscape modifications, the context of any prehistoric finds in the lawn or underneath Building 12 would be extremely difficult to interpret. Similarly, no sampling was recommended for historic period remains at this time. While shed remains may be encountered beneath the parking lot, it was believed that archaeological methods would not provide as much useful data on building function as documentary sources would (e.g. historic photographs). Because archaeological remains datable to the historic period are believed to be underrepresented at the Hat Factory, no further survey was recommended.

25-1172 Lucking, Laurie, Ellen-Rose Savulis and Mitchell T. Mulholland

1987 Archaeologica1 Locational Survey in the May Hollow Area, Agawam, Massachusetts. 56 pages.

The Phase IV Sewer Project that is proposed for the West Agawam/Feeding Hills Area lies in a region known to have been exploited by Native Americans for more than 10,000 years, and by European settlers since 1636. The project area lies on terraces east of Provin Mountain, within 1,000 feet of the Westfield River. Three prehistoric sites are recorded near this area. Seventy-eight shovel test pits were excavated in the project area. No significant archaeological or historical evidence was found. During the survey, two prehistoric findspots (each containing one lithic flake) were found, and a recent barn foundation was also located. The survey did not reveal sites that are eligible for listing in the National Register. No further archaeological survey was recommended.

25-1173 Mrozowski, Stephen and Edna Feighner

1991 Phase I Intensive Archaeological Survey, East Brookfield/Cottage Street Bridge #E-2-6, East Brookfield, Massachusetts. 47 pages.

Based on the results of the intensive survey no further archaeological examination is recommended. The lack of eligible standing structures in the project area precludes any necessity for above-ground resource documentation. The continuous reuse of mill structures and their subsequent destruction from fire, a 1955 flood, and subsequent construction has left little of what was, during the late 19th century, a thriving manufacturing complex. Due to the level of destruction and disturbance it is unlikely that the resources in this area would meet the criteria for nomination to the National Register as a district.

25-1174 Jones, Donald G., Ellen P. Berkland and Claire C. Carlson

1991 Archaeological Study of the Assawompsett/Quittacas Pond Complex in Lakeville, Middleborough, Rochester, and Freetown, Massachusetts. 191 pages.

The study was designed as a comprehensive archaeological survey of the land around Assawompsett, Pocksha, Great Quittacas, and Little Quittacas ponds, which comprise the watershed for the public water supply for the City of New Bedford. The primary goal of the study was to develop a management and protection plan for cultural resources located in the watershed. Specific goals of the project were to identify known and expected archaeological sites in the watershed and conduct a limited field assessment of those areas, to identify the type and extent of problems affecting identified resources, and to formulate management recommendations for the protection of identified resources. The resulting archaeological resources management plan will be used by the City of New Bedford in coordinating various aspects of the overall management of the watershed to avoid disturbing or disrupting archaeological sites. The management plan presents a land use history of the watershed and defines the archaeological potential of various portions of the watershed. The report describes the archaeological potential of various portions of the watershed and the potential threats to archaeological sites including erosion and inundation from water level fluctuation, tree and land maintenance activities, pressures from development, and site vandalism. A summary of the existing protection mechanisms, including a review of federal, state and local preservation legislation and New Bedford Water Board policies, is also presented. A field reconnaissance was conducted to investigate each recorded site area and to identify previously undocumented sites on the basis of background research and surface evidence. The results of the reconnaissance are presented by dividing the watershed into ten sections. A total of 21 prehistoric sites and 32 historical sites were identified. These sites are distributed around the entire watershed. Areas that were previously disturbed were also identified. A review of cultural resource management plans of publicly owned lands and preservation programs for sites on private land was conducted to provide comparative information and approaches. Management recommendations are divided into general recommendations for the entire watershed and specific recommendations for individual sites and potential site areas. The recommendations also include a variety of approaches to protecting the recorded and potential site areas, including erosion control measures, restricting timbering activities, increased monitoring and restricted access to sensitive locations and passive recreational use for less sensitive locations to encourage public participation and appreciation of the watershed's natural and cultural resources.

25-1175 Macomber, Gerald M.

1991 Intensive Archaeological Survey of the Proposed Wastewater Treatment Facilities Project at Otis ANG Base in Bourne and Sandwich, Massachusetts. 53 pages.

An intensive archaeological survey of proposed wastewater treatment facilities at the Otis Air National Guard (ANG) Base on the Massachusetts Military Reservation in Bourne and Sandwich was conducted. The proposed project will include the construction of an infiltration basin system, a pumping station/wet well, and approximately 50,000 feet of force-main pipeline to connect the pumping station to the infiltration basin system. The survey was limited to the construction impact

area of the proposed force-main pipeline and infiltration basin system. Plans for the construction of the pumping station/wet well were not finalized at the time of the survey. Background research indicated that no prehistoric sites were recorded within the project area but several sites are recorded in its immediate vicinity. Archaeological sensitivity was considered to be moderate to high. Historical background research indicated that the area was used minimally and primarily for agricultural purposes and sensitivity for historical sites was low. Twentieth-century construction of electrical transmission lines and of roads associated with the Massachusetts Military Reservation has caused surface disturbance throughout much of the project area. During the field reconnaissance, prehistoric artifacts, including three projectile points or fragments and a biface preform were recovered from the surface. Historical material noted during the reconnaissance included bullet shell casings, rations packaging, and bottle fragments which can be associated with recent military activities. Based on the background research, field reconnaissance, and topographical and environmental variables, 25 areas were selected for subsurface testing. During the testing, a total of 361 shovel test pits, including seven bracket units, were excavated. Nine historical and prehistoric artifacts, including a point base fragment, were recovered from six of the shovel test units. None of the recovered artifacts are considered to represent significant archaeological deposits. As a result, no further archaeological investigations are recommended for the infiltration basin system area and the force-main pipeline. However, that section of the project area to be used for the construction of the proposed pumping station/wet well must be surveyed for archaeological sensitivity when the plans for this portion of the proposed wastewater treatment facilities are finalized (see Report #25-1210).

25-1176 Jones, Donald G., Gerald M. Macomber and Nancy Seasholes

1992 Intensive Archaeological Survey of Temporary Work Spaces for Tennessee Gas Pipeline Company's Westfield Delivery Line for the Massachusetts Lateral Replacement Project in Westfield, Massachusetts. 33 pages.

An intensive archaeological survey was conducted of three proposed temporary work spaces for the Westfield Delivery Line in Westfield. The survey consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. The background research indicated that no prehistoric or historical sites were recorded within the proposed temporary work spaces, but the potential for undocumented sites was considered to be moderate to high. Field investigations consisted of the excavation of 20 shovel test pits. No prehistoric artifacts were recovered and only a small amount of historical artifacts were retrieved; most of the historical artifacts were recovered from the topsoil. None of these materials were associated with any historical structures or features and were not considered to be potentially significant. No further archaeological investigations were recommended.

25-1177 Jones, Donald G., Gerald M. Macomber and Nancy S. Seasholes

1992 Intensive Archaeological Survey of Temporary Work Spaces for Tennessee Gas Pipeline Company's Clinton Delivery Line for the Massachusetts Lateral Replacement Project in Bolton, Lancaster and Clinton, Massachusetts. 71 pages.

An intensive archaeological survey was conducted of five proposed temporary work spaces for the Clinton Delivery Line in Bolton, Lancaster and Clinton. The survey consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. The background research indicated that no prehistoric or historical sites were recorded within the proposed temporary work spaces, but the potential for undocumented sites was considered to be moderate to high. Field investigations consisted of the excavation of 42 shovel test pits. One prehistoric site was identified in TWS #1 and substantial deposits of late 19th to 20th century artifacts were identified in TWS #5. The prehistoric site (TWS #1) was considered to be potentially significant, and should be avoided during construction. If avoidance was not possible, then a Phase II site examination should be conducted. The historical deposits in TWS #5 were not considered to be potentially significant and no further archaeological investigations were recommended for this area. No further archaeologi-

cal investigations are recommended for TWS #2, #3, and #4.

25-1178 Berkland, Ellen P.

1992 Results of an Archaeological Site Examination of the Wetland Terrace Site (19-MD-689) in Proposed Segment 3X of Tennessee Gas Pipeline Company's Northeast Settlement Project – Phase 2 in Hopkinton, Massachusetts. 16 pages.

This report presents the results of an archaeological site examination of the Wetland Terrace Site (19-MD-689) in Segment 3X of Tennessee Gas Pipeline Company's (TGP's) Northeast Settlement Project – Phase 2 (NEX) in Hopkinton. Fieldwork for the site examination was undertaken in April of 1991. During the Phase I archaeological investigation of Segment 3X (Upton – Hopkinton) a prehistoric site was located in one segment of Area 8 (see Report #25-1192). A total of six prehistoric artifacts were recovered at this site from three shovel test pits. One gray felsite decortication flake and four milky quartz flakes were located in the B-horizon. One milky quartz flake was located in Level 1 of a test pit. The Phase II investigation consisted of the excavation of 41 shovel test pits (TP 341-389) and 5, 1 x 1 m units, which were judgmentally placed within the site area. During the site examination, no prehistoric artifacts were recovered. One whiteware vessel fragment was recovered from Level 1 of TP 380. No prehistoric artifacts were recovered during the Phase II site examination at the Wetland Terrace Site in TGP's NEX Segment 3X in Hopkinton. The site located during the Phase I investigation is not considered to be eligible for the National Register. No further archaeological investigations were recommended.

25-1179 King, Marsha K. and Ann K. Davin

1991 Archaeological Site Examination of the Parker Lombard House, West Barnstable, Massachusetts. 248 pages.

An archaeological site examination was completed within an eight acre project area in West Barnstable containing the Lombard Home Site (MHC #BAR-B-61), an almshouse site used from 1769 to 1971. The site examination methodology combined extensive documentary research with subsurface archaeological testing. The extensive documentary research was conducted in order to place the site's archaeological record within an appropriate historical framework. The documentary research included: creation of a chain of title for the property; examination of town and state records relating to care of the poor, specifically within Barnstable and the Lombard Home; and general information relating to the history and development of the town of Barnstable and village of West Barnstable. Archaeological field investigations included the excavation of 50 cm x 50 cm test pits along 14 transects, and of nine judgmentally placed 1 m x 1 m excavation units. Analysis of the historical cultural material, soil profiles, and other information collected during the fieldwork demonstrated that archaeological resources at the Lombard Home Site were confined almost exclusively to reflection of structural construction, alteration, and demolition dating to the period ca. mid 1800s to 1970. Few archaeological deposits and/or features were identified which relate to the late 18th to mid 19th century almshouse occupation at the site. No further archaeological investigations were recommended at the Lombard Home Site.

25-1180 Mulholland, Mitchell T., Richard Douglas Holmes and Carolyn D. Hertz

1991 Archaeological Site Locational Survey and Site Examinations of Prehistoric Sites on Helol Brook, Gill, Massachusetts. 132 pages.

An archaeological site locational survey was conducted in Gill for a proposed housing development. Three prehistoric sites were found during the survey: the Gaida Garden site (containing a possible Greene-like point), the Yukl Field site (containing a Meadowood point and ceramics) and the Yukl Pond site (containing Susquehanna Tradition artifacts, a Small Stem point, a Squibnocket point and ceramics). Subsequently, site examinations were conducted on the three sites to determine their eligibility for inclusion in the National Register. Two of the sites, the Yukl Field site

and the Gaida Garden sites were found to be too disturbed to qualify for eligibility. The Yukl Pond site, divided by Helol Brook, appeared to be intact and yielded a high artifact density with features. The site appears to be eligible for the National Register. It was recommended that a preservation restriction be implemented to protect the northern part of the site and to avoid this area during construction. The southern portion of the site, south of the brook, is located within an access road required by the proposed housing development. A data recovery is recommended for this portion of the site.

25-1181 Leveillee, Alan and Ronald Dalton

1990 An Intensive Archaeological Survey, Rogers Property Recreational Facilities/Senior Center, Westborough, Massachusetts. 33 pages.

The project area encompasses approximately 52 acres on the northwestern edge of the Cedar Swamp Archaeological District which is listed in the State and National Registers. The scope of work proposed for this project includes the construction of a building, an access road, parking lots, sports activity areas, trails, and picnic areas by the Town of Westborough. The survey included background and documentary research followed by a preliminary walkover/surface inspection, and subsurface testing. Although most of the project area was subject to moderate to severe landscape modifications prior to the survey, one fire related feature suspected to be of prehistoric origin was identified. These changes to the landscape have compromised the overall integrity of the project area and limit both the interpretative possibilities of encountered resources and the potential significance of them. It was recommended that the area where the fire-related, pit-like feature was identified be avoided during any planned construction, including the proposed picnic area scheduled for development there. If this locale cannot be avoided further archaeological testing was recommended.

25-1182 Clayton, David E. and Nicole A. Missio

1992 Results of an Intensive Archaeological Survey of a Proposed Metering Station for Tennessee Gas Pipeline Company's Northeast Settlement Project in Danvers, Massachusetts. 29 pages.

An intensive archaeological survey was conducted of a parcel of land for a proposed natural gas metering station in Danvers. The intensive survey consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. No prehistoric deposits and no potentially significant historical deposits were identified during the intensive archaeological survey. No additional archaeological investigations were recommended.

25-1183 Jones, Donald G., Nicole A. Missio, Gerald M. Macomber and Nancy S. Seasholes

1992 Intensive Archaeological Survey of a Proposed Access Road for Tennessee Gas Company's Pittsfield Delivery Line for the Massachusetts Lateral Replacement

Project in Pittsfield, Massachusetts. 28 pages.

An intensive archaeological survey was conducted of a proposed access road for the Pittsfield Delivery Line in Pittsfield. The survey consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. The background research indicated that no prehistoric or historical sites were recorded within the route of the proposed access road, but the potential for undocumented sites was considered to be moderate. Field investigations consisted of the excavation of 16 shovel test pits. One prehistoric quartz flake was recovered from a fill level in one of the test pits. A variety of historical artifacts were recovered; these materials, most of which are modern, are considered to be fill deposits associated with the construction of East Street and the former road bed. Most of the area was found to have been disturbed by the road construction activities. Therefore, neither the prehistoric flake nor the historical deposits were considered to be potentially significant. No further archaeological investigations were recommended.

25-1184 Mulholland, Mitchell T., Richard Douglas Holmes and David Bernstein

1992 Addendum Report to Archaeological Site Locational Survey of Segment 12, Northeast Settlement Project, Haverhill and Methuen, Massachusetts. 39 pages.

Survey Area A in Segment 12 was subjected to further testing near the remains of a stone foundation (see Report # 25-994). This structure appears to be a part of a c. 1920 building, and was used as a residence for an estate. Portions of the foundation are damaged, particularly the northern part. Redeposited fill was observed within and near the foundations. Recent debris is located on this site. As the foundation and the surrounding stratigraphy are disturbed, there appears to be little integrity or research potential to this site, and no further research was recommended. Survey Area B contained two lithic flakes. A site form is being completed for the Hawkes Brook Find spot. Given the low density of prehistoric material, no further research was recommended. Survey Areas C and D contained no prehistoric material or evidence of prehistoric or historic archaeological sites. No further research was recommended. The only prehistoric material found during this survey came from Survey Area H. Prehistoric material consisted of eight felsite flakes from four shovel test pits. All but one of these came from the B horizon. No prehistoric features or other artifacts were found in association with these flakes. This area has been identified as the Scotland Hill Prehistoric Find Spot. Because of the low density of prehistoric artifacts and the absence of features, it does not appear that this area has the potential to significantly add to our knowledge about prehistoric occupation of the area. Consequently, no further research was recommended. Historic material found in Survey Areas H, Q, T and U do not suggest the presence of intact historic archaeological sites. The street railway embankment in Survey Area H is heavily disturbed, and no artifacts were recovered in association with it. The depression in Survey Area H does not appear to be a cellar hole, nor does the depression in Area I. No further survey was recommended for any of these areas.

25-1185 Macomber, Gerald M.

1992 Archaeological Investigations of a Proposed Access Road and Expanded Work Area for Segment 2X of Tennessee Gas Pipeline Company's ELGEN Project in Tyringham, Massachusetts. 29 pages.

An archaeological survey was conducted of a proposed access road and an expanded work area for Segment 2X of the Electric Generation Transportation Project (ELGEN) in Tyringham. Previous archaeological investigations near the two project areas were conducted. These investigations identified several prehistoric sites in the immediate vicinity of portions of each of the areas: isolated findspots of prehistoric lithic debitage within 200 m of where the proposed ELGEN MP257+4.8 access road enters the existing TGP right-of-way in ELGEN Sta. 236+82 expanded work area in Tyringham. The project areas, therefore, were considered to have moderate to high potential for the presence of prehistoric cultural remains. Historical background research indicated low to moderate potential for the identification of historical remains. Subsurface testing was conducted at the proposed ELGEN expanded work area; cultural material was found during the testing. No further archaeological investigations were recommended for the expanded work area. In the case of the ELGEN access road, the lease agreement between the landowner and TGP limits the weight of vehicles and/or equipment that can use the road to two tons or less. No grading of the access road will be required. Subsurface disturbance to any archaeological sites that may be present at this location was considered negligible, and no subsurface testing was recommended for the access road (see also Reports #25-1157, 1159, 1186-1187, 1192 and 1219).

25-1186 Macomber, Gerald N.

1992 Intensive Archaeological Survey of a Proposed Access Road for Segment 2X of Tennessee Gas Pipeline Company's NEX Project in Lee, Massachusetts. 27 pages.

An intensive archaeological survey was conducted of a proposed access road for Segment 2X of Tennessee Gas Pipeline Company's Northeast Settlement Expansion Project – Phase 2 (NEX) in Lee. Previous archaeological investigations near the project area identified four prehistoric sites in the immediate vicinity of the project area. The proposed access road was considered to have moderate to high potential for the presence of prehistoric cultural remains. Historical background research indicated low to moderate potential for the identification of historical remains. Subsurface testing was conducted at the proposed NEX access road in Lee. No prehistoric cultural material was found in the any of the 34 test pits excavated. A small amount of historical material was found in 17 of the 34 test pits but none was associated with historical structures or features and the artifacts were considered to be field scatter and not archaeologically significant. No further archaeological investigations were recommended (see also Reports #25-1157, 1159, 1185, 1187, 1192, and 1219).

25-1187 Jones, Donald G. and Ellen P. Berkland

1992 Intensive Archaeological Survey of a Proposed Staging Area and Pipeline Realignment for Segment 2X of Tennessee Gas Pipeline Company's Northeast Settlement Project – Phase 2 in Lee, Massachusetts. 73 pages.

An intensive archaeological survey of a proposed staging area and a pipeline realignment were conducted in Segment 2X of Tennessee Gas Pipeline Company's Northeast Settlement Project – Phase 2 in Lee. During the Phase I survey of the original pipeline route, four prehistoric sites were identified within or adjacent to the proposed staging area and pipeline realignment – the Gully Site (19-BK-145), Turtle Site (19-BK-146), Hop Brook #1 Site (19-BK-147}, and Hop Brook #2 Site (19-BK-148). Phase II site examinations were conducted at these sites. The Gully, Hop Brook #1, and Hop Brook #2 sites were not considered to be significant; the Turtle Site was found to be significant, and it was recommended that if the Turtle Site could not be avoided a Phase III data recovery should be conducted there. The pipeline realignment that is the subject of this report was proposed to avoid the Turtle Site. In addition, a 10-acre staging area was proposed in the vicinity of the Turtle Site; the intensive archaeological survey of this staging area is also described in this report. The survey of the proposed staging area and realignment identified a prehistoric site in the east central portion of the staging area that is considered to be potentially archaeologically significant. No historic features or structures were identified in either the realignment or the staging area. The historical deposits were not considered to be potentially significant. No significant cultural material was found during the survey of the proposed realignment and no further archaeological investigations are recommended for the realignment. It was recommended, however, that a Phase II site examination be conducted at the prehistoric site identified in the proposed staging area if it cannot be avoided (see also Reports #25-1157, 1159, 1185-1186, 1192 and 1219).

25-1188 King, Marsha K., Duncan Ritchie, Edna Feighner and Valerie McCormack

1992 Intensive Archaeological Investigations of the Timber Creek Estates Subdivision and Site Examination of the Elijah B. Hill Farmstead Complex, Billerica, Massachusetts. 181 pages.

The 29 acre project area, site of a proposed 33 lot residential subdivision is located in the southwestern portion of Billerica, north of Dudley Road and west of Nashua Road. The intensive survey field methodology involved a walkover inspection of the ground surface and subsurface testing within areas identified with high to moderate archaeological sensitivity. A total of 138 test pits were excavated within a combination of seven 30 m x 30 m testing blocks, three judgmentally placed test pit transects, and 24 judgmental test pits. One prehistoric find spot and two historic sites were identified. Recommendations of no further archaeological investigation were made for the prehistoric find spot (Timbercreek Locus #1), consisting of a single piece of chipping debris, and for the foundation of a probable early 20th century summer house, identified near Nashua Road at the northern end of the sewer easement. The second historic site identified during the intensive survey (the Elijah B. Hill Farmstead Complex) consisted of three slumped cellar holes, a probable barn foundation, a depression, and surrounding house and barnyards. Historical research

indicated that the structures burned and were abandoned ca. 1860. Comparative research suggested the site could contribute important information on rural domestic/agrarian site of the early to mid 19th century. Because the farmstead complex site could not be avoided during proposed construction a site examination was conducted. A total of 57 test pits were excavated on the site in a ten meter staggered grid pattern along nine transects. Fourteen 1 m x 1 m excavation units were placed in areas of suspected cultural features, yard areas, activity areas, and in areas where high densities of historic cultural material had been noted. The relatively small historic cultural material assemblage recovered consisted of a low density of small fragments. No further archaeological investigations were recommended.

25-1189 Smith, Leith, Elena Decima and Chris Edens

1992 Reconnaissance and Intensive Survey of the Braintree Commerce Center, Braintree, Massachusetts. 70 pages

This study summarizes the results of a reconnaissance survey for an industrial park, which included the assignment archaeological potential to the 89-acre parcel. The land was found to contain a few discontinuous areas of high to medium potential consisting of small knolls overlooking wetlands. Only this series of knolls was recommended for intensive survey. A combination of both documentary and archaeological research failed to identify the presence of either prehistoric or historic cultural resources within the seven-acre Post Office parcel. It was recommended that the construction of the U.S. Post Office Detached Mail Facility proceed as planned. The archaeological investigation around the perimeter of the White Family cemetery found no evidence of burials or any other cultural features outside the cemetery boundaries. Nevertheless it was recommended that if any soil-disturbance or activities take place adjacent to the cemetery, an archaeologist should monitor the work to safeguard against the remote possibility of discovering undetected graves. Documentary research firmly established the cemetery as belonging to the White family of Weymouth from at least 1780 to the 1850s and found it to be one of only a few known family burial grounds in the Braintree/Weymouth area. As a result of the archaeological investigations, it can also be concluded that the site retains considerable integrity, despite a recent history of vandalism and neglect. Although the gravestones have been removed, all but one of the burials remain undisturbed. The subsurface damage that has occurred appears to have affected only a small portion of one interment, the details of which are now well documented. In addition, preliminary observations suggest that the interments themselves are in an excellent state of preservation. As a result of both documentary and archaeological investigations and the fact that the site represents an important and rare component of the early settlement and growth of the Braintree/Weymouth area, it was recommended that the cemetery and the small tract of undisturbed land around it be preserved. The most pressing need at present, however, is a stabilization plan that will cease the erosion of the north and west site boundaries. The repair of these exposures is critical to the preservation of the site. It was also suggested that the plan consider the use of the perimeter of the cemetery as a picnic area, outfitted with benches for the use of Post Office and other employees in the Commerce Park development. In this way, the site would become an active component of the industrial park rather than an area where trash could collect.

25-1190 Holmes, Richard D., Mitchell T. Mulholland and David Bernstein

1990 Addendum Report to Archaeological Site Locational Survey of Segment 7, Northeast Settlement Project, Columbia County, New York and Berkshire County, Massachusetts. 32 pages.

Additional intensive survey was conducted in Richmond and Stockbridge, Massachusetts because of a realignment of a proposed pipeline. Low-density deposits of prehistoric chipping debris and the remains of a building foundation lacking integrity were found. No further archaeological survey was recommended (see also Reports #25-994, 1105, and 1135).

25-1191 Begley, William

1992 Phase I Intensive Archaeological Survey of the Route 44 Relocation Project, Alternate 4-N-S Deviation and Route 3 Interchange. 52 pages.

In December 1991 – January 1992 an intensive archaeological survey was conducted for the proposed Route 44 Relocation Project in Kingston, Plymouth, Carver, and Plympton. The project area included a 6000' Deviation from alternate 4-M-5, the Route 3 interchange, and an emergency access ramp from Route 80 to the proposed Route 44 location. A walkover survey identified areas of moderate to high archaeological sensitivity for cultural resources in all three project areas. A large portion of the Route 3 interchange was identified as having low archaeological sensitivity for cultural resources, as were sections on either side of the 6000' Deviation from Alternate 4-N-S. Subsurface testing in the form of 50 x 50 cm test pits was conducted along transects in the project area. No historic cultural materials were recovered. The only prehistoric cultural material recovered was a single quartz flake. A quartz projectile point was also recovered during surface inspection. These cultural materials confirm the presence of prehistoric utilization of the project area but the overall results of the intensive survey indicated that additional investigations of the find spots would not contribute significant new information to the prehistoric land use and settlement patterns of the area.

25-1192 Macomber, Gerald N., Nancy S. Seasholes, Brendan J. McDermott, Claire C. Carlson and Ellen P. Berkland

1992 Final Report, Intensive Archaeological Survey of Five Proposed Pipelines of Tennessee Gas Pipeline Company's Northeast Settlement Expansion Project in Massachusetts. 283 pages.

This report summarizes the results of an intensive archaeological survey conducted for 55 archaeologically sensitive areas. A total of 2,448 shovel test pits, including 93 bracket and 15 judgmental units, were excavated in these 55 areas. In Segment 2X (Lee-Sandisfield), 1,298 shovel test pits, including 39 bracket and 4 judgmental units, were excavated in Areas 1-16. Eleven prehistoric sites were located, one in Area 1 (Lee), four in Area 4 (Lee), one in Area 6 (Tyringham), two in Area 9 (Tyringham), two in Area 10 (Tyringham), and one in Area 11 (Tyringham). Phase II site examinations were recommended for seven sites. In Segment 3X (Upton-Hopkinton), 378 shovel test pits, including 24 bracket and 7 judgmental units, were excavated. Prehistoric artifacts were found at four sites: one site in Area 4, one in Area 8, and two in Area 9, all in Hopkinton. The finds in Area 4 are considered isolated and no further work was recommended, but a Phase II site examination is recommended for the site in Area 8. The sites in Area 9, which are also considered isolated finds, are no longer in the project area due to the realignment of the proposed pipeline; no further work was thus recommended for these sites. In Segment 4X (Spencer-Charlton), 530 shovel test pits, including 14 bracket units, were excavated. Two prehistoric sites were located, one in Area 17 and one in Area 20, both in Spencer. The site in Area 17 was considered an isolated find; the site in Area 20 is no longer in the project area due to a realignment of the proposed pipeline. No further work was therefore recommended for either site. In Segment 5X (Wilmington), 35 shovel test pits, including 4 bracket units, were excavated. One prehistoric site was located in Area 2 but it is considered an isolated find and no further work was recommended. In Segment 6X (Danvers-Peabody), 207 shovel test pits, including 12 bracket and 4 judgmental units, were excavated. Five prehistoric sites were found, one in Area 2, two in Area 4, one in Area 5, and one in Area 7, all in Danvers. A Phase II site examination is recommended for the site in Area 5, but the sites in Areas 2, 4 and 7 were all isolated finds in disturbed contexts and no further work was recommended for these sites (see Reports #25-1157, 1159, 1178, 1185-1187, and 1219).

25-1193 Ritchie, Duncan and Edna Feighner

1990 Archaeological Site Examination (Site 19-NF-70) within the New Neponset Valley Relief Sewer Project Area, Canton, Massachusetts. 111 pages.

Archaeological investigations of six prehistoric site loci within a 210 m x 66 m area of a proposed

sewer project revealed the presence of activity areas utilized during the prehistoric periods. Only one radiocarbon date was obtained, resulting in a 1,270 ± 110 B.P. (Beta-33411) date for Locus 1. Avoidance and preservation of these significant sites was recommended.

25-1194 Hood, J. Edward, Leslie C. Shaw, Stephen A. Mrozowski and James C. Garman

1990 Archaeological Investigations at the Ephraim Skerry House and the March Street Peninsula, Salem, Massachusetts. 165 pages.

This report summarizes the results of the intensive survey and site examination of the Ephraim Sherry House and road project impact areas at the March Street detour and Burnside and Thorndike Streets. The initial study included documentary research and subsurface testing that led to the discovery of a discrete sheet refuse deposit containing 17th century artifacts at the Skerry House. It was predicted that these materials could date to the original construction of the Skerry House or to the occupation of the "Old Planters" settlement of the 1620s. A small room within the west side of the house had no basement and the soil beneath the floor was predicted to contain intact evidence of the Old Planters settlement, or of the early occupation of the Skerry House. A 19th century trash pit was also found in the rear yard of the structure. During the site examination of the Skerry House, the area inside the existing house, but beneath the former front yard of the original structure, was examined. This involved the removal of floorboards and excavation. The excavation inside the house revealed a scattering of construction and domestic debris from the 1710 house, 19th century material and prehistoric artifacts in a disturbed context. The area of an early bay east of the present house was also examined and appears to have been truncated during the removal of the bay in the mid-19th century. Two 19th century features were excavated in the yard north of the house, uncovering 19th century artifacts and evidence of sill stains which are probably the remains of another barn or outbuilding. Trenches were excavated in the front yard to evaluate the artifact distribution believed to date to the Old Planters settlement. In the process, a dry-laid stone structure (probably a foundation) was encountered, associated with 19th century material. No 17th century artifacts were directly associated with the structure. In the front yard, recovered artifacts included a thin distribution of pipe stems and bowls, buff-bodied slipware and brown stoneware, some dating to the first half of the 17th century. A thin scatter of prehistoric artifacts was found in disturbed historic context beneath the floor of the house and in the front yard. Artifacts included a Broad Spear or Wayland-Notched point of the Susquehanna Tradition (approximately 3,200 years old) and a thin scatter of lithic flakes and cord-marked pottery. Given documentary evidence and the excavated material, the structure is interpreted as an outbuilding dating from the 1850s or earlier. On the basis of evidence derived during the site examination, the subsurface portion of the Skerry House site does not appear to be eligible for inclusion in the National Register. As a result, no further survey was recommended in the vicinity of the Skerry House.

25-1195 Holmes, Richard D. and Mitchell T. Mulholland

1992 Archaeological Site Examination at the Pipeline Crossing of the Blackstone Canal and the East Bank of the Blackstone River, Northbridge, Worcester County, Massachusetts, Northeast Settlement Project, Segment 8. 39 pages.

An archaeological site examination was conducted on the west and east banks of the Blackstone River, where a proposed natural gas pipeline will cross the river and the Blackstone Canal. The Western Area is the location of the early 19th century Blackstone Canal and the Providence and Worcester Railroad. Construction plans are to excavate a "receiving pit" in this area. This pit will receive pipeline sections that will be pushed beneath the river, the canal towpath, and the canal from the east side of the river. Neither the towpath nor the canal will be impacted. Sixteen slit trenches (0.5 by 1.5 m) were excavated in order to find remains of structures was found. The Eastern Area is at the northern edge of the Mahoney/Blackstone Terrace Prehistoric site (19-WR-521). Plans are to construct a larger "bore pit" on this side of the river, from which pipeline sections will be pushed to the west. Twenty-four shovel test pits were excavated. Three lithic flakes and a fire-cracked rock were recovered. No further research was recommended for either area but, because

of the archaeological sensitivity of the areas, archaeologists should be present to monitor construction on the canal side of the river (see also Reports #25-1162 and 1165).

25-1196 Loparto, Leonard W.

1989 An Intensive Archaeological Survey of Lot #5 off Mitchell Lane in Brewster, Massachusetts. 46 pages.

An intensive (locational) archaeological survey was conducted of Lot #5, Brewster, Massachusetts. The intensive survey focused on the location of prehistoric and historic cultural resources within the project area. The survey was requested by the Brewster Conservation Commission under the Brewster Wetlands Protection Bylaw. Intensive survey research included background studies, a walkover inspection, and excavation of 36, 50 cm x 50 cm test pits in the house, garage and septic system area. A total of 86 pieces of chipping debris was recovered as well as calcined bone fragments, biface fragments, a broken preform, a broken Orient Fishtail and broken Meadowood projectile point. These materials represent a multi-component site, possibly a smaller foraging or collecting site or the extension of a larger site located on neighboring property, dating to the Transitional Archaic through Early Woodland Periods. Historic Period materials including coal, coal slag, nails, glass, shell and a concrete slab, possibly the floor for a shack associated with cranberry cultivation were also recovered. Significant historic and prehistoric cultural material will not be impacted by proposed construction activities. Significant prehistoric deposits are present in the area originally designed for the septic system; however, a new location which lacks significant cultural material has been chosen. In the event construction activities are planned in the area originally designed for the septic system or at other areas not tested during this survey additional archaeological testing was recommended. Otherwise, construction of the house, garage and septic system should proceed as planned.

25-1197 Begley, Bill and Alan Leveillee

1992 An Intensive Archaeological Survey of the Doel Farm and Adjacent Areas in Taunton, Massachusetts. 38 pages.

This report completes the archaeological survey of the Silver City Galleria project (see report #25-998). Archaeological testing within the remaining 28 acres located two gray felsite flakes and an insignificant scatter of 19th and 20th century field trash. No further work was recommended.

25-1198 Loparto, Leonard W.

1990 An Intensive Archaeological Survey of Lots 35 and 36 off North Pond Drive in Brewster, Massachusetts. 35 pages.

An intensive (locational) archaeological survey was conducted of Lots 35 and 36 in Brewster, Massachusetts. The intensive survey focused on the location of prehistoric and historic cultural materials within the project area. The survey was requested by the Brewster Conservation Commission under the Brewster Wetlands Protection Bylaw. The study included approximately 1 acre or all upland portions of the lots between North Pond Drive and Blueberry Pond. A total of 27, 50 cm x 50 cm test pits were used to test the project area. Historic or prehistoric cultural materials were not found in any test pits excavated during the project. Excessive slope on the property and the presence of cobbles in soils are possible factors influencing the lack of cultural materials in the area. Since significant cultural materials were not found, no further archaeological or historical studies were recommended for the study area.

25-1199 Loparto, Leonard W.

1990 An Intensive Archaeological Survey of Lot #2 off John Wing's Lane in Brewster, Massachu-

setts. 38 pages.

An intensive (locational) archaeological survey was conducted of Lot #2 of f John Wing's Lane in Brewster, Massachusetts. The intensive survey focused on the location of prehistoric and historic cultural resources within the project area. The survey was requested by the Brewster Conservation Commission and Massachusetts Historical Commission under the Brewster Wetlands Protection Bylaw. Intensive survey research included background studies, a walkover inspection and excavation of 60, 50 cm x 50 cm test pits. Prehistoric cultural materials recovered included 5 fragments of gray felsite chipping debris recovered in both A and B soil horizons indicating possible Archaic and Woodland components. Evidence was also present on the property indicating historic cranberry cultivation, a possible dam or dike and an old road surface. Both prehistoric and historic cultural materials identified in the project area were not considered significant or potentially eligible for inclusion in the State or National Register of Historic Places. No further archaeological or historic studies were recommended for cultural resources identified during this survey.

25-1200 Strauss, Alan E.

1992 Phase II Archaeological Site Examinations of the Evanswood Center Development in Kingston, Massachusetts. 99 pages.

This report includes the results of a Phase II archaeological site examination for the proposed Evanswood Center Development in Kingston, Massachusetts. Subsurface testing, consisting of the excavation of 64 systematic shovel test pits, 11 judgmental units, 22 bracket pits, and 17, 1 m x 1 m units, was conducted in Areas 1, 2, and 4, as defined during the Phase I intensive survey (see Report #25-852). As a result of the subsurface testing, Area 1 could be divided into four small loci of prehistoric activity. A total of 1,406 artifacts including 34 tools was recovered from all of Area 1. A subsurface charcoal feature dating to 3,920 $\pm$ 120 B.P. was excavated in Subarea 1-C. Although all of Area 1 had been plowed, 84% of the artifacts in Subarea 1-A was recovered below the plowzone. Low densities of chipping debris were recovered primarily from the topsoil in Area 2. Only 15 pieces of chipping debris and one tool were recovered from Area 2. Area 4, located near the Jones River on the east side of Lake Street, contained 688 pieces of chipping debris as well as 13 tools or related materials; a large percentage of the chipping debris was felsite. A Terminal Archaic Orient Fishtail projectile point (Ca. 3,000-2,000 B.P.) was also recovered in Area 4. A fire-cracked rock feature containing charcoal and felsite flakes was also excavated in this area. The radiocarbon date for this feature was 3,330 ± 95 B.P. Areas 1-A and 4 are eligible for nomination to the National Register of Historic Places because they contain high densities of artifacts below the plowzone, they possess subsurface features, and they may contribute substantially to our understanding of the prehistory of New England. It is recommended that Phase III data recovery operations be conducted in Areas 1-A and 4 if it is not possible to avoid these areas during construction. Areas 1-A and 4 were avoided and preservation restrictions were accepted for the two sites. The remaining portions of the project area which contained limited amounts of cultural materials, primarily in the plowzone, are not believed to possess adequate research potential to make them eligible for nomination to the National Register. No further archaeological was therefore recommended for Areas 1-B, 1-C, 1-D, 2, and 3.

25-1201 Loparto, Leonard W.

1991 An Intensive Archaeological Survey of Lot #3 on Upper Mill Pond in Brewster, Massachusetts. 39 pages.

An intensive (locational) archaeological survey was conducted of Lot #3 bordering Upper Mill Pond off Setucket Road in Brewster, Massachusetts. The intensive survey focused on the location of prehistoric and historic cultural resources within the project area. The survey was requested by the Brewster Conservation Commission and the Massachusetts Historical Commission under the Brewster Wetlands Protection Bylaw. Intensive survey research included background studies, a walkover inspection, and excavation of 67, 50 cm x 50 cm test pits and two larger 1 m x 1 m

square units. A total of 43 pieces of chipping debris were recovered as well as three tools or tool fragments. Historic materials were not recovered during the survey. Although cultural materials at the Berbrick site have integrity, the site does not appear to be eligible for listing in the State or National Register of Historic Places due to its limited research potential. Significant cultural materials will not be impacted by the proposed construction materials.

25-1202 Loparto, Leonard W.

1991 An Intensive Archaeological Survey of Lot #2 of Stony Brook Road in Brewster, Massachusetts. 45 pages.

An intensive (locational) archaeological survey was conducted at Lot #2 located between Smith Pond and Stony Brook Road in Brewster, Massachusetts. The intensive survey focused on the location of prehistoric and historic cultural resources within the project area. Approximately 0.75 acres were included in the testing. The survey was requested by the Brewster Conservation Commission and Massachusetts Historical Commission under the Brewster Wetlands Protection Bylaw. Intensive survey research included background studies, a walkover inspection, and excavation of 20, 50 cm x 50 cm test pits and two 1 m x 1 m square units. A total of 163 pieces of culturally related material was recovered during the testing. This total includes 134 prehistoric and 29 historic artifacts. Prehistoric material included 128 pieces of chipping debris, 1 Levanna Triangle projectile point, 2 burnt rock fragments, 3 pieces of calcined bone, and a prehistoric feature. Historic cultural materials included hard white, redware and porcelain ceramic fragments, bottle glass fragments, coal, brick and nails. Prehistoric materials likely represent a low density seasonal foraging or temporary campsite dating to the Late Woodland period (1,300-400 B.P.). All historic materials belong to what is commonly referred to as field trash spanning the 18th through mid 19th centuries. Since both historic and prehistoric materials lacked integrity and have limited research potential the site did not appear eligible for listing in the State or National Registers of Historic Places. No further archaeological or historical studies were recommended.

25-1203 Missio, Nicole A. and Donald C. Jones

1992 Archaeological Site Examination of Three Prehistoric Sites on Salem Neck for the South Essex Sewerage District in Salem, Massachusetts. 205 pages.

Two site examinations were conducted at three prehistoric sites on Salem Neck in Salem, Massachusetts – the Salem Neck Sewerage Plant site (19-ES-471), the Cat Cove Area 5 site (19-ES-666), and the Smith Pool site (19-ES-471). The site examinations were conducted as part of the cultural resources review for proposed secondary sewage treatment and solids disposal facilities for the South Essex Sewerage District (see Reports #25-1048 and #25-1134). The three prehistoric sites are situated on or near the eastern shore of Salem Neck on land that may be affected by the proposed construction of secondary sewage treatment facilities. The site examinations consisted of background research, field survey, subsurface testing, and laboratory analysis. All three sites were found to contain shell middens and a range of lithic and ceramic artifacts. The Salem Neck Sewerage Plant site dates to the Middle and Late Woodland periods, but this site may also have a Late Archaic/Early Woodland component. A shell midden, two refuse pits, and an ash pit were identified at the site; numerous lithic and ceramic artifacts were recovered from the site. The Cat Cove Area 5 site contains a small shell midden, but no features other than the midden were identified. This site dates to the Middle Woodland period, but a pre-midden lithic workshop was also identified at the site. The site may also contain a Late Archaic/Early Woodland period component. The Smith Pool site contained a shell midden, but no other features. This site also dates to the Middle to Late Woodland period; although no archaeological evidence of an earlier component of the site was identified, the recovery from the site of a slate knife by an avocational collector in 1937 indicates the site may contain a Late Archaic period component. Despite extensive disturbance of the areas surrounding each of the three prehistoric sites, the Salem Neck Sewerage Plant site, the Cat Cove Area 5 site, and the Smith Pool site are all considered to be individually eligible for the National Register of Historic Places. Furthermore, these three prehistoric sites may be eligible for in-

clusion in an archaeological district that includes other prehistoric sites on Salem Neck and possibly Winter Island and the outer islands of Salem Harbor. Avoidance or archaeological data recovery were recommended.

25-1204 Carolan, Jane, Joyce Clements and Michael Roberts

1992 Historical and Archaeological Survey, Swingle's Quarry, Quincy, Massachusetts. 77 pages.

This report is the first of several phases of historic preservation activities, including a projected Cultural Resource Management Plan and an education exhibit. Swingle's Quarry is proposed to be partially filled in and developed into a park with an exhibit that will interpret the quarrying industry in Quincy and the industrial history of Swingle's Quarry. The results of background research and an archaeological survey were used to develop a preliminary history of the Quincy granite industry and of Swingle's Quarry, and interpretive themes to be used in final park and exhibit design. Archaeological investigation at Swingle's Quarry involved a walkover reconnaissance to locate and identify surficial remains. Archaeologists generated a site map showing the location of 36 features and feature complex, and created an inventory which identified and described those features, all of which date later than the mid 19th century. Archaeological remains included tools and equipment used to extract, hoist and transport granite, in addition to "grout" or granite waste, the remains of a bridge which spanned quarry, and an early 20th century compressor house. Spatial analysis of the site indicates two broad patterns of surficial remains: 1) in situ remains of granite quarrying at the perimeter of the quarry, and 2) secondary deposition of grout, tools and equipment in adjacent depressions. Documentary research and archaeological investigations indicate that Swingle's Quarry is an important element in the industrial evolution in the City of Quincy. This quarry can be distinguished from similar sites because of its longevity, its close association with Quincy "Extra Dark" granite, and its identification with the entrepreneur J.S. Swingle. Furthermore, the quarry retains an abundance of archaeological features that can be used to demonstrate the mechanization of late 19th and early 20th century granite quarrying. The report recommended the stabilization of in situ metal components, such as plugs and feathers and wire winding rope, before their interpretive potential is lost. Unsightly spray paint should be removed from significant archaeological features. Finally, it was recommended that archaeologists work closely with project planners as they prepare a comprehensive plan for filling the quarry. Project planners should refer to information on feature significance and interpretive potential when making judgments about access to the quarry rim for dumping and about vehicular movement around the site during the filling procedure. In this way the protection of valuable cultural resources associated with the granite quarrying industry can be assured.

25-1205 McBride, Kevin A.

1990 Archaeological Reconnaissance Survey, Gardners Falls Hydroelectric Project (FERC 2334), Buckland and Shelburne, Massachusetts. 44 pages.

The project area consists of approximately 9,840 linear feet on both sides of the Deerfield River. Background research and a surface reconnaissance located a possible rockshelter, a cellar hole foundations, and an historic railroad trestle. The impacts from continued, unmodified operation of the hydroelectric plant was not considered likely to affect any cultural resources. Development of archaeologically sensitive areas should be evaluated.

25-1206 King, Marsha K., Virginia A. Fitch and Ronald Dalton

1992 Intensive Archaeological Survey of the Route 146 Corridor, Worcester and Millbury, Massachusetts. 168 pages.

This report summarizes the results of an intensive (locational) archaeological investigations conducted of the Route 146 improvement project area in Worcester and Millbury, Massachusetts between 1989 and 1992. The project area consisted of an approximately four mile long corridor lo-

cated adjacent to the Blackstone River and existing portions of Route 146. A number of different construction alternatives were examined within the project area. Project tasks included background research, walkover inspection with soil core augering, sensitivity assessment, and subsurface testing. Substantial portions of the project area had been previously disturbed by road construction, industrial activities, flood control, and landscaping. Portions of the project area contained known or suspected contaminated soils. A total of 92, 50 cm x 50 cm shovel test pits were excavated in judgmental transects or as individual judgmental units at selected locations of moderate to high sensitivity. No prehistoric archaeological sites were previously known or reported within the project area. No prehistoric sites were identified during the survey. Five potentially significant historic archaeological/engineering sites, previously known but not recorded in Massachusetts Historical Commission site files, were encountered. Additional site examination level research, recording, and testing is recommended for two sections of the Blackstone Canal and the Mill Brook Sewer Portal (also originally part of the canal route). The fourth site, the Isaiah Thomas Paper Mill/Washburn and Moen wireworks site, is outside impact areas and no additional work is recommended. No additional archaeological investigations were recommended for the fifth historic site, the Greenwood Site in Millbury.

25-1207 Davin, Ann K. and Beth Miller

1991 Results of the Site Examination of the Knoll I Site, Orr's Pond Rehabilitation Project Area Attleboro, Massachusetts. 66 pages.

A site examination was completed of the Knoll I Site located within the Orr's Pond Rehabilitation project area in Attleboro, Massachusetts. The site is situated on a knoll northwest of the confluence of the Fourmile Brook and Sevenmile River. Three prehistoric sites were located during the course of an initial intensive archaeological survey in 1982 (see Report #25-479). Additional archaeological investigations were recommended for the Knoll I Site because of the density of cultural material and the integrity of the site area. During the site examination, prehistoric cultural materials were located over most of the level portions of the knoll. The prehistoric cultural materials were recovered between 0 and 70 cm below ground surface and consisted of 2,129 pieces of chipping debris, 11 modified quarry blanks/bifaces, and nine bifaces. No prehistoric features or diagnostic artifacts were found during this phase of investigation. The most prevalent lithic material was Attleboro red felsite (82%) with small percentages of quartz (10%), other felsites (4%), and one piece each of chert, rhyolite, and quartzite. The primary activity on the Knoll 1 Site was the manufacture of Attleboro red felsite which was obtained from outcrops located less than one-half mile from the site. No additional archaeological investigations were recommended for the Knoll I Site. Analysis of the results of the site examination strongly suggests that a representative sample of cultural materials and activities have been recovered. The Knoll I Site also appears to be very similar to the Knoll C Site, which is located to the southwest in South Attleboro. A data recovery program was conducted at the Knoll C Site. Additional archaeological investigations at the Knoll I Site are not likely to recover any new and/or significant information.

25-1208 Hood, J. Edward

1992 Archaeological Survey at the Manse, Northampton, Side and Front-Side Yards.

Archaeological survey at the Manse, side and front-side years revealed physical evidence for a formal garden dating to the early to mid-l800s and later. This garden is characterized both by a distinct episode of re-landscaping, and by distinctive planting holes found in three of the test excavations. It is probable that a major re-landscaping effort took place in the early to mid-1800s that resulted in the removal of a significant amount of soil in the front-side yard, possibly for the purpose of removing a low hill in this area. This re-landscaping probably accounts for the high water table and surface dampness seen in the front-side yard of the house. This portion of the yard seems to have been a back/north yard up until the 1780s, thus probably making it an area of low intensity usage, and thus leaving little or no earlier archaeological deposits behind. The construction of the large, vernacular high-styled, gambrel roofed structure in the 1780s probably shifted

this area of the Manse property into a more utilized, and even formal garden space during the late eighteenth and early nineteenth centuries. Any excavation, re-landscaping or other subsurface alterations to this part of the yard would impact the remains of the garden. These planting holes may retain a pattern of the formal garden in which they were planted. It is recommended that if this part of the yard is to be disturbed by re-landscaping activities then further plans should be made to record the remains of these plantings. Other parts of the yard are felt to be of low archaeological potential. Re-landscaping and other subsurface disturbances in these areas will not cause significant impacts to archaeological remains.

25-1209 Rempelakis, John E.

1992 An Intensive Archaeological Survey (Phase I) of the Proposed Samoset Street Safety and Capacity Improvements Project, Plymouth. 31 pages.

An intensive archaeological survey was conducted in an approximately 3 mile linear corridor using shovel test pits. No significant cultural material was recovered and no further survey was recommended.

25-1210 Herbster, Holly and Ann Davin

1992 Intensive Archaeological Survey, Otis Air National Guard Wastewater Treatment Facility, Massachusetts Military Reservation, Cape Cod, Massachusetts. 37 pages.

The project area encompassed approximately three acres of woodland between Kittredge Road and a utility easement in Sandwich, Massachusetts. A total of 35, 50 cm x 50 cm test pits were excavated during the intensive survey. These included two 30 m x 30 m blocks, each containing a total of 13, 50 cm x 50 cm test pits, and a test pit transect excavated in the area where most of the construction impacts will occur. No prehistoric or historic cultural materials were located during the intensive archaeological survey. The project area may have been cleared at one time and/or used as pasturage or a woodlot, but there is no evidence of a plowzone. A linear mound of sand was the only evidence of activity found in the project area. This mound was relatively recent, within the last 10-20 years. The intensive survey determined that the proposed ANG Wastewater Treatment Facility will not impact any significant prehistoric or historic sites or deposits. No additional archaeological investigations were recommended (see Report #25-1175).

25-1211 McCormack, Valerie and Katherine Jones Garmil

1992 Phase I Intensive Archaeological Management Memorandum for the Algonquin Gas Transmission Company Proposed 3.1 Mile ENRON Power Station 12-inch Pipeline Loop in Bellingham, Hopedale, Milford, Massachusetts. 66 pages.

A total of 349, 50 cm x 50 cm test pits was excavated along 13 transects within the proposed project area. One prehistoric findspot (a quartzite flake) and two historic or modern period sites were identified. These cultural resources could not be placed with a specific temporal or cultural context, and no further archaeological investigations of these areas were recommended. It was determined that the original pipeline route would affect the historic viewscape (a large oak tree on the south side of Hartford Avenue and the stone wall associated with the Scammell House) in South Milford Village. An alternate route to avoid these historic features was utilized. Thirty-five 50 cm x 50 cm test pits were placed in transects along an alternate route. This testing identified one prehistoric findspot (an Attleboro red felsite end scraper) which could not be placed within a specific temporal or cultural context. No further archaeological investigations were recommended for this alternate route. Subsurface testing of the access roads was not conducted due to the existing disturbances in these areas.

25-1212 Jones, Donald G.

1992 Assessment of Potential Impacts to Historic Architectural Properties by Proposed Construction for the South Essex Sewerage District in Salem, Massachusetts. 36 pages.

An assessment of the potential impacts to historic architectural properties by the project involved the preparation of a series of maps showing the locations and boundaries of existing National Register properties and district in Salem and the location of the proposed facilities, and traffic route for the project. Current site layout plans were also reviewed to determine the potential impacts the proposed facilities may have on surrounding historic properties, and traffic mitigation plans were reviewed to determine the potential impacts on historic properties adjacent to the proposed traffic route. Two alternative site layout plans were reviewed for this assessment. Neither plan would result in structural impacts to historic properties because all proposed facilities and staging areas are proposed within the existing SESD property. Both site layout plans have the potential for incremental and/or partial or seasonal visual impacts to limited portions of the Winter Island Historic and Archaeological District, the Salem Willows Historic District and possibly Fort Lee. The remaining areas of these districts and the other districts in Salem are screened from view by vegetation, existing buildings, topography, or a combination of these. One of the proposed traffic routes, which follows Route 114-East to Bridge Street, Webb Street, and Fort Avenue, runs adjacent to, but not through, a portion of a number of National Register districts and properties. In addition, the Webb Street/north Bridge Street portion of the proposed traffic route is lined by numerous architectural properties that may be eligible for the National Register. Potential impacts from increased truck traffic is likely to be incremental in nature because most of the route (Webb Street and Fort Avenue) are currently used for truck access to the existing SESD plant. The potential impacts, such as noise, dust, and vibrations, to adjacent architectural properties may be reduced through mitigation efforts, such as restricted speed limits, the use of off-site parking/shuttle buses for construction personnel, and the placement of tarps on trucks. The proposed widening of the Webb Street/Bridge Street intersection was not expected to result in the demolition or alteration of any architectural properties. The proposed widening could, however, encroach on four historic buildings located north of Webb Street on Bridge Street and Arbella Street.

25-1213 Davin, Ann K., Marsha K. King and Bill Begley

1992 Results of the Intensive Archaeological Survey of the White Oak Island Project Area, Middleborough, Massachusetts. 80 pages.

The 763-acre project area (of which ca. 523 acres are wetlands) is located within a section of southeastern Massachusetts that is considered highly sensitive for prehistoric resources. Background research suggested that the project area was highly sensitive. A narrow section of the project area borders the Taunton River, and extensive wetlands are located around the more upland areas. A number of find spots of quartz materials were recorded within the project area prior to the intensive survey during an inventory of prehistoric resources in Middleborough (see Report #25-1239). Field investigations began with a walkover survey to stratify the project area. Subsurface testing was conducted in areas ranked as having moderate and high potential to contain archaeological deposits. A total of 410, 50 cm x 50 cm test pits were excavated during the intensive survey. A total of 16 pieces of quartz chipping debris and one quartz Levanna projectile point were recovered in five test pits during the subsurface testing. A small amount of historic cultural material, mainly field trash, was also recovered. Evidence of activity by “pothunters” was located around a partially dismantled stone pile in the central section of the project area. Additional testing yielded a low density of machine cut nails, glass, and metal knife blade. The presence of the chipping debris and the projectile point confirmed the prehistoric utilization of the project area. However, additional testing around all of the test pits with cultural material determined that these were isolated low-density find spots. These find spots do not represent potentially significant cultural resources. No additional testing was recommended.

25-1214 Goodby, Robert G.

1991 The Wheaton College Excavations at the G.B. Crane Site, Norton, Massachusetts. 70 pages.

The report describes the results of limited archaeological investigation of the G.B. Crane Site (l9-BR-214) undertaken by the Wheaton College field school. Three areas of this large, multi-component site were tested by means of shovel test pits and 1 m x 1 m units. The four-acre area of the site currently under cultivation was surface collected. The results are described in relation to the previous investigations of the site (see reports #25-296, 364 and 501) and regional settlement models. Specific discussion is made pertaining to the Late Woodland use of the site's multiple occupations which extend from Early Archaic through Late Woodland times. The report also includes faunal analysis of calcined bone from the site.

25-1215 Carlson, Catherine Carroll, Elizabeth A. Little, D. Richard Gumaer, Leonard W. Loparto and Brenda J. Baker

1992 Archaeological Survey and Historical Background Research for the Miacomet Indian Village and Burial Ground, Nantucket, Massachusetts. 166 pages.

Historical background research, electrical resistivity survey, and archaeological field testing were conducted at an historic Native American cemetery. Construction had previously disturbed ten unmarked graves thought to be burials of inhabitants of the 18th century Praying Indian town of Miacomet. The present study was undertaken to determine the boundaries of the burial ground and whether any remains of the village of Miacomet existed on the property. Subsurface testing during this survey revealed eight grave shaft outlines and a possible granite boundary marker. Two grave shafts were excavated to expose wooden coffin outlines and human skeletal remains. A long, linear mound feature in the project area may be the remains of a "ha-ha" enclosing sheep shearing pens built in 1822. A small lithic scatter, including an ovate projectile point, was found in the same level as 18th century bottle glass, in association with a large boulder feature. Site examination was recommended for these two features. The boundaries of the burial ground, including a buffer zone, should be fenced and/or landscaped to identify, secure, and inform the public of the importance of this historical site.

25-1216 Pendery, Steven R.

1988 Archaeological Survey of the Boston Common, Boston, Massachusetts. 78 pages.

Twelve 1 m x 1 m excavation units were excavated as part of Boston's City Archaeology Program, partially funded by a survey and planning grant from the MHC. Four areas were found to contain significant archaeological deposits requiring protection. These include the Colonial Encampment Site in Block 13, the Late Woodland Frog Pond prehistoric site in Block 27, the Powderhouse Hill Site in Blocks 34 and 45, and the Late Woodland prehistoric and colonial site in Block 79. Remote sensing methods may provide additional information about archaeological resources in these areas. Excavation greater than 6 inches from the surface in these areas is strongly discouraged. Archaeological preservation outside of these areas was low. Appendices to the report include a chronology of land use of the Common from 1630 to 1870, and public information materials and publicity generated by the project.

25-1217 Strauss, Alan E.

1992 Intensive Archaeological Survey of the Proposed Lewis Gammons Office Building in Lakeville, Massachusetts. 31 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area. Field investigations for the project included a surface inspection, followed by the excavation of 44 shovel test pits within the project area. A total of 90 pieces of prehistoric stone debitage was recovered during the subsurface investigations. A Small Stemmed point base section was also recovered as well as a quartz biface. The remains were all recovered from what appeared to be an old plowzone and from the B-horizon subsoil. Bracketing in the vicinity of the cultural materials produce additional prehistoric deposits. No significant historical cultural remains were

recovered. The artifacts appear to be clustered horizontally in the north and western portions of the project area. Quartz chipping debris, consisting of cobble decortication, angular waste, blocky fragments, and small flakes indicate on-site tool manufacture. Felsite chipping debris in the form of a small blocky fragment and flakes also indicate tool manufacture from this material. One small piece of calcined bone was also recovered which may indicate other on-site activities in addition to tool making. While this site provided some information on small, temporary loci in the Assawompset Pond Area, it contained a low density of artifacts primarily restricted to the plowzone. The site is not eligible for listing in the National Register and no further archaeological work was recommended.

25-1218 Holstein, Elizabeth and Denise Mowchan

1987 An Intensive Archaeological Survey of the Proposed Route 6 Mall Site, Seekonk, Massachusetts. 34 pages.

An intensive level archaeological survey was conducted for the project area which lies along the east side of the Runnins River and consists of approximately nine undisturbed acres and approximately eight acres which have been recently filled. Surface reconnaissance and auger coring were used to evaluate sensitivity and integrity. Background research revealed that a multi-component site (Read Farm, 19-BR-75) is located less than one quarter of a mile southeast of the project area. A combination of block, array, and transect testing was used. Three loci of prehistoric activity were discovered consisting of low-density deposits of Attleboro red felsite, argillite, and quartz chipping debris. Two were located on the north side of the wetland, bordering Route 6, and the other one was located on the south side of the wetland. The evidence gathered during the subsurface testing indicated that the prehistoric loci were not significant and did not warrant any further archaeological testing.

25-1219 Macomber, Gerald N.

1992 Archaeological Investigations of a Proposed Realignment and an Expanded Work Area in Segment 2X of Tennessee Gas Pipeline Company's Northeast Settlement Project-Phase 2 in Lee, Massachusetts. 37 pages.

Intensive archaeological surveys were conducted at a proposed pipeline realignment and an expanded work area (EWA) for Segment 2X of Tennessee Gas Pipeline Company's (TGP) Northeast Settlement Project Phase 2 in Lee. Previous archaeological investigations near the project areas were conducted for TGP's proposed Segment 2X pipeline in Lee. These investigations identified a prehistoric site on the opposite site of the existing TGP right-of-way from the proposed realignment. The locations of both the proposed realignment and EWA were considered to have moderate to high potential for the presence of prehistoric cultural remains. Historical background research indicated low to moderate potential for the identification of historical remains in both areas. Subsurface testing was conducted at both locations in Lee. Forty-three shovel test pits were excavated for the proposed realignment and seven were excavated for the proposed EWA. One black chert flake was found in a disturbed context in one shovel test pit and a small amount of historical material was recovered from 15 of the shovel test pits during testing for the proposed realignment. No cultural material was found during the testing for the proposed EWA. The historical material recovered was not associated with historical structures or features and the artifacts were not considered to be archaeologically significant. The chert flake was determined to be an isolated find from a disturbed subsurface context and not archaeologically significant. No further archaeological investigations, were recommended (see Reports #25-1157, 1159, 1185-1187, and 1192).

25-1220 Rainey, Mary Lynne and Katherine Jones Garmil

1992 Phase I Intensive Archaeological Survey for the Algonquin Gas Transmission Company Proposed 5.5 Mile G-8 20-Inch Pipeline Replacement, 1.5 Mile Realignment and Pipeyard, Wareham,

Plymouth, and Bourne, Massachusetts. 80 pages.

Subsurface testing within the project area resulted in the completion of eight transects, 20 judgmentally placed test pits and one array for a total of 393 shovel test pits in the original pipeline route. The recovered historic cultural material included glass, ceramic, shell and metal fragments. These materials were found scattered across the test areas in relatively low concentrations, predominantly within the A soil horizon and were attributed to 20th century dumping of trash along the pipeline easement. Prehistoric cultural material recovered was limited to one felsite flake and one quartz fragment. In both cases, the adjacent test pits were sterile. Examination of the quartz fragment concluded that the stone was fragmented naturally and should not be included in the cultural material inventory. The felsite flake was an isolated find. No further archaeological investigations were recommended for this portion of the project area. Subsurface testing of the sensitive areas of the proposed realignment resulted in the completion of four transects containing 62 shovel test pits. In addition, 19 judgmental test pits were excavated around the perimeter of several rock outcrops located in proximity to Valley Road, a potential Native American trail. One felsite Susquehanna Tradition projectile point base was discovered in a judgmental test pit. This appears to be an isolated find as no other cultural material was recovered in the adjacent area. The remaining 79 test pits were sterile. No additional archaeological was recommended for the proposed realignment. Subsurface testing of the proposed pipe storage area was not conducted due to the disturbed nature of the area. Prior use of the area as a municipal landfill reduced the potential for finding intact archaeological sites and increased the potential for encountering hazardous materials.

25-1221 McCormack, Valerie and Katherine Jones Garmil

1992 Phase I Intensive Archaeological Survey for the Algonquin Gas Transmission Company Proposed J-System Replacement Project, Belmont, Arlington, Medford, and Everett, Massachusetts. 80 pages.

Subsurface testing was conducted in the portions of the project area which could not be documented as previously disturbed and which were not wet. Subsurface testing in the archaeologically sensitive areas resulted in the completion of 12, 50 cm x 50 cm shovel test pits. All twelve test pits exhibited evidence of disturbance and no prehistoric cultural material was recovered during the intensive archaeological survey. Two test pits contained intact A and B soil horizons beneath levels of fill. Although historic cultural material consisting of glass, ceramics, brick and plastic was recovered from these test pits, it was not associated with intact soil horizons. Subsurface testing was also conducted near the Mystic River inlet. Two judgmentally placed test pits were located on either side of this inlet. The testing showed the area to be previously disturbed by the filling of the tidal flats. No subsurface testing was conducted in the temporary gas pipe storage yards and the staging area which were all found to be previously disturbed. No further archaeological testing was recommended for the project areas.

25-1222 Goodwin, Lorinda B.R.

1992 Archaeological Site Examination of the Turner House, Salem Massachusetts. 208 pages.

The Turner House, better known as the House of the Seven Gables Historic District (a Massachusetts Historic Landmark, listed on the National Register of Historic Places) was the focus of an archaeological site examination. Thirteen 1 m x 1 m units and one 0.5 m x 1 m unit were placed on the property. Archaeological features and artifacts, predominantly from the 18th century (but with Middle Archaic, Late Woodland, and late 17th century through 20th century materials in lesser quantities), were identified and described. A summary of the unit-by-unit finds is provided, as well as a detailed study of the artifacts, including special reports on faunal and macrobotanical remains and on marked 17th century window leads. Management recommendations take into account the expected differences in integrity in parts of the property.

25-1223 Pendery, Steven R.

1992 Intensive Site Survey, Boston Common Visitor's Information Center Project Area. 28 pages.

Three 1 m x 1 m test pits were excavated in the proposed location for the relocated Ranger Station and annex, as well as at the site of a major utility corridor adjacent to the structure. No significant archaeological resources were encountered during the archaeological testing. A utility of recent date was encountered in Test Pit 1, and both Test Pits 2 and 3 yielded disturbed soil deposits. Furthermore, probing beneath the walkway extending through the center of the site indicated substantial disturbance in this location as well. Artifact analysis suggests that the walkways and adjacent areas were disturbed as early as 1918, possibly in conjunction with the Olmsted soil renovation project. As it is unlikely that significant archaeological resources are preserved at the project area, no additional archaeological activity was recommended.

25-1224 Ritchie, Duncan, Martha K. King and Martha Lance

1988 Archaeological Reconnaissance Survey of the Westville Dam and Reservoir in Southbridge and Sturbridge, Massachusetts. 275 pages.

The purpose of this reconnaissance level survey was to provide information on the archaeological sensitivity of the ca. 1,200-acre Westville Dam project area and review the possible effects of current project operations on cultural resources. The data were used to make recommendations for developing an effective management plan for cultural resources within the project area and future investigations at the intensive survey level. Two primary tasks, background research to review data on known cultural resources and formulation of a sensitivity ranking (predictive model) for the project area were outlined. Background research also included the collection information on the physical environment. Environmental data such as geomorphology, soils and hydrology/drainage patterns were used to develop the predictive model for the location of prehistoric cultural resources. Known patterns of prehistoric and historic settlement and land use near the Westville Dam project area and the relationship of these patterns to local and regional developments were used to develop interpretive contexts for assessing the potential significance of identified sites. The Westville Dam project area was stratified into zones of expected archaeological sensitivity. An important aspect of the reconnaissance survey was field testing of the sensitivity map and predictive model for prehistoric resources through the application of limited subsurface sampling (shovel test pits). Historic cultural resources identified from documentary sources or the walkover inspection were also recorded. Additional observations were made on the nature and extent of previous disturbance and effects of current project operations at Westville Dam. A total of 2 prehistoric and 35 historic period cultural resources were identified. A number of these sites were considered to be potentially significant. Recommendations for maintenance and protection or preservation of cultural resources are offered, particularly in situations where archaeological sites occur in recreation areas or other places subject to regular public access. Supporting documentation for the reconnaissance survey including detailed site descriptions and recording forms were provided in the appendices of this report.

25-1225 Rosebrock, Ellen Fletcher

1978 A Historical Account of the Joy Street Block Between Myrtle and Cambridge Streets. 61 pages.

The report is a land use history for the African Meeting House area on Boston's Beacon Hill, from the 17th through the 19th centuries (see Reports #25-778, 868-871, and 130).

25-1226 King, Marsha K., Martha B. Lance and Valerie McCormack

1991 Archaeological Reconnaissance/Intensive Survey of the Birch Hill Dam and Reservoir in Royalston, Templeton, and Winchendon, Massachusetts. (Three volumes). 585 pages.

The purpose of this reconnaissance level survey was to provide information on the archaeological sensitivity of the 4,648-acre Birch Hill Dam project area and review the possible effects of current project operations on potentially significant historic properties. This data was used to make recommendations for developing an effective management plan for historic properties within the project area and future investigations at the intensive survey level. Two primary tasks, background research to review data on known cultural resources and formulation of a sensitivity ranking (predictive model) for the project area, were outlined. Background research also included the collection of information on the physical environment. Environmental data, including geomorphology, soils, and hydrology/drainage patterns, were used to develop the predictive model for the location of prehistoric cultural resources. Known patterns of prehistoric and historic settlement and land use near the Birch Hill Dam project area and the relationship of these patterns to local and regional developments were used to develop interpretive contexts for assessing the potential significance of identified sites. An important aspect of the reconnaissance intensive survey was field testing the predictive model for prehistoric resources through the application of limited subsurface sampling (shovel test pits). Historic cultural resources identified from documentary sources or the walkover inspection were also recorded. Additional observations were made on the nature and extent of previous disturbance and effects of current project operations within the Birch Hill project area. A total of four prehistoric sites and four find spots were located during the survey. In addition, a number of areas of high prehistoric archaeological sensitivity were identified. An archaeological sensitivity map was prepared for the fee and flowage easement portions of the Birch Hill Dam project area. An additional prehistoric site, a grinding stone lying just outside the boundaries of the project area was identified through informant interviews and located in the field. Several of the prehistoric sites/find spots are considered to be potentially significant, based on the limited information collected during the survey. A total of 250 historic period cultural resources were identified during the reconnaissance survey. The majority of these sites were identified from historic maps and/or real estate maps and were found to have been razed and destroyed. An additional historic period site, New Boston Cemetery, was identified outside, but surrounded by, the project area boundaries. A small number of the historic sites are considered to be potentially significant based on the limited information collected during the survey. Recommendations of additional intensive or site examination level archaeological investigations were made for all eight prehistoric and 16 of the 250 historic cultural resources. Open wells or septic tanks were located at four of the identified historic sites. Recommendations of filling were made for these potentially dangerous remains. Recommendations for maintenance and protection or preservation of cultural resources are offered, particularly in situation where archaeological sites occur in areas subject to regular public access. Supporting documentation for the reconnaissance survey, including site descriptions, site maps, and photograph logs were provided in the appendices of this report.

25-1227 Robbins, Roland Wells

1974 A Report on the Investigation of Buried Ruins of Colonial and Post Colonial Settlement and Activities at Moore Memorial State Park, Paxton, Massachusetts, June-October 1974. 52 pages.

Using a backhoe and high pressure water hoses, archaeological deposits were cleared away from foundation walls and stone ledge along Turkey Hill Brook in the vicinity of an historic gristmill and triphammer site. The report consists of color photos with descriptive captions of the work to restore “the natural setting and rustic beauty of the area.”

25-1228 Sardelli, Louis A. and Ann K. Davin

1988 Intensive Archaeological Survey, Field Investigations, Moore Memorial State Park, Paxton, Massachusetts. 54 pages.

Field investigations consisted of a walkover survey and subsurface testing. The walkover was useful in identifying the location of all known structures/foundations in the park. No new foundations were located and no surface evidence of prehistoric activity was found. Subsurface testing yielded

historic cultural material dating from the early to late 19th century. A low-density scatter of prehistoric chipping debris was located in disturbed context (house foundation trench).

25-1229 Roberts, Michael (Editor)

1989 Modified Historic Structures Reports for Moore State Park. 185 pages.

This report presents five modified historic structures reports and one summary of research and archaeological investigations for six locations within the Mill Village Complex of Moore State Park in Paxton, including the schoolhouse, ruins of the Comins House and barns, an earlier house and tavern site, and a triphammer site. Management recommendations were presented. The reports are designed to be used with the two volume cultural resources management plan (see Reports #25-333 and 25-390).

25-1230 Missio, Nicole A. and Donald G. Jones

1992 Intensive Archaeological Survey of the Proposed Hanover Marketplace Project in Hanover, Massachusetts. 50 pages.

This survey reports the results of an intensive archaeological survey of the proposed Hanover Marketplace in Hanover, Massachusetts. The survey was conducted in compliance with the Massachusetts Environmental Policy Act and consisted of background research, field reconnaissance, subsurface testing, and laboratory analysis. Background research for the survey indicated that, although the project area did not contain any recorded prehistoric sites, numerous prehistoric sites are recorded nearby. The project area is situated near Hanover Four Corners, which has been settled since the 17th century, but the project area consisted of the back part of farms that fronted Washington Street to the north. Therefore the potential for prehistoric sites was considered to be high and the potential for historic resources was considered to be only moderate. Field investigations for the project included a field reconnaissance and subsurface testing. Three areas were selected for subsurface testing on the basis of their potential to contain unrecorded prehistoric deposits. A total of 42 shovel test pits was excavated during the subsurface testing phase of the project within the three areas. The remains of a concrete foundation were also identified. No subsurface testing was conducted at this location, but the structural remains were surveyed and mapped. The archaeological testing rendered two prehistoric sites within the project area. The prehistoric site in Area 1 extends across a broad, high, wooded knoll adjacent to Columbia Road. The knoll steeply descends to a small stream and wetlands. A total of 205 prehistoric lithic artifacts were recovered from this area, consisting of flakes, cores, and angular waste of quartz, argillite, felsite, and chert. Seventy-four (or 36%) of the prehistoric artifacts were recovered in the B-horizon. The prehistoric site in Area 2 is situated on a smaller T-shaped knoll. Subsurface testing at this location produced five lithic flakes, one of which was recovered from the B-horizon. These materials consisted of quartz, argillite, felsite and chert. No diagnostic artifacts or features were identified at either prehistoric site, but both sites appear to be undisturbed. Therefore, these sites were considered to be potentially significant and should be avoided during construction. If avoidance is not possible, then a Phase II site examination should be conducted. The concrete structural remains identified in the southwestern portion of the project area adjacent to the stream probably represent the remains of a 20th century pump house. Due to its relatively recent date of construction, this site is not considered to be potentially significant and no further archaeological investigations were recommended for it.

25-1231 Raber, Michael S.

1992 Intensive Cultural Resources Investigation for Proposed Sewer Facilities, Killdeer Island Area, Webster, Massachusetts. 29 pages.

Background research indicated that the Killdeer Island area of Webster, Massachusetts, on Lake Chaubunagungamaug, was a likely area of prehistoric and historic Native American settlement,

making off-road project areas archaeologically sensitive. Field investigations, including subsurface testing, indicated that intense residential and commercial development since ca. 1930 have disturbed most parts of these areas, and that no potentially significant cultural resources have survived. No additional cultural resource investigations were recommended.

25-1232 Smith, Clifford E., Jr.

1992 Historic Archaeology at Sherburne: Nantucket, Massachusetts. 177 pages.

The purpose of the undergraduate thesis was to develop a preliminary research design for land and underwater archaeology at Sherburne, Massachusetts. The potential role of historical archaeology in investigating this early British-American colonial settlement was demonstrated by reviewing the known information on the site and identifying areas in which archaeological approaches may shed new light on its history. The physical and environmental aspects of Sherburne are discussed and illustrated. The location of Sherburne in New England and geological forces that formed Nantucket are discussed, along with the environmental conditions which have affected the site since the settlement was founded. The historical record of the early settlement was outlined, along with a discussion of the ways in which early" settlers interacted with the Native people and each other in the distribution of land and power. The previous archaeological work in the area of Sherburne and its harbor was then reviewed to indicate what efforts have been made thus far. Prior to this project there was no comprehensive plan for investigating Sherburne's past. In an attempt to address this issue, a synthesis of the available information of the site, coupled with a preliminary reconnaissance, provide a framework for developing a model that can be tested and redefined through future archaeological work.

25-1233 Riess, Warren C.

1992 Inspection of Possible Submerged Cultural Resources and Other Remote Sensing Targets in the Planned Outfall Construction Area, South Essex Sewerage District, Massachusetts. 16 pages.

A planned new outfall system for the South Essex Sewer District Salem, Massachusetts, will be constructed as an extension of the present outfall. Research indicates the possible presence of historically significant shipwrecks in the general area because of centuries of intensive maritime activity in the bay and harbors. Any outfall construction in the area might disturb one or more of the shipwreck sites. Therefore, an archaeological remote sensing and inspection survey was conducted to locate and identify any significant sites within the construction disturbance area. No cultural remains were located in the area. In addition, an inspection was performed of the sea floor near the present outfall for construction purposes. It appears to be compacted gravel and sand. No further survey work was recommended.

25-1234 Hamilton, Christopher E., Kenneth J. Kinkor and David A. Muncher

1992 The 1990-1991 Annual Report of Archaeological Data Recovery: The Whydah Shipwreck Site WLF-HA-1. 406 pages.

Data recovery from the shipwreck of the pirate vessel Whydah (WLF-HA-1) continued through 1990 and 1991. While no field work was conducted, substantial progress was made in the conservation, analysis and reporting of the site as well as in advancing the public benefits derived from the project. In late 1989, the Whydah project became guided by new goals to include the maintenance of the collection in a privately-owned "Pirate Theme Complex" based on recognition that the remains of the Whydah were of immense public as well as archaeological interest. An exhibit of a representative sample of Whydah material and a public demonstration laboratory was established at the Provincetown Museum on Cape Cod. The purpose of the Provincetown Museum exhibit is to allow the Whydah Joint Venture to proceed with the development of a permanent curatorial facility while assuring progress in artifact conservation and to assist in meeting public benefit needs associated with the Memorandum of Agreement concerning the project. Along with the

development of the Provincetown Museum Whydah Exhibit, laboratory staffing at South Chatham was reduced. The original need for a relatively large laboratory staff to meet project deadlines was replaced by the need to maintain the majority of the concretions in near stasis for slow public deconcretion within the context of the Provincetown Museum public demonstration laboratory and a more advanced laboratory planned for the permanent facility. Along with the change in project goals and the establishment of the Whydah Exhibit at the Provincetown Museum, in themselves tremendous benefits to the public and historic preservation, analysis of the artifacts and further investigation into the historic record has revealed a possible, if not probable connection between the pirate activities of Whydah, Freemasonry at a time when it was still a clandestine organization, and the Jacobite movement to restore the Stuart line of succession to the thrones of both England and Scotland. It is hoped that further study of the artifacts and historical record will continue to illuminate the suspected role of the Whydah in the contest to control the coming 18th and 19th century economic and political world hegemony of Great Britain. The 1990/1991 Annual Report is a precursor to the Final Report of Data Recovery.

25-1235 Nassaney, Michael S., Alan H. McArdle and Peter Stott

1989 Archaeological Locational Survey, Site Evaluation, and Data Recovery at the Russell-Harrington Cutlery Site, Turners Falls (Montague), Massachusetts. 122 pages.

The archaeological remains of the 19th century Russell Cutlery in Turners Falls (Montague) were to be impacted by the construction of the INDECK electric cogeneration facility. The 2-acre (0.8 ha) site was subject to an archaeological site locational survey and combined site examination/data recovery projects. Following intensive documentary review and subsurface testing, portions of the cutlery's waterpower system were found to be relatively intact. Portions of the site had integrity, data potential, clearly promised to contribute to historical archaeology and industrial history, and appeared to be eligible for inclusion in the National and State Registers of Historic Places. A data recovery project was conducted. Features evaluated include the turbine, tailrace, penstock, ducts and other power-related parts. Dumps of discarded production materials were also sampled and analyzed. The site provides an interesting glimpse into cutlery production, waterpower and the machine tool industry of the 19th century. No further archaeological treatment was recommended.

25-1236 Herbster, Holly and Mary Lynne Rainey

1992 Intensive Archaeological Survey, Proposed Dredge Material Transfer Project Haul Road, Brayton Point Station and South Somerset Site, Somerset, Massachusetts. 43 pages.

An intensive archaeological survey was conducted of a proposed dredge material haul road to re-establish a former dredge disposal site along the Taunton River just north of Interstate 195. The project area consists of a linear corridor (2950' x 25') for a proposed haul road between the disposal area and the Brayton Point Power Station. A 1978 survey (see Report #25-204) of the original dredge disposal area identified one significant, National Register-eligible archaeological site (Montaup Site, 19-BR-13l), and current construction plans have been designed to avoid and protect the intact portions of this site. A total of 77, 50 cm x 50 cm test pits were excavated during the intensive survey. These included a transect of 75 test pits, located along the proposed haul road, and two judgmentally placed test pits near the southern terminus of the transect. A low density of late 19th and 20th century field trash was recovered from the plowzone. Four pieces of quartz shatter were also recovered but were considered to be the result of natural and/or historic cultural processes (i.e., plowing). The intensive survey determined that construction of the proposed haul road will not impact any significant prehistoric or historic sites or deposits. No additional archaeological investigations were recommended.

25-1237 Holmes, Richard D. and Carolyn D. Hertz

1992 Archaeological Site Locational Survey of the Lenox Route 7/20 Improvement, Lenox, Mas-

sachusetts. 49 pages.

Most of the proposed route has been disturbed by previous construction, but two areas of potential impact were suitable for subsurface testing. Other than a thin deposit of historical artifacts, the only material found was a prehistoric lithic flake. This was found on the east side of the highway in Survey Unit 1 at a location that has been designated the Brushwood Farms Prehistoric Find Spot. No prehistoric or historic features were found. No further survey was recommended.

25-1238 Shaw, Leslie C. and Carolyn D. Hertz

1992 Archaeological Site Locational Survey for the Phineas Street Reconstruction Project, Dracut, Massachusetts. 72 pages.

The project area includes the full length of Phineas Street with four areas of moderate to high probability of locating prehistoric or early historic cultural resources selected for subsurface investigation. A total of 145 shovel test pits were excavated. One small prehistoric site (the Phineas Street Site) was located on a hilltop south of Beaver Brook. The site had a very low density of artifacts, with only five flakes (quartz and grey felsite) recovered from 24 shovel test pits. This low density, in combination with the possible historic disturbance of the upper level of the site, led to the decision to recommend no further archaeological work at this site. A very low number of historic materials was recovered from the project area, and these all indicated activity in the late 19th and 20th century. No further work was recommended.

