Craters of the Moon National Monument

1993 Gaseous Pollutant and Meteorological Monitoring Annual Data Summary

Technical Report NPS/NRAQD/NRTR-95/193

June 1995

United States Department of the Interior
National Park Service
Denver, Colorado

Introduction

The National Park Service Gaseous Pollutant Monitoring Network

Gaseous air pollutants, such as ozone and sulfur dioxide, are of concern to the National Park Service (NPS). Pollutants like these can affect park biological resources as well as the health of park residents and visitors. The NPS has established a gaseous pollutant monitoring program for several pollutants linked to effects on NPS resources. This program was designed to meet certain resource management objectives.

The primary objective of this monitoring program is to establish baseline (or current) park air quality conditions to determine if a park is exceeding the National Ambient Air Quality Standards established by the Environmental Protection Agency to protect public health and welfare. In addition, such monitoring is designed to detect changes or trends in pollution levels over time. A monitoring station may also be established if there is documented biological injury due to air pollution in the park unit. Information on ambient air pollution levels is an important part of research on effects of air pollutants on NPS resources, and can help confirm suspected causes of observed effects.

Other monitoring objectives call for the collection of data to support the National Park Service's required involvement in both the development of state air quality control plans, and the evaluation of permit applications for new or expanding air pollution sources wishing to locate near park units. The Clean Air Act gives federal land managers and superintendents an affirmative responsibility to protect air quality related values in class I areas and to assess whether new sources will have an adverse impact on park resources and values. Information on air quality levels in NPS units can also be used to evaluate the performance of atmospheric models that describe how pollutants are transported into parks and predict impacts on the park caused by air pollution sources.

Figure 1 displays the locations of sites and parameters measured in the National Park Service gaseous pollutant monitoring network in 1993. During this year, 38 monitoring sites in 29 units of the National Park System had some combination of ozone, sulfur dioxide, and meteorological monitoring. Monitoring methods and quality assurance procedures used in the Park Service data collection network meet the applicable 40 CFR Part 58 U.S. Environmental Protection Agency requirements. This allows for the direct comparison of NPS collected data with that collected by the EPA, and state and local air pollution control agencies. Data collected by this network is being incorporated in the EPA AIRS database which is a national database of all air quality data collected throughout the country. These data are also stored in a National Park Service data processing center that allows for easy access and analysis of the data.

Craters of the Moon National Monument

Craters of the Moon National Monument, a class I area, is located in southern Idaho about 60 miles northwest of Pocatello. Its location relative to the other gaseous pollutant monitoring sites in the National Park Service network is illustrated in Figure 1.

Craters of the Moon National Monument was established by presidential proclamation in 1924. It occupies approximately 54,000 acres in the eastern Snake River Plain, which crosses southern Idaho as a broad arc of low topographic relief, contrasting with the mountainous terrain of the rest of the state.

The significance of the monument is the relatively young age of the lava flows and the diversity of volcanic features in a small geographic area. The monument contains part of one of the four rift sets that make up the Great Rift, a volcanic rift zone that extends for 60 miles from the Pioneer Mountains south nearly to the Snake River. Visitors to the monument can see some of the most spectacular and diverse features along the Great Rift, including vast basaltic lava flows and associated volcanic products from eruptions that occurred between 15,000 and 2,100 years ago. Features include two types of lava flow, cinder cones, rafted blocks, fissure cracks, vents, spatter cones, lava tubes, and tree molds.

