

Nitrogen Critical Loads and Estimated Exceedances in NPS Areas

- Critical loads are the amount of deposition below which significant harmful effects on specified sensitive elements of the environment do not occur according to present knowledge.
- These critical loads (adapted from Pardo et. al 2011) are developed at the ecoregion scale and should only be used to evaluate risk. Where park specific or more recent critical loads exist, these should be used instead.
- **Bolded red** text denotes modeled deposition levels exceed the critical load.
- Total nitrogen deposition (2014-2016 3-year average, wet and dry) produced by National Atmospheric Deposition Program (NADP).
- 'NA' indicates that no critical load has been developed yet for this indicator.
- All values are in kg/ha/yr