25-1239 Hoffman, Curtiss

1991 Prehistoric Inventory, Middleborough, Massachusetts. 170 pages.

The Middleborough Prehistoric Inventory Project gathered information from public and private sources on site locations and prehistoric artifact distributions. This information has been placed on computer files and color slides for future access, for research, educational, and management purposes. Research for this project has included interviewing collectors, reviewing documents, and inventorying and photographing artifacts from various parts of the town. A total of 5,080 artifacts were entered into a computer-based inventory, keyed to individual photographic slide images. This has resulted in the identification of 120 previously unreported prehistoric sites, as well as the confirmation of 39 known sites within the town. The project also included the taking of a pollen core in a swamp north of Pocksha Pond to obtain a sequence of vegetative communities over time. On the basis of the information gathered from the research phase of the project, a model of prehistoric site distribution was constructed. The model took into account six environmental variables (aspect, distance from water, hypsometric integral, stream rank, soil type, and slope) and measures them against five cultural variables (site age, site function, complexity, redundancy, and intensity). Correlation of the last three cultural variables with the distance of a site to its nearest neighbor was also performed. The resulting tables allowed for the construction of hypotheses about the distribution of prehistoric cultural patterns throughout the Town of Middleborough. In summary, the study produced significant information demonstrating the importance of Middleborough as a central place throughout 10,000 years of New England prehistory. It has shown that certain areas of the town, particularly along the Nemasket and Taunton Rivers, were occupied more sporadically. Sites in the riverine areas also display a greater complexity of activity patterns than do the more isolated locations, indicating a more concentrated and varied population. There are high points of occupation, relative to the rest of the region of southern New England, during the Early Archaic, Transitional Archaic, and Early Woodland phases. The study produced a series of recommendations to the town as to how best to monitor and conserve its prehistoric cultural resources, accompanied by a detailed map based upon the above predictive model of site locations which can be used by town commissions and boards in estimating the archaeological sensitivity of any portion of the town in order to monitor construction or other land surface alterations (see Report #25-1240).

25-1240 Hoffman, Curtiss

1992 Middleborough Prehistoric Inventory, Supplementary Report, July 1991-May 1992. 136 pages.

This report supplements an earlier study (see Report #25-1239) of prehistoric land use in Middleborough, Massachusetts. The report describes field testing performed to test the accuracy of the model generated in the earlier study. Additional artifact collections research was also included. The report concludes that the model for site locations produced by the original inventory was confirmed by both field and further collections inventory. The model tested particularly accurate with regard to soil types (drainage) while other tested parameters (proximity to water, slope direct) either showed distributions relatively similar to those in the model, or were insufficiently tested. In conclusion, the inventory and field testing provide the Town of Middleborough with a powerful management tool that can and should be used in structuring future land use practices. The recommendations made in the original inventory were once again stated: continued inventorying of collections, nomination of districts and individual sites to the National Register, close and early monitoring of development plans, requirements that future archaeological survey work within the town take the model into consideration, encouragement of preservation land trust and public acquisition of important sites, cooperation with adjacent towns, and public education about the value of cultural resources. If even a fraction of these measures are undertaken, it is likely that a great deal of valuable information about past lifeways can be preserved for the enrichment of future generations of Middleborough residents and visitors.

25-1241 DePaoli, Neill

1992 The "Digging for Culture" Field Exercise: The Paine Estate "Barn" Site Dig. 20 pages.

This report summarizes the results of the 1991 "Digging for Culture" program conducted as part of the curriculum in the Waltham Public School System. The program was designed to introduce students to historical archaeology through classroom and field experiences. The field exercise focused on a 19th century barn site at the Paine Estate or Stonehurst in Waltham. Excavations produced a mixture of 19th to late 20th century artifacts most of which included glass, wire, nails, brick, wood, coal ash, charcoal, and road asphalt. Smaller amounts of redware, glass vessels, slag, and automobile window glass were also recovered. Most artifacts resulted from debris from the ca. 1974 fire that destroyed the barn and automobiles stored in it. Fieldstones, possibly rubble from the barn's foundation, were also recovered. Each class which participated in the project created a written and illustrated narrative report of their indoor and outdoor experiences.

25-1242 Beaudry, Mary, Jane Carolan, Sheila Charles, Elena Decima, Andrew Gilmore, Georgess McHargue and Michael Roberts

1989 History and Site Archaeology of the West Lawn of the Massachusetts State House. 82 pages.

This reports presents the results of background documentary and field research conducted on the west lawn of the Massachusetts State House. In the spring of 1988, a granite stone feature was encountered by workmen during the landscaping under Phase I of reconstruction activities for the Massachusetts State House. In the absence of any clues as to the exact identity of the feature, it was speculated that it could be remnants of the Hancock mansion, which had existed in the vicinity prior to its demolition in the mid 19th century. To determine the identity of the feature and its significance, emergency monitoring, documentation, and test excavations were conducted with two goals in mind. The first was to determine whether the stone feature was indeed related to the mansion itself; the second was to determine the feature's integrity and to evaluate its significance. Analysis of historic documents and maps, coupled with monitoring of already-planned landscape-related excavations and backhoe excavations indicated that the encountered stone feature was not directly related to the Hancock mansion. Additional directed research led to the hypothesis that this feature was a stone retaining wall for the formal gardens behind the mansion. Mortar analysis and a detailed excavation at one end of the wall plus a deep test behind the wall provide evidence

supporting this conclusion. The results of the excavations and documentary analysis indicate that a significant amount of the Hancock garden remains beneath the lawn of the State House, protected by no more than 10 to 14 inches of fill, and thus represents a significant archaeological resource whose investigation can aid researchers in understanding the nature of 18th century gardens, the evolution of garden design, and the role of these gardens in Colonial society. The terrace boundary of this remaining garden is defined by the retaining wall, which formed the edge and support for what was to be Joy Lane subsequent to the destruction of the Hancock mansion, and has remained despite landscaping and other activities associated with the development of the State House property.

25-1243 Nelson, Charles M.

1986 The Cove Site (l9-NF-82), Squantum, Quincy, Massachusetts. 17 pages.

This report summarizes archaeological research conducted at the Cove Site (19-NF-82) located in Squantum, Quincy, Massachusetts. Test excavations were conducted there in June and July of 1985 under the auspices of the City of Quincy Parks and Recreation Department and the University of Massachusetts at Boston. The goals of the excavation were to (1) determine how much of the site had survived construction and erosion; (2) assess the potential importance of the site and recommend policy for its conservation and development; and (3) determine the internal structure of depositional and activity areas within the site. Projectile points including Small Stemmed and Small Triangle varieties were recovered as well as a basal fragment from the Boats Blade and drills including one made from a Meadowood-like projectile point. Bifaces, scrapers, whetstones, grindstones retouched flakes, flakes and cores were also recovered. Carbon samples were also submitted for testing. A number of prehistoric sites once existed on the Squaw Rock peninsula. The Cove Site is the remnant of one of three contiguous sites. Near the tip of the peninsula, in the northern portion of the Chapel Rocks area, there is a spread of lithic debris in and beneath a soil which is covered in many areas by storm shingle. This probably represents an Archaic occupation prior to development of the present coastline. At the south end of the peninsula there is a shell midden composed mostly of soft shell clam.

25-1244 Pierce, Carolyn A.

1989 Intensive Cultural Resources Survey for the Proposed PSS-T Pipeline Facilities in Massachusetts. 31 pages.

This report summarizes the results of an intensive survey of 1.2 miles of a gas pipeline alignment in Plymouth, Massachusetts. Background research, a surface inspection and subsurface testing were employed in the 80-foot right-of-way. Fourteen pieces of chipping debris comprising the Frogfoot Brook Site were recovered on the surface along the southern boundary of the existing, highly disturbed right-of-way, well out of the proposed easement. Since the Frogfoot Brook Site was located outside the proposed easement and no cultural material was recovered within the proposed easement, no further cultural resource investigations were recommended.

25-1245 Garman, James C.

1992 Archaeological Locational Survey at Union Cemetery, Harwich United Methodist Church, Harwich, Massachusetts. 33 pages.

An archaeological locational survey was conducted within a 19th century cemetery in an area proposed for an addition to the historic church (ca. 1811). The congregation proposed to exhume marked graves in the area required for the building addition and reinter the graves elsewhere in the cemetery. MHC requested the survey to determine if any unmarked graves were present in the area proposed for the building addition and in the reinterment area. A funeral director who was associated with the congregation believed no unmarked graves were present because a walkover of the two areas with dowsing rods failed to detect any graves other than those marked with gravestones.

Topsoil in the two areas were stripped by machine and shovel skimmed. Four unmarked graves were found in the reinterment area, and ten unmarked graves were found in the area for the building addition. Sixteen graveshafts were verified to be associated with gravestones. Two existing footstones were not associated with any graveshafts, but two associated pit-like features suggested that two headstones were once present but removed; the two footstones and their once-present headstones were likely centotaphs. Two unmarked graveshafts may have been subject to exhumation, judging from the uneven nature of the features; a headstone found within the feature had been discarded and a newer stone commissioned for the reburial of the individual at another cemetery. A holding crypt built in 1860 was recorded prior to its demolition. Evidence of a structure, possibly an outbuilding, was also found. The report recommended that unmarked graves be avoided or subject to archaeological data recovery.

25-1246 Decima, Elena, Kathleen Bond, Leith Smith and Christopher Edens

1989 Intensive Archaeological Survey of Project Phase I Road Right-of-Way and Walkover Inspection for the Evergreen Estates Project, Tyngsborough, Massachusetts. 23 pages.

This report summarizes archaeological research conducted at the Evergreen Estates project, a proposed 106-lot cluster development in Tyngsborough. The project will affect approximately 100 acres of woodland in a parcel located between Coburn Road on the west and Willowdale Road and Mascuppic Lake on the northeast, east and southeast. The construction project is scheduled to take place in five phases spread out over the next few years. The intensive survey of the roadway at the Evergreen Estates project was performed in anticipation of the layout of a main road for the first phase of the proposed development. The physical characteristics, regional setting of the parcel, and the known patterns of prehistoric occupation in the region all confer a high archaeological potential to the project parcel. The apparent low intensity of historical occupation, coupled with a low probability that the land was ever used for agriculture, suggests that any prehistoric sites that may lie in the area are so far undisturbed. Subsurface testing along the roadway for Phase I of the Evergreen Estates project revealed no prehistoric occupation and no significant historic occupation. On the basis of field work and analysis, it was recommended that the construction of the road proceed as planned. Walkover inspection identified several areas within the project that should be tested via intensive archaeological survey prior to ground disturbance.

25-1247 Ritchie, Duncan and Beth Miller

1990 Reconnaissance and Intensive Level Archaeological Survey of the Nawn Factory Site Roxbury Heritage State Park, Roxbury, Massachusetts. 213 pages.

This report presents the results of several phases of archaeological investigation within a section of the proposed Roxbury Heritage State Park in Boston. The Nawn Factory site is one of the major elements of the proposed park and consists of a roughly half-acre parcel of land located at the intersection of Washington Street and Melnea Cass Boulevard in Roxbury. Reconnaissance level background research and a walkover inspection were synthesized to identify archaeologically sensitive areas within the project where subsurface testing, including machine assisted excavations were performed. Four areas of the Nawn Factory were identified as containing potentially significant information. The significance of these sections of the site was based on the potential they had to contribute to a more accurate reconstruction of the depositional history of the Nawn Factory site and larger research problems or themes associated with the development of Roxbury as an urban community. These areas of the Nawn Factory site were recommended for further evaluation at the site examination level. One area includes the large cut stone masonry wall located under the former location of Hunneman Court. With further subsurface sampling along the northern edge of the Nawn Factory site, it may be possible to establish the presence or absence of the wharf structure associated with the Doggett House/Tavern and referred to in documentary sources. Further investigation of the area under Hunneman Court could help to reconstruct the topography of the area in the late 18th century before major modifications took place. The second area includes the area to the rear (east) of the Doggett and Cunningham Houses containing 18th century depositions buried

under deposits of 19th century and modern fill. This area had the potential to yield data on the late 18th/early 19th century occupational histories of the Doggett House/Tavern and the Cunningham House, when these structures were owned by individuals or families engaged in small scale commercial enterprises or trades (tavern, bakery, soap manufacture, candle making). The third area focuses on the alley between the Doggett and Cunningham Houses. Although both houses were destroyed by arson in the l980s, and their cellars were subsequently filled and graded with sand, the alleyway between the houses may be a valuable source of information on the occupational history of the two structures. During the intensive archaeological survey of the Nawn Factory site, an unusual brick foundation was exposes along the rear of the Doggett House. Additional excavation could help to define the placement and purpose of this foundation and determine if it was built to support a section of the Doggett Tavern or for some other purpose. The fourth area recommended for evaluation at the site examination level included the foundation for the large tenement structure located immediately north of the Nawn Factory building and within the cobblestone "courtyard" area. Machine trenches uncovered deposits of 19th century domestic refuse (bone, ceramic sherds, bottle glass) associated with this structure buried under layers of more recent fill between the brick factory building and the tenement foundation. These deposits appeared to have retained more integrity than those observed around the other tenement structures exposed in trenches on the north side of Nawn Street. Deposits of this type could be a potential source of information on the lifeways of the people that occupied these early tenements, who may have been employees of Owen Nawn.

25-1248 Pendleton, Sally

1990 The Plant Remains from the Spencer-Pierce-Little Kitchen: A Historical Ethnobotanical Analysis. 132 pages.

This master's thesis is a study of the macrobotanical remains from the archaeological excavations under the kitchen floor of a 300-year-old house in Newbury. The bulk of the remains came from an interior stairwell abandoned and filled in the last quarter of the 18th century when the house was occupied by the upper-class family of Nathaniel Tracy, a Newburyport merchant and gentleman farmer. A summary of the history and future of the house and property is followed by a discussion of botanical analysis and the role it plays in historical archaeology. Excavation, sampling, and recovery methods used to remove the kitchen deposits are described. Charred and uncharred remains of wild grasses and an herb, uncultivated herbs and fruits (cheno/am, clover, smartweed, purslane, sheep sorrel, hickory, peach, cherry, sumac, blackberry or raspberry, elderberry, blueberry), and domesticated plants (squash, wheat, corn) were recovered. The recovery of comparatively large amounts of charred corn remains is undocumented in the Northeast. The character of the plant remains suggest that the stairwell fill was created by the deposition of kitchen refuse, architectural debris, and earth from near the house over a short period of time in late spring or early summer. The hypothesis, based on documentary sources, that the upper-class Tracys would have consumed fruits and vegetables only available in the market rather than foraging for wild plant foods, is not supported by the evidence, and may be related to their financial condition at the time the stairwell was abandoned.

25-1249 Beaudry, Mary C.

1988 Archaeology of the Spencer-Pierce-Little House Property, Newbury, Massachusetts. Interim Report No. 1. 14 pages.

This report summarizes archaeological activities at the Spencer-Pierce-Little property since the initial reconnaissance survey (see report #25-743) of the site conducted in 1987. The report includes brief results from excavations conducted in the summer of 1987 during a series of public workshops in archaeology in which excavations were conducted in the west, north and east yards of the house. The report also includes the results of excavations conducted in the winter of 1987 and spring of 1988 inside the house, in the cellar. Excavations in the yard produced deposits which provide information about landscaping and plantings as well as about outbuilding construction and

refuse disposal. Excavations in the west cellar failed to produce undisturbed archaeological deposits; however, excavations in the east cellar produced well preserved and deeply stratified remains. Recommendations were made for future excavations in the houselot as well as a more extensive survey of the entire Spencer-Pierce-Little property. Recommendations were also made for an inventory of all historic and prehistoric sites on the property as well as the recording of changing field boundaries.

25-1250 Pendleton, Sally

1988 Archaeology of the Spencer-Pierce-Little House Property, Newbury, Massachusetts Interim Report No. 2, Analysis of the Plant Remains. 37 pages.

This report summarizes a study of the macrobotanical remains recovered during the archaeological testing conducted at the Spencer-Pierce-Little house in autumn 1986. The report first gives a condensed ownership history of the property, with emphasis on those episodes mentioned in the documents that may be relevant to the past botanical character of the Spencer-Pierce-Little homestead. The next section describes the purpose of the archaeological testing, and excavation, sampling, and recovery strategies are summarized. The third section lists the excavation contexts of the macrobotanical remains themselves, followed by a discussion of the possible cultural uses of such plants. The fifth section contains an interpretation of the remains, including a discussion of what depositional and postdepositional factors may have been involved, and whether valid conclusions can be drawn from this preliminary sample. Finally, some recommendations geared toward the implementation of further archaeobotanical work at the Spencer-Pierce-Little property are presented. In general, the analysis of macrobotanical remains from limited excavations at the house were inconclusive. More macrobotanical analysis was recommended, possibly from a sealed and tightly dated well or privy on the property.

1989 Beneath the Kitchen Floor: Archaeology at the Spencer-Pierce-Little Farm, Interim Report No. 3. 149 pages.

This volume presents a collection of studies resulting from background research, fieldwork and analysis of finds at the Spencer-Pierce-Little House. Chapter one introduces the project followed by an overview history of the Farm in Chapter two. Chapter three details the excavations in the kitchen crawlspace followed by a study of the artifactual evidence from this area in Chapter four. Chapter five summarizes plant remains from the kitchen crawlspace with a pollen analysis of stairwell fill under the kitchen in Chapter six. Chapter seven presents a faunal study from the kitchen with overall conclusions in Chapter eight.

25-1252 Beaudry, Mary C.

1991 summary Reports for the 1989, 1990 and 1991 Field Seasons at the Spencer-Pierce-Little House, Newbury, Massachusetts. 8 pages.

Three brief reports are provided as summaries of the 1989, 1990 and 1991 field seasons at the Spencer-Pierce-Little Farm. The 1989 report reports on excavations in the House garden, wood house and poultry house areas. Excavations at the flower garden yielded mixed results indicating the garden had been relandscaped at some time in the recent past. Excavations in the wood house locale uncovered the possible foundation remains of a crude outbuilding. Excavations in the poultry house area produced enormous quantities of 19th century household refuse. During the 1990 field season excavations were continued in the East Yard and Scullery areas. A fieldstone foundation in the East Yard proved to be the upper portion of a deep, stone lined late 18th/early 19th century privy containing extensive quantities of ceramics and macrobotanical/faunal remains. Excavations in the area of the scullery foundation found it was partially destroyed by the installation of a

brick cistern dating to the late 19th century--an important find in and of itself. In 1991 several units were excavated immediately west of the kitchen ell in an area where a scullery or an addition to the kitchen once existed. Excavations in the scullery area produced evidence of features indicating possible wood floors and artifact deposits dating throughout the 18th and into the early 19th century. Excavations outside the kitchen/scullery area produced midden deposits containing quantities of animal bone in good condition and ample evidence of various landscaping episodes.

25-1253 Ritchie, Duncan, Edna Feighner and Diana Doucette

1992 Archaeological Investigations, Massachusetts Water Resources Authority (MWRA), Spot Pond Pipeline Improvement Pipeline Project Area, Stoneham, Massachusetts. 156 pages.

During the intensive survey, background research and a walkover/surface inspection were used to stratify the project area into zones of expected archaeological sensitivity. Background research indicated that while there were no known prehistoric sites in or adjacent to the project area, several types of sites (temporary camps, quarry site/lithic workshop) had been recorded within a few miles of the Spot Pond area. Documented historic/modern period cultural resources in or near the project area included several standing structures (Tudor Barn, Botume House, Spot Pond Pumping Station) listed in the National Register of Historic Places. Background research also indicated that the project area had the potential to contain the remains of structures associated with an episode of mid/late 19th century estate development on the eastern shore of Spot Pond. Test pits were placed at 10 meter intervals in zones of high sensitivity; low sensitivity zones were sampled at 20 meter intervals. The intensive survey identified two prehistoric site areas (Spot Pond I, II) and two small loci (Locus 1, 2) or activity areas with a few pieces of prehistoric cultural material (chipping debris). An isolated soil anomaly representing a possible prehistoric feature (TB-24) was also found. The only historic period feature found in the intensive survey was a section of abandoned roadway (carriage path) probably associated with 19th century estates, but was not considered significant. Loci 1 and 2 were found to contain very low densities of cultural material and not considered significant. The Spot Pond I and II sites were lithic workshops containing deposits of chipping debris and bifacial tool blades broken during manufacture and discarded. The temporal/cultural affiliation of the Spot Pond I and II sites was unknown, but they were considered to be potentially significant examples of lithic workshop sites located on the perimeter of a major lithic source area (Lynn Volcanic complex). These sites were investigated further at the site examination level, by sampling with a close interval (5, 10 meter) test pit grid and 1 x 1 meter excavation units. In addition to documenting the size, condition, and internal structure of the Spot Pond I and II sites, the site examination also confirmed that the isolated soil anomaly/feature (TB-24) was within a small lithic workshop which was designated as the Spot Pond III site. All three sites were found to consist of lithic workshop loci containing varying densities of broken, discarded bifacial tool blades or preforms and chipping debris. They were most likely created by prehistoric groups that had procured lithic raw material (felsite) at nearby source areas in the Wakefield and Melrose sections of the Lynn Volcanic complex. Fragments of tool blades and projectile points found during the site examination suggested these sites could have been occupied in either the Archaic or Woodland periods. It was recommended that the proposed pipeline be relocated to avoid the Spot Pond I, II, and III Sites. An avoidance and protection plan was developed for the sites.

25-1254 Hoffman, Curtiss

1993 Astra Pharmaceutical Products, Inc. Campus Expansion Plan, Archaeological Intensive Survey, Preliminary Report. 130 pages.

The intensive survey was conducted at the request of the Westborough Historical Commission, with assistance from the Ekblaw Chapter of the Massachusetts Archaeological Society and Bridgewater State College. The report includes a detailed overview of previous archaeological investigations in the Hoccomonco Basin area of Westborough and land use history. 128, 50 cm x 50 cm units were excavated in seven areas of the property. Lithic material, including a Small Stemmed point fragment, debitage of quartz, felsite, argillite, hornfels, and chert were recovered.

Three areas of the property were recommended for site examination/data recovery. See also Report #25-280.

25-1255 Garman, James C.

1993 Archaeological Site Locational Survey for the Bridge Replacement Project, Prescott Street Over the Nissitissit River, Pepperell, Massachusetts. 52 pages.

An intensive (locational) archaeological survey was completed for a bridge replacement project in an historic area. Background research included a collection of historic photographs from a local resident. Shovel test pits were excavated in the project impact area and to evaluate historic features located adjacent to the project. The south portion of the project area contains archaeological remains from the North Village, a mill complex developed in the third quarter of the 18th century and active until 1884. The North Village is potentially eligible for inclusion in the State and National Registers of Historic Places as an historic district. These remains include the stone foundation of the Old Brick Tavern, a late 18th century structure, as well as traces of the raceway and mill dam. Most of these structures are outside of the project area. An early 19th century sheet midden encountered here is associated with the occupants of the tavern. The river's north bank contains a feature also associated with the North Village--a stone-lined cellar hole identified only as "the Norwegian's House" on a map sketched in the 1920s. This cellar is outside of the project area. Review of project plans indicated it was possible to avoid and protect the features. No further survey was recommended for either area, provided the archaeologically sensitive areas were not disturbed.

25-1256 Bell, Edward L.

1993 Historical Archaeology at the Hudson Poor Farm Cemetery, Hudson, Massachusetts. 116 pages.

Archaeological testing located the boundaries of the 19th century Hudson Poor Farm Cemetery (MHC #HUD-HA-1) used from circa 1825 to 1866 by Marlborough and later, Hudson, Massachusetts, and associated with the towns' poor farm or almshouse. The history of the poor farm is interpreted within the larger context of poor relief and care for the sick, elderly, and disabled in 19th and 20th century Massachusetts. Seventeen graveshafts were identified using shallow shovel trenches. Fragments of a white limestone or marble headstone (once set in a granite plinth) and a footstone were found. The site was likely a plowed field prior to its use as a burial ground; two artifacts were recovered in the plowzone strata which date to the mid- to late 19th century. Likely evidence of a 1936 brush fire was identified. A prehistoric archaeological site is also present, as indicated by a quartz core and a possible fire-related feature. The Hudson Poor Farm Cemetery is eligible for listing in the State and National Registers of Historic Places under Criteria A and D. Recommendations were made to protect and preserve the cemetery through the granting of a preservation restriction, site stewardship, minor site clean-up, and a commemorative marker.

25-1257 Pendery, Steven R. and Robert W. Preucel

1992 The Archaeology of Social Reform: Report on the 1990 and 1991, Field Seasons of the Brook Farm Hive Archaeology Project. 135 pages.

This report details the results of the 1990 and 1991 field seasons at the Brook Farm Historic Site in West Roxbury. Its primary research goals were to identify the major archaeological resources of the site, to interpret their meaning in the context of social reform movements and to assist the Metropolitan District Commission by providing recommendations for managing these diverse resources. The project instructed students and volunteers in the basics of archaeological field methods and laboratory procedures and sought to raise the visibility of archaeology in the local community. Brook Farm is unique among historical sites in New England in possessing several different occupations which are linked together by the theme of social reform. Different visions are rep-

resented by the Utopian community, the Roxbury City Almshouse, the Lutheran Orphanage, and the Brook Farm Home. The central research problem was to examine how these views of social reform were expressed in the landscape, architecture, and material culture. Of particular interest were the attempts by institutions to control the behavior of resident populations through policies of centralization, segregation, specialization, and standardization and in the responses by the resident populations negotiating this control. Other related themes include the division of labor, the role of education and industry, the rural-town dichotomy, and social class. These issues are being addressed through archaeology and by means of an oral history project. The project identified the location of the building used during the Colonial and Utopian periods. This finding disconfirms the popular attributions of the Martin Luther Orphans Home as the Utopian period Hive. The size of the Hive corresponds in most respects with the measurements provided in an historical document. The fieldwork also sampled the cellar holes and backyard area dating to the Almshouse, Orphanage and Brook Farm Home periods. Toys, games, and phonograph records were found in the upper strata of many test pits. There is clear evidence in the upper strata of some test pits for the fire which destroyed the Home in 1977. A substantial fill deposit indicates a large scale leveling of the site, probably sometime during the Orphanage period. The prehistoric component of Hive/Home area was found to be more extensive than previously thought. Previous testing produced a single Squibnocket point. Six additional projectile points and a dozen felsite lithics from five different test pits were subsequently located; Fox Creek and Squibnocket types suggested an Early Woodland occupation (ca. 3000 BP) of unknown extent. Because of the disturbed context of these finds, it is not clear whether a primary or secondary deposit is represented. The oral history project was initiated about the Martin Luther Orphans Home and the Brook Farm Home periods of the site. Phone and written interviews have been conducted with over 50 individuals, including orphans and past directors of the Home.

25-1258 Young, William R.

1977 Phase I Archaeological Surface Survey of the Proposed Site for the New Hampshire County Jail and House of Correction. 6 pages.

This report briefly describes the procedures, findings and recommendations of a Phase I archaeological survey at the proposed Hampshire County Jail and House of Corrections site in Northampton, Massachusetts. The study was basically a surface survey although some test pit excavations were also done. Two quartz artifacts including a Late Archaic scraper were found. Fluted points have been reported in the area and pot hunters may have excavated at the site. Further intensive investigation was recommended based on the recovery of the two quartz artifacts.

25-1259 Dincauze, Dena F., Stephen Mrozowski, Michael Roberts, Catherine Carlson, Robert Thompson, Paige C. Newby and Thompson Webb III

1985 Reconnaissance Archaeological Study for the 500 Boylston Street Project. 60 pages.

A reconnaissance archaeological study was completed for the New England Life project located at 500 Boylston Street in the Back Bay section of Boston. The scope of the study included the extraction of two cores from Providence Street and their analysis; the completion of background research on coastal fishweirs throughout the world; and the development of a work plan and research design for the recovery of data from the site. The analysis of the cores reveals a wide variety of environmental indicators as well as a surprising diversity in sediment textures. The researchers were confident that a rich data set could be retrieved from the site. The analysis of the literature on fishweirs lends caution with regard to the fishweir concept until a full range of sea-level and embayment dynamics is understood through an accurate analysis of the feature's morphology, trapped sediments and other associated data. The introduction to this report places the archaeological study in perspective with the 500 Boylston Street project. This is followed by a brief description of the project and its status. The heart of the report is the Significance Statement and Research Design, based on the results of the coring and literature research.

25-1260 Dincauze, Dena F.

1992 Report of Cultural Resources Survey on Hampshire College Campus, South Amherst, Massachusetts. 20 pages.

New construction is anticipated close to the find spots of artifacts uncovered by construction in 1988. A large quartzite bifacial scraper was found after disturbance near extensive freshwater seeps at the foot of the slope from the Holyoke Range. The field investigations revealed no cultural remains in situ. Survey methods included landform and soils interpretation, walkover, plowed field examination, coring, and shovel test pits with screening; historic land use is interpreted. The finds are provisionally interpreted as ritual deposits near springs in the third millennium B.P., associated with a pathway leading east from the Connecticut River (the historic Bay Path).

25-1261 Loparto, Leonard W.

1993 Archaeological Intensive Survey of Project Areas II and III Phases II and III at Lot 3 of the Plimptonville Trust Property, Walpole, Massachusetts. 133 pages.

An intensive (locational) archaeological survey was conducted. Additional testing was also performed on a proposed sewer easement which extends through both project areas and was originally tested in a separate study (see Report #25-1133 and -1153). The study focused on potential prehistoric and historic cultural resources identified in Sensitive Areas II, III and IV during the earlier reconnaissance study. This study completes recommended surveys for the Lot 3 area by combining archaeological research for two phases of Lot 3 development in one study. The present study includes 87+ acres (35.24 hectares). The sewer easement measured 1,270 linear feet (387.60 meters). Background research, a walkover survey and hand (shovel) excavation indicated the presence of six prehistoric and one historic sites on the property. A total of 745, 50 x 50 cm test pits and 6, 1 x 1 meter units were excavated in the area over a one year period. The units were located along an off-set systematic grid, random test pits, judgmental transects and expansion units. Each of the prehistoric sites contained from 1 to 3 pieces of cultural material including chipping debris, biface fragments and ceramics. Based on the presence of a bifacial fragment in the B horizon at the Plimptonville I site and prehistoric ceramics in the A horizon at the Indian Hill #1 site, a period of land use from the Archaic through Woodland periods is possible for the area. A Late Woodland or Contact Period component may be present at the Indian Hill #1 site based on the presence of somewhat thin, fine-grained grit-tempered ceramics. Otherwise, the remaining cultural materials are undiagnostic. Extended habitation of the area associated with the Neponset Indian "Reservation" was not recognized; however, all prehistoric finds are consistent with the reservations use for hunting, fishing, and trapping, all of which are short term activities that would not leave high density or large scale archaeological signatures. All of the prehistoric sites or find spots located were determined to represent limited evidence of prehistoric activity and were not considered significant. One historic site was also encountered consisting of the remains of a probable piggery and animal pens associated with late 19th and 20th century land use from the Lewis Farm. Stone walls and recent trash were also found. Field trash in excavation units was limited to coal and coal slag. These activities were also not considered significant. Since both prehistoric and historic sites were determined to lack eligibility for listing in the National Register of Historic Places, no further archaeological or historical studies were recommended for the study area.

25-1262 Miller, Beth P.

1993 Phase 1a/b Intensive Archaeological Survey Along the Algonquin Gas Transmission Company's 5.5-Mile 24-Inch G-5 Lateral Replacement Pipeline, Attleboro, Rehoboth, and Seekonk, Massachusetts and Phase II Site Examination of the Ledge Road Prehistoric Site (19-BR-349) Seekonk, Massachusetts. 162 pages.

Intensive and site archaeological survey was conducted along a 5.5-mile natural gas pipeline route. The site examination was performed at the Ledge Road Prehistoric Archaeological Site located in Seekonk, Massachusetts. The Ledge Road Prehistoric site was determined to contain components dating from the Middle Archaic through the Woodland periods (7,500 to 450 B.P.), representing a variety of subsistence-related activities. Prehistoric cultural materials recovered included diagnostic projectile points (i.e., Stark, Small Stemmed, Squibnocket Triangle, and Susquehanna), a considerable quantity of lithic debitage, as well as an example of aboriginal pottery and a decorative or ceremonial object. The diversity of lithic materials found on the site is a potential indicator of Native American trade and exchange within the Runnins River and the Ten Mile River drainages of the Narragansett Bay basin system of southern New England. In addition, the presence of a hearth-feature, calcined bone, and fire-cracked rock, suggests that food preparation and processing activities had taken place at this site, along with tool manufacture and maintenance. The Ledge Road Prehistoric Site was considered eligible for listing in the National Register of Historic Places under Criterion D. The project impact area was relocated and no further archaeological excavations were recommended.

25-1263 Glover, Suzanne and Diana Doucette

1992 Archaeological Investigations: Site Examination and Data Recovery Program, The Heath Brook Site (19-MD-22). Volume I, 134 pages; Volume II, 203 pages.

A site examination investigation was conducted at the surviving portion of the Heath Brook Site (19-MD-22) in Tewksbury. The site examination determined that the prehistoric deposits associated with this site constituted a significant archaeological property that could contribute to the knowledge of the prehistory of the area. A data recovery program was designed and implemented to fulfill the archaeological mitigation for the proposed development. The data recovery program consisted of the partial retrieval (5%) of the archaeological elements within the defined 1,125 square meter surviving portion (knoll) of the original 50-acre Heath Brook Site. The original site area had been documented in the 1940s by Ripley Bullen during his comprehensive survey of the prehistory of the Shawsheen River drainage. Volume I presents the overall text for the study. Volume II presents the artifact catalog, specialized tests, correspondence, and technical proposals. The archaeological investigations at the knoll portion of the Heath Brook Site, combined with the site's large artifact assemblage from avocational collections and Ripley Bullen's excavations, provided substantial information concerning prehistoric land use systems along Heath Brook and within the Shawsheen River Valley. A deeply buried Early Archaic component was represented by a bifurcate-base projectile point and radiocarbon-dates from two deep, large pit features. These deposits were spatially intact and underlying an intensive Middle Archaic component along with subsequent, more specialized Late Archaic and Middle Woodland occupations. The archaeological data collected at the site was used to address research questions concerning settlement and subsistence, resource use, seasonality, and lithic technology in the Shawsheen River drainage. The information was also used to understand the full depositional history of the knoll portion of the site as well as complete that of the original 50-acre site area. An examination and comparison of the identified subsistence and settlement patterns within known prehistoric contexts at the subregional (greater Merrimack basin) and regional (eastern Massachusetts) levels was also made.

25-1264 Jones, Donald G.

1989 Results of an Archaeological Reconnaissance Survey of Beaver Brook Reservation in Belmont and Waltham, Massachusetts. 132 pages.

An archaeological reconnaissance survey was conducted to identify and assess the potential for prehistoric and historical archaeological resources that may exist within the park's boundaries. The survey was conducted in advance of current plans to renovate the park. The survey consisted of background research, field reconnaissance and site mapping, limited subsurface testing, laboratory analysis, and report preparation. The background research indicated that human activity within the park dates from the prehistoric period up to the present. The field reconnaissance resulted in the

identification of a number of historical sites and areas that have potential for both prehistoric and historical remains. Limited subsurface testing was conducted at the presumed location of two mills to investigate subsurface deposits at these sites. Analysis of the background research, field reconnaissance, and subsurface testing phases of the project provided recommendations for the protection of cultural resources and for additional archaeological and architectural investigations for areas that are slated for development or improvement. The cultural resources identified during the survey include two prehistoric sites in the southern section of the park; remains of an 18th to 19th century gristmill at the Upper Pond; remains of possibly a 19th century barn and the former location of a shed; a 19th century house, now used as offices for the Park Superintendent; the presumed locations of a late 19th century ice-harvesting operation; and a variety of park-related structures and features, such as picnic tables, paths, and footbridges. In addition to the individual cultural resources listed above, the historical landscape of Beaver Brook Reservation is considered to represent a significant cultural resource in its own right; this landscape includes topographical features such as the brook and the falls and cultural features such as stone walls and mill remains. Recommendations generated for the project include Phase I (intensive) archaeological testing for a number of areas that may be slated for development and additional architectural evaluations of the extant structures. In particular, recommendations include additional archaeological testing at the presumed locations of the two prehistoric sites, the mill remains, the mill dams, and the ice-harvesting operation; additional architectural evaluations of the barn and the Copeland House; and the establishment of a landscape design that is sensitive to the individual cultural resources identified during this survey and preserves the historical landscape of the park. In general, it was recommended that a qualified archaeologist evaluate any proposed development or improvement plan that may cause disruption or alteration to the landscape.

25-1265 Cross, John R. and Leslie C. Shaw

1991 A Long-Term Record of Short Term Use: Archaeological Data Recovery of the Baxter Neck Site (19-BN-643) Barnstable, Massachusetts. 213 pages.

Archaeological data recovery excavations revealed that the site contained components dating from the Middle Archaic Period (8,000-6,000 B.P.) through the Late Woodland Period (1,050-450 B.P.), although the Late Archaic, Early Woodland and Late Woodland Periods are most strongly represented. Radiocarbon dates indicate occupations of two areas at 550 $\pm$ 80 and 240 $\pm$ 70 B.P. A thin scatter of 17th and 18th century artifacts reflects Colonial historic refuse disposal in a non-residential context. The excavation identified eight spatially distinct activity areas, including a Late Archaic fire hearth, a lithic work area linked to the production of Levanna projectile points, and areas of ceramic use and breakage. The site spans the period when ceramic technology was introduced into southern New England. Data from the site suggest some temporal overlap between ceramic use and Small-Stemmed Point, Susquehanna/Orient and Early Woodland artifact traditions. Occupations at the site also span the period when shellfish beds were established on Cape Cod. The site was occupied repeatedly, but for brief periods of time. This is undoubtedly a common pattern in prehistory, but it is one that is seldom documented archaeologically.

25-1266 Holmes, Richard D., Carolyn D. Hertz, Elena L. Filios and Mitchell T. Mulholland

1993 An Archaeological Reconnaissance Survey for the Wastewater Treatment Facilities Plan/Environmental Impact Report, Plymouth, Massachusetts. 72 pages.

An archaeological reconnaissance survey was conducted. Four sites were surveyed. No standing structures were noted on the sites, but nearby historic structures that may be visually impacted were recorded. The project areas have not been used intensively in historic times, and, except for traces of Colonial period roads, no historic resources were observed. A "herring ditch" (ca. 1701), which was intended to introduce anadromous fish to landlocked ponds, was reported outside one project area. No evidence of prehistoric activity was found. The project areas contain well-drained knolls, several springs, and potential intermittent streams and ponds which would provide suitable conditions for prehistoric occupation. Consequently, much of the area has a moderate to high po-

tential for containing small prehistoric sites. Additional investigations were recommended for all sensitive areas that are to be impacted by the project.

25-1267 Jones, Donald G.

1993 Archaeological Reconnaissance Survey of Boston University's Proposed School of Management Building in Boston, Massachusetts. 34 pages.

An archaeological reconnaissance survey was conducted of the site of a proposed building on Commonwealth Avenue west of Kenmore Square. The archaeological survey consisted of historical research, review of geotechnical data obtained from borings, and test excavations at the site, and the review of relevant available comparative archaeological studies. The survey also included an assessment of existing surface conditions at the site based on a walkover of the project area. The results indicate that the project area is situated over a former island of marshes and mudflats that was separated from the south bank of the Charles River by a narrow inlet. The area remained underwater, or least subject to tidal inundation, throughout much of the historical period until it was filled in the 1880s. The parcel remained largely undeveloped throughout the 20th century, but it did contain a house in 1935 and later two successive gas stations with associated underground storage tanks. Review of geotechnical data obtained from the site indicates the presence of historical landfill, to a depth of ca. 15 ft below the surface. Below the landfill, and extending to a depth of ca. 40 ft below the surface, are undisturbed marine sediments. The Boylston Street Fishweir site, which is located approximately one mile east of the project area, contained the remains of a prehistoric fishweir in the lower levels of marine deposits at that site. Therefore, the undisturbed marine deposits at the proposed project area are considered to have potential for similar prehistoric remains. Archaeological testing is recommended for the project. Such testing would consist of monitoring by professional archaeologists during the construction of a perimeter lining wall and a combination of monitoring and archaeological excavation during the construction of the underground garage. The additional archaeological investigations should be limited to the eastern portion of the site because of the presence of contaminated soils associated with the former gas stations in the western portion of the project area.

25-1268 Pendery, Steven R.

1992 Report on Archaeological Testing at Long Island Head, Boston, Massachusetts. 38 pages.

An archaeological reconnaissance and subsurface testing program was conducted. The emphasis of the project was to provide inner-city Boston youths participating in the Boston Youth Conservation Corps with archaeological experience. The archaeological project focused on a 20 x 30 m area directly west of the Long Island lighthouse. Twenty-two 50 x 50 cm test pits were excavated at 5 m intervals throughout the project area. No conclusive evidence for prehistoric land use was uncovered. Relatively abundant 19th and 20th century artifacts were found in all test pits, including coal, nails, brick, pottery, and glass. The results of archaeological testing indicate that the project area is probably in the vicinity of one or more structures associated with both the lighthouse and Fort Strong. An undated photograph shows a small unidentified structure in the approximate location of the project area. Artifacts suggest that the period of occupation was ca. 1840 to 1950. Because of the absence of soil disturbance and the absence of earlier sites, it appears likely that Long Island Head was not subject to intensive occupation until the 19th century, perhaps because of the absence of fresh water.

25-1269 Pendery, Steven R.

1993 Report on Intensive Site Survey, MBTA Vent Shaft G-10, Deer Park Parking Lot and Park Street Improvement Project Area, Boston Common. 38 pages.

Archaeological testing was conducted at the Deer Park, Boston Common, by volunteers from the Boston City Archaeology Program. The location of tombs extending beneath the Deer Park park-

ing lot from the Central Burying Ground was determined and these were avoided by construction. Seven 1 x 1 m test pits were excavated in the project area, which yielded no significant results. No additional archaeological research was recommended. A second, modest program of archaeological testing was conducted at the project area for improvements to the Park Street Mall on the Boston Common. Project construction involved widening the mall and installing new drains. Three 50 x 50 cm test pits were excavated in the area of the drain in an attempt to evaluate the archaeological preservation of this portion of the Boston Common. No significant archaeological resources were identified and no additional archaeological research was recommended.

25-1270 Holmes, Richard D., Carolyn D. Hertz, Mitchell T. Mulholland and Eric S. Johnson

1993 Archaeological Site Locational Survey, Main Street/Route 20, Sturbridge, Massachusetts. 54 pages.

An archaeological site locational survey was conducted. Six areas were chosen for subsurface testing, but one area did not appear suitable for fieldwork. No prehistoric material was found. A depression related to a 20th century outbuilding was found. All the areas have been severely modified by fill deposits, grading, and utility lines. No further research was recommended.

25-1271 Holmes, Richard D. and Carolyn D. Hertz

1993 Archaeological Site Locational Survey for the Water System Improvement, Williamsburg, Massachusetts. 55 pages.

An archaeological site locational survey was conducted. A cross-country segment between Brass Millpond and South Street was subjected to subsurface testing. No prehistoric features or artifacts were encountered. Historic material found include Jackfield-type earthenware (1740-1850), plain creamware (1762-1820), pearlwares (1780-1820), whitewares (1820-1900), and yellowware (1827-1900). No evidence of a potential 18th century house site was found in the area of proposed impact. No further research was recommended.

25-1272 Decima, Elena, Chris Edens, Greg Laden and Veronica Kennedy

1992 Intensive Archaeological Survey for Approximately 7.2 miles of Transmission Line Right-of-Way in the Towns of Carver, Middleborough and Rochester, Massachusetts. 254 pages.

This report presents the results of the field investigation (reconnaissance and intensive surveys) carried out within a Commonwealth Electric right-of-way. The field work and survey analysis resulted in the discovery of 28 archaeological loci, of which 18 were identified as prehistoric and 10 as historic. The sites were evaluated in terms of their possible contribution to the prehistoric and historic archaeology of the area, their research potential, their cultural significance, and their possible association with other known sites of the area and region. Eight prehistoric sites were recommended for site evaluation, while two historic loci were recommended for further documentary research.

25-1273 Herbster, Holly and Ann Davin

1992 Intensive Archaeological Survey, I-495 Interchange Project Area, Marlborough, Massachusetts. 49 pages.

The project area consists of 35 acres on both sides of I-495 that is being planned to provide a new break in access along the highway between Routes 9 and 20. The intensive survey included background and documentary research, followed by a preliminary walkover/surface inspection and subsurface testing. A total of 103 test pits (50 x 50 cm) were excavated in a combination of four 30 x 30 m square blocks (each containing 13 test pits) and five transects with test pits located at 10 m intervals. One test pit was judgmentally placed to investigate a possible historic structure. Test-

ing was limited to a proposed impact zone. A single iron nail was found during testing. It was recovered from the A-soil horizon within a transect test pit excavated in a section of an abandoned roadway. No evidence of prehistoric activity was located in the project area during the intensive survey. No further documentary research or subsurface testing was recommended within the project area, provided that areas outside the impact zone are protected and avoided.

25-1274 Ritchie, Duncan

1993 Intensive Archaeological Survey, Spy Pond Shores Project Area, Arlington, Massachusetts. 105 pages.

The Town of Arlington is planning the reconstruction of an existing park located on the eastern shore of Spy Pond. The park encompasses 5.5 acres and extends along the shore of Spy Pond west of Massachusetts Avenue. The project area was known to contain previously documented prehistoric and historic period cultural resources. The intensive level survey included both background and documentary research, followed by a preliminary walkover/surface inspection and subsurface testing. A total of 80, 50 x 50 cm test pits were excavated within the proposed project area. A small quantity of prehistoric cultural material was recovered during subsurface testing. This material consisted of lithic chipping debris located in the open lawn area next to the Richardson house (Pond Street Locus). Structural (foundation) remains of three buildings related to the 19th and early 20th century ice industry (the Arlington and Belmont Ice Company, the Gage Ice House, and the William Wood Ice Tool Factory) were identified at and below surface level within the project area. Subsurface testing also located and identified portions of the demolished G.B. Richardson house. No further archaeological investigations were recommended for the Richardson House Site, the Wood Ice Tool Factory Site, and the Gage Ice House Site, provided impacts to these sites can be avoided. No further archaeological investigations were recommended for the Pond Street Locus prehistoric site or for the Arlington Pipe and Supply storage building/pipe rack foundation on Pond Lane.

25-1275 Dincauze, Dena F.

1993 Report of Cultural Resources Survey at Sweet Alice Brook Area, South Amherst, Massachusetts. 22 pages.

The survey area between two north-flowing brooks on the north slope of the Holyoke Range was on town conservation land and adjacent private property, south of Bay Road. Survey methods included interpretation of landforms, soils and sediments; walkover, plowed field examination; coring; and shovel test pits with screening. Historic land use was inventoried, with more work recommended. No prehistoric remains were encountered in a very small sample of the properties. The focus of the investigations was on a ditch-and-bank earthwork of the historic period, smaller than similar features elsewhere in the Connecticut Valley and eastern Massachusetts. The research was inconclusive in respect to the age and purpose of the feature, which was partly filled with boulders soon after construction. Indications of historic land use, including stock pasturage, arboriculture and timbering, dominate the landscape on the flanks of the range, now reverting to forest.

25-1276 Dalton, Ron and Duncan Ritchie

1993 Intensive Archaeological Survey of the Worcester County Transportation, Distribution, and Technology Center, Spencer and East Brookfield, Massachusetts. 134 pages.

An intensive level archaeological survey was conducted within a 218 acre project area. Only about 101 acres will be affected by the proposed construction. During the intensive survey, background research and a walkover/surface inspection were used to stratify the project area into zones of expected archaeological sensitivity. Background research indicated that while there were no known prehistoric period sites in the project area, the locations proposed for development were similar to environmental settings along the Seven Mile River that were known to contain prehistoric sites.

Several known prehistoric sites were located along the Seven Mile River within one mile of the project area. The project area also had the potential to contain evidence of historic period settlement and agricultural/pastoral land use on the perimeter of the village center in East Brookfield. Subsurface testing sampling was done with 30 x 30 m test pit blocks, judgmental test pit transects, and close interval test pit arrays in zones of high and moderate sensitivity. A total of 360 test pits were excavated. As a result of the walkover survey the historic period Bemis Farm complex with a mid-19th century (ca. 1860) farmhouse and barn, associated outbuildings, and agricultural fields was identified in the western end of the project area. A series of small loci of historic period stone quarrying/extraction located on rocky knolls and bedrock outcrops were also identified during the walkover inspection. Subsurface testing resulted in the identification of two prehistoric period sites. The Podunk River Site appeared to be the remains of a small, temporary camp located along the Seven Mile River in the northern end of the project area. The cultural material recovered from this site (felsite, quartzite chipping debris, ground stone tool fragment) was non-diagnostic. The other prehistoric site, Block 9 Locus, was an isolated find spot consisting of a non-diagnostic broken projectile point in the western end of the project area. Subsurface testing within the historic farm complex indicated that the archaeological deposits associated with the farmhouse consisted of low densities of mid/late 19th and 20th century material. Based on the results of the intensive survey, the two prehistoric sites (Podunk River, Block 9 Locus) were not considered to be potentially significant cultural resources. The archaeological component of the Bemis Farm complex was considered to have limited information content and not potentially significant. No further archaeological investigation of the prehistoric and historic sites was recommended. The standing structures (farmhouse, barn) in the farm complex were evaluated by an architectural historian and additional research conducted to provide the descriptive, historical, and contextual information needed to assess the eligibility of the complex for listing in the National and State Registers of Historic Places. Based on the results of this research, the Bemis Farm complex was not considered to be eligible for listing on the National and State Registers of Historic Places.

25-1277 Roberts, Michael

1992 Analysis of Archaeological Potential from Soil Borings at the Army Materials Technology Laboratory, Watertown, Massachusetts. 195 pages.

This report summarizes the results of an archaeological assessment of soil borings as part of a systematic geological study of subsurface conditions. The report includes a refinement of the archaeological sensitivity maps that were included in a previous study (see #25-1064).

25-1278 Simon, Brona G.

1992 Field Report: Walkover Survey of the Plowed Field at "Arrowhead," Pittsfield. 10 pages.

A systematic walkover surface reconnaissance was conducted of the plowed field at "Arrowhead," Herman Melville's estate in Pittsfield. Three loci of prehistoric cultural material (19-BK-154) and one locus of 19th century historic field trash were identified. Further archaeological investigation of the field and grounds was recommended, in order to assist in the planning and interpretation of the property.

25-1279 Glover, Suzanne, William Begley and Virginia H. Adams

1993 Archaeological Reconnaissance Survey and Intensive (Locational) Archaeological Survey of the Old Colony Railroad Rehabilitation Project: Main, Middleborough, and Plymouth Lines, Plymouth and Norfolk Counties, Massachusetts. 263 pages.

An archaeological reconnaissance survey was conducted for 14 proposed commuter rail stations and 2 layover facilities as well as an alternate terminal facility. Main Line project locations are in Braintree and Dorchester. Middleborough Line locations are at the Holbrook-Randolph town line, Brockton, Bridgewater, and Middleborough. Plymouth Line locations are in South Weymouth,

Abington, Whitman, Hanson, Halifax, Kingston, and Plymouth. The reconnaissance survey was followed by subsurface testing at archaeologically sensitive areas along all three commuter rail lines. These include the Neponset River Bridge staging area in Dorchester for the Main Line, and the Holbrook-Randolph Station, Bridgewater Station (Observatory Property), and Middleborough Layover Facility for the Middleborough Line. Plymouth Line project areas subjected to subsurface testing consist of South Weymouth Station, Abington Station alternative, Whitman Station, Hanson Station, Halifax Station, alternate Plymouth Line Terminal Facility (Kingston), and Plymouth Station. The archaeological investigations resulted in the location and identification of prehistoric resources at seven of the tested project areas. Two of these were assessed as potentially important prehistoric sites. The Holbrook-Randolph site, designated the HRS Site, consists of a concentration of chipping debris and a stone tool having a high degree of physical integrity and the Plymouth Site, designated the PCC Site, contains a very high density of prehistoric material (lithics, bone, aboriginal pottery) including a shell midden(s) which may date to the Late Woodland Period. One potentially important prehistoric site was also identified on the ground surface adjacent to the direct impact area of the Middleborough Layover Facility in Middleborough. This site contains chipping debris and evidence of hearth features exposed on the ground surface. Background research and subsurface testing also resulted in the location and identification of historic resources at nine of the tested project areas. Two of these are assessed as potentially important historic sites: one at Abington in the Abington Station alternative project area and one at Whitman in the Whitman Station project area. The Abington historic site consists of a previously undocumented 19th century domestic/agrarian deposition with structural remains and associated artifact assemblage. The Whitman site consists of the structural and artifactual remains of the 19th century Old Colony Railroad "round house." The remaining historic materials recovered in tested project areas consist of low to moderate density deposits of field refuse, the majority of which are in disturbed contexts intermixed with modern debris and/or fill soils. Field examination and preliminary background research were also conducted for one structure and one historic farm complex. The Bridgewater State College Observatory at the Bridgewater Station/Observatory Property was determined not be meet the age criterion for consideration as an historic property. The historic former Littlefield-Wyman, Inc. 19th century farm complex and 20th century nursery property in the Abington Station alternative project area was evaluated as a potentially significant historic property. Avoidance of all potentially significant cultural resources was recommended.

25-1280 Miller, Beth

1993 Reconnaissance Archaeological Survey for the Historic and Demolition Environmental Impact Report Suffolk University Law School Facility 110-120 Tremont Street Boston, Massachusetts. 45 pages.

A reconnaissance survey was conducted at the location of the proposed Suffolk University Law School Facility, 110-120 Tremont Street, Boston, Massachusetts. The proposed project consists of the demolition of two historic commercial buildings known as the New Studio Building (104-116 Tremont Street, and 60-62 Bromfield Street); and the Phillips Building (118-122 Tremont, and 1-6 Hamilton Place). These two buildings are individually listed in the State Register of Historic Places and have received a Determination of Eligibility for listing in the National Register of Historic Places. The results of the reconnaissance survey of the proposed project area indicated a low sensitivity for the presence of intact prehistoric and/or historic period cultural resources. This was based on extensive background research which documented extensive previous ground disturbances, particularly during the early 20th century. No additional archaeological investigations were recommended for the project area. Planned demolition and construction-related activities will occur within the upper layers of existing fill associated with the late 19th /early 20th century foundations. No intact prehistoric and significant historic cultural resources will be disturbed by current project plans.

25-1281 Herbster, Holly

1993 Intensive Archaeological Survey, The Crossing at Brigham Rise, Westborough, Massachusetts. 55 pages.

An intensive (locational) archaeological survey was conducted for a residential subdivision on 43 acres of wooded farmland. Thirty acres will be impacted and the remaining 13 acres will be placed under a conservation easement. The intensive survey included background and documentary research, followed by a preliminary walkover/surface inspection and subsurface testing. A total of 127 test pits (50 x 50 cm) were excavated in a combination of 15 x 15 m test pit clusters (each containing 5 test pits), transects, judgmental test pits, and arrays. The survey documented a mid-19th to mid-20th century farmstead that included a presently abandoned two-story wood frame house and outbuildings (since demolished), plowed fields, and pasture. A low density of historic domestic, agricultural, and structural debris was collected as field scatter in A/plowzone soils. One small locus of prehistoric activity was identified within in the project area. The deposit consisted of a total of ten quartz, argillite, and felsite flakes recovered in A and B soil horizons in an eight square meter area. The site area is located on a small terrace bounded by steep slopes and wetlands. No temporal or cultural affiliation could be assigned to the deposit. On the basis of background research and subsurface testing, it was determined that no significant historic or prehistoric cultural resources were located within the project area. No further documentary research or subsurface testing was recommended.

25-1282 Strauss, Alan E.

1993 Intensive Archaeological Survey of the Glover Houselot, 3 Landing Drive in Brewster, Massachusetts. 29 pages.

An intensive archaeological survey was conducted at a 1.54 acre parcel adjacent to Long Pond in Brewster. The goal of the project was to identify cultural remains that existed within the project impact area and to assess their potential significance. The project consisted of local background research, a field reconnaissance, and subsurface testing. Background data indicated that no prehistoric or historic cultural remains had been recorded in the project area. Subsurface testing consisted of the excavation of 35 shovel test pits including four bracket units. No prehistoric or historic artifacts were recovered during the intensive testing, and no further archaeological investigations were recommended.

25-1283 Hamilton, Christopher E. and Robert M. Cembrola

1991 Underwater Archaeological Reconnaissance Survey of the Proposed Effluent Outfall Diffuser Site, Boston, Massachusetts. 76 pages.

The archaeological reconnaissance survey of the Deer Island effluent outfall project area was conducted in two phases (see also report #25-1284). Following Massachusetts Board of Underwater Archaeological Resources permit regulations, four of fifteen anomalies nearest shore (M, N, O and P) planned for archaeological assessment were examined and are reported in this report. The results of documents research, interviews with local fishermen and pilots as well as models of shipwrecks for the region indicated little likelihood of shipwrecks occurring in the area. The 17 anomalies found during the magnetometer and side scan SONAR survey (15 were within the area of construction impact) were believed to be modern jetsam, though this remained to be proven. The results of the archaeological reconnaissance survey indicated that the four anomalies were signatures of 55 gallon drums (M, N, and O), and a 5 ft steel 6 in diameter pipe (P). No evidence of shipwrecks was detected at any of the locations. The survey did observe scatters of whiteware, blue and white and probable transferware ceramic sherds apparently dating from the late 19th and 20th centuries. No complete ceramic vessels were located. It is believed that the ceramic scatters are the cumulative result of individual acts of discard from ships passing through the area. It is likely that similar sherd scatters can be found at many locations within inner and outer Boston Harbor.

25-1284 Hamilton, Christopher E. and Robert M. Cembrola

1991 Report of the Underwater Archaeological Reconnaissance Survey for the Proposed Effluent Outfall Diffuser Site, Boston, Massachusetts. 106 pages.

Of 17 anomalies found during earlier magnetometer and side scan SONAR surveys, 15 were designated for further assessment as being within the area of construction impact (see report #25-1283). Following Massachusetts Board of Underwater Archaeological Resources permit regulations, 14 of 15 anomalies (B, C, E-J, & L-Q) scheduled for archaeological assessment were examined and are reported. Anomaly L was not examined due to obstructing cables running across the site area from the jack-up drilling platform extending to mooring buoys. The results of documents research, interviews with local fishermen and pilots as well as shipwreck modeling for the region indicated little likelihood of shipwrecks occurring in the area. All anomalies were believed to be modern jetsam, though this remained to be proven. The results of the archaeological reconnaissance survey indicated that the three anomalies were signatures of 55 gallon drums (M, N, and O), anomaly P was a 5 ft steel 6 in diameter pipe, anomaly G was two wire mesh lobster trap doors, anomaly I was a large concrete block, probably with iron reinforcement bars and used as a mooring; anomaly K was a small degraded piece of steel "I" beam, and anomaly Q, which was only a 5 ft side scan SONAR image, was found to be a boulder. The remaining anomaly locations (B, C, E, F, H, & J) yielded no materials which could have been sources of the reported magnetic signatures. All of the locations had some scattered rocks or small boulders which reached 2 ft to 4+ ft in diameter. These larger boulders may have been the source of the side-scan SONAR images noted during the previous survey of the area. No evidence of shipwreck was detected at any of the locations. Survey divers did observe scatters of whiteware, blue and white and transferware ceramic shards dating in manufacture from the 19th century through the early 20th century. One or two complete ceramic vessels were observed among the many shards at some locations. Non-systematic samples from locations F, G, H, I, J, and K were taken for positive identification. Of the 14 anomaly locations examined, areas B, C, E, and Q failed to exhibit ceramic scatters. It is believed that the ceramic scatters are the cumulative result of individual acts of discard from ships passing through the area. It is likely that similar shard scatters can be found at many locations within inner and outer Boston Harbor.

25-1285 Clayton, David E. and Sally Pendleton

1993 Intensive Archaeological Survey of Tennessee Gas Pipeline Company's Proposed Section 7 Pipeline in Sandisfield and Tolland, Massachusetts. 108 pages.

The intensive archaeological survey consisted of background research, field reconnaissance, subsurface testing, laboratory analysis, and report preparation. Background research indicated that no prehistoric sites were recorded within or near the project area, and only a few sites were known for this rural region of the state. Research also indicated that, although no historical sites were recorded for the pipeline route, several historical farmsteads and areas of mill activity were situated within or near the proposed pipeline corridor. No prehistoric sites were identified during the field reconnaissance, but two historical sites--the Allen Foundation site and the Whitney Farmstead site-were identified wholly or partially within the proposed impact area. In all, 25 area of archaeological sensitivity were identified and selected for subsurface testing. During the subsurface testing phase of the project, a total of 668 test pits was excavated within these 25 areas. No prehistoric artifacts were recovered, but historical artifacts were recovered from 14 of the 25 areas tested. Most of the historical artifacts were not in association with any structures or features and were considered to represent field scatter. Substantial archaeological deposits were found in association with the Allen Foundation site foundation in Area 10. Although very few artifacts were found in association with the Whitney Farmstead site, extensive structural remains associated with the site, including a stone wall enclosure, a stone-lined well, and numerous other stone walls, fieldstone piles, and remains of former roads, were identified in Areas 15 and 16. It is recommended that both the Allen Foundation site and the Whitney Farmstead site be avoided during construction. If avoidance is not possible, then a Phase II site examination of each site should be conducted. No further archaeological investigations were recommended for the remainder of the proposed Sec-

tion 7 pipeline corridor.

25-1286 Davin, Ann K. and Holly Herbster

1993 Archaeological Site Examinations T-194 (19-BR-372) and T-5 (19-BR-373) Sites in Lake Ridge Estates Subdivision and Black Pond Site (19-BR-303) in Black Pond Estates Subdivision, Taunton, Massachusetts. 151 pages.

Archaeological site examinations were conducted at three prehistoric sites in a 114-acre residential subdivision (see Report #25-933 for the intensive survey). A portion of the project area (Zone 1, Area 1) was proposed for conservation land, so while no additional testing was conducted, a combined conservation/preservation easement was recommended to protect archaeological deposits identified during the earlier, intensive survey. A total of 261, 50 x 50 cm test pits were excavated during the site examinations of the three sites. Eighty-five test pits were excavated at the T-5 Site, 21 at the T-194 Site and 155 at the Black Pond Site. The T-194 Site consisted of two separate occupation areas around a kettle pond and Lake Sabbatia. Area A contained a lithic workshop associated with processing, cooking, and disposal features radiocarbon dated to 2810±60 B.P. (Beta 53137), and hornfels chipping debris and a point preform. Features associated with this Late Woodland occupation included a possible postmold and small hearth. A portion of the site was impacted by the construction of a driveway associated with a house in the adjoining lot prior to completion of the site examination. The T-5 Site was located along the northern edge of the peninsula that extends into Sabbatia Lake. Prehistoric cultural material was widely scattered across this area and consisted of chipping debris, Small Stemmed, Atlantic, and Wayland-Notched projectile points, as well as an untyped hornfels corner-notched projectile point. No concentration areas or features were located during the intensive or site examination investigations. The Black Pond Site was located north of Black Pond and south of wetlands. A number of small concentration areas were located during the site examination, a pattern similar to the one found during the intensive survey. Cultural material included a Middle Archaic Neville point, a Late Archaic Squibnocket Triangle, and three undiagnostic projectile points or fragments of projectile points. No features were located during the intensive and site examination investigations. A concentration area with felsite chipping debris was destroyed by the construction of a single family house. The lot had been sold and built on separately from the Black Pond Subdivision prior to the site examination. The T-194 Site was determined to be eligible for listing to the National Register of Historic Places. No further construction activities are planned for the T-194 and as a result no additional testing is recommended. It is recommended that the remaining sections of the site be protected through a preservation easement. The T-5 and Black Pond sites do not represent significant archaeological resources, and no additional archaeological testing was recommended there.

25-1287 Russo, Paul and Duncan Ritchie

1993 A Reconnaissance and Intensive Archaeological Survey of the Westfield Wal-Mart Retail Development Project Area. 112 pages.

A reconnaissance/survey and disturbance assessment of the proposed location of a retail store was conducted. A subsequent intensive level archaeological survey used the results of the reconnaissance/walkover inspection to plan a specific subsurface testing strategy for the project area. The proposed retail development will consist of a discount department store and garden center with adjacent parking lots. Due to its location on the Westfield River floodplain, flood storage compensation including a detention basin and a graded swale will also be constructed. The 75.5 acre project area has been owned by Adam's Nursery, Inc. since 1912 and was still actively used as a nursery at the time of the archaeological survey. Background research indicated that the project area contained two previously known prehistoric sites (19-HD-36, 19-HD-114). Historic/modern period cultural resources in the project area included buildings forming the Adams Nursery complex. During the reconnaissance/survey, the locations of the two previously known prehistoric sites were confirmed, a third locus (Locus 3) of prehistoric activity and two loci of historic period cultural material were identified and the project area was stratified into zones of expected archaeo-

logical sensitivity. Subsurface testing during the intensive level survey was used to sample the three identified prehistoric sites, the two loci of historic period material and the sections of the project area considered to have high and moderate archaeological sensitivity. Prehistoric Loci 1 (19-HD-36) and 3 appeared to be the remains of small temporary camps containing low density deposits of quartz chipping debris. Prehistoric Locus 2 (19-HD-114) appeared to be a larger temporary camp with low density chipping debris (quartz, chert, quartzite) and non-diagnostic bifacial tool blade fragments dispersed across a wide area. Occupation of Prehistoric Locus 2 during the Late to Terminal Archaic period (ca. 5,000-2,500 B.P.) was indicated by recovery of a Small Stemmed projectile point. Historic Locus 1 was a scatter of domestic refuse (ceramic sherds, glass, etc.) including material dating from the early 19th to 20th century. This locus may have been associated with a 19th century farmstead (Hiram Harrison Farm) that was located near the existing Adams Nursery office building. No evidence of structural remains from the Harrison Farm were found in the survey. Historic Locus 2 was an isolated scatter of brick fragments located in nursery fields near prehistoric Locus 1. The three prehistoric loci and two historic period loci do not appear to have retained enough integrity or information content to be considered significant cultural resources. No further archaeological investigation of these loci was recommended. Standing structures within the Adams Nursery complex were evaluated and found eligible for listing in the National Register of Historic Places. Historic American Building Survey (HABS) level photographic documentation was completed on the structures in the Adams Nursery complex.

25-1288 McDermott, Brendan J. and Gerald M. Macomber

1991 Addendum to Interim Report Intensive Archaeological Survey of Five Proposed Pipelines of Tennessee Gas Pipeline Company's Northeast Settlement Expansion Project in Massachusetts, Segment 2 (Eastern Half). 58 pages.

An intensive archaeological survey was conducted for one of five proposed pipelines (Segment 2: Lee/Tyringham/Monterey/Otis/Sandisfield) of Tennessee Gas Pipeline Company's (TGP's) Northeast Settlement Expansion Project in Massachusetts. Sixteen area of archaeological sensitivity (Areas 1-16) were selected for subsurface testing in Segment 2. A report on Areas 1-8 was previously submitted. Completion of Areas 9-16 was delayed, due to realignment of the pipeline and minor land access problems. A total of 569 test units, including 551 shovel test pits and 18 bracket units, was excavated in Areas 9-16 in the towns of Tyringham, Monterey, Otis, and Sandisfield. Five prehistoric sites were identified in Areas 9 (2 sites), 10 (2 sites) and 11 (1 site), and two areas of historical sensitivity were noted, one in each of Areas 12 and 13. In Area 9, prehistoric lithic material was recovered from the subsoil of two test pits (1 gray felsite flake, 1 green-gray chert flake) and from the topsoil of one test pit (1 green-gray chert flake). Test Pit 991 exhibited disturbance and was not bracketed. Test Pits 996 and 997 were bracketed with seven units. Additional prehistoric material was recovered from the topsoil and subsoil of one bracket unit (2 dark gray felsite flakes and 2 green felsite flakes). Since prehistoric material was recovered from an undisturbed B-horizon, a Phase II site examination is recommended for this site in Area 9. The other prehistoric site in Area 9 (2 chalcedony flakes) and the two sites in Area 10 (quartz flake and angular waste) are considered to be isolated finds in disturbed context, e.g., plowzone or other subsurface disturbance, and are not considered to be archaeologically significant. The prehistoric site in Area 11 will be avoided due to a change in alignment of the proposed pipeline. No further archaeological investigations were recommended for these four sites. The first area of historical sensitivity was identified in Area 12 where the proposed pipeline crosses Beach Street in Tyringham. Background research indicated that an historical structure was located at or very near the pipeline route on the west side of Beach Street at least as early as 1858. No evidence of historical deposits or features was found at this location along the proposed pipeline route. The second area of historical sensitivity was located in Area 13 on the north side of Barnes Road in Tyringham. Remains of a sawmill were identified on the northeast side of the TGP pipeline and historical documentation indicated a residence on the southwest side of the pipeline on the west side of Barnes Road. No evidence was found for this structure either on the surface or in shovel test units. No further archaeological investigations are recommended for Areas 12 and 13.

25-1289 Mahlstedt, Thomas F.

1985 The Massachusetts Historical Commission Prehistoric Survey, Artifact Collections from Cape Cod. 75 pages.

This study summarizes the results of MHC's analysis of seven private artifact collections as well as several collections stored at the Cape Cod Museum of Natural History. A brief background description was provided to place each collection in context. Artifact summaries of specific site assemblages, based on identifications made with the MHC's classification system, documents the contents of each assemblage. Over 100 previously unrecorded sites were added to MHC files as a result of the study. The study also documented archaeological sensitivities and significance in many areas where no previous evidence of prehistoric activity existed. The study produced possible evidence of Paleoindian and Early Archaic occupation on the present-day land mass of Cape Cod. Additionally, extensive, if not intensive, Middle Archaic activity has also been recognized for the first time throughout the Cape. The study also identified several new core areas for the Middle Archaic and three new tool forms, believed to be related variants of the newly defined Cape Stemmed Tradition. Overall, the study documents over 12,000 years of human adaptations to a changing environment and resource base from the Paleoindian through Late Woodland periods.

25-1290 Johnson, Eric S. and Thomas F. Mahlstedt

1982 Prehistoric Archaeological Collections from Massachusetts: A Report on the Peabody Museum of Salem. 58 pages.

This report presents the results of collections analysis at the Peabody Museum of Salem. The study inventoried 22,672 artifacts provenienced to sites within Massachusetts, mostly Essex County. Collections from Middlesex, Norfolk, Suffolk and Barnstable counties were also included. Additional artifacts which could not be assigned to a specific site but for which town provenience was known were also inventoried. A detailed discussion of past research in Northeastern Massachusetts for the last 175 years was presented followed by summaries of the area's topography and environment and collecting biases in the area. The actual collection was discussed through an analysis of several artifact categories, human osteological remains, and other organic remains. A summary of temporal/cultural phases represented in the collection was included with specific references to artifact types and geographical provenience when available. Specific sites and their research potential were discussed with management recommendations and a summary of the study's results. Appendix B includes a summary of graves and cemeteries represented in the collection.

25-1291 Mahlstedt, Thomas F. and Eric S. Johnson

1982 An Analysis and Assessment of the Roy Athearn Archaeological Collection, Fall River, Massachusetts. 53 pages.

This report includes the results of a collections analysis for the Athearn Collection gathered by Mr. Roy Athearn over a period of 50 years in the Taunton River Basin. The collection includes over 13,000 artifacts of which 9,674 were inventoried. Most of the specimens were collected in the towns of Berkley, Freetown and Fall River. The report includes an overall discussion of the collection which includes the biases of Roy Athearn's collecting methods. The bulk of the report summarizes the collections analysis of eleven sites in the collection, many of which were excavated by the collector. New sites identified as a result of the study are also presented with a discussion of the state of knowledge for the collection area, research potential and threats. Tables are included which summarize inventoried artifacts by artifact class and projectile points by type.

25-1292 Johnson, Eric S. and Thomas F. Mahlstedt

1983 Prehistoric Collections in Massachusetts: The Barker Keith Collection. 39 pages.

This report summarizes the results of collections research on the Keith Collection containing a total of 1,070 artifacts. The collection represents the sum of over 60 years of archaeological study by Barker Keith who collected in a relatively small area in the immediate vicinity of Quaboag Pond and upper Quaboag River in the towns of Brookfield and East Brookfield. A total of eleven sites and collecting territories were represented. The study includes background information on Keith's activities and a series of site reports which discuss activities and finds at each site. A summary of the results and series of recommendations were included which discuss National Register potential for the sites, continued research and dissemination of information concerning the prehistory of the area.

25-1293 Anthony, David W., Frederick M. Carty and Linda A. Towle

1980 Massachusetts Historical Commission State Survey Project Prehistoric Survey Team, Interim Report.

This study presents the interim report of the State Survey Team after their methodology had been developed and tested and 24,000 artifacts were inventoried at the Peabody Museum at Harvard University in Cambridge and the Bronson Museum in Attleboro. The quality of the inventoried data is discussed. Museum data is analyzed and interpreted within the framework of cores, corridors, and fringes. Three regional clusters are presented: the Arlington/Mystic River Focus, the Attleboro/Ten Mile River Focus and the Concord/Sudbury River Focus. Lithic source areas in Eastern Massachusetts are also discussed as well as new perspectives in the area including quartz industries in Massachusetts and Dalton Complex points in the Northeast.

25-1294 Johnson, Eric S. and Thomas F. Mahlstedt

1984 Prehistoric Collections in Massachusetts: The Joseph Craig Collection, New Braintree, Massachusetts. 58 pages.

This report summarizes the results of collections analysis of the Joseph Craig collection assembled from a collecting territory approximately 15 miles long by 5 miles wide almost entirely within the Chicopee River Drainage of central Massachusetts. At the time of study, the collection contained well over 2,000 artifacts representing twenty-one collecting areas. Several hundred specimens, mostly chipping debris which could not be associated with specific sites were not inventoried. The entire collection was derived from the surface of sites within plowed fields. The report discusses the cultural/temporal components represented by the collection which include over 9,000 years spanning the Early Archaic through Late Woodland Periods. Raw materials represented in the collection are also discussed. Nearly half of the study includes a discussion of specific sites represented in the collection organized by river drainage. The study concludes with a summary and recommendation section which addresses research potential for the collection, potential impacts to sites in the collection area, recommendations for future archaeological research in the area and the maintenance of information value and research potential for collections by establishing minimum standards for private curation.

25-1295 Clayton, David E. and Sally Pendleton

1993 Intensive Archaeological Survey of the Proposed Section 8 Pipeline of Tennessee Gas Pipeline Company's Boston Energy Supply Project in Massachusetts. 76 pages.

This report presents the results of an intensive archaeological survey in Wilmington, Reading, and Lynnfield. Background research indicated that no prehistoric sites were recorded within the project area, but numerous sites were situated in the surrounding area. Research also indicated that, although no historical sites were recorded for the pipeline route, several historical farmsteads were situated within or near the proposed pipeline corridor. Eleven areas of archaeological sensitivity

were selected for subsurface testing, all of which were in Reading. A total of 168 test pits were excavated. Prehistoric artifacts were recovered from three areas. A total of 34 prehistoric lithic flakes were recovered from 4 of the 16 test pits excavated in Area 3, which is situated between a fairway and a green of the Meadowbrook Country Club golf course. This site--designated the Meadowbrook prehistoric site--is considered to have potential for more substantial prehistoric deposits. In Area 7, four lithic flakes (two each from TP 100 and TP 105) were recovered from 2 of the 42 test pits excavated in this area, which is situated within Reading Conservation Land. Supplemental testing did not identify any additional prehistoric materials, so these two sites--designated Reading Conservation Land 1 and 2--are considered to be isolated finds and not potentially significant. Another prehistoric findspot was identified in Area 9 at the northern end of the Camp Curtis Guild National Guard Reservation adjacent to Cedar Swamp. As in Area 7, supplemental testing in Area 9 did not identify any additional prehistoric materials. Thus, this site--designated the Camp Curtis Guild prehistoric site--is considered to be an isolated find and not potentially significant. A small number of historical artifacts was recovered from six of the areas, but none of these are considered to represent potentially significant archaeological deposits. It was recommended that the area of the Meadowbrook prehistoric site be avoided during construction. If avoidance was not possible, then a Phase II site examination should be conducted. The Reading Conservation Land 1 and 2 prehistoric sites and the Camp Curtis Guild prehistoric sites were not considered to be potentially significant and no further archaeological investigations were recommended for them; similarly, no further archaeological investigations were recommended for the remainder of the proposed Section 8 pipeline corridor.

25-1296 Paynter, Robert, Roy Larick, Susan Hautaniemi and Rita Reinke

1993 Monitoring Archaeological Remains from the Deerfield Academy Steam Pipe Trench: A Report. 33 pages.

A 100 ft utility trench was excavated by a private educational institution. One or possibly two building foundations and five to eight pit features were encountered during monitoring. One of the foundations (Feature 11) likely dates to the late 17th /early 18th century, judging from the sample of material retrieved. The stratigraphy in this portion of Deerfield (west of the Common) provided information on landscaping (filling), suggesting a high degree of integrity. Recommendations were made to better integrate archaeological preservation planning in the Academy's activities and on the town's land.

25-1297 Hadingham, Evan

1981 Archaeology and Early History at the Shaw Site, Central Massachusetts. 10 pages.

This is a popular report on the archaeological data recovery at a 19th century grist mill and domestic site, emphasizing the practice of industrial archaeology to understand technological development. See Reports #25-119, -260, and -277.

25-1298 Dalton, Ron and Ann K. Davin

1993 Results of the Intensive (Locational) Archaeological Survey, Sherwood Estates Subdivision. Bridgewater, Massachusetts. 66 pages.

The 10-acre project area was stratified into zones of archaeological sensitivity. Soil mining, soil borrowing, and soil stockpiling have disturbed three acres. Wetland areas, steep slopes, and several perc test locations accounted for approximately two additional acres having low sensitivity. Historic period cultural resources found and recorded during the walkover consisted of a dry laid stone well, a network of stone walls or fences, two unimproved roads, two historic period dumps, and a modern dump area. A total of 48, 50 x 50 cm test pits were excavated in areas assessed as being sensitive for prehistoric resources. The prehistoric Dyer Site was located in the northeastern-most proposed building lot adjacent to wetlands. The site was situated on a slightly elevated ter-

race, ranging from 70 to 74 feet above sea level. A total of 29 pieces of quartz chipping debris and one felsite flake were recovered as well as a possible feature. No diagnostic materials were found. Site boundaries were defined by environmental settings and sterile test pits. The prehistoric and historic period resources found during the intensive archaeological survey of the Sherwood Estates project area did not represent significant archaeological sites. No additional archaeological investigations were recommended.

25-1299 Doucette, Diana

1993 An Intensive Archaeological Survey, "The Bubble" Sports Facility, Mansfield, Massachusetts. 47 pages.

An intensive level archaeological survey was conducted on approximately seven acres of land. The intensive survey included background research, a walkover/surface inspection and subsurface testing. Background research revealed that several prehistoric sites are located within a one-mile radius of the project area; however, there were no prehistoric sites recorded within the project area. The majority of the surrounding sites were located during cultural resource surveys of the Interstate 495 construction project. Intensive subsurface testing consisted of 52, 50 x 50 cm test pits. A small scatter of prehistoric cultural material was recovered including quartz and felsite chipping debris and one quartz biface fragment. The absence of artifact concentrations and/or associated features indicates that the area was used on a short term basis by prehistoric groups. A scattering of historic/modern cultural material was recovered and cataloged as field debris. The historic/modern field trash was not considered to represent a potentially significant cultural deposition. The prehistoric cultural materials may represent a Late Archaic occupation by the presence of quartz chipping debris and a quartz biface fragment, but were not considered to represent a potentially significant cultural resource within the project area. No further archaeological investigation was recommended.

25-1300 Johnson, Eric S. and Thomas F. Mahlstedt

1982 The Ben Smith Archaeological Collection: A Preliminary Report and Assessment. 34 pages.

This report summarizes the results of collections analysis for the Ben Smith archaeological collection stored at the Concord Antiquarian Museum in Concord, Massachusetts. The collection contains well over 6,000 artifacts of which 4,275 were analyzed and coded. These totals do not include a considerable quantity of chipping waste, several hundred out-of-state specimens and approximately 2,000 unprovenienced artifacts. The collection documents the dense prehistoric occupation in the Concord, Sudbury, and lower Assabet river drainages. Most sites analyzed were located in the towns of Concord, Wayland and Framingham. The report includes discussions of various artifact types and lithic materials often discussed within the context of specific sites. The collection holds considerable potential for future study. Recommendations were made for curation and display of the collection. Research potential, state of knowledge, threats, and survey and registration priorities were also discussed.

25-1301 Mahlstedt, Thomas F. and Eric S. Johnson

1983 The Charles Read Archaeological Collection: Analysis, Interpretation and Recommendations for an Interpretive Program. 25 pages.

This report summarizes the results of collections analysis for the Charles H. Read Archaeological Collection curated at the Seekonk Public Library, Seekonk, Massachusetts. The collection includes 756 artifacts collected by Charles Read from several "hot spots" on his ancestral farm in South Seekonk. The report includes a cultural temporal discussion of the artifacts, most of which include projectile points spanning a 9,000 year period from the Early Archaic through Late Woodland periods. Artifact tables are included which summarize the collection by artifact and projectile

point type. Appendix I includes recommendations to the Seekonk Public Library for the display and curation of the collection.

25-1302 Johnson, Eric S. and Thomas F. Mahlstedt

1983 Prehistory at the Arnold Arboretum, Jamaica Plain, Massachusetts. 4 pages.

This report represents a brief summary of an inspection of prehistoric artifacts from 15 different "find-spots" in the Arnold Arboretum in Boston. The collection, which numbers 136 specimens, was collected by Mr. Al Fordham, a long-time staff member of the Arboretum and Mr. Ernest J. Palmer, also a long-time Arboretum associate. The collection, which is curated at the Arboretum, represents 8,000 years of prehistoric settlement in the locale spanning the Middle Archaic through Late Woodland periods. A short discussion places the Arboretum finds into a prehistoric context relative to other known sites in the general area. Recommendations were made for future curation of the collection at the Arboretum and its public display. A table which summarizes the collection down by artifact type was provided.

