

CHECKLIST OF TERRESTRIAL VERTEBRATES OF DINOSAUR NATIONAL
MONUMENT, COLORADO-UTAH

David M. Armstrong
Natural Science Program and University Museum
University of Colorado, Boulder

This is a list of terrestrial vertebrate animals to be expected in Dinosaur National Monument, Moffat Co., Colorado, and Uintah Co., Utah. It is based on a survey of the literature and includes all species known from the region which live in habitats that are present in the National Monument. Accidental species are not included. Extirpated species--animals that once lived in the area but have gone extinct in the general vicinity--are included to convey some idea of the former richness of the wildlife of the area. Such species are indicated with an asterisk (*). Introduced species are so indicated parenthetically.

The list is annotated with a species' typical habitats, using the following legend: L = lakes and ponds; W = wetlands; St = streams; G = grassland and pasture; M = meadows; F = fields, cultivated land; R = riparian deciduous woodland, including cottonwoods and willow thickets; A = aspen; S = shrublands, brushlands; C = coniferous forest, including spruce/fir and Douglasfir; J = juniper woodland; B = buildings; Cl = cliffs.

Mammals (other than bats), reptiles, and amphibians tend to be rather sedentary, living in a particular area throughout the year. Many kinds of bats and birds, however, are migratory, living in this area at some seasons but not at others. The seasonal status of birds and bats is indicated (in parentheses) according to the following legend: R = resident breeder; N = resident non-breeder; B = definite breeder; b = likely breeder; n = non-breeder (summer); W = winter visitor; M = migrant. Information on habitat and status is modified from Langlois (1978), Kingery and Graul (1978) and Bissell and Dillon (1982) and more recent sources. Common and technical names follow A. O. U. (1983) for birds, Jones et al. (1982) for mammals, and Hammerson (1982) for amphibians and reptiles.