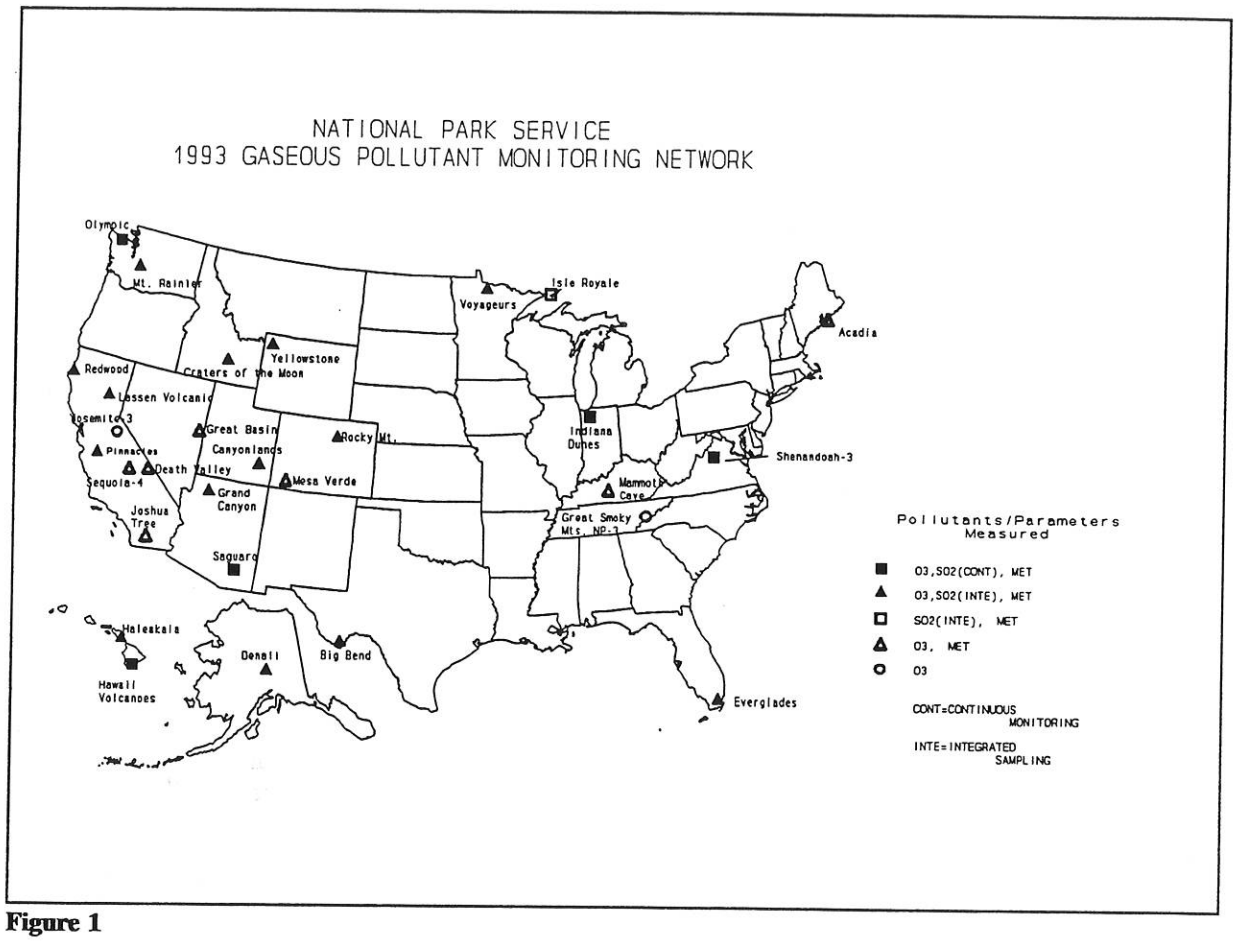

Figure 1

The monument's fauna and particularly its flora reflect the influence of the geologic setting. Plant succession is well illustrated among the different aged lava flows. Limber pine grows at a lower altitude in the monument than throughout the rest of its range. Three subspecies of small mammals were first described from this area and are found only in the vicinity of lava flows of the Great Rift.

The northern end of the monument includes a small portion of the foothills of the Pioneer Mountains. The north unit (4,125 acres) is a different environment from the volcanic area to the south: it is a sagebrush-grassland shrub steppe with stands of Douglas-fir and quaking aspen. Riparian areas surround the small watercourses that arise from springs in the foothills.

Approximately 81 percent of the monument (43,243 acres) was designated wilderness on October 23, 1970. This wilderness area was designated a class I area in the Clean Air Act, as amended in 1977. The rest of the monument is designated as a class II area, however, the entire monument is managed as a class I area.

Visibility and scenery are notable air quality related values at Craters of the Moon.

Site Specific Information

The AIRS identification number for this site is 16-023-0101.

The latitude of the monitoring site is 43° 27' 38" N and the longitude is 113° 33' 44" W (UTM Zone 12: UTM-Northing = 4814934: UTM-Easting = 00292714).
It is located to the southwest of park headquarters.

The site elevation is 1815 m MSL.

Table 1 provides a listing of the instrumentation and ancillary equipment used in the acquisition of ambient air quality data at this site. Monitoring commenced in October, 1992.