25-1303 Johnson, Eric S. and Thomas F. Mahlstedt

1983 The Fruitlands Museum Archaeological Collections: Analysis and Recommendations. 24 pages.

This report summarizes the study of the Sears and Thoreau collections curated at the Fruitlands Museum in Harvard, Massachusetts. The Clara Endicott Sears collection contains approximately 500 artifacts which were purchased or donated from collections in the Nashua Valley and other parts of New England. the Henry David Thoreau collection also contains approximately 500 artifacts, most of which were probably collected from Concord where Thoreau collected in the 19th century. Both collections were summarized in artifact tables. Recommendations were made for a public display and interpretive program with the artifacts and their storage. The Fruitlands Museum is also discussed as a potential regional repository for artifact collections. Appendix A includes an overview of New England prehistory.

25-1304 Mahlstedt, Thomas F.

1983 Report on the Prehistoric Archaeological Collections of the Sharon Historical Society. 11 pages.

This report summarizes interpretations for 85 prehistoric artifacts inventoried in a collection stored at the Sharon Public Library. Most of the artifacts (83) in the collection were obtained from the Geissler Farm designated as 19-NF-477. The collection is important since it represents the first documented information about prehistoric occupation in Sharon. The collection is discussed in terms of its temporal and cultural affiliations which span 8,000 years from the Middle Archaic through Late Woodland periods. An artifact inventory which summarizes the collection by artifact type, quantity and cultural periods was provided.

25-1305 Johnson, Eric S. and Thomas F. Mahlstedt

1983 Report on the Armand Gauthier Collection, Brookfield, Massachusetts. 9 pages.

This report briefly summarizes the results of collections research for the Armand Gauthier Collection. The collection includes 84 artifacts nearly all of which were collected from the Gauthier Farm in the town of Brookfield. The report discusses the artifacts recovered from the farm, their potential research value and makes recommendations for their maintenance. The chief importance of this collection is its potential to add new information concerning the prehistoric occupation of the Quaboag Pond area some distance uphill from more well known and documented sites along the pond shoreline.

25-1306 Johnson, Eric S. and Thomas F. Mahlstedt

1983 The Earl Avery Collection, Athol, Massachusetts. 13 pages.

This report summarizes the results of collections research for the Avery Collection in Athol, Massachusetts. The collection was made by Mr. Earl Avery between the 1940s and 1960s from sites in what is today the East and Middle branch of the Quabbin Reservoir. The study inventoried 557 artifacts including 277 diagnostic specimens. The collection lacked records and precise site provenience for the artifacts which limits its research potential. The value of the collection was in its display and educational value and from the fact that it represents areas now unavailable for study because they are submerged.

25-1307 Johnson, Eric S. and Thomas F. Mahlstedt

1984 Prehistoric Collections in Massachusetts: The William Ellsworth Collection, Petersham, Massachusetts. 64 pages.

This report summarizes the results of collections analysis for the William Ellsworth collection obtained mainly from within the Middle and East Branches of the Swift River drainages in the towns of Petersham and New Salem. Additional sites were also represented from the Winimisset Brook, a tributary of the Ware River in New Braintree and the west side of the Connecticut River in Gill. A total of 961 artifacts, mostly projectile points, were inventoried from 28 sites and collecting territories. The collection includes evidence for 12,000 years of Native American occupation in the upper Swift River Drainage and its vicinity spanning the Paleoindian through Late Woodland periods. Prehistoric sites represented by the collection were summarized with tables itemizing different artifact types represented. Lithic materials used for artifact manufacture were also discussed including associations between specific artifact types and materials. A summary section of the report discussed the overall significance of the collection, threats and survivals for prehistoric sites in the collection area, information needs, and recommendations.

25-1308 Johnson, Eric S. and Thomas F. Mahlstedt

1984 Report on the Dale Farrell Collection, Bolton, Massachusetts. 45 pages.

This report presents the results of collections research on the Dale Farrell Collection, Bolton, Massachusetts. The study inventoried a total of 1,018 artifacts from 47 sites in a large and diverse collecting territory incorporating portions of the Concord, Sudbury, Assabet, Nashua and Charles River drainages in the towns of Billerica, Concord, Acton, Sudbury, Wayland, Bolton, Lincoln, Framingham, Boxborough, Lancaster, Westborough, Carlisle, Franklin and Hudson. The study presents a background section and overview followed by site reports which detail the activities and artifacts recovered from the site. A summary and recommendation section at the end of the report notes the research value of the Farrell Collection because of its provenience information and because it represents one of the few sources of information for several areas, notably the Nashua Valley of Bolton, Lancaster and the Acton/Boxborough area. A recommendation was made to maintain periodic contacts with Mr. Farrell since he continually adds new sites and artifacts to his collection.

25-1309 Luedtke, Barbara E.

1992 Report on 1991 Archaeological Excavations at the Plimoth Plantation Spring Site, 19-PL-522. 68 pages.

The goals of the project were to determine the ages, extent, and condition of the site, and in addition to obtain information about how the site was used over time. A total of 42 one meter squares and 71 shovel test pits were excavated. While radiocarbon dates were not obtained, artifacts indi-

cate the site was occupied from about 8,000 years ago up to the present. Some disturbance is reported at the site, particularly the northern end. Site use or function varied through time including fishing, hunting, stone tool manufacture and possibly farming with changing environmental conditions. The report concludes with several recommendations for changes in policies pertaining to the preservation and protection of the site. See also report #25-1316.

25-1310 Johnson, Eric S.

1985 Prehistoric Collections in Massachusetts: The Walter S. Rodimon Collection, Connecticut River Valley. 108 pages.

This report represents the results of a collection analysis for the Walter S. Rodimon Collection, one of the largest and best documented artifact collections ever recorded by the Massachusetts Historical Commission Survey Team. A total of 5,109 artifacts were inventoried from the Rodimon Collection each of which had provenience from 71 sites within the Connecticut River Valley drainage. The collection is biased with surface collected sites located on riverine floodplain locations rather than the surrounding uplands. The study is organized with a background section to the collection, a collection overview including a discussion of artifact classes and cultural/temporal periods, site reports and management recommendations. Artifacts included in the collection range from the Early Archaic (ca. 9,000 B.P.) through Contact Periods. Several sites or portions of sites in the Rodimon Collection are already listed in the National Register of Historic Places. Numerous other sites in the collection are reported to have excellent research potential and probable National Register eligibility. Based on the collection's importance for archaeological research and its value for public display and public education the survey team recommended that the Rodimon collection be housed permanently in a local institution such as the Springfield Science Museum where the collection is presently on loan.

25-1311 Loparto, Leonard W., Douglas George and Thomas F. Mahlstedt

1987 Prehistoric Archaeological Collections Analysis in Eastern Massachusetts. Report on the Jesse Brewer and Ralph and Henry Hornblower Collections at Plimoth Plantation. 51 pages.

This report includes the results of a collections analysis of the Hornblower and Brewer artifact collections curated at the Plimoth Plantation in Plymouth, Massachusetts. It includes data from 27 sites containing 8,170 artifacts spanning the Paleoindian through Contact Periods. The collections also contained artifacts with less specific provenience (for which 11 landowners codes were assigned) and information on 6 sites, indicated by documentary sources for which no artifacts were present. The collections included primarily lithic artifacts and also contained ceramics, metal, shell, floral and faunal materials. An appendix at the end of the study also reports on 3 sites reported by Plimoth Plantation employees to MHC archaeologists during the analysis. The study demonstrated the effectiveness of studying documented collections and the complexity of prehistoric sites in the coastal Plymouth County area.

25-1312 Strauss, Alan E.

1993 Intensive Archaeological Survey of the Dewing Houselot 38 in Brewster, Massachusetts. 32 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area, although a prehistoric site was located adjacent to the property. Field investigations for the project included a surface inspection, followed by the excavation of 20 shovel test pits within the houselot. No prehistoric remains were recovered during the field investigations. A small amount of historical artifacts were identified. Because of the lack of prehistoric remains or significant historical resources, no further archaeological work was recommended.

25-1313 Holmes, Richard D., Carolyn D. Hertz and Mitchell T. Mulholland

1993 Archaeological Site Locational Survey for the Proposed Westminster Business Park, Westminster, Massachusetts. 74 pages.

This report summarizes the results of an archaeological site locational survey. In an area of 320 acres, a 2.7 acre complex of stone foundations (WST-HA-9) and roads dating from the eighteenth and nineteenth centuries was investigated. This complex has the potential to address questions on agriculture and land use in northern Worcester County. Slaves were reportedly held by a land owner of the period, and questions about slave life in Massachusetts may also be addressed by this site. This site may be eligible for the National Register of Historic Places under Criteria A, C and D. Avoidance of these structures was recommended; if avoidance is not possible, then a site examination was recommended.

25-1314 Herbster, Holly and Suzanne Glover

1993 Archaeological Investigations at Squibnocket Ridge, Chilmark, Massachusetts. 201 pages.

This report describes the results of archaeological investigations at a proposed 153 acre subdivision. The intensive (locational) survey included both background and documentary research, followed by a preliminary walkover/surface inspection and subsurface testing. In total, 371 test pits were placed within proposed building envelopes, the access roadway, and identified ancillary impact areas (septic systems, water wells). As a result of the intensive survey, 11 areas of prehistoric cultural activity were located and identified. The recovery of two quartz Small Stemmed projectile points suggests a temporal use of the project area by Late Archaic to Transitional periods (5000-2500 B.P.) and possibly Early Woodland (3000-1600 B.P.) groups. Aboriginal pottery recovered in conjunction with extensive shell midden deposits indicate repeated use of the area during the Middle and Late Woodland periods (1650-450 B.P.). The occupation of the project area therefore appears to span nearly 5,000 years. The MHC reviewed the preliminary results of the intensive survey and requested additional testing at the TA-10 Site, where relocation of a proposed section of access roadway was not feasible. A total of 4, 1 x 1 m units were excavated as part of the mitigation testing of the TA-10 Site. Due to the low density and limited information content of prehistoric deposits recovered within the tested portion of the site, it was determined that proposed construction will not impact important site elements. No further archaeological investigations were recommended for the project area, provided that potentially significant prehistoric sites and designated areas of high archaeological sensitivity within the buildable lots were avoided during construction.

25-1315 Pendery, Steven R.

1993 Report on Intensive Archaeological Site Survey, Olmsted Park – Jamaica Pond Park Bike Path. 47 pages.

Background historical research and intensive archaeological testing were undertaken by Boston's City Archaeology Program to evaluate the archaeological significance of the Jamaicaway bike path project area in Boston. The project area was constructed as "The Ride," a bridle path designed by Frederick Law Olmsted for the Jamaicaway. Because of its proximity to Jamaica Pond and the Muddy River and on the basis of historical documentation, the project area appeared to have archaeological potential for prehistoric, Colonial, and Federal period archaeological sites. However, archaeological testing yielded either disturbed or post-1890 stratigraphy in each of the thirty-three 50 x 50 cm test pits excavated at 10 m intervals throughout the project area. No significant archaeological resources were discovered and no additional research was recommended.

25-1316 Luedtke, Barbara E.

1993 Report on 1992 Excavations at the Plimoth Plantation Spring Site, 19 PL 522. 15 pages.

Limited test excavations were completed at the Plimoth Plantation Spring Site to help define further the internal configuration of the site (see report #25-1309). The testing results confirmed earlier perceptions that different areas were utilized at different times in the past during the Late Archaic and Woodland periods.

25-1317 Holland, Jeffrey L.

1989 Inventory of Known Cultural Resources Within and Adjacent to the Proposed Champlain Gas Pipeline Corridors, Massachusetts. 85 pages.

This report documents known historic and prehistoric resources along the mainline, and Pelham, Nashua, and Berkshire Branches of the proposed Champlain Gas Pipeline corridor in Massachusetts, based on historic maps, local histories and state records. Sites that were identified during the original literature and records search for this project were also included here. Historical maps were collected from state and local collections, and copies were obtained whenever possible. Sites and structures on these maps were checked against the proposed pipeline route, and were plotted on current USGS topographic maps based on natural and man-made features to determine their location in relation to the corridor. Sites which may have appeared to be outside of the 500 ft limit may be found to lie within that limit in the field. Similarly, sites that are recorded as being located within 500 ft here, may, in fact, not be within those limits. Local histories were consulted where available and checked for references to sites or names associated with sites that appeared to lie within 500 ft of the proposed corridor. After all the information had been gathered, the sites were given unique temporary numbers for the purpose of reference to pipeline mile post and distance from the corridor. The identified sites were listed by town in order of their mile post location. The sites are listed in Appendix 2. Appendices 2 and 3 report an additional literature and records search conducted to accommodate re-routes of the study corridor that were finalized after the research conducted in this report was completed. Appendices 2 and 3 are supported by an addendum map set that depicts the rerouted corridor and the newly described historic and archaeological sites.

25-1318 Ritchie, Duncan, Marsha K. King and Martha Lance

1988 Archaeological Reconnaissance Survey of the East Brimfield Dam and Reservoir in Brimfield, Holland and Sturbridge, Massachusetts. 270 pages.

A cultural reconnaissance survey was conducted within a project area of about 2,787 acres. The purpose of this reconnaissance level survey was to provide information on the archaeological sensitivity of the project area and review the possible effects of current project operations on cultural resources. Recommendations were made for developing an effective management plan for cultural resources and future investigations at the intensive survey level. The research design developed for the reconnaissance survey describes the general approach used for evaluating archaeological sensitivity and management. Background research on known cultural resources and formulation of a sensitivity ranking (predictive model) for the project area were outlined. Patterns of prehistoric and historic settlement and land use and the relationship of these patterns to local and regional developments were used to develop interpretive contexts for assessing the potential significance of identified sites. The project area was stratified into zones of expected archaeological sensitivity. An important aspect of the reconnaissance survey was field testing of the sensitivity map and predictive model for prehistoric resources through limited subsurface sampling. Historic cultural resources identified from documentary sources or the walkover inspection were also recorded. Observations were made on the nature and extent of previous disturbance and effects of current project operations. A total of 11 prehistoric and 33 historic period cultural resources were identified. A number of these sites were considered to be potentially significant based on the limited information collected during the survey. Recommendations of additional intensive level survey include known sites and areas considered to be potential site locations. Other recommendations for maintenance and protection or preservation of cultural resources are offered, particularly in situations where archaeological sites occur in recreation areas or other places subject to regular public ac-

cess. Supporting documentation for the reconnaissance survey including detailed site descriptions, site maps and recording forms are provided in appendices.

25-1319 Strauss, Alan E.

1993 Archaeological Reconnaissance Survey, Blue Line Modernization Project, Bowdoin to State, Boston, Massachusetts. 92 pages.

A reconnaissance level survey was conducted for the downtown Boston project area between Bowdoin Station and State Street Station to identify areas likely to contain historic and prehistoric archaeological sites. The goals of the reconnaissance survey were to identify whether archaeological resources exist in the project area, whether they meet the criteria for listing in the National Register, and whether the proposed project will impact them adversely. The reconnaissance survey consisted of background research followed by an assessment of existing conditions and isolation of areas believed to have the greatest sensitivity for containing undisturbed cultural resources. Because the project is in an area which has undergone centuries of intensive development with consequent disturbance, assessment of existing conditions and major disturbances within the project area was a crucial component of the study. An extensive analysis of site disturbance was undertaken, including review of current utility maps and archival research to determine previous alignments and construction techniques. A walkover of the project area was undertaken, focusing on the two project impact areas at State and Congress Streets and Government Center. During the walkover reconnaissance, special attention was paid to visible subsurface disturbance including subway tunnels, underground parking garages, service vaults, etc. These data were then collated with maps, subway and utility plans. Based on the results of the background research, impact assessment, and on observations made during the walkover, it was considered unlikely that any intact prehistoric or historical sites exist within in the State Street or Government Center Project Areas. No further archaeological work was recommended.

25-1320 King, Marsha K., Virginia H. Adams and Candace Jenkins

1992 Architectural Assessment/Inventory Update and Archaeological Reconnaissance Survey Fallon/Saint Vincent Medical City Project Area, Worcester, Massachusetts. 258 pages.

Project tasks for the archaeological reconnaissance survey included background research, walkover inspection, disturbance and sensitivity assessment, and analysis. Substantial portions of the project area had been previously disturbed by road and building construction, industrial activities, construction of the Blackstone Canal and Mill Brook Sewer, and landscaping. Significant portions of the project area contained known or suspected contaminated soils and groundwater. No prehistoric archaeological sites were previously known or reported within the project area. Small areas of moderate to high prehistoric archaeological potential may be present within the project area in association with remnant intact ground surfaces. Three types of areas have archaeological sensitivity for the presence of historic cultural resources. They are: 1) possibly intact portions of the Blackstone Canal terminus, a lay-by, and associated warehouses; 2) foundations of a railroad engine house and car house; and 3) foundations of several early 19th century buildings and yard areas associated with mixed 19th to 20th century residential/commercial sites. Additional intensive level research, recording, and testing is recommended for intact portions of the features associated with the Blackstone Canal as well as the area containing the railroad engine house and car house, if these areas do not lie within areas of known or potential soil and groundwater contamination. It may be appropriate and feasible to do this during the site preparation phase or during the hazardous waste investigations. As a result of the architectural update survey conducted, one property is recommended as eligible for listing in the National and State Registers (Summer and Bridge Streets Food Warehouse District, or 203 Summer Street as an individual listing); one property is recommended as possibly eligible, although it suffers from major building losses (Holyoke Machine Co.); and four properties are recommended as not eligible (Manchester and Bridge Streets Manufacturing District, Blackstone Street Manufacturing District, Tidewater Filling Station, and Cooney Block). One property (Mission Chapel) is listed in the State and National Registers.

25-1321 Willan, Steve, Suzanne Glover and Ann Davin

1993 Technical Report, Results of the Intensive (Locational) Archaeological Survey, Plymouth Municipal Airport Project Area, Plymouth, Massachusetts. 48 pages.

The goal of the survey was to locate and identify any archaeological resources in previously undisturbed areas which may be affected by proposed construction. Background research, a walkover survey, and subsurface testing were used to assess the archaeological sensitivity and previous disturbance within the project area. A total of 46 test pits were excavated and recorded during the fieldwork component of the intensive survey. No prehistoric or historic period cultural material was recovered during the intensive archaeological survey.

25-1322 Strauss, Alan E.

1993 Intensive Archaeological Survey of the Elmwood-Pleasant Street Subdivision in Grafton, Massachusetts. 36 pages.

Background research indicated that one recorded prehistoric site (19-WR-112) was situated within or adjacent to the project area. No chronological data were available about this site. No historical sites were recorded for the study area. The field reconnaissance identified recent historical trash in the project area; no foundations or features were identified. No prehistoric cultural remains were identified on the surface. Subsurface testing included 40 shovel test pits at 10 m intervals within eight linear transects also spaced at 10 m intervals. No prehistoric cultural resources were recovered during the testing program. Limited amounts of historical ceramics, glass, and bricks were recovered; these did not appear to represent a significant cultural deposit. No further archaeological work was recommended.

25-1323 Nassaney, Michael and Alan Leveillee

1992 Phase I Intensive Archaeological Survey of Portions of the Proposed GE-Altresco Pipeline, Pittsfield, Massachusetts. 60 pages.

An archaeological site locational survey of a proposed natural gas pipeline route included documentary research and subsurface testing to identify any historic or prehistoric use of the project area. A total of 287 test pits excavated during the archaeological survey located four prehistoric sites or find spots in Areas C, E, F, and G. One historic site was identified during the intensive survey (Area F), and historic artifacts were recovered from seven of the eight survey areas (all but Area H). Three loci of activity in Area C will be avoided by an alternative construction route. Because the significance of the prehistoric materials in this area remain unknown, the area should be designated a no access zone throughout construction. A historic dump in Area F does not appear to be eligible for the National Register of Historic Places. Historic artifacts observed in the other survey areas represent low density 19th and 20th century refuse dumping and agricultural activities. No sites eligible for the National Register of Historic Places will be impacted by the proposed construction. No further archaeological survey was recommended.

25-1324 Cook, Lauren J., Joseph Balicki and J. N. Leith Smith

1992 Central Artery/Tunnel Project Phase II Site Examination, Town Cove Archaeological Site, Study Block TC04, Boston, Massachusetts. 63 pages.

Phase II archaeological testing was conducted at a block to be impacted from utility relocation. Phase I investigations indicated that archaeological resources might be present beneath the block; specifically, the remains of a 19th century commercial block designed by Charles Bulfinch, Boston's foremost Federal Period architect. The Phase II investigations were designed to determine whether these resources were present and whether they possessed sufficient integrity and signifi-

cance to be eligible for nomination to the National Register of Historic Places. The excavation revealed that basements, filled during the 20th century, underlay most of the block. Excavation in the portion of the block that did not have a basement, and excavations below the floor of one of the basements, failed to encounter wharf remains from any period. Early 19th century fill layers, probably deposited during the development of India Wharf and Broad Street, were encountered below the basement floor, but these fills have limited potential to inform research on land filling processes, and are not considered eligible for the National Register. The remains of early 19th century buildings were encountered, in the form of basements. Documentary evidence calls their significance into question, however, and the archaeological evidence indicates that these structural remains lack the integrity to provide otherwise unavailable information about early 19th century building techniques. They are not considered eligible for the National Register. No further archaeological work was recommended.

25-1325 Willan, Steve, Ann K. Davin and Marsha King

1993 Intensive Archaeological Survey of the Chelmsford Phase IIIA Sewer Project Area, Chelmsford, Massachusetts. 72 pages.

The project includes the construction of four pump station locations and nine cross-country routes. A known prehistoric site, 19-MD-33, was reported located in close proximity to the Pine Hill Avenue section of the project area. Fieldwork included a walkover inspection to rank the archaeological potential of the 13 project locations, and the excavation of 60, 50 x 50 cm test pits. The fieldwork assessed the majority of the project area has having low potential due to poor soil drainage and/or previous construction. No evidence of prehistoric activity was located anywhere within the project locations. No further archaeological testing was recommended.

25-1326 Hoffman, Curtiss

1993 North River Archaeological Project Transect IV--1992 Season, Pembroke and Norwell. 132 pages.

This report describes an archaeological reconnaissance survey on public and private lands within a transect 1 km in east-west width and 8.5 km in north-south length, within the North River drainage in the towns of Norwell, Marshfield, and Pembroke, Massachusetts. This survey is part of the ongoing North River Archaeological Project. The report presents a preliminary study of the results of excavation in the southern half of Transect IV. Prehistoric and historic results are described within specific loci tested. These results were then used to evaluate the survey methodology and environmental and cultural parameters. Recommendations were made for the protection of sites and the promotion of public awareness and appreciation of cultural resources in the general study area.

25-1327 Holmes, Richard D., Carolyn D. Hertz and Christopher L. Donta

1993 An Archaeological Site Locational Survey for Stratus Computer, Marlborough Expansion, Marlborough, Massachusetts. 71 pages.

An archaeological locational survey was conducted on Addition Hill in Marlborough. The project area is north of the Native American "Praying Town" of Okommakamesit, and near the Flagg Swamp Rockshelter (19-MD-445) and the Fort Meadow Reservoir prehistoric sites. No prehistoric artifacts or features were found. Historic artifacts, found mainly in the A horizon of Area A, include 19th and early 20th century ceramics. No historic features were found in association with these artifacts; no historic documents suggest structures in the project area. It does not appear that the project area contains sites that may be eligible for the National Register. No further survey was recommended.

25-1328 Donta, Christopher L. and Mitchell T. Mulholland

1994 Archaeological Site Examination of Parcel B, Nantucket Housing Authority, Nantucket, Massachusetts. 33 pages.

An archaeological site examination was completed of two cultural features identified during the site locational survey for the Nantucket Housing Authority (see report #25-1215). The first feature was a low, linear earthen mound which may be an early form of fence known as a "ha-ha" use to enclose sheep shearing pens built in 1822. Four trenches were excavated into the "ha-ha". No features or clusters of artifacts were found to elaborate on the construction or use of this feature. The soil profiles did show the mounding of soils needed to build up the mound. The second feature, known as the Boulder Site, was a small artifact scatter containing lithic flakes and 18th century green bottle glass in association with a large boulder. This feature was examined using a metal detector, soil probe, twelve shovel test pits, two trenches, and two excavation units. No other features were found in association with the artifacts. The boulder appears to be a glacial erratic. No further survey of either feature was recommended, as neither site was considered to be significant.

25-1329 Clements, Joyce, Leith Smith and Cornelia Burr

1994 Reconnaissance Survey Report, Fall River CSO Abatement Program, Fall River, Massachusetts. 88 pages.

The City of Fall River Sewer Commission is currently preparing an Environmental Impact Report for a Combined Sewer Overflow (CSO). Documentary research and a site walkover identified several National Register properties located in close proximity to construction areas of the proposed project. Most of these properties will not be impacted by proposed construction activities. Where potential impacts existed, project developers altered the location of engineering features to mitigate damage to historic properties. In four locations, further archaeological investigations were suggested: within the parking lot of the Fall River Chamber of Commerce on Pocasset Street where historical sources identified 19th century mill buildings and activity areas; in an undisturbed area near Arnold and Swift Streets, in close proximity to wetlands, where site characteristics suggested some potential for prehistoric sites; in Quequechan Street, where a site walkover produced prehistoric and historic period artifacts; and at the Wastewater Treatment Plant, where construction activities will impact potentially sensitive areas in close proximity to the water's edge. No additional impact areas were identified as potential archaeological sites or historic structures that could be impacted during the construction or operation of the project.

25-1330 Clements, Joyce M.

1994 Report on Documentary Research and a Remote Sensing Survey for the Proposed Sanitary Landfill/Solid Waste Management Project in Sterling and Clinton, Massachusetts. 51 pages.

This report describes information gathered from oral histories and interviews, documentary research, and a remote sensing survey undertaken as part of an archaeological investigation of a proposed project. Documentary research and interviews with local residents, historians, an avocational archaeologist, and a Native American consultant suggested that the project area was archaeologically sensitive and could possibly contain human burials. Some comparative research on archaeological investigations of cemeteries was described. The geophysical (terrain conductivity) survey revealed 31 subsurface anomalies within the project area. Before archaeological testing of these anomalies could be undertaken, however, the project was indefinitely postponed. Recommendations included limiting access to the parcel, maintaining the current tree and brushcover, protecting stone markers that may be associated with graves, and undertaking archaeological testing to evaluate subsurface anomalies and surface features. See also report #25-1338.

25-1331 King, Marsha K., Virginia H. Adams and Ronald Dalton

1993 Archaeological Site Examinations of Two Blackstone Canal Segments in Worcester and Millbury, Massachusetts and the Mill Brook Sewer Portal in Worcester, Massachusetts. 115 pages.

Site examination-level research, recording and testing was completed on two sections of the Blackstone Canal, one in Millbury and one in Millbury and Worcester; and at the Mill Brook Sewer and Portal (also originally part of the canal route). Project tasks included additional background research, walkover inspection, and limited subsurface testing including the excavation of a machine trench. One segment of the Blackstone Canal in Worcester (Worcester/Millbury Segment) and the Mill Brook Sewer and Portal in Worcester were recommended to be potentially eligible for inclusion in the National Register of Historic Places under criteria A, C, and D. However, the Massachusetts Historical Commission determined that all five surviving canal segments discovered in this survey possess sufficient integrity to be eligible as components of the Blackstone Canal historic district. This report includes an historic overview of the Blackstone Canal with many illustrations, including overlay maps depicting the location of the canal through time.

25-1332 Clayton, David E. and Sally Pendleton

1994 Intensive Archaeological Survey of Tennessee Gas Pipeline Company's Proposed Colonial Gas Pipeline Project in Lynnfield, Massachusetts. 65 pages.

The proposed project will involve the construction of a new pipeline and adjacent transfer/regulator station. The intensive archaeological survey consisted of background research, field reconnaissance, subsurface testing, laboratory analysis, and report preparation. Background research indicated that no prehistoric sites were recorded within the project area, but several are situated in the surrounding area. Research also indicated that, although no historical sites were recorded for the pipeline route, several historical farmsteads were situated near the proposed pipeline corridor. No prehistoric or historical sites were identified during the field reconnaissance, but undisturbed portions of the project area were considered to have potential for undocumented archaeological remains. The project area was divided into four sections for the subsurface testing phase of the project. A total of 176 test pits was excavated within these four sections. No prehistoric artifacts were recovered from any of the test pits. A small number of historical artifacts was recovered from test pits in three of the sections, but none of these artifacts are considered to represent potentially significant archaeological deposits. No further archaeological investigations were recommended.

25-1333 McDermott, Brendan J.

1994 Intensive Archaeological Survey of the Proposed Section 9 Pipeline of Tennessee Gas Pipeline Company's Boston Expansion Project in Massachusetts. 166 pages.

An intensive archaeological survey of a proposed pipeline was conducted in Lynnfield, Wakefield, Saugus, and Revere. Background research indicated that four prehistoric sites were located near or possibly within the proposed pipeline corridor and that undisturbed portions of the project area had high potential for undocumented prehistoric remains. No recorded historical sites were situated within the project area, but the proposed pipeline corridor was considered to have high potential for historical remains in areas near historical roadways. During the field reconnaissance, 16 areas of archaeological sensitivity were identified. One prehistoric site--the Czarniawski's Garden site--was identified during the field reconnaissance in Area 6 (Wakefield) and three historical features were identified: the first two consist of pit features in Areas 8 and 14 (both in Saugus) and the third consists of a series of terraces and terrace walls in Area 16 on Broadway (Route 99) in Saugus near the intersection of Route 99 and Route 1. A total of 471 test pits, consisting of 433 systematic, 33 bracket and 5 judgmental units, was excavated in 14 areas (Areas 3-16) of archaeological sensitivity. Eleven prehistoric sites and three historical sites were identified during the course of this survey. The prehistoric sites identified are, from north to south, the Czarniawski's Garden site in Area 6 (Wakefield) and the Montrose Terrace site in Area 7 (Wakefield), both of which date to the Late Archaic/Early Woodland period; the undated Powerline and Chassis sites in Area 7 (Wakefield); the Breakheart #1 site in Area 8 (in Breakheart Reservation, Saugus), which dates to the Middle Archaic period; the Breakheart #2 site in Area 8 (also in Breakheart Reservation, Saugus), which dates to the Woodland period; and the undated Water Street Overlook site in

Area 8 (Saugus), Breakheart #3 and Breakheart Findspot sites in Area 9 (Wakefield), Dry Pond Findspot in Area 10 (Saugus), and Franklin Marshes site in Area 15 (Revere). Neither the Breakheart Findspot nor Dry Pond Findspot sites are considered to be potentially significant and no additional archaeological investigations are recommended for them. The other nine prehistoric sites identified are considered to be potentially significant and should be avoided during construction. A Phase II site examination should be conducted of each of these nine sites that cannot be avoided. The three historical sites identified are, from north to south, the 20th century Pit Feature site in Area 8 (Saugus), the 20th century Pit Features site in Area 14 (Saugus), and the late 19th to early 20th century Broadway (Route 99) historical site in Area 16 (Saugus), which consists of three terraces constructed of dry-laid fieldstones. Additional historical artifacts were recovered from all but 4 of the 16 archaeologically sensitive areas (Areas 1, 2, 8 and 14), but these materials are considered to represent low-density refuse. None of the historical sites identified nor any of the areas of low-density historical refuse were considered to be potentially significant. Therefore, no additional archaeological investigations were recommended for them. Prior to the completion of the intensive archaeological survey, the project was indefinitely postponed. Thus, two areas (Areas 1 and 2) that were determined to have archaeological sensitivity, situated within Camp Curtis Guild National Guard Reservation in Reading and Lynnfield, were not subjected to subsurface testing. Also, an additional six test pits originally planned for the area of the Czarniawski's Garden site in Wakefield were not excavated. Should the project be reactivated, these areas should be tested and the additional test pits in Area 6 should be excavated to complete the intensive archaeological survey.

25-1334 Filios, Elena L.

1993 Archaeological Site Locational Survey of Shattuck Farm, Loci A, C, and D, Andover, Massachusetts. 39 pages.

Two small areas of the Shattuck Farm site (19-ES-196) were the subject of a site locational survey. Area 1 is south of, and adjacent to, Locus A, as identified by Luedtke (1985) and Mahlstedt (1981) (see reports 25-1051 and 25-1026). It lies on the eastern bank of a sedimentation pond. A parking area and associated access roads were proposed by Hewlett Packard for Area 1. No prehistoric artifacts or features were identified in Area 1, and no further survey is recommended. Area 2 overlaps portions of Loci C and D, as identified by Leudtke and Mahlstedt and lies on the eastern bank of Spindle's Creek. A softball diamond or other recreational facility was proposed for this area. The northern two-thirds of Area 2 contain a relatively high density of prehistoric artifacts. The southern third of the area has been disturbed considerably. It was recommended that either a Preservation Restriction be conveyed to the Massachusetts Historical Commission for the northern portion of Area 2, or that a data recovery project be conducted. The Massachusetts Historical Commission has determined it to be eligible for the National Register as a contributing element to the historic district.

25-1335 Clements, Joyce M.

1994 Preliminary Report on an Archaeological Intensive Survey, Melone Landfill Extension Project (Locus III and Locus IV), Hudson and Stow, Massachusetts. 50 pages.

This report describes additional information gathered from documentary research, a preliminary and final site walkover, and subsurface investigations undertaken for the proposed landfill expansion project. An archaeological intensive survey was conducted in two areas untested during previous investigations in 1991 (see report #25-1061). Subsurface testing produced four historic-period artifacts associated with a 19th century property identified during previous investigations. The property is not considered historically significant because it has been severely impacted by quarrying activities. Subsurface testing located no prehistoric artifacts or features. Archaeologists therefore recommend that the proposed landfill expansion may proceed without further investigations.

25-1336 Garman, James C., Joan Gallagher, Virginia H. Adams and Steven A. Mrozowski

1994 Archaeological Reconnaissance Survey, South Boston Piers Transitway Project, Boston, Massachusetts. 76 pages.

The proposed Transitway Corridor involves construction of new transportation services through seven areas of downtown Boston: 1) Boston Common/Tremont Street; 2) Avery Street/Hayward Place/Avenue de Lafayette; 3) Essex Street; 4) South Station/Atlantic Avenue; 5) Russia Wharf; 6) Fort Point Channel and 7) South Boston Piers. Based on documentary sources and consultations with federal, state and private archaeological consultants, the project areas have a generally low sensitivity for prehistoric and historic cultural resources. A significant exception to this finding is the southeast corner of Boston Common, which has a moderate to high potential based on previous studies and the proximity of the Central Burying Ground. Further archaeological investigations are recommended for primary and secondary areas of construction activities in the southeastern corner of Boston Common near the intersection of Tremont and Boylston Streets. No other areas of the Transitway Corridor are recommended for further examination. Based on the sequence of filling and construction in the 20th century, it is unlikely that project plans will disturb significant cultural resources in areas other than Boston Common.

25-1337 Donta, Christopher L., Carolyn D. Hertz and Mitchell T. Mulholland

1993 Archaeological Site Locational Survey for the Shrewsbury Street Safety Improvement Project, West Boylston, Massachusetts. 71 pages.

The project area consists of a 2,134 m (7,000 ft) section of Shrewsbury Street with nine areas having a high probability to contain prehistoric or historic cultural resources. These areas were selected for subsurface investigation. A total of 94 shovel test pits was excavated. No prehistoric sites were located in the project area. A very low number of historic materials was recovered from the project area, all indicating 19th and 20th century activity. No further survey was recommended.

25-1338 Clements, Joyce M.

1994 Stone Markers in the Vicinity of the Proposed Sanitary Landfill/Solid Waste Management Project in Sterling and Clinton, Massachusetts. 31 pages.

This report describes a series of stone markers found in the vicinity of the proposed Sanitary Landfill/Solid Waste Management project in the towns of Sterling and Clinton, Massachusetts. Two photographs and a description of each stone are provided. The general location of each stone is given, but these locations are approximate because a professional survey was outside the scope of the original project. Although some of the stones are close to the project area, none is within the undisturbed portion of the proposed landfill, which was the focus of documentary research and geophysical testing in 1993. The proposed sanitary landfill project was indefinitely postponed in 1993, and no development in, or close to the project area is currently in progress. The report is supplementary to, and should be used in conjunction with report #25-1330.

25-1339 Davin, Ann and Craig Chartier

1993 Results of the Intensive (Locational) Archaeological Survey, Wareham Phase II Industrial Park Project Area, West Wareham, Massachusetts. 53 pages.

An intensive (locational) archaeological survey was completed prior to the construction of a 600 ft roadway to access 16 acres of industrially zoned land. The intensive archaeological survey included background research, a walkover inspection, and subsurface testing. During the walkover inspection, a sensitivity assessment was completed and the project area was examined for any surface evidence of historic and prehistoric sites. A total of 104, 50 x 50 cm test pits were excavated during the subsurface testing. No evidence of prehistoric cultural materials was found and historic materials consisted of recent bottle glass fragments. Due to the lack of evidence of any prehistoric

and significant historic period resources, no additional archaeological investigations were recommended.

25-1340 Ritchie, Duncan and Dianne Doucette

1994 Intensive Archaeological Survey of MWRA Framingham Extension Relief Sewer, Dover, Natick, and Wellesley, Massachusetts. 104 pages.

An intensive level archaeological survey was conducted within seven sections of the project area. Proposed construction will include a pumping station, 36 inch force main and 36 to 48 inch gravity sewers in the towns of Framingham, Natick and Wellesley, Massachusetts. Four staging areas and a previously known prehistoric site (Drucker findspot) were located in the Metropolitan District Commission Elm Bank Reservation property in Dover. Sections of the project area in Natick were a proposed access road between Matthew Court and Alger Street and a staging area on Leach Lane. The archaeological sensitivity of the project area was assessed from the results of several previous cultural resource management surveys in the immediate vicinity (see reports 25-306 and -878). The four staging areas within the Elm Bank Reservation had been modified by historic/modern period landscaping or other alteration and were considered to have moderate sensitivity for prehistoric and historic period cultural resources. The proposed access road was considered to have high archaeological sensitivity due to its proximity to a known prehistoric site (Dawborn Site, 19-MD-705). The staging area on Leach Lane was ranked as having moderate sensitivity.

Intensive subsurface testing within the Drucker find spot and Matthew Court/Alger Street access road yielded small amounts of prehistoric cultural material found in altered (landscaped) or disturbed soil horizons. The prehistoric depositions in the Drucker findspot and the Dawborn site were not considered to be potentially significant due to loss of integrity from historic/modern period disturbance. The historic/modern period cultural material recovered from the project area during the survey was not considered to represent potentially significant cultural resources. No further archaeological investigations of Areas 1-7 within the Natick/Dover section of the Framingham Extension Relief Sewer was recommended.

25-1341 King, Marsha K. and Beth P. Miller

1994 Archaeological Investigations, Haul Road Trenching and Disturbance Documentation of the Piggery Point Burials on Deer Island, Boston, Massachusetts. 65 pages.

Archaeological investigations of the Piggery Point Burial site included machine-assisted excavation of ten trenches across the proposed upper haul road, assessment of construction disturbance, collection of human skeletal material from construction backdirt piles, forensic analysis of this disturbed material, and documentary research. Disturbance occurred in 1990 during demolition and removal of concrete piggery foundations prior to construction of new wastewater treatment facilities on Deer Island in Boston Harbor. No human skeletal material or grave related soil anomalies were identified during excavation of ten machine trenches across the proposed route of the upper haul road, upslope from the area where human remains were recovered in May. Based on the results of the machine trenching no further archaeological investigations were recommended in the haul road vicinity. A total of 3,027 human bones and bone fragments were recovered from five of the ten piles of machine disturbed backdirt and from disturbed contexts on the surrounding ground surface. Remains of a single truncated coffin was identified in one profile (Wall C). The results of the disturbance documentation fieldwork suggest that, prior to the 1990 machine disturbance, the human remains recovered from Piggery Point were probably located in the relatively intact soil remnant bounded on the west and south by Wall C, which correlates closely with the location of a concrete retaining wall situated in front of the piggery. Forensic analysis of the human remains indicated that from 28 to 37 individuals were represented in the assemblage. All were adult Caucasians of northern European heritage and appeared to have died between ca. 1840-1890, within approximately 5 to 10 years. The probable cause of death appeared to

be brief intense illness(es), such as "famine fever" (also referred to as "hunger typhus"), cholera, or tuberculosis. It was not possible to positively determine the identities or city institution affiliation of the recovered remains. It appears likely that piggery construction impacted the Piggery Point burials in 1908, possibly truncating some of the graves. The remaining graves were then sealed behind a concrete retaining wall. Additional intact or partially intact burials may be located in the relatively undisturbed soils to the southeast of Wall C. It was recommended that no further disturbance (i.e., excavation, cutting) take place within the burial area. The construction activity and filling proposed to complete the earthen berm around the northern end of Deer Island should not cause further damage to remaining burials, if appropriate care is taken. It was also recommended that the human skeletal remains recovered during the archaeological investigations within the disturbance documentation area be reinterred on Deer Island. A suitable monument should be erected to mark the site of the reinterment.

25-1342 Beaudry, Mary C.

1994 Report of Archaeological Testing, Monitoring, and Evaluation: The Rea-Proctor Homestead and Farm, Danvers, Massachusetts. 104 pages.

Archaeological investigations were conducted at the Rea-Proctor Farm, listed in the National Register of Historic Places, as part of a certified rehabilitation project by the property owners. A total of 6 test units were excavated in areas of proposed impact from restoration and utility installation. One significant feature, a first-period (i.e., pre-1720) cellar hole/foundation, was uncovered in one of the test units; this feature was avoided during rehabilitation activities. Other test units revealed landscaping activities and additional features, but in each instance the relevant data were recorded and installation of the utilities proceeded according to plan. All mechanical excavation of utility trenches was closely monitored by an archaeologist. Useful recommendations for site preservation and future research were offered.

25-1343 Rainey, Mary Lynne, Burr Harrison, and Katherine Jones Garmil

1993 Phase I Archaeological Survey for the Algonquin Gas Transmission Company Proposed 3.3 mile Holliston Loop: The Original Route, Alternate Route, and Alternate A Through the Bullard Memorial Farm Property in Holliston, Massachusetts.

An intensive archaeological survey was conducted for a proposed 3.3 mile pipeline project which passes through the communities of Medway, Holliston, Millis, and Sherborn. Areas of moderate and high archaeological sensitivity were tested across the entire project area except for the section of the easement northeast of Hill Street up to the approximate point of intersection with the powerline easement. This project is not currently under active consideration by Algonquin and portions of the original 3.3 mile loop were not tested. Subsurface testing of the pipeline easement required seven transects (A through G) and 24 arrays or partial arrays for a total of 392 shovel test pits. Three hundred thirty-seven of the pits were sterile, 19 contained historic cultural material, and 44 contained prehistoric cultural material. A total of six prehistoric sites, two prehistoric findspots, two historic sites, and two historic findspots were recorded for the project area. The prehistoric sites dated from the Middle Archaic to the Middle to Late Woodland. Historic sites date from the 19th and 20th centuries. Should the project be reactivated, recommendations were made to complete the testing in untested areas, and to conduct further research and testing if potentially significant sites could not be avoided.

25-1344 Strauss, Alan E.

1994 Intensive Archaeological Survey and Excavation of a Prehistoric Shell Pit Feature at Houselot 37 Bates Lane in Brewster, Massachusetts. 103 pages.

An intensive archaeological survey for a proposed new house was conducted. The project area is located on a high terrace above Myricks Pond. Background research indicated that no recorded

prehistoric or historical sites were situated within the project area, although numerous sites were recorded on the freshwater ponds nearby. Field investigations for the project included a surface inspection, followed by the excavation of 22 shovel test pits. A prehistoric pit feature was identified. The feature contained a high density of marine shell; mammal, fish, and bird bone; prehistoric pottery; stone flakes; and carbonized maize kernels. Because of the importance of the shell pit, it was recommended that the pit feature be entirely excavated, thereby allowing a complete examination of its contents. The prehistoric pit feature was excavated with three excavation units. All of the contents of the unit were removed, labelled, and bagged for analysis in the laboratory. The pit feature contained approximately 153 pounds of edible shellfish shell, animal bones, 113 pieces of pottery, and 200 pieces of chipping debris. In addition, three carbonized maize kernels were recovered. Four radiocarbon dates were assessed from wood charcoal (865±95, GX-19564; 1215±250. GX-19563), maize (620±59, GX-19319), and shell (1150±90, GX-19318). Based on the available data, it appears that the pit feature dates to the beginning of the Late Woodland Period (ca. 700 B.P.). Numerous important and significant artifacts and data were derived from the excavation of the shell pit feature. Having removed the cultural feature, no additional archaeological investigations were recommended for the project area.

25-1345 Ulrich, Thomas

1975 Prehistoric and Historic Archaeological Survey of the Yankee Greyhound Racing Parking Area and Stream Relocation Project. 11 pages.

A 43-acre parcel in Tyngsborough was the subject of an intensive archaeological survey. Background research suggested that an historical archaeological site (Cromwell's House) might be located within the project area. A walkover reconnaissance found much of the project area to have been previously disturbed. Undisturbed portions were augered in transects. Thirty-one 1 ft square test pits were excavated. Bits of charcoal and reddish layers of sand were noted, but no evidence of cultural features was indicated. An appendix provided information on the 18th century J. P. Bancroft house, just outside the immediate project impact area. No significant historic or archaeological properties were noted and no further investigation was recommended.

25-1346 Parrish, James N.

1977 Reconnaissance Archaeological Survey of the Heaton Hall Hotel Site, Stockbridge, Massachusetts. 15 pages.

The reconnaissance survey included background research and a surface inspection. Several features (a well, spring, outbuilding foundation, and stone gate posts) were located, described, and photographed. The property was the site of the Heaton Hall Hotel, built 1903, and razed in 1972. Grading had severely compromised the archaeological integrity of the property. Appendices include engineers' soil boring logs and nine black-and-white photographs.

25-1347 Weeks, Janice M.

1976 Prehistoric and Historic Survey of the Proposed Shelburne Housing Authority Development for the Housing of the Elderly. 10 pages.

A 4.7-acre parcel was surveyed with a soil sampler using a 25 ft interval. No indications of prehistoric cultural material was observed. The property was at one time the location of a boardinghouse for the Arms Academy. No further archaeological investigation was recommended.

25-1348 Clayton, David E. and Brendan J. McDermott

1994 Archaeological Site Examination of the Meadowbrook Prehistoric Site in Section 8 of Tennessee Gas Pipeline Company's Boston Energy Supply Project in Reading, Massachusetts. 83

pages.

A Phase II site examination of the Meadowbrook prehistoric site (19-MD-719) was conducted prior to the construction of a pipeline. The site examination consisted of background research, field survey, subsurface testing, laboratory analysis, and report preparation. Background research determined that numerous sites are recorded in Middlesex and Essex counties, most of which are located in coastal regions or along major rivers or other inland water sources, in contrast to the Meadowbrook site, which is a relatively isolated interior site. Field investigations for the site examination consisted of the preparation of a topographical site map, sampling through screening of the backdirt of a utility trench excavated through the site prior to the site examination, and the excavation of 98 shovel test pits and 7 excavation units. A total of 1,907 prehistoric artifacts was recovered during the combined Phase I and Phase II archaeological investigations. These materials consist of 1,877 lithic flakes, 2 projectile point fragments, 4 cores, 5 bifaces, 4 preform fragments, 1 felsite perforator, and 14 pieces of angular waste. Only 83 (or 4.3%) of the artifacts were found in the A-horizon; the majority of the artifacts (1,824, or 95.7%) were found in undisturbed B-horizon soils. The felsite perforator has a stemmed base similar in form to a Small Stemmed projectile point that was recovered from this site, possibly indicating a Late Archaic/Early Woodland period component. No specific archaeological features such as hearths, pits, or post holes were identified during these investigations. The site contains a relatively low density of prehistoric artifacts across the knoll. Furthermore, the artifact assemblage is composed primarily of lithic flakes and very few tools. The knoll was probably truncated on the north, east, and west sides by the construction of the golf course, so it is possible that more substantial prehistoric remains that were once located at the site may have been destroyed. Thus, despite the presence of undisturbed deposits at the site, the potential for important research questions to be addressed through additional archaeological investigations is considered to be low. Therefore, the Meadowbrook prehistoric site is not considered to be eligible for the National Register of Historic Places and no further archaeological investigations were recommended for it.

25-1349 Holmes, Richard D., Carolyn D. Hertz and Christopher L. Donta

1993 Archaeological Investigations for Proposed Wastewater Treatment and Residuals Management Facilities, Plymouth, Massachusetts. 99 pages.

Additional archaeological investigations were conducted at two sites proposed for wastewater treatment facilities referred to as Site A and Site G (see report #25-1266). Also, reconnaissance surveys were undertaken for a third potential wastewater treatment facility site (existing plant site expansion area), a residuals management site (Manomet Landfill), and three force main routes. The Phase I (intensive) surveys took place in upland areas east and west of Route 3 and yielded no cultural material. A recorded prehistoric campsite, 19-PL-137, does not appear to extend into the project area. Possible historic sites were investigated and no further investigations were recommended for these sites. The reconniassance survey at the existing plant site expansion area indicated that this area is reported to be artificial fill and a recorded prehistoric site on the Plymouth waterfront, 19-PL-307, is located north of the area it is recorded to be in. It was recommended that, prior to any construction, this area be tested with a backhoe to verify the reported disturbance, and to ensure that sites that may be located below the fill will not be impacted. A reconnaissance survey of the proposed residuals management area at the Manomet Landfill indicates that there are not potentially sensitive areas of recorded archaeological resources in the study area; no additional investigations are recommended. A reconnaissance survey along proposed force main routes found that the only areas of high site potential are at the crossings of the Town Brook, the Eel River, a tributary of Beaver Dam Brook, and near Long Island Pond. However, in these areas, provided that the proposed force mains are placed within the road or shoulder of the road, no impact to prehistoric sites was anticipated. Should plans include excavation immediately outside of these areas, subsurface testing was recommended. No sites were located that appear to be potentially eligible for the National or State Registers of Historic Places.

25-1350 Davin, Ann K., Kerrylynn Boire and Holly Herbster

1993 An Intensive (Locational) Archaeological Survey of the Rockwood Estates Project Area, Canton, Massachusetts. 85 pages.

An intensive archaeological survey was conducted at a residential subdivision within a 38-acre parcel located west of York Street and immediately north of the town boundary with Stoughton. Background research, a walkover inspection, and subsurface testing were conducted as part of this investigation. The background research and walkover determined that the project area was highly sensitive for archaeological resources. Subsurface testing consisted of 30 x 30 m blocks and transects with test pits located at 10 m intervals. Additional testing in the form of test pit arrays and judgmental test pits were located around test pits that contained lithic chipping debris and historic-period domestic and structural materials. A total of 116, 50 x 50 cm test pits were excavated as part of the intensive survey. An historic EuroAmerican homestead and a prehistoric site were located during the intensive archaeological survey. The prehistoric site consisted of 47 pieces of chipping debris, with over 80% being Blue Hills rhyolite. Calcined bone, charcoal fragments, and a fire-cracked rock were also found, but not in a visible feature context. The historic EuroAmerican homestead consisted of a small cellar hole located along the edge of the wetlands. Materials included several pewter buttons/cufflinks, kaolin pipe fragments, redware ceramics, nails, a few glass fragments, and a piece of slate. The cultural materials indicated that this site was occupied during at least the 18th century and perhaps earlier. The absence of later materials suggests that the site was abandoned prior to the 19th century. A site examination was recommended due to the types and age of the cultural materials found during the intensive survey. These materials and the foundation suggested that important information on both the prehistory and early history of Canton was present in the project area. These sites may be potentially significant and eligible for listing in the National Register of Historic Places.

25-1351 Strauss, Alan E.

1993 Intensive Archaeological Survey of the Proposed Dormitory, Shed, and Parking Facilities at the Wellfleet Bay Wildlife Sanctuary in South Wellfleet, Massachusetts. 38 pages.

A Phase I archaeological survey was conducted in order to locate cultural remains within the impact areas of a proposed dormitory, shed, and parking facility. The project consisted of local background research, a site assessment, and subsurface testing. Background data indicated that numerous prehistoric remains had been recovered from the sanctuary and immediate project vicinity. A total of 26 shovel test pits was excavated. Test pit profiles indicated that the majority of the project area was covered by a layer of fill. Thirty-five pieces of chipping debris, consisting of quartz, felsite, chert, and quartzite, were recovered. The low density of prehistoric artifacts, lack of diagnostic materials and tools, and absence of subsurface features all suggest that the prehistoric sites are not significant. A ballclay pipe bowl, nails, and historic ceramics were recovered within the proposed parking area. The historical remains do not appear to represent a significant deposit. No further archaeological work was recommended.

25-1352 Willan, Steve and Suzanne Glover

1993 Intensive (Locational) Archaeological Survey, Valley Farm Residential Subdivision, Groveland, Massachusetts. 51 pages.

An intensive (locational) survey was conducted for a proposed 23 acre development located south of the Merrimack River and north of Main Street. The project area had been subdivided into 21 single family house lots with two access roads, Merrimack River and Valley Farm Roads. Background research and a walkover/surface inspection were used to stratify the project area into zones of expected archaeological sensitivity. The initial assessment determined that the parcel possessed a strong likelihood for containing prehistoric archaeological resources. This was based on its proximity to the Merrimack River as well as the presence of known prehistoric sites in the Groveland vicinity. Expected prehistoric resources included stone tool artifact assemblages along with evi-

dence of food processing and storage/disposal facilities (hearths, burnt rock platforms, pits, etc.). Subsurface testing conducted within the project area, however, did not result in the identification of any prehistoric deposits. Most sites recorded within the Merrimack River drainage are situated at major fall lines on the river itself and in areas bordering tributary streams and wetlands. These locations would have been the most productive settings for seasonally abundant food resources such as anadromous fish and waterfowl. The project area, on the other hand, lies adjacent to a relatively level segment of the river bordered by a steep embankment; there are no tributaries, streams, or substantial wetlands present within or immediately adjacent to the parcel. The intensive survey did recover 68 historic domestic and construction-related items in an A/plowzone horizon. These materials most likely represent field trash. Due to the absence of any evidence of prehistoric activity and very limited historic period activity within the project area, no additional archaeological investigations were recommended.

25-1353 Donta, Christopher L., Richard D. Holmes and Mitchell T. Mulholland

1993 Archaeological Site Locational Survey in the Vicinity of Possible Burials, Edgartown, Massachusetts. 37 pages.

An archaeological site locational survey was conducted in the vicinity of possible burials in Edgartown, Dukes County, Massachusetts. The construction of a new water tank is proposed, adjacent to an existing water tank erected in 1906. Some prehistoric materials, including bones, were reportedly encountered in the construction of the first water tank, indicating a high probability of finding prehistoric material upon further construction. Subsurface testing at the site was designed to identify possible burials, and included four testing stages. Electrical resistivity was employed to detect subsurface anomalies which were then explored in hand-excavated trenches. A series of shovel test pits was also excavated throughout the site. Finally, a backhoe was used to trench across the proposed location of the new water tank. Soil profiles exhibited an undisturbed subsoil over most of the site, with disturbance observed in the vicinity of the existing water tank and access road. Twenty prehistoric artifacts were found at the site. No features or burials were identified. It is concluded that bones found at a five-foot depth during the 1906 construction may have been associated with shallow soils, having fallen to depth from side walls. No further testing was recommended.

25-1354 Clements, Joyce

1993 Intensive Archaeological Survey for the Massachusetts Turnpike Authority Sewer Hook-Up Project, Westborough, Massachusetts. 37 pages.

An intensive archaeological survey was conducted at two testing areas: Segment I, approximately 220 m long and 12 m wide, extending from the Massachusetts Turnkpike Authority's Service Area 6AW to Belknap Street; and Segment II, approximately 12 m wide, extending from Belknap Street approximately 45 m south along the Piccadilly Brook. The project area is located in the southwestern area of Westborough, approximately 2 mi. from the town center. In Segment I, very low concentrations of 19th century artifacts were found indicative of yard scatter. In close proximity to Segment II, archaeologists found the remains of a 19th century axe mill. The remains are outside the project area, but are included in this discussion to indicate that the mill has been considered in the evaluation of the project's impact. On the basis of these investigations, it was found that the proposed project will not impact any historically significant cultural resources within the immediate project area and can proceed without further archaeological or historical investigations.

25-1355 Strauss, Alan E.

1993 Intensive Archaeological Survey of the Proposed 30,000 SF Retail Building at 2009-2039 Washington Street in Hanover, Massachusetts. 40 pages.

An intensive archaeological survey was conducted for a proposed retail building near Third Her-

ring Brook. Background research for the project indicated that numerous prehistoric sites were located in the vicinity of Third Herring Brook and that historical houses dating to the 19th century existed in the project area. Following the background research and field reconnaissance, 14 shovel test pits were excavated in the impact area. Recent historical trash and a small amount of 19th and 20th century artifacts were recovered. One sherd of prehistoric pottery was recovered from a fill level in association with historical remains. Because of the lack of intact prehistoric sites or substantial historical deposits associated with the 19th century structures, the project area was not believed to contain significant cultural resources; no further archaeological investigations were recommended.

25-1356 Donta, Christopher L. and Carolyn D. Hertz

1994 Archaeological Site Locational Survey for the Route 133 (Haverhill Street) Reconstruction Project, Rowley, Massachusetts. 73 pages.

An archaeological site locational survey was conducted for the proposed Route 133 (Haverhill Street) reconstruction project in Rowley and Georgetown. Portions of the project in Georgetown were not considered to be archaeologically sensitive, and required no subsurface testing. The project area consists of an impact zone approximately 4.5 km (2.8 miles) in length between Interstate Routes 95 and 1, to be affected by repaving and highway alterations. A total of 88 shovel test pits was excavated. No prehistoric materials were located within the project impact area. A small quantity of historic artifacts was recovered from disturbed contexts in the project area, all related to 19th and 20th century activity. One previously recorded prehistoric site (19-ES-467) just north of Survey Unit 5 was observed, and its present condition documented. An historic well was reported just north of Survey Unit 2, but is outside the proposed impact area. No further archaeological survey was recommended.

25-1357 Moran, Geoffrey P., Edward P. Zimmer and Anne E. Yentsch

1982 Archaeological Investigations at the Narbonne House, Salem Maritime National Historic Site. 317 pages.

The Narbonne house was built in ca. 1670 in Salem, Massachusetts, and is now part of the Salem Maritime National Historic Site. It was the home of tradesmen and artisans, and is valued as a rare surviving example of 17th century vernacular architecture. Excavations began in 1973 as part of the National Park Service program to rehabilitate the structure. Three field seasons included the excavation of numerous features, the most important being a first period lean-to foundation, cobblestone driveway, dairy, well, privies, and trash pits. The site was especially notable for the quantity of its artifacts (over 138,000) and the range of its fine imported late 18th century English ceramics and Chinese porcelain, which are described and illustrated in detail. Particular attention was given to the successive generations of occupants, their impact on the house and the site, and their relationship to the excavated evidence. The pattern of artifact distribution in sheet refuse and trash deposits was investigated. Recommendations for site interpretation and additional research were been made.

25-1358 Russo, Paul A.

1994 Historic and Archaeological Reconnaissance/ Inventory Survey, Cultural Resource Management Plan, Buffumville Lake, Charlton, [Dudley and Oxford], Massachusetts. 127 pages.

This report describes the background research and fieldwork for the intensive-level and site examination archaeological investigations conducted around Buffumville Lake and the reconnaissance level survey of the flow easement of Pierpoint Meadow Pond in Charlton, Dudley and Oxford. Twenty-five of the 27 locations identified around Buffumville Lake during a previous archaeological survey (see report #25-646) were tested during the intensive survey. No testing was conducted at two locations for reasons stated in the text. One additional location (10a) was identi-

fied and tested in the field. A total of 185 test pits was excavated as part of the intensive survey. Among the historic resources investigated around Buffumville Lake were Old Oxford Road, the old (breached) Colicum Dam, and the bulldozed remains of the L. Gould farmstead. None of these historic remains were determined to be significant. Four prehistoric areas were also identified and investigated. These included three isolated find spots and a small Transitional Archaic period campsite (Blue Heron Site). It was recommended that the prehistoric campsite undergo further archaeological investigation, at the site examination level, in order to determine its potential significance. Site examination level archaeological investigations were conducted in order to acquire sufficient information about the site to make a determination of eligibility for listing in the National Register of Historic Places. During the course of the site examination at the Blue Heron Site two distinct activity areas were located, approximately 15 m apart. One of these contained diagnostic artifacts, Atlantic type projectile points, indicative of the Atlantic phase of the Susquehanna Tradition of the Transitional Archaic Period. Non-diagnostic chipping debris and fragments of at least two ocher (iron-oxide) pigment pallets were recovered at the other activity area. Thus far the relationship between the two activity areas is not fully understood. The physical integrity of the site appears to be good. Unfortunately, it lies within the proposed project impact area. Since the proposed project does not allow for avoidance, a data recovery program was recommended in order to mitigate adverse effects from flood water impacts.

25-1359 Metropolitan District Commission

1989 Dorchester Shores Cultural Resource Management Plan, Executive Summary. 27 pages.

This executive summary is designed to accompany the Dorchester Shores Cultural Resource Management plan, separately published by the agency as "A History and Guide to the Restoration of Dorchester Shores" (see report #25-1363). The study of Dorchester Shores in Boston is one of a series of reports being prepared by the MDC on the cultural resources of its parks and reservations. It sets the historical context for park management by examining the development of the communities associated with it, and identifies surviving resources within the park. Evaluation of the resources and recommendations for the agency form the core of this executive summary, which is designed as a working document for in-house review of specific proposals for the Dorchester Shores property.

25-1360 Edens, Chris

1992 Intensive Archaeological Survey, Cabot Road Solid Waste Management Facility, Westfield, Massachusetts. 59 pages.

An intensive archaeological survey and an evaluation of the potential historic significance of two standing dwellings and associated outbuildings was conducted on a 32 ha (78 acre) development parcel. The intensive archaeological survey revealed only dubious traces of prehistoric occupation on the project parcel. Historic artifacts were more common, but only in the northern sections of the project parcel where the two dwellings are located; these artifacts are all firmly or probably dated to the 20th century. Deed and map research on the dwellings indicated their construction very late in the 19th century, a conclusion consistent with their vernacular, Greek Revival-influenced style. These dwellings lack stylistic, historical or associational significance, and are not eligible for inclusion in the National or State Registers of Historic Places.

25-1361 Pendery, Steven R.

1993 Intensive Archaeological Survey of the Spring Brook Village Site (19-SU-25), The Arnold Arboretum. 149 pages.

An intensive archaeological survey was conducted at the Spring Brook Village Site (19-SU-25) under the Boston City Archaeology Program. This project represents the first systematic archaeological survey within the Arnold Arboretum. Project objectives included locating and defining site

boundaries, evaluating the level of site integrity, educating the public about archaeology, and preparing site management recommendations for the Arnold Arboretum. At least 4 spatially discrete loci of prehistoric activity were identified at 19-SU-25 and 2 possible building sites dating to the early 19th century were located. Two of the loci contained features, and two bifaces found may represent fragments of Orient Fishtail and Greene projectile points. A concentration of grit tempered pottery was identified. The historic sites may date to the period of Benjamin Bussey's development of the property prior to the 1840s. Site 19-SU-25 possesses a relatively high level of archaeological integrity and it should be protected from subsurface disturbance.

25-1362 Dolan, Judith L.

1984 Excavations at the Ebenezer Man Furnace Site, Sharon, Massachusetts. 57 pages.

This report summarizes the results of excavations conducted at the Sharon casting furnace site in Sharon, Massachusetts. The research goal was to collect necessary evidence sufficient to propose the site for nomination to the National Register of Historic Places. Excavations confirmed the existence of an 18th century blast furnace at the site by revealing portions of the blast furnace foundation and large quantities of furnace by-products including slag, charcoal, cast iron shot, broken portions of cast iron holloware and nails that were originally attached to the leather bellows. The furnace is specifically important because of its contribution to the American Revolution and because it documents an antiquated technological process. Because of the site's historical importance and archaeological potential it was recommended that the Ebenezer Man Furnace site be nominated to the National Register of Historic Places. Continuing historical and archaeological research at the site was highly recommended.

25-1363 Metropolitan District Commission

1989 A History and Guide to the Restoration of Dorchester Shores. 31 pages.

The purpose of this document is to assure that important cultural resources are not inadvertently damaged or destroyed at Dorchester Shores in Boston. It also identifies the basis of an educational program and can help to guide design, construction, and interpretation. The Metropolitan District Commission is dedicated to the task of preserving significant elements of our past history so that our citizens can have unique learning experiences in the present and the future. The study briefly outlines the prehistory of the Lower Neponset River then historic settlement at Port Norfolk, Commercial Point, the Lower Mills and the Neponset River Reservation. Historical development, architectural and archaeological resources and recent planning activity for each of these areas is presented. Detailed references and a bibliography are included. See also report #25-1359.

25-1364 Glover, Suzanne and Kevin McBride

1993 Old Ways and New Ways. 7,000 Years Along the Old South Road: An Archaeological Study, Gay Head, Massachusetts. 21 pages.

This report represents a popularized version of archaeological research conducted for the Wampanoag Tribe of Gay Head (Aquinnah). The study was part of a master plan compiled prior to the development and use of several parcels of Trust Lands (Parcels I, IIA, IIB and III) awarded to the Tribe as part of the 1987 Settlement Act 9 (P.L. 95-100). The report presents a background of the project, a discussion of survey methods and techniques, the prehistory, history and archaeology of Gay Head and a comprehensive discussion of the Old South Road Community which incorporates the previously discussed sections. A topical bibliography is also included for further suggested reading.

25-1365 McManamon, Francis Patrick

1983 Prehistoric Cultural Adaptations on Cape Cod: Ecological Niches, Adaptive States and Temporal Variation. 398 pages.

This Ph.D. dissertation develops a method for applying the concept of ecological niche as developed and used by ecologists to the description and analysis of cultural adaptations. The cultural adaptation of a human population to the natural and social environment where its members reside is, in effect, its ecological niche. Ecologists typically describe the adaptive states of populations that they analyze as points or ranges of values along dimensions of the natural environment. Important dimensions of the natural and social environment also can be identified for cultural adaptations. The measurement of where along such dimensions a particular human population fits describes the population's adaptation. The bulk of this dissertation is both a case study of this approach in a prehistoric context and the description of a series of prehistoric cultural adaptations that existed during different time periods on Cape Cod, Massachusetts. Three dimensions of cultural adaptation, analogous to the niche dimensions of ecological studies, are analyzed: economic activities, spatial and seasonal organization, and external cultural contact. The archaeological data base that is analyzed consists of the assemblages, structural and spatial characteristics of 176 subsite concentrations distributed in 17 sites that have been discovered and examined by the Cape Cod National Seashore Archaeological Survey. Archaeological components from the Late Archaic through Late Woodland are included.

25-1366 Friedlander, Amy

1991 Salem Maritime National Historic Site, Historical Research 1626-1990. 273 pages.

Salem Maritime was the first National Historic Site established by the National Park Service. Enacted on March 17, 1938, the New Deal legislation which created the park recognized the importance of Salem in the maritime history of New England and the United States. The interpretive mission of the new park was originally focused on the surviving wharves, the Custom House, two residences facing Derby Street (Hawkes House and Derby House), and the West India Goods Store. Over time, the boundaries of the park have been enlarged; the approximately nine-acre park now includes the 17th century Narbonne House which faces Essex Street, St. Joseph's Hall on the corner of Derby Street and Palfrey Court, and two lots on the west side of Kosciusko Street. The purpose of the first research project was to develop a series of historical base maps, accompanied by a report, illustrating land use history within the park. The project was aimed at the period 1820 to the present, except in the case of those parcels acquired by the NPS since 1977, which required research from settlement to 1990. One goal of this research was to make an assessment of archaeological sensitivity within the park. The base map and text were to incorporate data on land ownership, location and function of structures, filling and dredging activities, and landscape evolution. Tracking utilities was excluded from the scope of this project. The second historical research project considered the history of the site more broadly, with particular reference to the period prior to 1820, and was designed to contribute to developing appropriate site interpretations as part of the General Management Plan for the park.

25-1367 Beaudry, Mary C.

1993 Narrative Summary of Archaeological Fieldwork, Summer 1992, Spencer-Pierce-Little Farm, Newbury, Massachusetts. 12 pages.

The 1992 field season at the Spencer-Pierce-Little Farm combined intensive excavations in three areas against the stone house, test trenching in two areas where electrical lines were to be installed, and survey consisting of field walking and surface collection. Related activities conducted as part of the Boston University Summer Term field school in historical archaeology included coring of selected trees in order to determine their ages and completing an inventory of 19th century newspapers found in the attic of the house. This brief preliminary report presents a summary of the summer field work and emphasizes the excavations next to the house. Archaeological field work continued beyond the six-week field school with funding provided by the National Endowment for

the Humanities and through volunteer efforts. The NEH grant is specifically to survey the farm as a whole, with the aim of locating all sites on the property. Excavations in 1992 focused on the kitchen area where cobble paving was exposed and excavations were completed for several features. Excavations were also continued in the West Yard and scullery foundation areas. Excavations in the area designated as East Front were aimed at recovering information about the landscape over time including historical grade levels and the construction date for the house. Excavations were also conducted in the West Front area and Breezeway. A field survey, also conducted in 1992, was completed for most of the cultivated fields around the house. That survey recovered both historic and prehistoric material including more than 40 shell midden features. In all, the 1992 field season recovered evidence for nearly 300 years of historic land use at the house. One important find was that recovered evidence indicates the house was completed by ca. 1680 corroborating circumstantial documentary evidence.

25-1368 Goodwin, Lorinda B.R.

1993 Archaeological Monitoring for Essex Alarm and Security at the House of the Seven Gables Historic Site. 7 pages.

This brief report describes the results of archaeological monitoring at the House of the Seven Gables Historic Site in Salem, Massachusetts. Four trenches were excavated for a renovated alarm system at the historic site. A previous archaeological investigation of the site (see report #25-1222) revealed that, while much of the site contained valuable and informative information about the history and prehistory of the site, areas near the edge of the garden and close to the other buildings on the site tended to be disturbed. The monitoring confirmed this observation in the excavated areas.

25-1369 Grumet, Robert S.

1992 National Historic Landmark Theme Study, Historic Contact: Early Relations Between Indians and Colonists in Northeastern North America, 1524-1783. 502 pages.

This National Historic Landmark Theme Study surveys archaeological, documentary, oral, and other evidence to establish historic contexts to identify, evaluate, and designate or thematically upgrade properties associated with the earliest phases of historic contact between Indians, Europeans, and Africans in the Northeastern United States from 1524 to 1783. The three historic contexts developed in this study summarize the current state of knowledge, review sources, and listed inventoried properties associated with major cultural areas within each historic context region. Although recent interest in interpretive reconstructions of meaning, gender, race and relations of inequality is reflected in this document whenever possible, primary emphasis focuses upom economic and socio-political factors affecting relations between native people and newcomers in the Northeast during early historic contact period times. This document is the first NHL Theme Study to develop historic contexts on a national scale. It is also the first document of its type to use the National Register of Historic Places' recently developed Multiple Property Documentation Form to present Theme Study findings. Using these frameworks to expand the scope of traditional NHL theme studies, this document coordinates NHL evaluation criteria to identify, evaluate, and nominate or thematically upgrade 20 properties (among which the Nauset Archaeological District in Cape Cod, Massachusetts is included). Pages 58 to 68 present the historic context for Eastern Massachusetts including a list of 89 inventoried properties associated with historic contact period Indian life in that area. The study also includes a summary of its identification and evaluation methods and an extensive bibliography, much of which is applicable to contact period studies in the Massachusetts area.

25-1370 McManamon, Francis P. and Christopher L. Borstel

1982 The Archaeology of Cape Cod National Seashore. 16 pages.

This pamphlet presents a popularized report of the Cape Cod National Seashore Archaeological Survey written for the general public. The report discusses archaeology at the seashore in general and the preliminary results of the seashore archaeological survey. The conservation and wise use of archaeological resources is discussed as well as conclusions about archaeological sites within the park boundaries preserving information about very different ways of life from the past. A reference list of books on historic period archaeology, prehistoric archaeology and Native Americans is included for further reading.

25-1371 Anthony, David W., Frederick M. Carty and Linda A. Towle

1980 State Reconnaissance Survey: Prehistoric Survey (Draft). 129 pages.

This report presents the results for the conceptualization and articulation of the design and implementation of the statewide survey. The study discusses biases in the collection of data from museum collections, survey methodology, typological biases, specific typological problems and basic assumptions which underlie the inventory. A projectile point typology is included within which form, flakes, size, approximate time range, additional names and references are identified for each type. An attribute list for non-projectile points is also included. This study forms the base for the Guide to Prehistoric Site Files and Artifact Classification System published by the Massachusetts Historical Commission in 1984.

25-1372 Mahlstedt, Thomas F.

1985 Report on the Walter Vossberg Collection, Tewksbury, Massachusetts. 9 pages.

This brief report summarizes an analysis of 587 artifacts inventoried from 16 sites in Middlesex and Norfolk counties, Massachusetts. Biographical information on Walter Vossberg is included, followed by a site summary tabulated by artifact type. A brief discussion of the Pine Ridge Cemetery site is also included. The Vossberg collection generally ranges from the Middle Archaic through Late Woodland periods.

25-1373 Mahlstedt, Thomas F. and Eric S. Johnson

1985 The Jesse Fewkes Collection, Lemon Brook Site, Newton, Massachusetts. 21 pages.

This report presents an analysis for a portion of the Jesse Fewkes collection which is currently stored at the Newton Historical Society's Jackson Homestead. Artifacts which could not be attributed to the Lemon Brook site in Newton were not coded because of their uncertain association. The report provides an inventory of 93 artifacts by type for the Lemon Brook site in Newton and Watertown, MA. The collection ranges from the Middle Archaic through Late Woodland periods. The major portion of the study, however, is an overview of New England prehistory based on the current state of knowledge. The overview was provided to assist the Jackson Homestead in understanding the collection they possess and as background information for display purposes. Recommendations were made for a public display and interpretive program based on the collection as well as its long term storage.

25-1374 Johnson, Eric S.

1985 Report on the Benjamin Franklin Green Archaeological Collection, Wilbraham, Massachusetts. 20 pages.

This report summarizes the analysis of 133 artifacts, all reportedly found on the B. F. Green farm (19-HD-11) located in the northeast part of Wilbraham, Massachusetts. The report includes a background history for the collection followed by a collection overview discussed by period and artifact type. Artifacts in the collection span the Middle Archaic through Woodland periods. Management recommendations are included as well as recommendations for curation and display.

25-1375 Mahlstedt, Thomas F.

1985 Report on the Raymond Seamans Jr. Collection, North Carver, Massachusetts. 36 pages.

This report analyzes 17,789 artifacts from 115 sites located primarily in southern and central Plymouth County and Cape Cod. Raymond Seamans Jr. identified 86 sites while his father Raymond Seamans Sr., part of whose collection is included as an appendix, added 27 sites. The sites and artifacts are discussed by temporal period. Each site is tabulated separately by artifact type. A summary attempts to integrate the collection results into a regional context adding that analysis of collections like the Seamans' indicates that interior portions of Plymouth County were more or less continuously inhabited from the Early Archaic through the Late Woodland periods.

25-1376 Mahlstedt, Thomas F.

1986 Prehistoric Collections in Southeast Massachusetts: The Edward Bielski Collection, Marshfield, Massachusetts. 8 pages.

This report briefly summarizes over forty years of collecting activities in Southeastern Massachusetts including Plymouth County and Cape Cod by Edward Bielski. A total of 722 artifacts from 21 sites and landowner codes are inventoried, representing only a portion of the Bielski collection. Each site and landowner code is tabulated separately by artifact type. Diagnostic types span the Early Archaic through Late Woodland and possibly Contact periods. Faunal remains and Native American burials are also included.

25-1377 Mahlstedt, Thomas F.

1986 Analysis of the Archaeological Collections of the Haverhill Historical Society's Buttonwoods Museum, Haverhill, Massachusetts. 65 pages.

This report summarizes the results of the MHC's inventory of the prehistoric archaeological collections of the Haverhill Historical Society. The Buttonwoods collection is comprised of at least 55 separate artifact collections ranging in size from one or two specimens to over one thousand. The sites represented are mainly from Essex County with emphasis on the Merrimack River Valley. Several important midden assemblages from the Truro area of the Outer Cape are also included. Many of the sites were collected by Frederick Almson Luce, one of the driving forces behind the society's development. The report describes the overall collection and includes artifact tabulations by site and type, site reports and a discussion of Native American burials originally associated with the collection. The report makes several recommendations relating to public display and interpretive programs for the museum and artifact storage. A Luce bibliography and appendix which includes a New England prehistoric overview is also included.

25-1378 Glover, Suzanne and Kerrylynn Boire

1993 Final Report Archaeological Inventory Survey Fort Devens, Massachusetts. 2 volumes, 14 appendices, 1,025 pages.

An archaeological survey was conducted within the 9,300-acre Fort Devens military installation which is located in the towns of Ayer, Shirley, Harvard, and Lancaster. Archaeological testing for prehistoric sites consisted of sampling the lands (both to be retained and property to be disposed of and reused) with moderate to high archaeological sensitivity rankings, based on a previously formulated sensitivity model (see report #25-1099). An approximate 20% testing sample was completed on sensitive areas of property to be disposed of and reused, and an approximate 10% sample was completed on sensitive areas of federally retained lands. Twenty prehistoric sites were discovered, and the previously formulated archaeological sensitivity model was refined for all Fort Devens lands. The field survey for historic archaeological sites consisted of the visual verification

of the 145 documented sites identified during the previous archaeological reconnaissance survey along with additional documentary research and local informant information. Visually verified historic sites on property to be disposed of and reused were subjected to limited subsurface testing. No subsurface testing was conducted at visually verified historic sites on retained lands. A total of 90 historic archaeological sites was identified as a result of the archaeological survey. Based on the level of archaeological testing conducted to date, the 20 identified prehistoric sites appear to represent small, temporary camps where the manufacture/ maintenance of chipped stone tools occurred. Three of the sites produced evidence for food processing/ procurement in addition to the stone-tool making activities. These include the Shoppette Site on the Main Post, the Nonacoicus Brook Site on the North Post, and the Range Control Site on the South Post. Only two of the sites could be assigned a tentative temporal/cultural affiliation based on the recovery of diagnostic artifacts. These include the Jackson Gate Site, tentatively dated to the Late Archaic Period (5,000-3,000 B.P.) and the Nonacoicus Brook Site, tentatively dated to the Woodland Period (3,000-450 B.P.). The physical condition and integrity of the prehistoric sites are assessed as good based on the limited subsurface testing conducted to date. In order to determine the National Register eligibility of these resources, additional archaeological investigations are recommended. Documentary and field research were used to classify the functional type, temporal affiliation, and research value of the 90 historic archaeological sites identified at Fort Devens. Seventy-three sites are related to domestic agrarian occupation/activity dating from the second-half of the seventeenth to early twentieth century. Associated agricultural field systems, domestic vegetation, and landscapes were recorded for many of these sites. Nine sites are related to public/institutional (including the Shaker movement) occupations dating from the second-half of the 18th to early 20th century. Four sites are related to rural industrial activities dating from the second-half of the 18th to early 20th century. Three sites are associated with local transportation networks established from the early 18th to late 19th century. There are also 12 former town roads within Fort Devens, the majority of which were laid out by the early 19th century. Only two archaeological sites date to the military period occupation of Fort Devens. Eighteen of the identified historic archaeological sites on property to be disposed of and reused (Main and North Posts) are assessed as having fair to very good and excellent physical integrity. Site avoidance and preservation in place is recommended. If avoidance is not feasible, then further research (i.e., deed searches, intensive subsurface testing) would be needed in order to make determinations of National Register eligibility. Eleven of the identified sites on property to be disposed of and reused (Main and North Posts) are assessed as being not eligible to the National Register, due to poor physical integrity and/or lack of sufficient information content. The potential National Register eligibility of 49 of the 62 historic archaeological sites identified on retained lands (one on the Main Post; 48 on the South Post) cannot be assessed without additional research. The remaining 13 identified sites on retained lands are assessed as being ineligible for the National Register, due to ground disturbances and/or lack of information content. There are 22 unidentified documented historic archaeological sites on property to be disposed of and reused and on retained lands of the Main and North Posts that have been destroyed or have minimal potential for survival. No further research is recommended for these sites. There are 23 unidentified documented sites on retained lands of the South Post. Thirteen of these have a moderate potential for survival. Their suspected locations should be avoided during ongoing/proposed earthmoving activities. If avoidance is not feasible, then further research would be necessary to locate and evaluate them for National Register eligibility. The remaining 10 unidentified documented sites on the South Post have been destroyed by military earthmoving activities. No further research is recommended for the sites which lack integrity.

25-1379 Fuchs, Adam and Sally Pendleton

1994 Intensive Archaeological Survey of Tennessee Gas Pipeline Company's Proposed GE Lynnfield Gas Pipeline in Lynnfield and Peabody, Massachusetts. 84 pages.

Seven areas of archaeological sensitivity were selected for subsurface testing. A total of 131 shovel test pits was excavated. Prehistoric artifacts representing five separate sites and findspots were recovered from three areas (Areas 3, 4, and 5) and an historical boundary marker was identified in Area 7. In Area 3, one lithic flake was recovered from one test pit. This site--designated the

Tophet Road find spot--was determined to be an isolated find based on additional testing. In Area 4, a total of five prehistoric lithic flakes was recovered from two test pits. This site--designated the Rocky Ground prehistoric site--is not considered to be potentially significant. Three prehistoric sites--the Pine Hill Road findspot, the Coda prehistoric site, and the Pad prehistoric site--were discovered in Area 5. The Pine Hill Road findspot consisted of a single lithic flake recovered from one test pit. At the Pad prehistoric site, 10 prehistoric flakes were recovered from the disturbed plowzone. At the Coda prehistoric site a total of 38 lithic flakes were recovered, many from undisturbed strata possibly representing more extensive potentially significant prehistoric deposits. The historical boundary marker in Area 7 was identified on the 1831 map of Lynnfield as the "Seven men's Bound." If it is not possible to avoid the area of the Coda prehistoric site, then a site examination should be conducted. If the "Seven men's Bound" marker cannot be avoided, then additional documentary research and surveying should be conducted to determine whether the marker is in its historical location and context. The remainder of the sites encountered during this project are not considered significant and no further archaeological investigations were recommended.

