

What's New in DataStore 4.3

DataStore patch release 4.3 provides a cleanup of the back-end SQL database with schema changes and bug fixes.

Bug Fixes

The following bugs were resolved in this release:

- An issue where downloading results from a quick search resulted in an empty sheet
- The 'Code' column (reference ID) now shows by default in all 'Products' grids
- Reference Editors and Data Stewards may now edit the 508 flag and file description for Active references with a DOI.
- An issue where the 'Units' filter did not consistently work.
- An issue where entered keywords were lost if switching to another tab without saving first.

User Interface

- Data Stewards now have access to references that include their unit as either Producing unit or Content unit. Users are encouraged to update the Producing unit on all references. Access will eventually shift to Producing Unit only for Data Steward permission.
- As part of the ongoing effort to reduce reference types, the following reference types are no longer available for selection when creating a reference:

- Docket, Permit, Plan, Proposal, Memorandum, Letter, Email, Notes, and Environmental Impact Statement have been consolidated into the new 'Administrative' reference type
 - Saved searches utilizing these reference types will be updated post- 4.3 release.
- The way keywords are handled has been restructured. You are now limited to:
 - A max of 375 keywords,
 - A max of 256 characters per keyword
 - A total of 10,000 characters in the keyword field.
 - Keyword lists must be comma delimited.

Known Issues

There are known issues when updating keywords via the API. These issues will be resolved in release 4.4. If you use the API to update keywords, please verify your changes after you submit them.