Table 1

Pollutant, Parameter, or Equipment	Manufacturer	Model No.
Ozone	Monitor Labs	8810
Calibrator	Dasibi	1003-PC
Wind Speed	Climatronics	100075
Wind Direction	Climatronics	100076
Solar Radiation	Li-Cor	Pyranometer
Dew Point	Climatronics	100528
Temperature (3 m AGL)	Climatronics	100093-2
Aspirator, Motor-driven --for Temperature & Dew Point	Climatronics	TS-10WA
Data Acquisition System	SumX	SX-445

Report Contents

This report contains data summaries organized into two major sections: 4th Calendar Quarter, and Month. This report contains the following figures and tables.

4th Calendar Quarter Data Summaries Section:

Data Recovery Percentages
Ozone "Quick Look" Annual Summary Statistics Report
Ozone Data Summary - 24 month
NAAQS Ozone Exceedances or Highest 10 Values
Hourly Ozone Data Plot
Diurnal Ozone Data Plot
Ozone EPA AIRS Standards Report
Ozone EPA AIRS Yearly Frequency Distribution Report
Ozone Pollutant Rose and Joint Frequency Distributions
Precision Check Data Summary
Annual Wind Rose With Joint Frequency Distributions
Hourly Scalar Wind Speed Data Plot
Hourly Ambient Temperature Data Plot
Hourly Dew Point Temperature Data Plot
Hourly Relative Humidity Data Plot

Monthly Data Summaries Section

Missing Data Codes and Monthly Data Summary Sheet Descriptions
Monthly Reports (Hourly Averages for October - December)
- Ozone
- Scalar Wind Speed
- Resultant Wind Speed
- Resultant Wind Direction
- Ambient Temperature
- Dew Point Temperature
- Relative Humidity
- Solar Radiation

ANNUAL DATA SUMMARIES SECTION

] From: David Joseph at NP-WASO-AQ 1/19/96 3:01PM (686 bytes: 1 ln)
Natalene Cummings at NP-CRMO
ject: CRMO resultant direction data recovery
---------- Message Contents ----------

Dear Natalene,

I recalcuated the percent recovery of resultant direction data for CRMO for 1993 and it was 99.6%. I don't know where the zero % came from. Can you change the value on the page in the annual report? Otherwise, if you want, I can send you a replacement page in word perfect format that you can print out in your office. Let me know.

Dave

Recovery Percentages for JAN - DEC 93

Craters of the Moon National Monument

Ozone :	90.3 %
Scalar Wind Speed :	99.6 %
Resultant Wind Speed :	99.6 %
Resultant Wind Direction :	0.0 % 99.6
Temperature :	99.6 %
Dewpoint Temperature :	99.6 %
Solar Radiation :	99.2 %
Station Temperature	99.8 %

[Run Date: 27-JUN-95]

DEFINITIONS AND COMPUTATIONAL PROCEDURES
FOR THE NATIONAL PARK SERVICE
QUICK LOOK ANNUAL SUMMARY STATISTICS REPORT

This report provides ozone summary statistics for various indices computed on a monthly basis for an entire year. Growing season (generically defined to be May 1 - September 30) and annual statistics are also presented under the "MAY-SEP" and "ANNUAL" columns, respectively. All concentrations are expressed in the units of parts per billion (PPB) and exposures in parts per billion-hours (PPB-HR). The definitions for each of the statistics appearing on the Quick Look Annual Summary Report are given below.

(1) **Daily 1-Hr Maximum.** The maximum 1-hour average concentration recorded during each month, the growing season or the year regardless of the number of valid hourly observations recorded during a given day. The number in parentheses below this statistic, (N), indicates the number of days in the month, growing season, or year with valid data.

(2) **Average Daily Maximum.** The average of all Daily 1-Hr Maxima during the month regardless of the number of Daily 1-Hr Maxima recorded during the month. For the "MAY-SEP" column the average of all the Daily Maxima recorded during the growing season is given. For the "ANNUAL" column the average of all the Daily Maxima is given. N is as in (1) above.

(3) **Maximum Daily Mean.** The maximum of the valid daily means computed for each month, the growing season ("MAY-SEP" column), and the year ("ANNUAL" column). A valid daily mean is one for which 75% of the observations are available for each day, i.e., 18 hours. N is the number of days during each month, growing season, and year with at least 18 observations.

(4) **Average Daily Mean.** The average of all valid daily means for the month, the growing season ("MAY-SEP" column), and the year ("ANNUAL" column). N is as in (3) above.

(5) **Max Peak:Min Ratio.** The ratio of the Daily 1-Hr Maximum to the Daily 1-Hr Minimum. A ratio is computed only if a valid Daily Mean is computed and if the Daily 1-Hr Minimum is not equal to zero. N is the number of days with a valid Peak:Min ratio.