25-1380 Beaudry, Mary C.

1994 Results of an Archaeological Site Examination: Swett-Ilsley House, Newbury, Massachusetts. 88 pages.

A site examination was performed at the Swett-Ilsley House, owned by the Society of the Preservation of New England Antiquities, and dating from ca. 1671. Seven exploratory trenches were excavated in advance of a proposed drainage improvement project. Evidence of recent landscaping and utility installation were found east and west of the house. Trenches along the north elevation located several features, including the remains of a ca. 18th century brick pier footing for an outbuilding. The high proportion of tobacco pipe fragments recovered reflects the use of the structure as a tavern. Recommendations were provided to avoid deep grading along the northern portion of the property.

25-1381 Cook, Lauren J.

1993 Report on an Historical Archaeological Resource Survey of Thompson's Island. 55 pages.

Extensive historical research and limited field testing was undertaken on Thompson's Island in Boston Harbor. Focused on the island's 17th and 18th century tenancy period, the author summarizes the historical evidence for landlord-tenant relations, and land use patterns. Four transects of 25 cm x 25 cm units at 10 m intervals were excavated. Several now-destroyed and extant structural features were investigated.

25-1382 Donta, Christopher L.

1994 Archaeological Site Locational Survey for the Highland Light Relocation Alternatives Study, North Truro, Massachusetts. 19 pages.

An archaeological site locational survey was conducted at a 1.67 acre site consisting of a lighthouse complex, an access road, and portions of a golf course. Twenty-four shovel test pits were excavated. No prehistoric materials were located within the project impact area. Cultural materials recovered during the survey consisted of a low volume of historic artifacts recovered from disturbed contexts in the project area. All artifacts were related to 19th and 20th century activity associated with previous domestic use of the area. Two building foundations were observed in the vicinity of the impact area. The first was a previously documented concrete foundation on the western edge of the project area, probably dating to the late 19th or early 20th century. The second foundations was found in the northeast part of the project area, and consisted of a poured concrete foundation, with a linoleum covered concrete floor. The entire area was found to be disturbed by previous construction and heavy landscaping associated with the golf course. No further investigations were recommended (see Report #25-1459).

25-1383 Edens, Chris

1994 Site Examination of Four Prehistoric Sites in the Farard Residential Development Parcel, Bellingham, Massachusetts. 108 pages.

Site examinations of four sites were conducted in connection with a residential development. The sites had been located during an intensive survey in 1986 (see Report #25-777). Site A-2 (19-NF-229) was found to contain a light scatter of quartz debitage, but to have been heavily disturbed by a nearby sand quarry. The site has lost integrity, and is not eligible for the National Register of Historic Places (NR); no additional work was recommended. The site examination at Site E-l (l9-NF-230) recovered 362 pieces of quartz and felsite debitage and bifaces, and several ground-stone tools from the topsoil and upper 10 cm of the subsoil. The site contains two overlapping parts, one composed entirely of quartz biface reduction debris, and the other of felsite Atlantic and quartz Small Stemmed materials. The site is undisturbed, and offers an opportunity to investigate the temporal and functional relationship between the Susquehanna and Small Stemmed traditions; the site is NR eligible. If the development design continues to avoid this portion of the development parcel, the site should be preserved in place. The site examination at Site H-1 (19-NF-23l) recovered six probably fire-related features (shallow pits) some with concentrations of fire-cracked rock, 56 pieces of calcined bone including rib fragments of canis (dog or coyote), several unidentified charred seeds, 432 pieces of chipped stone, and several ground-stone tools; the artifacts derived mostly from the topsoil and features. A distinct stratigraphic level at the base of the topsoil was interpreted as the result of intense occupational activities. Two radiocarbon dates from features (GX19995, 1165 ± 345 BP; GX19996, 1620 ± 145) indicate a Middle Woodland date for most of the site, while a Brewerton Eared Notched point (from the intensive survey) and a Stark-like point imply Middle and Late Archaic components. The lithic raw materials include felsites from the Boston Basin and from the Attleboro area, and several pieces of chert. The site is undisturbed, and offers an opportunity to investigate a small upland Middle Woodland camp; the site is NR eligible. If the development design continues to avoid this portion of the development parcel, the site should be preserved in place. The site examination at Site I-1 (l9-NF-227) recovered one feature (a hearth), 214 pieces of chipped quartz (biface reduction debitage), and two broken or reworked Small Stemmed points; the artifacts occurred in the topsoil and upper 10 cm of the subsoil. The site is undisturbed, but represents a common site type (lithic reduction near a wetland). Although it is NR eligible, no additional work is recommended at this site. Included in the conclusions of the report is an analysis of site variability that considers scales of observation to address site-specific and regional research questions. It considers the challenges inherent in addressing research questions in terms of "middle-range theory" (site deposition and transformation processes), the uncertainties in New England prehistoric chronology, and the requirements to address these issues with innovative methods. Framed within this discussion is an attempt to address the question of the relationship of the Small Stemmed and Susquehanna Traditions.

25-1384 Strauss, Alan E.

1994 Intensive Archaeological Survey for the Reconstruction and Relocation of Old Comers Road in Chatham, Massachusetts. 40 pages.

Field investigations for the project included a surface inspection, followed by the excavation of 12 shovel test pits. Subsurface testing revealed extensive disturbance through grading and bulldozing within the majority of the project area. No prehistoric cultural resources were recovered during the intensive survey. Minor amounts of 19th and 20th century artifacts were recovered within the project area; however, these were found in association with modern plastic, aluminum foil, and bottle glass. Because no significant historic or prehistoric resources were identified within the proposed construction route, no further archaeological investigations were recommended for the project.

25-1385 Strauss, Alan E.

1994 Intensive Archaeological Survey of the Telegraph Hill Subdivision in Provincetown, Massa-

chusetts. 33 pages.

The project consisted of local background research, a field reconnaissance, and subsurface testing. Background data indicated that the site was used as a signaling and telegraph station in the 1830s-1850s. Subsurface testing consisted of the excavation of 23 shovel test pits. No prehistoric or historical artifacts were recovered during the intensive testing. Testing determined that the project area consists of an ancient sand dune. Because no prehistoric or historical sites were identified, no further archaeological investigations were recommended.

25-1386 Donta, Christopher L., Richard D. Holmes, and Mitchell T. Mulholland

1994 Archaeological Site Locational Survey for the Proposed Walmart Site VHB Project 3548.26, Orange, Massachusetts. 49 pages.

The project area consists of a 51 acre parcel just north of Route 2A, 13 acres of which will be developed. Historic settlement near the parcel appears to have begun during the mid 19th century, in response to the development of the Wheeler industrial enterprises. Six areas of the parcel were identified as having a moderate to high probability of containing archaeological sites. A total of 118 shovel test pits were excavated in these areas, but no prehistoric materials were located. A small number of historic artifacts were recovered from disturbed contexts in several portions of the project area, all related to 19th and 20th century activity. No further archaeological survey was recommended.

25-1387 Holmes, Richard D., Carolyn D. Hertz, Christopher L. Donta, and Eric S. Johnson

1994 Archaeological Site Locational Survey for the Proposed Southbridge Water Distribution Extension, Charlton, Massachusetts. 60 pages.

Proposed locations of three water tanks and three pumping stations were examined by subsurface testing. No prehistoric artifacts or features were found. Historic artifacts found in the plow zone in two survey units include whiteware (1820-1900) and temporally undiagnostic redware, nail fragments, and glass. Remains of a structure were recorded adjacent to the project area. It does not appear that the project area contains resources eligible for inclusion in the National or State Registers of Historic Places. No further archaeological survey was recommended.

25-1388 Donta, Christopher L. and Carolyn D. Hertz

1994 Archaeological Site Locational Survey for the Newton Street Bridge Reconstruction Project, Amesbury, Massachusetts. 45 pages.

A background review of documented historic and prehistoric cultural resources was conducted. The historic documents indicated primarily an agricultural and industrial use of the general area back to at least the late 1700s. A sawmill was identified as possibly having existed within the proposed impact area in 1884. A total of 12 shovel test pits were excavated in the proposed wetland replication area. No prehistoric artifacts or features were found. Only two historic artifacts were recovered from disturbed soil contexts. No evidence of foundations or other structural elements was found in the project area, nor does it appear that a mill was ever located within the proposed wetland replication area. It appears that the mill indicated on the 1884 map was either misplotted or was located just to the north of the project area, in a location now bulldozed. No further survey was recommended.

25-1389 Hartigan, Douglas and Ann K. Davin

1994 Results of the Intensive Archaeological Survey, Eagle Farm Estates, Canton, Massachusetts. 60 pages.

A 65 lot residential subdivision was proposed within a 72.5 acre parcel of land. The background research and walkover survey determined that the project area was moderately sensitive for archaeological resources. Subsurface testing consisted of transects with test pits located at 10 m intervals. A total of 108, 50 cm x 50 cm test pits was excavated. Results of the intensive survey included a historic cartpath, stone walls, and a scattering of historic/modern cultural material that were recovered and cataloged as agricultural field trash. Prehistoric material recovered consisted of an isolated findspot containing four pieces of Blue Hills rhyolite chipping debris. These materials do not represent any potentially significant cultural resource. No further archaeological investigation was recommended.

25-1390 Miller, Beth P.

1994 Final Report Phase I a/b, Intensive Archaeological Survey, Algonquin Gas Transmission Company Proposed 3.83 Mile of 16-inch Pipeline Loop, Valve Site 1-22 to Brockton Meter Station. 62 pages.

Temporary workspaces, staging areas, access road, a spoil area, and the proposed loop, were investigated as part of the intensive survey. Field testing resulted in the recovery of one piece of quartz shatter/chipping debris, found in a fill deposited soil horizon. In addition, low densities of historic “field trash” were recovered. No further investigations were recommended.

25-1391 Cook, Lauren J., Robert G. Kingsley, Patrick W. O’Bannon, Glenn A. Ceponis, and Anne S. Dowd

1991 A Phase IA Cultural Resources Survey in Association with the Relicensing of Eight Hydroelectric Developments Along the Deerfield River Valley in Vermont and Massachusetts. 219 pages.

A cultural resources survey was conducted for eight hydroelectric developments in the Massachusetts towns of Buckland, Charlemont, Conway, Florida, Monroe, Rowe, and Shelburne. The survey involved an in-depth review and contextual synthesis of background information on the environment, cultural history, and previously recorded archaeological and historic properties within and in the vicinity of the eight hydroelectric developments’ project areas. Background and documentary research resulted in the identification of nine previously recorded archaeological sites and eight historical architectural resources. Archaeological site sensitivity models were developed in order to assess the potential of the project area to contain prehistoric and historic archaeological sites. In-field vehicular and pedestrian reconnaissance survey was performed in order to augment the documentary research and to evaluate and record the nature and extent of existing and potential impacts to cultural resources through on-going activities. Recommendations were offered for Phase IB archaeological survey where hydroelectric facility operation or maintenance impacts coincide with areas of medium or high archaeological sensitivity. A detailed technical and historical summary of the New England Power Deerfield River Developments was also presented, as well as recommendations regarding potential future impacts. A supplemental report which expands on this report’s findings and recommendations was prepared subsequent to this report (see Report #25-1392)

25-1392 Glover, Suzanne, Paul Russo, Amy McFeeters, and Maureen Cavanaugh

1994 Supplemental Report: Phase IA Cultural Resources Survey for the Relicensing of Eight Hydroelectric Developments Along the Deerfield River Valley in Vermont and Massachusetts. Three volumes, 370 pages.

A supplemental Phase IA cultural resources survey was conducted for eight hydroelectric developments in the Massachusetts towns of Buckland, Charlemont, Conway, Florida, Monroe, Rowe, and Shelburne. This supplemental survey work was designed to address issues outlined in comments from the Massachusetts Historical Commission and Vermont Division for Historic Preservation on a previous Phase IA cultural resources survey report (see Report #25-1391). The sup-

plemental Phase IA survey consisted of additional archaeological and architectural services for the project developments. The archaeological services included additional background research, fieldwork, site mapping, and the preparation of archaeological inventory site forms. The architectural services consisted of additional background research, fieldwork, and the preparation of inventory forms. The additional background research and fieldwork resulted in the refinement of the prehistoric and historic archaeological sensitivity models and assessments. A discussion of the environmental characteristics of each development was included along with operating the developments, effects of wave and ice scour activity, and forest management practices. This information was used to formulate management recommendations for future archaeological survey in project developments where direct and indirect impacts are or may have adverse effects on significant cultural resources. Information on the buildings and structures within each of the eight developments was organized and presented on standard inventory forms. National Register recommendations were developed to assist in a consensus Determination of Eligibility. The results and management recommendations will be used to assist in the preparation of a Cultural Resources Management Plan.

25-1393 Holmes, Richard D., Carolyn D. Hertz, and Mitchell T. Mulholland

1994 Archaeological Site Locational Survey of the Bayview Corporate Park, Quincy, Norfolk County, Massachusetts. 88 pages.

This area contains three granite quarries operated from the 19th to early 20th centuries. Adjacent to this parcel, along the route of a proposed access road, is the Lyons Turning Mill (1894-1917), a National Register property that will be avoided during construction of the road. Features identified and documented include foundation and parts of structures, iron fragments related to quarrying, grout (stone waste) piles, retaining walls and partially-finished stone architectural items produced at the turning mill. Quarry 1 appears to be eligible for the National Register under Criteria A, C, and D. It is recommended that the main part of Quarry 1 not be altered. Quarries 2 and 3 are smaller, later quarries that are damaged by dumping. Quarries 2 and 3 do not appear to be eligible f or the National Register. No further archaeological research was recommended for these two sites.

25-1394 Wilson, John S. and Richard S. Kanaski

1994 Archaeological Survey of the Pines Trail, Parker River National Wildlife Refuge, Essex County, Massachusetts. 27 pages.

Thirteen 50 cm square test pits as well as several auger samples, using a 17 inch Hoffer soil auger, comprised the bulk of the field study in Ipswich. The archaeological survey revealed eleven prehistoric features, consisting of ten small and shallow buried middens and one deflated midden on the trail surface. All eleven features were considered to be within one archaeological site designated as the Pines Site. Recommendations were made for a 2 m buffer zone around the features as well as modified construction techniques to protect the archaeological features from impacts of both aeolian erosion and pedestrian traffic.

25-1395 Herbster, Holly

1994 Phase I Intensive Archaeological Survey for the Algonquin Gas Transmission Company Proposed 4.0-Mile Canal Lateral Pipeline, Bourne, Massachusetts. 116 pages.

The intensive survey included the preferred route and alternate segments, as well as additional staging areas and access roads. The survey included background research, a walkover survey, an archaeological sensitivity assessment, and subsurface testing. A total of 196, 50 cm x 50 cm test pits were excavated during the intensive survey. The walkover survey identified a large glacial erratic known locally as Chamber or Sacrifice Rock, and was reported to have been used by Native Americans during the Contact Period. Testing in the vicinity failed to identify any cultural materi-

als. The proposed project will avoid impacting the rock by protective fencing no less than 9 m away. A small locus of prehistoric activity was identified, and six pieces of felsite chipping debris were recovered in the site area. Testing around this find spot defined the boundaries of the deposit. It is unlikely that this deposit represents a potentially significant archaeological site. Therefore no additional archaeological investigations were recommended.

25-1396 Strauss, Alan E.

1995 Intensive Archaeological Survey of the New Elementary School in Brewster, Massachusetts. 35 pages.

Field investigations for the project included a surface inspection, followed by the excavation of 150 shovel test pits within the project area. Three loci of prehistoric activity were identified which contained a few lithic flakes, and two sherds of prehistoric pottery. Bracket testing in the loci failed to produce additional cultural resources. No further archaeological investigations were recommended.

25-1397 Ella, Ricardo J., Donald G. Jones, David E. Clayton, and Nicole A. Missio

1993 Results of an Intensive Archaeological Survey of Proposed Water Main at Cogswell's Grant in Essex, Massachusetts. 40 pages.

Background research revealed that a late 19th century structure is likely to have existed within the project impact area. Although no prehistoric archaeological sites were recorded in the immediate project area, one site has been reported on the high ground to the northeast of the farm buildings. The proposed water line also crosses a portion of Strawberry Lane, part of the main road connecting Ipswich and Gloucester in the 17th century. During the field reconnaissance, no surface evidence was identified for either prehistoric activity or historical structural remains. A total of 33 shovel test pits were excavated at 10 m and 15 m intervals in linear transects parallel to the proposed water main line. No prehistoric artifacts were recovered from any of the test units. Historical artifacts were present in eight of the test pits; most of these were relatively modern but some may date to as early as the 17th and 18th century. These materials, however, were not associated with any historical features or structures and are not considered to represent potentially significant deposits. No additional archaeological investigations were recommended.

25-1398 Bell, Edward L.

1987 The Historical Archaeology of Mortuary Behavior at a Nineteenth-Century Almshouse Burial Ground. 187 pages.

This study examines and interprets the material culture recovered from the archaeological excavation of the 19th century Uxbridge Almshouse Burial Ground in the context of the social historical record on American deathways (see Report #25-963). Scholarly research on American death practices documents a transformation in social structures, attitudes, and material culture in the late 18th and 19th century that some historians have called the beautification of death. Late 18th and 19th century Americans created a wide range of decorative arts associated with death and funerals. Some researchers have interpreted this period as a reaction to an increasingly turbulent world, full of changes in social and economic structures. The transformation in death practices was socially pervasive and fostered the commercialization of the funeral industry. Partially as a result of the successful commercialization of deathways, specialized ornamental coffin hardware was widely used, even for coffins purchased for people at the lowest end of the socio-economic continuum. Paupers interred at the burial ground were given minimally decent care at death. The minimal nature of their funerary treatment is vividly captured in the archaeological record of the site, and underscores the historical fact of the dire social and economic circumstances of people who received economic assistance from the town.

25-1399 Wilkie, Duncan C.

1994 Phase I: Intensive Archaeological Survey of a 7.26 Acre Parcel of Land in Medfield, Massachusetts. 68 pages.

A background literature search, surface reconnaissance, and subsurface testing were conducted on a parcel of land slated for construction of a residential structure. Twenty test pits were excavated without finding any prehistoric artifacts. A brick reservoir believed to be associated with the "tannery farm" dating to the late 1800s was recorded and photographed as an historic site. Prehistoric site 19-NF-48 is believed to be adjacent to the project area. The developer agreed not to build in the project area along an existing driveway adjacent to site l9-NF-48 and to preserve the brick reservoir. These development restrictions will be placed in the deed to the property.

1994 Results of Archaeological Monitoring During Construction of the Red Lily Pond Wastewater Collection and Disposal System Project Area, Craigville, Barnstable, Massachusetts, and Management Recommendations Concerning Two Possible Native American Graves in the Project Area (19-BN-682). 17 pages.

Staff archaeologists from the Massachusetts Historical Commission conducted archaeological monitoring during construction of a septic system for the Town of Barnstable. Native American skeletal remains had been discovered in the project area vicinity in 1907 and in 1993. Two soil features were located by MHC during construction excavation. These features appeared similar to ancient Native American graves observed at other sites, and have been designated with the MHC site #19-BN-682. Surface examination of the features, collection of surface charcoal, and documentation were conducted. No excavation into the features was necessary as negotiation with project planners succeeded in redesigning the project to avoid the features. Two features were marked on project plans and management recommendations were offered to the property owners to avoid excavation in the vicinity of the features and to consider granting a preservation easement to ensure their long-term preservation. Graves have significant scientific, historical, cultural, and spiritual value, and should be preserved.

25-1401 Scarlett, Timothy James

1994 Pudding Pans and Broilers – Bread Pans and Pie: Redware, Consumption, and Economy in Eighteenth Century New England. 263 pages.

This research paper describes analyses undertaken to test the assumption that redware was locally made and consumed in colonial New England. Thin-section petrology was used to conduct a microscopic analysis of a sample of redware ceramic sherds, mostly from contexts at the Spencer-Pierce-Little Farm in Newburyport. Comparative materials were used from two Newburyport redware kilns (using samples collected by Lura Woodside Watkins and curated at the Smithsonian Institution since 1951). The results of the analysis led the author to reject a local market model of redware consumption. The paper uses the analysis as a means to examine underlying historical assumptions about consumer behavior and economy in historical archaeology.

25-1402 Scarlett, Timothy James

1994 Remote Sensing at the Old Burying Ground Morrison Kiln Site in Newburyport, Massachusetts. 14 pages.

A ground-penetrating radar survey was undertaken to locate the remains of an 18th century kiln site. Core samples were taken of clay in an area where a large anomaly was identified, but for which no graves were believed to be located. Some observations on the layout of the cemetery

were provided. Recommendations were provided to avoid archaeologically sensitive areas of the cemetery. This field report is also included as Appendix C of Report #25-1401.

25-1403 Davin, Ann, Holly Herbster, Virginia H. Adams, and Maureen A. Cavanaugh

1994 Historic and Archaeological Reconnaissance Inventory Survey, Cultural Resource Management Plan, Cape Cod Canal, Bourne, Sandwich, and Wareham, Massachusetts. 234 pages.

The goals of the reconnaissance/inventory survey were to locate, identify, and provide an inventory of cultural resources, and to prepare a cultural resource management plan. Background research on the prehistory, history, and environmental setting of the canal area was used to develop a preliminary sensitivity assessment for the Cape Cod Canal and included areas where extensive construction impacts were documented. This preliminary assessment was used as a guideline to determine where subsurface testing was conducted. A total of 230 acres was ranked as being archaeologically sensitive during the preliminary assessment. A total of 337, 50 cm x 50 cm test pits was excavated in these areas during the inventory survey. Prehistoric cultural material was recovered in four areas on the canal property. A total of 101 pieces of lithic material was found along with shell, calcined bone, and charcoal fragments in 40 test pits. Historic period materials were found scattered in seven different locations and consisted of 70 artifacts collected in 27 test pits. With the exception of the two prehistoric sites, the majority of these archaeological deposits were located in small intact areas surrounded by disturbed soils. Historic materials consisted of structural and domestic materials. The sensitivity assessment of the Cape Cod Canal project area was amended to reflect the results of the subsurface testing. The survey of the historic buildings, sites, structures, and objects was restricted to a windshield survey for the purpose of preparing recommendations for additional survey. The survey identified 55 buildings, sites, structures, and objects, 21 of which are 50 years or older. Fifteen of these properties have not been comprehensively documented and evaluated for eligibility for inclusion in the National Register of Historic Places. The Army Corps of Engineers currently has no plans to construct facilities in the areas identified as containing cultural resources. Subsurface testing identified the limits of most of the intact areas along the canal. Three prehistoric sites may represent significant resources and if future plans for construction occur then additional testing would be recommended. A comprehensive study and evaluation of the remaining 15 historic properties was also recommended.

25-1404 Beaudry, Mary C.

1994 Archaeology of the Spencer-Pierce-Little Farm, Newbury, Massachusetts. Interim Report No. 4. Results of Testing in Proposed Location for a Dry Well, August, 1994. 103 pages.

Archaeological testing in an area proposed for installation of a dry well at the Spencer-Pierce-Little Farm in 1994 added further to our knowledge of late 18th and 19th century landscape treatment in the area immediately west of the house. The site examination produced no indication that significant cultural resources would be destroyed by the construction activity, and subsequent monitoring of construction bore out this observation. Results of the site examination lead to a review of previous excavation and testing in this area. A summary of previous investigations at the Spencer-Pierce-Little Farm was included. The stratigraphic and artifactual evidence delineates at least two landscaping episodes; Locus 2 across the site resulted from Edward Henry Little's renovations to the house and grounds ca. 1865-70; the strata within the area labeled "Flower Garden" on an 1812 plan of the property most likely were deposited in the late 18th century and may result from a landscaping project of horticultural experiment by Nathaniel Tracy. The lack of evidence congruent with expectations of what a garden should look like archaeologically led to a search for comparable evidence from other sites. The deposits in the "Flower Garden" area at the Spencer-Pierce-Little Farm are closely comparable to the deposit comprising a drain field for an experimental grapery, or greenhouse, in the 19th century by Nicholas Biddle at Andalusia, Pennsylvania. It is therefore possible that the "garden" deposits are the remains of an extensive drain field intended for some as-yet unfathomed horticultural activity undertaken by Nathaniel Tracy or perhaps by Offin Boardman, who succeeded Tracy at Spencer-Pierce-Little as owner and gentleman

farmer. Recommendations were offered for analyses and synthesis of the material recovered from previous years' investigations at the property (see Report #25-743, 25-1238, 25-1249, 25-1250, 25-1251, 25-1252, and 25-1367)

25-1405 Strauss, Alan E.

1994 Intensive Archaeological Survey of the MetroWest Water Supply Tunnel Project, Marlborough, Northborough, Southborough, Framingham, and Weston, Massachusetts, Including Shaft Locations, Pumping Stations, Pipelines, Storage Tanks, Work Areas and the Wachusett Interim Corrosion Control Facility. 182 pages.

An intensive archaeological survey was conducted for the MetroWest Water Supply Tunnel, following a preliminary reconnaissance survey. Testing at the pumping station locations confirmed land disturbance in these areas. Testing at the work areas for the construction project resulted in the identification of eight prehistoric sites, one of which was previously recorded (19-MD-212 at Shaft L). Two of the sites-- 19-MD-724, located on the first terrace of the Sudbury River in Framingham (Shaft L Area) and 19-MD-725, located near Schenck's Pond at the Norumbega Reservoir in Weston (Shaft N Area) --produced high quantities of prehistoric cultural materials, many of which were recovered from undisturbed contexts. These two sites are believed to date to the Early Woodland and Middle Woodland Periods respectively. Because the sites are potentially eligible for listing in the National Register of Historic Places, the survey recommended that site examinations be conducted in these areas (see Report #25-1406 and 25-1407). The remaining prehistoric sites have poor archaeological integrity and low artifact densities; they are not National Register-eligible and no further archaeological work was recommended. No historical sites were identified within the project impact areas and no further investigations were recommended for any other portions of the project area.

25-1406 Strauss, Alan E.

1994 Phase II Archaeological Site Examination of the First River Terrace Site, Framingham, Massachusetts, Conducted at Shaft L for the Metrowest Water Supply Tunnel Project. 99 pages.

An archaeological site examination was conducted at the First River Terrace prehistoric site (19-MD-724), situated adjacent to the Sudbury River. The site was discovered during an intensive archaeological survey of Shaft L as part of the Metrowest Water Supply Tunnel project (see Report #25-1405). The site examination consisted of 46 shovel test pits, four 50 by 100 cm units, one 100 by 150 cm unit, and five one-meter units. The site stratigraphy indicated that the First River Terrace site had been plowed and therefore lacked some degree of archaeological integrity. However, 44% of the artifacts were recovered from the B-horizon to a depth of 50 cm. Four prehistoric activity loci were identified at the site. Locus 1 contained pottery from the end of the Middle Woodland or the beginning of the Late Woodland period, and Middle Woodland Lanceolate and Fox Creek points (ca. 1,800-1,200 B.P.). An Early Woodland Meadowood preform (ca. 3,000-2,500 B.P.) and finished point were also recovered from this locus as well as an Early Woodland Rossville point. A radiocarbon date from Excavation Unit 6A provided an absolute date of 3,125 $\pm$ 170 E.P., which corresponds to the Early Woodland period. A second locus (Locus II) consisted of a high density felsite workshop which contained Middle Woodland Lanceolate-like preforms. Small sherds of prehistoric ceramics were also recovered. Locus III contained a second high density felsite workshop; however, no diagnostic points or pottery were recovered. Finally, Locus IV contained a Middle Archaic Neville Point (ca. 8,000-6,000 B.P.) and chipping debris in the B-horizon. Horizontally, the site is estimated to be roughly 17,320 square feet (1,610 square meters). The area tested of the prehistoric site forms roughly an equilateral triangle that is 200 feet on each side. Vertically, artifacts were recovered from the plowzone and into the B-horizon subsoil to a depth of about 50 cm. A total of 2,027 pieces of chipping debris, 40 pieces of pottery, and 87 fragments of burned animal bone were also recovered from the site. Appended to the report is a descriptive analysis of the prehistoric ceramics. The site has the potential to provide important data about the prehistory of Framingham and the region in general. Because the site is believed to be eligible for

nomination to the National Register of Historic Places under criteria A and D, avoidance was recommended and the project plans were altered to avoid the site. If in the future avoidance is not possible, a Phase III data recovery is recommended for the site area within the work area boundary. Because of the importance of the site, it was also recommended that, in the case of any future threat to the portion of the site outside the present work area and jurisdiction of the MWRA, that portion warrants protection as well.

25-1407 Strauss, Alan E.

1994 Phase II Archaeological Site Examination of the Norumbega Prehistoric Site, Weston, Massachusetts. 57 pages.

An archaeological site examination was conducted at the Norumbega prehistoric site (19-MD-725), discovered during an intensive archaeological survey of Shaft N as part of the Metrowest Water Supply Tunnel project (see Report #25-1405). The site examination consisted of four shovel test pits, two 50 by 100 cm units, and three 1-meter units. The site stratigraphy indicated that the Norumbega site was unplowed and had good archaeological integrity. Artifacts were recovered from the topsoil as well as the B-horizon to a depth of 50 cm. Horizontally, the site is estimated to be roughly 7 m by 11 m in size. The site consists of a high-density lithic workshop, possibly with two cluster areas. Over 2,000 pieces of prehistoric lithic debitage were recovered from both phases of archaeological study. A total of six broken tools was found during the site examination. Broken preforms found at the site suggest a Middle Woodland association (ca. 1,800-1,200 B.P.) for the Norumbega site. The site has the potential to provide important data about the prehistory of Weston and the region in general. Because the site is believed to be eligible for nomination to the National Register under criteria A and D, a Phase III data recovery was recommended if the site cannot be avoided during construction and protected.

25-1408 Pendery, Steven

1992 Reconnaissance Archaeological Survey of the Arnold Arboretum. 30 pages.

A reconnaissance archaeological survey of the Arnold Arboretum of Harvard University, Boston, Massachusetts, was conducted. Project objectives included evaluating past research, conducting a walkover survey of the property, and inventorying and mapping sites and reporting on the survey results. At least four of the nine prehistoric sites representing the Middle Archaic, Late Archaic, and Woodland periods documented by Jesse Palmer in the 1930s appear to be preserved within the Arnold Arboretum. There are also numerous historic period sites representing three major periods of land use at the Arboretum: 1) the Subsistence/Commercial Farming period, 2) the Country Estate period, and 3) the Arnold Arboretum/Institutional period. Recommendations are made for protecting inventoried and undocumented sites, for conducting additional research, and for public education. (See also Reports 25-1302 & 25-1361.)

25-1409 Willan, Steve and Suzanne Glover

1994 Archaeological Reconnaissance Survey, Sagamore Hill New Antenna Run, Hamilton, Massachusetts. 70 pages.

As a result of the reconnaissance survey, the majority of the 30-acre property was assessed as possessing a low archaeological sensitivity for prehistoric resources because of construction and landscaping activities. Two areas of moderate sensitivity for prehistoric resources are present on relatively level, elevated terrain. The archaeological sensitivity for historic resources is assessed as low in areas where severe disturbances have occurred and moderate in all other portions of the property. Area Site #100 in the survey area is a commemorative marker, placed in 1910 in an area believed to be the grave of Masconomet, a 17th century Sagamore of the Agawams; the area is traditionally held to be the burial place of the Agawams. A 100-foot buffer zone was designated within and adjacent to the solar observatory property surrounding the burial site. This area has a

strong likelihood for containing isolated and/or clustered human burial features. Should future impacts be planned in areas of moderate prehistoric and historic sensitivity, then additional archaeological investigations may be warranted. Construction activities should be avoided within the 100-foot buffer zone surrounding Area Site #100. Limited subsurface testing was also conducted at the locations of two proposed new antenna facilities. This testing did not result in the recovery of prehistoric or historic cultural deposits. Test pit profiles revealed disturbed and/or poorly drained soils. No additional archaeological investigation was recommended f or the two proposed antenna pads. After the reconnaissance-level testing, the two antenna pads were relocated. No additional archaeological investigations of the project area was conducted in the new impact areas.

25-1410 Davin, Ann K. and Beth P. Miller

1995 Report on the Intensive (Locational) Archaeological Investigations, American Inn at Sawmill Park, Southwick, Massachusetts. 56 pages.

The majority of the 27-acre project area had been impacted by previous construction activities and the removal of topsoil. Fieldwork included a walkover survey that documented the extent of previous disturbance and assessed the potential for prehistoric resources to be present within the project area; approximately 15 percent or four acres of the total project area had the potential to contain prehistoric sites. Subsurface testing was completed in the four undisturbed acres located in the eastern edge of the project area. This portion of the project area was bordered by an unnamed tributary of Kellog Brook and wetlands and contained sandy well-drained Windsor and Merrimac soils. A total of 31, 50 cm x 50 cm test pits were excavated during the intensive archaeological survey. No prehistoric cultural materials were located during subsurface testing despite the favorable environmental setting and proximity of a known prehistoric site. A low density of historic period field trash consisting primarily of redware, nails, and glass was recovered. In addition, some butchered animal bones were collected which were likely associated with the use of this property as a pig farm more than 50 years ago. No significant archaeological deposits were recovered during the subsurface testing, and no additional archaeological investigations were recommended.

25-1411 Davin, Ann K.

1995 Intensive (Locational) Archaeological Survey, Stevens Farm Residential Subdivision, Westwood, Massachusetts. 78 pages.

An intensive (locational) archaeological survey of the 134-acre project area was conducted. Background research determined that there were several known prehistoric sites and felsite quarries in close proximity to the project area. In addition, the project area was once part of the Lee Estate, a large, late 19th and early 20th century estate. The walkover survey was conducted to assess the archaeological sensitivity of the project area and to locate any surface evidence of prehistoric and historic period activity, in particular, lithic quarry locations and rockshelters. One felsite outcrop, culturally unmodified, was found during the walkover. A total of 166, 50 cm x 50 cm test pits were excavated. Test pits were located judgmentally, along transects, as part of 30 m x 30 m blocks, and in arrays around test pits with prehistoric cultural material. Prehistoric cultural material consisted of one unfinished Blue Hills rhyolite projectile point and one flake found in two separate locations. Further testing around these two test pits failed to recover additional cultural materials. No additional archaeological investigations were recommended.

25-1412 Doucette, Dianna and Duncan Ritchie

1994 Technical Report, Intensive (Locational) Archaeological Survey, Winchester Water Supply Project, Winchester, Medford, and Stoneham, Massachusetts. 65 pages.

The intensive survey was limited to the area of disturbance for the construction of the reclamation ponds and associated piping and utilities for the transfer of water from the North to Middle Reservoir. These areas were thought to possess a strong likelihood for containing significant cultural re-

sources. The remaining areas had been previously impacted by construction activities and therefore did not require testing. Subsurface testing yielded no cultural material. No further archaeological investigations were recommended.

25-1413 Donta, Christopher L., Richard D. Holmes, Frederick T. Barker, and Carolyn D. Hertz

1995 An Archaeological Site Locational Survey for the Proposed Water Treatment Facility, at Gravelly Pond, Hamilton, Massachusetts. 31 pages.

The project area included a 3.2 acre parcel proposed as the location for a water treatment facility, and a 1.2 acre location for a pumping station. A total of 74 shovel test pits were excavated. No prehistoric sites were located in the project area. A small number of historic artifacts was recovered, associated with two 20th-century cabin foundations identified in the project area. No further investigations are recommended.

25-1414 Donta, Christopher L. and Mitchell T. Mulholland

1994 An Archaeological Site Locational Survey for a Portion of the Charlestown Meadows Site, Westborough, Massachusetts. 21 pages.

The survey area is situated just north of the Charlestown Meadows site. The purpose of the survey project was to determine whether or not archaeological materials and features continued into the project area. Twenty-four shovel test pits were excavated. No prehistoric features or artifacts were found. No further investigations were recommended.

25-1415 Donta, Christopher L., Richard D. Holmes, and Mitchell T. Mulholland

1995 Archaeological Site Locational Survey for the Cranberry Meadow Road Bridge Replacement Project, Spencer, Massachusetts. 54 pages.

An archaeological site locational survey was conducted for the proposed Cranberry Meadow Road bridge replacement project in Spencer, Worcester County, Massachusetts. The project area is 275 m (905 ft) in length, encompassing Cranberry Meadow Road east and west of a bridge crossing the Conrail railroad tracks, and a short segment of Briarcliff Lane, on the west side of the bridge. A total of 49 shovel test pits was excavated. Historic artifacts were recovered from two test pits, but they do not appear to be significant; no historic features were found. No prehistoric artifacts or features were identified. No further survey was recommended.

25-1416 Clements, Joyce M.

1995 Final Report of a Phase I Archaeological Intensive Survey, Town Well No. 6, Medfield, Massachusetts. 57 pages.

This report describes information gathered from oral histories and interviews, documentary research, and subsurface testing. The project area is cultivated seasonally, and located within the Medfield State Forest. Documentary research and interviews with local residents, and historians suggested that the project area possessed a high degree of archaeological potential. Walkover of the project area indicated little apparent disturbance, conferring a high degree of archaeological sensitivity on the project area. Subsurface investigations consisted of 57, 50 cm x 50 cm shovel test pits, 32 of which were excavated in a staggered transect at 8 m intervals. The remaining shovel test pits consisted of 17 randomly located excavations beyond the footprint of proposed development features, and 3 judgmentally located excavations in remaining untested portions. Subsurface investigations produced low density historic period artifacts (glass, whiteware, machine cut nails, and a kaolin pipe stem fragment) within the plowzone. These artifacts are considered to be field scatter associated with the historical J.L. Breck structure along Route 27, in a pre-1963 alignment of that road. Subsurface investigations also produced low density prehistoric artifacts,

consisting of 3 quartz flakes, 3 quartz chunks, 1 possible rhyolite flake, and 1 fragment of ground argillite. Because of the low density of material, the lack of diagnostic artifacts, the mingling of prehistoric and historical artifacts, the presence of prehistoric artifacts within the plowzone, and the spatially limited extent of the debitage, no further archaeological investigations were recommended.

25-1417 Willan, Steve and Ann K. Davin

1994 Archaeological Investigations, Pond Hill Subdivision, Amesbury, Massachusetts. 69 pages.

An intensive level archaeological survey and subsequent site examination was conducted. Background research and a preliminary walkover survey of the 97-acre project area determined that there was potential for historic and prehistoric resources to be present. The intensive survey resulted in the discovery of two prehistoric loci forming the Pond Hill Site. A total of 50, 50 cm x 50 cm test pits was excavated within the site area which yielded two bifacial tool blades and 39 pieces of lithic chipping debris. It was recommended that this site undergo a site examination to determine eligibility for listing on the National Register of Historic Places. Field testing included a 50 cm x 50 cm test pit grid placed over the site to establish boundaries and identify cultural material concentrations and determine the site integrity. A total of 50, 50 cm x 50 cm test pits and 5, 1 m x 1 m units were excavated during the site examination. An additional 47 pieces of prehistoric lithic material was recovered along with a small hammerstone. These materials were primarily collected from 10-30 centimeters below surface within the A soil horizon. Based on these finding it appears that chipped stone tool production was the primary onsite activity. The majority of the chipping debris is small (0-3 cm) in size. No temporal or cultural affiliation could be assigned due to a lack of diagnostic stone tool artifacts and datable cultural contexts. The site is not considered significant due to the low density of materials and limited range of activities. No further testing was recommended.

25-1418 Doucette, Diana and Ann K. Davin

1994 Cultural Resource Inventory and Assessment, Wenakeening Woods, Holliston, Massachusetts. 89 pages.

Background research found evidence that the project area could have been occupied by the early 18th century. Fieldwork, which included a walkover inspection and subsurface testing, located two historic sites (Cellar Hole #1 and #2) in addition to the well-documented Summer Street foundations associated with a late 19th and early 20th century estate. These two historic cellar holes appear to have been occupied during the 18th century and then abandoned by the early 19th century. Additionally, two small prehistoric find spots, Wenakeening Woods #1 and #2, were located during subsurface testing. The information collected during the archaeological survey has contributed to understanding how this particular part of the landscape was used by prehistoric groups and indicated that Wenakeening Woods has the potential to contain additional prehistoric resources. Additional testing around these site areas would be necessary to determine whether they contain significant cultural resources. The information collected during background research and subsurface testing strongly suggested that two of the historic sites present within the project area, Cellar Holes #1 and #2, represent 18th century dwellings. These historic resources have the potential to contribute to a better understanding of early historic period settlement patterns in the Holliston area and may be eligible for listing to the National Register of Historic Places. Additional testing would be necessary to evaluate their significance.

25-1419 Clements, Joyce M.

1993 Intensive Archaeological Survey for the Massachusetts Turnpike Authority Sewer Hook-Up Project, Westborough, Massachusetts. 37 pages.

The project consisted of two testing areas: Segment I, approximately 220 m. long and 12 m. wide,

extending from the Massachusetts Turnpike Authority's Service Area 6AW to Belknap Street; and Segment II, approximately 12 m. wide, extending from Belknap Street approximately 45 m. south along the Piccadilly Brook. In Segment I, archaeologists found very low concentrations of 19th century artifacts indicative of yard scatter. In close proximity to Segment II archaeologists found the remains of a 19th century axe mill. The remains are outside the project area. On the basis of these investigations, it was determined that the proposed project will not impact any historically significant cultural resources within the immediate project area and can proceed without further archaeological or historical investigations.

25-1420 Smith, Leith and Martin Dudek

1994 Site Examination of the Ellis Family Cemetery, Rockland, Massachusetts. 88 pages.

A historic cemetery and prehistoric site, for which an easement has been created, is located in the southwestern corner of the project parcel. The Massachusetts Historical Commission determined that a site examination was necessary to assure that all of the graves associated with the cemetery were located within the easement and, thus, would not be disturbed by construction activities. On the basis of documentary research, four graves were known to have been present in the cemetery, but the locations of only three of these could be discerned from the remains of vandalized stone markers. The site examination succeeded in identifying six grave shafts as well as a prehistoric archaeological site. Chipping debris, hearths, and a possible prehistoric stone alignment were found. The graves were found to be arranged in a fairly tight cluster. The prehistoric remains were present both within and outside of this cluster. They maintain excellent integrity, as evidenced by high artifact densities and relatively undisturbed stratigraphy. An archaeological site examination is not necessary since the easement intended to protect the historic cemetery has been slightly enlarged to protect the prehistoric site as well. A preservation restriction was recommended for the property.

25-1421 Willan, Steve and Ann K. Davin

1994 Intensive Archaeological Survey of the Chelmsford Phase III B Sewer Project Area, Chelmsford, Massachusetts. 71 pages.

Fieldwork included a walkover inspection as part of assessing the archaeological potential of the 12 project locations. The fieldwork ranked the majority of the project area as having low to moderate potential and a total of 25, 50 cm x 50 cm test pits was excavated in these areas. The majority of the project locations were ranked as having low potential due to poor soil drainage and/or previous disturbance. No evidence of prehistoric period activity and only limited evidence of historic period activity was recovered. No further archaeological testing was recommended.

25-1422 Mulholland, Mitchell T., Richard D. Holmes, and Sharon A. Swihart

1993 Archaeological Data Recovery Project on the Southern Portion of the Yukl Pond Site, Gill, Massachusetts. 124 pages.

Archaeological data recovery yielded information concerning the intermittent occupation of this small site over the past 5,000 years. Seven projectile point styles were recovered from the site. They include Vosburg (3990 to 5095 B.P.), Small Stem points (2800 to 5075 B.P.), Fox Creek/Greene (1400 to 1559 B.P.), and Triangles (possibly Levanna points dated to 445 to 1600 B.P.). The predominant activity took place at the end of the second or the beginning of the third millennium Before Present. A fire hearth with charcoal but no fire-cracked rocks yielded a radiocarbon date of 1990 $\pm$ 70 B.P. The hearth is associated with a larger feature a few meters distant that contained a large volume of fire-cracked rocks, but no charcoal. The related function is interpreted as a sweat lodge, with outside fires used to heat rocks for steam generation inside the lodge. Information on the seasonality of occupation is limited, but on the basis of a possible windbreak shielding a fire-hearth from prevailing winds, and two berry seeds within the feature, a summer

occupation is inferred. The archaeological data recovery was conducted on a portion of the site proposed for impact. A preservation restriction was secured for portions of the site that could be avoided.

25-1423 Willan, Steven and Duncan Ritchie

1995 Reconnaissance and Intensive Archaeological Surveys, Nantucket Memorial Airport Perimeter Fence, Nantucket, Massachusetts. 51 pages.

Background research indicated that the project area had the potential to contain prehistoric sites that may have been located in proximity to large, shallow swales that formerly contained freshwater ponds. There was also some potential for early historic period Native American dwelling sites and later 19th century and modern period farmsteads. Intensive subsurface testing was conducted in the zones of high and moderate sensitivity. A total of 235 shovel test pits was excavated in a transect sampling method, at 10 or 20 m intervals, depending on the archaeological sensitivity. The only prehistoric cultural material recovered during the intensive survey was a small stemmed projectile point of Late/Terminal Archaic period (ca. 4000-2500 B.P.) found on the surface in a disturbed area. Small amounts of shell fragments found in a plowzone context in two test pits were considered to be of historic/modern period origin, probably representing refuse discarded as field trash. None of this prehistoric or historic cultural material is considered to be potentially significant and no further archaeological investigations of the proposed security fence easement were recommended.

25-1424 Skinas, David C.

1995 1994 Massachusetts Natural Resources Conservation Service Cultural Resources Activities Report. 8 pages.

This report summarizes the results of archaeological walkover survey conducted at 22 locations proposed for soil conservation projects. The projects are located in the following towns: Agawam, Barnstable, Bolton, Bourne, Boxford, Chester, Colrain, Deerfield, Gill, Granby, Hadley, Harwich, Haverhill, Lancaster, Mashpee, Nantucket, Orleans, Rochester, and Salisbury. Ten of these projects were redesigned to avoid known or potential archaeological resources. None of the other projects affected significant cultural resources.

25-1425 Skinas, David C.

1994 Archaeological Reconnaissance Survey of the Ingaldsby Farm Project, Boxford, Massachusetts. 7 pages.

Walkover surface inspection and the excavation of four shovel test pits resulted in the discovery of lithic materials (19-ES-687). The proposed soil conservation project will not affect the prehistoric site area.

25-1426 Skinas, David C.

1994 Archaeological Reconnaissance Survey of the Nantucket Recreational Field (NA-16-94), Nantucket, Massachusetts. 6 pages.

A reconnaissance survey was conducted at the location of proposed soccer and softball fields. A ground sensing survey was conducted by using two metal detectors. Metal artifacts dating to the modern period were identified. Seventeen shovel test pits were excavated at 8 or 16 meter intervals. No historic or prehistoric resources were identified.

25-1427 Skinas, David C.

1995 Archaeological Reconnaissance Survey of the Noel Brown Farm Project (HA-3-94), Agawam, Hampden County, Massachusetts. 9 pages.

A walkover survey was conducted and 18 shovel test pits were excavated at 8-meter intervals along a transect. Two prehistoric sites were discovered (19-HD-234 and 235) through the presence of chipping debris and other artifacts. The soil conservation project will not affect the two sites.

25-1428 Skinas, David C.

1995 Archaeological Reconnaissance Survey of the Lescizka Pond Project (ES-1-94), Haverhill, Essex County, Massachusetts. 4 pages.

A walkover survey of the Lescizka farm resulted in the discovery, mapping and collection of 53 prehistoric artifacts (19-ES-652). The proposed pond project will not affect the site area.

25-1429 Strauss, Alan E.

1995 Intensive Archaeological Survey of the Philip Dennis Houselot, 4 Skaket Way in Brewster, Massachusetts. 39 pages.

Field investigations for the project included a surface inspection, followed by the excavation of 47 shovel test pits within the proposed houselot site and within new sections of the proposed access road. One prehistoric site was identified within the proposed route of the access road. This site contained a quartz Madison-Like Point that possibly dates to the Late Woodland Period (ca. 1,300-400 B.P.) and a stemmed point that may date to the Late Archaic Period (ca. 5,000-3,500 B.P.). In addition to the points, a small number of lithic flakes were recovered. Bracket testing in the localities where these artifacts were found failed to produce any additional substantial cultural resources. No further archaeological investigations were recommended.

25-1430 Herbster, Holly and Ann K. Davin

1994 Intensive (Locational) Archaeological Survey, Mashpee High School, Mashpee, Massachusetts. 82 pages.

The project area consists of a 50 acre parcel. The intensive archaeological survey included background research, a walkover survey, an archaeological sensitivity assessment, and subsurface testing. A total of 129, 50 cm x 50 cm test pits was excavated. Testing was concentrated along the eastern edge of the limit-of-work project boundary, approximately 200 m from the Quashnet River, and along two historic cart paths, Bates and Hollow roads. Aside from several pieces of a ceramic transformer associated with an abandoned utility easement, no cultural deposits were identified. No additional archaeological investigations were recommended.

25-1431 Strauss, Alan E.

1995 Intensive Archaeological Survey of the Demetras Houselot, 76 Marshview Lane in Brewster, Massachusetts. 3 9 pages.

Field investigations included a surface inspection, followed by the excavation of 42 shovel test pits within the proposed houselot site and within sections of the existing access road which will be widened. Three prehistoric loci were identified. Locus I is located on the wooded knoll proposed for the house foundation as consists of a Susquehanna-Like Point and deeply buried chipping debris. Bracket testing in the localities where these artifacts were found failed to produce any additional substantial cultural resources. The site at Locus I probably dates to the Late Archaic Period (ca. 4,000-3,500 B.P.). Loci II and III were identified within the area of the roadway widening.

Locus II contained chipping debris and two sherds of prehistoric pottery. Locus III contained a broken projectile point and a single flake. Loci II and III probably belong to the same Woodland period site (ca. 1,000-500 B.P.). No further archaeological investigations were recommended as long as the proposed roadway is restricted to the dimensions as set forth in the plans presented in this report (see Report #25-1534).

25-1432 Strauss, Alan E.

1993 Intensive Archaeological Survey of the Cobbs Pond Residential Development in Brewster, Massachusetts. 76 pages.

Background data indicated that prehistoric remains had been recovered from the surface in portions of the project area during the construction of an access road. The Cobb House, a Georgian-style clapboard home built about 1799, is also located on the property. Two prehistoric stone flakes were recovered during the surface reconnaissance. The project area was divided into five zones (A-E) for subsurface testing. A total of 150 shovel test pits were excavated. Over 100 prehistoric artifacts were recovered from the shovel testing. The majority of cultural remains were recovered from the northernmost portion of the project area. Two major prehistoric site areas were identified: one in the northern area adjacent to the coast (Zone A) and the other in the central area next to Cobbs Pond (Zone C). Scattered low densities of prehistoric remains were also found in Zones D and E. No diagnostic artifacts or subsurface features were recovered. Testing in the vicinity of the Cobb House produced a large quantity of artifacts from the 18th through 20th centuries. Historical artifacts included numerous domestic and imported utilitarian items such as wine bottles, dishes, beads, and buttons. In addition, numerous structural remains were also recovered including mortar, brick, nails, and window glass. One possible historical feature was identified adjacent to the historic house. The feature consisted of stones and mortar as well as numerous cultural remains. The function of this feature is unclear at this level of investigation. A site examination was recommended for the northernmost prehistoric site because of the moderate to high density of artifacts recovered from an apparently undisturbed context. A site examination was also recommended at the Cobb House area in order to recover diagnostic cultural remains associated with the Cobb family residence.

25-1433 Herbster, Holly and Suzanne Glover

1993 Archaeological Site Examination, Old Colony Railroad Rehabilitation Project: HRS Site (19-NF-283), Holbrook/Randolph, Massachusetts. 45 pages.

The intensive (locational) survey conducted in 1991 (see Report #25-1279) identified a potentially significant prehistoric site, designated the HRS Site (19-NF-283). A total of 26, 50 cm x 50 cm test pits and six 1 m x 1 m excavation units were excavated during the site examination. The artifact assemblage recovered at the site consists of 744 prehistoric lithic materials and one historic iron railroad spike. The horizontal extent of the site encompasses 375 square meters, and materials were found from 0 to 50 cm below ground surface. These materials were primarily collected from disturbed and A/plowzone soil contexts. Based on the archaeological investigations conducted to date it appears that chipped stone tool production from Blue Hills rhyolite was the primary on-site activity. No archaeological evidence was collected to indicate other site activities such as food processing or storage/refusal disposal. The majority of the chipping debris is small (0-3 cm) in size, indicating that at least the excavated portion of the site was the location of tertiary and/or finishing stone tool reduction sequences. No temporal or cultural affiliation could be assigned due to a lack of diagnostic stone tool artifacts and datable cultural contexts. However, the high density of Blue Hills rhyolite at the site may be associated with Middle and/or Late Archaic period components. A number of sites in the immediate area have yielded high densities of this lithic material from dated Middle and Late Archaic components. Due to a limited information content, poor to fair physical integrity, and low probability of encountering additional archaeological data classes, the HRS Site is not considered to be eligible for listing on the National Register of Historic Places. No additional archaeological investigations were recommended.

25-1434 Herbster, Holly and Suzanne Glover

1993 Additional Archaeological Investigations, Old Colony Railroad Rehabilitation Project: Middleborough Layover Facility Site (l9-PL-782), Middleborough, Massachusetts. 43 pages.

Additional intensive (locational) survey and an archaeological site examination of an area not subjected to previous archaeological testing were conducted. The intensive survey in 1990 and 1991 (see Report #25-1279) had identified this area (the summit of an esker-like landform) as containing surficial evidence of prehistoric cultural deposits. These deposits were designated the Middleborough Layover Facility (19-PL-782). Two staggered parallel transects, each containing 50 cm x 50 cm test pits excavated every 10 m, were place across the top of the esker to determine horizontal and vertical site boundaries, and investigate concentrations of surface artifact deposits. Larger test units, measuring 1 m by 1 m, were excavated in cultural material concentration areas to collect the data necessary for determining site condition, complexity, and function(s). The field investigations resulted in the recovery of 236 prehistoric cultural materials (2 bifaces, 233 chipping debris, and 1 charcoal). These materials were recovered primarily from exposed sandy soils on the ground surface, eroding out of the slope of the esker, and to a depth of 10 cm in A and B horizon soils. Very limited deposits were collected to a depth of 50 cm in B subsoils. No evidence of a previous identified hearth-like feature remained at the site due to extensive soil erosion. No additional features were encountered during the surface inspection or subsurface testing. This site likely represents an important lithic workshop station where a variety of material types were used in the manufacture of chipped stone tools. Felsites comprise 78 percent of the total lithic assemblage recovered at the site. These include Mattapan and Mattapan Banded, Hingham Red, Attleboro Red, and Sally Rock varieties. Blue Hills rhyolite, argillite, quartz, quartzite, and slate were also collected at the site. These materials may have been collected from nearby source areas and brought to the site as quarry blanks for finished stone tool production. Due to a lack of diagnostic materials and datable features, no cultural or temporal affiliation could be assigned to the site. The limited information content along with severe erosion to the surviving portion of the site do not make it eligible to the National Register of Historic Places. No additional archaeological investigations were recommended.

25-1435 Cherau, Suzanne G.

1994 Archaeological Monitoring, Study Area No. 6 (Landfill No. 2), South Post, Fort Devens, Massachusetts. 24 pages.

Archaeological monitoring was conducted at the location of Study Area 6 (Landfill No. 2) on the South Post of Fort Devens in Lancaster, Massachusetts. The landfill was identified as a potentially important archaeological site (Historic Dump 6) during the 1993 archaeological inventory survey at Fort Devens (see Report #25-1378). The archaeological monitoring was included as part of an environmental investigation of the landfill. Background research and archaeological data recovered during the monitoring of environmental trenches were used to make an assessment of the site's research value and recommendations for further archaeological study. The archaeological monitoring of the test trenches at Historic Dump 6 yielded information concerning the size, age, and contents of the site. The site was determined to be roughly one-half acre in size, with subsurface deposits covering an area of about one-quarter acre in a seasonally wet depression. Cultural materials found both below ground and on the surface of the site range in dates of manufacture from the late 1700s to the early 1900s. A majority date from the late 1800s to the turn-of-the-century. The materials are predominantly household debris, including a large quantity of commercial food containers and food consumption and service items. The historic dump site was determined to have the potential to address research questions relating to 19th century rural middle class socioeconomic status and patterns of refuse disposal behavior in Lancaster. Further archaeological and documentary study of Historic Dump 6 was recommended prior to any proposed remedial activities.

25-1436 Goodman, Davis

1975 Report on Excavations at Fort Washington 1974-75. 15 pages.

Students from Harvard University conducted an archaeological investigation of parts of Fort Washington, a Revolutionary War fortification, in Cambridge. Test pits were excavated at 5-foot intervals along six transects across the site. A 30-foot trench was excavated across an embankment in order to define the original contour of the earthwork. The stratigraphy and artifacts revealed that the earthwork had been modified in the 19th century. Recommendations were made to conduct further investigations of the area postulated as the site of the powder magazine.

25-1437 Pendery, Steven R. and William A. Griswold

1995 Management Summary: Archaeological Testing at Dorchester Heights National Historic Site, South Boston, Massachusetts. 58 pages.

Dorchester Heights was fortified during three separate episodes in Boston's history (in March 1776 during the siege of Boston by colonists, in May 1776 for the defense of Boston, and in 1814 for the War of 1812). Preliminary archaeological testing was conducted to determine whether significant archaeological resources existed at the park and the magnitude of construction-related impacts. Eight test units of varying depths and dimensions were excavated at the project area. Five exposed portions of the ditch of the May 1776 fort at Dorchester Heights. There was no obvious evidence for earlier or later fortifications. Additional features and artifacts relating to the construction and use of Thomas Park from 1852 until the present were encountered. Because of the role of the May 1776 fort in the defense of Boston and the information the site provides on Revolutionary War period military topics, the remains of the scarp and counterscarp are considered to be significant archaeological resources. Construction in the vicinity of the ditch greater than 20 inches below surface should be avoided or subject to mitigation through archaeological excavation and recording.

25-1438 Luedtke, Barbara E.

1994 Report on 1994 Excavations at the Plimoth Plantation Spring Site, 19-PL-522. 14 pages.

Two one-meter squares were excavated in 1994. Artifacts were consistent with the findings of previous excavations (see Report #25-1309 & 25-1316). Late Archaic and Late Woodland materials dominate, but a Middle Archaic component may also be present in this area of the site.

25-1439 Ritchie, Duncan and Beth P. Miller

1994 Archaeological Investigations of the Prehistoric and Historic Period Components of the Dillaway-Thomas House Site, Roxbury Heritage State Park, Boston, Massachusetts. 279 pages.

This historic period (ca. 1754) site is within the John Eliot Square National Register District and forms an important part of the Roxbury State Heritage Park. Background research conducted during the reconnaissance survey established the sequence of ownership/occupancy for the house and collected information on the development of John Eliot Square as an element of the Roxbury section of Boston from the seventeenth century to modern period. A review of available information from previous (1975-77) archaeological investigations at the Dillaway-Thomas House by the Museum of Afro-American History (MAAH) was used to assess the potential for significant prehistoric and historic period components to be present on the site. Close interval subsurface testing conducted during the intensive survey confirmed the presence of a prehistoric period component on the site and collected additional information about the historic period depositions from the yard areas surrounding the house. A site examination level investigation was completed of the prehistoric period component and mitigation of four historic period features (trash pit, cobble paving,

storage shed, well) first identified in the 1975-77 MAAH testing. The site examination yielded information on the characteristics of several loci of prehistoric cultural material including Middle (ca. 7500-5000 B.P.) and Late Archaic (ca. 5000-3000 B.P.) components. Data collected from the historic period features in the mitigation program included methods/date of construction, function and relation to landscape modification and depositional patterns on the site. The information from the intensive survey, site examination and mitigation program was used to address a set of historic contexts or research problems (development of Roxbury urban core, landscape modification, refuse disposal). The results of the site examination demonstrated that the prehistoric period component contained some significant categories of information. A data recovery program was conducted on the prehistoric period component of the Dillaway-Thomas House Site to mitigate the effects of proposed construction. This final investigation yielded categories of information (chipped stone tools, debitage, lithic workshop feature) relevant to several research problems (settlement in southwest Boston basin, Middle/Late Archaic resource use, prehistoric site survival). The Dillaway-Thomas House has been restored into a Visitors/Resource Center for the Roxbury Heritage State Park. It will function as a museum, archive for documents and oral history, and community center for historic preservation and research in Roxbury. Recommendations were made for future management of the archaeological resources on the property.

25-1440 Davin, Ann K.

1994 Intensive (Locational) Archaeological Investigations, MTA Interchange 12 Park and Ride, Framingham, Massachusetts. 78 pages.

The project area consisted of a main site area which had been the location of a commercial development. A smaller parcel to the south was the location of National Register of Historic Places properties associated with the early 20th century Boston architect, William Hartley Dennett. This included the ca. 1774 Rugg/Dennett house and the former carriage house/workshop of the Annie Dennett Estate. Construction will occur in the previously disturbed main site area only. The Massachusetts Turnpike Authority is working with the Massachusetts Historical Commission to properly protect the National Register eligible properties against vandalism and fire until a reuse plan is developed. The intensive archaeological survey involved monitoring machine work for geotechnical studies in the main site area to determine the depth and extent of disturbance, fill deposits, and the possible presence of a wetland. Subsurface testing was conducted in the smaller parcels to the south to locate any subsurface features associated with the National Register properties. A total of 16 test pits and a 1 meter by 50 cm unit was excavated in this portion of the site. Cultural material included one felsite flake and historic 18th to 20th century domestic and structural debris. The only feature found was a small cement slab with a hole in the center which could have been used as part of a fence post system, flag pole, or other function. The diagnostic ceramics indicate a relatively strong 18th century presence within the southern half of the project area. The actual date of construction of the Rugg/Dennett House is not known nor is it known whether there was an earlier structure. The 1774 date was suggested by the fact that Daniel Rugg was married that year and by the Georgian style of the house. A site examination is recommended if future use of the property includes disturbing intact portions of the ground surface. The archaeological investigations and background research that constitute a site examination would contribute to a better understanding of when the house was built, if there is evidence of an earlier structure, and what features are still present around the house.

25-1441 Strauss, Alan E.

1995 Archaeological Reconnaissance Survey for the MWRA Wachusett Reservoir Water Treatment Plan, Northborough, Southborough, Marlborough, and Clinton, Massachusetts. 52 pages.

The project consisted of three alternative water filtration plant sites (Rock Hill, Walnut Hill, and Sudbury Reservoir) and three alternative non-filtration plant sites (Shafts A, B, and C). Background research indicated that no prehistoric sites were recorded within the project areas. Field investigations for the project consisted of an on-site inspection of each of the project areas and a de-

termination of their overall archaeological sensitivity. The field reconnaissance identified 19th century cellar holes, foundations, and wells at the Rock Hill and Sudbury Reservoir locations. No prehistoric cultural remains were identified on the surface. All of the level, rock-free, well-drained areas that were adjacent to water sources were determined to possess a high potential for containing prehistoric or historical cultural resources. Intensive archaeological surveys are recommended for any of the project locations chosen for construction except for Shafts B and C, which have already been disturbed as a result of previous earth moving operations.

25-1442 Herbster, Holly

1995 Addendum to: Technical Report, Phase I Intensive Archaeological Survey for the Algonquin Gas Transmission Company Proposed 4.0 Mile Canal Lateral Pipeline FERC Docket #CP94-260-000, Bourne, Massachusetts. 23 pages.

This report addendum presents the results of a supplemental reconnaissance and intensive archaeological survey conducted at ancillary impact areas and revised pipeline route associated with a proposed pipeline project in Bourne and Sandwich (see Report #25-1395). Based on the results of the walkover, it was determined that the proposed ancillary areas of impact possessed a low archaeological sensitivity and would not require an intensive level archaeological testing. It was also determined that the revised pipeline route possessed a moderate to high archaeological sensitivity and would require subsurface testing as part of an intensive level archaeological investigation. Forty-one shovel test pits were excavated in a judgementally located transect, but no significant deposits were identified. No further investigations were recommended.

25-1443 Cherau, Suzanne G. and Dianna Doucette

1994 Intensive Archaeological Survey, Hodges Village Dam Disposal of Excess Property Area, Oxford, Massachusetts. 68 pages.

Background research indicated that there were no documented prehistoric or historic sites located within the 3.22 acre project parcel. Prehistoric sites were found in similar environmental settings within the Upper Thames River drainage and there was a potential f or prehistoric resources to be present within the project area. Historically, the location of the Hodges Village Dam along the French River supported mill operations such as grist, saw, and woolen mills. The project area is located .2 miles west of this area on the French River and had the potential to contain historic resources associated with these early industrial businesses. A total of 25, 50 cm x 50 cm test pits were excavated as part of the intensive level survey. Of these, five test pits yielded historic cultural material that could not be directly associated with any historic period sites or structural remains. The assemblage of historic cultural material was typical of “field trash” deposits formed from the occasional dumping or disposal of domestic refuse on land under agricultural or pastoral use and did not represent a potentially significant cultural resource. Based on the results of the background research and fieldwork, no further archaeological investigations were recommended.

25-1444 Rainey, Mary Lynne and Deborah C. Cox

1995 Archaeological Investigations of the Algonquin Gas Transmission Company’s 1.6 mile 24” G-12 Pipeline Loop in Seekonk, Massachusetts and East Providence, Rhode Island. Volumes I and II. 498 pages.

An intensive survey conducted in 1990 resulted in the identification of four prehistoric sites, one of which (19-BR-72) was originally documented in the 1930s by a local artifact collector. These were designated the Seekonk 1 (19-BR-344), Seekonk 2 (19-BR-72), Seekonk 3 (19-BR-345), and Seekonk 4 (19-BR-346) sites. Site examination investigations were recommended for three of the four sites in order to determine their size, integrity, and potential significance. The Seekonk 4 Site consisted of a single artifact in poor stratigraphic context, and was not recommended for additional work. Site examinations were carried out at the Seekonk 1, Seekonk 2, and Seekonk 3 sites

in 1990. Based on the completed site examinations, two of the three sites were recommended as eligible for listing in the National Register. The Seekonk 1 Site, a small lithic deposit highly disturbed through historic agricultural activity, was not recommended as eligible. The Seekonk 2 and 3 sites, both located on a terrace of the Ten Mile River, were interpreted as large, complex cultural deposits with a high degree of subsurface integrity. The Massachusetts Historical Commission concurred that these two sites were eligible as a district of prehistoric cultural activity. The possibility of avoiding the sites by redesigning the pipeline route was considered; however, avoidance was not a prudent or feasible alternative. As a result, a data recovery program was designed as a mitigation measure for the Seekonk 2 and 3 sites. The data recovery program was predicated on several specific questions regarding regional and local prehistoric archaeological research. In general these included prehistoric land use and settlement patterns in the upper Narragansett Bay drainage system, the nature of the Archaic to Woodland cultural transition, and lithic use/preference/availability, trade and/or exchange issues for the Ten Mile/Seekonk River drainage area. The recovery resulted in a large cultural material assemblage, and has assisted in a refinement of research priorities for this particular region.

25-1445 Goodby, Robert

1995 Intensive Archaeological Survey, Beverly-Salem Colonial Delivery, Tennessee Gas Pipeline, Lynnfield, Massachusetts. 40 pages.

This survey was required in response to a change in the proposed pipeline corridor in one segment of the project area, and serves to supplement the results of an archaeological survey for the original pipeline corridor (see Report #25-1332). The report includes a discussion of the overall significance of prehistoric archaeological resources in wetland settings. A single prehistoric site was discovered within the project impact area. This site, defined on the basis of lithic chipping debris recovered during the excavation of shovel test pits, is approximately 10 m by 20 m in size. Recommendations were made to avoid and protect the site during construction.

25-1446 Clements, Joyce M.

1995 Preliminary Report of an Archaeological Reconnaissance Survey, Ashburnham Wastewater Collection System Facilities, Ashburnham, Massachusetts. 67 pages.

The project area covers approximately 28 km (17 miles) within the towns of Ashburnham and Gardner, Massachusetts. As currently proposed impacts to archaeological sites or historic properties are possible in eight locations within the project area. These locations include four areas where the proposed sewer construction will be located in the vicinity of extant mill ponds, dams and sluiceways; one area where a dwelling will be demolished; and two overland areas close to seasonal wetlands. In these locations it was recommended further documentary research and subsurface excavations to more carefully locate and identify the archaeological resources that may be impacted by proposed construction. Archaeologists have also identified several locations that should not be used for staging areas, when those areas are finally selected. These additional locations will not be impacted by project construction as it is currently planned and are discussed only to alert project planners to the quantity of historical structures and potential archaeological sites in Ashburnham, and to advise project developers that changes to project plans should not be made on an ad hoc basis (see Report #25-1474).

25-1447 Holmes, Richard D., Carolyn D. Hertz, and Mitchell T. Mulholland

1995 An Archaeological Reconnaissance Survey of Fort Hill, Cape Cod National Seashore, Eastham, Massachusetts. 59 pages.

The project was conducted in cooperation with the North Atlantic Regional Office of the National Park Service as a part of a Cultural Landscape study. Previous research located a large, multicomponent prehistoric site (19-BN-308, 323, 324, 325, and 326) on the property. The Fort Hill

area was visited in 1605 by Champlain, who described a Native American settlement there. In the late 17th century, the Rev. Samuel Treat, who preached to English settlers and the Nauset people, occupied the land. Salt production and agriculture were practiced at Fort Hill. To the west of the project area is the Edward Penniman House and barn, a National Register property. Field investigation located a quarried boulder and a 20th century dairy structure. No surface evidence was found of the Treat homestead or of any saltworks. The entire area has a high potential to contain significant archaeological sites and features related to historic contexts important to Lower Cape Cod.

25-1448 Holmes, Richard D., Carolyn D. Hertz, Frederick T. Barker, and Mitchell T. Mulholland

1995 Archaeological Reconnaissance Survey of Long Point, Cape Cod National Seashore, Provincetown, Massachusetts. 108 pages.

Despite limited access by land, Long Point is heavily visited by the public. This area was the location of an early 19th century fishing community, saltworks, two Civil War-era gun batteries, an oil processing plant, and a lifesaving station. There are also two lighthouses that are on the National Register. Remains potentially related to maritime enterprises were found. Surface remains of the gun batteries and associated features were mapped. These are constructed of sand and are apparently eroding but do have substantial integrity. The gun batteries may be eligible for the National Register as examples of Civil War coastal fortifications that are rare in Massachusetts.

25-1449 Holmes, Richard D., Carolyn D. Hertz, and Mitchell T. Mulholland

1995 Archaeological Reconnaissance Survey of the Atwood-Higgins Complex, Cape Cod National Seashore, Wellfleet, Massachusetts. 54 pages.

Bound Brook Island was the site of an agricultural and maritime community in the 18th and 19th centuries, which declined by 1900. The Atwood-Higgins Complex includes the Atwood-Higgins House (ca. 1730), a National Register property. There may be undisturbed subsurface features and artifacts related to the pre-20th century occupation of the parcel, but standing structures and the landscape appear to have been modified by the seasonal residents.

25-1450 Holmes, Richard D., Carolyn D. Hertz, and Mitchell T. Mulholland

1995 Archaeological Reconnaissance Survey of Higgins Hollow, Cape Cod National Seashore, Truro, Massachusetts. 58 pages.

This area contains standing historic structures on the MHC Historic Inventory, a cemetery from the 20th century that is not recorded at the MHC, and an area of recent structural remains on high ground at the eastern end that is probably associated with the Ball family. Several paths join Higgins Hollow Road, which passes through an area that may have been used for orchards and other agricultural activities. The principal use of the area appears to have been residential. The Hollow contains 18th and 19th century dwellings and outbuildings. The area has a high potential to contain sites from this period, particularly in the western section.

25-1451 Decima, Elena

1994 Intensive Survey for Approximately 25 Miles of Transmission Line Right-of-Way in the Towns of Chatham, Orleans, Brewster, Dennis and Harwich, Massachusetts. 484 pages.

The field work and survey analysis including excavation of 1,462 test pits resulted in the discovery of 108 loci, of which 40 were identified as prehistoric and 68 as historic. Based on a set of criteria which includes the research potential of the finds, their cultural significance, their possible association with other known sites of the area and region, and historic features, seven prehistoric sites, two historic sites and 10 prehistoric/historic sites were recommended for site evaluation,

while 12 historic loci were recommended for further documentary research. This report describes the archaeological study conducted so far in the COMElectric reconnaissance and intensive surveys and makes recommendations for the next step in the archaeological study process. (See Report #25-1452, 25-1453, & 25-1522)

25-1452 Decima, Elena, Chris Edens, Greg Laden, and Leith Smith

1992 Site Specific Historic Research and Analysis, Commonwealth Electric Right of Way. Volume I: Sites HLD14-4-1 and HS1-4-1, Sections 1 and 3B, Orleans and

Brewster, Massachusetts. 14 pages. Volume II: Sites HS11-1-1, HS11-2-1, HS11-4-1, and HS11-5-1, Section 3B, Muddy Creek Vicinity, Chatham and Harwich, Massachusetts, 47 pages. Volume III: Sites HLD5-2-1, HLD5-6-1, HLD5-8-1, HLD5-8-2, HS5-20-1 and HLD6A-7-1, Section 1, Harwich and East Dennis, Massachusetts, 46 pages. Volume IV: Sites HS8A-6-1, HS8A-7-1, HS8A-10-1, HS8A-12-1, HLD8a-13-1 and HLD8A-18-1, Section 2, Harwich, Massachusetts. 82 pages.

The four volumes presented in this study present the findings of documentary research conducted at 18 historic loci identified during the intensive survey of the Commonwealth Electric ROW (see report #25-1451) in the mid and outer Cape locale. In Volume I, the research conducted for HLD14-4-1 (a late 18th early 19th century site) and HS1-4-1 (a possible small brick-making operation) revealed that: a) the area around 14-4-1 remained largely undeveloped during the 18th century with a persistent Native American occupation, raising the possibility that the cultural material recovered could belong to a Native American residence located away from the main roads and urban centers of the time; b) though none of the documents researched mentioned brick-making operations in the area, the economic activities of the 1880 owner of the land (cranberry bogs, sand quarrying, the making of an artificial pond) suggest that a small brick kiln could be expected. As a result of this research, it was recommended that both sites be considered for site evaluation during the next phase of the project. In Volume II, documentary research conducted for these locations revealed that: a) HS11-1-1, while not identified in the documentary research, will require archaeological evaluation to establish its nature, integrity and possible significance as a Historic Period domestic site possibly of an acculturated Native American; b) HS11-4-1 and HS11-5-1 also were not directly identified in the documentary research and while smaller than HS11-1-1, have enough similar characteristics to warrant site evaluation as Historic Period sites. HS11-4-1 and HS11-5-1 should be evaluated as Historic Period sites in association with Prehistoric/Historic Native American sites; c) HS11-2-1 appears to be slope wash associated with the more important prehistoric site (PSS11-2-1). During site evaluation of the prehistoric component, archaeologists should be alert for intact Historic Period deposits. The research conducted for the six sites in Volume III revealed that: a) HLD5-2-1 could be the site of Native American or mixed Native American and European occupation. The Native American component, as evidenced by lithic material, may or may not predate artifacts of European origin; b) HLD5-6-1, HLD5-8-1 and HLD5-8-2 are similar to HLD5-2-1 in that both prehistoric and 18th to 19th century historic material was discovered in these sites. The deed and documentary research did not succeed in clearly identifying the early occupants of these parcels, possibly because this area remained under Native American ownership well into the 19th century; c) HS5-20-1 may be the location of one or more outbuildings associated with the John Wing family farmstead. This occupation may date as early as the 17th century, as evidenced by the finding of a tin-glazed ceramic sherd; d) HLD6A-7-1 may merely represent widespread sheet refuse (field trash) from domestic habitations on Setucket Road. No further analysis of this site is recommended. As a result of this research, it was recommended that sites HLD5-2-1, HLD5-6-1, HLD5-8-1, HLD5-8-2 and HS5-20-1 be considered for site evaluation during the next phase of the project. In Volume IV, documentary research conducted for these locations revealed that: a) HS8A-6-1, David Roger's homestead, west of North Westgate Road, and HS8A-7-l, contain up to three separate homesteads dating from the early 18th century to the last third of the 19th century, forming a complex of potentially important and well preserved sites. These loci will require archaeological evaluation to establish their nature, integrity and possible significance as Historic Period domestic sites; b) HS8A-12-1, near Queen Anne Road and the Herring River, is a site

associated with property owned by prominent Cape citizens of the 18th century, and contains artifactual material placing it in the mid or late 18th century through the early 19th century. It is recommended that a site examination of this locus be conducted to establish its nature, integrity and possible significance as a Historic Period site; c) HLD8A-13-1, southeast of Queen Anne Road and north of Chatham Road, may have reasonable archaeological integrity, and could be the occupation site of a Native American servant or African American slave, which would indicate a high level of historical and anthropological significance. It is recommended that a site examination be conducted at this locality to further specify its archaeological integrity, and to assess the possibility of association with the activities of later period Native Americans or African American slaves; d) HS8A-10-1, west of wetlands near the west bank of the Herring River, contains little historic material of questionable context, and is disturbed; e) HLD8A-18-1, on Kelly Street (Chatham Road) is of late age, questionable integrity, and probably of little scientific value. The two latter sites were considered unsuitable candidates for site examination.

25-1453 Edens, Chris, Greg Laden, and Cornelia Burr

1995 Site Examination for Approximately 25 Miles of Transmission Line Right-of-Way in the Towns of Chatham, Orleans, Brewster, Dennis and Harwich, Massachusetts. Volumes I and II. Volume I, 499 pages, Volume II, 330 pages.

Site examinations were conducted for 17 prehistoric and 13 historic localities found during reconnaissance and intensive surveys (see Report #25-1451, 25-1452, & 25-1522). Of the 30 prehistoric and historic localities, 18 overlapped to form seven sites with both prehistoric and historic components, five were distinct prehistoric sites, and another five were historic sites; the site examination work thus addressed 17 sites. Four prehistoric and three historic components were in Chatham and Harwich. Two of the prehistoric sites, the Muddy Creek Head and the Muddy Creek Hollow sites, were found to retain a high level of integrity, and to contain regionally significant information (a lithic reduction station and a pair of shell middens, respectively); both sites were recommended as eligible for National Register (NR) listing, and data recovery was recommended as mitigation of unavoidable adverse impacts to these sites. The prehistoric Captain Kendrick's Road site and the prehistoric/historic Bog Overlook site were both found to be heavily disturbed, and not significant. Two prehistoric and two historic sites were located in the interior of Orleans and east Brewster. The Lee's Pond East prehistoric site and the Lee's Pond Brick Kiln historic site was found to be extensively disturbed, its intact sections were considered to be significant, and avoidance of these portions of the site was recommended. The Hurd Homestead site in Orleans was a working farm between the 1780s and the 1820s, a kind of site not well represented on the Cape. The site retained a high level of integrity and contained significant information; the site was recommended as NR eligible, and impact avoidance was recommended. A second group of three interior sites, each containing both prehistoric and historic components, lay in central and west Harwich. The Griffith's Pond and Ed Snow sites were both found to be heavily disturbed and to lack significance and NR eligibility. While the historic component of the Canoe Pond site was redeposited fill that also lacked significance, the prehistoric component was an intact site that contained features, relatively good organic preservation, and a diverse inventory of chipped stone and some pottery. This site was judged significant and eligible for NR listing. The power line upgrade will not directly impact the site, but all reasonable measures should be taken to avoid any secondary impacts. Mill Pond East and Mill Pond West sites were two very large, multi-component prehistoric sites in Brewster, within the Stony Brook drainage. Both sites contained zones of concentrated artifacts and some features within a much larger general artifact scatter, and seemed to represent repeated occupations during Late Archaic through Late Woodland times. The resources of the ponds, and especially the spring fish runs through the Stony Brook drainage, account for the persistent use of these localities. Although portions of both sites were disturbed, other parts of the sites were intact and contained significant information; both sites were judged to be NR-eligible. Data recovery was recommended in mitigation of any unavoidable impacts in the undisturbed portions of these sites. The North West Gate Road West and North West Gate Road East sites, in the Harwich interior, both represented early 19th century farmsteads. The North West Gate Road West site was largely contained in redeposited fill, and lacked both integrity and significance. The North West

Gate Road East site consisted of a broad and relatively dense artifact scatter between and around a pair of cellar holes. The artifact scatter was composed of several zones of deposition that represented somewhat different household activities at slightly different times during the first half of the 19th century. Like the Hurd Farmstead site, the North West Gate Road East sites contained evidence for rural activities in the mid Cape interior before the rise of the cranberry industry, a period that is relatively poorly documented. The site retained a high level of integrity, and was recommended for NR listing. Data recovery was recommended for mitigating any unavoidable impacts. The Herring Bluff site (prehistoric and historic) and the Queen Anne Road site (historic) were both located in Harwich. Both sites were heavily and extensively disturbed, and neither was significant or eligible for NR listing. Volume I presents the actual site studies with appendices in Volume II.

25-1454 Clements, Joyce M.

1995 Preliminary Report of an Archaeological Reconnaissance Survey, Great River Bridge Improvement Project, Westfield, Massachusetts. 83 pages.

Known as the "compound rotary alternative," proposed development involves constructing a second bridge several hundred feet downstream from the existing bridge crossing, and reconfiguring approach roadways on both sides of the river. Based on the results of preliminary research, field reconnaissance, and auger testing, archaeologists recommend further documentary research and subsurface excavations.

25-1455 Seufert, Christopher Kelly

1994 A Predictive Archaeological Model: Chatham, Massachusetts (12,000 BP-450 BP). 70 pages and 1 VHS videocassette.

This study presents a predictive model for prehistoric archaeological site distribution for the town of Chatham, based on known site locations and on favorable ecological zones as reconstructed from the recent geological history of the town, especially extinct freshwater resources and the effect of sea level rise. Recommendations and predictive maps are provided in the report that will be useful for planning. Accompanying the thesis is a 35-minute documentary video (co-produced with Nancy Barr) entitled Natives of the Narrowland: The Unwritten History of the First Cape Codders. The video, produced for the general public, provides an overview of the archaeology of Cape Cod and the connection of ancient history to present-day Wampanoags.

