Fig. 4. Bubble plots display the relative abundance of the main algal groups and species richness for the 2004 and 2006 surveys. Bubbles are overlaid on the MDS plot (Fig. 4), where each bubble represents an island in a given year (2004 or 2006).

for their help in collecting algal field data. Special thanks to Captains Ken Barton and Scott Kuester and the crews of the NOAA ships Oscar Elton Sette and Hi'ialakai. Funding to PIFSC-CRED for scientific expeditions to American Samoa was provided through the NOAA Fisheries Office of Habitat Conservation, as part of the NOAA Coral Reef Conservation Program. The observations and collections of algae carried out in American Samoa complied with the current laws of the country.
