

What's New in DataStore 4.0.2 and 4.0.3

DataStore patch release 4.0.2 provides several fixes to the DataStore 4.0 Look and Feel release. DataStore release 4.0.3 provides a single bug fixed from release 4.0.2.

Bug Fixes

- When adding a content unit to a reference, items for “Include Linked Units” and “Add Related Geography” are now correctly omitted when their check boxes are not selected.
- An issue where, in Advanced Search, series parent and grandparent reference types (e.g. Journal Issue and Journal) do not show up in the ‘Reference Type’ drop downlist has been fixed.
- Reference editors may now change the reference type for references that meet existing criteria (not linked to a project or program, not versioned, etc) for references that have been previously activated.
- In release 4.0.3, an issue where previously activated references could not be changed from internal to public is fixed. This is the only issue addressed in 4.0.3.

API

- The Core Bibliography Patch endpoint is fixed, and Miscellaneous Code can be updated.
- Core Bibliography WebService GET end point now returns a value for the miscellaneousCode
- ProjectReferences end point changed label “crossReference” to “projectReferencelds”

User Interface

- In Project type references, editors will now be able to delete external links, even after the reference has been activated