(6) **Average Peak:Min Ratio.** The average of all Peak:Min ratios for the month, growing season, or year. N is as in (5) above.

(7) **Max 9AM-4PM Average.** The maximum of all valid 9AM-4PM Averages computed for the month, growing season, or year. A valid 9AM-4PM Average is one which has 75% of the observations available during that time period, i.e., 6 hours. N is the number of days with valid averages.

(8) **Monthly 9AM-4PM Average.** The average of all valid 9AM-4PM Averages for the month, growing season, or year. N is as in (7) above.

(9) **Max 7AM-7PM Average.** The maximum of all valid 7AM-7PM Averages computed for the month, growing season, or year. A valid 7AM-7PM Average is one which has 75% of the observations available during that time period, i.e., 9 hours. N is the number of days with valid averages.

(10) **Monthly 7AM-7PM Average.** The average of all valid 7AM-7PM averages for the month, growing season, or year. N is as in (9) above.

(11) **Monthly Mean.** The average of all 1-Hr ozone concentrations recorded during the month, growing season, or year. A mean is computed regardless of the number of hours with valid data. N is the number of hours with valid observations.

(12) **SUM0 Exposure Index.** The monthly sum of all hourly ozone concentrations. Units are PPB-HR. The "MAY-SEP" column sums across the months of May through September to give the cumulative exposure for the growing season. The "ANNUAL" column sums across every month to give the cumulative exposure for the year. N is the number of hours with valid observations and is the same N as in (11) above.

(13) **SUM60 Exposure Index.** The monthly sum of all hourly ozone concentrations equalling or exceeding 60 PPB. Units are PPB-HR. The "MAY-SEP" column sums across the months of May through September to give the cumulative exposure for the growing season. The "ANNUAL" column sums across every month to give the cumulative exposure for the year. N is the number of hours equalling or exceeding 60 PPB during the month, growing season, or year.

(14) **SUM80 Exposure Index.** The monthly sum of all hourly ozone concentrations equalling or exceeding 80 PPB. Units are PPB-HR. The "MAY-SEP" column sums across the months of May through September to give the cumulative exposure for the growing season. The "ANNUAL" column sums across every month to give the cumulative exposure for the year. N is the number of hours equalling or exceeding 80 PPB during the month, growing season, or year.