25-1456 Horvath, Mark and Steven Grevelis

1994 Looting on Dennis Conservation Lands: Dennis, Massachusetts. 59 pages.

A reconnaissance survey aimed at recording the signs of looting and vandalism. The survey consisted of mapping the entire 23 acre parcel, using tape measures and compasses, locating and marking disturbances, recording the disturbances, and finally alerting the proper authorities.

25-1457 Ritchie, Duncan and Mary Lynne Rainey

1994 Final Report, Archaeological Site Examination, Polpis Road Bicycle Path, Nantucket, Massachusetts. 182 pages.

Archaeological sites examinations were conducted at five prehistoric sites and one historic site along the proposed 8.1 mile project area. This archaeological work resulted from a 1988 intensive archaeological survey during which the sites were identified as potentially significant resources (see Report #25-1100). Polpis Road winds through the interior eastern region of Nantucket Island, crosscutting moraine and outwash features as well as extensive salt marsh and estuarine environmental zones. The six archaeological sites which are discussed include Site 19-NT-68, The Fol-

ger's Marsh Site (19-NT-180), The Norwood Farm Trust Site (19-NT-174), The Martin Site (NAN-HA-14), The Roadkill Site (19-NT-166), and Site 19-NT-50. Based on both the intensive survey and site examination, four of the six sites are recommended as eligible for listing on the National Register of Historic Places under criterion D. Site 19-NT-68 contains a substantial Middle to Late Woodland Period stratified midden feature. Marine and terrestrial species have been identified and carbon dating of shell samples indicate repeated use over approximately 1,000 years. The Folger's Marsh Site (19-NT-180) contained small concentrations of prehistoric lithic materials and diagnostic tools indicating Middle and Late Woodland Period occupations. In addition, a portion of the site contains an historic component which may represent the location of a former dwelling or structure. A shell strata from this area was radiocarbon dated to the 18th century. The Roadkill Site (19-NT-l66) contains an intact lithic workshop area associated with the Late Woodland Period. Site 19-NT-50 is a large, complex multicomponent site which contains evidence for a range of activities and occupations spanning the Woodland Period. If avoidance is not a feasible alternative, data recoveries were recommended. The Norwood Farm Trust Site (19-NT-174) contained a concentrated and discrete lithic deposit and diagnostic stone tools indicating a Late or Transitional Archaic Period time frame; however, most of the cultural materials from the site was found in poor stratigraphic context. The discovery of a fieldstone bridge or culvert feature at the site warrants documentary research to determine its age and significance. No further archaeological work was recommended. The Martin Site (NAN-HA-14) contains a small concentrated shell refuse deposit which probably dates to the 19th or 20th century. Evidence for long term occupation at the site was not found, and no supplemental historic features or cultural materials were found. No further work was recommended at the Martin Site.

25-1458 Loparto, Leonard W.

1995 A Report of Archaeological Testing at the Endean Property in Walpole, Massachusetts. 183 pages.

A reconnaissance, intensive and site examination level archaeological survey was conducted. The survey area consisted of approximately 95.2 hectares (235 acres) and included areas referred to as the 1-A Farm, Endean North, DiMascio, Endean West and Endean East. The intensive survey included only those locales where development was planned in 1987 and 1988. The present report, originally written as a draft in 1990, summarizes all archaeological studies conducted to date on the Endean Property. A total of five archaeologically sensitive areas were identified on Endean land. Intensive testing later identified 10 areas where potential prehistoric activity was present. After expanded testing, five of the ten areas were determined to be non-cultural in origin containing ubiquitous quartz shatter which is common in the area. Expansion units failed to produce additional information in any of the five areas. In the remaining five test pits, most of which were tested at the site examination level, two areas were found to represent isolated findspots of one felsite flake each. One area also represented an isolated ulu find. The remaining two areas are included within the Bird Pond Site area which was determined to be potentially eligible for the National Register of Historic Places. Recommendations were made to avoid the Bird Pond Site. If avoidance was not possible, a data recovery program was recommended. Recommendations were also made to evaluate prior archaeological testing against any changes in project plans since 1987-88 to determine the need or lack thereof for additional archaeological testing. No further research was recommended for isolated findspot areas.

25-1459 Holmes, Richard D.

1995 An Archaeological Site Locational Survey of Proposed Highland Light Parking Areas, Cape Cod National Seashore, Truro, Massachusetts. 27 pages.

The project area is adjacent to Highland House (1907), a National Register property within the National Seashore. Five survey units were examined, and 49 shovel test pits were excavated. No prehistoric artifacts or features were found. Historic material included recent artifacts, window glass, coal, and a corroded spoon. Four features related to previously existing structures were ob-

served, including the remains of a bowling alley outside the project area. Proposed construction does not appear to endanger significant archaeological remains. No further survey was recommended (see Report #25-1382)

25-1460 Ritchie, Duncan

1995 An Archaeological Data Recovery Program on a Section of the Watertown Dairy Site (19-MD-378), Wayland, Massachusetts. 184 pages.

An archaeological data recovery program was conducted on a section of the Watertown Dairy Site (19-MD-378) for the construction of a single-lane access road leading to a town water well site and pump station located on the northern edge of the former Watertown Dairy or Shick Farm tract and adjacent to Great Meadows National Wildlife Refuge. The access road easement crosses a section of the Watertown Dairy Site, a multi-component prehistoric site which is a contributing element of the Watertown Dairy Archaeological District. The data recovery was designed to collect a sample of cultural material and other categories of information (features, faunal, floral remains) from deposits forming part of known Middle Archaic (ca. 7500-5000 BP) and Middle Woodland (ca. 1650-1000 BP) components on the site. The research design contained research problems or contexts relating to the formation processes/depositional patterns on multicomponent riverine sites, Middle Archaic settlement and resource use and Middle Woodland settlement in an interior river drainage. Information collected from the access road easement included an assemblage of chipped, ground and rough stone tools, chipping debris, several small pit/hearth features and a small amount of faunal and floral remains. The chipped stone tools were primarily bifacial tool blades of argillite, felsite, quartzite and quartz. Fragments of a single Middle Archaic (Neville or Stark) projectile point and two drill/perforators were also found. Some of the bifaces were also considered to be associated with the Middle Archaic component on the site. Several small concentrations of chipped stone tool and debitage considered to be parts of the Middle Archaic component were sampled. A radiocarbon date of 6680 $\pm$ 170 BP (Beta 52205) was obtained from one of these small concentrations or activity areas in the Middle Archaic component. The only cultural material associated with the Middle Woodland component was a single ceramic sherd. The information collected in the data recovery program was considered sufficient to address the research problems posed for this investigation and mitigate the effects of proposed construction. It was recommended that construction of the proposed access road take place within the designated easement. Monitoring of the construction activity by members of the Wayland Archaeology Group to insure that sections of the site outside the easement were not damaged and to record any features or concentrations of cultural material uncovered by machine excavation was also recommended. See also Report #25-589, 25-946, 25-1090, & 25-1168.

25-1461 Ritchie, Duncan

1994 An Intensive Level Archaeological Survey of the South Natick Square Reconstruction Project Area, South Natick, Massachusetts. 127 pages.

The South Natick Square project area is at the center of the John Eliot Historic District which is listed on the National and State Registers of Historic Places. This 71-acre district contains a complex of 18th and 19th century structures and the location of the original 17th century Christian (Praying) Indian settlement and burial ground. In March 1989, unmarked Native American burials were accidentally uncovered in a trench opened by the Town of Natick Water Department to carry out repairs on a water main. Following investigation of the burial discovery site by staff of the Massachusetts Historical Commission, the MHC requested that trench excavation be monitored by an archaeological consultant. Background research conducted as part of the intensive survey indicated that unmarked burials had been found in the project area on several occasions over the last 150 years. During the fieldwork, small amounts of prehistoric cultural material and one feature (hearth or pit) were found in disturbed contexts in several sections of the project area. This material included a Late/Terminal Archaic (ca. 4500-2500 years ago) small stemmed projectile point. Several categories of historic/modern period deposits and features were also found and recorded

including former road surfaces and fills, demolition rubble and utility trenches. The base of what appeared to be a late 19th or early 20th century watering trough or fountain was found in a trench near the center of South Natick Square. None of the prehistoric material or historic/modern period features were considered to be potentially significant. Four unmarked burial shaft features associated with the Praying Indian burial ground were identified in the project area, recorded, and left in situ. It was recommended that proposed improvements be redesigned so that these features could be preserved in their original locations. It was also recommended that all of South Natick Square be considered archaeologically sensitive due to the potential it has to contain additional unmarked burials. The Praying Indian burial ground and the unmarked burials within it are significant cultural resources and important elements of the John Eliot National and State Register of Historic Places district. Any future plans to carry out construction or modifications in the South Natick Square will require careful review.

25-1462 Dunford, Frederick J. and Leonard W. Loparto

1991 Preliminary Management Summary, Site Examination of the Red Brook Site (19-PL-587), Wareham, Massachusetts. 25 pages.

The study provided evidence of the presence of a Middle to Late Woodland Period (1,800-400 BP) archaeological site. The site boundaries, function, integrity and age have been established. Furthermore, the site provides significant potential for future research. As a result, this site is clearly eligible for nomination to the National Register of Historic Places. Therefore, it was recommended that adverse impacts to the project area be avoided. If that is not possible, then it was recommended that a data recovery be undertaken.

25-1463 Clements, Joyce and Chris Edens

1994 Historical and Archaeological Survey, Boston College Master Plan for Physical Facilities Development 1991-2001. 112 pages.

An archaeological reconnaissance survey and architectural review was conducted for both the Chestnut Hill and Newton campuses. Documentary research revealed the possible locations of several historic archaeological sites within the project area, the majority of which date to the 19th century, although some sites may date to the 17th and 18th centuries. Extensive disturbance was evident, particularly at the Chestnut Hill Campus, where modern college buildings have been erected over areas that may have contained historic archaeological sites. At the Newton Campus both modern and historic-era development is less extensive. Based on documentary research and a site walkover, archaeologists identified areas of archaeological potential on both campuses. Further archaeological investigations to locate and evaluate sites should be conducted. Historic structures on both the Chestnut Hill Campus and the Newton Campus were previously inventoried and eligibility determinations made. On the Chestnut Hill Campus, historic structures are clustered in Middle Campus and within the area south of Beacon Street. The Newton Campus has historic structures and both campuses show evidence of historic landscape features. No additional historic structures, other than those already identified, were found.

25-1464 Dwyer, Alison

1995 Intensive Survey and Site Examination, Fall River CSO Abatement Program, Fall River, Massachusetts. 63 pages.

A previous archaeological survey (see Report #25-1329) determined that the project would impact four archaeologically sensitive areas. The present survey was conducted at the Arnold Street and Wastewater Treatment Plant sites and the Pocasset Street and Quequechan Street sites. The site examination conducted at the Quequechan Street site and the intensive survey conducted at the Wastewater Treatment site indicated that both areas have extensive 20th century disturbance and do not require further archaeological testing. The intensive survey at the Arnold Street site indi-

cated the area has been used as a dumping ground throughout the 20th century. Archival research showed that no structures were ever present on the site. Additional testing is not recommended for this site. A geological core taken from the Pocasset Street site after the reconnaissance survey determined that over 31 ft of fill is present at the site. Subsequent research determined that approximately 19 ft of that fill postdates 1964. Archaeological work was not conducted at the site because of the excessive amount of 20th century fill.

25-1465 Dwyer, Alison

1995 Intensive Archaeological Survey, Castleview Development, Gloucester, Massachusetts. 34 pages.

The survey identified a prehistoric site located in the center of the project area adjacent to a wetland. The site consisted of a concentration of prehistoric pottery and lithic debitage. Further archaeological testing was recommended for this site. In addition, the buildings associated with a 1930s Catholic summer camp located in the northwest section of the project area was documented (see Report #25-1470)

25-1466 Begley, William and Ann K. Davin

1995 Results of the Intensive Archaeological Survey of the 47 East Grove Street Project Area, Middleborough, Massachusetts. 45 pages.

Twenty 50 cm x 50 cm test pits were excavated. Seven pieces of lithic debitage and one quartz Squibnocket Triangle projectile point were recovered in five test pits during the subsurface testing. A small amount of historic cultural material was also recovered. The presence of the projectile point and chipping debris confirmed prehistoric utilization of the project area; however, grid testing of the entire project area determined that the low density of prehistoric material did not represent potentially significant cultural resources. No additional testing was recommended.

25-1467 Davis, Margo Muhl

1995 Intensive Archaeological Survey of a Proposed Parking Lot, Greenwood Farm, Ipswich, Massachusetts. 41 pages.

A total of nine test pits were excavated across the top of the knoll on which the project area was located. They resulted in the recovery of small amounts of historic period field trash and one felsite flake from a small crushed shell deposit. Three bracketing pits (two at 10 m and one at 5 m intervals) failed to reveal any indications of shell or other prehistoric artifacts. This prehistoric deposit does not appear to be significant, and was probably almost fully excavated by the test pit. It is recommended that construction proceed, but that given the potential for the discovery of significant historic and prehistoric resources on other areas of Greenwood Farm, that archaeological testing be initiated before future construction projects.

25-1468 Donta, Christopher L., Richard D. Holmes, Carolyn D. Hertz, and Thomas L. Arcuti

1995 Archaeological Site Locational Survey for the I- 290 Exit Ramp Project, Marlborough and Northborough, Massachusetts. 58 pages.

A total of 97 shovel test pits was excavated. No prehistoric features or artifacts were found anywhere in the project area. A single historic feature was identified consisting of an early to mid 20th century cellar hole, which was bulldozed at least twenty years ago. Several historic artifacts were recovered, none of which appear to date earlier than the present century. Soils throughout the project area were found to be variable, with some areas evidencing natural forest soil profiles, and other locations consisting of graded and filled deposits or plowed soils. No further survey was recommended.

25-1469 Donta, Christopher L. and Thomas L. Arcuti

1995 Archaeological Site Locational Survey for the East Street Replacement and Realignment Project, Pittsfield, Massachusetts. 51 pages.

A total of 182 shovel test pits was excavated. No prehistoric features or artifacts were found anywhere in the project area. No historic features were found, although a thin scattering of historic artifacts was recovered from the plow zone. Soils throughout the project area were found to be disturbed, primarily due to several episodes of road construction. No further survey was recommended.

25-1470 Dwyer, Alison and Chris Edens

1995 Site Evaluation, Castleview Development, Gloucester, Massachusetts. 52 pages.

An archaeological site examination of a prehistoric site was performed. The site, which is surrounded by a wetland and granite outcrops, was located as part of the intensive survey of the project area (see Report #25-1465). A total of eighteen 50 cm x 50 cm test pits unevenly distributed across a 200 m x 250 m area were excavated as part of the intensive survey. Lithic debitage, pottery, and shell were recovered from six of the test pits. No diagnostic lithic artifacts were found. However, the presence of pottery indicated that the site dated to the Woodland Period. The site examination consisted of the excavation of an additional 38 test pits and seven excavation units. The testing recovered a considerable amount of pottery and a scattering of lithic debitage and shell. The artifact variety and density suggest that the site represents a single seasonal occupation. The fabric, decorative elements, and thickness of pottery indicate that the site dates to the Middle to Late Woodland period (1,700-400 BP). This date is further substantiated by two C-l3 corrected radiocarbon dates on shell of 1,425 ± 75 BP and 1,450 ± BP. If the site cannot be avoided and preserved, an archaeological data recovery program was recommended.

25-1471 Donta, Christopher L. and Thomas J. Arcuti

1995 Archaeological Site Locational Survey for the Proposed Water System, Gardner, Massachusetts. 64 pages.

The project consisted of the testing of four survey units. Survey Units 1 and 4 were tested with 36 shovel test pits. No cultural materials were found in the main portion of either of these survey units. The easternmost of four test pits located on the pipeline route contained prehistoric artifacts. Soils in these survey units were found to be occasionally disturbed, otherwise consisting of deep deposits of alluvial silts and sands developed as part of the surrounding wetlands associated with the Otter River. Survey Units 2 and 3 were tested with 61 shovel test pits. Survey Unit 2 included eight test pits with prehistoric artifacts, while two test pits in Survey Unit 3 contained prehistoric material. All of these test pits, as well as the single positive pit from Survey Unit 1 represent parts of one prehistoric site, located on a knoll overlooking the Otter River. Artifacts found at this site include 19 pieces of quartz chipping debris, two pieces of rhyolitic chipping debris, and three quartz projectile points. Two of these points are diagnostic of the Late Archaic period, ca. 6,000-3,000 years ago. A site examination survey was recommended.

25-1472 Holmes, Richard D., Carolyn D. Hertz, Joannah L. Whitney, and Mitchell T. Mulholland

1994 Archaeological Site Locational Survey for Washington and King Street Reconstruction Project, Franklin, Massachusetts. 81 pages.

One concentration of 19th and 20th century artifacts was found, but no structures or features were associated with it; it appears to be a small trash deposit. No features related to historic mills or a railroad grade were found. One white quartz flake was found in fill material; a site form for the

Washington Street Prehistoric Find Spot will be filed. No further research was recommended.

25-1473 Davin, Ann K. and Holly Herbster

1995 Reconnaissance Archaeological Survey, Oakwood Senior Estates, Swansea, Massachusetts. 66 pages.

A reconnaissance archaeological survey was conducted with a 6.5 acre project area. An area north of the present project area was surveyed in 1980 as part of the proposed Swansea Wastewater Facilities Plan (see Report #25-310). During the fieldwork, the prehistoric Souza Site (19-BR-234) was found in the field north of the project area and the remains of a mortar and fieldstone foundation and/or stone walls which may have been a part of the ca. 1730 Alpheus Manchester farmstead were identified along the southern edge of the project area. Two parallel stone walls and the remains of the privies were also found during this reconnaissance survey. The background research, walkover inspection, and auger testing conducted as part of the reconnaissance survey of the present project area resulted in the assessment of a low potential for prehistoric and historic period resources. No cultural materials were recovered during the fieldwork portion of the survey. Surficial evidence of historic period activity within the project area was limited to a section of a stone wall. No other above ground prehistoric or historic materials were noted. While historic cultural resources were once present in and adjacent to the project area, there have been significant modifications to the landscape over the last 25 years. Of particular importance was the barn having burnt down and the subsequent activities related to demolishing the remaining structure and clearing the area of debris. This disturbance has also adversely affected the potential for prehistoric resources to be present in the project area. No additional archaeological investigations were recommended.

25-1474 Clements, Joyce M.

1995 Final Report of an Intensive (Locational) Archaeological Survey, Ashburnham Wastewater Collection System Facilities: Ashburnham and Gardner,

Massachusetts, Volumes I and II. 133 pages.

As a result of an earlier reconnaissance survey (see Report #25-1446), three areas were evaluated during the intensive survey. Documentary research and subsurface excavations produced no evidence of historic structures or archaeological sites in Area A. Therefore, no further investigations were recommended for Area A. Extensive documentary research, field observations, and judgmental and systematically placed subsurface excavations in Area B produced evidence of extant industrial remains, documented sites, and several subsurface features associated with late 18th and 19th century industrial structures within and in close proximity to the project area. The sewer line impact area that traversed the site of 19th century tannery and morocco factory in one locus of Area B was investigated. Sufficient information was collected from subsurface excavations to make an evaluation of the site's potential, allowing the project to proceed without further investigations. Investigations in Area B indicated that this vicinity is potentially eligible for listing in the National Register of Historic Places, under Criteria A and D. Further documentary research may also indicate that the area is potentially eligible under Criterion B. The Ashburnham Historical Commission desire to work toward nominating the area as a National Register district. As currently proposed, the construction and development of the project will not alter these eligibility criteria. No further documentary research or subsurface excavations were required in Area B. In Area C, subsurface excavations revealed a filled subsurface cavity, possibly a filled structural foundation. Because the cavity possessed little research potential and project engineers agreed to move the impact area to avoid damage to the cavity, no further documentary research or subsurface excavations were recommended for Area C.

25-1475 Smith, Leith

1994 Intensive Archaeological Survey of the Sanctuary Development Site, Natick, Massachusetts.

68 pages.

The intensive archaeological survey revealed only a few traces of prehistoric occupation on the parcel. Historic artifacts were more common, particularly in the southern section of the parcel, where 20th and possibly 19th century farming activities had taken place. No documentary or archaeological evidence suggests earlier Historic Period occupation of the project parcel. The parcel contains no significant archaeological properties and therefore requires no additional investigation.

25-1476 Holmes, Richard D., Carolyn D. Hertz, and Joannah L. Whitney

1994 Archaeological Site Locational Survey of Wetland Replication Area Within the Route 57 Reconstruction Project, Agawam and Southwick, Massachusetts. 72 pages.

Four survey units were examined. No prehistoric artifacts or features were found. Historic artifacts were mostly recent materials. In Survey Unit 4, an unmortared stone pond, possibly for fire-protection purposes, was observed and recorded. No further archaeological survey was recommended.

25-1477 Holmes, Richard D., Carolyn D. Hertz, Joannah L. Whitney, and Mitchell T. Mulholland

1994 Addendum, Archaeological Site Locational Survey Within the Route 57 Reconstruction Project, Agawam and Southwick, Massachusetts. 70 pages.

The survey addressed modifications to the proposed wetland replication areas and to evaluate minor alignment changes associated with the preferred alternative. This is a continuation of work documented in Report #25-1476. The Tuckahoe Farm Prehistoric site, which contained a small stemmed point and a Squibnocket Triangle on the surface, was found outside the project area, but no significant prehistoric or historic remains were found within the project area. No further archaeological survey was recommended.

25-1478 Seasholes, Nancy S.

1994 Archaeological Reconnaissance Survey of the 10 St. James Avenue Site, Boston, Massachusetts. 29 pages.

A reconnaissance survey included a review of information about the prehistoric and historical development of the project area, especially about the Boylston Street Fishweir, geotechnical information from subsurface borings, and a walkover of the project area. The results of the survey indicate that the subsurface stratigraphy of the 10 St. James Avenue site is probably similar to that of other locations in the Back Bay where remains of the Boylston Street Fishweir have been found. The 10 St. James Avenue area was, however, separated by a relatively deep channel in the Back Bay from the other known locations of the fishweir, so a fishweir under the 10 St. James Avenue site would probably be separate from the structure(s) examined by previous archaeological investigations in the area between Berkeley and Clarendon Streets. The historical archaeological remains on the 10 St. James Avenue site are not likely to be significant--the area was filled ca. 1854 by the Boston and Providence Railroad, railroad depots were built on the made land in the 1870s and removed in the first decade of the 20th century, and the area was then used as a parking lot until the Greyhound Bus Terminal was built in 1949-1950. The fill would have protected any prehistoric remains from subsequent disturbance, however, and the high water table would have preserved any organic material. Given the possibility that significant prehistoric archaeological resources may be present at the 10 St. James Avenue site and that the proposed construction will extend about 60 feet below surface--about 26-30 feet below the level of possible prehistoric resources--it is recommended that archaeological testing be conducted early in the construction process. When the method of construction has been determined, a plan for this testing should be developed and the testing should be monitored by a professional archaeologist.

25-1479 Donta, Christopher L. and Richard D. Holmes

1995 Archaeological Site Locational Survey in the Proposed Water Pollution Control Outflow Pipe, Greenfield, Massachusetts. 67 pages.

The area surveyed consists of two alternative corridors each approximately 9 m (30 ft) wide and 387.5 m (1272 ft) long. Background research determined that numerous prehistoric archaeological sites have been recorded in the vicinity of the project area, including human burials. Within the project area proper at least one prehistoric site is known the Mohawk Meadows West site (19-FR-250), containing diagnostic Late Archaic to Late Woodland artifacts. A total of 1,152 shovel test pits was excavated along the two corridors. Prehistoric materials were recovered in 20 test pits on both alignments, dating from the Late Archaic and Woodland periods. It appears that the proposed construction would impact intact portions of the Mohawk Meadows prehistoric site, and a site examination survey was recommended.

25-1480 Edens, Chris, Joyce M. Clements, and Jane Carolan

1995 Archaeological Reconnaissance Survey for the Worcester Commuter Rail Extension, Framingham, Ashland, Southborough, Westborough, Graf ton, Millbury, and Worcester, Massachusetts. 126 pages.

A reconnaissance survey was conducted along 23 miles of existing railway corridor. During the walkover, one prehistoric and three historic sites were observed. The prehistoric site corresponds with a previously recorded site cluster (19-WR-417 to -420) in the Cedar Swamp Archaeological District (Westborough); the surface collection consisted of two felsite flakes, two quartz flakes, and four shatter. The three historic sites included two mill sites, one in Westborough and the other in Southborough, set on channels off the Sudbury River. The Westborough remains correspond to the location of a mill since the 1830s, while the Southborough site seems to date to the 1870s. The third site is a probable cellar hole, an oval, above-ground stone chamber, and a well-shaft that together may represent a farmstead of undetermined date in Southborough. In addition, the location of the proposed station in Southborough extends over buried remains of the Cordaville Manufacturing Company, which began operations during the 1840s and continued into the 20th century. The reconnaissance survey report recommended that archaeological intensive survey should be conducted in the identified high sensitivity portions of the rail corridor that will be impacted by erection of the chain-link fencing, construction staging areas, or other project-related activities. The proposed stations in Millbury and Grafton should also be archaeologically tested. The proposed stations in Westborough and Ashland incorporate extensive areas of graded land and fill; since recorded prehistoric sites neighbor both locations, the extent of disturbance should be ascertained and then undisturbed areas tested. The proposed station in the Cordaville neighborhood of Southborough will abut extant (both above and below ground) remains of the mill and may encroach on them; these remains should be mapped and further researched in order to identify portions of the mill complex that the station construction might impact, and to provide information for a public education program.

25-1481 Davin, Ann K. and Beth P. Miller

1995 Report on the Intensive (Locational) Archaeological Investigations, Berkshire Power LP Facilities, Agawam, Massachusetts. 48 pages.

A total of 64, 50 cm x 50 cm test pits was excavated. One piece of quartz chipping debris was recovered. Further testing did not recover any additional prehistoric cultural material. No additional archaeological investigations were recommended.

25-1482 Garman, James C., Virginia H. Adams, and Paul A. Russo

1995 Reconnaissance Archaeological Survey, Historic and Architectural Assessment of the Proposed United Shoe Manufacturing Corporation Redevelopment, Beverly, Massachusetts. 124 pages.

Once the largest factory in the world, the buildings of United Shoe have already been determined eligible for the National Register of Historic Places as a potential historic district. The reconnaissance archaeological survey resulted in the identification of one archaeological site, the remains of the John Friend Grist Mill (1647) outside the project impact area. The site consists of structural remains of one of the first mills in Beverly. The survey also stratified the remainder of the project area into zones of low and moderate archaeological sensitivity for subsurface cultural resources. A partial reconnaissance of the property carried out in 1978 (see Report #25-210) suggested that the Gervas Garford homelot (1636) could be located in the project area. Primary deed research was recommended to determine whether or not the homelot site was located within the proposed development. The extent of cutting and filling along the Bass River has been substantial, resulting in severe disturbance to the original shoreline and within the project area. The extent of ground-disturbing impacts seems serious enough to rule out further survey for potential Native American cultural resources. The historic and architectural assessment survey resulted in the preparation of MHC survey forms, including an amendment to the 1993 USMC complex form and individual forms for the two principal buildings in the South Parcel. Based on their dates of construction, degree of integrity, and historical associations within the United Shoe Machinery Corporation industrial plant, it was recommended that the buildings be considered as contributing resources within the historic industrial complex. Appropriate mitigation measures such as additional research and large format photographic documentation of the complex should be developed.

25-1483 Fragola, Patricia and Duncan Ritchie

1995 Intensive Archaeological Survey of the Village at Stoneybrook Project Area, Lynn, Massachusetts. 52 pages.

A total of 55 shovel test pits was excavated in the 33.4 acre project area. No prehistoric or historic cultural material was recovered. No additional archaeological investigations were recommended.

25-1484 Ritchie, Duncan and Beth P. Miller

1995 Intensive Archaeological Survey, Quincy Pump Facilities Project Area, Quincy, Massachusetts. 64 pages.

The walkover survey of the project area noted evidence of previous landscape modification. The construction of the existing pump stations and force mains had resulted in the filling of salt marsh and other wetlands; additional landscape modifications were observed along the force main route. Subsurface testing was conducted at all three pump stations and in undisturbed sections of the force main routes. Testing revealed that the proposed pump station sites contained deposits of modern period fill related to the construction of the existing facilities. Similar deposits were found in most of the test pits placed along the route of the 24-inch force main. The only areas containing intact soil horizons were small sections of the proposed Quincy Pump Station Site and 24-inch force main route near Merrymount Park. The intensive survey did not identify any significant prehistoric or historic period cultural resources. No further archaeological investigations were recommended.

25-1485 Ritchie, Duncan, Dianna Doucette, and Holly Herbster

1994 Addendum to Intensive Archaeological Survey of MWPA Framingham Extension Relief Sewer, Leach Lane Access Road, Natick, Massachusetts. 11 pages.

An intensive (locational) survey was conducted of the proposed location of a temporary access road, 600 feet long and 75 feet wide. An intensive survey of the FERS initial staging areas and ac-

cess roads was completed in 1993 (see Report #25-1340). Intensive subsurface testing consisted of 37, 50 cm x 50 cm test pits excavated as part of two judgmentally placed parallel, staggered transects, and one test pit array (four test pits placed in cardinal directions at five m intervals). No prehistoric cultural material was recovered. A total of 42 pieces of historic or modern period cultural material was found in eight of the 37 test pits excavated during the intensive level survey and consisted mostly of glass fragments, along with metal fragments, whiteware ceramic fragments, coal slag, and one gun flint. In addition, ten pieces of historic cultural material was recovered from the ground surface by the MHC during a site visit which has been incorporated into the catalog inventory. The historic/modern cultural materials recovered do not represent significant archaeological deposits. This material was not directly or clearly associated with any historic period structural features or the existing residential structures located to the north and south of the project parcel. Given the lack of prehistoric deposits and non-significant historic depositions, no further archaeological investigation was recommended.

25-1486 Hautaniemi, Susan

1994 Archaeological Site Survey at the Moors Homelot, Deerfield, Massachusetts. 47 pages.

Subsurface archaeological testing was conducted within an area to be impacted by foundation repair. The impact area lay along two sides of the rear ell of the house on the Moore Homelot. The survey attempted to ascertain whether significant archaeological features would be destroyed by the construction work. No significant artifact scatter was uncovered on existing or past land surfaces. Episodes of filling were discovered. On the south side of the ell, a builder's trench for the current (late 19th century) foundation was seen. No trench was discernable on the north side. On both sides there was a deep fill apparently predating the foundation. Archaeological features encountered were below the proposed construction disturbance. No further testing was recommended before construction. However, this testing, and the remote sensing that was done as well, raised many more questions than they resolved. The Moors Homelot would be a fertile area for further archaeological research.

25-1487 Herbster, Holly

1994 Technical Report, Intensive Archaeological Survey, Cooks Farm Estates, Franklin, Massachusetts. 53 pages.

A total of 48, 50 cm x 50 cm test pits was excavated within two test pit blocks and five judgmental transects in the archaeologically sensitive portions of the 75 acre project area. No prehistoric or historic cultural materials were located during the intensive survey. The project area may have been cleared at one time and/or used as pasturage, and one area contains an abandoned apple orchard. The project area was probably a peripheral part of a large farm that has operated nearby for many decades. No additional archaeological investigations were recommended.

25-1488 Decima, Elena

1995 Intensive Survey, Windswept Estates, Framingham, Massachusetts. 67 pages.

The survey included background research, a walkover and subsurface testing. A total of 5 prehistoric sites and one historic site was found during the survey. The prehistoric sites were relatively small sites representing temporary occupations, thin artifact distributions, and lacked diagnostic artifacts. No further work was recommended at any of the prehistoric sites. The historic site included the remains of a brick structure and may be associated with the late 1800s and 1900s occupation of Bowditch. It was recommended that additional historic research be conducted to clarify and complete what is known of the historic occupation of the parcel and that a site examination be carried out at the location of the potential Bowditch residence.

25-1489 Mulholland, Mitchell T. and Stephen Williams

1977 Final Report, Phase I/Reconnaissance Cultural Impact Study, Proposed Water Pollution Control Projects, Lenox, Massachusetts. 101 pages.

This report describes a Phase I/Reconnaissance cultural resource survey on the site of the proposed sewer project in Lenox, Massachusetts. The study involves a historical document search designed to locate and evaluate known historic and prehistoric cultural resources within the project area, and an ecological analysis of the project area to assess the potential existence of prehistoric sites likely to be impacted. Persons knowledgeable in the history and prehistory of the area were consulted. This study concludes that there are twelve (12) sensitive areas in which significant cultural resources are likely to be directly impacted from the project. In addition, portions of an 1875 sewer and a 1901 trolley line will also be affected. An intensive survey was recommended.

25-1490 Johnson, Eric S., Elizabeth Chilton, Charles Laing, and Tonya Largy

1994 Data Recovery Operations at the Chassell 2(19-BK-141) and Kampoosa Bog (19-BK-143) Sites, Stockbridge, Massachusetts. Volume I, 251 pages; Volume II, 288 pages.

An archaeological excavation was conducted at the Chassell 2 (19-BK-141) and Kampoosa Bog (19-BK-143) sites (see Report #25-1523). In conjunction with the archaeological effort, two sediment cores were extracted from the bog and analyzed in order to reconstruct local and regional vegetational, fire, and paleoenvironmental histories. The archaeological sites were occupied from the Late Archaic through the Late Woodland/protohistoric period (approximately 5000 BP-1600 AD). A large assemblage of lithics, ceramics, faunal and floral remains, was recovered. Projectile points and bifaces recovered included a large concentration of Snook Kill-like blades, Normanskill-like points, Small Stemmed points including Lamoka-like specimens, and a Levanna Triangle. Numerous retouched flakes, scrapers, cutting tools and piercing tools were also recovered. Lithic materials consist almost entirely of Hudson Valley cherts. Ceramics exhibit a variety of vessel forms, manufacturing characteristics, and decorative techniques. Twenty-nine cultural features were documented, all from the Chassell 2 site. These included sheet refuse deposits, hearths, pit features, and postmolds. Two of the refuse deposits dated to the Late Archaic period; a hearth feature dated to the Late Woodland. Activity areas excavated include a large lithic workshop area associated with the production of Snook Kill blades, as well as areas where other lithic reduction, hide processing, cooking, and refuse disposal took place. Correlation of the data from the archaeological sites and the bog sediments indicates that the area was first utilized when the bog began its transition from a body of open water to its present form. Charcoal deposits in the bog as well as evidence of fire at the sites in the form of heated lithic debitage, suggest a period of increased local understory burning during the fifth, fourth, and second millennia BP, the time of the area's most intensive use.

25-1491 Ward, Jeanne A. and John P. McCarthy

1994 Cultural Resources Reconnaissance Survey, Barracks Modernization Building 15, U.S. Army Natick Research Development and Engineering Center, Natick, Middlesex County, Massachusetts. 43 pages.

Background research and a pedestrian survey were undertaken to document the potential for significant archaeological resources which might be affected by the proposed replacement of Building 15. While background research indicated that the project area possessed high prehistoric archaeological sensitivity prior to development in the 1950s, construction of Building 15 and related grading and utility installation, including expansion of the structure in the l970s, appears to have severely disturbed or destroyed any archaeological resources that may have been present. As a result, the project area now possesses low sensitivity for significant prehistoric archaeological resources. The project area appears to never have possessed greater than low sensitivity for historic archaeological resources. No further archaeological investigation was recommended.

25-1492 Soulsby, Mary G. and J. Hartman

1994 Archaeological Survey, Technical Study Report of the Northeast Corridor Improvement Project from New Haven, Connecticut to Boston, Massachusetts. 178 pages.

Archaeological studies were conducted of properties to be impacted by the Northeast Corridor Improvement Project, which includes electrification of railroad lines from New Haven, Connecticut, to Boston, Massachusetts. The properties studied included four substation sites with associated power line corridors, three switching station sites, 18 paralleling station sites, and nine bridge-modification sites. The technical level of survey differed in each state, according to state regulations, but the goal and result of the surveys were the same: to determine the archaeological sensitivity (i.e., potential for yielding archaeological sites) of each property studied. The following was concluded: one of the four substations/power line corridor sites has the potential for containing buried cultural materials; none of the three switching station sites have archaeological potential; nine of the 18 paralleling station sites are archaeologically sensitive; and four of the nine bridge-modification areas have archaeological potential. Additional archaeological work including subsurface testing is recommended at all of these 14 sites which have the potential for yielding buried cultural remains. In Massachusetts, the Attleboro and East Foxborough paralleling stations were found to be sensitive and recommended for a Phase I reconnaissance survey. The Maskwonicut Street Bridge modification area in Sharon, Massachusetts was also found to be sensitive and recommended for an intensive level survey. There were no sensitive substation/power line sites in Massachusetts.

25-1493 Simpson, Timothy, Wing K. Chong, and Mohammed Nasir Shir

1993 Determining Prehistoric Archaeological Site Potentials in Westborough, Massachusetts. 71 pages.

This project is intended to execute an analysis of the town of Westborough, Massachusetts, searching for land areas with high potential for prehistoric site locations. The variables used to determine these “site potentials” are elements of the physical environment including slope, aspect, proximity to waterbodies and soil type. A Geographic Information System (GIS) is used to analyze the variables to arrive at a final image depicting areas with high potential for prehistoric archaeological site locations. The final image is compared to a town zoning map to arrive at conclusions concerning land use sensitivities to archaeological potentials. In the concluding statements, suggestions are made on how to continue this research with further studies and analyses.

25-1494 Mead, Leslie A. and Frederica R. Dimmick

1994 Archaeological Investigations at the Rogers Property, Minute Man National Historic Park, Concord [sic-Lincoln], Massachusetts. 75 pages.

The Frederick Law Olmsted National Historic Site is planning to install a nursery at the Rogers Property in Lincoln, at Minute Man National Historical Park. The testing procedure employed 50 cm x 50 cm shovel test pits set at 8 m intervals throughout the impact area. The excavations found little evidence of intact archaeological deposits. Three features were identified during testing, two of which were probably related to human behavior. However, both of these features had been extensively disturbed by subsequent plowing and little remained which would allow successful dating or interpretation. The vast majority of the artifacts recovered came from the plowzone. A total of four prehistoric artifacts were found. The historic period assemblage appeared to date from the 18th, 19th, and 20th centuries. Many of these artifacts appear to represent field scatter which was subsequently transformed by slope movement and surface run-off. Three concentrations of historic material were identified. One appears to be related to former structures northwest of the project area which might date to the 18th century. The second appears to be related to an unknown structure, probably dating from the 19th century, off the southeast corner of the project area. The third,

located at the southwest end of the project area has no apparent association at this time. None of these concentrations appeared to have intact feature material in test pits in their immediate proximity. Given that the majority of the artifacts were found in plowzone contexts and that what features were present appeared to have been severely truncated by plowing, we believe the level of integrity of archaeological deposits is minimal. Further testing was not recommended.

25-1495 Boire, Kerrylynn and Suzanne G. Cherau

1995 Archaeological Site Examination, Old Colony Railroad Roundhouse (WHI-HA-2), Whitman Station Project Area, Old Colony Railroad Rehabilitation Project. Whitman, Massachusetts. 113 pages.

The site examination consisted of additional site-specific background research and field investigations. Research questions included the internal complexity and integrity of the site's character-defining elements, the socioeconomic and transportation history of the Abington/Whitman area, and 19th century railroad roundhouse construction and engineering techniques. The roundhouse and turntable was constructed circa 1880-81 at the time of land purchase by the Old Colony Railroad Company. Prior to this purchase the land appears to have been unimproved rear lots. The establishment of a terminal facility at this location in Whitman coincided with increased commuter and summer resort traffic between Boston and points south, particularly in Bridgewater and Brockton. The field investigations, which included both hand and machine-assisted excavations, resulted in the identification and assessment of structural remains associated with the roundhouse, turntable, water tank, and former rail bridge abutments. In addition, a large sample of industrial cultural materials (both structural and nonstructural) was recovered from the site area. The roundhouse foundation was found to be constructed of large cut granite blocks, bricks, and fieldstones. At least one brick-lined inspection pit with a fieldstone flooring is present within the roundhouse foundation. The turntable pit is constructed of a cut granite circular side wall and center pivot foundation. The turntable bridge itself and machinery parts appear to have been removed. The investigations determined that the identified structural remains possess a very good to excellent physical integrity and represent perhaps one of the few surviving intact archaeological examples of a 19th century terminal facility built by the Old Colony Railroad in southeastern Massachusetts. The Old Colony Railroad Company was a decisive socioeconomic force in the region and a pioneer of railroad engineering techniques and construction methods. For these reasons, along with the scant documentary record for the site and probability of additional related features and elements, the Old Colony roundhouse site in Whitman was recommended as being eligible for listing on the State and National Registers of Historic Places. Avoidance and preservation in place of the site area was recommended. Should avoidance and preservation in place not be deemed feasible, then alternative mitigation measures, such as an archaeological data recovery program, may be warranted. In the interim, it was recommended that the Whitman Station roundhouse site be enclosed within security fencing to reduce further damage from heavy vehicular traffic and dumping by local residents.

25-1496 Ritchie, Duncan, Neil DePaoli, and Marley Brown III

1975 Preliminary Archaeological Investigations at the Fort Phoenix National Historic Site, Fairhaven, Massachusetts, Fall, 1975. 72 pages.

This report presents the results of background research and excavations recommended by the Massachusetts Historical Commission and requested by the Fairhaven Historical Commission in order to gain more insight into the potential of the site as an archaeological resource. The study also collected management data to guide further archaeological research and restoration at the site. Archaeological research documented that the fort and its various activity areas are relatively intact. The study recommends further documentary research and excavations in several areas which were tested and determined significant as well as potentially significant areas which were not tested. The study also identified the parapet wall as an area requiring stabilization and restoration.

25-1497 Blancke, Shirley

1976 Billerica, Massachusetts, Archaeological Field Survey for Sewer System Expansion Program (Remainder of Phase I). 3 pages.

One test pit contained evidence of prehistoric activity including two felsite chips and fire reddened rock. Four expansion pits around the previous finds failed to produce additional results. The survey also recovered evidence of the Talbot Dye Wool and Chemical Company including ceramics, red brick, iron, glass, and structural remains. The site was determined to be potentially significant for research into the history of industrialization in the United States. Recommendations were made to avoid the Talbot Company site locale by shifting the sewer line closer to the railroad tracks. In the event avoidance was not possible a salvage excavation was recommended.

25-1498 Raber, Michael S. and Leonard W. Loparto

1989 Archaeological Examinations of the Andrew's Knoll and Windy Shore Sites for the Proposed Milford/ Bellingham Technology Park, Milford and Bellingham, Massachusetts. 21 pages.

Testing was conducted at the Andrew's Knoll and Windy Shore Sites as a result of recommendations made during an earlier intensive survey (Report #25-751). The Windy Shore site was found to encompass some 250 square meters and appeared undisturbed. Cultural material recovered included largely felsite, hornfels, chert, and quartzite chipping debris, calcined bone, and a drill tip suggesting hunting and related processing activities and the later stages of tool manufacture and/or maintenance. While diagnostic cultural materials were not recovered, lithic types, particularly hornfels suggested a correlation with Middle Woodland sites. At the Andrew's Knoll site, site size indicated by the overall distribution was about 900 square meters, however, actual site size relative to prehistoric activities is probably much smaller in the range of 100 to 200 square meters. This site also appeared largely undisturbed with no plowzone. Chipping debris of which over 99% was hornfels comprised nearly the entire prehistoric assemblage recovered. White quartz chipping debris, a hornfels biface fragment and small amounts of calcined bone and charcoal were also found. No diagnostic materials were found; however, as with the Windy Shore site, the predominance of hornfels lithics in the assemblage may indicate a Middle Woodland presence at the site. The study concluded that the Windy Shores site was not eligible for inclusion in the National Register of Historic Places and was not recommended for further work. The Andrew's Knoll site did appear to be NR eligible. It was recommended that project development avoid the Andrew's Knoll site and, if avoidance was not possible, that a data recovery program be implemented.

25-1499 Cassalo, Joanne and Rebecca Davidson

1975 Setucket River Site, East Bridgewater.

This study presents the results of archaeological excavations and subsequent site reports designed to fulfill the requirements for a directed study course at Bridgewater State College. The study included historical research, a surface survey and excavation. Prehistoric cultural material recovered included projectile points, scrapers and chipping debris representing food processing, gathering and lithic workshop activities. The site appears to represent a temporary camp of the Late Woodland Period. Historic artifacts were also found dating roughly from 1745 to 1820. Additional excavation was recommended in the area to further identify historic land use in the locale and possibly identify the location of the Latham home and barn reported in this area.

25-1500 Rosebrock, Ellen Fletcher

1981 Phase I Archaeological Reconnaissance/Intensive Survey for the Urban State Heritage Park, Lawrence, Massachusetts. Volume I: Historical Research. 147 pages.

This report was undertaken as part of the planning for a Heritage State Park which will focus on part of the Lawrence Mill island, including Canal Street and an early company boarding house, and will extend to the Lawrence Common park. The report includes finding based primarily on historic research. A separate report (#25-395) described the results of archaeological field studies. This report discusses the various sites within the park and how they relate to the historical development of the city as a whole. Specific archaeological sites are discussed as they occur within each area as well as potential prehistoric or historic archaeological resources which may also be present.

25-1501 Donta, Christopher L. and Frederick T. Barker

1995 Archaeological Site Locational Survey for the Proposed Pleasant and Turnpike Streets Reconstruction Project, Stoughton, Massachusetts. 57 pages.

An archaeological site locational survey was conducted within two proposed wetlands replacement areas, one proposed treatment detention pond, and two proposed access road associated with the Pleasant and Turnpike Streets Reconstruction Project in Stoughton, Massachusetts. The project was conducted for the Massachusetts Highway Department. The remainder of the project was eliminated from further consideration due to unsuitable site locational criteria (e.g., slopes, wet soils, and disturbance associated with previous road construction and roadside development). Background research determined that prehistoric archaeological sites have been recorded in the vicinity of the project area. In addition, historic sites associated with the Native American settlement of Ponkapoag to the northwest of the project area raised the possibility that early historic period sites might be located in the project area. No known sites have been recorded within the proposed project area. A total of 82 STPs was excavated, the same number as recommended in the project proposal. No prehistoric features or artifacts were found anywhere in the project area. Two historic artifacts were recovered, neither of which were of significance. Soils throughout the project area were found to be shallow and often disturbed.

25-1502 Strauss, Alan E.

1995 Intensive Archaeological Survey at the Howard Estate Development in Ashland. 33 pages.

The field reconnaissance resulted in the identification of eight 20th century historical structures: small buildings, a chicken coop, a shed, and a fieldstone foundation. All of the buildings appeared to be of recent construction (1910-1940) with the exception of the fieldstone foundation which probably predated this period. The historical structures were all in extremely poor condition and did not represent potentially significant resources. A stone-line well was also identified on the property and it was determined that portions of the project area were used as a farm and for a summer camp. Subsurface testing was conducted in those portions of the project area that were considered archaeologically sensitive. A total of 54 shovel test pits was excavated. No prehistoric or potentially significant historical resources were identified during the subsurface testing. The 20th century structures identified were all in extremely poor condition and do not meet National Register criteria of significance. No further archaeological investigations were recommended.

25-1503 Strauss, Alan E.

1994 Phase II Archaeological Site Examination of the Cut River Point Development in Marshfield, Massachusetts. 64 pages.

The site was discovered during an intensive archaeological survey. The Phase II site examination consisted of 30 shovel test pits, two 50 cm by 100 cm units, and seven 1 m units. The soil stratigraphy indicated that the site had been plowed. Artifacts were all recovered from the plowed topsoil to a depth of 30 cm. Horizontally, the site area was estimated to be roughly 4,100 square meters in size. The site consists of one or more high lithic workshops. Over 5,000 pieces of prehistoric lithic debitage were recovered. A total of 46 prehistoric tools and cores were recovered from

the site. Diagnostic points include Late Woodland Levanna Points and One Atlantic-Like Point from the Late Archaic period. A few sherds of prehistoric pottery were also recovered. A small and shallow pre-historic feature was identified and dated on wood charcoal to 510 ± 95 years B.P. Because the multi-component, lithic workshop site has poor archaeological integrity and lacks research potential, no further archaeological work was recommended.

25-1504 Davin, Ann K.

1995 Intensive Archaeological Survey, Soccer Field Construction Project, New Bedford, Massachusetts. 51 pages.

Subsurface testing consisted of 28 test pits excavated as part of a 30 x 30 meter block, two transects, and two arrays in the 2 acre project area. Two pieces of prehistoric quartz chipping debris were recovered from test pits located along the western edge of the project area. Further testing around these test pits did not recover any additional materials. No additional archaeological investigation was recommended.

25-1505 Davin, Ann K.

1995 Intensive Archaeological Survey of the Crossroads Shopping Center, Bellingham, Massachusetts. 64 pages.

Two archaeological surveys were conducted separately in two project parcels with a total size of 65 acres. Three prehistoric sites, one locus of prehistoric activity, and two late 19th century foundations were found. At this time no additional archaeological investigations are recommended for the Spring Brook 1 and 2 sites since no construction is planned for this section of the project area. If project plans change and impacts to the ground surface will occur, then additional archaeological investigations in the form of site examinations were recommended for these sites. No additional archaeological investigations are recommended for the Spring Brook Locus since this area does not appear to represent a significant archaeological deposit. The 19th century cellar holes have been heavily impacted by previous activity, including the construction of the gas station. Efforts to fill in the cellar holes resulted in substantial impacts to the foundation walls. The majority of the cultural material indicates a late 19th to 20th century occupation. No additional testing was recommended due to the lack of physical integrity. Subsurface testing in Parcel 2 found no evidence of pre-historic activity and only scattered, – low density historic cultural material. No additional testing was recommended for Parcel 2.

25-1506 Donta, Christopher L., Richard D. Holmes, and Carolyn D. Hertz

1995 Archaeological Site Reconnaissance and Site Locational Surveys for the Proposed Burning Tree Subdivision, Great Barrington, Massachusetts. 74 pages.

Following background research, the project area was divided into survey units on the basis of topography, and the property was examined for evidence of prehistoric or historic potential. Recommendations were made for subsurface testing in areas having a potential to contain historic and prehistoric sites. Eight of thirteen survey units were recommended for further testing, which was completed as a site locational survey. Only one historic and one pre-historic artifact were found in the eight survey units. No further survey was recommended.

25-1507 Cherau, Suzanne G. and Kerrylynn Boire

1995 Final Historical Archaeological Reconnaissance/Inventory Survey, Cultural Resource Management Plan, Tully Lake, Royalston, Massachusetts. Volumes I and II. 327 pages.

An historic and archaeological reconnaissance/inventory survey was conducted within the 1,310 acre project lands in fee ownership, of which 468 were testable. Prior to the reconnaissance sur-

vey, approximately 30 percent of this area was assessed as being archaeologically sensitive for prehistoric and historic resources. As a result of background research and field investigations, 17 prehistoric sites and six documented historic sites were located and identified within the project area. These archaeological sites constitute a partial inventory of cultural resources contained within archaeologically sensitive zones of the project area. Limited subsurface testing was conducted at the six visible historic site locations. The documented eight historic sites that could not be visually verified in the field were evaluated in terms of their potential for survival. The identified prehistoric sites consist primarily of low to moderate density deposits of chipping debris. Two of the sites could be assigned tentative temporal-cultural affiliations based on the recovery of diagnostic artifacts. Shepardson 1 yielded grit-tempered aboriginal pottery, typically diagnostic of the Woodland Period. The Doane Falls Site yielded two modified projectile points tentatively identified as diagnostic of the Middle Archaic and/or Transitional Archaic periods. The 17 site areas have the potential to contribute information concerning the prehistory of the Millers and Tully River drainages in North Central Massachusetts. Their subsurface integrity is generally very good to excellent, and they are considered potentially significant archaeological resources. Avoidance of each is recommended since further research would be needed to determine potential eligibility to the National Register of Historic Places. In addition, portions of the project area having moderate and high sensitivity for prehistoric resources should be subject to archaeological investigations prior to any future developments. The documented historic sites within the project area consist of residence/farmsteads, saw mills, a school, and the West Meetinghouse of Royalston. They date primarily from the 19th century, although several may date to the 18th century. Some of the sites appear to have been standing at the time of dam and reservoir pool construction. The six identified sites consist of residence/farmsteads containing the visible cellar hole and foundation remains of dwellings and outbuildings along with associated artifact assemblages. All but one of the identified historic sites are in generally good to very good physical condition, based on the limited fieldwork conducted to date. Five of the six identified and seven of the eight unidentified documented historic sites cannot be assessed for significance at this time due to the limited reconnaissance survey. However, based on their physical integrity and contents recovered to date, they are interpreted as having the potential to address research themes related to 19th and possibly 18th century rural agrarian settlement and land use in the town of Royalston. Avoidance is recommended since further research would be needed to determine potential eligibility to the National Register of Historic Places. The remaining two sites have been destroyed by dam construction and road widening activities. No further research is recommended at these two site areas. In addition, portions of the project area designated as having a moderate sensitivity for additional historic resources should be subjected to archaeological investigations prior to any future developments.

25-1508 Gallagher, Joan, Joyce Fitzgerald, Michael Roberts, and K. Ann Turner

1992 Procedures, Processes, and Methods, Central Artery North Reconstruction Project, Charlestown, Massachusetts. Volume I. 113 pages.

In 1985 the Public Archeology Laboratory, Inc. contracted with the Massachusetts Department of Public Works to undertake an archaeological data recovery program on the five historic archaeological properties that were to be affected by the Central Artery North Reconstruction Project in Charlestown. The excavation resulted in the discovery of two more sites, one prehistoric and one historic site. Hence a total of seven properties were subject to archaeological excavation. The data recovery program is described in eight reports (totaling 10 volumes) and a popular report. This first volume begins with the project overview and the development of research context and technical methods for field and laboratory procedures, data processing, conservation, material analysis, public participation programs, and project management.

25-1509 Gallagher, Joan, John Cheney, Neill DePaoli, and Joyce Fitzgerald

1992 Central Artery North Reconstruction Project, Archaeological Data Recovery, Charlestown, Massachusetts. Volume II, Section 1 Henley Distillery, Section 2 Smith Site. 318 pages.

The Henley Distillery site was one of nine archaeological sites subject to data recovery within the corridor of the Central Artery North Reconstruction project area in Charlestown. Data recovery consisted of documentary research, site sampling, and excavation of archaeological features. The Henley Distillery Site was located slightly to the northwest of the historic Charlestown Navy Yard, and was bounded by the lines of Chelsea Street, Wapping Street, Foss Street, and an access ramp for I-93. It was considered significant and recommended for data recovery on the basis of its potential for providing information concerning the operation of a pre-Revolutionary and early 19th century rum distillery. Documentary research and site testing during investigation prior to data recovery suggested two distilleries were located within the site bounds during the 18th and 19th centuries. The first distillery (1741-1775) was owned by a prominent Charlestown businessman, Samuel Henley, for whom the site was named. Following the destruction of the distillery in the Revolution, it was rebuilt, and was owned and operated by a series of Charlestown residents from ca. 1789 to ca. 1866. Archaeological data recovery in the summer of 1985 exposed the surviving remains of the post-Revolutionary distillery. Archaeological data recovery required the excavation of 40 hand excavated units, 13 measuring 50 cm x 50 cm and 27 measuring 2 m x 2 m, as well as 9 machine-assisted units. The result of data recovery fieldwork were the location, excavation, and recording of elements of the ca. 1789-1866 distillery, which included its fire-box, vats, and trough system. No evidence of the pre-Revolutionary distillery was located. The Smith Site, an early component of the Henley Distillery site, was discovered during the distillery's data recovery in the site's southeast corner. Following the site examination in 1985, archaeological data recovery took place in 1987. Documentary research and site examination subsurface testing indicated that the site contained elements of a dwelling occupied by the John Smith family, who lived on or near the site between ca. 1644 and ca. 1715. John Smith and sons were ship wrights, repairing or constructing ships near the wharf that the family owned. Archaeological data recovery in 1987 required the excavation of 6 hand-excavated units within the area tested during site examination in 1985. A series of significant proveniences were excavated and recorded. They included structural features, fills, and two intact early barrels sealed with a storage cellar in the late 17th or early 18th centuries. Cultural material included local domestic redware and imported pottery, and, wooden objects related to ship repair and cooperage. The significance of the Henley site's archaeological record lies in its ability to provide information regarding the operation of a post-Revolutionary rum distillery, an important element in the community's economy. The Smith Site provided information regarding maritime industry, trade and land use in a core or urban zone during a highly important, early period in colonial history. The results of archeological data recovery fieldwork, laboratory activities, and documentary research are presented in the report, with 15 appendices describing the analysis of specific classes of artifacts.

25-1510 Gallagher, Joan, Laurie Boros, Joyce Fitzgerald, and Neill DePaoli

1992 The Parker-Harris Pottery Site, Central Artery North Reconstruction Project, Archaeological Data Recovery, Charlestown, Massachusetts. Volume III. 210 pages.

The Parker-Harris Pottery site was one of seven archaeological sites subject to archaeological data recovery within the corridor of the Central Artery North Reconstruction project area in Charlestown. The site was bounded by City Square on the north, Front Street on the south, Warren Street on the east, and the old line of Jenner Street on the west. Archaeological data recovery included documentary research, archaeological fieldwork, and extensive analysis of recovered cultural material. Previous archeological investigation and documentary research suggested that the site was the location of the pottery operated by two generations of the Parker family (1714-1757), and later by Josiah Harris (1758-1775). Archaeological data recovery fieldwork took place on the site in 1986. Site sampling and excavation required the excavation of 25 units, 7 of which were machine assisted and the balance hand excavated, 5 measuring 1 m x 1 m and 13 measuring 2 m x 2 m. The results of subsurface investigation determined the extent of post-pottery disturbance to the site, the extent and content of a pre-pottery wall, and the type and extent of significant pottery-related features. The pre-pottery wall consisted of three courses of dry-laid stone, oriented north-south, with a total exposed length of 6.4 m. Its significance lay in the information it provided concerning the architectural elements of a 17th century urban house site. The pottery-related features were con-

fined to a fill level observed on eight excavation units, consisting of olive green clay containing cultural material associated with the operation of the 18th century pottery. The significance of this temporally stratified deposit of wasters and sherds lay in its ability to provide information regarding an intra-site comparison of the attributes of Charlestown redware in the 18th century, as well as providing the basis for intersite analysis of this important colonial industry. The results of data recovery were the identification of the extent of post-pottery disturbance, which destroyed all but a 32 square meter portion of the site, the location and excavation of the pre-pottery wall and pottery-related fills, and the extensive analysis of the cultural material recovered. The methods and results of the site's data recovery are presented, as are detailed appendices describing the results of cultural material analysis. The data from all these sources are used to explicate the significance of the site.

25-1511 Gallagher, Joan, Laurie Boros, Joyce Fitzgerald, and Neill DePaoli

1994 The Town Dock Wharves/Dry Dock Site, Town Dock Pottery Site, Central Artery North Reconstruction Project, Archaeological Date Recovery, Charlestown

Massachusetts. Volume IVA. 261 pages.

Data recovery investigations were conducted on the Town Dock Wharves/Dry Dock Site, located within the Town Dock Archaeological District, and on the Town Dock Pottery Site, as part of the Central Artery North Reconstruction Project. The Town Dock Wharves/Dry Dock and the Town Dock Pottery historic sites were first identified during site examinations conducted in 1981. Both of these sites were considered eligible for listing in the National Register of Historic Places. Data recovery consisted of documentary research, site sampling, and excavation of archaeological features. Archaeological fieldwork was conducted between 1986 and 1987. Data recovery investigations revealed that the Town Dock Wharves/Dry Dock Site contained the remains of timber wharving associated with Charlestown's Town Dock (ca. 1640-1835). The site's significance relates to the data it provided concerning maritime adaptations of the Charlestown community, especially in relation to early dry dock construction in North America. Historic documentary research on the Town Dock Pottery Site indicated that the site was the activity area of Charlestown potter Battery Powers (1736-1805). The ceramics recovered during the data recovery excavations were valuable examples of the town's post-Revolutionary redware, although features or deposits that could be clearly attributed to Battery Powers were not found. The investigation also exposed a section of wharving that corresponded closely with that found within the Town Dock Wharves/Dry Dock Site, along with a dockside walkway (corduroy road) and intact wharf fills. In addition, during the course of data recovery level investigations on the Town Dock Pottery Site in 1987, evidence of an intact prehistoric period component was discovered in the eastern half of the site. Prehistoric cultural material was recovered from a thin stratum of sandy clay under a deposit of salt marsh peat, and there appeared to be minimal disturbance from historic wharf construction. The site contained evidence of prehistoric occupation dating to possibly the Late Archaic/Early Woodland time period. The Town Dock Pottery Prehistoric Site report is discussed in Volume IVB (Report #25-1512).

25-1512 Ritchie, Duncan

1994 Archaeological Data Recovery, Town Dock Prehistoric Site, Central Artery North Reconstruction Project, Charlestown, Massachusetts. Volume IVB. 96 pages.

A data recovery program was conducted at the Town Dock Pottery Prehistoric Site in 1987 as part of the Central Artery North Reconstruction Project. During data recovery of the Town Dock Pottery historic component (Volume IVA), evidence of a previously unknown, intact prehistoric period component was discovered in the eastern part of the site. Excavation along the perimeter of an historic dockside walkway or "corduroy road" yielded a small amount of chipping debris. Following this discovery, a limited amount of additional investigation was conducted. This testing was designed to estimate the site boundaries, collect a larger sample of cultural material, and document

the stratigraphic relationship between an overlying peat deposit and the underlying subsoil containing the prehistoric deposition. Based on the information collected in the second investigation the site was considered to be potentially significant. It was recommended that the remaining sections of the prehistoric site be excavated to recover several categories of data. These categories of data included a lithic assemblage (chipped stone tools, debitage) suspected to be of Terminal Archaic/Early Woodland Period (ca. 3000-2000 B.P.) provenience, a possible feature (small hearth or pit), and deposits of salt marsh peat that could provide samples for palynological studies (paleoenvironmental reconstruction). A mitigation plan for recovering these categories of data from the remaining unexcavated sections of the site consisted of the excavation of a 20 square meter sample within the defined prehistoric site. The data recovery program sampled 80 percent of the site area, providing adequate mitigation of impacts from the proposed construction. The prehistoric cultural material collected from the site did not include any diagnostic artifacts clearly indicating it temporal/cultural context. However, from analysis of the lithic assemblage (felsite chipping debris) and features it was possible to suggest that the site functioned as a small, temporary camp where chipped stone tools were manufactured when the site was occupied by prehistoric hunter/gatherers (ca. 3000-2000 B.P.). The local environment probably included fresh and/or brackish tidal streams and wetlands along the margins of the developing estuaries in the Boston Harbor area. The results of palynological analysis and radiocarbon dating of peat samples (680 $\pm$ 50 B.P.) indicated that the site was later flooded by shallow estuarine waters that eventually became a salt marsh in the late prehistoric and early historic period.

25-1513 Gallagher, Joan and Laurie Boros

1992 The Ingalls-Penny Pottery Site, Central Artery North Reconstruction Project Archaeological Data Recovery, Charlestown, Massachusetts. Volume V. 39 pages.

The Ingalls-Penny Pottery Site was one of nine archaeological sites subject to an archaeological data recovery program within the Central Artery North Reconstruction project area. Located north of Chelsea Street, it lies beneath and adjacent to he highway ramps overlying the pre-1950 line of Henley Street at what was the junction of Henley, Wapping, and Chelsea Streets. The site was considered to be significant as one of the four thematic pottery sites within the project area. Data recovery at the site took place in 1986. After site sampling and subsurface testing it was found that no significant features remained within the site area. Extensive disturbance by utility placement and highway construction had destroyed any intact pottery-related features. It was found that the primary research interest of the site lay in its documented land use history rather than its archaeological record. The land use history of the site area and documentation of the impacts to the site are described.

25-1514 Gallagher, Joan

1992 The Newhall-Runey Pottery Site, Central Artery North Reconstruction Project, Archaeological Data Recovery, Charlestown, Massachusetts. Volume VI. 26 pages.

The Newhall-Runey Pottery Site was one of nine archaeological sites considered for an archaeological data recovery program within the Central Artery North Reconstruction project area. Located north of Water Street, it lies beneath the elevated Central Artery along the western side of Gray Street. The site was considered to be significant as one of the four thematic pottery sites within the project area. Archaeological data recovery was proposed for the site, and was planned for 1986. After review of documentary information, it was determined that there was no evidence that the site was a pottery. Data recovery was confined to a thorough review of the documentary data and site examination field records, and the collection of sufficient new documentation to establish a clear sequence of ownership in the site vicinity.

25-1515 Gallagher, Joan, Laurie Boros, Neill DePaoli, K. Ann Turner, and Joyce Fitzgerald

1994 Archaeological Data Recovery, City Square Archaeological District, Central Artery North Reconstruction Project, Charlestown, Massachusetts. Volume VII. 206 pages.

The City Square Archaeological District was comprised of several archaeological sites considered eligible for listing in the National Register of Historic Places within the Central Artery North Reconstruction project area. The district is contained within a roughly triangular area fronting on Charlestown's Municipal Court and Police Station, bounded by the block containing the courthouse on the north, North Washington Street to the south, Park Street to the east, and Harvard Street to the west. Within the 2,096 square meter parcel, four archaeological sites were identified during site examination in 1981, of which the Great House/Three Cranes Tavern (1629-1775) was considered the most significant. During the data recovery program, archaeological features associated with the Great House/Three Cranes Tavern were examined, as well as features associated with other properties within the District. These included the Mary Long Lot and the Stable Lot. Data recovery at the site took place in 1985. Removal of the stone foundation of the Great House/Three Cranes Tavern took place in 1987. Data recovery resulted in the exposure, sampling, and excavation of many features within the district, notably the foundation and associated deposits of the Great House/Tavern. The research framework, historic documentation, fieldwork results, cultural material analyses and synthesis of site-specific and project wide research topics are presented in this report and Volume VII, Appendices A-Q (Report #25-1516). The report includes a detailed discussion of the history of the Great House/Three Cranes Tavern site, and a thorough interpretation of the archaeological features and their periods of construction and use. Analysis of the archaeological and documentary records revealed that the stone foundation originally believed to be the foundation of Governor John Winthrop's Great House, had most likely been a later improvement made to the Great House by its owner John Long sometime between 1635-1660. The existing archaeological evidence for the earliest period of construction (1629-1630), that of the Great House, consists of a series of postholes and postmolds underlying sections of the stone foundation and hearth base, and possibly areas of soil stains, charcoal, brick, and mortar scatter found beneath the hearth. Excavation of the City Square Archaeological District resulted in the recovery of significant artifact assemblages, principally from privies and John Long's Ordinary, trash pits associated with the Three Cranes Tavern (which was operated by John Long's widow Mary Long in the late 17th century), and Long House (1635-1775), which contribute to a better understanding of colonial life, tavern and domestic activities, the role of women in Colonial America, and regional and global trade networks.

25-1516 Gallagher, Joan, et al.

1994 Archaeological Data Recovery, City Square Archaeological District, Central Artery North Reconstruction Project, Charlestown, Massachusetts. Volume VII. Appendices A through Q. 592 pages.

This report includes 17 appendices for the city Square Archaeological District data recovery report (see Report #25-1515). The appendices included detailed lists of features, and specific analytical reports on certain classes of archaeological data. The appendices are titled: Feature Identification; Feature Provenience; Cultural Material Associated with Demolition Debris, Category 1 Features; Cultural Material Recovered from Privies, Category 2 Features; Cultural Material Recovered from Trash Pits, Category 3 Features; Non-Significant Features; Floral Samples; Faunal Samples; Objects Identified for Conservation; Ceramic Analysis; Kaolin Pipe Analysis; Glass Analysis; Miscellaneous Object Analysis; Vegetal Remains; Architectural Report -The Great House by Robert Blair St. George; Faunal Analysis Data, Avian Remains; and Faunal Analysis Data, Mammal Remains.

25-1517 Gallagher, Joan and Duncan Ritchie

1992 Archaeological Data Recovery, Synthesis Volume, Central Artery North Reconstruction

Project, Charlestown, Massachusetts. Volume VIII. 163 pages.

This volume summarizes and synthesizes the results of the archaeological data recovery program carried out within the corridor of the Central Artery North Reconstruction Project in Charlestown, conducted between 1985 and 1992. It consisted of historic documentary research, archaeological field investigation, cultural material analysis, and report writing and production. Archaeological data recovery was conducted at nine sites within the project corridor. They were the Henley Distillery Site; the Smith Site; the Parker-Harris Pottery Site; Ingalls-Penny Pottery Site; Newhall-Runey Pottery Site; Town Dock Pottery Site; Town Dock Wharves/Dry Dock Site; Town Dock Pottery Prehistoric Site; and City Square Archaeological District. The results of documentary research and archaeological excavation at these sites form the data base for this volume. During the data recovery program, several research contexts were developed that formed a framework within which the sites were placed. These project-wide historic contexts included Charlestown's ceramic industry; maritime facilities; regional exchange network and foodways; and prehistoric adaptations to estuarine environments. They are presented in this volume in their original, theoretically-oriented form as well as in a synthesized form that incorporates site-specific archaeological and historical data. This volume also presents a chronological narrative of Charlestown from the 17th to the 19th century, based on the historic documentation of the sites within the project corridor. The final section of the volume provides suggestion for future research.

25-1518 McHargue, Georgess, Joan Fleming, Stephen A. Mrozowski, Deborah C. Cox, Mary Lynne Rainey, Beth P. Miller, Dianna Doucette, and Dana Richardi

1994 Redware and Redcoats: A Popular Report on the Archaeology Performed in Charlestown, Massachusetts, for the Central Artery North Reconstruction Project. 39 pages.

The Central Artery North archaeology program produced a wealth of new information for researchers to consider. The redware industry was brought into focus as never before through excavations at the Parker-Harris and Town Dock Pottery Sites, which yielded detailed data concerning actual production processes, a broad sample of the types of wares produced and a valuable look at the ways in which urban potters used space in siting their facilities during the 18th and early 19th centuries. Most revealing in terms of Charlestown's maritime facilities was information obtained from the Town Dock Wharves/Dry Dock and Town Dock Pottery Sites concerning the specifics of wharf technology over two centuries (roughly 1630-1830). Archaeologists were able to reconstruct the actual building sequence of the wharf containing Charlestown's Dry Dock, a structure that was the first of its kind in North America, and to observe techniques that illustrated both the variability and conservatism of wharf-building craftsmanship at the time. Although several different types of construction were used, the basic techniques had not changed since medieval times, and did not change significantly even as late as the post-Revolutionary period. Evidence that the Town Docks themselves were being repaired and maintained as late as the early 19th century contradicted earlier assumptions that the dock had undergone a period of decay and disuse before being filled in the 1830s. Almost every site contained information relevant to regional exchange or trade networks from 1630 to 1880, most prominently the City Square Archaeological District and the Henley Distillery. Artifacts from the Three Cranes Tavern were particularly illuminating since the tavern was a center of exchange, visited by travelers, and expected to display the newest fashions in both foodstuffs and serving utensils. The artifacts from the tavern site revealed new patterns in regional and even global trade. The distillery remains proved to originate from a single, self-contained "shop" operating within a larger distillery complex between 1790 and 1864. As such, they demonstrated an interesting middle stage between rum distilling as a cottage industry and the fully industrialized distilling processes of the later 19th century. Rum began as an important component of regional trade but was later replaced, in most of the country, by whisky. The persistence of rum production in Charlestown clearly indicated that its exchange network was regional rather than national in scope. Another finding, which emerged from an examination of the ceramics from several of the excavated sites was that the people who lived in Charlestown owned pottery from Europe and England. Most of the pottery made in Charlestown was sold to people living in the rural towns of Massachusetts. In analyzing regional foodways, it was again the Three Cranes Tavern that

played the greatest role. Documentation of features such as the inn's hearth, chimney, and wine cellar related to the topic of food preparation, while the remains recovered from the inn's privies related to food consumption, as seen in the collections of butchered bones and edible plant remains, and to trash disposal, which is also an essential element of a society's foodways. The site as a whole provided invaluable comparative information for future studies of taverns and the role they played in early American life. The subject of the relationship between urban and rural areas was clearly addressed through the archaeology conducted at the Smith Site. The Smith Site contained evidence for mixed commercial and residential use, a pattern that prevailed on the waterfront as a whole and reflected the internal patterning that resulted from both kinship ties and the economic dependence on the maritime economy. The artifacts from the Smith Site reflected land alteration, and other processes about which little had previously been known. A final, unexpected research issue which was addressed related to the prehistoric site at the Town Dock Pottery. In the case of the Town Dock Pottery Prehistoric Site, the issue of the sea level stabilization and estuary information as it relates to human settlement of the area could be addressed. Thus the Central Artery North archaeology program has enlightened and clarified our view of early Charlestown, from the long-gone vision of Native American hunter-gatherers chipping stone tools around a campfire, to the building of a Great House in a new world.

25-1519 Leveillee, Alan, Ron Dalton, and Curtiss Hoffman

1994 Site Examination of Cedar Swamp No. 1, No.2 and No. 24 in the Cedar Swamp Archaeological District, Westborough, Massachusetts. 71 pages

The archaeological sites which were the focus of the examination (19-WR-4l7, 419 and 434) are contributing elements of the Cedar Swamp National Register District. The results of the study include the interpretation that prehistoric utilization, occupation, and activities occurred over 5,000 years. Rather than a landscape with three distinct sites situated across it, the area was actually occupied many times resulting in a large multi-component site with as many as six distinguishable temporal activity areas. Rather than serving as a residential area, it was a temporary campsite by prehistoric peoples. The area was probably occupied numerous times for short durations during the Middle Archaic, through the Late Archaic, and into the Woodland periods. The existence of a stone-lined cellar hole attests to a Historic Period component on the island as well (WBO-HA-3). The long-term but limited duration prehistoric hunting, gathering, and processing has resulted in differential distributions of artifacts and features across the area. The archaeological site examination results indicate that the multi-component sites recorded as Cedar Swamp 1, Cedar Swamp 2, and Cedar Swamp 24 are significant cultural resources and should continue to be listed as contributing elements to the Cedar Swamp National Register District. Avoidance of impacts during any planned construction was recommended. If avoidance was not prudent and feasible, archaeological data recovery was recommended.

25-1520 Kerber, Jordan

1986 Archaeological Investigations at the Soccer Field Site (l9-PL-520), Middleborough, Massachusetts. 10 pages.

Staff of the Massachusetts Historical Commission conducted preliminary investigations at a prehistoric site identified during construction of a soccer field on town land in Middleborough. The soccer field project was not supported by any state or federal funding. At the request of the Middleborough Historical Commission, Brady Fitts, of the MAS Cohannet Chapter, was asked to field check the area, about four acres in size, for prehistoric archaeological materials that may have been disturbed by topsoil stripping. After observing a few projectile points, possible hearths, dense concentrations of chipping debris, and bone fragments, Brady notified the MHC. The MHC, along with members of the MAS and the Middleborough Historical Commission, inspected and mapped the site area. Archaeological materials identified on the surface of the disturbance and from the loam piles included Neville, Squibnocket, Susquehanna and untyped projectile points, several possible hearths containing burnt rock and charcoal, a gouge, atlatl fragment, dense deposits of quartz

chipping debris, felsite, quartzite, and Saugus red jasper flakes, as well as bone fragments which are mammalian, but not human. Based on the preliminary investigations, it was determined that the archeological site had been largely destroyed or disturbed by the topsoil removal. While it is difficult to interpret and reconstruct the boundaries of the site, or its internal configuration and functions, it appears that the observed materials were deposited as a result of stone tool production and food preparation from about 6,000 B.P. until a more recent but unknown time period. The valuable assistance provided by MAS members enabled the MHC to document and record the site in the state inventory and to alert Middleborough town officials of the archaeological sensitivity of future projects generated by the town.

25-1521 Strauss, Alan E.

1995 Intensive Archaeological Survey of the Norumbega Reservoir Project, Weston, Massachusetts. 49 pages.

A total of 207 shovel test pits was excavated during the project; 150 under the original permit and an additional 37 that were added to the project as well as 20 used to test the wetland buffer areas. Three prehistoric sites were identified during the subsurface testing. Locus A consisted of a low density of chipping debris and one biface. Bracket testing failed to identify further archaeological resources. Locus B consisted of a single Neville Point (ca. 8,000-6,000 B.P.). Extensive bracket testing failed to produce additional cultural resources. Locus C consisted of a low density of tertiary flakes within a very limited area. Bracket testing in the locus failed to produce significant cultural remains. While the sites possess a good archaeological context (they are not plowed), the low density of artifacts, lack of subsurface features, absence of internal complexity, and lack of diagnostic artifacts, suggest that these sites have low research potential. The sites do, however, shed light on a poorly understood class of archaeological sites, the temporary tool sharpening, repair of manufacturing locus. One historical stone foundation and nearby surface deposit were identified, located just north of Schenck's Pond and situated outside of the proposed impact area. The function of the foundation structure is not known; however its small size (8 x 10 feet) suggests that it is not a dwelling. An historical surface deposit (10 x 12 feet) was also located in this area within the proposed route of a pipeline. The deposit consists almost exclusively of coal ash and slag and contains minor amounts of ceramics, glass, metal objects, and oyster shells. Based on the ceramics, the deposit dates to the late 19th or early 20th century. Because of the limited nature of the deposit and lack of numerous intact diagnostic artifacts or association with any particular historical feature, personality, or event, it was not considered to represent a significant cultural resource.

25-1522 Edens, Chris

1995 Summary Report, Archaeological Surveys for Approximately 25 miles of Transmission Line Right-of-Way in the Towns of Chatham, Orleans, Brewster, Dennis and Harwich, Massachusetts. 15 pages.

This report summarizes the results of three previous studies (See Report #25-1451, 1452, & 1453) conducted within approximately 25 miles of Commonwealth Electric Company Right-of-Way. At the end of this four year project, COMElectric is left in stewardship of six prehistoric and two historic period sites that are significant to the prehistory or history of Cape Cod and New England, and that are eligible for listing in National Register of Historic Places: The Canoe Pond Site (PSS 5-19-1), in Brewster; The Mill Ponds West Site (PSS 5-16-1, PSS 1-17-1), in Brewster; The Mill Ponds East Site (PSS 5-14-1, PSS 5-25-1), in Brewster; The Lee's Pond West Site (PSS 1-4-2), in Brewster; The North West Gate Road East Site (HS 8a-7-1), in Harwich; The Muddy Creek Head Site (PS 11-2-1) in Chatham; The Muddy Creek Hollow Site (PS 11-4-1, PS 11-5-1), in Harwich; and the Hurd Homestead Site (HLD 14-4-1), in Orleans. COMElectric has the responsibility to undertake reasonable care of these sites during its routine maintenance and use of the ROW. COMElectric also has the regulatory obligation to plan around, to preserve in place, or to sponsor a data recovery excavation program in mitigation of any new construction, construction-related, or other projects that may disturb these sites. At the same time, the reconnaissance and intensive sur-

veys have discharged COMElectric from future cultural-resource management obligations in other sections of the ROW. COMElectric has also made a material contribution to the archaeological heritage of Cape Cod. Under the terms of an agreement between COMElectric, the MHC, and Timelines, the artifacts recovered during all phases of work are permanently housed in the Cape Cod Museum of Natural History, where they can serve as study materials in the archaeology program of that institution. This collection amount to well over 20,000 items, including 4,325 prehistoric artifacts and 16,242 historic artifacts, as well as shell and bone samples, charcoal samples, and soil samples. These materials bear permanent witness to Cape Cod's past, and represent the fruits of COMElectric's responsible stewardship of its ROW.

25-1523 Johnson, Eric S.

1996 Discovering the Ancient Past at Kampoosa Bog Stockbridge, Massachusetts. 38 pages

This report represents a popular report for data recovery excavations at two ancient Native American sites. The report summarizes information presented in a two volume data recovery report (see Report #25-1490). This report explains the archaeological research process in laymans terms providing background information on the prehistory of the area, the environment and the research questions posed during the research. A glossary and reading list is also included.

25-1524 Gambrill, Howard, Jr. and Charles Hambrick-Stowe

1977 The Tavern And The Tory – The Story of the Golden Ball Tavern, Weston, Massachusetts. 111 pages.

This volume details much of the background research for the Golden Ball Tavern project in Weston, Massachusetts. The study draws on a wide array of documentary sources and archaeology to provide an alternative to the period restoration approach so common until recently in building restorations. Research conducted at the Golden Ball Tavern sought to preserve the house as a document of architectural and social change emphasizing changes in architectural styles and building techniques as well as the changing lifeways of their inhabitants. The study includes extensive illustrations and photographs as well as citations for documentary sources.

25-1525 Bower, Beth Anne

1978 Report on the Archaeological Excavation at the Dogget and Cunningham Houses, Roxbury, Massachusetts. 26 pages.

This report summarizes the results of background research and excavations conducted in the vicinity of the Dogget and Cunningham Houses in Roxbury, Massachusetts. Archaeological research found that considerable alterations including extensive filling took place around both houses in the late 19th century. A number of features were also found including a brick wall which may have been part of the kitchen cellar. Recommendations were made that further archaeological investigation of the site be proceeded by additional extensive historical research on the history of the site. Two areas were also recommended for further archaeological investigation. One area includes the north side of the Doggett tavern which contains the remains of a bowling alley. The second locale includes the kitchen area behind the Cunningham House which includes the brick wall noted above.

25-1526 Turnbaugh, William A.

1974 Archaeological Investigations at Fort Independence on Castle Island in Boston Harbor, 1973-74. 96 pages

This report summarizes the results of documentary research and excavations. The report was intended for informational purposes only as part of the fort restoration phase. This report represents

the first of three archaeological reports (see Report #25-108 & 25-512) on the fort. The study summarizes the overall history of the site and history of archaeology during two phases of the project. Detailed discussions of excavation are presented for structures A, C and the North Grid area. Recommendations are made for further archaeological investigations of the Parade Ground, interior of walls, surface of walls, and the remainder of the island. Interesting recommendations were also given relating to the relationship between the MDC (the contractor) and future archaeological consultants.

