

What's New in DataStore 4.0.1

DataStore patch release 4.0.1 provides several fixes to the DataStore 4.0 Look and Feel release.

API

- An issue existed where web services erroneously allowed the creation of internal references. Creation of restricted landing pages was deprecated with release 4.0. Requests to change the 'Reference Access' level from 'Public' to 'Internal' are now ignored by the API, but changes from 'Internal' to 'Public' are allowed.
- An issue where attempts to retrieve digital files through web services would return an error has been fixed.
- An issue where taxa were not correctly updated when using web services has been fixed.

User Interface

- When activating a reference with a DOI, an incorrect error message displayed stating the file access was required to be public. The reference activated properly after clicking 'ok.' This error message has been corrected.
- An issue existed where, if a user attempted to batch transfer references to themselves, they would be removed as an owner from their existing references. Attempting to transfer records to yourself will now result in an error message.
- An issue where the Author Affiliation was not saved for Non-NPS Individuals has been fixed.