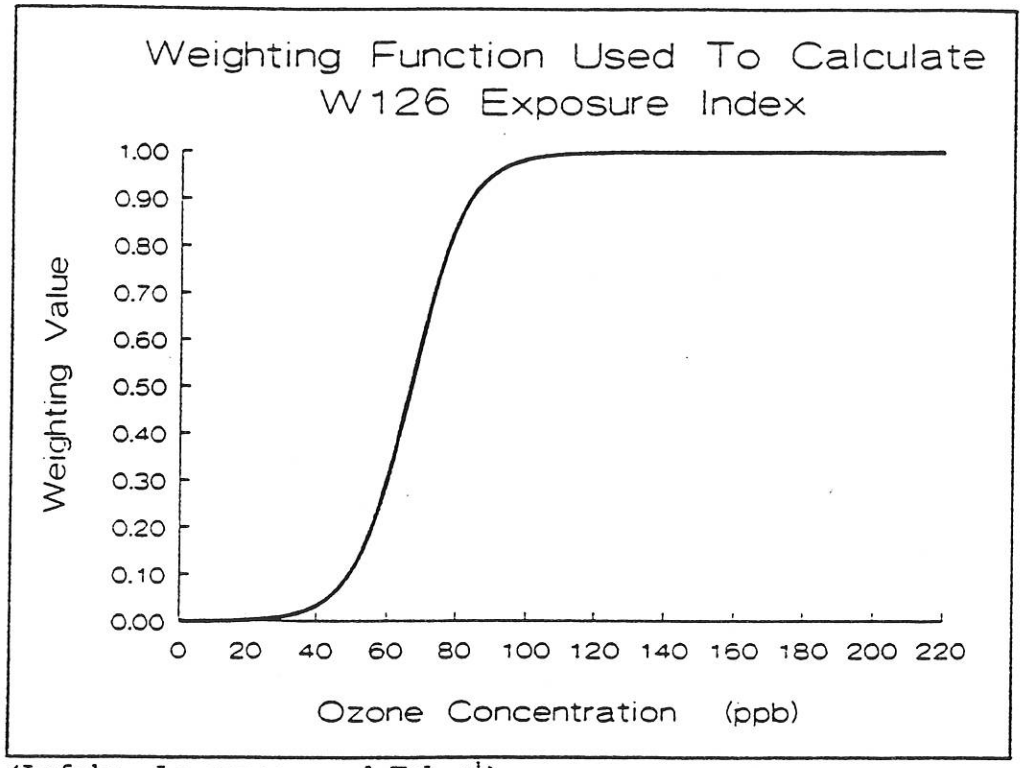

(15) **W126 Exposure Index.** The monthly sum of all hourly ozone concentrations where each concentration is weighted by a function that gives greater emphasis to the higher hourly concentrations while still including the lower ones. This weighting function provides a weighting value that is unique for each hourly ozone concentration. The weighting function, as described by Lefohn, Laurence, and Kohut[1] is:

$$w_i = \frac{1}{1 + 4403\exp(-.126c_i)}$$

where

w_i = weighting value for hourly concentration i, and
c_i = hourly concentration i in PPB.

The graph of weighting value versus ozone concentration, in the figure below, illustrates the greater weights given to higher hourly ozone concentrations.

(Lefohn, Laurence, and Kohut[1])

Each hour's weighting value is multiplied by its corresponding hourly concentration. This product is summed over all the valid hours in each month to calculate the monthly W126 exposure. Thus, the monthly W126 exposure is:

$$W126 = \sum_{i=1}^{n} w_i c_i$$

where

W126 = monthly W126 exposure index,
w_i = weighting value for hourly concentration i,
c_i = hourly concentration i in PPB, and
n = number of hours in the month with valid ozone concentrations.

The "MAY-SEP" column sums across the months of May through September to give the cumulative exposure for the growing season. The "ANNUAL" column sums across every month to give the cumulative exposure for the year. The exposure units are PPB-HR.

Because each hour contributes to this exposure index, N is the number of hours with valid observations and is the same N as in (11) and (12) above.

The U.S. Environmental Protection Agency usually considers air quality statistics, such as a mean, to be "valid" (i.e., representative of the parameter being estimated for the time interval in question) only if 75% or more of the total possible observations have been measured during that time interval. Therefore, one should exercise caution when comparing these statistics between months and sites, particularly those that are <u>not</u> averages (e.g., maxima and exposures) whenever the number of valid observations is less than 75% of the total possible.