25-1527 Ulrich, Thomas and Robert Paynter

1974 Prehistoric Survey of the Proposed Route 2 Project in Fitchburg and Westminster, Massachusetts. 11 pages.

Survey methodology employed included soil core transects, test pits, phosphate analysis, and test trenches. While the survey did not recover any prehistoric or historic artifacts, it did recommend that the State Archaeologist and the Department of Anthropology, UMass/Amherst be notified if any resources were encountered during construction of the highway.

25-1528 Bragdon, Kathleen

1979 Excavations at the Cedar Dell Pond Site: 1978 Season. 41 pages.

This report describes the results of the second field season at the Cedar Dell Pond Site in Dartmouth. A separate report (#25-225) describes the results of the first season's excavations. The second season excavations produced several artifacts including several felsite and argillite flakes, a diagnostic (Stark) point base and fire-cracked rock. Site boundaries were established, except for the southern boundary which needs further testing. This season corroborated the first season's results which indicated the site was a short term occupation site of unknown use. Further testing was recommended to establish the nature of activities carried out and the total range of cultural materials present at the site.

25-1529 Dincauze, Dena F., H. Martin Wobst, Robert Hasenstab, and David Lacy

1981 Retrospective Assessment of Archaeological Survey Contracts in Massachusetts, 1970-1979. 4 vols. 968 pages.

A quantitative and qualitative assessment of 220 archaeological survey reports (completed between 1970 and 1979) was undertaken as part of a 1980 MHC Survey and Planning Grant. The assessment of survey methods and performance offered recommendations for improvements in archaeological performance standards.

25-1530 Denault, Susan Ann

1990 Mt. Greylock: The Years Before Protection 1760-1900. 190 pages.

This study summarizes research which examined the settlement location of historic farmsteads on Mt. Greylock in the northern point of Berkshire County from the 1760s to 1900 when the mountain range came under the protection of the Commonwealth of Massachusetts. Various historical documents were used to inventory, document, and locate historic sites. The significance of each type of document and its contribution toward historical interpretation of the sites was examined and its use explained. Historical research revealed that farmers selected certain areas for settlement based on previous knowledge of land utilization. As the townships grew these same farmers weighed the local and regional economic conditions that effected agricultural and husbandry practices. This information was compared with an existing historic farmstead settlement model in Vermont. This study infers that specific environmental variables that influenced settlement decisions temporally and spatially. The settlement locations in Vermont were compared temporally

and spatially to those on Mt. Greylock. The findings in this study have increased the knowledge and data base for 18th and 19th century sites on Mt. Greylock. Particularly it has revealed that a significant number of 18th-century farmsteads existed at that time and has provided some insights to their development through the years of this study. All the data accumulated is pertinent and valuable to the Massachusetts Department of Environmental Management in their efforts to inventory, protect, and manage archaeological resources within the state park system.

25-1531 Baggerman, Anne E. and Kristin Heintz

1978 Cultural Resources Inventory and Evaluation of Effect: Historic Districts in Massachusetts. 94 pages.

This report represents a reconnaissance-level study of the effects the Northeast Corridor Improvement Project (NECIP) will have on cultural resources by upgrading the existing railroad corridor between Washington, D.C. and Boston. The study includes an inventory and assessment of the effects the NECIP will have on historic districts along the right-of-way. The study discusses potential inputs from project actions along the corridor and inventories twelve historic districts along the right-of-way in Massachusetts. The significance of each district is discussed as well as a description of the district and its relation to the right-of-way. A "no adverse effect" was cited for each of the twelve historic districts in Massachusetts.

25-1532 O'Donnell, Patricia A. and Stephen P. Leatherman

1980 Generalized Maps and Geomorphic Reconstruction at Outer Cape Cod Between 12,000 B.P. and 500 B.P. 63 pages.

This report uses available documentary sources including scientific studies to reconstruct the topography, stream and river patterns, ground water and pond levels, fresh water marsh development, and coastline of outer Cape Cod at various points in prehistory. A series of maps were also prepared which depict the shore features for the time period between 12,000 B.P. and 500 B.P. The report was intended to serve as the basis for National Park Service archaeological studies, involving the excavation of pre-Colonial Native American artifacts on the outer Cape.

25-1533 Gimigliano, Michael N., Nan A. Rothschild, and Edward S. Rutsch

1978 A Report on Archaeological Sensitivity Along The Amtrak Northeast Corridor, Boston, Massachusetts to Washington, D.C. 613 pages.

This report presents the results of an archaeological sensitivity (reconnaissance) survey of the 456 mile long Northeast Railroad Corridor (NEC) from Washington, D.C. to Boston, Massachusetts. In Massachusetts, the corridor runs approximately 38 miles from South Station in Boston to Pawtucket, Rhode Island, in Norfolk, Suffolk and Bristol Counties. The study relied almost exclusively on documentary and interview sources with field reconnaissance limited to windshield car survey in some areas. A total of 247 archaeologically sensitive zones were identified along the entire route of which 105 were considered historically sensitive and 145 sensitive for prehistoric resources. A total of 31 sensitive zones (historic and pre-historic) were located in Massachusetts.

25-1534 Strauss, Alan E.

1995 Addendum to: Intensive Archaeological Survey of Lot 76 Marshview Lane in Brewster, Massachusetts. 5 pages.

This addendum summarizes additional intensive archaeological investigations implemented to evaluate additional impact areas for a proposed project originally reported earlier in 1995 (see Report #25-1431). Additional impact areas included planting areas A-D of which plantings A and B were determined to potentially impact prehistoric cultural resources found during the earlier sur-

vey. Additional testing did recover Native American cultural material associated with the Demetras Site, which appears to be a Late Archaic and Woodland Period (ca. 5,000-1,000 B.P.) short term habitation site. While additional investigations provide further information on the nature of Native American land use at this site, the site is not considered to be eligible for listing in the National Register of Historic Places because of low density and low diversity of material. As a result, no further archaeological investigations were recommended.

25-1535 Spencer-Wood, Suzanne

1980 Archaeological Investigation of Part of The Hard & Court Estate. 2 pages.

This brief memorandum summarizes the results of archaeological investigations for a 2 to 3 acre roadway within a 30 acre housing development at the Hard & Court Estate in Andover. Archaeological investigations included assessments of 14 backhoe pits excavated in the center of the roadway at approximately 75 foot intervals from the lakeshore to the access road. Examination of the backhoe pit stratigraphy and a screened sample of the backhoe pit back dirt failed to locate any cultural resources. The roadway was determined to have a low probability for locating archaeological sites, however, the remaining area of the 30 acre housing development was thought to be archaeologically sensitive and recommended for a survey.

25-1536 Hoffman, Curtiss

1990 Charlestown Meadows Site, Westborough, Massachusetts, Archaeological Data Recovery Program, 1988-1990, Management Summary. 72 pages.

This report is a summary description of data recovery operations undertaken from 1988 through 1990. The report describes the site in terms of its geological setting and previous excavation history. It presents the research objectives which were developed for the data recovery operation, and details the field methodology used. Results of excavation obtained to date are presented, along with interpretive conclusions and recommendations for the unexcavated portions of the site. Radiocarbon dates and diagnostic artifacts indicate the site as multicomponent containing Middle Archaic, Late Archaic, Transitional Archaic and possible Middle Woodland components containing lithics and concentrations of features. This report will be followed by more detailed study (see Report #25-1537) of the recoveries from the data recovery operation at such time as the various analyses involved are complete.

25-1537 Hoffman, Curtiss and Tonya Largy

1989 Archaeological Investigation at Charlestown Meadows. 87 pages.

This report includes seven archaeological studies conducted for the Charlestown Meadows Site in Westborough, between 1980 and 1988. The report was submitted as part of an Environmental Notification Form in order to summarize archaeological work performed to date at the site and to document how the development plan is sensitive to the additional surveys which are proposed. Six of the studies, mainly field session summaries, were prepared by Curtiss Hoffman. One study which analyzes the site botanical remains was written by Tonya Largy.

25-1538 Garman, James C. and Patricia Fragola

1996 Technical Report, Intensive (Locational) Archaeological Survey of the National Amusements Project Area and Site Examinations of the Showcase 1, Showcase 2, Showcase 4, and Draper Farm Sites, North Attleborough, Massachusetts. 132 pages.

This report summarizes the results of two phases of archaeological investigations at the 22.5-acre project area. The intensive (locational) survey located five Native American sites (Showcase 1 through 5), and the Draper Farm Site, an elite agricultural complex with evidence of occupation

from 1772 to the present. Site examinations of Showcase 1, 2, and 4 and the Draper Farm Site have provided additional data concerning 7,000 years of human occupation of the Sevenmile River drainage. The Showcase 1 Site has proven to be an extensive lithic workshop of unidentified temporal or cultural association. Although the site contains a relatively high density of Attleboro Red Felsite chipping debris, no diagnostic artifacts or archaeological features were identified after two phases of investigations. No further archaeological investigation was recommended for Showcase 1. The Showcase 2 Site is likely to have been a series of small temporary campsites at which some degree of lithic reduction occurred. The site has demonstrated a relatively low density of chipping debris; furthermore, it has yielded neither diagnostic artifacts nor archaeological features after two phases of investigation. No further archaeological investigation was recommended for Showcase 2. The Showcase 4 Site appears to have been a small lithic workshop associated with people of the Laurentian Tradition of the Late Archaic (5500 to 4000 years before present). The presence of five complete Brewerton projectile points in a relatively small, concentrated area suggests strongly that this is an intact, potentially single-component site that can answer questions abut medium-distance travel to source areas, lithic reduction, and patterns of exchange during the Late Archaic. Since the site has yielded and can continue to yield information important to the study of prehistory, it appears to be eligible for listing in the National Register of Historic Places. If the site cannot be avoided, a data recovery was recommended. The Draper Farm Site contains standing structures, foundations and intact archaeological deposits, the most extensive of which is a sheet-refuse midden deposited inside the foundation of the Stephen Draper House. Other features, associated with particular occupants in the site's 220-year history, have contributed to interpretations of both yeoman and elite lives at different periods of Bristol County's history. If the site cannot be avoided, a data recovery was recommended. A related complex of foundations, structural features, and a cemetery are located outside the project area on the west bank of the Sevenmile River. In order to protect these resources, it was recommended that the foundations be capped with clean fill and posted to avoid further looting of intact archaeological deposits.

25-1539 Boire, Kerrylynn and Suzanne G. Cherau

1996 Intensive Archaeological Survey, MCI Shirley Correctional Facility Expansion Project, Shirley and Lancaster, Massachusetts. 132 pages.

The survey consisted of archival research and subsurface testing. The project is located within the Shirley Shaker Village Historic District which is listed in the National Register of Historic Places. Due to the proximity of the Nashua River and well-drained sandy soils, it was expected that prehistoric resources would be located in intact portions of the project area. Historic period resources were expected to be primarily associated with the Shaker occupation from ca. 1792-1908. One prehistoric find spot consisting of a single piece of quartz chipping debris was identified within the project area during the survey. The find spot was not assessed as a potentially important archaeological resource. Historic archaeological remains identified during the survey consisted of late 18th- through 20th-century domestic and construction-related artifacts. The majority of these materials was recovered as low to moderate density field debris encountered throughout the project area. Despite their probable affiliation with the Shaker occupation of the site, the field scatter of artifacts did not represent a potentially important archaeological source. One Shaker-related historic dump site was identified during the intensive survey, located on the east side of Harvard Road. The dump site has the potential to address research questions relating to 19th-century patterns of Shaker refuse disposal in north central Massachusetts. Avoidance or further archaeological research was recommended for this site area. One historic foundation of unknown temporal and cultural affiliation was identified just outside the western boundary of the project area. Testing within the project area to the immediate east side of the foundation did not identify any potentially important archaeological deposits or historic landscape features. No testing was conducted within or to the north, west, and south side of the foundation due to its location outside of the proposed parking lot impact area. Since the foundation may be of Shaker origin, avoidance or further archaeological research was recommended. Due to its proximity to the limit of proposed construction, protection measures during construction activities were recommended.

25-1540 Donta, Christopher L., Mitchell T. Mulholland, and Richard D. Holmes

1996 Archaeological Site Examination of the Mohawk Meadows West Prehistoric Site, Greenfield, Massachusetts. 63 pages.

A survey was conducted at the Mohawk Meadows West Prehistoric Site (19-FR-250) as part of a proposed water pollution control outfall pipe project (see also Report #25-1479). The survey investigated an area thought to be a part of a Native American cemetery excavated by Smith College Professor Harris Hawthorne Wilder and Amherst College Professor Ralph Wheaton Whipple in 1916. The study concluded that the burial ground found in 1916 is some 200 m north of the project area, but that the project area had a high potential to contain human burials. Subsurface testing revealed a Late Woodland prehistoric site with a Levanna projectile point and mica and quartz tempered pottery. This is a locus of prehistoric occupation within the greater site 19-FR-250 which covers most of Mohawk Meadows. Seventeen of the 75 shovel test pits and all six 1 m x 1 m excavation units were found to contain prehistoric material. Pottery was restricted to the northern portions of the survey area nearest the Deerfield River. Lithic material, including quartz and gray chert, was recovered throughout the site, with the highest density occurring on the slope on the southern side of the hill overlooking the Green and Deerfield Rivers. One pit feature was recovered but no evidence of human burials was encountered during this study. This portion of site 19-FR-250 has integrity, and has the potential to contribute information of importance to archaeology. Thus, the site appears to be eligible for inclusion in the National and State Registers of Historic Places. The route of Outfall Pipe Alignment E is located in the southernmost part of the corridor, and is in the area least likely to impact the documented prehistoric site. However, given the deep soils of the confluence of the Green and Deerfield Rivers it is likely that earlier occupations and perhaps human burials lie deeply buried. It was recommended that archaeologists monitor a trench excavated by backhoe to detect deeply buried prehistoric sites.

25-1541 Donta, Christopher L. and Mitchell T. Mulholland

1995 Archaeological Site Examination of the Otter River Knoll Site, Gardner, Massachusetts. 53 pages.

A survey was conducted at the site of the proposed wellhouse associated with the Kendall and Snake Pond Water and Sewer System Improvements project. The area investigated consisted of a 30 m x 30 m block proposed as the location for a wellhouse, which lies on a terrace and small knoll overlooking the Otter River in western Gardner. Seventy-four shovel test pits (STPs) and four 1 m x 1 m excavation units were placed in and around the proposed building site in order to look at the context, integrity, age, structure and size of the Otter River Knoll prehistoric site. This site was first identified during the initial survey for the is project in June, 1995 (see Report #25-1471). In total, 21 STPs and all four other excavation units contained prehistoric material. Soils were found to be almost entirely undisturbed, consisting of a typical forest profile. Artifacts recovered numbered 139 specimens, all lithics. Two diagnostic pieces were found, both fragments of a Small-Stemmed projectile point which date to approximately 5,300-2,800 years ago. Artifact density was patchy, consisting of a low density scatter over the general area, with a few small concentrations of moderated density. No definite cultural features were found at the site.

25-1542 Donta, Christopher L. and Thomas L. Arcuti

1996 Archaeological Site Locational Survey for the Myrtle Street Bridge Replacement Project, Millis and Norfolk, Massachusetts. 56 pages.

Background research determined that the project area was used primarily for agriculture and grazing until the early 19th century. Manufacturing technology then became important in the region, and the towns began to grow. Two prehistoric sites are recorded in the vicinity, one of which (19-NF-51) includes the project area. The project consisted of the testing of three areas,

totaling 17 shovel test pits (STPs). Eight STPs were excavated in Survey Unit 1, which is located on the south side of the Charles River, on the west side of Myrtle Street. No artifacts or features were found here. Survey Unit 2 is located on the north side of the Charles River, on the east side of Myrtle Street. Six STPs were excavated here, five of which contained historic artifacts This survey unit lies directly across the street from the Captain Joshua Partridge House, which reportedly dates to the year 1734. Survey Unit 3 is located just south of Survey Unit 2, still on the north side of the Charles River. Three STPs were excavated here. No artifacts or features were found. No further survey was recommended.

25-1543 Fragola, Patricia and Ann Davin

1996 Reconnaissance Archaeological Survey Wastewater Facility Plan, Wachusett Reservoir Watershed (MDC No. WM93-001-SIA, MHC No. 8798), Holden and West Boylston, Massachusetts. 62 pages.

The wastewater project will develop 12 cross-country routes and 23 pump station locations, to eliminate sources of potential contamination to the Wachusett Reservoir watershed. The project area is located in the Blackstone River drainage, a section of central Massachusetts that is considered highly sensitive for archaeological resources. Background research indicated that the project areas were highly sensitive due to the presence of archaeological resources in the vicinity. Field investigations consisted of a walkover survey with limited subsurface testing. During the walkover survey the project area was ranked according to the potential for archaeological resources to be present. This sensitivity assessment was made on the basis of a number of environmental criteria. Subsurface testing was conducted within the project areas having high potential to contain archaeological deposits. A total of nine 50 cm x 50 cm test pits was excavated. No prehistoric cultural material was recovered. One redware ceramic sherd and one iron wire nail were recovered. The low density of historic material recovered does not represent potentially significant cultural resources No additional archaeological investigations were recommended.

25-1544 Ritchie, Duncan and Nicole Missio

1996 Archaeological Data Recovery Program at the Salem Neck Sewerage Plant Site (19-ES-471), Salem, Massachusetts. 209 pages.

The data recovery program was designed to mitigate the impact of proposed construction of a secondary sewage treatment plant planned by the South Essex Sewerage District. The Salem Neck Sewerage Plant Site contained a multicomponent Archaic and Woodland period shell midden site that had been studied during previous reconnaissance, intensive survey, and site examination level investigations completed in 1991 and 1992. The research design for the data recovery program consisted of a set of questions relevant to prehistoric settlement patterns, subsistence/diet, site formation processes, lithic and ceramic technology, and burial features in shell middens. The data recovery program was also expected to contribute information related to two regional scale themes: the effect of shellfish exploitation on Middle/Late Woodland period subsistence and settlement, and the role of marine resource use in adoption of horticulture by Late Woodland populations. Excavations completed during the data recovery provided a ten percent sample of the site area. A substantial amount of archaeological data consisting of assemblages of lithic and faunal material, shellfish remains, and ceramic vessel sherds was collected from the site and analyzed. A Late Archaic Susquehanna Tradition component formed the earliest occupation on the site and was radiocarbon dated to 3,800 BP. This component contained diagnostic Atlantic projectile points, point preforms, and other tools associated with several lithic workshop loci and hearth features. Sampling of shell midden deposits associated with a Middle/Late Woodland period component uncovered a range of hearth and pit (ash pit, refuse pit) features. Radiocarbon dates obtained from features in this component ranged from 1,345 to 1,095 BP. Analyses of the species composition of midden deposits showed that occupants of the site collected mostly soft-shell clam and mussel from shellfish beds near the site. Faunal remains recovered from the midden and feature contexts on the site also indicated that intensive processing of fish (e.g., cod, sea bass)

took place at this location. Terrestrial species hunted by prehistoric groups using the site included deer, raccoon, and bear. Specialized studies carried out as part of the data recovery program included petrographic and geochemical analysis of lithic material (felsite) and palynological analysis of soils from shell midden contexts. The data recovery program on the Salem Neck Sewerage Plant Site yielded categories of information that will make a contribution to current knowledge of prehistoric settlement in the coastal zone.

25-1545 Herbster, Holly and Suzanne G. Cherou

1996 Intensive (Locational) Archaeological Survey Acushnet Golf Course, Acushnet, Massachusetts. 152 pages.

A reconnaissance and intensive archaeological survey was conducted in Acushnet, Massachusetts. The Acushnet Golf Course project area borders and includes a section of the Acushnet River and several tributary streams. It encompasses approximately 293 acres including former cranberry bogs and several large gravel pits. The archaeological investigations consisted of background research and subsurface testing to identify potentially significant archaeological deposits that may be affected by proposed project impacts. Background research consisted of a review of known and expected Native American and historic resources within and surrounding the project area. Due to the proximity of the Acushnet River and well-drained sandy soils, it was expected that Native American archaeological deposits would be located in intact portions of the project areas. Historic period resources were expected to be primarily associated with documented industrial activities along the river. Three pre-Contact Native American sites were identified within the project area during the intensive survey. These site areas were designated the Spinning Wheel, Spikey Pine (Loci 1 and 2), and Sleeping Toad sites. Recovered cultural materials consisted of moderate densities of lithic chipping debris and chipped stone tool fragments, as well as calcined animal bone from cultural features. The Sleeping Toad and Spikey Pine sites were occupied during the Late Archaic Period, evidenced by the presence of diagnostic Small Stemmed and Squibnocket Triangle projectile points and associated quartz chipping debris assemblages. The Spinning Wheel Site contained a predominance of quartz chipping debris, suggesting a similar Late Archaic occupation. The cultural material assemblages recovered to date at the three site areas indicates that a number of activities occurred within the project area during the prehistoric period. These include the manufacture and maintenance of chipped stone tools as well as food preparation and disposal. The identification of lithic tools and cultural features (possible hearth, trash pits) indicates a potential for these sites to provide important information relating to settlement patterns and subsistence systems along this section of the Acushnet River drainage. These sites represent potentially significant archaeological resources that may be eligible to the National Register of Historic Places. Avoidance or additional archaeological investigations at all three site areas was recommended. Seven historic archaeological site areas were identified through documentary research and field investigations within the project area. Three of the sites (HS-1, HS-3, and HS-4) are related to 19th-century industrial activities along the Acushnet River. The remaining four sites (HS-2, HS-5 through 7) are associated with 19th-century rural domestic and agricultural land use in this section of Acushnet. Field investigations at HS-1 through 4 were limited but provided enough information to suggest that they have the potential to address research questions relating to historic socioeconomic developments in the town. Due to the potential for National Register eligibility, avoidance or further research of these four historic site areas was recommended. Additional intensive survey field testing was recommended at HS-5 through 7 in the northern part of the project area. This testing is needed to determine the presence and potential significance of any archaeological deposits associated with these documented historic site areas. Three standing structures are present in the easternmost part of the project area bordering Main Street (known as Lot 11). The yard areas surrounding these structures will need subsurface testing to determine the presence and potential significance of any associated archaeological deposits.

25-1546 Strauss, Alan E.

1996 Intensive Archaeological Survey of the MWRA Walnut Hill Water Treatment Facilities, Marlborough, Northborough, and Southborough, Massachusetts. 47 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area. Field investigations included a surface inspection, followed by the excavation of 120 shovel test pits within the proposed clearwell and wetland replication area. The shovel testing produced a total of 177 pieces of chipping debris and two stone tools including a Late Archaic Genesee-Like Point (ca. 5,000-3,000 BP) and a quartzite biface. Two prehistoric sites were identified during the archaeological investigations. The Old Stony Brook Site, located in the vicinity of Test Pit 14, contained primarily quartz and quartzite chipping debris. This site most likely represents an activity area where stone tools were being manufactured from locally available cobbles. The second site, the Crane Swamp Site, located in the vicinity of Test Pit 60, contained a high density of felsite and some chert debitage, also indicative of stone tool manufacturing. It was recommended that a site examination be conducted in the vicinity of Test Pits 14 and 60 because the sites are potentially significant for National Register nomination under Criterion D. No cultural remains were recovered from the wetland replication area.

25-1547 Mahlstedt Thomas F.

1996 Belle Isle Marsh Reservation Proposed Boardwalk Impact to Historic Resources, East Boston, Massachusetts. 12 pages.

After a review of a similar assessment for a salt marsh restoration project by the Army Corps of Engineers, it was determined that the construction of the proposed boardwalk and observation deck would not impact any significant historic or archaeological resources. An unidentified wooden pen-like enclosure is located to the south of an earthen berm, approximately 75 m from the boardwalk, so it should not be damaged or otherwise affected by the project. The project area itself was a low-lying tidal marsh, with historic development occurring first on the hill to the west (present day Orient Heights) and later on Beachmont and Youngs Hill, to the north. It was recommended that the project be allowed to proceed without further archaeological study.

25-1548 Dudek, Martin

1996 Archaeological Site Examination at the Franklin Marshes Site, Revere, Massachusetts. 72 pages.

A site examination of the Franklin Marshes Site (19-SU-62) was performed in advance of a proposed natural-gas pipeline. The site sits on an eastern ledge terrace that projects from a larger hill composed primarily of volcanic outcroppings that extend throughout the project area and west of the pipeline corridor. The ledges are formed by outcrops of Lynn volcanics, primarily felsites, that rise roughly 25 ft above marshlands that extend east of the pipeline corridor. The site examination consisted of 18 bracketed shovel test pits and three excavation units. In all, 629 prehistoric artifacts were recovered, bringing the total number of prehistoric artifacts from Franklin Marshes to 815. The 629 artifacts consisted of 626 pieces of chipped stone and three rough stone artifacts. This testing defined two separate and distinctive site clusters within the boundaries of the Franklin Marshes site set by the intensive survey. Area A, located on a higher terrace or ledge, contained a lithic chipping station almost exclusively of gray felsite. The area contains densely clustered debitage at two distinct locations, encompassing an area of no more than 200 sq. m. A total of 341 artifacts was recovered; the assemblage was composed of 339 pieces of chipping debris, a utilized cobble, and a possible plummet or grooved stone. No diagnostic artifacts were recovered. Area B, downslope on a lower terrace ledge south of Cluster A, contained more dispersed lithic debris and tools of a probable encampment and lithic chipping station where local maroon felsite predominated the assemblage. Cluster B encompassed an area of about 600 sq. m. A total of 474 artifacts was recovered, comprising 467 pieces of chipping debris, six partial or intact bifaces, and a ground-stone fragment. Two mending biface fragments formed an intact unfinished point that has been identified as an Archaic stemmed variety, most

likely a Middle Archaic Neville-Variant or Late Archaic Small Stemmed point, the only diagnostic artifact recovered. Two pit features containing charcoal were located in the two excavation units in Cluster B. They were both in areas of dense lithic debitage and lacked historic material. However, radiocarbon determinations from the features have yielded historic dates. The Franklin Marshes site, despite some localized disturbances, is at least 95% intact. It has integrity and contains unambiguous spatial patterns related to at least two episodes of prehistoric tool making activities, with at least one episode dating to the Archaic period. The site is considered significant for answering research questions related to preferential lithic procurement and reduction strategies in southern edge of the Lynn volcanics, and for its significance to the history of Revere as the only identified prehistoric site that is in a presently known location and in a well preserved state. The current routing of the proposed pipeline will entirely remove the most significant portion of the site and directly impact the remainder. Because of the integrity, diversity, and research significance of the Franklin Marshes site, site avoidance by the proposed pipeline was recommended. If the site cannot be avoided, then a data-recovery program was recommended for the site prior to the commencement of pipeline installation at the site.

25-1549 Putnam, Barbara, Michael Roberts, Paul Pollard, Kate April, and Daniel Mandell.

1996 Reconnaissance Archaeological Survey and Traditional Cultural Properties Consultation for Proposed Improvements of the Ski Area Mt. Wachusett, Westminster/Princeton, Massachusetts. 93 pages.

Documentary research was conducted at state and local archives and knowledgeable individuals were interviewed. In addition, there was a walkover survey. This research revealed the existence of 16 historic/archaeological resources within the Mt. Wachusett State Reservation. These include 13 historic period resources, two prehistoric resources and two zones of high archaeological potential which are expected to contain significant Prehistoric/Contact period resources. Analysis of the proposed project in relation to the known or expected resources led to recommendations for site evaluation of the “Old Indian Trail” and intensive survey of the summit component of the Old Indian Trail. An intensive survey was also recommended in the base lodge area where construction activities will occur at the Base Lodge, the Skier Facilities building and the expansion of parking lot #3. In addition, the Mt. Wachusett area was the stronghold of King Philip and his allies for much of King Philip’s War. As such, it may be eligible for inclusion in the National Register of Historic Places under Criterion A and/or B. Accordingly, a site evaluation of the mountain itself was recommended to determine its significance under this criterion. The results of the documentary research and interview indicate that native people in southern New England regard Mt. Wachusett as a sacred place. The mountain is, to some of the native nations in southern New England, the traditional source of power and is central to their existence as a people. While this study demonstrated the fact that the mountain and its resources are of concern to Native American groups, it did not identify individual Traditional Cultural properties that may be impacted by the proposed project.

25-1550 Donta, Christopher L. and Thomas L. Arcuti

1995 Archaeological Site Locational Survey for the Bridgewater Public Golf Course, Bridgewater, Massachusetts. 60 pages.

The project consisted of the testing of two large areas, totaling 248 shovel test pits(STP’s). Test pit intervals were generally 7.5 m. In Survey Unit 1, which is located on the north side of Spruce Street, 140 STPs were excavated. A prehistoric site, the Dirty Pond Site, was found in the northeastern portion of the survey unit, in the vicinity of wetlands associated with a small pond to the north. Most of the effort in Survey Unit 1 was concentrated around the site, where four prehistoric artifacts and a burn feature were found. Survey Unit 2 is located on the south side of Spruce Street, and 108 STPs were excavated here. Much of the eastern portion of Survey Unit 2 was disturbed. A single prehistoric artifact was found on the ground surface in the western portion of this survey unit. Subsurface testing turned up no further cultural material in this location. Two

alternatives were recommended for the Dirty Pond Site: a) a site examination should be conducted to determine whether or not the site is eligible for inclusion in the National and State Registers of Historic Places; or b) a site preservation plan should be established with the Massachusetts Historical Commission with an agreement to avoid impacts to the site during planned construction or currently unplanned future land alteration.

25-1551 Edens, Christopher

1996 Archaeological Intensive Survey for the Proposed Parking Lot No. 3 Expansion, Mount Wachusett, Westminster and Princeton, Massachusetts. 41 pages.

As part of its plan to increase the capacity of the Mount Wachusett ski facility Wachusett Mountain Associates, Inc. intends to expand the existing Parking Lot No. 3 northward over a 90 m x 120 m area in Westminster. The survey consisted of systematic test pits along in transects at 10 m intervals, plus judgmental and bracketing test pits. The testing amounted to 25 shovel test pits. The testing recovered seven quartz flakes and three pieces of quartz shatter, defining a very small site, perhaps no more than 5-8 m across, at the western edge of the expansion parcel. Although the intensity of testing provided reasonable assurance of site integrity, boundaries, contents, and structure, it was recommended that several excavation units should be placed in the site to confirm its ephemeral nature. The Massachusetts Historical Commission concluded that no further archaeological investigation of the parking area was required, given the nature of the site and the adequacy of the test sample already obtained.

25-1552 Holmes, Richard D., Christopher L. Donta, and Mitchell T. Mulholland.

1995 Archaeological Site Locational Survey and Site Examination of Three Sites, Route 66 Highway Improvement Project, Northampton, Massachusetts. 178 pages.

Archaeologically sensitive areas of the Route 66 project were tested with 375 shovel test pits. Two prehistoric sites, a prehistoric findspot and three historic archaeological sites were discovered. One prehistoric and two historic sites were subjected to site examination. The Kingsley Tavern Site contains 19th-century structural remains. The Connor House Site is a 19th-century residence site; a prehistoric Woodland-period site was found here during site examination. The King-West Prehistoric Site is located on a small terrace that contained two projectile points, probably dating to the Late Archaic period. Two smaller sites, the North Branch Prehistoric Find Spot and the Phelps Historic Site, were investigated. The Kingsley Tavern Site and Connor House Prehistoric Site may be eligible for the National Register of Historic Places; avoidance was recommended. If the Kingsley site cannot be avoided, data recovery was recommended. Additional site examination was recommended for the Connor Prehistoric Site. No further survey was recommended for the historic component of the Connor House Site because of a lack of research potential. Low artifact density and the absence of features makes King-West Site appear ineligible for the National Register, and no further survey was recommended. No further survey was recommended for the North Branch Prehistoric Findspot, or Phelps Historic Site.

25-1553 Cherau, Suzanne G. and Beth P. Miller

1995 Intensive Archaeological Survey, Army Materials Technology Laboratory, Watertown, Massachusetts. 108 pages.

Subsurface testing at the Army Materials Technology Laboratory (AMTL) (Watertown Arsenal) focused on three testable areas that were identified as possessing moderate to high sensitivity for prehistoric archaeological resources and a moderate potential for the presence of historic archaeological resources. These sensitive areas consist of the Northwest Investigative Area, a rectangular-shaped section of land under pavement in the northwest quadrant of AMTL; the Central Investigative Area, a grassy and landscaped portion of land in the vicinity of the Commanding Officer's House (Building 111); and the Southeast Investigative Area, the strip of

land known as MDC Parcel situated between the Charles River and North Beacon Street. A total of 12 acres was tested with shovel test pits and test trenches. No archaeological resources were identified in the Northwest and Southeast Investigative Areas. In the Northwest Investigative Area this was due to the presence of military-related fill deposits and underground utility easements which have obscured and truncated the natural and historic soil horizons that would have contained evidence of the four documented historic sites. In the Southeast Investigative Area the absence of potentially important archaeological resources was due to the presence of modern fill deposits used to even out the ground surface for the parkland setting. The fill extends to the water table at depths up to five feet. Deeply buried (at depths greater than five feet) prehistoric resources may be present in this portion of the AMTL facility. One prehistoric site and one historic site were identified in the Central Investigative Area as a result of subsurface testing. The prehistoric site, designated Watertown Arsenal West, contains evidence of stone tool manufacture and maintenance as well as food procurement and processing. Diagnostic artifacts indicated and occupation associated with the Watertown Phase of the Transitional Archaic Period. A wide variety of lithic material types suggests earlier and later site occupations during the Archaic and Woodland periods. Avoidance of this site area was recommended, or additional archaeological investigations would be needed to determine its eligibility to the National Register. The historic site is associated with the mid-19th- to 20th-century farming activities and occupation of the ca. 1851 Commanding Officer's House (Building 111) at the Arsenal. A moderate density of domestic and structural debris was collected as sheet refuse and in historic orchard/plowzone areas. No dense refuse deposits, such as trash pits or middens, were located during subsurface testing. The historic materials were not assessed as potentially eligible to the National Register. No further archaeological investigation of the historic site was recommended. Subsurface testing in the Central Investigative Area verified the presence of a partially buried brick walkway associated with the Olmsted Landscape designed in 1919 and executed beginning in 1920. The identified prehistoric site is situated within the boundaries of the Olmsted Landscape at the AMTL facility. This landscape has been determined to be a contributing element in the Watertown Arsenal Historic District, a district eligible for listing in the National Register.

25-1554 Strauss, Alan E.

1996 Intensive Archaeological Survey of the Rowean Parcel, 182 South Street, Medfield, Massachusetts. 49 pages

Field investigations for the project included a surface inspection, followed by the excavation of 33 shovel test pits within the proposed houselot. The shovel testing produced a total of 344 pieces of chipping debris and seven stone tools including a Middle Archaic Neville-like point (ca. 8,000-6,000 BP), a Late Archaic Small Triangle point (ca. 5,000-3,000 BP), an untyped point, three broken bifaces, and a felsite end scraper. Numerous fragments of calcined animal bone were found throughout the project area particularly in the B horizon. One prehistoric subsurface feature was identified at a depth of 50 cm below the surface. The feature was recognized by a dark black soil stain with numerous fragments of calcined animal bone. The feature was not excavated at this level of investigation. A site examination was recommended for three specific zones (Zones A, B, and C) within the project area. Zones A, B, and C are the locations where artifacts were found beneath the plowzone in good archaeological context. The remaining portions of the project area, while they did contain artifacts, had extensively disturbed soil from percolation tests and house and road construction; no further archaeological work was recommended for those areas. The prehistoric site or sites within Zones A, B, and C are potentially eligible for nomination to the National Register because they may provide important data for understanding the prehistory of Medfield and New England in general.

25-1555 Pierce, Carolyn A. and Leonard W. Loparto

1995 Draft Reconnaissance Level Archaeological Survey for the Proposed MMWEC Natural Gas Pipeline, Towns of Wilbraham, Hampden, and Ludlow, Hampden County, Massachusetts. 112

pages.

The survey included background research, interviews, and limited subsurface testing along the 14.13 mi (22.74 km) pipeline route. The potential integrity of all locales along the route and archaeologically sensitive areas were identified. Thirty-one archaeologically sensitive areas were identified, accounting for 7.21 mi (11.60 km) or 51% of the total route. Each area was sensitive for prehistoric resources based on locational criteria including favorable slope, drainage, proximity to perennial wetland resources, and integrity. One area was also considered to be sensitive for historic period remains based on the location of unidentified structural remains immediately outside the existing electric easement. An intensive archaeological survey was recommended.

25-1556 Strauss, Alan E.

1996 Intensive Archaeological Survey of the Riverview School Expansion in Sandwich, Massachusetts. 42 pages.

Background research indicated one recorded prehistoric site was situated in or near the project area. Field investigations for the project included a field reconnaissance, followed by the excavation of shovel test pits within the project area. The field reconnaissance resulted in the identification of one prehistoric site that contained surface quartz debitage. An historical barn foundation was also identified. There were also two 19th-century houses on the property. Subsurface testing was conducted in those portions of the project area that were considered archaeologically sensitive. A total of 55 shovel test pits was excavated. A low density of quartz and felsite debitage was identified in one portion of the project area. A second site was found which contained quartz debitage and a quartz Small Triangle point (Late Archaic ca. 5,000-3,000 BP). No significant historical deposits were recovered. The prehistoric sites represent limited activity areas where tools were manufactured or sharpened. Because of the low density of prehistoric artifacts, lack of tools, and absence of subsurface features, it is believed that the two sites identified are not eligible for National Register nomination. No further archaeological work was recommended.

25-1557 Clements, Joyce M.

1996 Report of Reconnaissance and a Phase I Intensive (Locational) Archaeological Survey, Woodcliff Hills Residential Subdivision, Medfield, MA. 65 pages.

Documentary research, field observations, and subsurface excavations indicated that historic period activity within the subdivision was limited to subtle terrain modifications resulting from tree harvesting, pond drainage, and stream channelization. A theoretical model of prehistoric site locations based on wetland research indicated high archaeological potential within portions of the project area. Subsurface investigations validated this model as archaeologists located five prehistoric sites within the proposed subdivision. Four of the five sites were clustered around the margins of Wetland C, three were within 50 ft of the existing wetland margin. One of the four sites associated with Wetland C appeared concentrated in a zone approximately 20 to 26 m (65 to 85 ft) from the wetland. The fifth site consisted of a single find spot where archaeologists excavated an Archaic Notched projectile point approximately 29 m (87 ft) from Wetland B. Prehistoric cultural material excavated from these sites consisted of two projectile points and quartz and felsite flakes and angular shatter. No prehistoric features were encountered during Phase I investigations. The nature of the artifacts indicates that these sites are activity areas associated with tool manufacture and/or repair. The location of the sites suggests expeditious tool production in order to exploit food resources within and at the margins of wetlands. Further archaeological investigation of sites located around Wetland C will not be conducted because three of the sites are within an existing ‘no build’ zone. A ‘no build’ zone will be established around the fourth site in the vicinity of Wetland C. The fifth site, located at the margins of Wetland B, will not be further evaluated because 31 bracketing and systematic shovel test pits excavated around this wetland produced no additional cultural material. While no further

subsurface excavations will be conducted, a series of conditions were recommended in order to protect existing sites within the wetland buffer zone from construction impacts.

25-1558 Begley, William and Suzanne G. Cherau

1996 Intensive(Locational) Archaeological Survey, Proposed Walmart Store, Halifax, Massachusetts. 73 pages.

The 23 acre project area, currently used for growing and selling agricultural products, is located on the northern side of the intersection of Plymouth Street (Route 106) and Monponsett Street (Rout 58). The survey consisted of archival research and subsurface testing in intact archaeologically sensitive areas to identify potentially significant archaeological deposits that may be affected by proposed project impacts. One prehistoric find spot was identified within the project area during the intensive survey. This find spot consists of the surface recovery of a single projectile point fragment in the western portion of the project area. Subsurface testing conducted as part of the survey failed to recover any related subsurface deposits (artifacts, features). This absence of below-ground prehistoric materials indicates a poor degree of site integrity and lack of potentially significant archaeological resources within the project area. Historic archaeological remains identified during the intensive survey were limited to a low density of 20th-century field debris. These materials were attributed to the nursery-related land use of the property and were recovered from a well-developed plowzone horizon. They were not considered to represent a potentially significant archaeological resource. No further archaeological investigation was recommended.

25-1559 Garman, James C. and William Begley

1996 Intensive (Locational) Archaeological Survey, Bridgewater Correctional Complex Emergency Housing Project, Bridgewater, Massachusetts. 37 pages.

This report, which serves as the final summary for all archaeological research conducted to date, reviews research conducted concerning the history of burial at the site, describes the goal and methodology of the survey, and provides recommendations concerning further work at the site. Excavation of five machine-assisted trenches in the east yard of the SDP Treatment Center indicated that cutting and filling of the yard had impacted interments. However, three locations on or adjacent to the site were known to contain human burials: the presumed site of secondary interment, located at the northern end of the Treatment Center; the area between the southern Treatment Center perimeter and the Mental Hospital; and the area across the driveway east of the Treatment Center, where human burials were first discovered in a steam trench in 1981 (see Reports #25-367 and 25-410). While no further survey was recommended for the project area, it was recommended that future construction activity on the site should include testing to determine the presence or absence of burials. A second recommendation concerned the original state farm and prison ledgers, stored in Warren House at the Bridgewater Correctional Complex. These ledgers, which represent irreplaceable documentation for the 19th-century history of the complex, are currently stacked in a closet. To ensure the protection of the documents, it was recommended that they be moved to a central location, preferably the Massachusetts State Archives, for further conservation and curation.

25-1560 Hoffman, Curtiss

1996 Hooper Street Parking Lot, Bridgewater State College, Bridgewater, Massachusetts, Archaeological Intensive Survey. 99 pages.

This report summarizes a locational archaeological survey conducted for a proposed parking facility on the east side of Hooper Street, between Plymouth Street (Route 104) to the north and the grounds of the Campus School of Bridgewater State College to the south. The property included an area measuring approximately 10,000 sq. ft. The study included background research and test excavation. Prehistoric artifacts recovered included flake scatters and casual tools

discovered in the plowzone. Because of poor integrity and low artifact density, the project area was determined to contain no significant prehistoric resources. Considerable evidence for historic land use of the property during the development of lower middle class suburban neighborhoods in the late 19th to early 20th century was recovered. The same information, however, would be readily obtainable from documentary records and examination of structures of this period which are still extant in the same neighborhood. No further archaeological testing was recommended.

25-1561 Clements, Joyce M.

1996 Report of a Phase I Intensive (Locational) Survey, Mason Road Reconstruction, Palmer, MA. 55 pages.

The project area is approximately 2,000 ft (667 m) x 60 ft (18 m). Potential impacts were associated with the removal of existing culverts, construction of subdrains and manholes, alteration to drainage slope, and resurfacing and leveling of the existing road. The survey included background research and subsurface testing. During the survey archaeologists found no prehistoric cultural material, but found evidence of historic period archaeological sites in two portions of the project area. One site contains the 18th-century Deacon Samuel Shaw/Alpheus Converse Homestead while the second is the 19th-century Deacon Hiram Converse Homestead. Project engineers will erect high visibility fencing around the Deacon Samuel Shaw/Alpheus Converse Homestead, and will alter the limit of slope and confine all construction activities south of existing stone fences in the area of the Hiram Converse Homestead in order to mitigate impacts to these sites. Project engineers also offered to hold pre-construction conferences to guarantee these guidelines were understood and followed by the project contractor. Construction procedures are thus unlikely to impact historical or archaeological sites associated with the project area. It was recommended that the project proceed as planned without further archaeological evaluations.

25-1562 Tritsch, Electa Kane

1996 Developing an Archaeological Sensitivity Map for Your Town. 20 pages.

This study is a “How To” report for archaeological sensitivity mapping prepared for the Archaeological Advisory Committee of the Medfield Historical Commission. The report includes an introduction to locating sites and the mapping process, then detailed discussions of predictive criteria and sources for both prehistoric and historic site identification. A separate chapter on evaluation site disturbance is also included. The final chapter discusses the end product (map) of the study and steps which should be taken to operationalize the results including field investigation by a professional archaeologist, evaluation, registration of the map with the MHC and different governmental/educational groups which could make use of the results.

25-1563 Fragola, Patricia and Ann Davin

1996 Results of the Reconnaissance Archaeological Survey, Jug End State Reservation and Wildlife Management Area, Egremont, Massachusetts. 56 pages.

The MHC determined that the former Jug End resort contained the potential for intact archaeological resources associated with the prehistoric and early historic Native American and Dutch occupation of Egremont to be present. The 1,158 acre project area currently contains 18th- and 19th-century farm buildings, 20th-century resort buildings and recreation areas, orchards, woods, mountains, and meadows. Fenton Brook, a tributary of the Housatonic River, flows south to north through the project area. The survey assessed the archaeological sensitivity of the project area. The Guilder Homestead and May House areas were determined to have high historic archaeological sensitivity. The main resort complex area, on both sides of Jug End Road and Fenton Brook, were assessed as having low sensitivity. Areas that exhibited favorable environmental settings but along the edges of developed or landscaped areas were ranked as having moderate potential. The potential of these terrace areas was also affected by soil drainage,

amount of cobbles, and extent of level area. Wetlands, uplands with slopes greater than eight percent, and other areas where resort construction had occurred were ranked as having low potential for cultural resources. No prehistoric or historic materials were located during the walkover inspection of the project area. A search of background literature also disclosed no reports of prehistoric sites located on the property. An intensive locational archaeological survey was recommended for moderate and high sensitivity areas where project impacts may occur.

25-1564 Hautaniemi, Susan and Rita Reinke

1996 Archaeological Site Locational Survey for the Proposed Curatorial Facility, Historic Deerfield, Inc. 60 pages.

This study presents the results of a survey for a proposed curatorial facility in Deerfield, Massachusetts. In the field, 138 shovel test pits(STPs) were laid out and 133 were excavated in three separate survey areas. Area 1 lay in and adjacent to the currently cultivated cornfield and is the location for the proposed facility itself. Sixty-seven STPs were excavated in Area 1. Area 2, which will contain the proposed parking and access routes into the facility, was tested with 47 STPs. Area 3, a possible construction access route, will not be used, and was not tested. Area 4, the utility access corridor, was tested with the remaining 18 STPs. No discrete prehistoric or historic period features were discovered. A large area of 20th-century filling, and a separate area of plow zone within, and extending north from, the cornfield was noted. A total of 2,024 Native and Euro American artifacts were recovered. Most of these were recovered from fill. No further archaeological testing was recommended under the current construction plans. However, if the utility corridor is moved, it was recommended that the new corridor be tested.

25-1565 Strauss, Alan E.

1996 Intensive Archaeological Survey of the Proposed New Main Post Office in Hanover, Massachusetts. 34 pages.

The project area is located at the intersection of Routes 53 and 139 in Hanover near Iron Mine Brook. Background research indicated that numerous prehistoric sites were located in the immediate and general project vicinity and that a house and chicken coop, built in the 1940s, once stood on the property. The field reconnaissance identified the stone foundation of a porch from the previous home that stood on the property. The historical resources did not appear to represent potentially significant cultural remains. Two prehistoric flakes were also recovered from the surface. Thirty shovel test pits were excavated in the impact area. Three quartz rough cores were recovered from the project area as were felsite and quartz flakes. No diagnostic artifacts, tools, subsurface features, or pottery were found in the project area, which exhibited a plowzone and disturbance. The site is believed to represent a small activity area where stone tools were manufactured and may be associated with the adjacent two prehistoric sites 19-PL-749 and -750. Because of the lack of subsurface features, archaeological integrity, diagnostic tools, and low research potential, the site is believed not to be eligible for National Register nomination. No further archaeological investigations were recommended.

25-1566 Donta, Christopher L. and Richard D. Holmes

1994 An Archaeological Site Locational Survey for the Water Disinfection System, Acton, Massachusetts. 43 pages.

The project area consisted of an approximately 460 sq. m (5,000 sq. ft) construction site and a 200 m (660 ft) access road. These two locations had a high potential for prehistoric or historic cultural resources. Twenty-six shovel test pits were excavated. No prehistoric artifacts or features were found. No historic artifacts were recovered. A single historic quarry pit was documented outside the project area; it will not be impacted by the proposed construction. This pit is probably related to remains previously reported in MHC Site #ACT-HA-1. No further investigations were

recommended.

25-1567 Strauss, Alan E.

1996 Intensive Archaeological Survey of the Herreman Houselot, Martha's Vineyard in Chilmark, Massachusetts. 70 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area, although prehistoric sites were located in various similar settings in the nearby area. Field investigations for the project included a surface inspection, followed by the excavation of 20 shovel test pits within the proposed houselot. Following shovel testing, a backhoe was used to strip the plowzone away in order to expose soil stains and evidence of human burials and subsurface features. The shovel testing produced a total of 72 pieces of chipping debris and one bifacial tool fragment. No features or diagnostic artifacts were found as a result of the subsurface testing. Machine stripping of the plowzone revealed the presence of four soil stains and one prehistoric pit feature; no human burials were identified. The soil stains were very shallow and contained few prehistoric artifacts. They most likely represent the base of prehistoric refuse pits. The pit feature contained numerous prehistoric artifacts including exterior corded pottery sherds, broken projectile points, a triangular point, a stemmed point, preserved animal, bird, and fish bone, bone tools, chipping debris, a hammerstone, datable charcoal, and marine shells. The feature was excavated in quadrants and all of the shell from the west half was collected. In addition, bulk samples were recovered for analysis. Based on the ceramics, Feature 1 can be relatively dated to the late Middle Woodland or early Late Woodland period (ca. 1,300 to 1,000 BP). Bulk samples were sifted through fine mesh and resulted in the recovery of two possible carbonized maize kernels, a carbonized hickory nut, a possible carbonized walnut fragment, and numerous small flakes and fragments of pottery and bone. A single, isolated fragment of a human tooth was also identified in the fine-screen samples. Analytical results from the study of the materials will be provided as an addendum to this report. While the data from Feature 1 are very important and will surely add to our understanding of prehistoric lifeways, little else is important about the overall site. Because the overall site is not eligible for National Register nomination due to low research potential, and because the soil stains and Feature 1 have been excavated and the contexts removed, no further archaeological investigations were recommended.

25-1568 Dwyer, Alison

1995 Reconnaissance and Intensive Archaeological Survey of Great Brook Farm State Park, Carlisle, Massachusetts. 114 pages.

The project was divided into two phases. The first phase consisted of developing a predictive model of historic and prehistoric land use in the park. Through background research and a walkover of the park a map was generated that identified areas of high, medium and low archaeological potential. The second phase of the project consisted of establishing the nature of previously identified prehistoric and historic sites within the park through limited subsurface testing and interviews with Native Americans. The results of this work were used to verify and refine the predictive model and to assist in the establishment of resource planning and management plans. The work conducted indicates that numerous intact archaeological sites and at least two important Native American areas are contained within the park boundaries.

25-1569 Rainey, Mary Lynne and Alan Leveillee

1996 Archaeological Reconnaissance Survey, Boston Edison Company Right-of-Way Line 274-509 Rebuild Project Area, Medway, Holliston, and Sherborn, Massachusetts. 67 pages.

The total project area included approximately 9.5 mi of an existing 250-foot wide Right-of-Way. The survey classified the project area into zones of differing archaeological sensitivity. Zones of high, moderate, and low archaeological sensitivity exist within the proposed construction Right-

of-Way. Additional archaeological investigations including subsurface testing were recommended at specific locations of proposed new structures within areas identified as having a moderate-to-high sensitivity.

25-1570 Donta, Christopher L., Thomas L. Arcuti, and Mitchell T. Mulholland

1996 Archaeological Site Locational Survey for the Proposed Wastewater Collection, Treatment, and Disposal System, West Island, Fairhaven, Massachusetts. 60 pages.

The proposed project consisted of the construction of a wastewater treatment facility, a forcemain route, and a wastewater disposal field. Background research determined that no prehistoric archaeological sites had been recorded in the vicinity of the project area. Historic information indicated that the area was undeveloped or served mainly agricultural purposes until late in the 19th century. The project consisted of the testing of three survey units, totaling 90 shovel test pits (STPs). These consisted of the proposed wastewater treatment facility (survey unit 1:9 STPs), the force main (survey unit 2:37 STPs), and the disposal field (survey unit 3:44 STPs). No significant prehistoric or historic resources were found. No further survey was recommended.

25-1571 Begley, William and Alan Leveillee

1996 Intensive Archaeological Survey, Wrentham Village Premium Outlet, Wrentham, Massachusetts. 54 pages.

The project, located on a 102-acre parcel, consisted of a retail development complex including a 500,000 sq. ft. retail outlet center, with 3,300 parking spaces and associated access drives, drainage, and grading and roadway improvements. The survey consisted of archival research and subsurface testing to identify potentially significant archaeological deposits that may be affected by proposed project impacts. The Wrentham Village Premium Outlets project area was the subject of a 1993 site visit by a Massachusetts Historical Commission archaeologist. At that time, members of the Wrentham Historical Commission pointed out the remains of a fieldstone structure that was then designated as historic site WRE-HA-1. The walkover survey conducted as a part of the 1996 survey indicated that the historic feature still existed within the project area despite ongoing gravel removal operations. Although gravel removal operations had caused severe disturbance to an estimated 80 acres of the project area, the walkover survey identified areas of moderate sensitivity for prehistoric archaeological resources. The portion of the project area containing WRE-HA-1 was considered an area of high sensitivity for historic resources to be present. Subsurface testing was conducted in areas considered to have the highest archaeological sensitivity. The subsurface testing failed to locate any archaeological deposits within the project area. The previously recorded historic period site, WRE-HA-1, was documented and subsurface testing was completed within and around the feature. No significant archaeological deposits were recovered in association with this feature. Since no significant Native American or historic period deposits were discovered within the project area, no additional archaeological investigation was recommended.

25-1572 Strauss, Alan E.

1995 Intensive Archaeological Survey of the Proposed Old Colony YMCA Additions and Ballfield in Middleborough, Massachusetts and Phase II Archaeological Site Examination. 54 pages.

Chapter I of this report presents the results of the intensive survey. Chapter II presents the results of the site examination. Background research indicated that prehistoric chipping debris and a scraper were found in the general project vicinity. Field investigations identified two prehistoric site loci. Locus A consisted of a moderate to high density lithic workshop that was dated to the Middle Woodland period (ca. 1,800-1,300 BP) based on Lanceolate Point forms. Locus A was undisturbed by agricultural plowing. Locus B consisted of a low density of chipping debris within

a plowed context. No further archaeological work was recommended for Locus B. A site examination was recommended for Locus A. Seven 1 m x 1 m units and one 60 cm x 60 cm unit were excavated at Locus A. Five hundred pieces of prehistoric debitage and five projectile points were found. Two Middle Woodland Lanceolate Points were recovered as was one Late Archaic Susquehanna-like Point. The site at Locus A is believed to be a Middle Woodland lithic workshop with a minor Late Archaic component. No subsurface features or datable charcoal were identified. The lack of a variety of tools, internal site complexity, and absence of features suggest that the site is not eligible for National Register nomination. No further archaeological investigations were recommended.

25-1573 Putnam, Barbara

1996 Intensive Archaeological Survey for the Proposed Student Center, Boston College Chestnut Hill Campus. 75 pages.

A survey was conducted of the Chestnut Hill Campus of Boston College in Newton. As the area had been filled during the development of this section of the campus, five backhoe trenches were excavated in the landscaped area north of McElroy Commons to search for evidence of prehistoric, Colonial or Federal period occupations of the project area. As a result of the survey, a thinly distributed scatter of 18th- through 19th-century ceramics and a 19th-century drainage pipe were recovered. The area proved to have been extensively disturbed and no further testing was recommended.

25-1574 Fragola, Patricia

1996 Reconnaissance Archaeological Survey, Massachusetts Military Reservation Facilities Upgrade, Cape Cod, Massachusetts. 67 pages.

Previous archaeological surveys conducted within the Massachusetts Military Reservation in Bourne have identified several prehistoric Native American sites and find spots indicating this area is highly sensitive for archaeological resources (see Reports #25-929, 25-1175, and 25-1210). A walkover survey was conducted to rank proposed facility upgrade locations according to the potential for archaeological resources to be present. Two project areas were assessed as having high potential to contain archaeological resources. One area was assessed as having moderate potential to contain archaeological resources. An intensive (locational) survey was recommended for these areas. The remainder of the proposed facility upgrade locations was assessed as having low potential to contain archaeological resources.

25-1575 Fuchs, Adam J.

1994 Documentary Survey and Inventory of Historical Archaeological Resources on the Prescott Peninsula, Quabbin Reservoir. Volume I, 109 pages; Volume II, 756 pages.

Documentary research and a preliminary inventory of historical archaeological resources was conducted for the Prescott Peninsula section of the Quabbin Reservoir in New Salem. The inventory was prepared as a pilot study for the Metropolitan District Commission's Division of Watershed Management to assist the MDC in managing its archaeological resources. The primary goal of the project was to generate an inventory of potential historical archaeological resources within the study area based on available documentary sources. Additional goals were to perform a limited field reconnaissance and to prepare management recommendations for the protection of the identified resources. The study discusses the historical archaeological resources of the Prescott Peninsula and their research potential. The agrarian, industrial, commercial, civic, and religious resources of the study area are detailed. The potential threats and previous impacts to these resources, including logging practices, are addressed. A summary of the data sources consulted for the inventory is presented, including historical maps, MDC property acquisition files, and documentary sources. The inventory describes the history of the study area from the prehistoric period

to the creation of the reservoir with particular attention to the former towns of Greenwich, Enfield, and Prescott. The inventory generated 174 site forms for potential historical resources within the study area. A preliminary field reconnaissance was conducted of approximately 30 percent of the sites included in the inventory in order to test the information from various data sources. The location, general condition of the sites, and their existing surface features were investigated. It was determined that a majority of the sites that were shown on the 1927 real estate plans appear to be disturbed by bulldozing. Previously undocumented sites were also discovered during the field reconnaissance. Management recommendations for the study area are divided into protection, summary of threats, inventory recommendations, coordination with the GIS program, and recommendations for future work. Recommendations include suggestions for improving the inventory, integrating data with the MDC's existing GIS program, and a more intensive investigation of the study area. Volume I presents the overall results of the study with Volume II containing the archaeological site forms.

25-1576 Herbster, Holly, Suzanne G. Cherau, and Virginia Adams

1995 Intensive (Locational) Archaeological Survey, Walmart Project, Plymouth, Massachusetts. 125 pages.

The proposed project area is located on a 12.7 acre parcel of land within the former Plymouth Cordage Company (PCC) manufacturing complex in North Plymouth. The project area contains a previously documented prehistoric shell midden site (19-PL-787) within or immediately adjacent to the project area, as well as the potential for historic resources. The survey included background and documentary research along with subsurface testing. A total of 84 shovel test pits and four machine-assisted trenches was excavated. Two areas of prehistoric deposits and one historic site area were identified within the project area. A large shell midden feature and associated artifact assemblage were identified in the far western portion of the project area. These materials and feature are associated with site 19-PL-787. An additional area of prehistoric activity, Locus 1, interpreted as a locus of the main site and midden area, was identified to the immediate south. This area is separated from the main site by artificial land disturbance associated with the PCC occupation. Diagnostic material recovered within and/or associated with the shell midden include a quartz Levanna projectile point, decorated aboriginal ceramic sherds, bone and a bone awl, groundstone tools, and chipping debris. Based on the assemblage and the previously recovered data, the occupation at 19-PL-787 dates to the Woodland Period (3,000-450 BP). 19-PL-787 and Locus 1 represent a potentially significant prehistoric archaeological resource given its age, content, and good physical integrity. The site is potentially eligible to the National Register under Criteria A and D. Avoidance of this site area as delineated through additional subsurface testing was recommended. The site is potentially eligible to the National Register under Criteria A and D. The stone foundation of the former PCC brick headhouse (1893) was identified through machine trenching in an area presently paved for parking. A small section of the north foundation wall and an internal brick dividing wall were encountered in one of the trenches. No other subsurface remains of company buildings were identified. A sheet refuse deposit associated with the company’s historic period land use was also identified during fieldwork. Due to the extensive documentary record that exists for the PCC, particularly the brick headhouse structural and internal lay-out plans, and a lack of undocumented archaeological features, no additional archaeological investigation of the historic archaeological resources was recommended. The cultural resource survey also included an historic building photodocumentation of the seven former PCC buildings proposed to be demolished or removed. Black and white photographs of these buildings were submitted, along with an accompanying keyed site plan These photographs supplement the existing information on the former PCC complex in the MHC’s and Plymouth Historic District Commission’s survey files.

25-1577 Wheeler, Kathleen and Joyce Clements

1996 Results of Reconnaissance Survey of the Locke Family Tomb, Winchester, Massachusetts.

50 pages.

A survey was conducted of an abandoned family tomb located on property proposed to be developed as a residential subdivision. The objective was to ascertain the presence or absence of human remains within the tomb and from the areas surrounding the tomb. Research consisted of background research, a walkover survey, and limited data collection at the tomb site. The tomb was found to be associated with the Locke family, where three brothers lived in closed proximity to one another in the 19th century. Data were conflicting about the identity of those who may have been interred within the tomb until archaeologists found a memorial stone said to have come from the tomb site. Two names are listed on the slate stone, indicating that Josiah Locke, Jr., and his daughter, Mary Locke Fowle, were buried in the family mausoleum in 1818 and 1835, respectively. Upon inspection of the tomb and the ground surrounding it, human bone was found, and a special permit was granted to recover it. The human remains consisted of small bones (primarily phalanges) left behind after grave robbing. Additional evidence of desecration of the tomb was noted in the abundance of vandals' trash and the caved-in brick opening of the tomb. Archaeologists recommended two alternatives. The first was to leave the tomb and its contents untouched. The second was for archaeologists to remove all human bone and associated artifacts to be reinterred, where the incidence of vandalism may be minimized.

25-1578 Macpherson, Jennifer

1996 Intensive (Locational) Archaeological Survey, Millennium Study Project, Charlton, Massachusetts. 84 pages.

The survey included background research, fieldwork, and laboratory analysis. Fieldwork involved a walkover survey and subsurface testing of 50 cm x 50 cm shovel test pits. Two historic cultural resources and no prehistoric cultural resources were identified. The first historic resource consists of remnants related to the Philips Mill, a 19th-century grist and fulling mill that had remained active until 1938. Spillways, fieldstone ramps and earthworks associated with the mill were identified in the southeastern portion of the project area, on both sides of Cady Brook. The second historic resource, designated Historic Site 1, consists of a fieldstone-lined cellar hole, two smaller depressions, a series of stone walls and historic Bigelow Road. Subsurface testing located additional historic cultural materials dating from the 18th and 19th centuries. The Philips Mill Site and the Sherwood Farmstead are located outside the areas of proposed impact. Therefore, no subsurface testing was conducted in these areas. Historic Site 1 is within an area that may be impacted by construction of a proposed gas line. As a planning element of the proposed development, additional fieldwork and background research was recommended at the site examination level to evaluate this site.

25-1579 Davin, Ann, Holly Herbster, Virginia Adams, and Maureen A. Cavanaugh

1994 Historic and Archaeological Reconnaissance/Inventory Survey, Cultural Resource Management Plan, Cape Cod Canal. 235 pages.

The primary goal of the survey in Bourne, Sandwich, and Wareham, Massachusetts, was to locate, identify, and provide and inventory of cultural resources within the U.S. Army Corps of Engineers' Cape Cod Canal property. Another goal of the survey was to assist the Corps in fulfilling its legal obligations under Section 110 of the National Historic Preservation Act. This involved the preparation of a cultural resource management plan which includes recommendations for the management of the prehistoric and historic archaeological resources within the Canal property and provides recommendations for further survey of historic buildings, sites, structures, and objects. The survey included background research on the prehistory, history, and environmental setting of the canal area. Information on known sites in and adjacent to the Canal property was collected to assess the potential for additional sites to be present and to develop predictive statements concerning their location, age, and function. Information on the historical development of the towns included in the canal area was collected for the periods prior to and

following canal construction. This information was used to develop a preliminary sensitivity assessment to determine where subsurface testing should be conducted. A total of 230 acres was ranked as being archaeologically sensitive during the preliminary assessment. A total of 337, 50 cm x 50 cm test pits was excavated in these areas during the inventory survey. Prehistoric cultural material was recovered in four areas on the canal property. A total of 101 pieces of lithic material was found along with shell, calcined bone, and charcoal fragments in 40 test pits. Historic period materials were found scattered in seven different locations and consisted of 70 artifacts collected in 27 test pits. With the exception of the two prehistoric sites on Hog Island, the majority of these archaeological deposits were located in small intact areas surrounded by disturbed soils. Historic materials consisted of structural and domestic materials. The sensitivity assessment of the Cape Cod Canal project area was amended to reflect the results of the subsurface testing. The survey of the historic buildings, sites, structures, and objects was restricted to a windshield survey for the purpose of preparing recommendations for additional survey. The survey identified 55 buildings, sites, structures, and objects, 21 of which are 50 years or older. Fifteen of these properties have not been comprehensively documented and evaluated for eligibility for inclusion in the National Register. The Corps currently has no plans to construct facilities in the areas identified as containing cultural resources. Subsurface testing identified the limits of most of the intact areas along the canal. One site located in a disturbed context is not considered significant and no additional research was recommended. The prehistoric sites on Hog Island, Sagamore Hill, and Herring Run may represent significant resources, and if future plans for construction occur in this area then additional testing in the form of a site examination was recommended. A comprehensive study and evaluation of the remaining 15 historic properties was also recommended.

25-1580 Holmes, Richard D., Mitchell T. Mulholland, and Christopher L. Donta

1994 Archaeological Reconnaissance Survey for the Proposed Treatment Plant Site, Effluent Disposal Site, and Collection Systems, Oak Bluffs and Tisbury, Massachusetts. 60 pages.

Nine proposed construction areas were assessed for prehistoric and historic archaeological potential on the bases of a walkover and background research. Proposed plans included portions of the Vincent Site (19-DK-21) and the head of the Lagoon Site (19-DK-115). Both sites are prehistoric. Other proposed areas of proposed impact were within the glacial outwash plain of Martha’s Vineyard, which is not well known archaeologically. Recommendations were made for subsurface testing in areas having a potential to contain historic or prehistoric sites.

25-1581 Donta, Christopher L. and Thomas L. Arcuti

1996 Archaeological Locational Survey at the Woodbridge and Jenkins Family Cemetery, Andover, Massachusetts. 41 pages.

A proposed residential subdivision construction area included a small family cemetery with a number of standing gravestones, dating between 1805 and 1853. This survey was initiated in order to determine whether or not unmarked graves exist in the cemetery, and, if so, the boundaries of the cemetery. Background research determined that five graves of the Jenkins family were moved to another cemetery in 1882. However, little documentation existed regarding the history of these families and the use of this cemetery. The project consisted of three phases of testing: 1) an initial phase in which the cemetery was cleared, mapped, and checked for additional monuments; 2) hand excavation of three trenches in the immediate vicinity of the standing gravestones; 3) backhoe excavations around the perimeter of the cemetery to look for possible additional gravesites. Eleven probable graveshafts were identified around the six standing headstones, with another six probable graveshafts found without markers. Boundaries for the cemetery were determined accordingly.

25-1582 Hall, Wes, Barbara Putnam, Chris Edens, and Martin Dudek

1996 Cultural Resource Survey of the Proposed Artificial Fish Reef, Sculpin Ledge Channel,

Boston Harbor, Massachusetts. 29 pages.

The Massachusetts Highway Department is using Spectacle Island as a dump site for excavated sediments from the Central Artery/Tunnel Project, with the resulting loss of approximately 1.6 acres of subtidal habitat. Various federal and state permitting agencies (U. S. Army Corps of Engineers; Massachusetts Department of Environmental Protection; and Massachusetts Office of Coastal Zone Management) require the construction of an 88, 000 sq. ft. fish reef in compensation of the lost ecological habitat. A seven acre underwater site off Sculpin Ledge, near Spectacle and Long Islands in Boston Harbor has been selected as the location for this artificial reef. Prior to the implementation of the fish reef plan, an archaeological reconnaissance survey was undertaken to detect any cultural resources at the proposed reef location. Background documentary research revealed no recorded historic shipwrecks in the Sculpin Ledge site. However, the area had not been dredged or otherwise extensively disturbed for channel maintenance, and the project area was considered sensitive to contain shipwrecks or other submerged cultural properties. Weston Geophysical, Inc., of Northboro, MA., carried out a side-scan sonar and marine magnetometer survey of the project area, under the supervision of an underwater archaeologist. Although this survey did detect multiple acoustical features and minor magnetic anomalies in the project area, none of these is consistent with the signature of a shipwreck or other potentially significant cultural feature. The proposed fish reef replacement project will have no effect on cultural resources and therefore may proceed as planned.

25-1583 Johnson, William F. et al.

1996 Documentation and Description of the Stopcock Chamber at Thomas Park/Dorchester Heights, Boston National Historic Park, Massachusetts. 14 pages.

During construction work at Thomas Park on Dorchester Heights in the fall of 1995, a brick chamber with a wrought-iron lid was uncovered. The chamber was found to contain two cast iron water pipes and two large cast-iron gate valves associated with the long-defunct South Boston Reservoir, part of the original Cochituate Water Supply System for the City of Boston. This reservoir was used primarily as an auxiliary reservoir until being taken out of active service about 1872. Research indicated that the chamber probably dated from 1848, and contained a 20 inch diameter influent-effluent pipe and valve and a 12 inch diameter drain pipe and valve. The valves were most probably made by the Boston Machinery Company of Boston. The chamber originally had a wooden floor, and showed signs of having been rebuilt at some time since installation and before being totally abandoned with the building of South Boston High School in 1899. Very similar valves can be seen in small chambers in front of the Brookline Distribution Chamber in the City of Brookline.

25-1584 Clemens, Joyce M.

1996 Preliminary Report of a Reconnaissance Archaeological Survey, Town Well No. 9, Canton, Massachusetts. 25 pages.

This report presents information gathered from documentary research. a project area walkover and a telephone interview with a local historian, undertaken as part of an archaeological reconnaissance survey of the Town Well No. 9 project in the Fowl Meadow of Canton. Examination of the site files at the Massachusetts Historical Commission identified ten prehistoric archaeological sites within 2,000 m of the project area. Sites dated from the Paleo-Indian period (19-NF-70) to the Late Woodland (e.g. 19-NF-156) and included the potentially significant multi-component Fowl Meadow site (19-NF-266). Because most of the proposed water well facilities were located within a wetland zone, archaeological investigations isolated smaller components within the project area for further evaluation. Investigations focused on undisturbed upland zones to determine whether any part of the new construction area was intact and archaeologically sensitive. Evidence of project area disturbance was gathered through walkover visual inspection. Results of the project area walkover indicated low archaeological potential within the area that will be impacted during the

proposed construction, which will take place largely within previously disturbed locations. Based on these results archaeologists recommend no further investigation prior to construction of the Town Well No.9 project.

25-1585 Garman, James C.

1996 Intensive(Locational) Archaeological Survey, New Elementary School Project. 68 pages.

An intensive (locational) archaeological survey was completed of a proposed New Elementary School in Beverly. The purpose of the intensive survey was to determine the presence or absence of Native American and EuroAmerican archaeological sites. This report details the objectives, methodologies and results of the intensive survey and serves as the final summary for all archaeological research conducted in the project area. Subsurface testing was conducted primarily in the zone of moderate archaeological sensitivity to identify any potentially important archaeological resources. This included excavation of a total of 40 test pits: 26 in two blocks (Blocks 1 and 2) and 14 in two transects (Transects A and B). The intensive archaeological survey of the New Elementary School project suggests that the USMC Gardens Site (19-ES-455), identified in proximity to the project area in the 1920s, is either outside the current project bounds or destroyed. A single flake found near an obliterated house foundation derived from a post-demolition fill. It is likely that the fill used to cover the house foundation in the early 1960s came from an archaeological site. However, the low density of artifacts from the 1982, 1983, and 1996 surveys, the lack of undisturbed stratigraphic context, and the absence of archaeological features or temporally diagnostic artifacts all render the site ineligible for inclusion in the National Register of Historic Places. The house foundation itself, built between 1907 and 1913 and occupied until the early 1960s, has been destroyed by demolition and filling activities. Archaeological survey around the foundation did not identify significant trash deposits or other archaeological features. Given the absence of sites identified during the intensive survey, no further archaeological survey is recommended for the New Elementary School Project area.

25-1586 Ritchie, Duncan

1996 Intensive(Locational) Archaeological Survey, Dighton Power Project. 116 pages.

A reconnaissance and intensive archaeological survey was completed of the proposed location of the Dighton Power Associates, LP, project in Dighton. The project is located on undeveloped land between the lower Taunton and Segreganset rivers within a known core area of prehistoric period settlement. The project area was also within a locus of late seventeenth and eighteenth century EuroAmerican period settlement in the town of Dighton. It included part of an eighteenth century farmstead (Fisher/Baylies House) and land formerly used for agriculture. The reconnaissance survey indicated that a majority of the project area was archaeologically sensitive and had a high probability to contain prehistoric cultural resources. Sections of the project with high expected archaeological sensitivity had locational attributes typically associated with prehistoric sites specifically, well-drained, sandy subsoils on level terrain in close proximity to a riverine environmental zone. A section of a proposed access road into the project area also had the potential to contain historic period archaeological deposits or features associated with the eighteenth-century farmstead. The intensive survey resulted in the identification of one prehistoric site and two small loci or findspots of prehistoric cultural material. The Fisher/Baylies Loci 1 and 2 both consisted of a few pieces of non-diagnostic chipping debris found in the eastern half of the project area. The River Bend Site is located along the Segreganset River in the western end of the project area. A single non-diagnostic bifacial tool blade of rhyolite was found and the temporal/cultural affiliation of this site is unknown. However, the range of lithic materials found as chipping debris, including Braintree slate, felsite, and argillite, suggests that the site contains several Archaic and Woodland period components. A small sample of historic period cultural material consisting of brick and ceramics was found during the intensive survey. The find consisted of brick and ceramics from a secondary depositional context of field trash. Neither the Fisher/Baylies Loci 1 and 2 sites are considered to be potentially significant cultural resources. No further archaeological investigation

of these loci is recommended. Additional archaeological investigation at the site examination level is recommended for the River Bend Site to determine size, internal complexity, integrity, and temporal/cultural affiliation and to evaluate its potential significance and eligibility for listing on the National Register of Historic Places.

25-1587 Donohue-Putnam, Barbara

1996 Intensive Archaeological Survey, The Charlton Middle School, Charlton, Massachusetts. 34 pages.

An intensive (Locational) archaeological survey was conducted at the proposed site for the Charlton Middle School, located on a previously undeveloped wooded parcel south of the intersection of Mugget Hill and Oxford Roads between Bond and Partridge Hill Roads. The design for the school consists of the construction of a main building at the center of the plot, together with playing fields and a parking area to the south of the building. An access road will enter the facility from the intersection of Mugget Hill and Oxford Roads. A series of stone walls that cross the project area will be removed. An intensive survey showed that the area has been extensively disturbed throughout the historic period. It would appear that the early settlers of the property not only cleared the area for pasture but also extracted rocks from the property in order to build a series of stonewalls to internally divide the parcel. The southern section of the parcel has also been used for gravel extraction in the past. The recovery of one quartzite flake is yet another example of an isolated find in the area, probably associated with foraging activities. Due to the extremely low frequency of artifacts, no additional testing was recommended.

25-1588 Decima, Elena, Barbara Donohue-Putnam, Michael Roberts, Martin Dudek, and James Mambro

1996 Reconnaissance and Intensive Survey Report, Wastewater Treatment Facilities, Plymouth, Massachusetts. 106 pages.

Archaeological work was conducted in advance of proposed construction and improvements for additional wastewater facilities. The archaeological field work, which consisted of shovel test pits and a back-hoe trench, respectively, located at: 1) a low-density flake scatter classified as a lithic chipping station in Site A, which seems to be part of registered site 19-PL-137; and 2) a historic trash dump, probably related to the late nineteenth- and early twentieth-century occupation of the housing complex owned by the American Woolen Company. The reconnaissance and evaluation research conducted on the remaining sites identified areas of archaeological potential in Site 101 and evaluated the potential impacts of increased flows from the proposed facilities to historic resources at Russell Mill Pond, Hayden Mill Pond and Gilbert Trout Hatchery, making recommendations as to the materials and design of the improvements. The Gilbert Trout Hatchery was recommended for National Register listing at the local and state levels. No adverse impacts to the historic and archaeological resources for the hatchery area were identified beyond those caused by floods. A monitoring program was recommended to effectively identify, address and avoid unforeseeable impacts to the facilities to the site's historic and archaeological resources.

25-1589 Dudek, Martin and Barbara Putnam

1995 Archaeological Reconnaissance Survey of Central Artery/Tunnel, Boston, Massachusetts. Task Assignment No. 1, Crown Glassworks.

An archaeological reconnaissance survey was conducted on the Contos property, located in South Boston immediately northwest of the intersection of West Second Street and B Street. Historical maps and records of the property document a succession of early to mid-nineteenth century glass factories including the Boston Crown Glassworks, followed by other industries in the second half of the century. The reconnaissance survey documented sub-surface strata and buried cultural resources in the recovered split-spoon samples taken from geotechnical borings. Glass recovered from the borings include 586 pieces of slag, flat, bottle, and table glass and glass rods, chiefly

clear in color. Analysis of the strata and samples of glass from the borings and the property surface suggests that the southwestern portion of the property contains potentially significant archaeological resources. It is recommended that a site examination be conducted if the site is impacted by future work.

25-1590 Donta, Christopher L., Thomas L. Arcuti and Mitchell T. Mulholland

1996 Archaeological Site Locational Survey for the Proposed Wastewater Collection, Treatment, and Disposal System, West Island, Fairhaven, Massachusetts. 60 pages.

An archaeological site locational survey was conducted at the site of the proposed West Island wastewater project areas. The proposed project consists of the construction of a wastewater treatment facility, a forcemain route, and a wastewater disposal field. Background research determined that no prehistoric archaeological sites have been recorded in the vicinity of the project area. Historic information indicates that the area was undeveloped or served mainly agricultural purposes until late in the nineteenth century. Three survey units were tested totaling 90 shovel test pits(STPs). These consisted of the proposed wastewater treatment facility (survey unit 1: 9 STPs), the forcemain (survey unit 2: 37 STPs), and the disposal field (survey unit 3: 44 STPs). No significant prehistoric or historic resources were found. No further survey of the project area was recommended.

25-1591 Clements, Joyce M.

1997 Archaeological Evaluation of Construction Damage, the Abbott Site(BED-HA-4), Bedford, Massachusetts. 20 pages.

This report contains an evaluation of damage to a fieldstone well on the historic Abbott Site (BED-HA-4). A portion of the site was damaged during residential construction on an adjacent lot in the spring of 1996. Evaluation procedures consisted of documentary review, a pedestrian survey, surface collection of exposed artifacts, and hand excavation of the well interior. These procedures indicated that the damage was limited to the yardspace surrounding the well, while the well itself was virtually intact. Archaeologists therefore recommended that the impacted area must be topped with clean, sandy soil to isolate and protect the exposed cultural deposits, then covered with clean loam and seeded with native plants.

25-1592 see 25-1540

25-1593 see 25-1479

25-1594 Clements, Joyce M.

1997 Final Report of a Phase I Intensive(Locational) Survey, Marlborough Middle School. 65 pages.

The City of Marlborough is in the process of renovating and expanding the school which was originally constructed as the Marlborough High School in 1961. The Middle School is located within the general vicinity of the 6,000 acre Praying Indian Town of Okommakamesit which contained residences, planting fields and a burial ground. As part of the intensive survey archaeologists conducted documentary research, oral interviews, and systematic subsurface excavations. Field evaluations revealed intact historical surfaces ('Buried A' horizon) in Area A and undisturbed, natural stratigraphy in Area B. Prior to construction archaeologists will monitor machine assisted soil stripping to search for soil anomalies indicative of potential burials. This work is currently scheduled for 1997 or 1998 and a separate report of findings will be issued when that work has been completed.

25-1595 Garman, James C.

1996 Intensive(Locational) Archaeological Survey, United Shoe Manufacturing Corporation Redevelopment. 87 pages.

An intensive (locational) archaeological survey was completed of the former United Shoe Manufacturing Corporation (USMC) South Parcel in Beverly. Construction of a Super Stop & Shop is proposed on the abandoned industrial parcel. The purpose of the intensive survey was to determine the presence or absence of Native American and EuroAmerican archaeological sites. This report details the objectives, methodologies and results of the intensive survey, and serves as the final summary for all archaeological work completed on the project. A combination of machine trenches and 50 x 50 cm test pits to identify archaeological sites within the proposed development. The results of intensive survey testing indicate that extensive cutting and filling operations associated with nineteenth and twentieth-century industrial uses of the property have severely impacted any original land surfaces. No further archaeological survey is recommended for the USMC South Parcel. The survey identified a stone footing on top of a knoll north of the Drop Forge. Testing in the vicinity of the foundation revealed a thin scatter of late nineteenth and early twentieth-century trash. The structure associated with this footing may have been an outbuilding related to a nearby mill or temporary housing erected for USMC workers building the Drop Forge. Given the low density of artifacts and the absence of archaeological features, no further archaeological survey is recommended far the site. An earlier reconnaissance archaeological survey resulted in the identification of the remains of the John Friend Grist Mill (1647) in the tidal flat at the extreme northern end of the proposed development, outside the proposed buffer zone. Provided project plans do not change, no further archaeological survey of the John Friend Grist Mill is recommended.

25-1596 Strauss, Alan E.

1997 Intensive Archaeological Survey of Lot 47- Berkshire Trail Subdivision in Barnstable, Massachusetts. 37 pages.

An intensive archaeological survey was conducted of Lot 47 Berkshire Trail in West Barnstable. The project consisted of background research, field reconnaissance, and subsurface testing. Background data indicated that a possible Native American burial ground was located in or near the project area based on oral tradition and a surveyor's map from 1975. Extensive background research was conducted in order to determine the validity and origin of the burial map. An on-site inspection was made with Mr. Tysto Ranta, a local resident who knew of the actual location of the burial ground from his association with the previous landowners in the project vicinity. While Mr. Ranta established that the burial ground was located several hundred fret to the east of the project area, it was not certain that burials did not also exist in the nearby project area.The field reconnaissance indicated that about 3/4 of lot 47 contained a kettlehole. The northern quarter of the lot was considered to have a moderate potential for containing prehistoric cultural resources and human burials. The testable area was defined by a slight rise in the land; the surrounding area was low, in an old road, or disturbed by road construction within the Berkshire Trail development. Four parallel, north-south oriented, slit trenches were excavated across the small level rise in the northeast portion of the project area. The trenches were 50 cm wide and between about seven and nine meters long. Disturbance was identified in the northern end of the trenches, likely the result of the construction of Berkshire Trail and the grading and filling of a former depression in this location. No evidence of human burials was identified in the trenches which were excavated into the light colored B horizon soils. Quartz angular materials were found in Slit Trench 3 and it was believed that these were possibly of prehistoric origin. Two test pits were. excavated near Trench in hopes of finding additional bone fide prehistoric remains. Three glassy quartz prehistoric flakes were found in Test Pit 1. A fifth slit trench was excavated in a small level area between an old road and an existing kettlehole. Soils in this trench exhibited disturbance and indicated that the trench was actually on the downslope of the kettlehole. No cultural remains were recovered from the fifth trench and no burials were found. Because no human burials were found and the prehistoric site

that was identified is not eligible for National Register nomination, no further archaeological investigations are recommended for Lot 47-Berkshire Trail Subdivision.

25-1597 Loparto, Leonard W.

1997 Intensive Archaeological Survey of Parcel 21 off Owl Pond Road in Brewster, Massachusetts. 41 pages.

The survey was conducted for the proposed Tupper single family residence which included approximately 2.1 acres of upland(approximately 0.88 acres) and bog(approximately 1.22 acres). The survey focused on the upland area with an emphasis on the proposed house site. Much of the upland area was determined to be archaeologically sensitive because of its close proximity to the bogs, Vesper Pond and the presence of excessively drained soils on level to moderately sloping land surfaces. Background research indicated the archaeological sensitivity of the area for prehistoric resources and the location of several known sites in the area. Research indicated historic land use of the area probably dating to the 19th-century with cranberry cultivation of the bogs and swamps in the area. In spite of this potential and the excavation of twenty 50cm x 50cm test pits on the property, no evidence of prehistoric or historic resources was found. Field research also indicated a significant portion of the upland area of the property had been impacted by gravel pit excavation for construction and maintenance of the cranberry bogs. Existing vegetation on the house site and interviews with informants also indicate the house site area had been cleared in the recent past. As a result of the above information and the lack of cultural resources on the property, no further historical or archaeological research are recommended for the property.

25-1598 Hight, Shelly, F. Timothy Barker and Thomas L. Arcuti

1996 Archaeological Intensive(Locational) Survey for the South Hadley Square Development, South Hadley, Massachusetts. 93 pages.

An archaeological intensive (locational) survey was conducted at the site of the proposed South Hadley Square Development. A Massachusetts Historical Commission Area Form also was completed for the Oertel farm complex. Background research revealed that the Oertel House has been on the property since the mid-nineteenth century. Today there are seven standing buildings on the property, none of which have been determined to be eligible for inclusion in the State or National Registers of Historic Places. Most of the project area is open agricultural field, with several pieces of horse-drawn farm equipment in the eastern portion near the house and barn. Subsurface testing included 96 shovel test pits that were excavated over the property. Soils were sandy and very well-drained, and characterized by a well-developed plowzone. With the exception of an area surrounding a constructed farm pond in the eastern portion 6f the project area, the only disturbance evident was from agricultural pursuits. A thin scatter of nineteenth- and twentieth-century materials related to the Oertel farm was found throughout the project area. No prehistoric artifacts were found. No significant historic or prehistoric sites were found. No features were encountered. No further survey is recommended.

25-1599 Dwyer, Alison

1996 Intensive Archaeological Survey, Combined Sewer Overflow Abatement Program, Swift Street, Fall River, Massachusetts. 24 pages.

The city of Fall River is conducting a Combined Sewer Overflow Abatement Program. As part of this project, an area between Arnold and Swift streets will be disturbed. The project area is located just east of Mount Hope Bay, is adjacent to wetlands, and is located on level ground. Due to these physical characteristics, it was thought that the area had prehistoric potential and an intensive archaeological survey was conducted. However, no prehistoric artifacts were recovered in the test excavations, and only a scattering of twentieth century material was present. No additional work is recommended.

25-1600 Riess, Warren, Mitchell T. Mulholland and Christopher Donta

1997 Remote Sensing and Underwater Archaeological Survey, Hyannis Harbor Navigation Improvement Study, Barnstable and Yarmouth, Massachusetts. 94 pages.

Batelle Ocean Sciences, in affiliation with University of Massachusetts Archaeological Services and Ocean Surveys, Inc., conducted a background research study and remote sensing survey of a planned dredging area in Hyannis Harbor. Deposition of dredged materials on Dunbar Point and off-shore areas is unlikely to disturb the prehistoric site there because the area contained approximately 2.4 m (8 ft) of fill from past dredging operations. Past dredging operations and underwater turbulence have disturbed the bottom of the proposed channel and its immediate border. Thus, no further survey is recommended to search for the presence of prehistoric sites. Forty-one remote sensing targets, which are possible cultural resources, were detected during the remote sensing survey. Of these 41 targets, nine were determined to be either outside of the proposed impact area or within the previously dredged existing channel. The remaining 32 targets were the subject of an underwater archaeological survey. Thirty-one targets were examined; one target, Target 9, was not found. There were no indications of shipwrecks or other significant cultural resources at any of the target locations. None of the targets inspected during this survey had historical significance. No further survey to examine these targets is recommended. Conceivably, Target 9 could be buried below more than 1.2 m (4 ft) of sediment and could be part of a significant cultural resource. Care should be taken during dredging operations to ensure minimal damage to a possible site at that location.

25-1601 Begley, William and Mary Lynne Rainey

1997 Intensive Archaeological Survey, Boston Edison Company Right-of-Way Line 274-509 Rebuild Project Area, Medway, Holliston, and Sherborn, Massachusetts. 84 pages.

An intensive archaeological survey was conducted for the Boston Edison Line 274-509 Rebuild project area. The total project area includes approximately 9.5 miles of an existing 250-foot-wide right-of-way. A reconnaissance survey classified the project area into zones of differing archaeological sensitivity. Zones of high, moderate, and low archaeological sensitivity were determined to exist within the proposed construction right-of-way. Additional archaeological testing, including subsurface investigations, was recommended at structure-specific locations within areas identified as having a moderate-to-high probability to contain archaeological sites. Subsurface investigations were conducted as part of an intensive (locational) archaeological survey within areas that were ranked as highly and moderately sensitive to contain historic and prehistoric sites, based on results of the reconnaissance. The archaeological investigations conducted within the Boston Edison right-of-way indicate that no potentially significant prehistoric or historic resources will be affected by proposed construction impacts.

25-1602 Strauss, Alan E.

1996 Intensive Archaeological Survey of the Drummer Boy Property in Brewster, Massachusetts. 50 pages.

An intensive archaeological survey was conducted of the proposed Drummer Boy new facilities in the Town of Brewster. The project is slated for the construction of a playground, a building addition, septic facilities, parking areas, and general public use. Background research indicated that there was one recorded prehistoric site within or adjacent to the project area. Historical resources indicated that the area was used for farming and saltworks throughout the historical period. Field investigations consisted of a surface inspection of the entire project area followed by the excavation of 130 shovel test pits. Prehistoric artifacts were found scattered across the project area from the Drummer Boy gift shop to the far northern end of the property near Quivett Creek and the saltmarsh. Three diagnostic stone tools were recovered. These tools were small triangular projec-

tile points made of locally available quartz. The points are relatively dated to the Late Archaic or Early Woodland periods (ca. 5000-3000 B.P.). In addition to the points, several felsite broken bifaces and broken projectile points were found. A light scatter of felsite, quartz, and quartzite chipping debris was also recovered. A few flakes of non-locally available chert were also found. One sherd of sand-tempered pottery was recovered. The site appears to represent a series of low density lithic workshops; no evidence of habitation was found. Soil profiles in the project area exhibited deeply plowed topsoil horizons and areas that were disturbed through the removal of topsoil. Most artifacts were recovered from the plowzone layer. No prehistoric features were identified and no historical structures or foundations were found. Because of the poor archaeological integrity of the site, the low density of artifacts, the low variety of tool types, the lack of internal site complexity, and the absence of subsurface features, the project site is considered to have minimal research potential. Only one area, in the northern extent of the property, is believed to be potentially significant. This area contained several tools and relatively high densities of prehistoric debitage. Forty-three flakes were found in one shovel test pit and calcined animal bone was recovered. No further archaeological investigations are recommended for the project area. It was recommended that the site area in the northern end of the property be avoided. If avoidance is not possible, it is recommended that further archaeological investigations be conducted.

25-1603 Macpherson, Jennifer and James C. Garman

1996 Intensive (Locational) Archaeological Survey, Beverly Airport Industrial Roadway, Beverly, Massachusetts. 88 pages.

This report details the objectives, methodologies and results of the intensive survey of the Beverly Airport Industrial Park. A total of 98 test pits was excavated. Subsurface testing concentrated along the level terraces west of the Bass River, where two known Native American sites had been identified and recorded on MHC site files (Sites 19-ES-494 and 19-ES-527). Testing also focused on the upland knolls of Lots 1A and 1B, in the central portion of the project area. The survey identified one Native American archaeological site (the Fonzo Site), two Native American findspots, and one EuroAmerican cement slab. Archaeological survey of the Fonzo Site suggests that it represents a potentially-significant archaeological site. The presence of a rim sherd from a steatite vessel and the midsection and tip of a large projectile point suggests an occupation during the Susquehanna phase of the Transitional Archaic period. A diversity of lithic material used in the manufacture of stone tools in this area may indicate multiple occupations. Avoidance of the Fonzo Site is recommended. If the site cannot be avoided, a site examination survey to determine the site's boundaries, internal **c**onfiguration**,** complexity and eligibility for inclusion in the National Register of Historic Places was recommended.

25-1604 Fragola, Patricia S. and Duncan Ritchie

1997 Intensive Archaeological Survey, Crosby Corporate Center Buildings 7,8, and 9, Bedford, Massachusetts. 76 pages.

An intensive (locational) archaeological survey was completed of the proposed Crosby Corporate Center expansion project, within a 28.75 acre project area. The project area is located near the Shawsheen River. Subsurface testing within the proposed project area identified one low density Native American locus, Crosby Hill Locus 1, consisting of one felsite flake recovered from a deep fill deposit located along the Shawsheen River. This locus is considered to be an isolated find of Native American cultural material within a disturbed context. A high density of historic/modern period artifacts were also recovered from the fill deposit along the Shawsheen River, and a low density of historic/modern period artifacts were recovered throughout remaining portions of the project area. These historic/modern period artifacts were not associated with a historic period site or structure. No further archaeological investigations were recommended.

25-1605 Cherau, Suzanne G. and Beth P. Miller

1996 Archaeological Site Examination, Watertown Arsenal West Site (19-MD-758) Former Army Materials Technology Laboratory, Watertown, Massachusetts. 96 pages.

A site examination was conducted at the Watertown Arsenal West Site within the former Army Materials Technology Laboratory (AMTL) facility in Watertown. This prehistoric site was discovered during the intensive archaeological survey of the Central Investigative Area within the former AMTL. Subsurface testing revealed that the site covers an area of 8,835 square meters. The prehistoric deposits are bounded by a variety of historic and modern period constructions, underground utilities, and historic/modern landscape features. The occupation of the site appears to have spanned the Late Archaic and Woodland periods-roughly 5,000 years of use. This temporal range of occupation is based on the presence of diagnostic artifacts including projectile points such as Susquehanna Tradition Points and aboriginal pottery. No radiocarbon-datable contexts were encountered within the site area. Despite a high degree of historic and modern period subsurface disturbances, lithic concentrations within the west-central and southwest portions of the site are suggestive of intense occupation that included the probable presence of a felsite workshop. No other identifiable features such as hearths, storage pits, or cremation burials were located during the archaeological investigations. Two calcined mammal bone fragments were recovered from a disturbed soil horizon in the southeast portion of the site. These fragments were closely analyzed, but could not positively be identified as human. The documented historic and modern period disturbances to the natural landscape within and surrounding the Watertown Arsenal West Site were determined to have compromised its physical integrity. This is supported by the recovery of 9S percent of the prehistoric artifact assemblage in disturbed soil horizons. These disturbances have also compromised the presence of and potential for the recovery of intact radiocarbon-datable contexts and features, including lithic workshops and subsistence-related hearths, fire pits, and storage/disposal pits. Archaeological site analyses indicate that the Watertown Arsenal West Site lacks physical integrity, thus making it ineligible for listing on the National Register of Historic Places. No further archaeological investigation of the Watertown Arsenal West Site within the former AMTL facility was recommended

25-1606 McHargue, Georgess

1996 Seashells, Seashells, By the Seashore, The Story of the Spectcle Island Archaeological Site. 36 pages.

This popular report for general readers describes the results of the archaeological data recovery program at Spectacle Island, conducted as part of the Central Artery/Tunnel Project. A Native American shell midden site(19-SU-38) was excavated by archaeologists as mitigation for the use of Spectacle Island as a place for fill from the Central Artery/Tunnel project. The site dates to the Middle and Late Woodland periods(A.D. 535-1590). This report highlights the results of the archaeological investigation as well as a history of the use of Spectacle Island through time.

25-1607 Decima, Elena

1997 Intensive Archaeological Survey, Jefferson at Den Rock, Lawrence, Massachusetts. 52 pages.

An intensive (locational) survey was conducted at Jefferson Den Rock, a 18.5-acre housing lot near Den Rock Park in Lawrence. Ninety-three systematic, bracket and judgmental test pits were excavated during the intensive survey. The archaeological work resulted in the identification of seven prehistoric sites, three of which are located outside the boundaries of the Den Rock project. The DR1 Site is a small foraging campsite on a flat, high, dry area in between the two streams, possibly used for tool maintenance and food preparation. One crude quartz uniface, a hammer stone grinding stone, 28 flakes (felsite, quartz and unidentified sedimentary rock), six pieces of quartz shatter, three possible carbonized nuts, one calcined bone and charcoal fragments were recovered. The DR2 Site is a .dispersed occupation near Den Rock. A quartz hammer stone, 11 flakes (felsite, quartz, quartzite, granite and English flint), three pieces of shatter (felsite and

quartz), 18 sherds of grit-tempered pottery (a few decorated) and 23 small, unidentified calcined bone fragments make up the inventory. This site seems to represent a small foraging camp used for tool maintenance and possibly food preparation; opportunistic use of the nearby available quartz is suggested by the grit temper of the pottery. The DR3 Site is a small campsite located on the highest section of the project. Twenty-nine flakes (felsite, quartz), two pieces of shatter (quartzite) and a few charcoal fragments were recovered from this area. The finds and the setting, at the edge of a flat area that extended east toward the roads and houses, suggest that the site could have been a small foraging camp located on a high plateau overlooking the streams and wetlands. The DR4 Site is a very small campsite located on a relatively dry spit of land between two wetland areas. Fourteen flakes (felsite, rhyolite) were recovered. The site seems to represent an opportunistic use of a very small finger of dry land, or perhaps the remains of a larger site. The DR5 Site is a find spot, defined by one judgmental test pit on a island of flat, dry land to the north/northwest of the southern wetlands. Fifteen flakes (felsite, quartz), five pieces of shatter (quartz) and historic artifacts characterize the site. Redeposited soil layers with a mixed historic/prehistoric context was found above a buried A horizon. Beneath the buried A horizon five pieces of quartz shatter were recovered. Because of the ubiquitous presence of quartz veins in and around the rock, it is also possible that this quartz is a natural occurrence. The DR6 Site is a possible quarry site, located on a small ledge by Den Rock. Four possible flakes and *25* pieces of shatter, all quartz, define the site. The finds and their location hint at the possibility of quartz quarrying occurred around the rock; this hypothesis is somewhat supported by the presence of a fire-blackened depression on the rock, showing clear veins or quartz within it. The DR7 Site is defined by several surface finds from crevices, small "caves" and the general area around Den Rock, though outside the project. The finds include two utilized quartz flakes possibly used as scrapers; four quartz cobbles, on possible quartz flake, one conical granite flake, 14 pieces of quartz shatter, and one piece of metal. Some of these finds are natural quartz pieces, probably from the quartz sources of the area, while others could represent the visitors' efforts to utilize the easily available quartz.

25-1608 Strauss, Alan E.

1997 Phase II Archaeological Site Examination of Lot 40, Parcel B at 182 South Street in Medfield, Massachusetts. 103 pages.

An archaeological site examination was conducted in three archaeological site areas that were previously identified (Zones A, B, and C) during the intensive survey of this parcel. The site examination and intensive surveys were conducted under local review procedures. Sixteen shovel test pits and eight meter units were excavated during the site examination. Two distinct prehistoric sites were identified within the project area. Zone A contained a early Middle Archaic site dating to 6,810+/- 480 B.P. based on two radiocarbon dates. Fourteen Neville Points were recovered from the site which contains a dark stained buried B horizon paleosol. The lowest levels of the site (dated to 8,580 +/- 420 B.P.), beneath the Middle Archaic Neville materials, contained milky and crystal quartz debitage and tools. Zone B contained Middle Archaic materials on the north side which are part of the site in Zone A. Zone C contained a shallow site with one prehistoric feature as well as Late Archaic and a Middle Woodland projectile point. In addition to projectile points, numerous unifacial and bifacial tools and debitage were recovered, as well as a sizable quantity of calcined animal bone. It is clear from the soil stratigraphy, archaeological context, chronological and cultural affinities, faunal remains, and internal site complexity that the Middle Archaic Site in Zone *A* is eligible for nomination to the National Register of Historic Places. Therefore, a Data Recovery Program was recommended for the site in Zone A and the northern half of Zone B. The Late Archaic/Woodland site in Zone C was not considered to represent a significant cultural resource because of the extensive amount of land disturbance in this area as well as the fact that the site was shallow and from a well represented prehistoric time period both locally and regionally. The landowners did not delay their construction project in order to have additional archaeological work conducted. Consequently, a house and septic system have been built on the property. The septic system is located within Zone A in the Middle Archaic site and it has no doubt adversely impacted this important site. The house is located in Zone C, however it appears to be in an area

that did not contain a high density of artifacts. This report, therefore, must stand as testimony to the important cultural resources that once existed at 182 South Street. The results of the excavations are provided herein in detail in order to document the site to the fullest extent possible.

25-1609 Reinke, Rita

1996 Archaeological Intensive (Locational) Survey for the Proposed Herman Melville Arrowhead Estate, Pittsfield, Massachusetts. 33 pages.

An archaeological (intensive) site locational survey was conducted at the site of the proposed drainage project at the Herman Melville House ("Arrowhead") in Pittsfield. Background information provided by the Berkshire County Historical Society indicated that the project area was in the site of an outbuilding in the mid-nineteenth century. Historic graphic and photographic images from the Historical Society were used to guide the placement of excavation units. In all, eight shovel test pits (STPs) and three trenches 50 cm , each by 2 m in length, were excavated. The units contained historic materials; no prehistoric artifacts or features were recovered. An intact sewer line was found to run across the center of the main portion of the project area. Intact evidence of the outbuilding was not discovered. No further survey is recommended at this time.

25-1610 Waller, Joseph

1996 Intensive Archaeological Survey Blackburn Industrial Park Expansion. 54 pages.

An intensive (locational) archaeological survey was conducted for the 71-acre proposed expansion area to the Blackburn Industrial Park in Gloucester. A previously documented prehistoric site (19-ES-64) is recorded in the project area and its immediate vicinity, and there is a potential for the presence of historic sites. A total of 60 shovel test pits was excavated, but no prehistoric or historic cultural materials were recovered in any of the test units. A fieldstone enclosure, possibly an animal pound or pen, was found in the northern section of the project area. This feature was not considered to be potentially significant. Proposed construction will avoid this animal pound, and it is recommended that the feature be preserved in place. No further archaeological investigations were recommended.

25-1611 Waller, Joseph N. and David K. Schafer

1997 Intensive (Locational) Archaeological Survey of the Chelmsford Phase IIIB Sewer Project Area, Chelmsford, Massachusetts. 66 pages.

The intensive archaeological survey included background research, a walkover of the project area, and subsurface testing. The Chelmsford Phase IIIB cross-country sewer lines are located in the central section of Chelmsford. Four of the sewer lines are just west of Interstate 495 while one is just east of the Interstate 495-North Road intersection. The pump station facility is west of Interstate 495. During the fieldwork, extensive disturbances including constructions of roadways and drainage culverts, landscaping activities, and some agricultural activities were noted. No evidence for any prehistoric archaeological sites was observed on the surface while an early-nineteenth century house and barn and a monument marking the vicinity of a seventeenth century house were noted within the Crosby Lane and Meeting House Road portion of the project. With the exception of this agrarian complex, all of the projected impact areas associated with the Chelmsford Phase IIIB Sewer project exhibited low sensitivity for the presence of archaeological sites. Any sites that may have existed within the project area have subsequently been destroyed by developments. Within the Crosby Lane and Meeting House Road portion of the project, it was recommended that avoidance of the monumental marker which commemorates the first town meeting in Chelmsford in 1654 should be considered. Furthermore, the standing historic apple tree located immediately south of the driveway at 8 Murray Hill road should not be impacted by the proposed construction as long as the option to place the sewer line to the north of the residential structure is maintained. Intensive subsurface testing within the Chelmsford Phase IIIB Sewer project area did not identify

any documented or previously undocumented Native American or EuroAmerican archaeological sites. As a result no further archaeological investigations were deemed necessary.

25-1612 Begley, William

1997 Intensive (Locational) Archaeological Survey, Algonquin Gas Transmission Company Taunton Municipal Lighting Plant Project FERC Docket No. CP97-318-000, Taunton, Massachusetts. 55 pages.

An intensive (locational) archaeological survey was conducted of the proposed Taunton Municipal Lighting Plant (TMLP) project area in Berkley and Taunton. The proposed TMLP project involves the construction of an approximately 950–foot 12–inch pipeline that will connect the Algonquin G–10/G–10L System pipeline in Berkley to a proposed meter station in Taunton. The intensive survey within the TMLP project area included the collection of background information, an assessment of the archaeological sensitivity of the entire parcel, and fieldwork. Subsurface testing consisted of the excavation of 37 shovel test pits within the project impact areas identified during the walkover survey as having high archaeological sensitivity for the presence of cultural deposits. A low density of prehistoric cultural material was recovered from one test pit. No historic cultural materials were recovered during subsurface testing. The archaeological investigations conducted within the TMLP project area indicate that no potentially significant cultural resources will be affected by proposed construction impacts. No additional archaeological investigations were recommended.

25-1613 Herbster, Holly and Duncan Ritchie

1997 Intensive Archaeological Survey Falmouth Country Club, Falmouth, Massachusetts. 64 pages.

A nine-hole expansion of the existing Falmouth Country Club is proposed in a wooded area encompassing 61 acres adjacent to the existing course and a 2.5-acre easement of privately owned land. The intensive survey included background research, a walkover survey, and subsurface testing. Based on the walkover survey, a majority of the project area was considered to have high or moderate archaeological sensitivity. A total of one-hundred, 50 x 50 cm test pits was excavated in moderate and high sensitivity areas. The recovered material assemblage consisted of one hand wrought nail, two shell fragments, and a piece of bottle glass collected as field trash adjacent to the historic roadway. This material is not associated with a specific archaeological site. No additional archaeological investigations were recommended.

25-1614 Fragola, Patricia and James C. Garman

1997 Intensive(Locational) Archaeological Survey Barnstable County Jail and House of Correction, Barnstable, Massachusetts. 62 pages.

This report details the objectives, methodologies and results of the intensive archaeological survey, and serves as the final summary for all archaeological work completed on the Barnstable County Jail project in Sandwich. Excavation of 61 50 x 50 centimeter test pits identified no trace of Native American or EuroAmerican archaeological sites. Although the project area has few signs of disturbance and was assigned a sensitivity ranking of moderate, all test pits proved sterile. Based on the results of the intensive survey, construction of the Barnstable County Jail is unlikely to impact subsurface archaeological sites. No further archaeological survey was recommended.

25-1615 Begley, William and Duncan Ritchie

1997 Archaeological Site Examination River Bend Site, Dighton, Massachusetts. 58 pages.

The River Bend Site, a prehistoric period archaeological site, was identified during an intensive (locational) survey of the Dighton Power project area. An archaeological site examination was

conducted to provide additional information on the site's size and significance. A total of 49, 50 x 50 centimeter test pits and six, 1 x 1 meter excavation units were placed along the eastern bank of the Segreganset River within the River Bend site area. Subsurface testing strategies included a grid of test pits over the site area to locate activity areas or concentrations of cultural material and to define site boundaries. The larger excavation units were used to explore site integrity, density and complexity. A low density of prehistoric cultural materials was recovered from six of the 49 test pits and five of the six excavation units from 0 to 50 centimeters below the ground surface. The total assemblage of prehistoric cultural material included two chipped stone tool fragments, along with 37 pieces of lithic debitage, including quartz, argillite and rhyolite. The chipped stone tools were both bifacial tool blade fragments, non–diagnostic of any specific temporal period. No organic material suitable for radiocarbon dating was recovered during the site examination. No evidence of prehistoric cultural features, activity areas or high–density concentrations of cultural material were encountered during the site examination. The River Bend Site does not represent a significant archaeological resource and is not considered eligible for inclusion on the National and State Register of Historic Places. No additional archaeological investigation is recommended.

25-1616 Decima, Elena and Barbara Putnam

1997 Reconnaissance Archaeological Survey Weston Aqueduct Supply Mains 1,2 and 4 Rehabilitation Project, Weston and Newton, Massachusetts. 42 pages.

A reconnaissance survey was conducted for sections of the proposed rehabilitation of the water main and associated appurtenances of the Weston Aqueduct Supply Main 4 (WASM4), which runs through Weston, Newton, Watertown, Cambridge, and Boston(approximately 14,325 m. or 47,000 ft.) and portions of WASMs 1 and 2, which parallel WASM4 for approximately 2,200 m. (7,200 ft.). It was determined that the type of rehabilitation planned for WASM 1, 2 and 4 is unlikely to adversely impact archaeological sites along most of the project corridor, since the disturbances will mostly occur within the existing disturbance footprint of the WASMs. Preliminary research revealed that, except for the initial segment between the Weston Aqueduct Terminal Chamber and Commonwealth Avenue, the WASM4 and relevant portions of WASMs 1 and 2, run under or along streets and avenues where utility lines have severely impacted the corridor within which the pipelines are found. The reconnaissance survey, thus, focused on the sections of the alignment that potentially retain archaeological integrity, namely, those between the Weston Aqueduct Terminal Chamber in Weston and Commonwealth Avenue in Newton (approximately 2,000 ft.). The area around the hilltop on which sits the Weston Aqueduct Terminal Chamber had already been surveyed as part of the MetroWest project, and no archaeological resources were identified there. The results of this reconnaissance survey showed that the corridor crosses no known archaeological site between the Weston Aqueduct Terminal Chamber and Commonwealth Ave. The general patterns of site location indicate that prehistoric sites (12,000-350 BP) are highly likely to exist in *undisturbed* portions of small pockets of land adjacent to the corridor between Loring and River roads, and possibly in small pockets of land on both banks of the Charles River. Low potential is assigned to this section for archaeological historic sites (AD 1600-1950). Two Metropolitan District Commission (MDC) buildings are located on the eastern bank of the Charles River, adjacent to WASM 4. Both were originally built as part of Norumbega Park, a contributing element of the National Register nomination being assembled by the MDC within an MDC-wide thematic nomination. The two structures are eligible for the National Register of Historic Places as contributing elements within the district encompassing Norumbega Park. If any work associated with the rehabilitation project is to be conducted outside the existing disturbance footprint, within one of the areas with archaeological potential, it is recommended that the area be assessed for existing disturbances, and if warranted, subjected to an intensive (locational) survey.

25-1617 Brighton, NancyJane

1989 An Island of History: Household Archaeology and Historical Land Use at the Jackson

Homestead, Newton, Massachusetts. 129 pages.

This B.A. honors thesis develops a model with which to study households and the landscapes in which they are situated using the Jackson Homestead in Newton as a case study. The model includes the examination of the documentary record and the archaeological record, as well as the processes that led to the formation of the site. The main focus is the placement of the Jackson Homestead in its proper historical context by combining oral traditions of the family with evidence from written sources. By detailing the activities of the members of the Jackson family who owned, lived, and worked in and around the house, it is possible to determine what may be present in, and the effects different uses of the site would have on, the archaeological record. The study can serve as a useful aid to curators at the Jackson Homestead in interpreting Jackson family history and the family's place in Newton's history from the unique combined perspective of the documentary and archaeological record of the household and landscapes. The study further contributes to the study of households and landscape by providing a model on how documents and the material record can define the activities and changes that have occurred at a site over time. Through a life history approach to the archaeological site, emphasis is placed on the people who are responsible for creating, arranging, and altering the house and the landscape.

25-1618 Ziesing, Grace H.

1990 Results of Archaeological Testing at the Jackson Homestead, Newton, Massachusetts. 46 pages.

Findings from limited test excavations conducted in October 1988, are reported. Five test trenches were placed in the rear yard, north of the house, on a judgmental basis. Results of the testing strongly suggest that major portions of the north yard have been extensively altered since the 18th century. None of the test pits contained pre-19th-century deposits, indicating that, if there ever were any, they were removed in the 19th century or later, through grading activities. The topography at the Jackson Homestead is not natural, and leveling must have occurred when the present structure was erected in 1809 and again in the 1920s-1930s when the tennis court was built. It is thought that if any intact, pre-19th-century cultural deposits survive, they would probably be on the high ground close to the existing structure, or possibly in the south or west yard areas. The tennis court was created by filling rather than, or in addition to, grading, and it is therefore possible that if this was the location of the original 17th-century house, remains of a truncated cellar hole might survive in this location beneath the clay court. If the original 17th-century house was razed (and the current structure is not sitting on top of it), there should be a distinctive pattern of debris at the spot where the house once stood. Future excavations at the Jackson Homestead should seek out such traces. Further investigation is recommended for the north yard, particularly the area slated as the site of a storage facility. If this is not feasible, then the construction of the storage facility should at least be monitored by an archaeologist. Other areas that may warrant further investigation are the deposits on the berm near the house, and the south and west yard areas. Remote sensing techniques might be used profitably in various areas of the yard, particularly the driveway. Another line of investigation that might help to pinpoint likely areas of intact early deposits is a contour survey.

25-1619 Chilton, Elizabeth S.

1996 Embodiments of Choice: Native American Ceramic Diversity in the New England Interior. 246 pages.

This dissertation examines the complex relationships among technical choices, historical context, and society during the Late Woodland period (1000-1600 A.D.) in the middle or Massachusetts portion of the Connecticut valley. Ceramic assemblages from two New England Alqonquian sites—Pine Hill in Deerfield (19-FR-17) and Guida Farm in Westfield (19-HD-111)—and one Mohawk Iroquoian site—Klock Site, in Ephratah, New York—are examined using an attribute analysis of technical choice. The attributes selected for analysis reflect choices made by potters

along the production sequence: paste characteristics, vessel morphology, construction techniques, surface treatments, and firing conditions. Differences between Algonquian and Iroquoian ceramic attributes are interpreted as embodiments of profound differences in technical systems, which include intended function, the context and scale of production, and stylistic signaling. Since the two groups were interacting and sharing information during the Late woodland period, Connecticut Valley Algonquians had access to similar kinds of cultural knowledge and technologies. Nevertheless, rather than becoming sedentary farmers, forming extensive and rigid social structures, and producing large, thin-walled, cooking pots like the Iroquois, Connecticut valley peoples maintained fluid and mutable subsistence, settlement, and social relationships that are reflected in the their diverse and flexible ceramic traditions. Instead of assuming that New England Algonquians were not as culturally or technologically advanced as the Iroquois, the author suggests that they can be understood as active agents of their own social change. As such, they made decisions concerning subsistence, settlement, and social structure. As potters, they made choices in ceramic production that both reflected and affected these decisions.

25-1620 Strauss, Alan E.

1997 Intensive Archaeological Survey of the Proposed Osco Drug Store in Marshfield, Massachusetts. 44 pages.

An intensive archaeological survey was conducted of the proposed Osco Drug Store in Marshfield. Background research indicated that one recorded prehistoric site based on surface flakes and oral tradition, was situated within the project area. The project area also contained the Marcia Thomas House, a standing structure, built in 1835. Field investigations included a surface inspection, followed by the excavation of 27 shovel test pits. Thirteen of the 27 test pits contained cultural material. A total of 39 pieces of prehistoric stone debitage was recovered during the subsurface investigations. The remains were recovered from what appeared to be primarily the plowzone. No significant historical deposits were identified. No diagnostic artifacts, subsurface features, or faunal or floral remains were recovered. The age of the site is unknown and little can be said about the site's function or complete dimensions. Because the site contains little research potential and is not eligible for National Register listing, no further archaeological investigations are recommended.

25-1621 Waller, Joseph and James C. Garman

1997 Intensive (Locational) Archaeological Survey, Charles Root Residential Subdivision, Uxbridge, Massachusetts. 90 pages.

The intensive survey of the Root Farm Residential Subdivision identified a total of five loci of Native American cultural materials and one find spot of a single Native American artifact. Structural remains from a EuroAmerican domestic site were also identified and photographed; however, these do not constitute an archaeological site because the remains had been moved out of context and the site destroyed. Root Farm Loci 1 through 4, located in Lots 8, 9, 10, and 11 of the project area, are low-to-medium-density scatters of lithic artifacts. Loci 1 through 4 are part of the larger Uxbridge Village 1 Site, first identified in the 1940s by collector Larry Gahan. Locus 2 yielded an untyped point that may be a Stark or Neville variant; Locus 3 yielded a quartz small-stemmed point which had been reworked. In all four cases, stratigraphic integrity of the loci was excellent, with the majority of the artifacts recovered from the A/B interface or deeper. The lots in which Loci 1 through 4 are located do not appear to have been recently plowed, establishing the integrity of the sites. Based on the results of the intensive survey, they must be considered potentially significant in terms of criteria for inclusion in the National Register of Historic Places. A site examination is recommended to determine the age, density, spatial extent, and eligibility of the site for inclusion in the National Register. Root Farm Locus 5, located in Lot 5 of the project area, is a low-to-medium-density scatter of lithic artifacts linked to the Small-Stemmed Tradition of the Late Archaic. The diversity of lithic materials suggested that it functioned in the same capacity as Loci 1 through 4 – that is, as a short-term site to which Native Americans returned repeatedly.

However, unlike Loci 1 through 4, Locus 5 has been disturbed by deep agricultural plowing, and lacks stratigraphic integrity. The locus is not considered potentially significant in terms of criteria for inclusion in the National Register. No further archaeological survey is recommended for Root Farm Locus 5. Root Farm Find Spot 1, located in Lot 21 of the project area, consists of a single quartz flake recovered from questionable context. The site is not considered potentially significant. No further archaeological survey is recommended for Root Farm Find Spot 1. In sum, Lots 1 through 6 and Lots 13 through 24 do not contain significant archaeological resources. Archaeological resources in Lots 7 through 12 should be evaluated for their significance and eligibility to the National Register through an archaeological site examination.

25-1622 Donta, Christopher L., Thomas L. Arcuti and Mitchell T. Mulholland

1996 Archaeological Reconnaissance Survey of Falmouth, Massachusetts. 211 pages.

A Survey and Planning Grant from MHC was awarded to the Falmouth Historical Commission for the completion of a town-wide archaeological reconnaissance survey. The purpose of the survey was to identify known and potential cultural resource areas within the town. Data recovered during this survey are part of a management plan that is to be integrated with a local comprehensive plan for future town development. The project included: 1) background research into the prehistoric and historic uses of town lands; 2) stratification of town lands into areas of low to high potential to contain cultural resources, based on topography, water sources, soils, and known sites; 3) a walk-over inspection of known sites and selected areas of high potential; 4) interviews with local informants and town personnel; and 5) integration of this information into a narrative of the town's past and development of a management plan for identified resource areas.

25-1623 Clements, Joyce M.

1994 Final Report of Phase I Intensive Archaeological Survey, Doty Tavern, Canton, Massachusetts. 128 pages.

During late July and early August, 1994 archaeologists conducted a Phase I intensive archaeological survey in the location referred to as the site of the late-eighteenth century Doty Tavern in Canton. The work was requested by the Friends of Prowse Farm, a non-profit organization dedicated toward preserving Prowse Farm and associated lands and historical structures. As the venue for pre-Revolutionary political meetings in Suffolk County, the Doty Tavern is an historically important part of state and local history. Archaeologists excavated 50 shovel test pits within a 5-m grid across the project area. Two 1 m x 1 m excavation units and three .5m x 1.5 m trenches were judgmentally located in productive areas of the project. These excavations produced multiple artifacts dating from the late-eighteenth to the twentieth century. The excavation also generated evidence of four features, with a demonstrated correlation between these features and historically documented structures. Archaeologists recommend further investigations in order to produce a comprehensive understanding of the tavern site. Although the site is not threatened by developmental impacts, archaeologists have suggested ways in which this research can be achieved by a non-profit organization. In this way the Friends of Prowse Farm can further their efforts to preserve and acknowledge the unique contribution of Doty Tavern and its role in area history.

25-1624 Dwyer, Alison

1996 Intensive Archaeological Survey The Concord and Bradford Elementary Schools, Haverhill, Massachusetts. 56 pages.

The School Building Committee is planning the construction of two new elementary schools: the Concord Street Elementary School (to be called the Concord School) and the Bradford Elementary School (to be called the Bradford School) for the City of Haverhill. The purpose of the intensive survey was to conduct a systematic and detailed archeological field investigation for the purpose of locating and identifying any sites which exist in the project area. A concentration of prehistoric

artifacts was identified in the southeast portion of the Concord Street project area and a blanket of historic sheet refuse across the site. The presence of a Susquehanna Broad point base and pottery suggests that the site is multicomponent. This is supported by records on file at the Massachusetts Historical Commission (MHC) as well as communication with local collectors. MHC site files, which identify this site as 19-ES-28, record that 98 Archaic and Woodland points were recovered from the area by local collectors. Only two flakes and a few historic artifacts were recovered from the Bradford site. Additional work, in the form of a site exam was recommended for the Concord Street site. No additional work was recommended for the Bradford project area.

25-1625 Dwyer, Alison

1997 Archaeological Site Examination of the Concord Street Elementary School, Haverhill, Massachusetts. 49 pages.

This report summarizes the results of the site examination of the Concord Street Elementary School Site in Haverhill(see report 25-1624). The site exam recovered additional prehistoric material including bifaces, a preform, and debitage. No features were identified. Although the site is small, it contains information that would contribute to the reconstruction of the Archaic to Woodland cultural sequence and would aid in the explanation of prehistoric land use in Haverhill.

25-1626 Johnson, Eric S.

1993 “Some by Flatteries and Others by Threatenings”: Political Strategies Among Native Americans of Seventeenth-Century Southern New England. 360 pages.

This Ph.D. dissertation examines political processes within Native American societies of seventeenth-century southern New England, focusing on the strategies used by individuals and groups to legitimize or challenge political authority within Native society. Documentary, archaeological, and oral history data are integrated in order to investigate the significance of and variation in different political strategies involving ideology, alliance, marriage, coercion, settlement, exchange, and the manipulation of material culture. The author compares the political strategies employed by the leadership of three historically known polities (the Mohegans, Pequots, and Narragansetts). Two of these experienced a violently contested change in leadership personnel, while in the third leadership was more stable. These differences in internal political struggles, particularly in the legitimizing of authority, provide a context for understanding variation in political strategies.

25-1627 Waller, Joseph and Alan Leveillee

1997 Intensive(Locational) Archaeological Survey of Three Annex Parcels within the Towermarc Complex, Harvard and Boxborough, Massachusetts. 112 pages.

An intensive (locational) archaeological survey was conducted on three annex parcels within the Towermarc Development Complex, Boxborough and Harvard. The project areas consist of proposed new golf course and business park construction. An assessment was also made of the current condition of prehistoric resources that were identified by previous surveys in 1988, and in 1989 on the Veneska property, a 3-acre parcel in the northeastern portion of the development. The intensive archaeological survey consisted of archival research and subsurface testing to identity potentially significant archaeological deposits that may be adversely affected by proposed project impacts. The recovery of chipping debris, a calcined bone fragment, and a stone projectile point fragment from the northeastern survey area mark the loci of prehistoric Native American activities. The two identified prehistoric activity areas are in close proximity to Late Archaic Period sites identified in the 1989 survey within the Towermarc project area. The identification of a historic period cellar hole with associated early-19th century ceramics and construction materials marks the second locus of cultural activity identified during the survey. This structure appears to date to the early 19th century. This site is a potentially significant cultural resource that could aid in understanding late 18th through 19th century communal development in the Boxborough and

Harvard area. Visual inspection of the Beaver Brook, C.T.B., Oak Hill Winds, and L.O. sites identified by in 1988 and 1989 resulted in the observation that the sites are intact. Proposed construction may impact the prehistoric sites and the historic period cellar hole identified to date within the project area. Whenever possible, archaeological sites should be avoided during planned construction. Sites that cannot be avoided should be subject to archaeological site examination. Objectives of any site examination subsurface testing would include establishing the vertical and horizontal site limits and evaluating the site's integrity in terms of levels of disturbance. Site examination testing may secure evidence of the cultural/chronological affiliation and the range of human activities represented at the prehistoric activity areas and the historic domicile and permit evaluation of each site's significance in terms of National Register criteria.

25-1628 Decima, Elena

1996 Archaeological Reconnaissance Survey Forges Field, Plymouth, Massachusetts. 30 pages.

A reconnaissance survey was conducted in advance of a proposed regional recreational facility. The archaeological study identified several areas of high and medium prehistoric archaeological potential, one area of historic potential, and a historic site (the location of a nineteenth century exotic bird farm). It was recommended that an intensive survey be conducted in the areas identified as having archaeological potential, if they are to be impacted by construction. It was also recommended that additional research be conducted on the bird farm to determine its significance.

25-1629 Putnam, Barbara

1995 Intensive Archaeological Survey Newton Campus, Boston College. 116 pages.

This report describes the findings of an intensive survey carried out at the Newton Campus of Boston College Law School, in conjunction with Boston College's Master plan for physical facilities development occurring between 1991 and 2001. As a result of the intensive survey 7,943 prehistoric and historic artifacts were recovered and five sites (two prehistoric and three historic) were located. The two prehistoric sites represent a multicomponent use of the project area from the Middle Archaic through Woodland periods. Boston College Law School Prehistoric Site 1, located southeast of a slate outcrop, yielded several fragments of Woodland pottery and pieces of fire-cracked rock. Boston College Law School. Prehistoric Site 2, located near the campus west boundary, revealed a Middle Archaic Neville-type point amidst a concentration *of* several hundred chipping debris. Also recovered amongst the debitage were slate flakes, suggesting that the slate outcrop on the campus may have been quarried. The three historic sites represent the development of the project area from the eighteenth through early twentieth centuries. From Boston College Law School Historic Site 1, located south of the main entry road to the campus, artifacts representative of the Spring homestead (1644 to 1796) were recovered. Unfortunately this area had been adversely impacted from previous construction and landscaping activities, Which affected the integrity of the site. Boston College Law School Historic Site 2, located southeast of the drumlin, yielded a dense concentration of architectural materials dating from the late nineteenth to early twentieth centuries. Historic atlases do not show a structure in this section of the project area, so this site may either represent a historic dump or a previously unknown component of the project area's history. Boston College Law School Historic Site 3, located south of the Colby Road entrance to the campus, is a stratified site that contains a concentration of architectural remains and three possible foundation stones. Historic atlases show a cottage to have existed on this section of the project area in 1874, when it was owned by philanthropist Gardner Colby. The cottage had been removed by 1895. This site could therefore represent the cottage that was on Gardner Colby's property or even an earlier structure of a previous occupant. Archaeological site examination investigations were recommended for all of the sites except for Boston College Law School Site 1, which lacks integrity.

25-1630 Mullins, Paul R. and Mitchell T. Mulholland

1996 Archaeological Site Locational Survey for a Proposed Barn Project, The John Alden House, Duxbury, Massachusetts. 85 pages.

As part of an archaeological site locational survey at the site of the John Alden House in Duxbury, testing was conducted throughout the property to assess archaeological integrity, identify the range of cultural material, and determine the impact of a barn reconstruction on archaeological resources. The property has been the home to John and Priscilla Mullins Alden and their descendants since 1653. John and Priscilla came to the American colonies aboard the *Mayflower*, settled with other Pilgrims in Plymouth, and married there in 1621. By 1632 the Aldens moved to nearby Duxbury, where they built a home about 300 yards from the 1653 Alden House. The Duxbury area contains many seventeenth- and eighteenth-century sites associated with English colonists. At least 48 prehistoric archaeological sites spanning 8,000 years of human habitation have been identified in the Duxbury area. In 1960 archaeological excavations by Roland Wells Robbins were conducted at the ca. 1632 Alden home, recovering a rich assemblage of early seventeenth-century material culture and more than 2,000 prehistoric artifacts, including diagnostic artifacts ranging from 5,000 years old to the period of European contact. The project area was tested through the excavation of 59 shovel test pits (STPs). Forty-nine of the 59 STPs contained historic artifacts. All 23 STPs around the house contained historic artifacts dating from the eighteenth to early twentieth centuries. A post hole and postmold also was identified in this area near the house. The flat expanse extending from Alden Street to the house contained extremely few artifacts and no features. Twenty-two STP's were excavated south of the house. Very few historic or prehistoric artifacts were recovered in this area. No unequivocal evidence of seventeenth-century material culture was identified. However, since seventeenth-century material assemblages typically contained very few goods and no stratigraphic disturbance was identified, seventeenth-century deposits may remain intact in the project area, particularly under the house itself. Twenty-eight prehistoric artifacts were recovered. Only one was datable, a partial Levanna projectile point.

25-1631 Strauss, Alan E.

1996 Intensive Archaeological Survey of Lot 53-2 at Griffiths Pond in Brewster, Massachusetts. 36 pages.

An intensive archaeological survey of Lot 53-2 at Griffiths Pond in Brewster was conducted. The project is slated for the construction of a single family dwelling, garage, deck, access road, and septic system. Background research indicated that there was one recorded prehistoric site within close proximity to the project area and several others in the general vicinity. Historical resources indicated that the overall area was used for farming throughout the historical period. Field investigations consisted of a surface inspection of the entire project area followed by the excavation of 72 shovel test pits and two 50 x 100 cm excavation units. Two prehistoric sites were identified within the project area, which was divided into Zones A and B. Zone B, located on ridges near the pond but away from the actual house site, contained no prehistoric artifacts. Zone A (situated in the actual proposed house site) contained a Late Woodland prehistoric site (ca. 1,000-400 B. P.) with a small amount of lithic debitage, pottery, and a clay pipebowl fragment. This site had a very low density of artifacts which were principally recovered from the plowzone. The second site consisted of a Late Archaic Small Stemmed Point (ca. 5,000-3,000 B.P.) a quartz point tip, and a low density of felsite debitage. This site also exhibited plowed soils. Because of the poor archaeological integrity of the site’s, the low density of artifacts, the low variety of tool types, the lack of internal site complexity, and the absence of subsurface features, the sites are considered to have minimal research potential. Because the sites are not potentially eligible for nomination to the National Register of Historic Places, no further archaeological investigations are recommended.

25-1632 Clements, Joyce M.

1997 Report of a Phase I Intensive (Locational) Survey Rt. 149 Stormwater Quality Improvement Project, Barnstable, MA. 47 pages.

The Town of Barnstable is in the process of upgrading and improving stormwater facilities along Route 149 in the Village of Marstons Mills. Documentary research, oral testimony, a pedestrian survey and subsurface excavations indicate potential for a variety of archaeological sites in the general vicinity. Historical documents identify the likely locations of a 1704/5 grist mill, a ca. 1738 fulling mill, a small fish-processing structure, and a nineteenth century dwelling. However, shovel test excavations revealed extensive road fill and disturbed subsoils within the footprint of the stormwater facilities. Therefore no further archaeological excavations are necessary within the alignment tested by archaeologists. It is imperative, however, that construction be restricted to the area where subsurface testing was conducted. If changes in the project design necessitate moving the impact area then archaeologists should be offered the opportunity to test the alternative alignment prior to construction.

25-1633 Brett, William and Diana Doucette

1997 Intensive(Locational) Archaeological Survey Carver to Plymouth: Route 44 Relocation Project Wetland Replacement Area PR-8 and Compensatory Flood Storage Areas 1 and 2, Kingston and Carver, Massachusetts. 54 pages.

As part of the Massachusetts Highway Department's Route 44 project (Carver to Plymouth) an intensive (locational) archaeological survey was conducted in the proposed wetland Replacement Area PR-8, and Compensatory Flood Storage Areas 1 and 2 in Kingston and Carver. The purpose of the intensive survey was to determine the presence or absence of Native American and EuroAmerican archaeological sites through background research and fieldwork. This report details the objective, methodologies and results of the intensive survey. Subsurface testing was conducted in the zones of moderate to high archaeological sensitivity to identify any potentially important archaeological resources. This included: the excavation of 27 test pits in seven judgmentally placed transects at the Wetland Replacement Area PR-8; the excavation of 10 test pits in four judgmentally placed transects at the Compensatory Flood Storage Area 1; and the excavation of 12 test pits in three judgmentally placed transects at the Compensatory Flood Storage Area 2. No significant archaeological resources were identified. No further investigation was recommended.

25-1634 Donta, Christopher L.

1997 Shattuck Farm '96: Archaeological Site Locational Survey for the Niuna-River, Inc., Proposed Office/Research and Development Complex Andover, Massachusetts. 81 pages.

An archaeological site locational survey was conducted at the site of the proposed Niuna-River, Inc., office/research and development complex in Andover. The proposed project consists of the construction of a five-lot office/research and development complex, with associated utilities, roads, and landscaping. Background research determined that the area proposed for impact has numerous known prehistoric and historic resources. The prehistoric site called the "Shattuck Farm Site" (19-ES-196) has been known for well over one hundred years, and has been the subject of several archaeological surveys. The site has also been the focus of historic use since at least the early eighteenth century as a homestead and farm, and includes building foundations from the past three centuries. The historic farm has also been studied previously. The present archaeological survey consisted of the testing of three survey units, totaling 200 shovel test pits. Testing was concentrated in and around the historic homestead and at Locus H of the prehistoric site. Evidence of ten structures was found in the historic area, along with artifacts dating from the late eighteenth through twentieth centuries. No earlier materials were identified. Prehistoric artifacts were found in nine test units at the prehistoric locus, including a high density and wide variety of materials. No additional study is recommended for the historic site, due to previous thorough documentation, and because no new or different information was found at the site during this survey. Additional survey is recommended for the Locus H area. Portions of this locus have not yet been tested, as they are presently covered with fill piles from nearby drainage work. Research indicates that intact features and artifact deposits, possibly dating from the Middle Archaic Period, may be located under the fill piles.

25-1635 Putnam, Barbara and Wes Hall

1995 Underwater Archaeological Survey for the Proposed Artificial Reef Off Spectacle Island, Boston Harbor, Massachusetts. 28 pages.

This report summarizes the results of an underwater archaeological survey conducted at the site of a proposed artificial fish reef being considered by the Massachusetts Highway Department as a mitigation against habitat loss caused by the closure of the Spectacle Island landfill (see report #25-1582). The proposed project consists of 20 reef modules to be distributed over a four-acre portion of the Sculpin Ledge Channel between Spectacle and Long Islands. The survey included background research and a remote sensing survey. The background research, which included a review of known shipwreck records in Boston Harbor, failed to identify any shipwrecks within the proposed target area. The study also determined that the potential of the area for containing underwater archaeological sites is low. The remote sensing survey, which included side-scan sonar and marine magnetometry, identified one sonar anomaly, Bottom Feature A, and three magnetic anomalies in the vicinity of the target area. The magnetic anomalies were all situated at least 200 feet from the nearest proposed reef module and are not expected to be impacted by the modules. Bottom Feature A was situated approximately 50 feet from the initial location of proposed Module No.16. Module 16 was therefore relocated, leaving Bottom Feature A in excess of 100 feet from the next nearest module. None of the anomalies identified by the remote sensing survey, whether archaeological resources or not, are expected to be impacted by the proposed reef modules. No further archaeological survey is recommended.

25-1636 Luedtke, Barbara E.

1996 The Archaeology of Thompson Island. 135 pages.

This report summarizes the results of a 1993 survey by UMass/Boston, and a synthesis of all previous archaeological fieldwork on Thompson Island in Boston Harbor. The survey included background research, documentary research, walkover reconnaissance, and subsurface testing with shovel test pits and 1 meter square excavation units. Despite the fact that many parts of the island have not yet been surveyed, twenty prehistoric sites are now known, an unusually high density for the Boston Harbor Islands. Components range in age from Late Archaic through Late Woodland, with Middle Woodland especially well represented. Several large habitation sites with shell middens are known, in addition to numerous small special purpose camps of various types. The report includes recommendations for protecting the sites from further erosion and from damage by human activities.

25-1637 Dwyer, Alison

1996 Results of the Intensive Survey of the Dynasty Estates Milford, Massachusetts. 42 pages.

An intensive archaeological survey was conducted within the project area for the construction of a 53-unit residential subdivision and entrance road in Milford. Test excavations and surface topography indicate that much of the project area had been disturbed by 20th century gravel operations. Artifacts recovered consisted of a sparse scattering of late nineteenth and twentieth century historic material, a possible quartz shatter and a felsite flake. Given the disturbed nature of the project area and the low density of recovered artifacts, additional archaeological work is not recommended. However, it is suggested that a buffer zone in the form of vegetation be created at the Dynasty Estates entrance to lessen the visual impact of the new development on the 1810 Federal Period home on Purchase Street.

25-1638 Cherau, Suzanne G. and Kerrylynn Boire

1997 Intensive Archaeological Survey Hingham Cohasset Training Annex, Hingham, Massachu-

setts. 91 pages.

An intensive archaeological survey was conducted at the Hingham Cohasset Training Annex in Hingham. The survey area included 125 acres which are currently being studied for environmental remediation prior to the army base disposal and reuse. These 125 acres were included in two previous archaeological studies, one of which determined that there were archaeologically sensitive areas in intact sections of the parcel. Based on the previous archaeological studies, the initial sensitivity assessment estimated that approximately 30 to 40 acres of the 125-acre project area possessed moderate to high prehistoric and historic archaeological potential. A walkover survey revised this assessment to 20 sensitive acres based on current models of regional prehistoric and historic land use and settlement patterns as well as existing physical and environmental conditions. Subsurface testing was conducted within the revised archaeologically sensitive portions of the parcel. The subsurface testing resulted in the location of one prehistoric site and one historic archaeological site. The prehistoric site, designated the Annex Site, yielded two pieces of quartz chipping debris and two calcined mammal bone fragments. Additional testing around this site area did not produce additional prehistoric deposits nor were any cultural features encountered in association with the lithics and faunal remains. The historic site, designated Historic Dump 1, was identified on the basis of surface debris scattered across an approximately l50 square-meter area in the northwest portion of the project area. A representative sample of collected materials indicates a domestic dump site dating from the late nineteenth to early twentieth century. The precise type, function, and specific temporal/cultural affiliation of the prehistoric site could not be determined. Given this limited information content, the Annex Site was not considered to represent a potentially significant archaeological resource. No further investigation of this site area was recommended. The historic/modern period dump site also possesses limited information content and low research potential. It could not be definitively associated with any documented historic residential site in proximity to the project area. It possesses a low research value with little potential to address research issues identified for the greater Boston area. No additional archaeological investigation of the dump site was recommended.

25-1639 Johnson, Eric S.

1996 Archaeological Overview and Assessment of the Lowell National Historic Park, Lowell, Massachusetts. 138 pages.

Previous archeological and relevant documentary research at the Lowell National Historical Park is reviewed and evaluated. The history of Lowell extends back thousands of years, when the Pawtucket Falls drew Native Americans of the Merrimack River valley here for spring fishing. The area was an important center of Native American life into the seventeenth century, when it was the homeland of the Pennacook Pawtucket community. Later that century, the Native "Praying Town" Wamesit was located here. After King Philip's War, English settlers acquired the Wamesit lands and began developing agriculture and small scale industry, similar to that in many interior Massachusetts towns. In 1821, East Chelmsford began a period of rapid transformation, when it became the nation's first large scale planned industrial town known as Lowell. Lowell grew rapidly into one of the largest and most successful cotton textile manufacturing centers in the world. It was significant for its enormous scale, technological innovation, employer-employee relations, development of the New England industrial capitalist and industrial working classes, and immigration. Lowell underwent many changes during the nineteenth and early twentieth centuries, as its textile industry expanded, declined, reorganized, grew, and again declined. Archeological research in the industrial areas of Lowell began in the mid 1970s, when the City College of New York archeological field school excavated at a number of sites in the greater Lowell area, including a site of mill worker housing. Although this research has not yet been completely reported, two brief progress reports demonstrated the archeological potential of Lowell's urban industrial landscape. At the time of the CCNY research, both state and federal governments were moving to preserve, protect, research, and interpret Lowell's history. The Commonwealth of Massachusetts was developing the Lowell State Heritage Park; the National Park Service was developing the Lowell National Historical Park. A series of archeological reconnaissance studies followed. These

generally involved little or no subsurface testing, relying on documentary research to assess the archeological potential of various properties including commercial blocks, mill agents' housing, mill, and canal locks. In the early to mid 1980s, archeologists focused on two industrial facilities: the Lowell Machine Shop and portions of the Boott Mill complex. These projects also involved only limited subsurface testing; the Boott Mill research involved archeological monitoring as well. Finally, in the late 1980s, extensive subsurface testing was combined with historical research in an interdisciplinary investigation focused on a boarding house associated with the Boott Mills and with a nearby mill agents' house. These endeavors have verified the archeological research potential buried beneath Lowell's paved lots and under the basements of its old mills. Moreover, they have used archeological data to address important research questions concerning many aspects of the industrial revolution: technology, labor, class divisions, working class life, material culture, diet, health and sanitation, and landscape. As the relatively new field of industrial archeology develops new research questions and new methods, the known and potential archeological resources within and around Lowell National Historical Park will take on added significance. These significant resources must be protected from destruction. Park developments that will impact known or potential archeological resources must plan for avoidance or, if necessary, mitigation. Archeological resources must be considered early in the planning process of any project. If impacts to archeological resources are unavoidable, and mitigation is required, it should be research problem-oriented, interdisciplinary, controlled, and comprehensive. Well-planned excavation should be preferred over monitoring. Finally, the results of archeological research can and should be integrated into the interpretive programs at the Lowell National Historical Park.

25-1640 Johnson, Eric S.

1997 Archaeological Overview and Assessment of the Frederick Law Olmsted National Historic Site, Brookline, Massachusetts. 59 pages.

Previous archeological and related documentary research at the Frederick Law Olmsted National Historic Site is reviewed and evaluated. The site has seen little archeological research, although its location and history suggest moderate potential for precontact archeological resources and high potential for eighteenth through twentieth century archeological remains related to early rural life in the greater Boston area, as well as to the later use of the property as residence and office by Frederick Law Olmsted, the founder of landscape architecture in America, during the late nineteenth century. A series of geophysical anomalies have been identified on the South Lawn of the site, although some of these may be correlated with buried utilities dating from the early twentieth century, others are of unknown origin and none have been examined by subsurface testing. Limited subsurface testing has identified intact archeological deposits and landscape features from the eighteenth through twentieth centuries. These may have significant research and interpretive potential. A program of subsurface testing is recommended for the South Lawn.

25-1641 Johnson, Eric S.

1996 Archaeological Overview and Assessment of the Saugus Iron Works National Historic Site, Saugus, Massachusetts. 90 pages.

Previous archeological and relevant documentary research at the Saugus Iron Works National Historic Site is reviewed and evaluated. Portions of the property, particularly the area containing the seventeenth century industrial complex, were extensively and intensively excavated between 1948 and 1953 by Roland Wells Robbins. Following Robbins' excavations, the major components of the industrial complex, including the furnace, forge, and rolling/slitting mill, were reconstructed. During the 1970s, additional archeological testing was conducted in the area surrounding the Iron Works House. Several features were identified, including a waterway associated with the original iron works, structures and refuse deposits associated with later inhabitants of the site, and features related to Native American occupation of the site. The collections from these excavations, archival materials, and the reconstructed iron works themselves all constitute a significant archeological resource with value for research and interpretation. Documentary research suggests additional

potential for prehistoric and seventeenth through nineteenth century features in the area surrounding the Iron Works House and the area on the east side of the Saugus River. Archeological testing is recommended for known features as well as for other areas at the site in advance of any proposed ground disturbance. The research and interpretive possibilities for the site, its collections, and its archives in the areas of industrial archeology and history, Native American archeology and history, and the history of interpretation are discussed.

25-1642 Johnson, Eric S.

1997 Archaeological Overview and Assessment of the Cape Cod National Seashore, Massachusetts. 263 pages.

Previous archeological and relevant documentary research at the Cape Cod National Seashore is reviewed and evaluated. The Cape Cod National Seashore is located on what is known as the outer Cape, an area whose history goes back thousands of years, when the area's marine, estuarine, and terrestrial resources, all located in proximity to one another, attracted Native Americans here. The area was an important center of Native American life into the seventeenth century, when it was the homeland of the Nauset, Monomoyick, and Pamet Native communities. It was also the site of some of the first recorded European visits to the Northeast. Among these early visitors were the people commonly known as the Pilgrims, who explored parts of the region before deciding to settle in Plymouth. A generation later, English settlers acquired land in the area. As they began to farm and clear the forests, they initiated a sequence of environmental and economic transformations that continues to this day. The settlers' agricultural and forest clearance practices caused environmental degradation and deforestation, soils were depleted, agricultural growth was arrested. At the same time, exploitation of shellfish, fish, and whales near the shores of the Cape's bayside increased until overfishing depleted these resources and fishermen turned to deeper waters. Because of its isolation and lack of water power, the outer Cape never experienced the industrialization that shaped the growth of much of New England. Beginning in the nineteenth century, transportation developments brought Cape farmers and fishermen access to Boston and other regional urban markets. Provincetown eventually became the area's leading fishing port. Maritime industries such as saltmaking, sailmaking, fish oil processing, and (later) fish freezing and canning, grew up around its wharves. The dangerous waters off the outer Cape's Atlantic shore were the scene of numerous shipwrecks. In response to these tragedies, beginning in the late eighteenth century, lighthouses and lifesaving stations were built at various points along the shore. In towns like Eastham, with no deep-water harbors, farming of specialty crops like cranberries and market gardening for sale in New England cities became a means of livelihood. Railroads, and, later, automobile roads, stimulated a growth in tourism and seasonal residence beginning in the late nineteenth century and continuing today. Archeological research in the outer Cape began with antiquarian collecting in the nineteenth century. By the mid-twentieth century, several large precontact sites had been excavated in the Highlands of Truro, the western side of Wellfleet, and the shores of Nauset Harbor. With the establishment of the Cape Cod National Seashore in 1961, the Federal Government began to take steps to preserve, protect, research, and interpret the history and archeology of the outer Cape. Early archeological surveys (Cotter 1958a, 1958b; Moffett 1962) summarized then current knowledge of the area's archeological resources. During the next 20 years, only one archeological research project of note was conducted, the excavation of a seventeenth-eighteenth-century tavern on Great Island in Wellfleet (Ekholm and Deetz 1970a, 1970b, 1971). At the end of the 1970s, new reviews of historic documents (Clemensen 1979; Rockmore 1979) identified historic-period archeological resources. At the same time, an ambitious program of field testing was initiated: the Cape Cod National Seashore Archeological Survey (McManamon, ed. 1984a, 1984b, 1985). This survey's carefully designed reconnaissance and intensive surveys focused on precontact archeological resources. Most intensive testing was focused on the Highland area of Truro and the Nauset region of Eastham. The Survey also undertook data recovery at the Indian Neck Ossuary, an unusual mortuary feature located outside the Seashore in Wellfleet (McManamon et al. 1986), and at a well-preserved Late Archaic site on High Head (Borstel 1985). By the mid 1980s this high level of activity had subsided, and archeological research largely consisted of limited testing in advance of some development projects (Strauss 1986). In 1990, a large-

scale, multidisciplinary study of the Coast Guard Beach area began when a storm exposed a pre-contact Native American site at Coast Guard Beach (Stillson 1994). Historic-period archeological resources, which were never emphasized during the years of the Survey, received renewed attention in 1993, when a cultural land use study of the outer Cape was initiated (Holmes, Hertz, and Mulholland 1995a). This project, now nearing completion, used comprehensive documentary research to identify and develop contexts for evaluating, researching, and interpreting historic-period archeological resources, and employed this framework in a series of archeological reconnaissance projects (Holmes, Hertz, Barker, and Mulholland 1995; Holmes, Hertz, and Mulholland 1995b, 1995c, 1995d). These varied archeological research efforts have demonstrated that the Cape Cod National Seashore contains a wide variety of archeological resources including Native American habitations thousands of years old, shipwrecks, farmsteads, tourist facilities, industrial facilities, and military installations. Thus far, the information from these resources has been tapped unevenly. Archeology has contributed much to our understanding of precontact Native American settlement and subsistence, and to our knowledge of the in-shore whaling industry of the late seventeenth and early eighteenth centuries. Archeological studies can continue to make important contributions to our understanding of many aspects of the history of the outer Cape, provided that significant archeological resources can be protected from destruction. The Seashore must take steps to minimize the effects of looting and erosion; these two are perhaps the biggest threats to archeological resources in the Seashore today. Future research should be focused on areas where threats from erosion and looting are most serious. Monitoring of threatened areas, subsurface testing for site evaluation, and even data recovery of threatened sites may be necessary. More generally, education must be an important element of any preservation program since it can foster a public attitude of stewardship towards fragile archeological resources. The conservation ethic as well as the results of archeological research can and should be integrated into the interpretive programs at the Cape Cod National Seashore.

25-1643 Johnson, Eric S.

1996 Archaeological Overview and Assessment of the Adams National Historic Site, Quincy, Massachusetts. 77 pages.

Previous archeological and related documentary research at the sites of the Adams Old House, Beale Estate, and the John Adams and John Quincy Adams Birthplaces are reviewed and evaluated. The Old House and Beale Estate have seen little archeological research, although documentary research suggests the potential for the archeological remains of numerous structures and landscape features, many of which are associated with the Adams family. Archeological survey is recommended in order to identify and assess these as well as any as yet undocumented resources on the property. The four archeological studies that have focused on the birthplaces of John Adams and John Quincy Adams have identified and tested several nineteenth-century features. Other features were identified but never tested; still others may exist undetected at the site. Archeological testing is recommended for known features as well as for other areas around the Birthplaces in advance of any proposed ground disturbance.

25-1644 Ritchie, Duncan

1997 Medfield Community Wide Reconnaissance Archaeological Survey Planning and Review Process Project, Medfield, Massachusetts. 96 pages.

A community–wide archaeological reconnaissance survey and planning and review process project was completed for the town of Medfield. This project was developed by the Medfield Historical Commission and its Archaeology Advisory Committee (MAAC) in consultation with the MHC. In 1994 four archaeologically sensitive areas or districts were identified by the MAAC. These sensitive areas were formally recognized as an Archaeological Protection District in a demolition delay by–law accepted by the Town of Medfield and members of the MAAC. In 1996, the Medfield Historical Commission applied to the MHC for funding to conduct a town–wide archaeological reconnaissance survey and planning and review project. Funding for this study was

provided by the MHC, the Town of Medfield, and the Department of the Interior, National Park Service (NPS) through a matching survey and planning grant administered by the MHC. The reconnaissance survey and planning and review project had three general objectives: to define areas of archaeological and historic sensitivity; develop a town–wide archaeological sensitivity map and user's guide; and to develop a town by–law amendment and establish a review procedure for the Medfield Historical Commission. Tasks involved in the reconnaissance survey were carried out in four separate phases. The primary tasks were comprehensive background research, development of a predictive model for locating both prehistoric and historic period archaeological sites, field survey to establish zones of archaeological sensitivity and review of existing by–laws protecting cultural resources in other towns. Other tasks were coordination with town boards and commissions to develop the by–law amendment and review procedure and preparation of a final report on the reconnaissance survey. During background research the inventory of known prehistoric and historic period sites in Medfield was reviewed to evaluate the extent of current knowledge. As a result of background research and study of artifact collections, a number of potential locations for unrecorded prehistoric and historic period archaeological sites were identified. Predictive models for prehistoric and historic period cultural resources described the types of sites that could be expected to occur in different environmental settings within the town. Based on observations about the current condition of both open and developed land and a field check of some known archaeological sites, a sensitivity map of the town was developed. The proposed by–law amendment establishes a mechanism to be used by the Medfield Historical Commission for reviewing new development in the town employing the sensitivity map and user's guide. It is recommended that the Medfield Historical Commission present the proposed by–law amendment to the town for approval at town meeting in the spring of 1998. It is also suggested that the town consider employment of a part–time Preservation Planner to assist in implementation of the by–law amendment and other related tasks. The MAAC should also continue to collect information on unrecorded sites, develop a town repository for archaeological collections, and promote increased awareness of Medfield's cultural resources through public education.

25-1645 Fragola, Patricia and James Garman

1997 Intensive(Locational) Survey of an Unmarked Burying Ground, Heritage at Dartmouth Assisted Housing Project Area, Dartmouth, Massachusetts. 32 pages.

An intensive (locational) survey was conducted at a suspected EuroAmerican burying ground in Dartmouth. The burying ground, located within the bounds of the Heritage at Dartmouth Assisted Housing project, was discovered during construction by surveyors. Subsurface testing identified two burials, the identity of which have yet to be determined. It is likely they are members of a family belonging to the Society of Friends(Quakers) during the late eighteenth or early nineteenth centuries. Based on the results of subsurface testing, the developers have redesigned project plans to protect the cemetery and its stone enclosure and avoid impacts during construction. They have also proposed a plan to repair gaps or broken portions of the stone enclosure and to install a gate at the entrance to the cemetery. These actions will avoid the cemetery during construction and also promote long term preservation of the stone enclosure. No further survey of the unmarked burying ground was recommended, provided these protective measures are implemented**.**

25-1646 Decima, Elena, Jeff Carovillano and Natasha Zamecnik

1997 Tenneco Gas Pipeline Domac Project-Phase II Saugus-Everett Lateral Line NO. 270C-1100 Saugus and Revere-Massachusetts Intensive Survey Report. 30 pages.

An intensive archaeological survey was conducted within a realigned section of pipeline at the Franklin Marshes Site, a realigned section of pipeline in the Mount Hood area (New England Power Company right-of-way), and several new access roads (cross-over roads) in the vicinity of Mount Hood within the NEPCO right-of-way, in Saugus and Revere. The intensive survey work included a preliminary walkover to assess the sensitivity of the areas to be crossed by the realignment, additional documentary research for the new Mount Hood area, and field testing.

Three areas along the realigned sections were tested by means of systematically and judgmentally placed test pits. The areas are located by the Franklin Marshes site (19-SU-62) in Revere, near wetland D (approximately 500 m north/northeast of Route 99) in Saugus, and near wetland B (in the Mount Hood section), also in Saugus. No prehistoric or historic site was identified. Only twentieth century historic material, mostly trash from abandoned houses, squatters, surrounding houses and drinking parties, was recovered from the excavations. No additional work is recommended.

25-1647 Donta, Christopher L., Thomas L. Arcuti and Mitchell T. Mulholland

1996 Archaeological Site Locational Survey for the Proposed Lee Business Park, Lee, Massachusetts. 57 pages.

An archaeological site locational survey was conducted at the site of the proposed Lee Business Park, which consists of the construction of a series of business lots, associated utilities, roads, and landscaping. Background research determined that no known sites are located within the project area, and that the general vicinity was mainly used for industrial purposes, particularly marble quarrying in the middle nineteenth century. The project area has been disturbed in the past by its use for borrow pits and as a junkyard. The project consisted of the testing of three areas, totaling 48 shovel test pits. No prehistoric artifacts or features were found. No historic sites were identified. No further survey is recommended.

25-1648 Donta, Christopher L. and Thomas L. Arcuti

1997 Archaeological Site Reconnaissance and Locational Survey for the Westfield Middle School, Westfield, Massachusetts. 73 pages.

An archaeological reconnaissance survey was conducted for the proposed middle school in Westfield. Background research indicated that no known sites are recorded for this area during the prehistoric era. Historic use of the area was limited, apparently confined to agricultural purposes. Following background research, the project area was divided into survey units on the basis of topography and proposed impacts, and the property was examined for evidence of prehistoric and historic potential. Recommendations were made for subsurface testing in areas having the potential to contain historic and prehistoric sites. Three survey units were recommended for intensive survey, which was completed through the excavation of shovel test pits. Two prehistoric artifacts were found in the central and northern portions of the project area. Additional test units placed around these artifacts found no other cultural material or associated features. The artifacts appear to be isolated finds. No historic sites were found in the project area. No further testing is recommended for this project.

25-1649 Rainey, Mary Lynne and Duncan Ritchie

1997 Intensive (Locational) Archaeological Survey Miacomet Golf Course Project Area, Nantucket, Massachusetts. 89 pages.

An intensive archaeological survey was conducted of the proposed Miacomet Golf Course project area, which includes an existing 9-hole public golf course and an abutting tract of undeveloped land owned by Nantucket Islands (administered by Nantucket Land Bank Commission). Plans are to rehabilitate the existing 9-hole golf facility and expand to an 18-hole public golf course, within the combined 165-acre tract. An additional 4-acre parcel adjacent to the existing practice fairway is the proposed site of a maintenance facility, and was included in the archaeological survey. Background research and a walkover survey of the project area concluded that most of the project area was archaeologically sensitive and had the potential to contain prehistoric and historic period cultural resources. During the intensive survey fieldwork, 201 test pits were excavated in high and moderate sensitivity zones within the project area. Approximately 36 acres were designated as an undisturbed habitat zone. Subsurface testing did not occur within this zone. The intensive survey

resulted in the identification of two prehistoric find spots. Locus 1 consisted of a single, quartz, Orient-style projectile point discovered near the western edge of the project area. The point is diagnostic of the Terminal Archaic Period (circa 3000 to 2500 B.P.). Locus 2 consisted of a single quartz flake found near the eastern edge of the project area. The two loci are not considered to have the potential to contain additional information about the prehistory of Nantucket. Fourteen test pits in five different locations contained low density scatters of nineteenth- and twentieth-century historic cultural materials. Two of the locations were within the existing golf course, and three were in the undeveloped land near Miacomet Pond. Historic structural remains were not discovered within the project area. None of the historic cultural material finds are considered to mark locations of potentially significant historic period sites. They most likely represent scattered refuse from a nearby farm discarded or dumped in the project area when it was in active pastoral land use. No further archaeological work was recommended for the archaeological site areas.

25-1650 Macpherson, Jennifer and David K. Schafer

1997 Intensive (Locational) Archaeological Survey Greystone Estates Westford, Massachusetts. 103 pages.

This report presents the results of a reconnaissance and intensive survey of the proposed Greystone Estates, a 429–acre residential subdivision in Westford. Eighty 50 x 50 cm test pits were excavated in a series of nine linear transects, and the locations of all test pits were recorded. The project area was inspected for visible, extant historical resources. Photographs were taken that depict the extant historical resources, the general landscape, and the disturbed condition of the soils throughout the project area. The archaeological survey of the Greystone Estates project area did not identify any Native American archaeological sites. Historic resources identified during the survey include four small granite quarries, a nineteenth–century gravestone, a twentieth–century extant foundation, and three granite boundary markers. All but the Northwestern Quarry are small quarries interpreted as being exploratory pits associated with the operation and expansion of the adjacent Fletchers Granite Quarry. Although the area around the Central Quarry contains small amounts of historic materials, such as iron cables and pulleys, the land immediately around the quarry is disturbed and there are no indications of intact above or below ground features associated with the operation of the quarry. An 1849 gravestone belonging to an infant is located in the south-central portion of the project area. Since it is 120 m east of the area that will be impacted by the proposed project construction, no additional testing is recommended. However, it is recommended that the gravestone, adjacent stone walls, and the area within a 30 m radius of the gravestone be marked with high visibility tape in order to prevent accidental disturbance to the grave or to other possible unmarked graves. A historic foundation is located in the northeastern corner of the project. Given the degree of contemporary disturbance and absence of archaeological integrity evident at the site, Historic Foundation 1 is not eligible for inclusion in the National Register of Historic Places. Three small granite boundary markers associated with the Fletchers Quarry were identified within the northeastern and north–central portions of the project area. Although the boundary markers may be impacted by project construction, no additional testing is recommended. The identified historic resources, consisting of four granite quarry pits, an 1849 gravestone, and a historic foundation, are not within the area to be impacted by the proposed cluster/open–spaced layout. If the proposed layout significantly changes, the recommendations will need to be re–evaluated to determine if the identified historic resources will be impacted. Based on the significant degree of disturbance already present, the lack of any recovered cultural materials, and the absence of intact archaeological features, no further testing is recommended for the Greystone Estate project area.

25-1651 Dudek, Martin

1996 Intensive Archaeological Survey Gallops and Bumpkin Islands Harbor Islands State Park Boston, Massachusetts. 30 pages.

An intensive survey with shovel test pits and backhoe monitoring was conducted on Gallops and

Bumpkin Islands to test and archaeologically document the relocation areas for the trail heads. The islands are listed in the National and State Registers of Historic Places as contributing elements of the Boston Harbor Islands Archaeological District. At Gallops Island two areas were surveyed: Area A, on a terrace near the south shore, and Area B, on the south edge of the parade ground in the north-central region of the island. The intensive survey shovel tests recovered historic artifacts from the nineteenth and twentieth centuries. Backhoe excavations at those locations exposed a stone-filled drain in Area A, and a buried A-horizon ground surface in Area B. No significant resources were located in either area, however, the potential for undisturbed prehistoric, historic and Civil War resources is suggested. At Bumpkin Island the intensive survey consisted of shovel test pits to locate the route for a drainage trench for the trail head, and the monitoring of the backhoe excavation and relocation of the trail head. The 17 shovel tests revealed a low-density flake scatter consisting of 3 flakes and 4 possible flakes, covering an area 8 x 4 meters N-S and E-W respectively. A route around the flake scatter was located for the drainage trench. Backhoe excavation of the trench exposed an early twentieth century post/posthole, a probable previous road, and other modern or natural disturbances. The relocation of the trailhead exposed an early twentieth century water main and associated trench, and a shallow bowl-shaped feature, first noticed in 1995, that contained two micro-flakes of red 'jasper' and two small fire-cracked rocks. The nature of the feature and the surrounding area suggest that this area could retain some integrity, but that the World War I camp here has greatly disturbed much of this area.

25-1652 Roberts, Michael

1994 Archaeological Monitoring of Pre-Design Investigation Test Pits at the Army Research Laboratory (ARL-WT) Watertown, Massachusetts. 51 pages.

Archaeological monitoring was conducted for pre-design test pitting at the Army Research Laboratory in Watertown. The purpose of the archaeological monitoring was to observe the progress of back-hoe test pitting in case intact, potentially significant prehistoric and/or historic resources were encountered. Previous research had established the historic and prehistoric archaeological potential at the Army Research Laboratory. This establishment of archaeological potential was based on the monitoring and analysis of 63 borings taken to assess the presence and nature of subsurface hazardous materials. These borings provided information on the site's stratigraphy, from which anticipated depths of fill, extent of cutting, and existence of undisturbed cultural surfaces could be evaluated. The integration of locations where historic and prehistoric archaeological remains might be present and information on filling and/or cutting led to designation of those areas potentially containing archaeological resources that were most vulnerable to ground-disturbing activities. In all, 18 back-hoe test pits were excavated on the Army property. Several test pits were terminated after encountering massive foundation materials. All other test pits were excavated down to culturally sterile material as determined by the archaeologist and the on-site geotechnical engineer. The contents of each back-hoe bucket were slowly spread out to allow the archaeologist to evaluate the cultural contents, if any. In several cases, artifacts were recovered for the purpose of demonstrating fill content and allowing installation public-relations personnel to prepare public information/education materials. Considerable fill was encountered, and in most cases correlated well with previous predictions. No excavations encountered intact, potentially significant historic or prehistoric archaeological resources.

25-1653 Mascia, Sara F.

1994 Report on the Archaeological Investigations at the Jethro Coffin House in Nantucket, Massachusetts. 142 pages.

An archaeological site examination was conducted at the site of the Jethro Coffin House in Nantucket, for the Nantucket Historical Association in advance of the installation of a perimeter drain, storm drain, and landscaping around the house. Field investigations for the project consisted of the excavation of 25 shovel test pits (50 x 50 cm) and 15 test trenches (1m x 50 cm) around the house.

The results of testing produced an extensive artifact assemblage as well as evidence of houselot activities (fencing, utilities, drainage facilities, and cobble paving). The artifacts recovered span the time from the prehistoric/early historical occupation of the site to the present. The area immediately surrounding the house was found to have been significantly impacted by earlier restoration activities (1880s and 1927) as well as by the present restoration work being carried out by the Nantucket Historical Association after the house was damaged by lightning in 1987. The investigation concluded that there would be no adverse affect upon any buried cultural resources by the proposed grading and drain installation.

25-1654 Elia, Ricardo J.