1993 PRECISION CHECK DATA SUMMARY

Craters of the Moon National Monument

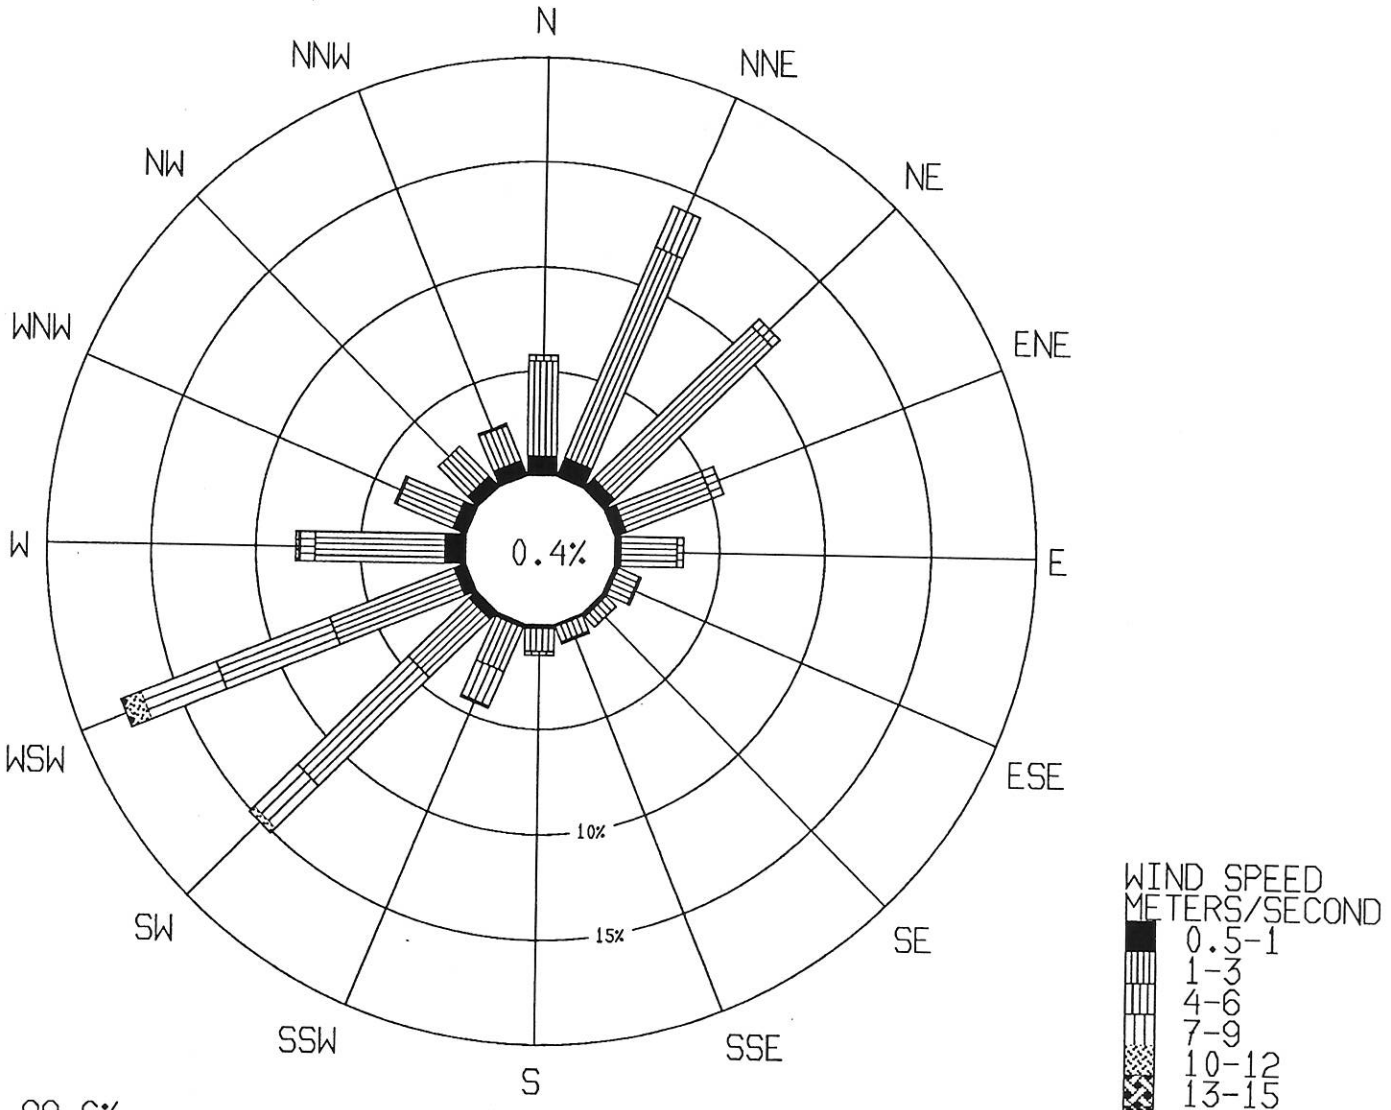

Precision checks are required by the Environmental Protection Agency (EPA) of all monitoring instruments collecting data which are to be submitted to the EPA Aerometric Information Retrieval System (AIRS) data base. A precision check is performed by challenging the pollutant analyzer with a known concentration of gas (between 0.08 and 0.10 ppm for ozone and sulfur dioxide) from the pollutant transfer standard. This precision check must be performed every 14 days of monitoring operation. The percent difference between the analyzer and the transfer standard is then calculated. The tables below give the quarterly number of precision checks, the average percent differences, and the upper and lower 95% probability limits for precision checks.

Ozone

Calendar Quarter	Number of Precision Checks	Average Percent Difference[1]	Lower 95% Probability Limit	Upper 95% Probability Limit
1	0	0	0	0
2	0	0	0	0
3	8	0.75	-06.	07.
4	13	-1.29	-04.	01.

[1]Average Percent Difference = $\frac{\text{analyzer ppm - transfer std ppm}}{\text{transfer std ppm}} \times 100$

"The level of the national primary and secondary ambient air quality standards for ozone measured by a reference method based on Appendix D to this part and designated in accordance with part 53 of this chapter, is 0.12 part per million (235 ug/m3) The standard is attained when the expected number of days per calendar year with maximum hourly average concentrations above 0.12 part per million (235 ug/m3) is equal to or less than 1, as determined by Appendix H."