1997 Archaeological Investigations at the Paul Revere House in Boston, Massachusetts. 139 pages.

This report describes the results of archaeological investigations conducted in 1983 at the Paul Revere Memorial Association's property in Boston's North End. The property includes the Paul Revere House, the Pierce-Hichborn House, and remnants of the 17th-century Revere, Barnard, and Hichborn houselots. The archaeological work was conducted in order to assess the effect of two proposed changes to the property: 1) the construction of a bell housing for a Revere-cast bell; and 2) the replacement of a metal staircase behind the Revere House. The National Park Service funded a portion of this work, and the Paul Revere Memorial Association sponsored the archaeological study. The research included historical studies of the Revere, Barnard, and Hichborn lots and the excavation of six test pits totaling 8.14 square meters. The archaeological testing demonstrated that the Revere lot possessed high integrity. The Barnard lot was found to have negligible integrity owing to the fact that a 19th-century building with a basement covered the lot. The west end of the Hichborn lot also had no integrity because it was occupied by a structure with a basement, while the southern part of the Hichborn lot is considered highly sensitive. The excavations in the Revere lot revealed intact yard and garden levels and features, including the original buried topsoil (17th century) and subsoil sequence; a series of strata possibly associated with the 1676 burning of Increase Mather's house; several intact yard and garden levels and features dating to the first half of the 18th century, including a ca. 1720 cobble paving; a mid 19th-century cobble paving; and a wood-lined privy pit dating to the second half of the 19th century. The excavations resulted in the recovery of 12,587 artifacts and organic samples.

25-1655 Donta, Christopher L.

1997 Archaeological Reconnaissance Survey of the Eastern Corridor for the Proposed MMWEC Stony Brook Natural Gas Pipeline, Hampden, Wilbraham, and Ludlow, Massachusetts. 143 pages.

An archaeological reconnaissance survey was conducted along the eastern corridor of the Massachusetts Municipal Wholesale Electric Company (MMWEC) Stony Brook Natural Gas Pipeline Project. The proposed project consists of the construction of a natural gas pipeline that would connect MMWEC's Stony Brook Energy Center in Ludlow to the existing Tennessee Gas Interstate Pipeline in Hampden via Hampden, Wilbraham, and Ludlow. Background research determined that several recorded sites as well as several undocumented prehistoric sites lie within or near the pipeline's eastern corridor. Historic occupation along the MMWEC eastern corridor dates from the eighteenth century, passing near several communities dating to this period. The MMWEC project area contains no buildings on the National Register of Historic Places which will be endangered or impacted by the pipeline. The major effort of this project was a walkover of the 15.7-mile long eastern corridor pipeline route. Based on the background research and the reconnaissance, 43 survey units are recommended for subsurface testing, totaling *7.25* miles in length.

25-1656 Garman, James C.

1997 Archaeological Reconnaissance Survey and Intensive(Locational) Archaeological Survey Peabody-Salem Super Stop & Shop Peabody and Salem, Massachusetts. 77 pages.

This report summarizes the results of a reconnaissance and a intensive archaeological survey on the site of a proposed Super Stop & Shop in the cities of Peabody and Salem. The reconnaissance survey of the project area suggested that the 6.5–acre parcel had the potential to contain Native American and EuroAmerican archaeological sites. Intensive survey of the property, carried out with machine–assistance, has demonstrated that 150 years of land modifications have compromised any stratigraphic integrity within the proposed development. Excavation of Machine Trenches 1 through 3, on the project area's lower terrace, were successful in confirming the original course of the North River. However, while Native Americans almost certainly hunted and fished along the shores of the river, it is likely that occupation and camping sites were on higher terraces of the river, as was the case with the Boston Street Site east of the current project area. Excavation of test pits in the central portion of the project area also demonstrated evidence of landscape modification, with no evidence of a seventeenth–century EuroAmerican presence on the site. It is likely that William Trasks' house was slightly east of the project area, perhaps just outside its boundaries; it is also possible that it was in the project area and has been destroyed by centuries of industrial activity. Excavation of test pits in the southwest corner of the project area indicated that the nineteenth–century house lots at the corner of Main and Howley streets have no stratigraphic integrity. No evidence of archaeological features or intact land surfaces was visible in this portion of the project area. Given the lack of archaeological sites and the extensive disturbance to the project area, no further archaeological survey is recommended for the proposed project area.

25-1657 Waller, Joseph N. and Duncan Ritchie

1997 Intensive Archaeological Survey Sleepy Hollow North Cemetery Expansion, Concord, Massachusetts. 80 pages.

The proposed cemetery expansion includes two access roads from both primary and secondary entrances and a circular, "loop drive" within a project area of about 10 acres. This project will also require installation of drainage lines, grading and landscaping within the cemetery grounds. A known prehistoric period archaeological site, 19–MD–100, is located in the project area. Background research indicated that this site is within a concentration or core area of prehistoric Native American settlement in the Great Meadows section of the Concord River drainage. Historic/modern period land use in and around the project area over the last 350 years has been limited to agriculture. Site 19–MD–100 has been investigated by avocational archaeologists from the Concord area. Several private artifact collections contain stone tools diagnostic of the Middle, Late Archaic and Woodland periods. A prior survey by a professional archaeologist identified some possible concentrations of prehistoric cultural material in one section of the project area. During the intensive survey, systematic surface inspection located chipped stone tools (Find Spot 1) and two concentrations of prehistoric cultural material (Find Spots 2 and 3) in the project area. The locations of these concentrations conformed to an area where artifacts had been found by avocational archaeologists. Subsurface testing confirmed that Site 19–MD–100 has retained some integrity. High to moderate densities of chipping debris were found in test pits placed within Find Spot 2. Another high density concentration of chipping debris was found in the wooded section of the site. Two possible prehistoric features were also found in test pits. The assemblage of prehistoric cultural material collected during the intensive survey included a diagnostic Middle Archaic projectile point (Stark type), two bifacial tool blades and over 200 pieces of chipping debris. Site 19–MD–100 is considered to have the potential to yield more information about Native American settlement and resource use in the Concord River drainage. The proposed cemetery expansion will impact sections of the site known to have concentrations of prehistoric cultural material. It was recommended that a mitigation plan for the identified concentration areas be developed. The mitigation could be carried out by local avocational archaeologists and volunteers working under the direction of a professional(see report 25-1679).

25-1658 Donta, Christopher L. and Norene A. Roberts

1996 Archaeological Site Locational and Examination Surveys for the Proposed Cape Cod National Golf Course, Brewster and Harwich, Massachusetts. 127 pages.

Archaeological site locational and site examination surveys were conducted at the site of the proposed Cape Cod National Golf Course. Background research determined that numerous prehistoric archaeological sites have been recorded in this part of Massachusetts, 17 of which are located within 2 km of the project area. Historic information indicates that the vicinity of the project area has been occupied continuously from the beginning of the Contact period (by Native Americans) through the historic era. Although no structures appear on maps in the project until the 1850s, it is believed that at least one house located on the property dates to as early as 1807. Four historic sites with multiple buildings were recorded, none of which was found to be historically or architecturally eligible for inclusion on the National Register of Historic Places. No further work on the historic sites is recommended. The site locational survey of the project consisted of the testing of 14 areas, sampled by the excavation of 145 shovel test pits (STPs). Prehistoric artifacts were found in two locations, on Fairway 14, just north of an existing cranberry bog, and at Fairway 5. The former location was designated the Wequassett Fairway 14 prehistoric site, and was recommended for additional testing. Site examination (Phase II) of the Wequassett Fairway 14 prehistoric site required 24 STPs and two 1 m-square units, and recovered a small amount of additional lithic and ceramic artifacts, but no intact subsurface features. The site appears to be a temporary campsite or short-term resource use area of some kind. No further investigation of the area is recommended.

25-1659 Smith, Leith and Elena Decima

1997 Intensive Archaeological Survey Gordon College Wenham, Massachusetts. 33 pages.

An intensive archaeological survey was conducted for the proposed construction of a residence hall, associated parking area and a new physical plant building on the grounds of Gordon College in Wenham. The survey consisted of documentary research, a walkover of the project areas and the excavation of twenty eight systematic shovel test pits. Excavations in the area of the residence hall and parking lot, which overlook Coy Pond, revealed no evidence of prehistoric occupation. Use of the area during the historic period was evidenced by a small refuse deposit primarily of architectural debris and some vessel glass. This material was dumped in a shallow depression created by graveling activities in the late nineteenth or twentieth century. Investigation of the site for the proposed physical plant consisted only of a walkover since the area was found to be steeply sloped and heavily disturbed from construction of Route 128, a parking area and skating rink. The proposed residence hall area revealed no evidence of prehistoric occupation and the historic remains were of no known origin and of relatively recent date. The physical plant area was steeply sloped and heavily disturbed by prior construction activities. It was therefore recommended that the proposed construction activities proceed as planned.

25-1660 Strauss, Alan E.

1997 Phase II Archaeological Site Examinations at the Crane Swamp and Old Stony Brook Sites MWRA Walnut Hill Water Treatment Facilities Marlborough and Northborough, Massachusetts. 135 pages.

Site Examinations of the Crane Swamp and Old Stony Brook sites in Marlborough and Northborough were conducted. The sites were first identified during an intensive archaeological survey of the MWRA Walnut Hill Water Treatment Facilities Project. Subsurface testing consisted of a total of 26 shovel test pits and ten one-meter units. The horizontal and vertical boundaries, archaeological integrity, cultural affinities, and temporal associations were determined for both sites. The Crane Swamp site contained over 1,600 pieces of prehistoric chipping debris. The majority of the material (98.1%) was locally available felsite; a small amount (1.7%) was fine-grained volcanic material that may have its source to the west of the Boston Basin or outside New England; and there were a few flakes of quartz (0.2%). One projectile point recovered during the Phase I (Gene-

see-Like or Atlantic) places the site in the period ca. 3,500-5,000 B.P. within the Late Archaic Period. In addition to lithic remains, several fragments of burned deer bone and one fragment of burned wolf/dog bone were recovered. The site is believed to represent a high density lithic workshop/campsite of locally indigenous people who may have interacted with cultures from the west of New England. Alternatively, the site could represent a high density lithic workshop that may be the result of activities of peoples who originated to the west of the site area. The Old Stony Brook site contained a relatively low density of lithic debris (270 pieces); however, it contained 17 tools or projectile points as well as several lithic cores. The points all date to the Late Archaic Period (ca. 3,000-6,000 B.P.) and include Small Stemmed and Small Triangle varieties. In addition several bifaces and an edge tool were recovered. The majority of lithics at the site consist of quartz and quartzite (96.3%) and very little felsite. The site also contained two units that exhibited reddened soil; one unit also contained over 70 fragments of calcined animal bone. This site most likely represents a hunting camp from the Late Archaic Period. It is not clear at this time why there were so many projectile points and so little debitage within such a small area; it may represent some form of non-subsistence behavior. Both sites are located adjacent to Crane Swamp within the uplands of central Massachusetts, a region which has not been as intensively researched as other areas of the state. These two sites, which are unplowed and have excellent archaeological integrity, provide an opportunity to study Late Archaic sites in the uplands of Central Massachusetts. The sites are believed to be potentially eligible for National Register nomination under Criterion A for their relationship to prehistoric settlement patterns in the area and under Criterion D because of their ability to address a broad spectrum of research questions important to our understanding of prehistory in Massachusetts and New England in general. Data recovery programs are therefore recommended if the sites cannot be avoided. A detailed discussion of the alternatives considered is included in Appendix C.

25-1661 Strauss, Alan E.

1997 Intensive Archaeological Survey of the New Stairway at Pilgrim Monument in Provincetown, Massachusetts. 57 pages.

An intensive archaeological survey was conducted at the proposed new stairway at the Pilgrim Monument in Provincetown. The goal of the project was to identify cultural remains that existed within the project impact area and to assess their potential significance. The project consisted of local background research, a field reconnaissance, and subsurface testing. Background data indicated that no prehistoric or historical cultural remains had been recorded in the project area, however the project area at the base of High Pole Hill once contained a house dating to ca. 1840. Subsurface testing consisted of the excavation of six shovel test pits. Prehistoric lithic flakes were identified at the base of High Pole Hill. Historical fill layers and artifacts were found in association with the prehistoric flakes and therefore the integrity of the site has been compromised. The historical artifacts date to the 19th and 20th centuries and are most likely associated with a house that once stood on the property. The Massachusetts Historical Commission determined that the prehistoric and historical archaeological deposits did not posses sufficient integrity or significance to meet the criteria of eligibility for listing in the National Register.

25-1662 Luedtke, Barbara E.

1995 Archaeology at Aptucxet. 50 pages.

The 1995 archaeological field school at the Bourne Historical Society's property at Aptucxet located five archaeological sites, two left by native inhabitants of the area and three by later historic period peoples. The first, named the Cattail site, is located adjacent to a small wetland and represents a quartz chipping station of unknown age. The second, named the Hammond site, overlaps the present Museum grounds and has produced numerous flakes and two Middle Woodland projectile points. Both of these sites may be remnants of much larger sites that were destroyed by construction of the Cape Cod Canal. The three historic sites include the 17th century site focused on the Aptucxet Trading Post Museum, a farmstead located in the southeast corner of the property

that was apparently occupied from the late 18th through late 19th centuries, and another house located in the southwest area that was apparently occupied from the 19th through early 20th century.

25-1663 Strauss, Alan E.

1997 Intensive Archaeological Survey of the Proposed Stage Coach Plaza Development in Westborough, Massachusetts. 34 pages.

Background research indicated that no recorded prehistoric or historical sites were situated within the project area, although data indicated that there were numerous prehistoric sites with in the Assabet River Drainage. Field investigations for the project included a field reconnaissance, followed by the excavation of shovel test pits within the project area. The field reconnaissance resulted in the identification of one area that was considered to be archaeologically sensitive in the north-central portion of the impact area. The remaining areas were disturbed, gravelly, on slopes, or poorly drained, and had low archaeological potential. No prehistoric artifacts or historical features were found during the field reconnaissance. Subsurface testing was conducted in the north central dry portion of the project area. No testing was done in areas that were poorly drained, steep, contained surface bedrock, or disturbed. A total of 42 shovel test pits were excavated. A total of five prehistoric flakes were recovered during the subsurface testing phase of the project. The artifacts represent a very small and localized prehistoric site where tool making or maintenance took place. No diagnostic artifacts or subsurface features were identified. Small amounts of 19th- and 20th-Century artifacts were found, however, these did not represent a significant historical deposit. Because the prehistoric site has limited research potential and is not eligible for nomination to the National Register of Historic Places, no further archaeological investigations are recommended.

25-1664 Donta, Christopher L. and Thomas L. Arcuti

1996 Archaeological Site Locational Survey for the Routes 6/132 Interchange Park and Ride, Barnstable, Massachusetts. 66 pages.

Background research determined that two known prehistoric archaeological sites exist within 750 m of the project area, although little is known about these sites. Historic information indicates that the area was not utilized until the latter half of the nineteenth century, with no construction ever recorded for the project area itself, resulting in an evaluation of low potential to contain historic sites. In recent decades, commercial development has taken place here. The survey consisted of the testing of three areas, totaling 36 shovel test pits. No artifacts or features of any kind were found. No further survey of this project area is recommended.

25-1665 Fragola, Patricia S and Duncan Ritchie

1996 Intensive (Locational) Archaeological Survey, Highfields of Grafton, Grafton, Massachusetts. 147 pages.

Based on background research and a walkover survey, most of the project area was considered to have moderate to high sensitivity for prehistoric and historic period cultural resources. The Highfields project area consisted of hilly, upland terrain in close proximity to the Quinsigamond River, a major tributary of the Blackstone River. Two known prehistoric sites were located just outside this project area. Sections of the project area near wooded wetlands and small streams also had strong potential to contain prehistoric sites. The project area included Keith Hill, known to have been within the Hassanamisco Plantation. This historic period Native American settlement was occupied from the mid-seventeenth to eighteenth century. Background research indicated the project area had the potential to contain the meetinghouse and other elements of this Praying Indian community. Large sections of the project area had been in agricultural use since at least the early-eighteenth century and there was also some potential for this property to contain abandoned farmsteads or other evidence of this land use. A systematic surface inspection of plowed fields in the

project area resulted in the identification of two prehistoric and two historic period sites. The prehistoric sites (Highfields 4, 6) were small findspots or loci of cultural material, primarily chipping debris. One of these loci, Highfields 4, was an isolated recovery of a Late Woodland Period projectile point. The two historic period sites exposed on the surface were the location of a house (Pratt-Keith Site) marked by fieldstone rubble and plowed sheet refuse and a small borrow pit/stone quarry. Subsurface sampling on the Pratt-Keith Site yielded an assemblage of mid eighteenth to early nineteenth domestic refuse and structural materials. Subsurface testing also identified four other prehistoric sites. Three of these (Highfields 2, 3, 5) were small findspots of chipping debris or a bifacial tool blade. One site (Highfields 1) appears to contain a single Middle Archaic component and lithic workshop. Six of the sites (Highfields 2, 3, 4, 5, and 6 and historic/modern stone quarry) identified in the project area are not considered to be potentially important cultural resources. Two sites, Highfields 1 and Pratt-Keith are recommended for further study at the site examination level to evaluate their potential significance and eligibility for listing on the National Register of Historic Places.

25-1666 Strauss, Alan E.

1997 Intensive Archaeological Survey for the Lake Winthrop Park Urban Self-Help Project in Holliston, Massachusetts. 30 pages.

An intensive archaeological survey was conducted for the proposed improvements for Stoddard and Patoma Parks on Lake Winthrop in Holliston, Massachusetts. The goal of the survey was to identify cultural remains that existed within the project impact area and to assess their potential significance. The survey consisted of local background research, a field reconnaissance, and subsurface testing. Background data indicated that one prehistoric site (19-MD-239) had been recorded in or adjacent to the project area. No historical structures or features were expected within the impact areas. Subsurface testing consisted of the excavation of 30 shovel test pits in the project area within the proposed parking a new lodge sites. No prehistoric or historical artifacts were recovered during the intensive testing. Because no prehistoric or historical sites were identified within the impact area, no further archaeological investigations are recommended for the Lake Winthrop Urban Self-Help project.

25-1667 Wheeler, Kathleen and Myron O. Stachiw

1996 Archaeological Investigations at Cogswell's Grant: Foundation and Downspout Drainage Improvements, Essex, Massachusetts, October-November 1995. 81 pages.

Archaeological investigations took place in the vicinity of the Cogswell's Grant House in three phases. Phase I included a data recovery in anticipation of excavating trenches to channel roof runoff away from the house. Phase II included further investigations of an early foundation wall at the southeast corner of the house. Phase III included monitoring backhoe excavations for the installation of the new drainage pipes. In the southwest corner of the yard, no significant archaeological resources were encountered during hand excavation, and the backhoe trenching proceeded for the installation of the new drainage system. In the southeast corner of the yard, highly sensitive deposits including a stone foundation(Feature 11) and prehistoric remains were found. The stone foundation could represent the 17th-century William Cogswell dwelling. Because of the high sensitivity of both prehistoric and historic resources in this area, 100 % sampling was recommended of all areas to be impacted prior to construction. Portions of one drainage line were also recommended to be aborted due to disturbance and possible destruction it would create for the foundation. Alternative drainage lines were recommended. Based on ceramic and pipestem evidence, Feature 11 appeared to have been occupied through the first half of the 18th-century. In the northeast corner of the yard, an early stone footing(Feature 13), possibly associated with the late 17th-century Feature 11 was found north of the house. Because Feature 13 may represent part of the original William Cogswell House, data recovery excavations were recommended prior to trenching in this area. The data recovery from the Cogswell Grant has produced a rich collection of archaeological artifacts. Preliminary cataloging and identification have been performed for the preparation of this

report. However, the interpretation of the site can gain a great deal from further analysis of the archaeological assemblage.

25-1668 Strauss, Alan E.

1997 Archaeological Reconnaissance Survey of the proposed Waterford Park Development in Marlborough, Massachusetts. 31 pages.

Background research indicated that no prehistoric sites were situated within the project area, although data indicated that there were numerous prehistoric sites within the Assabet River Drainage and that the area was in close proximity to the Hillside and Robin Hill Schools which contain 19th-century buildings. Plans of the project area from 1960 indicated that soils were removed to a depth of from two to seventy-four feet from the eastern part of the project area. Field investigations for the project consisted of a field reconnaissance followed by the excavation of cores and deep probes within the project area. The field reconnaissance indicated that while the eastern part of the project area has been disturbed, the western portion may contain intact soils and possibly undisturbed prehistoric sites. It was recommended that an intensive archaeological survey be conducted in the western portion of the project area in order to locate buried cultural remains and to assess the area's archaeological integrity.

25-1669 Donta, Christopher L., Thomas L. Arcuti, Frederick T. Barker and Mitchell T. Mulholland.

1997 Archaeological Site Reconnaissance and Site Locational Surveys for the Proposed Sewer System, Southwick, Massachusetts. 94 pages.

Background research indicates that portions of the project area were heavily utilized during the prehistoric era, particularly in the vicinity of Congamond Lakes. Historic use of the area began in the mid-eighteenth century, and consisted primarily of residential development and the production of gunpowder, tobacco, and ice. Following background research, the project area was divided into survey units on the basis of topography, and the property was examined for evidence of prehistoric and historic potential. Recommendations were made for subsurface testing in areas having the potential to contain historic and prehistoric sites. Three survey units were initially recommended for further investigation, which was completed as a site locational survey. Much of the project area has been impacted by heavy residential development during this century. Nevertheless, one prehistoric and two historic sites were found. Artifacts found consist of chert and quartz lithic debris associated with the prehistoric site, and a variety of late eighteenth- and early nineteenth-century domestic artifacts associated with two historic house sites. Since the start of the project, the route that would have impacted the three sites has been relocated to a railroad berm that parallels the original route. No impacts to archaeological sites are anticipated in this area. Historic features along the nineteenth-twentieth century railway were documented in this survey. One further area was added to the project following the completion of the subsurface testing. Reconnaissance and site locational surveys of this area were conducted. No further testing is recommended for this area.

25-1670 Decima, Elena B., Jeff Carovillano and Barbara Donohue-Putnam

1997 Reconnaissance and Intensive(Locational) Survey, Charles River Wellfield Water Treatment Facility, Needham, Massachusetts. 38 pages.

Historic research, a walkover and test pit excavation were conducted within a 67-acre parcel owned by the Town of Needham as water supply land. The intensive survey covered approximately 3 acres where the new water treatment facility will be located and where several new water and sewer connections will be made. The field work, which consisted of the excavation of 78 systematic test pits, with seven judgmentals and four brackets, covered most of the area identified for construction impacts. The survey recovered one isolated chert flake and a handful of historic artifacts (one whiteware sherd, one redware sherd, 2 machine-cut nails, three brick

fragments and some modern glass). The chert flake is considered a spot find, perhaps associated with undetected sites of the general vicinity, or with site 19-MD-612, a Middle Woodland site in Wellesley that yielded chert flakes. The find is not considered to be potentially eligible for the National Register of Historic Places; thus, no additional archaeological work is recommended in this approximately 3-acre area to be developed within the 67-acre parcel. The reconnaissance survey found little historic disturbance within the 67-acre parcel. Most of the area is rather flat and within 100 m. from either the Charles River, or the two streams and the adjoining wetlands of the area. On the basis of these variables, most of it was assigned high prehistoric potential. Two small areas by Charles River Street were assigned medium prehistoric potential. Because of the possibility that extensive wetlands could have covered the parcel in the past, it is recommended that if any further work is proposed in the remaining 64 acres, more in-depth topographical research take place to study the past topography of the parcel. If no clear proof is found to demonstrate that the wetlands were once more widespread, then an intensive (locational) survey should be conducted.

25-1671 Begley, William and James C. Garman

1997 Intensive(Locational) Archaeological Survey, High Rocks Sewer Project, Blackstone, Massachusetts. 50 pages.

An intensive (locational) archaeological survey was conducted at three locations along Route 122 (Main Street) in Blackstone. Plans for the High Rocks Sewer project include plans to bore new sewer pipe under the Blackstone Canal and construct a new pumping station. During the intensive archaeological survey of the High Rocks Sewer project area, a total of 18, 50 x 50 cm test pits were excavated in three impact locations. At the proposed pumping station, a total of ten test pits revealed previous disturbance associated with modification of the existing terrace, including cutting, filling, and modern trash dumping. Investigation of the jacking and receiving pits recorded relatively undisturbed soils, but recovered no artifacts associated with Native American or EuroAmerican archaeological sites. In addition to the testing, field personnel carefully inspected the areas of proposed work. No evidence of any canal features was observed either through the archaeological testing or the walkover. Because no archaeological sites or canal features were identified in the archaeological survey, no further archaeological investigations are recommended for the project.

25-1672 Dwyer, Alison and James D. Stark

1996 Intensive Archaeological Survey, Walden Pond State Reservation, Concord, Massachusetts. 38 pages.

Walden Pond's high visitation rate, in conjunction with natural processes, has caused many of the reservation's paths to become badly eroded. As a result, the Massachusetts Department of Environmental Management (DEM) will be embarking on a project to reconstruct, stabilize and restore the paths, slopes and banks along the north and south shores of the pond. The Massachusetts Historical Commission (MHC) requested that an intensive archaeological survey be conducted in an area (Area "A") located at the eastern end of the North Path prior to the stabilization project. In addition to this work, the DEM requested that archaeological work occur in two other areas identified as areas "B" and "C" (Fig. 2). The purpose of conducting work in Area "B" was more precisely to identify the location of the bean field Henry Thoreau tended while living at Walden and to identify the trees he planted after he left. The work in Area "C" was designed to identify the remains of the hut belonging to Edmond Hotham--a man who lived at Walden during the winter of 1869. Excavation within Area "A" indicated that the area has experienced excessive erosion from water run off and path use. It appears that little or none of the original topsoil is present. Only twentieth century artifacts were recovered. No additional work was recommended. Excavation within Area "C" identified a distinct concentration of artifacts which may the vicinity of Hotham's hut. Unfortunately, the stratigraphy cannot further clarify the hut's location. It is not surprising the remains are so ephemeral, given the short period of time

Hotham lived at Walden. Additional work in the area may be able to further clarify the location of the hut. Archaeobotanical work within Area "B" identified the stumps of 21 white pines; unfortunately the stumps were too decayed to permit coring for dendrochronology. Therefore, it is unknown if these were planted by Thoreau.

25-1673 Rainey, Marylynne and Duncan Ritchie

1998 Intensive(Locational) Archaeological Survey, Eel Point Road Bicycle Path Enhancement Project, Nantucket, Massachusetts. 84 pages.

An intensive archaeological survey was completed of the proposed Eel Point Road Bicycle Path project area located in Nantucket. Massachusetts. The Town and County of Nantucket are proposing the construction of the Eel Point Road Bicycle Path to link the Madaket Road Bike Path to Dionis Beach, a distance of approximately 0.8 mile (mi) (1.4 kilometer). The route will follow the north side of Eel Point Road and the east side of Dionis Beach Road, crosscutting a series of gently rolling hills along the northern margins of Trott's Hills in the western section of the island. Background research and a walkover survey concluded that most of the project area was archaeologically sensitive for the potential to contain prehistoric period cultural resources. During the intensive survey fieldwork, test pits were excavated in high and moderate sensitivity zones within the project area. The intensive survey resulted in the identification of two prehistoric find spots. Find Spot 1 consisted of two rhyolite flakes found in a single test pit along Eel Point Road. In this location, the soil context was interpreted as fill resulting from a telephone pole installation. Find Spot 2 consisted of four rhyolite flakes found in two adjacent test pits 5 m apart, also along Eel Point Road. The two loci are not considered to mark the locations of potentially significant prehistoric sites. Six test pits in Transect A along Dionis Beach Road contained low density scatters of historic and modern period cultural materials. All of the material was recovered from fill contexts associated with this unpaved road. None of the historic cultural material is considered to be significant. No further archaeological investigation is recommended.

25-1674 Clements, Joyce M.

1998 Report of a Phase I Intensive(Locational) Archaeological Survey, Northside Militia Training Field, Charlton, Massachusetts. 41 pages.

This report presents the results of a Phase I intensive (locational) archaeological survey at the Northside Militia Field in Charlton. The Phase I Survey consisted of documentary review, informant interviews and subsurface testing in the footprint of a proposed walking trail around the perimeter of the field. Field investigations produced evidence of general sheet refuse containing historical artifacts and two features associated with refuse burning on the eastern margins of the Militia Field. Neither the features nor the sheet refuse represent an archaeological site that would be potentially eligible for listing on the National Register of Historic Places. It is therefore unnecessary for further archaeological evaluations, and the project may proceed as planned. However, the views and vistas surrounding the field allow a viewer to imagine how a portion of Northside Village may have looked in days gone by. These views and vistas, that eloquently recall a peaceful, more gracious time, should be cherished and protected.

25-1675 Strauss, Alan E.

1996 Intensive Archaeological Survey of the Shankpainter Associates Subdivision in Provincetown, Massachusetts. 35 pages.

An intensive archaeological survey was conducted at the proposed Shankpainter Associates Subdivision adjacent to Shank Painter Pond in Provincetown. The survey consisted of local background research, a field reconnaissance, and subsurface testing. Background data indicated that no prehistoric or historical cultural remains had been recorded in the project area. Subsurface testing consisted of the excavation of 37 shovel test pits. No prehistoric and no significant historical artifacts were recovered during the intensive testing. Deep core testing using a bucket auger was con-

ducted to determine if evidence of sites existed beneath the dunes. Testing determined that the project area consists of an ancient sand dune deposits to a depth of at least twelve feet. Proposed project impacts will only occur to a maximum depth of eight feet. Because no prehistoric and no significant historical sites were identified, no further archaeological investigations are recommended.

25-1676 Garman, James C., Paul A. Russo and Stephen A. Mrozowski

1996 Results of an Intensive(Locational) Archaeological Survey of the Middlesex School East Fields Project Area and a Site Examination Survey of "The Paul Adams Place", Concord, Massachusetts. 118 pages.

An intensive (locational) archaeological survey and a program of supplemental investigations were completed at the planned site of the Middlesex School East Fields Athletic Facility in Concord. The proposed project includes the construction of new athletic fields and faculty housing east of the current campus. A wetland crossing, a new access road, and landscaping are also elements of the plan. This report, which serves as the final summary of all investigations completed to date, describes the goals and methodology of the fieldwork, details the results of the investigations, and provides recommendations concerning the potential National Register-eligibility of three archaeological sites identified and evaluated in the study: "The Paul Adams Place", a late eighteenth to early-nineteenth century farmstead; the Blue Salamander Site, a Late Woodland to Contact-era lithic maintenance camp; and the hilled field, a relict agricultural landscape likely dating to the eighteenth century. "The Paul Adams Place" is considered eligible for listing on the National Register under Criterion D. Archaeological investigations of the site have yielded important information about long-term changes in landscape, with particular regard to changing agricultural economies in Concord during the first half of the nineteenth century. Based on the results of the site examination, the site is likely to continue to yield information concerning the households of Hugh and Rebecca Cargill as well as that of Paul and Rebecca Adams. The site has a high degree of integrity; little post-abandonment disturbance was noted during the study. Current project plans indicate that Middlesex School will not impact "The Paul Adams Place" as part of the proposed construction. Avoidance of "The Paul Adams Place" during all construction activities is recommended. If project plans change and the site cannot be avoided, data recovery is recommended. This could entail machine stripping of impact areas prior to construction and excavation and analysis of selected features, including trash dumps, wells, and other significant deposits. The Blue Salamander Site appears to be a discrete locus of Native American activity stretching across the eastern portion of the proposed development. Based on the presence of chipping debris in the hill features of the hilled field, this site may have once extended across the field. However, construction and maintenance of the field has likely had an impact on any site that might have been there. Project plans will not impact the area in which Native American material was discovered. Furthermore, the absence of features or even a well-defined site makes it unlikely that the Blue Salamander Site is eligible for listing in the National Register. Based on current project plans, no further archaeological survey is recommended for the Blue Salamander Site. The hilled field, identified by Henry David Thoreau as a Native American corn field, appears to be a relict eighteenth-century agricultural landscape. Its survival is unprecedented in Massachusetts. The field has the potential to answer a range of questions concerning agricultural methods and intensification of agricultural economies in the early nineteenth century. Furthermore, it is possible that the hilled field was constructed on an earlier Native American site. Current project plans indicate that Middlesex School will not impact the hilled field as part of the proposed construction. Avoidance of the hilled field during all construction activities is recommended. If project plans change and the site cannot be avoided a site examination is recommended.

25-1677 Clements, Joyce M.

1997 Results of a Phase I Intensive(Locational) Archaeological Survey, Thomas-Webster Estate, Marshfield, MA. 58 pages.

This report presents the results of a Phase I intensive (locational) archaeological survey on the

Thomas Webster Estate in Marshfield. The survey consisted of documentary review, informant interviews and subsurface testing in a small grassy area adjacent to the existing dwelling. Field investigations produced evidence of an intact historical horizon that dates to the nineteenth century and may be contemporary with Daniel Webster's tenure. A modest fieldstone wall represents 19th-century landscaping between a gravel drive and a small garden. A cut slab , found resting on the buried horizon under dense fill deposits, is associated with a late 19th or early 20th-century retaining wall extant to the north of the existing dwelling. At the request of archaeologists, project engineers have modified the proposed facilities to avoid both features. Subsurface testing also produced evidence of a prehistoric lithic workshop in the impact area. Prehistoric material consisted of quartz and felsite flakes and angular shatter, and two broken felsite blades. All the prehistoric material came from disturbed contexts, including engineers 'perc' tests, uppermost topsoil and fill, and within the buried historical horizon. Therefore, no further testing of the prehistoric site is recommended. However, because of high potential for both historic and prehistoric sites throughout the remainder of the estate archaeologists recommend that any subsurface activity on the property be preceded by archaeological testing.

25-1678 Clements, Joyce M.

1997 Archaeological Monitoring During Construction, Route 149/Mill Pond Stormwater Quality Improvement Project: MHC # 17190. 13 pages.

This memorandum presents the results of archaeological monitoring during construction in the village of Marstons Mills, Barnstable, Massachusetts. Monitoring was requested by the Massachusetts Historical Commission to avoid unintentional damage to adjacent archaeological features identified during an earlier Phase I intensive(locational) survey(#25-1632) of the project. Previous research indicated that this area of Marstons Mills could contain archaeological deposits associated with the 19th-century J.M. Backus dwelling and outbuildings. During the monitoring, a small foundation was identified which was interpreted as a small outbuilding probably associated with the J.M. Backus Homestead. The foundation remains were determined to be adequately protected and secure. No further research was conducted for this resource. In the future, members of the Barnstable Land Trust will work with the Barnstable Department of Public Works to place protective shrubbery(e.g. wild roses) around the project area to limit access and reduce the visibility of the foundation remains.

25-1679 Blancke, Shirley

1998 Volunteer Intensive Archaeological Survey of the Sleepy Hollow North Cemetery Expansion: Final Report. 20 pages.

A volunteer survey was conducted for the area planned for expansion of the Sleepy Hollow Cemetery in Concord. Testing was designed to complement the intensive survey previously conducted in the project area(see report 25-1657). Results of the testing reveal the presence of an archaeological site with considerable research potential in the western portion of the cemetery expansion area. A Transitional Archaic Fishtail point and a Woodland period ceramic sherd added to the previous findings of a Middle Archaic Stark point suggesting that the site was inhabited at intervals by Native Americans for more than 6,000 years. Several intact features attested to the integrity of the site. It was recommended that the east side of the project area be constructed first so that additional archaeological research can be conducted to mitigate the effects of the cemetery expansion on the western side. Because this will be a volunteer project, it is important that sufficient time be available to organize a volunteer group and conduct the excavations.

25-1680 Donta, Christopher L. and Thomas L. Arcuti

1997 Archaeological Site Reconnaissance, Locational, and Examination Surveys for the Hanson Middle School, Hanson, Massachusetts. 84 pages.

An archaeological reconnaissance survey was conducted for the proposed middle school in Hanson, followed by a locational survey and a site examination. Background research had indicated that portions of the project area may have been utilized during the prehistoric era, as there was one recorded prehistoric site potentially within the property (19-PL-575). Following background research, three survey units were recommended for further investigation and a site locational survey was completed in these units. One new prehistoric site was identified, named the Little Cedar Swamp site. No sign of the previously recorded site 19-PL-575 was found. No historic sites were located. The Little Cedar Swamp site included a number of lithic waste flakes, charcoal, and a possible feature over a small area within the proposed footprint of the school building. Additional testing of this site was recommended to ascertain its age, extent, and nature. A site examination survey of the Little Cedar Swamp site, however, resulted in only a minimal amount of information being recovered. No diagnostic artifact types or cultural features were found. The feature was found to be a natural anomaly, and the site was assessed as having a low artifact density with little potential to contribute to our knowledge of prehistory of the region. No further testing was recommended.

25-1681 Keene, Arthur S. Claire C. Carlson and Kit Curran

1997 Interim Report of the 1995 UMass Archaeological Summer Field School. 136 pages.

This report summarizes the archaeological work conducted at three locations in Deerfield by the UMass/Amherst field school under MHC permit #1431. Research was conducted at the Pine Hill Site, the Dwight House Historic Homelot and at Pocumtuck Ridge areas A and B. The report consists of a summary of the fieldwork conducted, a report of ongoing materials analyses, individual student authored reports on the three field school sites, and additional papers by the field school staff that address ongoing UMass research in Deerfield.

25-1682 Thomson, Charlotte M.

1980 Archaeological Survey(Reconnaissance Level) for the Danvers, Massachusetts Sewerage System Improvements. 26 pages.

The survey had three objectives: to identify archaeological and historic sites that might exist within the proposed sewer easements, to record any sites so identified, and to advise the Massachusetts Historical Commission and consulting engineers on the effect of construction activities on any properties identified as a result of this or prior studies. One recorded prehistoric site and a historic dump were found in the project area. The historic dump was not considered significant. It was recommended that the consulting engineers consult with the Massachusetts Historical Commission on the necessity of a Phase II or Intensive survey to determine the horizontal and vertical extent of the prehistoric site. For the rest of the project, sewer construction activities were expected to have a minimal impact on cultural resources.

25-1683 Ryerson, Alice

1975 The Chocker’s Point Site, An Archaeological Study. 59 pages

The site described in this report is an Indian shell heap on the south shore of Menemsha Pond in the town of Chilmark on the island of Martha's Vineyard in Massachusetts. It is a small site, much eroded by the action of water on its northern side, where a cross-section through the center of the midden is exposed on the low bank along the beach. Its existence has been known locally for a long time partly because the shell layers are easily visible where the water has made its neat cross-section, and partly because artifacts have been found washed from the midden onto the adjoining beach. The Ryerson family owns Chocker’s Point and built a summer home there in 1950. An area of eighty square feet was dug in 1972, 1973, and 1974, in the southern side of the remaining shell layers. A trench was excavated to a depth of about two and a half feet; below this there was yellow sand containing no shell. Several distinct shell strata were encountered; the next to earliest associ-

ated with pottery of a Middle Woodland type, and the latest with projectile points usually identified as belonging to the Late Woodland stage in the northeast. Tentatively (no carbon dating has been done), occupation of the site spanned the time from about 400 A.D. to about 1400 A.D. A few artifacts found in the sand below the shell layers may indicate an earlier Archaic occupation.

25-1684 Skinas, David

1997 USDA Natural Resources Conservation Service FY96 Cultural Resources Activities End of Year Report for Massachusetts. 40 pages.

This document describes all NRCS cultural resource activities conducted in Massachusetts during the federal fiscal year 1996. Included in this report are Practice Description Forms, Trip Reports and copies of USGS quadrangle maps that show the location of each practice that was reviewed. The Cultural Resources End of Year table shows the data that is annually submitted to National Headquarters and then to Congress. A total of 47 conservation practices were reviewed in Massachusetts during FY96. Forty-five projects had a finding of no significant archaeological or historic properties. Two additional projects had a no effect finding after construction was relocated to avoid archaeological sites.

25-1685 Skinas David C.

1997 Archaeological Site Examination of the Northland Cranberry Inc., Project(BA-1-96), Nantucket, Nantucket County, Massachusetts. 26 pages.

This study focused on an area where an open channel is proposed around two cranberry bogs. The Massachusetts Historical Commission determined that the project was located within an area identified as a prehistoric and historic Native American settlement, and that an intensive archaeological survey was required if well drained sandy soils adjacent to Phillips Run would be disturbed. The intent of the investigation was to determine if prehistoric archaeological sites considered eligible for the National Register of Historic Places might be affected by the proposed project. Six loci of prehistoric Native American activities were identified. Five loci were located in the proposed construction zone where many of the archaeological materials were identified in a disturbed context. A sixth intact locus of activity was found outside of the area of potential effect.

25-1686 Skinas, David C.

1997 Archaeological Reconnaissance Survey of the R. Jenkins Irrigation Project(BA-5-96), Brewster, Barnstable County, Massachusetts. 10 pages.

The USDA Natural Resources Conservation Service in Massachusetts is providing assistance to R. Jenkins to design and construct a spray irrigation system for his strawberry farm located in Brewster. The Jenkins project (Ba-5-96) was submitted for review to the Massachusetts Historical Commission (MHC). The MHCC determined that this project may be located in an area that is known or expected to contain historic or prehistoric archeological resources and recommended that the NRCS archeologist conduct an archeological reconnaissance of the Jenkins project. This report describes the results of a systematic surface survey and limited subsurface testing within the area of potential effect. The intent of this investigation was to determine if prehistoric archeological sites considered eligible for the National Register of Historic Places might be affected by the proposed project. Five loci of prehistoric Native American activities were identified. The layout of the irrigation project was redesigned and placed in disturbed soils to avoid the archeological site.

25-1687 Folsom, Michael and Laurence Gross

1979 Middlesex Canal Survey, Final Report. 46 pages

The purpose of this survey was to provide the Middlesex Canal Commission and the Northern

Middlesex Area Planning Council with the information they need to plan future development of the Canal and associated properties for educational and recreational use. The Middlesex Canal is located in Eastern Massachusetts between the Merrimack River and Boston. In addition to reviewing previous research and existing archival resources, the research team was also engaged to survey the surviving physical remains of the Canal and to present their findings, primarily in the form of maps, indicating as accurately as possible the route of the Canal and the location of associated features on Town Assessor's plats, or other municipal maps. Remote sensing with a proton magnetometer was employed during the survey.

25-1688 Loparto, Leonard

1986 Draft Report, Prehistoric Background Study, Olmsted Parks Project. 21 pages.

This draft study outlines the background prehistory for five Olmsted Parks in the Roxbury area of Boston, Massachusetts. The parks include Franklin Park, Back Bay Fens, Jamaica Pond, Olmsted Park and the Riverway. The study utilizes documentary sources to summarize prehistoric settlement patterns emphasizing the greater Boston area, the Charles River Drainage and the Muddy River/Stony Brook drainages. Important sites are notes as they provide data which contribute to the different stages of prehistoric history for southeastern New England. The history of archaeological research in the Greater Boston area is discussed as well as the archaeological potential of the individual parks under study.

25-1689 Ring, James W. and James W. Skehan

1986 Geologic History of the Five Olmsted Parks in the Boston Basin. 31 pages.

This draft report represents the geological portion of a documentary study for five Olmsted Parks in the Roxbury area of Boston, Massachusetts. Report No. 25-1688 presents the background prehistory for this project. The five Olmsted Parks under investigation include Franklin Park, Jamaica Pond, the Riverway, Olmsted Park and the Back Bay Fens. Since all five parks share the common geologic history of the Boston Basin area, that topic is discussed first followed by the geology of each individual park. The study includes discussions of such topics as stratigraphy, structure, lithology, early and recent history and Pleistocene History. References, figures and tables are included.

25-1690 Strauss, Alan E.

1998 Intensive Archaeological Survey of the Osborn House Site Lot 2A Franklin Cartway in Brewster, Massachusetts. 37 pages.

An intensive archaeological survey was conducted of the proposed Osborne House site on Lot 2A, Franklin Cartway in Brewster. The project is slated for the construction of a single family house, driveway, and septic system. Background research indicated that there was one recorded prehistoric site within or adjacent to the project area. Historical resources indicated that the area was used undeveloped throughout the historical period. Field investigations consisted of a field reconnaissance followed by the excavation of 19 shovel test pits. Subsurface testing revealed the presence of a small, very low density prehistoric site that contained primarily quartz chipping debris. One quartz flake was recovered at the base of the plowzone in Test Pit 7. Bracketing around this unit failed to produce further cultural remains. A limited and discontinuous deposit of marine shell was found in one location within a buried plowzone. A few fragments of quartz, thought to be possibly prehistoric, were recovered from the shell deposit. However, shell was also found mixed with historical artifacts in the overburden layer above the buried plowzone. Consequently, it is unclear if the shell deposit is of prehistoric or historical origin. Because of the poor archaeological integrity of the site, the low density of artifacts, the lack of internal site complexity, and the absence of diagnostic tools, the project site is considered to have minimal research potential. No further archaeological investigations are recommended for the project area.

25-1691 Begley, William and Duncan Ritchie

1998 Intensive(Locational) Archaeological Survey, Robinson Well Project Area, MHC No. RC 20211, Concord, Massachusetts. 64 pages.

An intensive archaeological survey was conducted of the proposed Robinson Well Site project area in Concord. The proposed development project consists of a well, control station and approximately 1800 feet of water main. The project area is adjacent to the lower Sudbury River and had the potential to contain both prehistoric and historic period cultural resources. Background research indicated that the project was within a core area of prehistoric Native American settlement/land use. A number of known prehistoric sites are located in the immediate vicinity in both riverine and upland environmental settings. Historic period settlement in and around the project area consisted of farmsteads and large parcels of land in agricultural/pastoral use. A walkover inspection confirmed that the project area had minimal evidence of prior alteration or disturbance. The proposed locations of the well, control station, and most of the water main easement were expected to have high and moderate archaeological sensitivity. One section of the water main easement on a steeply sloping hillside was considered to have low archaeological sensitivity. Subsurface testing within the zones of high and moderate sensitivity did not identify any prehistoric or historic period archaeological sites. A small amount of historic/modern period cultural material including ceramic sherds and coal was found in several test pits along the water main easement. This material was found in a plowzone context and was interpreted as a scatter of domestic refuse from a nearby farmstead or other dwelling along Sudbury Road. It is not considered to be a potentially significant cultural resource and no further archaeological investigation of the Robinson Well project area is recommended.

25-1692 Doucette, Dianna L. and John R. Cross

1997 Annasnappet Pond Archaeological District: An Archaeological Data Recovery Program, North Carver, Massachusetts. 1,043 pages. 3 volumes.

As part of the Massachusetts Highway Department's Carver to Plymouth Route 44 Relocation project (see Reports #25-256, #25-257, #25-327, #25-388, #25-389, #25-1191, and #25-1633, #25-1838), site examination and data recovery investigations were carried out within the Annasnappet Pond Archaeological District (19-PL-337). Nine loci were identified initially during investigations conducted from 1978 to 1980. The Massachusetts Historical Commission recommended that four of the Loci (1, 2, 8, and 9) constituted an archaeological district and were eligible for nomination to the National Register of Historic Places. The fieldwork took place between 1992 and 1995. The data recovery program consisted of partial retrieval (approximately 5%) of archaeological resources within the 16,900 sq m that make up the four site areas. Artifact assemblages and features representing the Late Paleoindian to the Middle Woodland periods were identified. A Middle Archaic human burial feature was uncovered at Locus 1 represented by calcined human cranial fragments associated with two winged atlatl weights, two Middle Archaic Neville projectile points, and a radiocarbon date of 7570 ± 150 BP (Beta 58115). This is the earliest human burial in Massachusetts and one of the earliest burials in the Northeast. This discovery provided evidence for the earliest use of winged atlatl weights in the Northeast. Following the burial identification, a Native American observer was on-site for the remainder of excavations at Locus 1 and for all of the Locus 9 excavations. The investigations yielded the largest assemblage of radiocarbon dates for Middle Archaic artifacts in the Northeast. This assemblage allowed a re-examination of the technological and morphological bases for classifying Middle Archaic chipped stone industries in the Northeast. In addition, a palynological study conducted in a nearby wetland provided radiocarbon-dated vegetation sequences that corresponded with the two significant periods of human occupation at Annasnappet Pond: 8,000-6,500 years ago and 4,000-2,000 years ago. This study showed decreasing water levels between 9,500 and 7,500 years ago, rising water levels after 4,500 years ago, and intermittent periods of flooding during the interim. The palynological data indicated that conditions were wetter and that drier conditions came about much more gradu-

ally during the Late Archaic period than traditionally believed. The archaeological data were used to explicate the full depositional history of the site and to examine subsistence practices and settlement patterns at the subregional and regional levels. The excavations at Loci 1, 2, and 9 suggest that the southwestern edge of Annasnappet Pond was occupied briefly during the Late Paleoindian and Early Archaic periods. There was a substantial and nearly continuous distribution of materials from these three loci, dating to the Middle and Late Archaic periods, however. These loci may be viewed as a single site where a variety of activities took place. Loci 1 and 9 were also used briefly during the Early and Middle Woodland periods. The data recovery excavations at Locus 8 support the interpretation that the northeastern edge of Annasnappet Pond was occupied briefly during the Early Archaic Period, more intensely during the Late Archaic Period, and briefly again during the Middle Woodland Period.

25-1693 Cherau, Suzanne G., Jennifer Macpherson, and Matthew Kierstead

1997 Archaeological Site Examination, Bates-Randall Homestead Site (Formerly Historic Site 1), Millennium Power Project, Charlton, Massachusetts. 90 pages.

The Bates-Randall Site encompasses approximately 30,000 sq ft within a 24 acre tract of land. The archaeological site contains four structures and associated artifact assemblages related to the occupation of the farmstead from the 1750s to the 1830s. The site's architectural and artifactual components indicate the presence of a mixed domestic-industrial (blacksmithing) occupation. The main house had a relatively large, brick, center chimney that rested on a probable fieldstone footing. The recovery of redware milkpan sherds, farm animal bone fragments (e.g., cow, pig, sheep), and an iron hoe, along with the identification of a possible animal pen within the site area, suggest the agricultural uses of the site. The identified remains of a blacksmith forge consist of flagstone flooring, associated oxidized soils, and an associated industrial artifact assemblage. Two identified depressions may have served as a storage area for equipment or a borrow area for sands and other materials needed to work iron at the forge. Disturbed areas associated with an electric transmission line corridor to the west and a natural gas pipeline easement to the north surround the site. Within the defined boundaries of the Bates-Randall Site, however, the physical integrity of archaeological deposits is good to excellent. This integrity, combined with a high research value, contribute to the Bates-Randall Homestead Site's significance under Criteria A and D of the National Register of Historic Places. The combined presence of domestic, agricultural, and industrial resources at one site that can be isolated to a relatively brief time span (1750s to 1830s) during the late Colonial and Federal periods makes a meaningful contribution to the historical and archaeological database.

25-1694 Begley, William and Peter Mair

1998 Intensive (Locational) Archaeological Survey: Chelmsford Phase IIIC Sewer Project Area, Chelmsford, Massachusetts. 65 pages.

The survey included background research, a walkover of the project area, and subsurface testing. An initial stratification of the project area into zones of expected archaeological sensitivity was based on background research and a walkover inspection. This preliminary evaluation indicated that the project area contained many locations that had evidence of previous disturbance from commercial and residential development as well as locations that contained poorly-drained, low-lying areas adjacent to wetlands. These areas were ranked as having low archaeological sensitivity. The remainder of the project area was ranked as having moderate to low archaeological sensitivity. Subsurface testing during the survey sampled those portions of the project area considered to have moderate to low archaeological sensitivity. No Native American or EuroAmerican archaeological sites were identified during the fieldwork aspect of the survey.

25-1695 Adams, Virginia H., Alan Leveillee, Patricia Fragola, and Mary Kate Harrington

1998 Intensive (Locational) Archaeological Survey, Historic Building and Landscale Assessment,

Proposed Bird Estate Residential Development Area and Site Examination Bird Pond 2 Site, Walpole, Massachusetts. 163 pages.

The survey of the Bird Estate project area identified five prehistoric Native American loci. Four of these, Bird Pond 3, Bird Estate 1, Bird Estate 2, and Bird Estate 3 were low-density scatters of non-diagnostic prehistoric cultural material. The absence of diagnostic material prevents these sites from being associated with a specific temporal period. Site examination-level investigations were recommended and carried out at the Bird Pond 2 site. To date, a low to moderate density of prehistoric cultural material has been recovered from within the 8,075 sq m Bird Pond 2 Site. Quartz, felsite, and rhyolite chipping debris have been recovered from the site along with one scraper, a biface fragment, and a ground stone axe. The absence of diagnostic artifacts and features from Bird Pond 2, as well as the suggestion that upper strata across the greater part of the Bird Pond 2 Site area has been removed, limit the site's potential to add further to the local or regional archaeological data base. The site is not considered eligible for listing in the National Register of Historic Places. The Bird Pond 1 (prehistoric) Site is is indicative of a moderate-sized, upland settlement site, probably related to a large settlement located along the Neponset River floodplain. This site is considered eligible for inclusion in the State and National Registers of Historic Places. Avoidance of the Bird Pond 1 Site is recommended. This assessment confirmed the previous findings that the property is eligible for listing in the State and National Registers of Historic Places. Background research and fieldwork delineated the potential boundaries for the historic and architecturally significant sections of the estate. The Bird House and its immediately surrounding landscape form a significant entity at the local level and appears to meet State and National Register Criterion A for its associations with the Bird family and the industrial, social, and civic history of the Town of Walpole, and Criterion C as a good example of early 20th-century, Neoclassical-style country estate residential architecture in association with an historic landscape.

25-1696 Rainey, Mary Lynne and Duncan Ritchie

1995 Intensive Archaeological Survey, Nantucket Golf Club, Nantucket, Massachusetts. 270 pages.

A majority of the 250 acre project area was considered to have moderate to high sensitivity for prehistoric and historic archaeological sites. Background research indicated that the project area was adjacent to a core area of prehistoric settlement in the vicinity of Gibbs Pond. Four known sites were located nearby, and the project area had a strong potential to contain other prehistoric sites located in several types of environmental settings: wetland margins, small kettle holes or swales, and knoll and ridge crests. Subsurface testing resulted in the identification of 10 small findspots of prehistoric cultural material. Several of these loci were isolated recoveries of Late/Terminal Archaic and Early Woodland period projectile points. Four larger prehistoric sites were identified. Two of these sites appear to have Late Archaic (Squibnocket/Small Stemmed Point) components, one site may contain a Woodland period component, and another is of unknown temporal affiliation. Historic period sites identified in the survey included a 19th-century archaeological component associated with one of the standing structures (Coffin Farm House 1) and two small, midden-like deposits of late 18th- to early 19th-century domestic refuse and structural material (Coffin Farm Complex 1 and 2). Another site (Milestone Road) was a small deposit of structural material. These sites may be associated with former dwellings, including Native American houses. The sites are considered to be potentially important cultural resources. The Coffin Farm complex is a rare local example of a relatively intact farm possessing strong associations with Nantucket's 19th- and 20th-century agricultural traditions. It is potentially eligible for listing in the National Register of Historic Places under Criteria A and D.

25-1697 Boire, Kerrylynn and Suzanne Cherau

1998 Intensive Archaeological Survey: Devens Commerce Center Wastewater Interceptor Replacement Project, Ayer and Harvard, Massachusetts. 112 pages.

Documentary research and subsurface testing of a planned replacement wastewater interceptor route that includes cross-country sections along the Nashua River through former Fort Devens lands in north-central Massachusetts resulted in the identification of historic sheet refuse. The refuse appears to be associated with HS 8M, the 18th- and 19th-century Eli A. Page Homestead, previously recorded within the former Main Post of Fort Devens. The cultural material types (ceramics and nails) are commensurate with the classes of historic artifacts recovered during previous testing within the site area. No concentration of artifacts or architectural features was identified within the proposed sewer route. The identified historic cultural materials have been added to the site's inventory form, but were not assessed as representing a potentially important deposit related to the recorded historic archaeological site. No prehistoric archaeological deposits were encountered within the proposed cross-country sewer route during the intensive survey.

25-1698 Miller, Beth P., Suzanne G. Cherau, and Mary G. Soulsby

1994 Archaeological Reconnaissance and Intensive (Locational) Surveys, Northeast Corridor Electrification Improvement Project, Attleboro, Foxboro, Sharon, and Boston, Massachusetts. 59 pages.

All ground areas to be impacted were first studied in an archaeological reconnaissance survey conducted in 1993 and 1994 (see Report #25-1492) including the alterations to two areas. These two new sites were subjected to an archaeological reconnaissance survey (see Report #25-1492). The revised location of the proposed Readville Paralleling Station was determined not to contain any archaeologically sensitive areas, thus no additional archaeological investigation was recommended. Subsurface testing was conducted at the four archaeologically sensitive project locations as part of an intensive archaeological survey. Low densities of historic/modern field debris were recovered at the Attleboro Paralleling Station and East Foxboro Paralleling Station project areas. A moderate density of secondary deposit historic/modern field debris was recovered at the location of the Maskwonicut Street Bridge project area. None of these historic/modern cultural deposits is considered to represent potentially significant archaeological resources. No further archaeological investigations at these proposed project locations are recommended. No cultural materials were found within the revised Canton Paralleling Station project area during this intensive survey. A prehistoric site within a disturbed topsoil context was identified within an adjacent utility easement situated outside of the project work area.

25-1699 Decima, Elena

1998 Intensive Archaeological Survey, Quaboag Regional School, Warren, Massachusetts. 40 pages.

Sixty test pits were excavated during the intensive survey. The archaeological work resulted in the identification of three small prehistoric sites: QSl, QS2, and QS3 characterized by three flakes, three flakes and one piece of shatter, and one flake, respectively. The sites are either the remains of larger sites destroyed by the construction of the original school and associated landscaping, or they represent very small campsites. Though the prehistoric files of the area mostly represent collections, the record suggests large, rich multicomponent sites near the many tributaries of the Quaboag and by the river itself. On the basis of the information at hand, it is likely that the intensive-survey finds represent the edges of a site (or sites) once located on the school area, which overlooks a large bend on the river and associated wetlands. Though all of the identified sites will be impacted by the design of the project, the special circumstances of their location and the fact that the whole project area is characterized by its marginal location and by a high degree of construction and landscaping disturbance lessen the sites' significance. No additional work is needed, and the sites are not eligible for inclusion in the National Register of Historic Places.

25-1700 Ritchie, Duncan and Paul Russo

1997 Site Examination of the Fonzo Site within the Beverly Airport Industrial Roadway Project Area, Beverly, Massachusetts. 74 pages.

The Fonzo Site was identified in a previous intensive level survey of the Beverly Airport Industrial Roadway project area (see Report #25-1603); it appeared to contain important information relative to Native American settlement and resource use along the Bass River drainage. This site appeared to contain a Late/Terminal Archaic Period (3,900-3,200 years ago) occupation associated with the Susquehanna Tradition and had the potential to contain other components based on the range of lithic materials in the sample of chipping debris. Test pits were used to define site boundaries, investigate the horizontal and vertical distribution of prehistoric cultural material, and locate concentration areas. Excavation units (1 m x 1 m) were used to investigate concentrations of cultural material and to provide the larger sample of cultural material needed to evaluate the contents and complexity of these concentration areas. Boundaries for the Fonzo Site were defined. The assemblage of prehistoric cultural material consisted of three chipped stone artifacts and approximately 290 pieces of rhyolite and quartz chipping debris. The three artifacts were base/midsection and edge fragments of bifacial tool blades made of rhyolite. None of these is diagnostic. Densities of chipping debris varied from very low to moderate in the test pits and excavation units. No prehistoric features were found. No organic materials (e.g., charcoal or shell) from intact archaeological contexts suitable for radiocarbon dating were recovered. The site examination identified three areas with concentrations of cultural material. One moderate density concentration of rhyolite chipping debris was located near the southern boundary of the site. This concentration probably contains a prehistoric lithic workshop that has been dispersed by repeated plowing. A second, less dense and smaller concentration was also located on the southern periphery of the site. A third area was located in the southeast portion of the site in close proximity to an intensive survey test pit that yielded a soapstone vessel sherd. Historic/modern period cultural material consisted primarily of small ceramic sherds with manufacture dates ranging from the early/mid 18th to early 20th century, bottle glass, and structural materials. This material represents domestic refuse deposited as “field trash” while the project area was in active use as farmland. The site examination delineated the horizontal and vertical boundaries of the Fonzo Site and evaluated its contents, internal complexity or structure, and probable function. No new information on the periods of occupation was obtained and the Fonzo Site did not appear to contain potentially significant categories of information.

25-1701 Leveillee, Alan and Paul Russo

1997 Reconnaissance Archaeological Survey within the ANP-Blackstone Energy Project Area. 44 pages.

The survey included background research, a walkover survey, and sensitivity assessment of the project area in Blackstone, Massachusetts. The site of proposed plant construction is within the existing Kimball Sand and Gravel Company, an active gravel pit. Past and ongoing sand and gravel mining and blasting of bedrock exposures have resulted in radical modifications to original ground surfaces, eliminating the likelihood that archaeological deposits would be encountered here. No further archaeological investigations are recommended for the proposed ANP Blackstone Facility. An estimated 60% of the easement of the proposed pipeline interconnect easement into the facility has not been disturbed and is considered sensitive and may contain prehistoric archaeological sites, given the relative proximity to the Mill River and related wetlands. Prehistoric sites have been found in comparable environmental settings. Subsurface testing at the intensive (locational) level is recommended for the proposed pipeline interconnect construction easement.

25-1702 Cherau, Suzanne G., Holly Herbster, and Matthew Kierstead

1997 Archaeological Site Examination, Old Pond Dam and New Pond Dam, Easton, Massachusetts. 92 pages.

The Old Pond and New Pond dam sites are contributing elements in the Furnace Village Historic

District and are significant resources based on their association to the historic ironmaking industry in the town. The archaeological tasks included background research, subsurface testing, and laboratory processing and analysis of recovered cultural materials. The Old Pond dam was the location of several iron foundry sites that operated on the property from circa 1752 to the 1890s. The archaeological investigations recovered a high volume of ironmaking waste confirming the historic industrial use of the site. The majority of this ironmaking waste was recovered from subsurface strata that have been spread across the site as a result of 250 years of continuous industrial activity, followed by modern improvements and re-landscaping. One area containing possibly intact historic strata and artifactual remains related to the documented industrial use of the site was identified. These deposits are probably associated with the 19th-century Drake foundry operation. They are located in the far eastern portion of the site area, closest to the area behind an abutting used car lot. Additional archaeological investigations may be warranted in this portion of the site should future improvements be planned by the Town of Easton. The New Pond dam site functioned historically as a power source for the Old Pond iron industries. The archaeological investigations provided documentation that the stone-lined dam structure was filled with relatively clean, sandy soils, the majority of which probably came from the edges of Poquanticut Brook when it was dredged circa 1810 to create the reservoir. Several prehistoric artifacts, including a projectile point fragment, were found in the fill soils, further supporting the dredging of sandy knolls and terraces along the nearby brook. The proposed repairs to the two dams were limited to the reconstruction of the spillway structures. This study was unable to completely document the internal complexity and condition of the spillways because of concrete and metal reinforcements. Additional archaeological monitoring and recording of the spillway structures was conducted during the repair work. The removal of modern concrete from the stone structures allowed photo-documentation and measured drawings of the underlying spillway features. This recording confirmed that the integrity of the original stonework at each spillway had been impacted by earlier repair efforts.

25-1703 Donta, Christopher L., Thomas L. Arcuti, Carolyn D. Hertz, Richard D. Holmes, and Mitchell T. Mulholland

1998 Archaeological Site Reconnaissance and Locational Surveys for the Proposed Falulah and Regional Water Filtration Facilities, Westminster and Fitchburg, Massachusetts. 68 pages.

Background research did not identify any prehistoric or historic resources in the proposed impact areas. Reconnaissance survey resulted in the recommendation of two areas for subsurface testing, with a total of 72 shovel test pits. No prehistoric or historic sites were found. The site is not recommended for further study.

25-1704 Boire, Kerrylynn, Timothy Binzen, Suzanne G. Cherau, Mary Kate Harrington, and Virginia H. Adams

1998 Intensive (Locational) Archaeological Survey and Historical Architectural Assessment MBTA Hamilton/Wenham Station and Parking, Hamilton and Wenham, Massachusetts. 114 pages.

Documentary research and subsurface testing resulted in the identification of a railroad turntable pit, including its center pivot support and sidewall, and the footing or support remains of an associated railroad water tank/tower. These resources are related to the 19th-century Hamilton and Wenham Depot that functioned as part of the Boston and Maine Railroad. The archaeological deposits have been impacted by modern parking lot improvements and utility construction. Due to a generally poor physical integrity, the historic railroad-related archaeological resources were not considered to be eligible to the National Register of Historic Places. No further archaeological investigations were recommended. The architectural assessment identified three standing structures within the project area: existing passenger platforms, a loading ramp and platform, and a corrugated metal storage container. They are less than 50 years old and therefore are not historic resources. The architectural assessment identified one historic district, the Wenham Historic District, a National Register-listed and locally designated historic district included in the State Register, lo-

cated immediately west of the proposed station project area in Wenham. One highly altered and relocated historic building within the district, the former Freight House, is situated immediately west of the project area.

25-1705 Leveillee, Alan and Joseph N. Waller

Intensive Survey and Site Examinations, East Terrace Site and West Terrace Site, Algonquin Gas Transmission Company (Algonquin) Bellingham Interconnect Pipeline Route FERC Docket No. CP98-100, Bellingham, Massachusetts. 129 pages.

The survey was designed to identify existing archaeological deposits within the proposed pipeline corridor and included background research, a walkover survey, sensitivity assessment, and subsurface testing. This investigation resulted in the recovery of low densities of historic period cultural material. Recovered prehistoric cultural materials were concentrated within two site areas, the East and West Terrace sites. No standing structures more than 50 years old that the project may visually impact were identified during the survey. The West Terrace Site consists of two discreet deposits of stone tool manufacture. The East Terrace Site similarly consists of two discreet loci of Native American activity. Both the sites yielded lithic chipping debris, biface fragments, and tools consistent with Native American manufacturing techniques from good vertical and horizontal contexts. Both sites were considered potentially significant cultural resources and were recommended for evaluation at the site examination level if avoidance was not possible. Site examinations showed that both Locus 1 and Locus 2 of the East Terrace site demonstrate excellent stratigraphic integrity and have produced intact features dating to the Early/Middle Woodland Period and artifacts resulting from Native American occupation. Artifact types recovered from the site and radiocarbon dated features indicate that occupation of the East Terrace Site commenced during the Late Archaic Period and continued through to the later Woodland Period. Locus 1 of the West Terrace Site contained a low density of lithic chipping debris and a single, non-diagnostic projectile point fragment. The integrity of Locus 1 (West Terrace) has been severely impacted through numerous episodes of historic plowing. No temporally diagnostic artifacts or evidence for prehistoric features was encountered at Locus 1 (West Terrace). Locus 2 (West Terrace) produced a relatively high density of lithic chipping debris. Lithic material types recovered from Locus 2 include Boston Basin volcanics. Flake patterns on broken tools and biface fragments are consistent with the broad-blade Susquehanna lithic technology of the Transitional Late Archaic Period. It is recommended that Locus 2 of the East Terrace Site and Locus 2 of the West Terrace Site be avoided. These loci are significant cultural resources that meet Criterion D for National Register eligibility. Individually and collectively, they can contribute to our understanding of Native American occupation of the upper Charles River Basin. A program of archaeological data recovery is recommended as a mitigative treatment of Locus 1 of the East Terrace Site. Locus 1 of the West Terrace Site does not meet eligibility criteria for listing in the National Register of Historic Places and no further archaeological investigations are recommended.

25-1706 Macpherson, Jennifer and Duncan Ritchie

1998 Intensive Archaeological Survey, Treetops Subdivision, 641 Boston Post Road and Adjacent Parcels, Sudbury, Massachusetts. 96 pages.

Background research and a preliminary walkover inspection determined that a majority of the project area has high and moderate archaeological sensitivity. Two known Native American sites (19-MD-199 and 19-MD-201) are located in close proximity to the project area. This 43 acre property also contained upland environmental settings with features (potential lithic source area, small wetlands) that would have made it a likely location for small prehistoric sites. Historic/modern period cultural resources in the project area were likely to be related to past use of the land as woodlot and farmland. One section of the project area alleged to contain unmarked burials was identified through an interview and walkover inspection with a local informant. This informant also pointed out a boulder suspected to have been used by Native Americans as a “grinding stone” or mortar. This “grinding stone” is located 80 ft outside the project area. The northern half of the project area

contained two houses built during the early modern period. Subsurface testing identified one prehistoric archaeological site and a small boulder shelter (Hemlock Boulder Shelter) with evidence of use during the Middle to Late Woodland Period. The area alleged to contain unmarked burials was found to contain bedrock outcrops, steep slopes, and rocky soils. Close interval subsurface testing did not yield any evidence of burial features. The remains of several small tent floors or demolished cabin sites associated with a former Boy Scout camp were found in one section of the project area. The Hemlock Boulder Shelter is a potentially significant cultural resource. The demolished cabin sites and two modern period houses in the project area are not potentially significant cultural resources and no further investigation of them is recommended. The suspected "grinding stone" was outside the Treetop Subdivision project area and will not be affected by any proposed construction. No further cultural material was recovered within the project area. No further archaeological investigations are recommended.

25-1707 Holmes, Richard D., Carolyn D. Hertz, and Mitchell T. Mulholland

1997 Historic Contexts of Lower Cape Cod, A Study of the Historical Archaeology and History of the Cape Cod National Seashore and the Surrounding Region. 353 pages.

This report defines, describes, and graphically illustrates the historical contexts within which archaeological resources may be identified, located, interpreted, and evaluated. It assesses the relative importance of each context so that management decisions may be made for resource preservation and protection. Archaeologically sensitive areas are identified on the basis of previous research, field surveys, documentary evidence, and the expectations derived from the historic contexts. The present volume is the fourth portion of a larger project. Its first chapter provides background information on the environment, prehistory, and history of the region. It places the lower Cape into a general historical framework through a timeline and discusses the specific historical development of the six towns of the Lower Cape: Chatham, Orleans, Eastham, Wellfleet, Truro, and Provincetown. Topics addressed include early European exploration and settlement, the Pilgrims at Plymouth and Nauset, changes in economy, subsistence, and population, and major events of the past three and a half centuries. Historical sources useful for research are noted and evaluated. Subsequent chapters discuss the principal historic contexts for the interpretation of archaeological resources and historical trends. The location of known historic resources and the sensitivity of places for containing such resources are indicated on maps in this volume and in a separate set of USGS quadrangle maps. As site locations and predictive data could be misused by pothunters and vandals, confidentiality of this information must be maintained. The present volume also can be used as a handbook for further research. In addition to the text, it contains a compendium of historic maps useful for archaeologists, historians, and cultural geographers. The bibliography includes all of the titles in the annotated bibliography, with a guide for locating some of the rarer works.

25-1708 Atwood, Kathleen A.

1998 Conant Brook Dam, Historic Properties Management Plan. 190 pages.

The purpose of the Historic Properties Management Plan (HPMP) is to provide a comprehensive program to direct the historic preservation activities and objectives at the Conant Brook Dam flood Control Project, located in Monson, Massachusetts and to effectively manage and protect each historic property. A cultural resource reconnaissance (see Report #25-314) of the Conant Brook Dam project area was conducted during the summer of 1978. Background research and limited field investigations failed to locate any prehistoric resources within the project area. The report concluded, however, that the Conant Brook Dam project area had a moderate potential for containing prehistoric sites. Eight historic period sites were identified during background investigations. Four of these sites had been destroyed during dam construction, and the other four had been disturbed. In order to achieve compliance objectives, a four step Action Plan is recommended: Integrate HPMP with Project Management; Fund and Conduct Inventory/Evaluation; Nominate/Protect; Enhance Public Education.

25-1709 Atwood, Kathleen A.

1998 East Brimfield Lake, Historic Properties Management Plan. 224 pages.

The purpose of the Historic Properties Management Plan (HPMP) is to provide a comprehensive program to direct the historic preservation activities and objectives at the East Brimfield Lake Flood Control Project, located in Brimfield, Holland, and Sturbridge, Massachusetts, and to effectively manage and protect each historic property. An archaeological reconnaissance survey (see Report 25-1318) of the East Brimfield Lake project area was completed in 1988. Background research, a walkover, and limited subsurface testing identified 11 prehistoric sites and 33 historic sites within the project area. The report provided archaeological sensitivity maps with recommendations for further inventory of sensitive areas, and evaluation of identified sites. In order to achieve these objectives, a four step Action Plan is recommended: Integrate HPMP with Project Management; Fund and Conduct Inventory/Evaluation; Nominate/Protect; Enhance Public Education.

25-1710 Strauss, Alan E.

1998 Intensive Archaeological Survey of the MWRA Cosgrove Disinfection Facility at Shaft A, Clinton, Massachusetts. 37 pages.

An intensive archaeological survey of the MWRA Cosgrove Disinfection Facility at Shaft A in Clinton, Massachusetts was conducted. The project consisted of background research, field reconnaissance, and subsurface testing. Subsurface testing was conducted in those portions of the project area that were considered archaeologically sensitive. No testing was done in areas that were poorly drained, steep, contained surface bedrock, or were disturbed. Six shovel test pits were excavated during the project. One sherd of 19th-century glazed ironstone ceramic was found in the project area as well as a few brick fragments and pieces of coal and a non-diagnostic metal fragment. No prehistoric artifacts were found in the impact area. No further archaeological investigations are recommended for the project.

25-1711 Strauss, Alan E.

1998 Intensive Archaeological Survey of the Frost Fish Hill Subdivision in Chatham, Massachusetts. 34 pages.

Background research indicated that no recorded prehistoric sites were situated within the project area; however, several sites were located near the impact area. Field investigations for the project included a surface inspection and excavation of 40 shovel test pits. One historical standing structure, originally an ice house, was found in the western end of the project area. The building was in poor condition and had been remodeled and used for a garage and storage facility. The historical integrity has been somewhat compromised; there are only three ice houses on the Cape and this may be the only ice house in Massachusetts built after 1910. It is therefore recommended that the ice house be avoided. If avoidance is not possible it is recommended that a determination be made by an architectural historian as to the structure's integrity and historical significance. No prehistoric or historic cultural resources were recovered during the intensive survey. Because no significant historic or prehistoric resources were identified within the proposed construction area, no further archaeological investigations are recommended for the project.

25-1712 Russo, Paul A. and James C. Garman

1998 Results of an Archaeological Site Examination of a Portion of CON-HA-01 (The American Powder Mill Complex), Concord, Massachusetts. 55 pages.

Subsurface testing of Structures 1-3 in the Camp Thoreau project area encompassed the excava-

tion of 24 test pits and six 1 m x 1 m excavation units. Archaeological remains associated with the American Powder Mills complex within the Camp Thoreau project area comprise a small portion of the larger industrial landscape. The remains, dating from the late 19th and early 20th centuries, represent operations peripheral to the larger effort. According to the 1929 Sanborn map, the infrastructure of the mill had grown to include nine mixing buildings, two of which (Strs. 2 and 3) are located within the project area. Thus, it cannot be argued that these are unique and outstanding examples of industrial process. Subsurface archaeological testing at these near-identical sites yielded little that can be used to further address the approved research design. It is expected that further archaeological investigation is unlikely to yield additional information important to the understanding of powder mill landscapes and industrial practice that would not be readily available through the documentary record and other, more complete industrial landscapes. Archaeological remains associated with CON-HA-01 in the Camp Thoreau project area do not appear to meet the criteria for eligibility for inclusion on the National Register of Historic Places. No further archaeological investigation is recommended.

25-1713 Macpherson, Jennifer

1998 Intensive (Locational) Archaeological Survey, Martignetti Company Access Road, Norwood, Massachusetts. 58 pages.

This report details the objectives, methods, and results of the intensive survey, and serves as the final summary for all archaeological work completed on the project. The extent of disturbance within this area led to a reduction of the total number of test pits needed to adequately test the project area. A total of 17 test pits was excavated. Subsurface testing was concentrated within a shallow swale east of an existing Algonquin Gas Transmission pipeline. One known Native American site (19-NF-132) is located in close proximity to the project area. Archaeological investigations of the project area did not yield any cultural material or locate any potentially-significant archaeological sites. No further archaeological investigations are recommended.

25-1714 Macpherson, Jennifer

1998 Intensive Archaeological Survey Reebok World Headquarters, Canton, Massachusetts. 78 pages.

Background research indicated that the project area was within a core area of Native American settlement. Numerous known prehistoric sites are located nearby in the Blue Hills and adjacent to the Neponset River. It was expected that some evidence of prehistoric activity would be found within the project area. The project area has also been intensively used during the historic period for agricultural and other related uses. The project area was divided into zones of expected archaeological sensitivity. During the intensive archaeological survey, subsurface testing was concentrated in zones of high and moderate sensitivity. An early 20th-century estate house and associated outbuildings stands in the north and central portions of the project area. These areas have undergone extensive landscaping and were considered to have a low potential for containing intact archaeological deposits. Subsurface testing identified one prehistoric site along the southern boundary of the project area. On the Royall Site, eight pieces of rhyolite chipping debris were recovered from several test pits. This material was in the upper portion of a sandy loam topsoil and the topsoil/subsoil interface. None of this material can be placed in a specific temporal or cultural context. It does not have the potential to yield any further information regarding Native American settlement or resource use in the Blue Hills and Neponset River drainage. No further archaeological investigations are recommended.

25-1715 Clements, Joyce M.

1998 Results of an Archaeological Site Examination, The Bidwell House Farm Shop (Piggery), Monterey, MA. 44 pages.

This report presents the results of a Phase II Site Examination as part of a Massachusetts Preservation Projects Fund matching grant for The Bidwell House Farmshop ("The Piggery"). Subsurface testing produced very shallow deposits of sheet refuse in topsoil horizons, and a dense refuse midden behind the structure to the west. Artifacts from the midden provided samples of domestic refuse and architectural debris used to interpret episodic household renovation. Excavations also revealed a flagstone walkway extending along the eastern facade of the building. Staff from the Massachusetts Historical Commission consulted with the restoration specialists to mitigate negative impacts to the feature. No significant archaeological deposits or architectural features occurred in the remainder of the project; therefore stabilization and restoration efforts, exclusive of Feature 1, may proceed as planned.

1996 Site Examination on Fenceline, Interval, Vista, and Shadow Prehistoric Sites; and Coffin Farm Complex 1 and 2, Coffin Farmhouse 1, and Milestone Road Historic Sites, Nantucket Golf Club Project Area, Nantucket, Massachusetts. 183 pages.

The site examination was conducted in order to determine whether the sites contribute to the Nantucket Historic District, a property listed in the National State Registers of Historic Places. Information collected from these sites included size, contents, internal composition, temporal/cultural affiliation, condition, and function. Results of fieldwork indicate that the Fenceline Site is a Late Archaic to Early Woodland Period temporary hunting camp set along the margins of a large wetland. The site could contribute detailed information on the apparent contrasts between Archaic and Woodland Period settlement patterns and resource use on Nantucket. The other prehistoric sites (Shadow, Vista, Interval) have limited information content and are not considered to be significant. The Coffin Farm Complex 1 Site is a 17th- to early-18th-century dwelling site that contains intact features and deposits of domestic refuse. The site is expected to contain valuable information regarding house form, foodways, and material culture of the inhabitants of Occawa, a Native American settlement formerly located in the project area. The Coffin Farmhouse 1 contains evidence of an early/mid 19th-century structural feature, trash pit, and other deposits of historic refuse relating to a sequence of occupation by members of the Folger and Coffin families. The Milestone Road Site is a deposit of architectural and domestic refuse that is suspected to represent a former late-18th- to early-19th-century house site. It is considered a potential source of information on the process of abandonment, and moving and recycling of houses on Nantucket. These three historic sites may contain information that could contribute to a more comprehensive and detailed landscape history of Nantucket. Based on the results of the site examinations, one prehistoric (Fenceline) and three historic (Coffin Farm Complex 1, Coffin Farmhouse 1, Milestone Road) sites are considered to be significant and eligible for listing on the National Register of Historic Places. Avoidance of all four sites is recommended. No further archaeological investigation is recommended for the Shadow, Vista, Interval and Coffin Farm Complex 2 sites.

25-1717 Clements, Joyce M.

1997 Preliminary Report of a Phase II Site Examination, Memorial Field Self Help Project, Hanson, Massachusetts. 56 pages.

Field investigations revealed low-density lithic debris in the area where a soccer field is proposed, and a rock platform, an oval-shaped pit, and anomalous soil stains near the area where basketball courts are to be built. While several types of rock platforms have been excavated in Massachusetts, the Hanson feature is dissimilar to those that have been described in the literature. Archaeobotanical analysis produced evidence from a variety of plants in the feature fill, with a range of seasons identified. Because the feature is anomalous and does not conform to existing interpretations, it has the potential to add to our understanding of rock features, and to explore their use in the historical period. Furthermore, the relationship between the rock platform and adjacent features is not clear and requires further research and interpretation. The way these features can elucidate the past makes them potentially eligible for listing in the National Register of Historic

Places. Archaeologists have therefore recommended procedures to ensure that the features are protected from any and all construction impacts.

25-1718 Donta, Christopher L. and Thomas L. Arcuti

1997 Archaeological Site Reconnaissance and Locational Survey for the Middleborough Middle School, Middleborough, Massachusetts. 77 pages.

Background research indicated that portions of the project area were used during the prehistoric era, as there were three recorded prehistoric sites potentially within the property, and a large and important Native American village just north of this location. Historic use of the area was limited, as it is made up almost entirely of hilly terrain that is poorly suited to agricultural or settlement purposes. Following background research, the project area was divided into survey units on the basis of topography and proposed impacts, and the property was examined for evidence of prehistoric and historic potential. Recommendations were made for subsurface testing in areas having the potential to contain historic and prehistoric sites.

25-1719 Macpherson, Jennifer, William Brett, and Deborah C. Cox

1998 Cultural Resources Survey EMI/Dighton Interconnect Project, 1.6 Miles of 12-inch Loop, Norwich and Montville, Connecticut, 0.10-Miles of 12-inch Connector in Dighton, Massachusetts. FERC Docket No. CP98-99-000. 71 pages.

This report serves as the final summary for all archaeological work completed on the project. A total of 15 50 cm x 50 cm test pits was excavated during the archaeological reconnaissance survey at the Norwich and Montville, Connecticut project area. All test pits were arranged along six transects except for one judgmentally placed test pit. Subsurface testing concentrated along level, wetland terraces in the northern portion of the project area and south-facing, upland terraces of Schoolhouse Hill. The survey identified no Native American archaeological sites or findspots, nor any EuroAmerican resources. No cultural materials were identified within the project area. Therefore, no further archaeological investigations are recommended.
